Tailoring the structure and the properties of pyrolysed carbon electrodes

Letizia Amato, Lars Schulte, Arto Heiskanen, Anja Boisen, Stephan S. Keller, Sokol Ndoni, Jenny Emnéus
 Technical University of Denmark, Department of Micro- and Nanotechnology, Denmark

Introduction

- Carbon 3D micro and nano electrodes can be fabricated using a carbon MEMS technique in a very simple high-yield process. Although not all polymers can be used as carbon precursors, carbonizable polymers are typically much less expensive than metals used in thin film metal electrode fabrication.
- Possibility to explore many polymers to tune the physical, microstructural, and electrical/electrochemical properties of carbon electrodes in different fields.

Aim

Here we present a study with pyrolysed carbon derived from the photoresist SU-8, polystyrene and polystyrene-blockpolydimethylsiloxane copolymers to evaluate them as electrode material.

Fabrication of pyrolysed carbon electrodes

SEM images of pyrolysed polystyrene (PS) and polystyrene-blockpolydimethylsiloxane (PS-PDMS).

Thermal Gravimetric Analysis

X-Ray Photoelectron Spectroscopy

Raman Spectroscopy

Determination of the standard rate constant for electron transfer

Standard rate constant for electron transfer (k^0) values calculated from the experimental ΔE_p of the CVs obtained at scan rate of 10 mV s^{-1} .
