Scaling up primary health services for improving reproductive, maternal, and child health: a multisectoral collaboration in the conflict setting of Afghanistan

Jai Das and colleagues present an innovative and evolutionary model of multistakeholder and multisectoral collaboration in scaling up coverage of health services in Afghanistan

owing to the longstanding civil war after the Soviet invasion of 1979, neglect of the social sector, and subsequent political instability, Afghanistan faced economic collapse in 2001, with compromised infrastructure and extremely limited capacity for delivering health services.¹ Compounded by complex geography and widespread poverty, Afghanistan's health and survival indicators were among the worst globally. The average life expectancy was only 44.5 years, and the estimated maternal mortality ratio (1600 per 100 000 live births) and infant mortality rate (165 per 1000 live births) were alarmingly high.² Recurrent illness and suboptimal infant and young child feeding and hygiene practices led to high rates of childhood undernutrition.³

Coverage of essential reproductive, maternal, newborn, and child health interventions was abysmal, with skilled birth assistants at only 14% of births and safe drinking water being available to <40% of the population.⁴ Access to health services was also poor, with only 10% of the population living within one hour's walking distance of a health facility.⁵ Economic and social indicators had waned after three decades of war—only 30% of Afghans were literate (only 5.7% of females) and annual gross domestic product (GDP) per capita was about \$199 (£156; €176) (see section 1 of supplementary file).^{4,6}

Afghanistan's priorities in 2001 were to rapidly increase access to primary healthcare and to prioritise key interventions, such as basic civic services, education, food security, and childhood immunisations, particularly for rural and underserved populations. Meanwhile the government embarked on longer term, multisectoral planning. Afghanistan introduced the Basic Package of Health Services (BPHS) in 2003 through a process of innovative multisectoral collaboration that encompassed devising, implementing, scaling, and iteratively refining health service delivery in a poor, postwar crisis setting. This package is one of the first and longest running primary healthcare models of its kind, and has been cited as a success, despite reported limitations and ongoing challenges.⁷⁻⁹

In response to the World Health Organization's Partnership for Maternal, Newborn, and Child Health's call for proposals on success factors for multisectoral collaboration, we report our case study of BPHS.¹⁰ We define multisectoral initiatives as deliberate collaboration between stakeholders (such as government, donors, non-governmental organisations, and academia) and key sectors (such as health, economy, and environment) to ensure rapid gains in health service coverage and outcomes.^{11,12}

Limited documentation exists on the process of developing BPHS, and there was no formal evaluation; not surprising in a country rebuilding after decades of conflict.¹³⁻¹⁵ We evaluate and report the successes, challenges, and lessons from the multisectoral development of BPHS; our methods are described in box 1.

Context, challenge, and stakeholders

Afghanistan's social, political, economic, environmental, and health context in 2001 required immediate and innovative actions. Faced with poorly distributed and dysfunctional health facilities, insufficient funding, and extreme shortage of healthcare professionals, the conception and implementation of BPHS was the first step in tackling Afghanistan's complex health challenges (see section 1 of supplementary file).⁸ In 2002, a diverse group of stakeholders from government (line ministries), UN agencies, international and national non-governmental organisations, academia, and donors (including the World Bank, European Union (EU), and United States Agency for International Development (USAID)), agreed on a collaborative model to deliver essential health services through BPHS (fig 1).¹⁹

Programme description: what did BPHS encompass?

BPHS was designed to provide a standardised package of basic health services to the population (prioritising women's and children's health) and equitable access through targeted services to underserved areas.^{2,4,6,19} It comprises seven primary elements: maternal and newborn health; child health and immunisation; nutrition; communicable disease treatment and control; mental health; disability and physical rehabilitation services; and regular supply of essential drugs (see section 3 of supplementary file).¹⁹ After launching in 2003, it was revised in 2005 and 2010, expanding the package to respond to

KEY MESSAGES

- Afghanistan's BPHS programme has successfully scaled up health services in a poor, low capacity setting, using effective multisectoral collaboration among stakeholders and sectors
- Key factors in its success include the interest and commitment of donors, coupled with coordination and stewardship from the Ministry of Public Health and implementation contracted out to non-government organisations
- Community based outreach programmes have been critical and will be the platform for achieving universal health coverage, particularly for remote and isolated populations
- Multisectoral planning, exploiting the interconnectedness of the sustainable development goals and deliberate engagement of multiple sectors will be critical to achieving Afghanistan's development goals

Box 1: Methodology

We formed a country working group of stakeholders including representatives from government, donors, United Nations agencies, major non-governmental organisations and academia (see section 2 of supplementary file). Then we conducted a systematic review to identify existing literature; two reviewers searched EMBASE, Medline, Scopus, CINAHL, PubMed, and Google Scholar with relevant key words. Grey literature was also searched using Google and other indexes. Data from identified studies were abstracted on an extraction sheet, and conflicts were resolved by consensus or contacting a third reviewer. We reviewed the genesis and implementation of BPHS using the seven component conceptual framework, developed for the WHO Partnership for Maternal, Newborn, and Child Health.¹⁶ The components are context, challenge, and stakeholders; programme description; framing and planning; implementation architecture and mechanisms; monitoring, accountability, and learning; results; and evolution, scale, and sustainability. We also conducted a search to identify large, national, household surveys (including Demographic Health Surveys, Multiple Indicator Cluster Surveys, National Risk and Vulnerability Assessments, Afghanistan Living Conditions Surveys, National Nutritional Surveys, and Afghanistan Health Surveys), and extracted data on relevant indicators including for poverty, GDP, WASH (water, sanitation, and hygiene), and reproductive, maternal, newborn, and child health. We performed a trend analysis over the years for which data was available. We prepared a preliminary report and shared it with key stakeholders and the country working group; a multistakeholder review meeting was held in July 2018 in Kabul to appraise and refine the report’s content, suggest additional sources of data, and provide feedback on the process of developing this case study. The multistakeholder review process drew on both the methods used in the first success factors study series¹⁷ and the Partnership for Maternal, Newborn, and Child Health’s guide for multistakeholder dialogues.¹⁸

strategy. Non-governmental organisations working in Afghanistan were given the responsibility of implementing BPHS based on their experience and capacity.

Non-governmental organisations delivered BPHS services in 31 of Afghanistan’s 34 provinces through a contracting-out mechanism. In three provinces (Panjshir, Kapisa, and Parwan), the Ministry of Public Health delivered BPHS through a contracting-in approach called the strengthening mechanism.²² The ministry provided overall stewardship and responsibility for the delivery of quality services throughout the country. A grants and services contract management unit was set up at the ministry to manage the wide range of implementers, to monitor grants compliance and service delivery, and to coordinate with other departments (including the Expanded Programme of Immunisation, nutrition, reproductive health, and others). A public health directorate was set up for each province to coordinate and monitor the non-governmental organisations. Consultative mechanisms were established at national, ministerial, provincial, and community levels to keep stakeholders engaged and informed (detailed in section 4 of the supplementary file).

The findings of our systematic review and multistakeholder consultations indicated

newly identified health priorities (table 1).^{4 19} A third revision is underway, with a focus on non-communicable diseases. In 2005, the essential package of hospital services was modelled to complement BPHS and to define the hospital referral system.

Planning, implementation architecture, and mechanisms

The developers of BPHS relied on data from household surveys, global experience from comparable circumstances, and the resources and capacity of the government to devise a

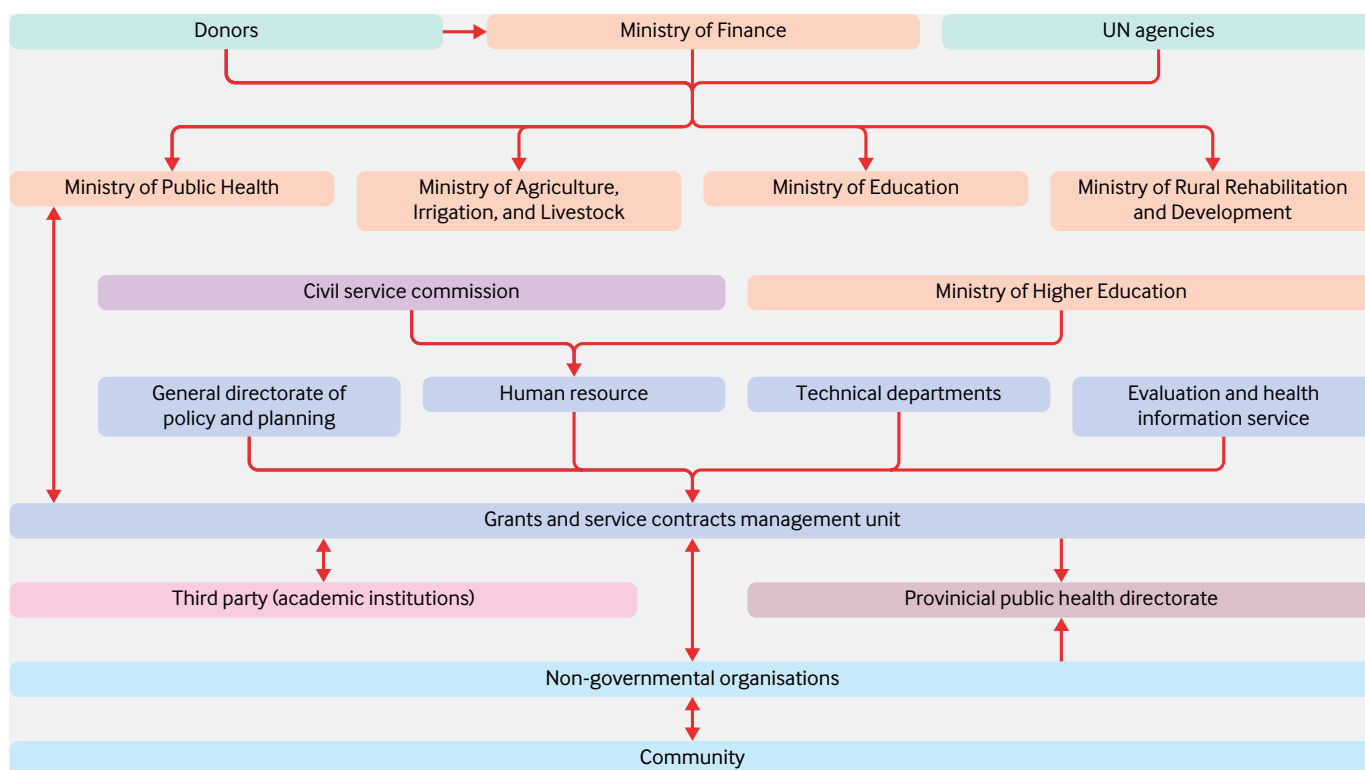

Fig 1 | Multisectoral model of engagement for Afghanistan’s BPHS

Table 1 | Major elements and revisions of BPHS¹⁹⁻²¹

Healthcare services	2003	2005	2010
Maternal and newborn health	Antenatal care Delivery care Postpartum care Family planning Care of the newborn	Same as 2003	Same as 2003
Child health and immunisation	Expanded Programme on Immunisation services (routine and outreach) Integrated Management of Childhood Illness	Same as 2003	Same as 2003
Public nutrition	Micronutrient supplementation Treatment of clinical malnutrition	Prevention of malnutrition Assessment of malnutrition Treatment of malnutrition	Prevention of malnutrition Assessment of malnutrition
Communicable disease treatment and control	Control of tuberculosis Control of malaria	Control of HIV Control of tuberculosis Control of malaria	Prevention of HIV and AIDS Control of tuberculosis Control of malaria
Mental health*	Community management of mental health problems Health facility based treatment of outpatients and inpatients	Mental health education and awareness Case detection Identification and treatment of mental illness	Mental health education and awareness Case identification, diagnosis, and treatment
Disability and physical rehabilitation services*	Physiotherapy integrated into primary healthcare services Orthopaedic services expanded to hospital level	Disability awareness, prevention, and education Assessment Referrals	Disability awareness, prevention, and education Provision of physical rehabilitation services Case identification, referral and follow-up
Regular supply of essential drugs	All essential drugs required for basic services	Listing of all essential drugs needed	Same as 2005

*Though included in 2003, these were deprioritised from 2005 onwards

that the Ministry of Public Health and non-governmental organisations were the major drivers of BPHS, with important influence from donors (table 2). The Ministry of Finance and the Provincial Public Health Directorates also had notable involvement and influence. Other sectors (education, development, agriculture) had complementary roles in human resource and structural capacity. Local communities were the primary beneficiaries and were also involved in development.

The Ministry of Finance set up multidonor trust funds to mobilise human and capital resources for the rebuilding of socioeconomic institutions. The Afghanistan Reconstruction Trust Fund (ARTF), the largest and longest running such trust in the world, was established in 2002.²³ Donors averse to funding the Afghan government directly preferred ARTF

owing to its relatively high accountability and transparency (box 2).²⁴

Staff training, recruitment, and deployment strategies were central to the success of BPHS. The Ministry of Higher Education provided training to doctors, and the Ministry of Public Health provided pre-service training to midwives and paramedics. A national standard salary policy was announced in 2006, which encouraged incentives for employment in underprivileged locations.²⁶

BPHS's vision was to get services to the poorest, most underserved and isolated regions, so community based outreach modalities were critical. Voluntary community health workers and community groups provided the major health workforce, attending to about two thirds of all family planning clients and managing nearly half of all sick children.²⁷

The various tiers of community engagement and demand creation strategies are detailed in section 5 of the supplementary file.

Multisectoral planning and actions

Although direct multisectoral planning to support investments in education, promotion of food security, the built environment, and WASH services were uncoordinated, several parallel cross-sectoral initiatives in these sectors led to or enabled gains in health.

In 2003, the Ministry of Agriculture, Irrigation, and Livestock—working closely with Public Nutrition Department in the Ministry of Public Health—developed the country's first Public Nutrition Policy and Strategy to coordinate BPHS nutrition services. The Health and Nutrition Policy and Strategy 2012-20 and Food Security and Nutrition Strategy 2015-19 showed further commitment to the right to nutrition.

Table 2 | BPHS stakeholder roles

Organisation or group	Role	Phases in which engaged	Involvement, (in terms of time, resources)	Influence	Notes
Ministry of Public Health	Stewardship/ oversight	All phases	High	High	Stewardship/ oversight
Ministry of Finance	Fund holder	Finance Report	Medium	Medium	
Ministry of Higher Education	Training doctors	Implementation	Low	Medium	Trainings
Ministry of Agriculture, Irrigation, and Livestock	Lead development in agriculture and livestock	Implementation	Low	Medium	Support food security and nutrition related activities
Ministry of Rural Rehabilitation and Development	Lead infrastructure and road development	Implementation	Low	Medium	Develop Infrastructure
Provincial Public Health Directorates	Coordinator	Implementation	Medium	Medium	Provincial level monitoring
Donors	Provide funds	Design and reporting	Medium	Medium	Influencing Policy
Non-governmental organisations	Implementation	Planning/reporting	High	High	Technical Support
UN	Support/technical assistance	All phases	Low	Low	Oversight
Political groups	Lobby	Implementation	Low	Low	Lobby
Community	Support services	Implementation, planning	Low	Medium	Voluntary work

Box 2: Funding mechanisms

Among the 34 donors that have contributed to the ARTF since its inception, 17 continue to contribute regularly (fig 2).²⁴ ARTF channels funding to all sectors, the mechanisms of which have changed over time, including improved monitoring and evaluation and various performance based approaches. BPHS's three major donors are the EU, USAID, and the World Bank. USAID provided support in 13 provinces, the World Bank in 11, and the EU in 10.²⁵ These donors, together with Ministry of Public Health, have also funded non-governmental organisations to deliver BPHS through various mechanisms. The majority of BPHS's major donor funding has been disbursed through the Ministry of Finance for general BPHS budget spending, while other donors have pledged money for specific activities (vertical programs and innovations), generally made directly to service providers (Ministry of Public Health or non-governmental organisations). By the end of 2008, donors were fully funding BPHS service delivery through non-governmental organisations.

Outcomes: trends across collaborating sectors

The multisectoral collaboration of BPHS implementation in Afghanistan has generally been positively received.^{7 8 33} Inequities are described in box 3.

Trends in health status and outcomes

The UN's best modelled estimates show that under 5 child mortality fell from 130 to 70 deaths per 1000 live births from 2000 to 2016.³⁴ WHO estimates indicate that maternal deaths per 100 000 live births fell from 1100 in 2000 to 396 (uncertainty interval, 253 to 620) in 2015.³⁵ But these estimates may not be reliable, as other data sources indicate that maternal deaths rose from 716 (441 to 1123) in 2003 to 885 (508 to 1445) in 2013.³⁶ These uncertainty intervals are very wide and overlap, but they indicate continuing doubt and the need for better data sources and analytical methods. Nonetheless, progress and trends in many maternal and child health interventions corroborate that maternal mortality has improved in Afghanistan over the past decade and a half³⁷; further analyses are needed to better understand these estimates.³⁸ Since 2003, coverage of many essential maternal interventions (including antenatal care, skilled birth attendants, and facility births for pregnant women) has improved gradually, from around 15% to over 55% in 2015. Coverage of tetanus vaccination among pregnant women, however, has remained stagnant since 2003, and contraceptive use among women has been stagnant since 2012 (fig 4). Full immunisation coverage of children under 2 improved from 30% in 2010 to around 59% in 2015, whereas coverage of oral rehydration therapy for childhood diarrhoea and of care seeking for childhood acute respiratory tract infection has plateaued since 2012, after some initial gains (fig 4).³⁹

Healthcare infrastructure and workforce have also improved. The total number of active healthcare facilities has risen from 1075 in 2004 to 2493 in 2017, and the absolute number of visits for healthcare rose from 2 million to 84 million over the same period.⁴⁰ The number of health workers of all cadres has also improved⁴¹; the number of female community health workers rose from 729 to 14 016. Two midwifery schools were established in 2002; by 2014, there were 34 institutions, one in each province, which collectively trained several thousand midwives⁷

Trends across non-health sectors

In 2001, only one million children were in school, and almost all of those were boys; by 2015, 8.8 million children were enrolled

Various approaches were used to expand access to education in remote and rural communities, including community based education and accelerated learning centres.²⁸ The 2004 Education Quality Improvement Programme aims to increase access to quality basic education, especially for girls, through school grants, teacher training, and strengthened institutional capacity, with the support of communities and private providers.

The National Solidarity Programme, established in mid-2003 by the ministers of finance and rural rehabilitation and development, is a flagship programme to reduce poverty through establishing and strengthening a national network of self governing community institutions and empowering rural communities to make decisions on their own lives. Its projects included construction of irrigation facilities, health facilities, roads, bridges, schools, water supply facilities, and clinics, income generation, and vocational training projects.²⁹

Monitoring, accountability, and learning

Despite data gaps, particularly in severe conflict areas, BPHS's unique, comprehen-

sive, and rigorous evaluation mechanisms have been fundamental to evidence based decision making and policy formulation.²⁵ The roles of stakeholders in the monitoring and evaluation of BPHS are shown in table 3.

The Ministry of Public Health established the Evaluation and Health Information System department to manage, monitor, and provide timely progress data to all stakeholders,³⁰ specifically on national health priority indicators, and to coordinate across ministry departments (see section 6 of supplementary file).³⁰ Tools were developed to collect, monitor, and evaluate the performance of BPHS, such as the routine facility based health management information system, balanced score card, household and facility surveys, field supervision, monitoring checklists, periodic reports submitted by non-government organisations, and surveillance data. Finally, third party academic institutes, including Johns Hopkins University, the Indian Institute of Health Management Research, and KIT Royal Tropical Institute, conducted annual independent evaluations from 2004 onwards.^{31 32}

Fig 2 | Donor contribution to the Afghanistan Reconstruction Trust Fund since 2002

Table 3 | Stakeholders' roles in monitoring and evaluation

Partners	Expected input
Evaluation and health information system	Lead and coordinate all activities
Grants and services contract management unit	Coordinate to apply national monitoring and evaluation tools Demand data on performance required for contract and grant management
Ministry of Public Health technical departments	Assist in prioritisation, development, and revision of performance indicator Provide technical input to design assessment tools and for verification of values of performance indicators Coordinate to apply national monitoring and evaluation tools
EU, World Bank, USAID	Provide financial support for monitoring and evaluation process Promote integrated monitoring and evaluation system
Other partners (eg, UNICEF, WHO, and Global Fund)	Promote integrated monitoring and evaluation system Provide technical input in designing of monitoring and evaluation tools Provide logistic and financial support for monitoring and evaluation process
Academic partners (Johns Hopkins University, the Indian Institute of Health Management Research, and KIT Royal Tropical Institute)	Perform third party evaluations of health service activities and reach

in schools, nearly 38% of which were girls.²⁸ There was a concurrent increase in school educators, growing from 21 000 to 187 000.²⁸ Adult literacy rates improved overall, but the proportion of primary school age children attending school is still low at 57% (64% for boys and 48% for girls); the gender parity index (ratio of girls to boys in primary education) also improved from 0.69 to 0.74 between 2007 and 2012.²⁸

Rural water supply activities have accelerated and reached about 365 000 people, and community led total sanitation has also been scaled up. Between 2000 and 2017 population access to improved drinking water sources and to sanitation facilities rose from 42% to 64% and from 5% to 41%, respectively, but progress has plateaued since 2013. Handwashing with soap and water has improved from 5% in 2011 to 36% in 2015, whereas data on open defecation rates do not show any overall change since 2003; there are no data after 2011 (fig 5).⁴²

There have been concurrent gains in economic development (fig 6) and in promising regional trade partnerships, as well as substantial efforts by the government to increase domestic revenue.⁴³ GDP per capita increased from \$199 in

2002 to \$669 in 2012, but thereafter declined to \$586 in 2017. Poverty rates have risen from 36% in 2007 to 55% in 2017, and prevalence of food insecurity has increased from 28% in 2008 to 45% in 2017. Despite fluctuations in data, stunting prevalence has fallen from about 61% in 2004 to 41% in 2013, prevalence of underweight children has declined from 41% in 2003 to 25% in 2013, and wasting prevalence has remained constant since 2003 (fig 6).

Evolution, scale, and sustainability

The funding mechanism of BPHS was modified after 2010 to reflect donor transitions and streamlining of funds (see section 7 of the supplementary file). The contracts awarded to non-government organisations for implementation became performance based, with 20% of total payment linked to proportional achievement of key indicators stipulated in the contract. The Community Midwifery Education programme was added to BPHS to tackle the shortage of midwives in rural and hard-to-reach areas.⁴⁴ This programme engaged the community at all stages, including designing, priority setting, planning, and implementation. The Community Health Nursing Education programme builds on the successful

experiences and lessons learnt from the midwifery programme. Various innovations have been pilot tested and implemented to improve the coverage of essential interventions (box 4).

Afghanistan's BPHS continues to evolve, and many have questioned its sustainability.^{8 33} The Ministry of Public Health provides stewardship and oversight of funds, but prospective planning and coordination with diverse sectors, particularly education, agricultural, and rural development is needed for sustainability. The recent Citizens Charter (2016), for example, is a joint effort between the Ministry of Rural Rehabilitation and Development, the Ministry of Public Health, and other ministries that entrusts accountability of the health system to communities themselves. Such prospectively planned cross sectoral initiatives are the next steps for healthcare sustainability in Afghanistan.

Discussion

Afghanistan's BPHS is an example of how stakeholders and sectors collaborated to implement a basic health structure, achieving gains in a region affected by conflict. These gains were largely realised owing to the well defined roles of stakeholders, structured programme governance and implementation, monitoring and evaluation systems, committed external funding, and political will. After the initial response phase, with its focus on national immunisation campaigns, the subsequent development of BPHS reflected the government's desire to expand provision of basic primary care services. Notwithstanding the multi-sectoral consultations in design, execution, and oversight, the programme was mainly stewarded and implemented by the Ministry of Public Health with contributions from other ministries. Multistakeholder planning was a formal process, but mul-

Box 3: Inequities in health

Coverage of interventions for all indicators (health and non-health) varies regionally, with stark inequities between underprivileged, rural, and conflict areas and regions that have more money or are unaffected by conflict.^{39 41} These regional and socioeconomic inequities jeopardise Afghanistan's likelihood of meeting its goals of universal coverage of health services and interventions.⁴¹ Data from Multiple Indicator Cluster Surveys 2010-11 show vast disparities in coverage of essential reproductive, maternal, newborn, and child health interventions (fig 3). The interventions most inequitably distributed are antenatal care by skilled birth attendants and receipt of four or more antenatal care visits, whereby richer areas had between three and 5.6 times more coverage than poor areas. Breastfeeding interventions and treatment of sick children, however, were more equitably distributed.⁴¹ Inequities also existed across regions, with the highest coverage in urban east, west, and central regions of Afghanistan and lowest in south and southeast regions of the country.⁴¹

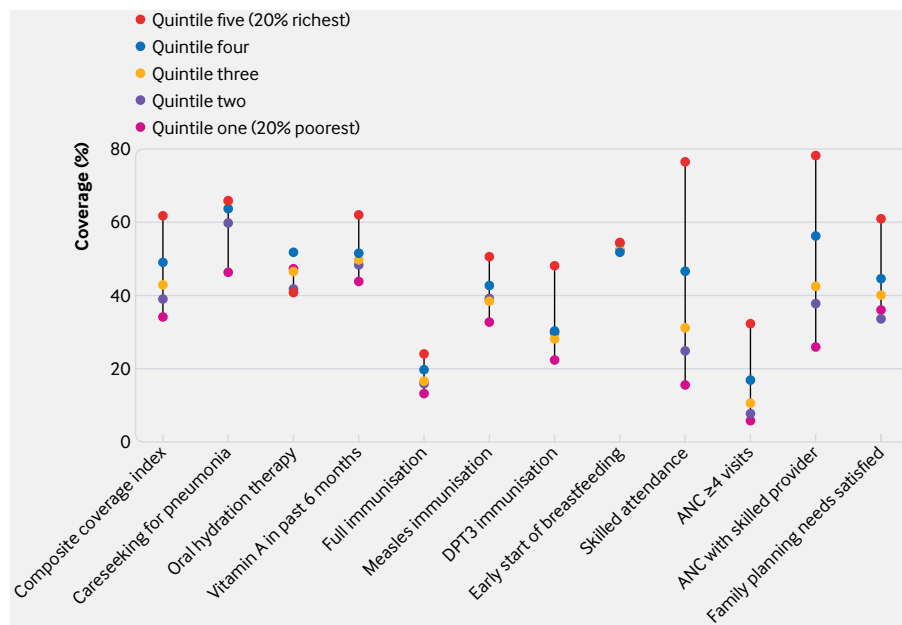

Fig 3 | Inequities in coverage of key interventions from MICS Multiple Indicator Cluster Surveys 2010-11.⁴¹ ANC=antenatal care.

tisectoral implementation had few formal processes, one was Afghanistan’s nutrition policy and strategy, which was a formal collaboration between the Ministry of agriculture, irrigation and livestock and the Ministry of Public Health.

Evidence on the effect of BPHS on the coverage of essential reproductive, maternal, and child health interventions and on health outcomes is mixed. Antenatal care, skilled birth attendants, and facility based births have improved, but use of contraceptives has been stagnant, which

has been linked to low education among women, insecurity, lack of access, and low socioeconomic status of the population.⁴⁵ Among child interventions, there have been improvements in vaccination, care seeking behaviour, and management of childhood illnesses. Prevention of malnutrition has been challenging, because improvements in nutritional status require efforts and collaboration across sectors other than health, encompassing poverty alleviation, food security, agricultural and economic growth, education, and social safety nets⁴⁶;

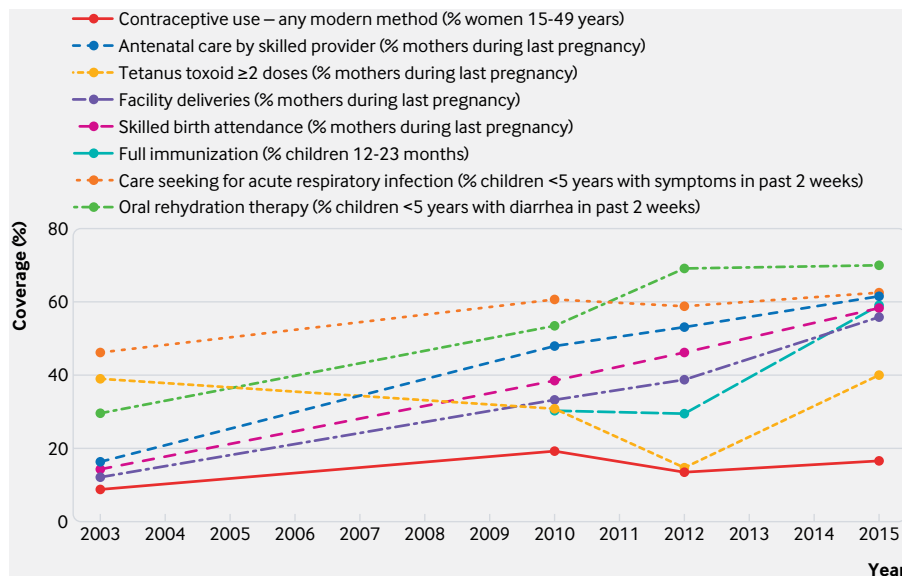

Fig 4 | National trends in maternal, newborn, and child health interventions from 2003 to 2015. Sources: Multiple Indicator Cluster Survey (2003 and 2010); Afghanistan Health Survey (2012 and 2015).

progress on these has been suboptimal in Afghanistan, especially in populations with low access to healthcare in rural and conflict areas.

BPHS is adaptive, as evident in its changing modalities of funding, contracting process, interventions provided, and mechanisms for monitoring and evaluation. Community based approaches have also helped increase access to healthcare, generate demand, and improve equity. The Community Midwifery Education programme has been a major success in delivery of services, also providing marginalised women with work opportunities, which aided the economic uplift, but the high attrition rate of female health professionals is an ongoing obstacle.³⁸ Mobile health teams and community groups have helped in increasing demand for healthcare.

There are several limitations and unaddressed challenges, including limitations in data collection linked with the inherent difficulties in obtaining robust information in a chronically fragile state, with limited access in areas affected by severe conflict. There are cultural barriers to women seeking care, and the female health workforce is below the required numbers, especially in rural and severe conflict areas. This, together with low education levels among women, further complicates existing challenges and hinders simple solutions. There are still a high percentage of out-of-pocket expenditures and these are largely due to lack of access to health facilities, inconsistent quality of BPHS, and an unregulated private sector.^{44 47}

Although Afghanistan has improved some health indicators and service delivery and has vastly increased the number of health facilities and workers, the health system remains far weaker than needed to ensure universal coverage, equitable access, and uniform benefit. The proportion of the population living within an hour’s walking distance of a health facility has increased from 10% in 2002 to 57% in 2014.⁴⁷ Much of the gain achieved through the contracting-out model needs to be supplemented with robust public sector programmes focusing on reducing inequities and reaching marginalised populations, as a majority of the population lives in rural areas (75.5%).^{41 48 49} There must be an enhanced focus on reducing gender disparities, promoting education and reducing school dropout rates among girls in rural populations. This requires strategies and progress in multiple other sectors, including economic growth,

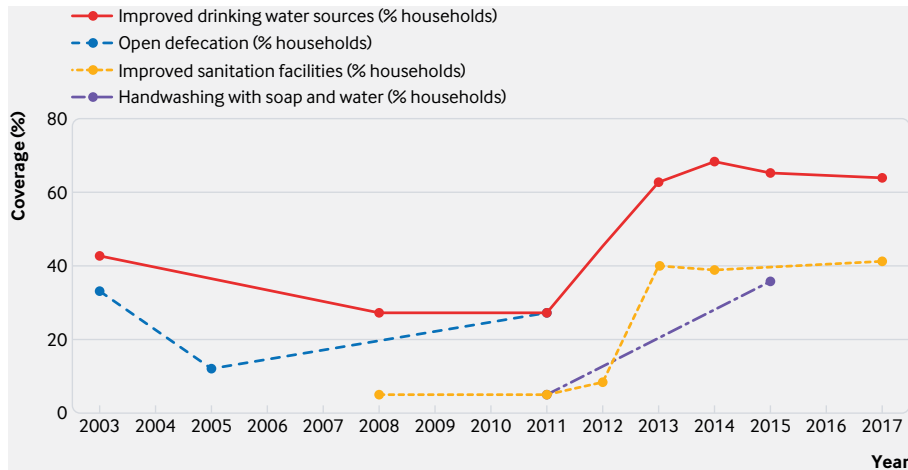

Fig 5 | National trends in water and sanitation from 2003 to 2017. Sources: Multiple Indicator Cluster Survey (2003); National Risk and Vulnerability Assessment (2005, 2007-8, 2011-12, 2013-14, and 2016-17); Afghanistan Living Conditions Survey (2007-08, 2011-12, and 2016-17); National Nutritional Survey-Afghanistan (2013); Afghanistan Health Survey (2015)

poverty reduction strategies, investments in education, and emphasis on improved transport and communication networks (see section 9 of supplementary file).

Afghanistan has experienced a debilitating conflict and civic unrest for almost four decades. An entire generation has experienced conflict and adversity, with consequences that may run across generations.^{37 50} With escalating conflict since 2010, limited capacity of the health system and the heavy dependence on donors, much of the development support has come from the coalition countries and is likely to diminish in future. There is now a need for sustainable plans with greater emphasis on multisectoral implementation and an earlier move towards multisectoral

and intersectoral planning; this was not a key element during the era of the millennium development goals. This has changed in the context of the sustainable development goals,⁵¹ and investments could be accelerated.

As a signatory to the sustainable development goals, Afghanistan should explore a national dialogue on developing an integrated strategy for health and related determinants. Creation of a national think tank to oversee this process and to develop formal multisectoral plans for action is an important next step. The Ministry of Economy was designated as the lead ministry and focal point in this effort in 2015 under the guidance of the UN Development Programme,⁵² and,

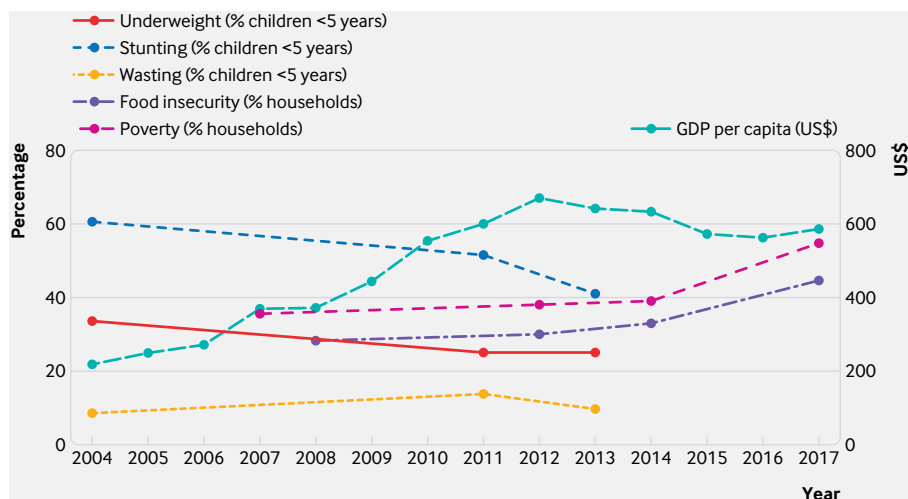

Fig 6 | National trends in poverty, nutrition and food security from 2003 to 2017. Box 4: Innovations in health

Core elements and delivery of BPHS have been modified over time, based on the evidence it generated. Innovations that have been tested as part of BPHS include those targeted to improving the reach of health services (mobile health teams), increasing access (family health houses and maternity waiting homes), improving quality of services (results based financing and conditional cash transfers), and increasing the use of technology (ehealth innovations) (see section 8 of the supplementary file). The current contracts of non-government organisations have a separate budget for innovations, which is equivalent to around 10% of the total budget.

moving forward, additional ministries (notably those involved in public health and nutrition) must be closely engaged in this effort. Afghanistan has shown progress in an ongoing conflict, and there is no reason why the next decade should not see accelerated progress in human development.

We acknowledge the country working group who participated in the multistakeholder meeting and provided valuable feedback. This comprises Alim Atarud, Abdullah Fahim, Sayed Attaullah Sayedzai, Aziz Baig, Habibullah Ahmadzai, Khalil Mohmand, Khwaja Mir Islam Saeed, Mohammad Fareed Asmand, Nasir Hamid, Bahara Rasooly, Muzhgan Habibi.

Ethical approval: Ethical exemption was sought and approved by the Ethical Review Committee at Aga Khan University, Karachi, and the Institutional Review Board, Kabul.

Contributors and sources: NA, JKD, SM, and ZAB conceived the idea for this study and wrote the study proposal. JKD guided and worked on the systematic review with a technical team (ZP, KM) at Aga Khan University, Karachi. NA guided and worked with ON on the systematic review at SickKids Toronto. JKD and SM conducted the multistakeholder meeting with guidance from ZAB and AJN. CEA provided overall project coordination and oversight. All authors contributed to the synthesis and writing of the manuscript. ZAB is responsible and overall guarantor of the content.

Competing interests: The authorship team has read and understood BMJ policy on declaration of interests and declare the following interests: JKD, NA, ZP, ON, CEA, KM, ZAB declare no competing interests. SM was associated with the Aga Khan Health Service, Afghanistan from 2003 to 2005 and 2008-2018 and involved in implementing BPHS in three provinces of Afghanistan: Badakhshan, Baghlan, and Bamyan. AJN is the current Deputy Minister of Health, Afghanistan.

Provenance and peer review: Commissioned; externally peer reviewed.

This article is part of a series proposed by the Partnership for Maternal, Newborn, and Child Health, hosted by the World Health Organization (WHO PMNCH) and commissioned by *The BMJ*, which peer reviewed, edited, and made the decision to publish

the article. Open access fees for the series are funded by WHO PMNCH.
