Future Studies, Mental Health and the Question of Citizenship.

Abstract

Purpose: This paper seeks to examine the value of utilising future studies to explore citizenship for people with mental health challenges.

Design/methodology/approach: This paper critiques the discipline of future studies and considers it in the context of the citizenship and mental health literature. It explores how future studies can be utilised to promote marginalised voices, such as those of people with mental health challenges.

Findings: Technology is leading to rapid change in society including what it means to be a citizen (Isin and Nielsen 2008; Isin and Ruppert 2015). Whilst citizenship has been promoted within mental health for a long time, change has been slow (Rowe and Davidson, 2016). In order to create inclusive opportunities for people with mental health challenges, any focus on citizenship in mental health needs to not only address the present time but to anticipate and influence future technological directions.

Originality/value: This paper is original in bringing together mental health and the future impact on society of new technologies. It stands to offer a new perspective to discussions on citizenship.

Key Words: Mental Health, Citizenship, Future Studies, Futurology

Introduction

Digital technologies are impacting on every sphere of life, including employment, leisure, transport, relationships, health care and education. All are changing at a rapid pace (Chace 2018; Harari 2016). As digital technologies are changing everyday occurrences, they are influencing what it means to be a citizen. New practices of citizenships are emerging including digital citizenship (regular users of the internet who engages in politics and social movements via information technology), consumer citizens (people who define their citizenship through their purchasing choices), global citizens (people who define their citizenship through a sense of shared humanity and roles and responsibilities that transcend the nation state) (Isin and Nielsen 2008; Isin and Ruppert 2015).

Future Studies includes disciplines such as sociology, media, cultural, technology and business studies, and makes predictions on changes to society based on economics, climate, demographics, political theory, and developments in information technology (Potts 2018). Whilst predominantly used in business, planning and policy making, as an academic study there are opportunities to adopt critical sociological perspectives (Potts, 2018; Bergman et al, 2014). There is also a growing body of popular Future Studies literature that is exploring the likely changes of society due to technological advances and how this will impact on citizens (Chace, 2018; Harari, 2016).

In terms of civil and human rights, people with mental health challenges continue to be significantly excluded from participation in society and experience stigma and discrimination (Slade et al, 2017). This results in social exclusions that perpetuate and sustain inequalities. Recent enquiries into the causes of mental ill health have identified the role of structural inequalities which has led to a renewed call to examine citizenship so that people with mental health challenges are able to access the same opportunities and enjoy the same

rights as other citizens (Hamer and Finlayson 2015; Hamer 2012; Hamer et al. 2018; Harper et al. 2017; Rowe 2015; Rowe and Davidson 2016; Slade et al. 2017). It could be argued people with mental health challenges have a unique experience of citizenship, as their human rights are dependent their health status, for example when detained under the Mental Health Act (Brannelly, 2018; Hamer and Finlayson 2015; Vervliet et al. 2017). Due to these fundamental concerns, citizenship is long fought for, a contested concept and challenged within the survivor movement. Despite this the pace of change has been slow. Neither the de-institutionalisation in the 1980s and 1990s, nor the Recovery movement have delivered the level of equalities required (Eiroa-Orosa and Rowe, 2017; Rowe and Davidson, 2016). Now, there is another ubiquitous issue that needs to be considered in this debate, and that is the role of technologies.

Due to the impacts of technology society is changing rapidly. This paper will argue that it is important that citizenship for people with mental health challenges is not just explored in the present but also to look at future impacts. Currently, the development of this tech-led future society is driven by industry (Potts, 2018), to the exclusion of other voices (Bergman et al, 2014). People with mental health challenges, as a marginalised population, are excluded from contributing and influencing the conversation about citizenship, rights, the use of technologies and the future. The technology industry focus is on people with higher levels of social connectivity and social capital to monetarise their social value, and these industries are less interested in marginalised populations (Skeggs and Yuill 2016).

Bergman et al, (2014) argue that part of the Futures Studies approach is that there are opportunities for marginalised voices to play an active role in shaping futures, for example, feminist Future Studies approaches challenge existing power structures. It can also be a vehicle for expressing constructive hope when dealing with complex social issues such as climate change (Ojala 2015). This paper explores literature relating to Future Studies, citizenship and mental health and poses the question do Future Studies have a role in promoting citizenship for people with mental health challenges?

Visions of the Future

One consensus in the Future Studies literature is that over the next 20-40 years (2020 – 2040) there will be significant advances in technologies which will influence what it means to be a citizen (Chace, 2018; Harari, 2017; Potts, 2018). Typically, these tend to be dystopian or utopian predictions. Dystopian futures are characterised by increased social control and inequality where the privileged elite have access to the benefits of a technologically driven society or even a society where Artificial Intelligence (AI) itself takes control of society and dictates to humans (see for example Harari, 2016). Utopian futures are described as heralding a new age of democracy, equality and creativity due to technology (Bregman, 2017).

Calum Chace (2018), in his book *Surviving AI*, describes the following future scenario where a character called Julia describes a day in her life, summarised below:

Julia wakes up refreshed having been supported by her digital assistant to monitor her sleep patterns. Her health is monitored and ensures she is healthy and well. Based on her morning health readings, the digital assistant provides advice on diet and what to eat for breakfast. Overnight a drone has delivered a new outfit for work...Whilst she commutes, her personal assistant helps her prepare for work and suggests news stories of interest. As the journey continues she relaxes by wearing a virtual reality (VR) headset allowing her to look at the journey as if it had been in the Victorian era....At work, she uses the latest psychological evaluation algorithm to understand how best to communicate with the people in her virtual meeting. Using

1
2
3 *VR technology she communicates with people across the world. After dark, on the*
4 *way home from work she has her personal assistant checking the street CCTV*
5 *cameras to ascertain the safest way home.*
6
7

8 Whilst this is a fictional account, it paints a picture of how technologies may impact on
9 employment, housing, health, transport, leisure and security. Perkins and Morgan (2017)
10 argue that if people with mental health challenges, in line with the social model of disability,
11 had greater access to social supports or adjustments this could empower people to access
12 the opportunities open to all in society. If technologies were harnessed to promote inclusivity
13 they could provide some of this additional support. Many of these new technologies are
14 already with us or are under development. For example, digital innovations within mental
15 health care include chatbot therapy, smart phones being used to monitor relapse from
16 psychosis, wearable technologies to monitor physical and emotional health, diagnosis
17 through the use of AI predictive technologies, monitoring for suicidality on social media and
18 remote stress or symptom monitoring. People with mental health challenges are already
19 interacting with technology to monitor and support mental wellbeing. For example, people
20 are using *Alexa* or *Google Home* to discuss their emotional distress (Luxton et al. 2016;
21 Miner et al. 2017; Poulin et al. 2016; Tal and Torous 2017).
22
23

24 These developments, not just in healthcare but across wider society are raising new ethical
25 questions about the impact on citizens' rights, in particular around surveillance, privacy, data
26 and algorithmic programming (Harari, 2017 ; Luxton et al. 2016; Poulin et al. 2016). This is
27 particularly important for marginalised groups, such as people with mental health challenges,
28 who already struggle to access their full rights as citizens. There is also evidence that people
29 with mental health challenges are disadvantaged by some of the algorithms programmed
30 into social media (Skeggs and Yuill 2016). People with mental health problems are one of a
31 number of groups who are more likely to be digitally excluded (do not have access to or are
32 unable to access the internet). Therefore, they may not have the opportunity to engage in
33 digital citizenship (Greer et al. 2019).
34
35

36 As well as ethical challenges these technologies have the potential to benefit the lives of
37 citizens. For example, work may become less important as AI takes on more traditional
38 employment roles and there may be a greater focus on happiness and wellbeing rather than
39 measuring a nations success on Gross Domestic Product (Bregman, 2017; Harari, 2016).
40 This is something that Slade et al (2017) have advocated in regards to promoting the mental
41 health of the whole population.
42
43

44 **Citizenship**

45 In Western society, citizenship has conventionally been the relationship between the
46 individual and the state and the balance between the rights and responsibilities of each
47 (Ponce and Rowe, 2018.) This definition and balancing of rights and responsibilities are
48 based on social norms and favour some groups over others and can sustain oppression
49 (Atterbury and Rowe 2017; Vervliet et al. 2017). In the U.K. in particular this tradition has
50 grown out of the work of T.H. Marshall and his seminal work from 1949 *Citizenship and*
51 *Social Class* (Marshall, 1987) and the establishment of the welfare state. He describes how
52 people have civic, political and social rights. However, the tradition has been criticised from a
53 neoliberal perspective arguing the welfarist approach has been replaced by individuals
54 taking personal responsibility (Atterbury and Rowe, 2017). It has also been criticised by
55 feminists and post-colonialists for its gendered and ethnocentric stance (Hamer et al, 2018).
56 It was never intended to take into account the needs of people with disabilities or mental
57 health problems, it was designed to support the employed when not in employment
58 (Atterbury and Rowe, 2017).
59
60

Citizenship and People with Mental Health Challenges

Ponce and Rowe (2018) argue that by critiquing citizenship and understanding who is included and excluded, the concept of citizenship can be used as a vehicle for social change by exposing the processes of exclusion and advocating for marginalised groups. There has been a long-standing movement within mental health, and in particular the survivor movement to promote citizenship and equal rights. This can be traced back to the development of moral treatment in the 19th Century, through deinstitutionalisation in the 20th, to the current Recovery movement (Rowe and Davidson 2016). Despite this focus each of these approaches has failed to deliver access to full citizenship for people with mental health challenges (Rowe and Davidson, 2016; Slade et al, 2017). This is largely thought to be due to the dominance of the combination of systematic injustices and the dominance of the abnormality approach to mental health. People with mental health challenges disproportionately experience the injustices of unemployment, forced treatment and compulsion, poverty, and hardship (Brannelly 2018). These injustices do not stand alone; they intersect with other forms of discrimination and structural inequalities relating to ageism, disablism, poverty, racism, sexism, homophobia, and transphobia. When mental health is approached primarily from a clinical standpoint these problems become located in the individual rather than people's psychological and social context (Faulkner, 2017; Rowe and Davidson, 2016).

Faulkner (2017) argues this long-standing view of locating the problem within the individual has been reinforced through the dominant ideology of neoliberalism. This, she argues, not only links to clinical understanding of recovery but also to those ideas of personal recovery leading to an over reliance on promoting personal responsibility to the exclusion of understanding the impact of the material conditions and context within which the person lives. This is happening despite the origins of the Recovery approach being within the service-user survivor movement. There are claims these attempts to promote citizenship have been "colonised" by policy makers to harness the values of empowerment and mutual support to cut services and blame individuals for their problems (Eiroa-Orosa and Rowe 2017). Faulkner (2017), Rowe and Davidson, (2016) and Slade et al, (2017) state that in order to address these inequalities it is essential that approaches to citizenship and mental health have the voice and experience of people with mental health challenges at their centre and that solutions need to be led by or co-produced with people with mental health challenges and be linked to the wider disability struggle and identity politics.

Rowe and Davidson (2016) promote a citizenship framework to tackle these injustices. Their citizenship framework is defined by the 5 Rs of rights, responsibilities, roles, resources, and relationships that a democratic society makes available to its members through public and social institutions, social networks, and everyday social interactions. Rowe and Davidson argue that services should promote citizenship as the foundation of recovery from mental health challenges not the end point. They propose a twin focus for mental health services to support this agenda. Firstly, by undertaking community development work and secondly, developing a citizenship education programme for people accessing such services.

They have also developed a measure and training programme which they are in the process of piloting. It evaluates both individual support towards citizenship and community change.

Acts of Citizenship and People with Mental Health Challenges

Hamer et al (2017) and Brannelly (2018) take a different position on understanding and promoting citizenship within mental health services. Rather than looking at the 5 Rs as a

1
2
3 citizenship framework they explore Isin's work on *Acts of Citizenship* (Isin and Nielsen 2008).
4 Isin and Nielsen (2008) and Isin and Ruppert (2015) argue that citizenship should not be
5 constituted as a single definition or even multiple definitions but instead should be
6 understood as *Acts of Citizenship*. They critique traditional approaches to citizenship linked
7 primarily to the relationship between the individual and the state, as reductionist, arguing
8 people are citizens across multiple domains such as global citizens, consumer citizens,
9 digital citizens. They suggest that it is more useful to explore acts of citizenship as a concept
10 in its own right outside of the usual definitions of citizenship. *Acts of Citizenship* are
11 described as the events through which people constitute themselves as citizens and this
12 creates a pluralistic understanding. They claim that such acts involve both responsibility and
13 answerability, but are irreducible to either. As *Acts of Citizenship* are either collective or
14 individual deeds that rupture social-historical patterns, they are able to lead to positive
15 change for marginalised groups. This provides opportunities for feminist and post-colonial
16 critical perspectives. Therefore, they transform people from being passive subjects to
17 political actors creating new ways of being as citizens (Hamer et al, 2017).
18
19

20
21 Hamer et al (2017) used this framework to interview peer workers and professionals working
22 within inpatient mental health services. They explore how mental health workers promote
23 inclusion by subverting rules and organisational practices as existing practices and
24 structures do not effectively support peoples' access to full citizenship. Hamer et al. (2017)
25 argue that by making these practices visible this can lead to organisational change. They
26 argue a citizenship-based rights framework for mental health workers can be embedded and
27 prioritised to support inclusion and citizenship.
28

29
30 Brannelly (2018) through a study titled '*Acts of Citizenship*' explored the priorities of service
31 user activists campaigning for change in mental health service provision. The service user
32 activists from New Zealand and England – unequivocally their priorities for change were the
33 removal of the use of force, compulsory treatment and detention. The study questions the
34 ways in which people experience a lack of care within mental health services and question
35 the lack of progress within service provision. The work explores which practices are just or
36 not and how the marginalisation and subjugation of certain groups can be challenged
37 through *Acts of citizenship*.
38

39
40 Whilst none of the research outlined here explores the impact on citizenship of future
41 technologies, it does outline priorities to support people's participation as full citizens. These
42 are: rights and care in relation to compulsion, and alternatives to restrictive practices, access
43 to relationships, employment, housing and leisure activities, freedom from discrimination and
44 stigma. They also highlight the importance of understanding how these issues intersect
45 across all protected characteristics.
46

47
48 As the pace of social change for people with mental health challenges is slow it could be
49 argued that it is essential to explore both the impact of future technological advances and
50 the changing multi-dimensional nature of citizenship. If there is not a future focus, the
51 developments on citizenship within mental health could be misaligned with the direction of
52 society or miss opportunities to contribute to these discussions. This is especially important
53 as it is not just governments but also large corporations, in particular technology companies,
54 such as Google or Facebook that are shaping the future (Potts, 2018) and in turn include
55 and exclude the voices that contribute to those discussions (Bergman et al, 2014), and who
56 gets access to data for research (Edwards and Brannelly 2017).
57

58 **Future Studies and Mental Health**

59
60

1
2
3 Whilst there are numerous studies looking at future developments in mental health (a search
4 of Medline and CINAHL returns 100,000 articles) the utilisation of the academic approaches
5 of Future Studies have only had limited application within mental health. These studies have
6 focused on population changes in relation to dementia and not changes to society due to
7 technology (Abramson and Halpain 2002; Connolly 2012). Whilst they do not focus on
8 citizenship they do demonstrate the value of future thinking and planning in relation to
9 dementia. They also show the limitations of the approach in the challenge of only being able
10 to see things in the context of your own time and context, as the emphasis is on professional
11 solutions rather than technological or community solutions. Connolly (2012) argues that in
12 mental health Future Studies is under used and even there is a focus on the future it looks at
13 immediate threats and consequences, not the medium to longer term future.
14

15
16 One exception to this, whilst not a research paper, is a Youtube video created by a service
17 user activist O'Hagan (2013), who imagined a radio interview set in 2042 which describes
18 the repeal of the Mental Health Act. This approach has a lot in common with the Future
19 Studies approach of back casting (Davidson, 2017) and gives concrete examples of how
20 current United Nations human rights documents can shape the future. As often with service
21 user led research, rather than the focus being clinical it is on how society and the state
22 responds to people in distress (Faulkner, 2017). Within the video there is very little on the
23 use of technology and how this could impact on restrictive practices within mental health
24 services. However, this is a good example of how future thinking approaches can contribute
25 to discussions on citizenship and human rights in both the present and the future. Within the
26 Future Studies literature itself mental health is very much explored through the lens of
27 clinical recovery and the need to change peoples' brains rather than the need to also change
28 society (Bregman, 2017; Chase, 2018; Harari, 2016).
29
30

31 **The Value of Future Studies**

32
33 One of the key debates within Future Studies is the accuracy of prediction. Lee (2012)
34 makes the claim that the future is knowable and that future studies should be considered a
35 science. He argues that approaches that look for multiple perspectives are pessimistic and
36 too concerned with uncertainty. (Potts 2018) counters Lee's argument arguing that the
37 evidence is not there to back up his claims and that people only really have the capacity to
38 see things from the perspective of their own time, for example people expecting to have Jet
39 Packs in the 21st Century rather than predicting smart phones. (Odeleye 2015) argues that
40 Lee is overly optimistic about the ability of Future Studies to accurately predict the future and
41 that Lee is too dismissive of post-modern approaches in being able to highlight complexities.
42 They go on to argue that by treating Future Studies as predictive and not exploring the
43 disadvantages Future Studies may bring, a full exploration is not undertaken for the benefits
44 and threats across different sectors and therefore maintains the status quo. If Future Studies
45 is not approached from a critical standpoint there is a danger that it may lead to self-fulfilling
46 prophecies (Odeleye, 2015).
47
48

49
50 One of the challenges within the Future Studies literature is that it does not always explicitly
51 articulate the political standpoint of the author especially those that take neoliberalism as a
52 neutral standpoint. This maintains current political categories, choices and conflicts present
53 in current power relations and gender dynamics (Bergman et al, 2014). Gunnarsson-Östling
54 et al. (2012) state gender perspectives or perspectives of marginalised groups are rare
55 within Future Studies and are often side tracked. Because of this it has been argued that
56 Futures Studies does not have value for feminists. Bardzell (2018) and Bergman et al.
57 (2014) counter the argument that future studies does not have value for marginalised groups
58 by suggesting that if feminists do not explore future thinking, the possibility of bring about
59 more equal futures is diminished. They also argue that without embracing feminist
60

1
2
3 methodologies Future Studies become monolithic and maintain existing power structures
4 and that these feminist methodologies can lead to more critical and reflexive positions within
5 Future Studies research and could radically change the dynamics of the field. Bardzell
6 (2018) explicitly calls for feminist participative action in relation to the development of
7 technologies.

8
9 It is important to note, that whilst feminism has not linked strongly with the academic
10 discipline of Future Studies, future thinking has played a strong role in feminism in critiquing
11 and challenging the status quo. Perhaps no more so than in Donna Haraway's seminal book,
12 from 1985, the *Cyborg Manifesto* (Haraway, 1994). In the *Cyborg Manifesto*, using
13 blasphemy and irony, she breaks down the ideas of division between humans, machines
14 and animals by exploring inter-species and technological kinship and how this challenges
15 existing power structures and categorisations (for example, between machine/living
16 organism). Latimer (2017) describes how Haraway rages at technoscience, that whilst it has
17 scope for inclusion, it is at the heart of division. Through the metaphor of the cyborg
18 Haraway critiques traditional conceptualisations of gender, sexuality, humanity, nature and
19 technology. Both Sofoulis (2015) and Latimer (2017) argue that revisiting these ideas from
20 the context of the 21st Century provides a new perspective on the work. Sofoulis (2015)
21 highlights the importance of having values-based rather than positivist approaches to
22 science and technology. Latimer (2017) calls for direct challenge of current divisions with
23 more inclusive and collaborative visions for the future.
24
25

26
27 As well as Future Studies, in regards to mental health, it may be worth learning from other
28 approaches to future thinking from groups who experience marginalisation. Capers (2019)
29 puts forward a similar argument, to that of Bergman et al (2014), for Afrofuturism.
30 Afrofuturism is a unique discipline and is described as the intersection between black
31 culture, technology, liberation, imagination and mysticism which can bridge the future and
32 the past. As well as an academic discipline it is expressed through literature, art, music and
33 film. It thereby helps reimagine the experience of people of colour providing an opportunity
34 for black communities and African diaspora to engage in potential, real and imagined futures
35 that can rupture the status quo, providing a link between the past, present and future
36 (Womack 2013). It could be argued that similar themes are important when advocating for
37 equality for people with mental health challenges. Both Afrofuturism and Haraway's *Cyborg*
38 *Manifesto* show the importance of creativity in imagining futures and breaking down taken for
39 granted power structures.
40
41

42
43 Bergman et al. (2014) propose that the purpose of utilising future studies with feminist
44 methodologies is not to create a singular unified vision for feminist futures but rather to open
45 new ways of thinking and innovative approaches. They suggest there are multiple ways of
46 exploring feminist futures. These could be: imaging what the future could look like;
47 describing preferred scenarios; working as "alarm clocks" [sic] if the future is not wanted or
48 as a way of showing things are on the right track. Future Studies can encourage students to
49 express constructive hope about controversial social problems such as climate change
50 rather than denying them or feeling passive (Ojala 2015). There are specific teaching
51 techniques within future studies such as discussion, role play and back casting (identifying a
52 potential desirable future and then working backwards to identify the steps required to reach
53 it) (Davidson, 2017). Gunnarsson-Östling et al. (2012) argue that participatory research
54 methods are best suited to developing alternative futures, thus there is a commonality
55 between Future Studies and participatory research methods. Both seek to transition students
56 or research participants from knowledge consumers to knowledge creators (Davidson,
57 2017).
58
59
60

Discussion:

It is clear there is a need for further research into citizenship for people with mental health challenges. There are a range of voices articulating that an increased focus on citizenship is required to challenge and change people's experience within both mental health services and society in general (Eiroa-Orosa and Rowe 2017; Faulkner 2017; Hamer et al. 2018; Rowe and Davidson 2016; Slade et al. 2017). It could be argued that the needs of people with mental health challenges in the present are so acute that exploring the future is a privileged indulgence which will be of limited immediate benefit and that all research should focus on promoting citizenship in the here and now. This focus on citizenship in the here and now should include ethical considerations in relation to technology particularly in relation to surveillance, privacy, and algorithmic programming.

It is not proposed that Future Studies should be the only focus of citizenship research in mental health but rather it may complement existing directions. In both feminist Future Studies and Afrofuturism it is argued exploring the future it is possible to impact positively on the present (Caper, 2019; Bardzell 2018). In addition, it is important to note technologies are not the only impact on citizenship. Rowe and Davidson (2016) describe the importance of paying attention to the material, social, cultural, and political environment in which recovery and citizenship can be impeded or nurtured. On-going austerity, climate crisis and demographic changes are also significant and may be more or equally important issues for people with mental health challenges to explore.

Digital technologies are changing society and what it means to be a citizen across multiple domains and these changes are taking place rapidly. Technological companies and policy makers already utilise Future Studies or future thinking approaches to ensure they anticipate challenges and set the direction for their own developments. If the same approaches are not explored for their validity within mental health this could lead to the rights and needs of people being left even further behind. Whilst there are very few studies in both gender studies and mental health research, there are indications that Future Studies could have value in supporting conversations around future societal change and engage and amplify diverse voices that are currently missing from conversation about the future (Bergman et al, 2014). In particular it is crucial that those who experience the greatest exclusions and rights violations due their mental health status are included, in particular those from the Black and Minority Ethnic community or LGBTQI community and those involved in the wider disability struggle (Slade et al, 2017). With the development of "Mad Studies" (Faulkner, 2017) lessons could be drawn from Afro-futurism to develop "mad-futurism" led by people with mental health challenges. Drawing learning from feminist future thinking participatory methods may be beneficial in developing research in this area. It would also suggest with the critiques of neoliberalism in the development of citizenship for people with mental health challenges feminist and post-colonial approaches would provide useful critical perspectives.

As technologies are impacting on what it means to be a citizen and are being delivered in healthcare it is more important than ever that people who experience mental health challenges are included and have the opportunity to lead these developments. This is not just in the testing of the technology but in the ethical considerations and the setting of agendas within the development of digital technologies within mental health. This means not just seeking engagement and partnership with mental health services and policy makers but also digital technology companies. At present within the literature there has not been a comprehensive review of the level of involvement of people with lived experience in the development of digital mental health products. It is evident one of the key priorities for citizenship for people who experience mental health challenges is around coercion and unforced treatment (O'Hagan 2013; Wilson et al. 2016). Therefore, it may be important to explore ethical technological solutions to promoting citizenship in this area. Also it will be important to include technology (and future technologies) in any proposed citizenship

1
2
3 frameworks for people experiencing mental health challenges (Hamer et al, 2017; Rowe and
4 Davidson, 2016).
5
6

7 As described above citizenship is a complex and contested concept. In order to discuss the
8 future technological impacts on citizenship it is important to conceptualise citizenship which
9 is flexible to change and provides a framework for challenge for people from marginalised
10 communities. It could be argued Isin's "*Acts of Citizenship*" has clear advantages over the
11 other approaches to citizenship outlined. Firstly, it has a broader definition of citizenship and
12 incorporates broader forms of citizenship such as digital and consumer citizens. Secondly, it
13 positions the individual as a political actor and defines acts of citizenship as acts that rupture
14 the status quo rather than the individual experiencing citizenship as tension between the
15 state and individual. It could be argued that participating in Future Studies research and
16 contributing to generating new knowledge is an *Act of Citizenship* in itself.
17
18

19 As well as exploring the notion of citizenship, in order to explore future citizenship it may be
20 worth exploring the following questions:
21

- 22 • What are the likely technological impacts on citizenship?
- 23 • Whose voices are being heard in the development of technology?
- 24 • What threats and opportunities do technological changes present for people with
25 mental health challenges?
- 26 • How do each of these threats and discrimination intersect with other forms of
27 discrimination and oppression?
- 28 • What would desirable future citizenship look like?
- 29 • What steps would need to be taken to achieve this?
- 30 • What would be the "alarms" that it is off track and what can be the responses?
31

32 33 **Conclusion**

34 Does Future Studies have a role in promoting citizenship for people with mental health
35 challenges? This was the question posed in the Introduction. This paper argues that it does,
36 particularly as society is changing quickly and changes for citizenship for people with mental
37 health challenges have been slow. Future studies can provide a framework to prepare for
38 these changes, express constructive hope and be a way of sounding alarms. It is important
39 to acknowledge the limitations of Future Studies; that it is not predictive and people can only
40 see things from the context of their own time, nevertheless it can be useful to explore and
41 critique power dynamics and create opportunities for marginalised communities. It is
42 important not just to look at the future, many of the technologies are already under
43 development or are being applied within mental health care. It is essential to understand
44 what extent are people with mental health challenges are involved in setting the agenda for
45 new innovations and then the extent to which they are co-developed. It is recommended a
46 scoping literature review is undertaken to explore this. It is also important to continue to be
47 aware of the digital exclusion of people with mental health challenges and the reasons for
48 and consequences of this. The other key consideration both now and in the future is the
49 ethical implications of digital technology and big data in relation to all citizens but in particular
50 those from marginalised groups such as people with mental health challenges.
51
52
53

54 It is vital people with mental health challenges are able to lead and contribute to discussions
55 that shape future citizenship. Participating in these discussions could be considered as an
56 *Acts of Citizenship* as they have the potential to expose inequality and contribute to
57 discussions on social change. In relation to digital technologies it is also important within this
58 to explore engagement with technology companies and how these conversations can be
59
60

shared and promoted across all stakeholders, including mental health professionals, family members and the wider community.
