#### Abstract

The manipulation of trinuclear ruthenium clusters $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (1) with $\mathrm{PH}_{2} \mathrm{Ph}$ in refluxing hexane produces $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{8}\left(\mathrm{PH}_{2} \mathrm{Ph}\right)(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (2) where $\mathrm{PH}_{2} \mathrm{Ph}$ coordinates as a terminal ligand. Cluster 2 is converted to $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{PMes}\right)\left(\mu_{3}-\mathrm{PPh}\right)\right]$ (3) when heated in a toluene solution in the presence of CO. This study provides the solutions of the X-ray structures for clusters $\mathbf{2}$ and $\mathbf{3}$.

Keywords: cluster; X-ray crystal structure; ruthenium; phosphinidene.

## 1. INTRODUCTION

Phosphinidene is a versatile ligand that bridges transition metals in several coordination modes [1,2]. Many transition metal clusters with phosphinidene ligands have been reported along with their chemical properties, structures, and preparation methods [3-6]. I previously reported the synthesis of phosphinidene-capped, ruthenium, carbonyl clusters and their expansion reactions using the produced clusters as building blocks containing more ligands or vertices $[7,8]$. The reactions demonstrated that the phosphinidene ligand is beneficial in preserving the ruthenium cluster core. Cluster expansion reactions are useful for preparing large, complicated molecules. In this study, stepwise formation of triruthenium clusters containing two types of phosphinidene ligands is examined, beginning with the reaction of a phosphini-dene-capped cluster with a terminal phosphine ligand. Clusters produced via these methods were analyzed by X-ray studies.

## 2. EXPERIMENTAL

All procedures were performed under a dry nitrogen atmosphere using Schlenk techniques. Before usage, toluene and hexane were distilled from sodium benzophenone ketyl. Dichloromethane was evaporated over calcium hydride and purified by trap-to-trap distillation, and benzene- $\mathrm{d}^{6}$ was dried over potassium mirrors. ${ }^{1} \mathrm{H}$ and ${ }^{31} \mathrm{P}$ NMR spectra were obtained using a Bruker AVANCE 300 spectrometer and IR spectra were obtained using a HORIBA FT-730 spectrometer. Elemental analyses were performed at the Instrumental Analysis Center for Chemistry, Tohoku University. The $\mathrm{Ru}_{3}$ cluster $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (1) was prepared as previously reported [7]. All other reagents were purchased and used without further purification.

## Synthesis of $\left[\mathrm{Ru}_{3}(\mathbf{C O})_{8}\left(\mathrm{PH}_{2} \mathbf{P h}\right)\left(\mu-\mathrm{H}_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]\right.$ (2).

$\mathrm{Ru}_{3}$ cluster $1(50 \mathrm{mg}, 0.071 \mathrm{mmol})$ and $\mathrm{PH}_{2} \mathrm{Ph}(10 \mathrm{mg}, 0.091$ mmol ) were dissolved in 20 mL of hexane, and the solution was refluxed overnight. The solvent was evaporated at low pressure and the resulting yellow residue was dissolved in tetrahydrofuran (THF). The THF solution was adsorbed onto Celite ${ }^{\mathrm{TM}}$ and the solvent was removed under low pressure. The Celite was then placed on a silica gel column $(2 \mathrm{~cm} \phi / 4 \mathrm{~cm})$ in a hexane/ toluene $(5 / 1)$ mixture under $\mathrm{N}_{2}$ pressure. A yellow fraction with a yield of $57 \%$ ( $32 \mathrm{mg}, 0.041 \mathrm{mmol}$ ) was collected as cluster 2. ${ }^{1} \mathrm{H}$ NMR $\left(300 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}\right): \delta-18.80(\mathrm{brm}, 2 \mathrm{H}, \mu-\mathrm{H}), 2.24$ (s, $\left.3 \mathrm{H}, p-\mathrm{CH}_{3}\right), 2.67\left(\mathrm{~s}, 6 \mathrm{H}, o-\mathrm{CH}_{3}\right), 5.85\left(\mathrm{brd}, 2 \mathrm{H}, J_{\mathrm{PH}}=144.6 \mathrm{~Hz}\right.$, PH ), 6.91-7.39 (m, 7H, ArH). ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR (121.5 $\mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $\delta-68.9\left(\mathrm{~d}, J_{\mathrm{PP}}=113.6 \mathrm{~Hz}, \mathrm{PH}_{2} \mathrm{Ph}\right), 233.2\left(\mathrm{~d}, J_{\mathrm{PP}}=113.6 \mathrm{~Hz}\right.$,

X-ray diffraction data were collected at 150(2) K with a Rigaku R-AXIS RAPID imaging plate using Mo radiation $(\lambda=0.71069$ $\AA$ A). The structural identification and refinement were performed using the SHELXL-97 software [9]. Two H atoms bridging Ru atoms and two H atoms on the P atom observed in cluster 2 within a difference-Fourier map were freely refined. All other H atoms were placed at geometrically calculated positions, i.e., $\mathrm{C}-\mathrm{H}=0.95$ or $0.98 \mathrm{~A}^{\circ}$. Crystallographic data from the structural analyses are available at the Cambridge Crystallographic Data Center, CCDC 1950762 and 1950763.

Figure 1. (A) Packing of $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{8}\left(\mathrm{PH}_{2} \mathrm{Ph}\right)(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (2) along the a axis and (B) the structure of the two independent molecules, A and B, of cluster 2. The thermal ellipsoids are shown at $50 \%$ probability.

## 3. RESULTS AND DISCUSSION

The thermal reaction of $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (1) with $\mathrm{PH}_{2} \mathrm{Ph}$ in a hexane solution formed the complex $\left[\mathrm{Ru}_{3}(-\right.$ $\left.\mathrm{CO})_{8}\left(\mathrm{PH}_{2} \mathrm{Ph}\right)(\mu-\mathrm{H})_{2}\left(\mu_{3}-\mathrm{PMes}\right)\right]$ (2) (Scheme 1). X-ray analysis suggests that complex 2 is crystallized in the triclinic crystal system with P-1 space group. Complex 2 crystallized with two independent molecules in an asymmetric unit (Figure 1A). The structure of cluster 2 maintains a phosphinidene-capped, triangular, and pyramidal core, in which the $\mathrm{PH}_{2} \mathrm{Ph}$ moiety coordinates as a terminal phosphine ligand (Figure 1B). The phenyl groups of the two independent molecules, A and B , are inclined in di-
fferent directions (Fig. 1B), probably due to intermolecular interactions of aromatic rings (Figure 2). Selected bond lengths and angles for cluster 2 are presented in Table 1. The Ru-Ru bond intervals containing hydrogen bridges, i.e., Ru1-Ru2, Ru1-Ru3, Ru4-Ru5, and Ru4-Ru6, are slightly longer than those without hydrogen bridges, i.e., Ru2-Ru3 and Ru5-Ru6, for molecules A and B, respectively.
Heating complex 2 in a toluene solution under CO atmosphere produced $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{PMes}\right)\left(\mu_{3}-\mathrm{PPh}\right)\right]$ (3). The crystalline structure of 3 is depicted in Figure 3, with selected bond lengths and angles presented in Table 2. The complex $\mathbf{3}$ is crystallized in the monoclinic crystal system with $\mathrm{P} 2_{1} / \mathrm{c}$ space group. It

contains a square, pyramidal $\mathrm{Ru}_{3} \mathrm{P}_{2}$ core, with a distorted square base comprising two phosphorus atoms, two ruthenium atoms, and a capped $\mathrm{Ru}(\mathrm{CO})_{3}$ moiety. The pyramidal core possesses two different phosphinidene ligands, i.e., $\mu_{3}$-PMes and $\mu_{3}$-PPh. The creation of $\mathrm{Ru}_{3} \mathrm{P}_{2}$ clusters containing two types of phosphinidene ligands is possible through several synthetic approaches

performed in this study and in the literature. Freytag et al. combined asymmetric diphosphene, Mes- $\mathrm{P}=\mathrm{P}-\left(\mathrm{C}_{6} \mathrm{H}_{2}-2,4,6\right.$-tert$\left.\mathrm{Bu}_{3}\right)$ and $\mathrm{Ru}_{3}(\mathrm{CO})_{12}$ to produce $\mathrm{Ru}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{P}-\mathrm{Mes}\right)\left(\mu_{3}-\mathrm{PC}_{6} \mathrm{H}_{2}-\right.$ $2,4,6$-tert- $\mathrm{Bu}_{3}$ ) [10]. Scheer et al. reported $\left[\mathrm{Ru}_{3}(\mathrm{CO})_{9}\left(\mu_{3}-\mathrm{PPh}\right)\right.$ $\left.\left\{\mu_{3}-\mathrm{PC}(\mathrm{CO}) \mathrm{Ar}^{\prime}\right\}\right]\left(\mathrm{Ar}^{\prime}=\left(2,4,6-\mathrm{tBu}_{3} \mathrm{C}_{6} \mathrm{H}_{2}\right)\right)$ as a final product of a reaction between $\left[\mathrm{Ru}_{4}(\mathrm{CO})_{13}\left(\mu_{3}-\mathrm{PPh}\right)\right]$ and phosphalkynes $\mathrm{Ar}^{\prime} \mathrm{C}$ $\equiv \mathrm{P}[11]$. Compound $\mathbf{3}$ produced in this study is also an asymmetric $\mathrm{Ru}_{3} \mathrm{P}_{2}$ cluster formed by stepwise reactions.

In conclusion, the thermal reaction between complex 1 and $\mathrm{PH}_{2} \mathrm{Ph}$ formed trinuclear ruthenium, complex 2, incorporating $\mathrm{PH}_{2} \mathrm{Ph}$ as a terminal phosphine ligand. Subsequent thermolysis of complex 2, in the presence of CO, produced asymmetric $\mathrm{Ru}_{3} \mathrm{P}_{2}$, i.e., cluster 3. X-ray analyses of clusters $\mathbf{2}$ and $\mathbf{3}$ revealed that compound 2 crystallized with two independent molecules in an asymmetric unit, while the $\mathrm{Ru}_{3} \mathrm{P}_{2}$ cluster $\mathbf{3}$ combined two different phosphinidene ligands into a molecule.
