21 **The ethics of fertility treatment for same-sex male couples: considerations for a modern**
22 **fertility clinic**

23
24 **Abstract**

25 Social and legal equality for same-sex male couples continues to grow in many
26 countries. Consequently, increasing numbers of same-sex male couples are
27 seeking assisted reproductive technology to achieve parenthood. Fertility
28 treatment for same-sex male couples is an undoubtedly complex issue and raises
29 a variety of ethical concerns. Relevant considerations include ethical issues
30 relating to the surrogate and a possible egg donor, the commissioning same-sex
31 couple, the welfare of the child and the fertility clinic itself. This work analyses
32 these arguments in the context of modern fertility services, providing reflection
33 on the evidence present and what it means for clinicians today. Herein, we argue
34 that fertility treatment for same-sex male couples via surrogacy agreements are
35 acceptable, subject to considerations of each individual case, as in all assisted
36 reproductive treatment. It is in the interest of open and equal access to health
37 services that barriers to assisted reproductive technology for same-sex male
38 couples should be minimised where possible.

39 **Keywords:** Same-sex male couple, LGBT, ethics, surrogacy, assisted reproduction.
40

41 Introduction

42 The last 50 years have seen a drastic shift in the social acceptance of homosexuality in the
43 western world [1]. Expanding legal recognition of same-sex unions, be it through civil
44 partnerships or marriage, have redefined traditional ideas of who can choose to have children.

45 As a result of this growing social and legal equality, the number of same-sex male (SSM)
46 couples seeking to achieve parenthood outwith any previous heterosexual relationships via
47 co-parenting, fostering, adoption or surrogacy has risen. Indeed, growing numbers of non-
48 heterosexual men are now seeking medical assistance to have biological children [2–4]. This
49 change in reproductive practices, coined by press of the late ‘80s and early ‘90s as the ‘*Gayby*
50 *Boom*’, continues to spark controversy [5].

51
52 Assisted reproductive technology (ART) for SSM couples present a unique issue for some, as
53 they fundamentally challenge what is considered basic reproductive biology [6]. Instead of
54 coital conception or heterosexual ART, achieving biological parenthood for SSM couples
55 always involves third parties, i.e. a surrogate and possibly an egg donor. Furthermore, SSM
56 parenthood is not accepted in all countries, with concerns for welfare of the child historically
57 often at the forefront of criticism. Critics amplify these concerns in a setting such as the UK’s
58 NHS, where use of limited public funding to treat SSM couples – who are arguably *socially*
59 and not *medically* infertile – is considered financially irresponsible [7]. However, despite this
60 criticism, Scotland – a liberal country with a generous history of state-funded fertility
61 treatment – recently made news as the first country in the UK to fund IVF for a SSM couple
62 [8]. Regardless of any of these criticisms, or sources of funding, the number of SSM couples
63 seeking to explore their fertility treatment options will rise in future, and clinics and
64 practitioners need to be prepared for it.

66 In assisted reproduction for a SSM couple the interests of a number of people are at play: up
67 to two women (surrogate and egg donor), the commissioning couple and their families; the
68 child; the treating healthcare professionals; and, one could argue, society as a whole.
69 Consequently, it is essential that those involved in providing fertility treatment to SSM
70 couples fairly consider the ethical issues, and that such considerations are free of prejudice in
71 order to provide treatment and support that is moral, fair and socially justifiable. It should
72 also be borne in mind that, in a significant number of countries, there is a legal duty not to
73 unfairly discriminate based on sex or sexual orientation – for example, the UK’s Equality Act
74 (2010) [9]. We will thus examine the arguments that are commonly used by those who
75 oppose, or at least have concerns about, fertility treatment for, or child rearing (or both), by
76 SSM couples. These arguments can be subdivided into: a) issues encountered through the egg
77 donation and gestation surrogacy process; b) issues for the commissioning couple; and c)
78 issues regarding welfare of the child.

79
80 **a) Issues for the egg donor and surrogate**

81 If a SSM couple wish to have a biological child then surrogacy, and possibly other-party egg
82 donation, are essential. As such, a variety of ethical concerns accompany what has become a
83 supply and demand market for providers of third-party reproductive services. It should be
84 noted that these ethical issues are not unique to SSM couples, and apply to many other
85 surrogacy agreements. We include them here for completeness.

86
87 Although egg donation and surrogacy are can be roles fulfilled by the same woman, this is
88 not always the case. Regardless of whether the eggs come from the planned surrogate or
89 someone else, the risks involved with each role differ significantly, and need to be considered
90 separately. Kenney and McGowan [10] reported that egg donors in the US retrospectively

91 cite both altruistic and financial motivations in their decision to donate. For these women,
92 risk fell into two main categories – physical and psychological – and concerns exist in regard
93 to pre-treatment awareness of the two types of risk. Although such recall data are limited, a
94 fifth of the sampled women reported not being aware of any risks associated with the egg
95 donation process, and only a third reported awareness of ovarian hyperstimulation syndrome
96 (OHSS), a serious and common complication of the egg donation process. This risk is not
97 without consequence, as moderate to severe OHSS affects 3–8% of all cases of ovarian
98 stimulation [11]. Given that OHSS is an iatrogenic complication of optional treatment with a
99 potentially fatal outcome, the ethical issues are significant [12]. Hence, healthcare
100 professionals should take care to reduce these risks on an individual basis whenever possible.
101 Encouragingly, pre-donation awareness of psychological risks was found to reflect more
102 challenging outcomes than the generally positive emotional reaction the donors actually
103 experienced [10]. These findings emphasise the importance of adequate pre-treatment
104 information and counselling for women choosing to donate eggs for a SSM couple.
105 Furthermore, the counselling must prepare donors for the possibility of future contact from
106 donor-conceived children in the UK and the psychosocial implications this could have [13].
107
108 Secondly, surrogacy is in itself ethically challenging. The risks of pregnancy, even for a
109 woman considered healthy, are not insignificant. In the UK in 2013–15, 3.8 per 100,000
110 women died due to complications of pregnancy either during the pregnancy or in the six-
111 week period after the pregnancy had ended [14]. In a surrogacy arrangement all the risks of
112 pregnancy, and possibly those of donation, are adopted by the surrogate who agrees to carry a
113 child with the intention to relinquish it to the commissioning couple. Critics suggest that this
114 type of agreement objectifies and unnecessarily medicalises the surrogate, making her
115 vulnerable to exploitation. Furthermore, some consider surrogate pregnancy a high-risk

116 emotional experience and argue that it subordinates the wellbeing of the surrogate and the
117 child by sacrificing their relationship to satisfy the commissioning couple [15, 16]. Although
118 qualitative studies of surrogate experience often comment on inherent risks, most agree
119 altruistic surrogacy is a positive experience [16,17].

120
121 In the UK, legislation [18] prohibits commercial surrogacy in an attempt to reduce the
122 potential for exploitation, in theory permitting altruistic agreements with remuneration of
123 only reasonable expenses. It is, however, unclear if such legislation is successful in protecting
124 women: even if women in the UK are protected to a higher level than in the absence of
125 legislation, the number of clandestine financial payments that surrogates and egg donors
126 receive is uncertain but definitely non-zero. There is, however, significant difference in laws
127 internationally, and many couples seek to bypass UK safeguards by extending their surrogacy
128 search overseas, where women may receive payment, but be less effectively protected from
129 exploitation.

130
131 Although commercial surrogacy is a contentious topic, provided appropriate protections are
132 in place it may represent a suitable option for SSM couples. Reports suggest that in some US
133 states where commercial surrogacy is permissible, such a system may work well to facilitate
134 successful surrogacy experiences in which relationships between surrogates, children and
135 commissioning parents are found to be positive [19].

136
137 Additionally, as surrogacy agreements cannot be enforced in the UK by or against any of the
138 persons making the arrangement, such situations leave the surrogate, any partner the
139 surrogate may have, and the commissioning couple, vulnerable to the other party renouncing
140 their position and choosing to abandon any prior agreement. Such uncertainty necessitates the

141 involvement of counselling and independent legal advice. In recent years, there have been
142 substantial calls, spearheaded by prominent surrogacy agencies, to reform UK law and
143 address areas of concern, particularly to Parental Orders [20]. Such lobbying has successfully
144 secured funding for the UK Law Commissions to begin a joint consultation to reform current
145 law which will ideally improve transparency relating to surrogacy for couples in the UK [21].

146

147 Respecting the autonomy of those involved in a pregnancy arrangement for a SSM couple is
148 important, however it is essential to recognise that certain restrictions on autonomy are
149 agreed upon. As a result of these complexities it is essential that those involved seek both
150 counselling and legal advice, and all ART providers should assist patients in doing so [22].

151 This may not be the case in some countries where affluent Westerners go to find surrogates.

152 Nevertheless, altruistic surrogacy arrangements are currently acceptable in the UK. Provided
153 safeguards are in place to protect those involved fertility clinics should act with caution, but
154 not allow this to act as a barrier for SSM couples to have biological children.

155

156 **b) Issues for the commissioning couple**

157 There are a particular set of issues that SSM couples face when looking to achieve biological
158 parenthood, and some of these issues relate to the complexities and uncertainties relating to
159 surrogacy. As aforementioned, in the UK, although legal surrogacy agreements are often
160 required, they are not enforceable in law. When a child is born, the birth mother/surrogate is
161 the child's legal parent at birth. The commissioning couple must then apply for a Parental
162 Order once the child is born, which, if granted, transfers parental rights to them. This process
163 cannot begin until six weeks after the child's birth [13,18]. In this interim period, the
164 commissioning couple may be unable, for example, to make medical decisions on their
165 child's behalf.

166

1
2 167 Another issue is that one child can have only one biological father, requiring identification of
3
4
5 168 a single intended genetic parent by each SSM couple. Although the value of parent-child
6
7 169 biological ties has been convincingly argued to be minimal – see Di Nucci [23] – such ties
8
9
10 170 may, particularly when unequal in a parental unit, affect prospective parental power,
11
12 171 influence and responsibility in ways that are not fully understood. To circumvent such issues
13
14 172 some SSM couples may seek fraternal twinning with dual paternity as a solution. Though
15
16
17 173 such practices are not licensed in the UK, such approaches have been idyllically portrayed
18
19 174 online [24–26] with little consideration of the ethical implications of double-embryo transfer
20
21
22 175 and consequent multiple pregnancy, which are broadly considered as the single greatest risk
23
24 176 of fertility treatment [27]. Such arrangements may fit with some SSM couples’ perceived
25
26
27 177 ideal family structure, but clinics have a responsibility to counsel both couples and surrogates
28
29 178 as to why fraternal twinning carries significant risks and to discourage couples seeking such
30
31
32 179 treatment overseas.

33
34 180

35
36 181 Lastly, SSM couples are not immune to the well-documented emotional, financial and time-
37
38
39 182 related costs of ART and they may bear an additional burden of guilt for subjecting third-
40
41 183 parties to such risk [28]. For these couples, success of treatment is reliant on the continued
42
43
44 184 co-operation of third-parties and the availability of funding which cannot be guaranteed
45
46 185 through multiple ART cycles that may be required. Even if such arrangements are
47
48
49 186 successfully realised, it is important to remember that ART does not guarantee an embryo,
50
51 187 pregnancy or healthy live birth and SSM couples must, through adequate pre-treatment
52
53
54 188 counselling, understand this reality.

55
56 189

57
58 190 **c) The welfare of the child**
59
60
61
62
63
64
65

191 When deviations from a traditional nuclear family are seen, debate often shifts from the best
192 interests of the parents to the welfare of the child. It should be evident that welfare of the
193 child ought to be the most important consideration in any aspect of reproductive medicine.
194 Yet, Pennings and Mertes [29] comment on how the shift from heterosexual to homosexual
195 parenthood triggers a discrete range of concerns, where raising a child outwith a heterosexual
196 relationship – where both parents share a direct genetic relationships with their children – is
197 assumed to have suboptimal outcomes for the child [30]. Largely following from the ‘gay
198 adoption’ debate, a growing body of research evaluating the psychological and physical
199 welfare of children with same-sex parents concludes that overall mental health and general
200 wellbeing of the children of same-sex parents does not differ compared to children of
201 heterosexual parents [31–35].

202
203 Critics of SSM parenthood argue that children need both a mother and a father in order to
204 recognise gender roles and develop ‘*normally*’ [36]. Studies commonly used in support of
205 this argument are Regnerus [37] and Allen, Pakaluk and Price [38], where suboptimal
206 outcomes were described for children of same-sex parents in multiple domains (education,
207 employment and mental health). However, these studies have been widely criticised by peers
208 for poorly handling data-sets and failing to account for confounding factors such as family
209 breakdown, therefore not uniquely considering children who have been raised by same-sex
210 parents [39,40].

211
212 The ‘need for a father’ forms a debate that has been persistent in the UK for a number of
213 years, often serving to criticise the parenting ability of single mothers. The ‘need for a father’
214 often assumes, however, that a mother was present by default – which is not the case when
215 considering SSM couples. In 2008, the Human Fertilisation and Embryology Act removed a

216 clause which required fertility clinics providing treatment to consider a child's need for a
217 father figure, requiring instead that prospective parents show they can provide 'supportive
218 parenting' [13,41]. This inclusive change in legislation illustrated how the legal – and maybe
219 societal – consensus was that the absence of a father or indeed parental gender has no
220 detrimental effect on the wellbeing of a child.

221
222 Child welfare concerns could be argued based on the increased likelihood of a child parented
223 by a SSM couple not receiving breast milk in early life. Breastfeeding is widely regarded to
224 improve both mother and infant wellbeing [42]. However, despite the well-documented
225 benefits of breastfeeding, rates remain poor, particularly in high-income countries [43].
226 Nonetheless, an Australian study found over one fifth SSM parents managed to provide some
227 breast milk to their child in early life, usually via surrogate donation [44]. With respect to the
228 low prevalence of breastfeeding in the general population and the social acceptance of bottle-
229 feeding, limiting SSM couples' fertility options based on breastfeeding concerns seems
230 unreasonable if current practices persist.

231
232 In the context of same-sex parenting, most child welfare data present analyses of same-sex
233 parenting as a whole. Commonly the SSM couples included in studies with children present
234 in the household are as a result of adoption or a previous opposite-sex relationship. However,
235 the data suggest that being raised by same-sex parents has no negative developmental or
236 psychological outcomes for a child, nor does it result in differing gender identity, gender role
237 behaviour or sexual partner preference compared to opposite-sex parents [45–48]. Such data
238 indicate that historical concerns that homosexuals wish to have children to reproduce
239 homosexuality is inaccurate. This argument has, firstly, never been evidence-based and,
240 secondly, only holds as an argument if homosexuality is to be considered as a negative trait

241 or a form of harm [31]. This attitude is clearly dependant on the societal acceptance of
242 homosexuality and it has been reasonably argued that subjecting a child to gay parents in an
243 overly homophobic society is indeed harmful [49].

244
245 Gay men have a demonstrably higher incidence of most psychiatric disorders [50]. We know
246 that perceived societal discrimination correlates strongly with mental health in homosexual
247 men [51]. Sceptics use these population statistics to suggest that these mental health issues
248 impact on the parenting ability of SSM couples. In the fertility context, if child welfare is an
249 issue as a consequence of mental health concerns, then decisions should be made on a case-
250 by-case basis. Therefore, limiting the reproductive options for SSM couples based on
251 population wide mental health trends is inappropriate.

252
253 The vilification of homosexual men as promiscuous or paedophilic has long been a powerful
254 rhetoric to incite public hostility towards homosexual men. Sexual abuse from homosexual
255 male parents is a notion that still pervades in the minds of some, despite the historical
256 absence of evidence to support it [52,53].

257
258 Many SSM couples considering parenthood are concerned that their child will experience
259 social stigma, social exclusion or bullying in their school years due to their non-conventional
260 family structure. A recent study found that children of same-sex parents experienced ‘feeling
261 different’ and microaggressions from peers [54]. Microaggressions – including heterosexism,
262 public outing and bullying – were experienced by most children, however, they reported them
263 at a low to medium intensity and with neutral emotion. Encouragingly, this study found that
264 children’s positive feelings about their family structure were more commonly reported than
265 feelings of difference or microaggressions, explaining that children often cope with such

1
2
3
4
5 268 experiences with resilience. Yet, more can be done to ensure social support structures are in
6
7 269 place so that school environments can be safe places for minority families and
8
9
10 270 recommendations by which to achieve this are present [55].
11

12 271 The arguments that SSM couples have more psychological issues, that they will produce
13
14 272 homosexual children or that their children will be bullied all hinge on a negative societal
15
16 273 view of homosexuality and consequently, SSM relationships. Disappointingly, these
17
18 274 arguments – through their citation of social prejudice – further stigmatise SSM couples.
19
20 275 Firstly, they blame the victim. It must be emphasised that the responsibility for societal
21
22 276 stigma should not fall to SSM couples, but instead those who choose to propagate it.
23
24 277 Secondly, they weaponise societal prejudice and discrimination to fuel further discrimination,
25
26 278 with significant cost. Lastly, blaming society allows individuals to absolve themselves of
27
28 279 responsibility for their own intolerance. Societal acceptance and equality of SSM couples
29
30
31
32
33
34 280 would go far to eliminate many of these concerns.
35

36 281 The body of research illustrates the homophobia and heterosexism inherent in society by
37
38 282 using heterosexual families as control groups on which to compare homosexual families.
39
40 283 These studies regard heterosexual parenthood as a ‘gold standard’ and they determine the
41
42 284 acceptability of homosexual parenthood by comparison, often coming to a ‘no difference’
43
44 285 conclusion. Pennings and Mertes [29] argue that this method is fundamentally flawed: if
45
46 286 evidence showed superior parental competence of homosexual parents, it would be absurd to
47
48 287 think that heterosexual couples would be denied fertility treatment. Therefore, the converse
49
50 288 should not be considered. It is frustrating that such studies are required to reassure sceptics
51
52 289 who assign a burden of proof on those they wish to discriminate against. Pennings [56]
53
54
55
56
57
58 290 comments how morally revealing it is that many clinics accept dangerously high heterosexual
59
60
61
62
63
64
65

1 291 multiple pregnancy rates which carry significant risks for the children but use the argument
2
3 292 against multiple pregnancies to restrict access to treatment for non-heterosexual parents-to-
4
5 293 be. Heterosexism need not be an inevitability; a more appropriate approach would be to
6
7 294 quantify child welfare and compare to what we consider acceptable parameters. It may be
8
9 295 true that the children of gay parents have poorer outcomes, but that does not mean they are
10
11 296 unacceptably poor. Instead of limiting the reproductive options these families have,
12
13 297 understanding why they may have difficulties and how they can be supported would be a
14
15 298 fairer approach.

20 21 22 300 **Discussion**

23
24 301 With regard to egg donation and surrogacy, regulation and clinic level assessment are
25
26 302 important in ensuring that women are fully informed and are donating or entering into
27
28 303 surrogacy agreements for appropriate reasons. It is important to remember that SSM couples
29
30 304 cannot fall into parenthood by accident like many heterosexual couples do. SSM couples
31
32 305 must think very seriously about embarking on a journey of parenthood, just as any other
33
34 306 couple who decide to use the services of fertility clinics. It is, however, unfair that SSM
35
36 307 couples should be subjected to higher level of scrutiny for doing so. Additionally, expecting
37
38 308 SSM couples to prove their ability to parent with threats of limiting parenthood if outcomes
39
40 309 are suboptimal perpetuates the idea that discrimination based on sexual orientation is
41
42 310 acceptable. The welfare of children is of course essential to consider, but arguments against
43
44 311 SSM parenting are often imbued with a moral contempt for homosexuality and inconsistently
45
46 312 applied.
47
48
49
50
51
52

53 313

54
55
56 314 Lastly, SSM couples may pose unique ethical and logistical challenges for individual fertility
57
58 315 clinics. It is important to be aware of such issues to allow them to be properly prepared for,

316 and hence not affect patient care at the point of access. Conscientious objection by some
317 clinic staff to the treatment of SSM couples may be an issue. It is essential that clinics
318 identify any concerns present among staff and plan appropriately to either a) ensure other
319 staff members are available to treat such patients or b) clarify that if other staff members are
320 unavailable, it is inappropriate for conscientious objection to interfere with medical care.
321 Also, it is important that clinics are adequately resourced to manage SSM couples given the
322 additional associated complexities. Furthermore, clinics should make it clear to patients that
323 such services are available. Research suggests that clinics often fail to provide online
324 information for same-sex couples and this is often the first point of contact with potential
325 patients [57]. This example illustrates how steps to integrate equality and diversity into
326 aspects of care as simple as patient information can help minority groups feel less
327 marginalised and more accepted, and this is something we should strive to achieve.

328
329 Reflecting changes in the social zeitgeist with the care we provide is essential. Indeed,
330 unconscious biases of healthcare professionals may play an important role, but such
331 influences await further investigation. ART for SSM couples has both benefits and risks, and
332 the balance of these may change as ART advances, pregnancy becomes safer, laws change
333 and social attitudes shift. Many of these risks are unique to SSM couples, but most are not.
334 Nonetheless, SSM parents are here to stay, and modern fertility clinics should afford them the
335 respect they deserve. After all, equality, inclusivity and diversity are aspects of the care that
336 healthcare professionals provide, that they can look back on and be proud of.
