	Preface	xiii
1	**Introduction**	1
1.1	Historical remarks	1
1.2	Path integral in quantum mechanics	3
1.2.1	Feynman path integral	3
1.2.2	Euclidean path integral	6
1.3	Euclidean quantum field theory	8
1.3.1	Scalar fields	9
1.3.2	Schwinger functions	10
1.3.3	Wick rotation	12
1.3.4	Free field	14
1.3.5	Reflection positivity	14
1.4	Euclidean functional integrals	16
1.4.1	Gaussian integrals	16
1.4.2	Euclidean free field	18
1.4.3	Functional integral for the Euclidean free field	21
1.4.4	Functional integral for the interacting field	22
1.4.5	Perturbation theory	24
1.5	Quantum field theory on a lattice	26
1.5.1	Lattice regularization	26
1.5.2	Transfer matrix	29
1.5.3	Reflection positivity	31
1.6	Continuum limit and critical behaviour	34
1.6.1	Lattice field theory and statistical systems	34
1.6.2	Renormalization and critical behaviour	36
1.6.3	Universality	39
1.7	Renormalization group equations	41
1.7.1	Renormalization group equations for the bare theory	41
1.7.2	Callan–Symanzik equations	43
1.7.3	Renormalization group equations for a massless theory	45

1.7.4	Fixed points	46
1.8	Thermodynamics of quantum fields	49
1.8.1	Field theory at finite physical temperature	49
1.8.2	Anisotropic lattice regularization	51
2	**Scalar fields**	54
2.1	ϕ^4 model on the lattice	54
2.1.1	Green's functions	55
2.1.2	Particle states	58
2.1.3	Renormalized quantities	60
2.2	Perturbation theory	62
2.2.1	Free field theory	62
2.2.2	Perturbation theory in the symmetric phase	64
2.2.3	Perturbation theory in the phase with broken symmetry	70
2.3	Hopping parameter expansions	74
2.4	Lüscher–Weisz solution and triviality of the continuum limit	77
2.4.1	Triviality of four-dimensional ϕ^4 theory	77
2.4.2	Infinite bare coupling limit	80
2.5	Finite-volume effects	81
2.5.1	Perturbative finite-volume effects	82
2.5.2	Tunneling	85
2.6	N-component model	87
3	**Gauge fields**	91
3.1	Continuum gauge fields	91
3.1.1	SU(N) gauge fields	91
3.1.2	Abelian gauge fields	96
3.2	Lattice gauge fields and Wilson's action	97
3.2.1	Lattice gauge fields	97
3.2.2	Wilson's action	99
3.2.3	Functional integral	101
3.2.4	Observables	105
3.2.5	Gauge fixing	107
3.2.6	Transfer matrix	108
3.2.7	Group characters	110
3.2.8	Reflection positivity	113
3.2.9	Other actions	114
3.3	Perturbation theory	116
3.3.1	Feynman rules	117
3.3.2	Renormalization group	124
3.3.3	Λ-parameters	128
3.4	Strong-coupling expansion	130
3.4.1	High-temperature expansions	130
3.4.2	Strong-coupling graphs	131
3.4.3	Moments and cumulants	135
3.4.4	Cluster expansion for the free energy	138

3.4.5	Results from the strong-coupling expansion	141
3.5	Static quark potential	142
3.5.1	Wilson loop criterion	142
3.5.2	Strong-coupling expansion	146
3.5.3	Roughening transition	150
3.5.4	Numerical investigations	152
3.6	Glueball spectrum	153
3.6.1	Glueball states	153
3.6.2	Strong-coupling expansion	156
3.6.3	Monte Carlo results	159
3.7	Phase structure of lattice gauge theory	160
3.7.1	General results	161
3.7.2	Abelian gauge groups	162
3.7.3	Non-Abelian gauge groups	163
4	**Fermion fields**	164
4.1	Fermionic variables	164
4.1.1	Creation and annihilation operators	164
4.1.2	A simple example	165
4.1.3	Grassmann variables	166
4.1.4	Polymer representation	171
4.2	Wilson fermions	174
4.2.1	Hamiltonian formulation	175
4.2.2	Euclidean formulation: Wilson action	178
4.2.3	Reflection positivity of the Wilson action	182
4.2.4	Wilson fermion propagator and Green functions	187
4.2.5	Timeslices of Wilson fermions	192
4.3	Kogut–Susskind staggered fermions	195
4.3.1	From naive to staggered fermions	196
4.3.2	Flavours of staggered fermions	199
4.3.3	Connection to the Dirac–Kähler equation	205
4.4	Nielsen–Ninomiya theorem and mirror fermions	208
4.4.1	Doublers in lattice fermion propagators	208
4.4.2	Doublers and the axial anomaly	213
4.5	QED on the lattice	218
4.5.1	Lattice actions	221
4.5.2	Analytic results	225
4.5.3	Non-perturbative studies	228
5	**Quantum chromodynamics**	231
5.1	Lattice action and continuum limit	232
5.1.1	Lattice actions	232
5.1.2	Quenched approximation	235
5.1.3	Hopping parameter expansion	238
5.1.4	Strong gauge coupling limit	241
5.1.5	Lattice perturbation theory	244

5.1.6	Continuum limit	249
5.2	Hadron spectrum	257
5.2.1	Hadronic two-point functions	258
5.2.2	Hadron sources	266
5.2.3	Heavy quark systems	270
5.3	Broken chiral symmetry on the lattice	273
5.3.1	Ward–Takahashi identities	275
5.3.2	PCAC and the quark mass	282
5.3.3	Current algebra	286
5.3.4	Scalar densities	290
5.3.5	The U(1) problem	292
5.3.6	Current matrix elements	294
5.4	Hadron thermodynamics	297
5.4.1	Hadron thermodynamics on the lattice	299
5.4.2	Deconfinement and chiral symmetry restoration	307
5.4.3	Non-zero quark number density	312
6	**Higgs and Yukawa models**	318
6.1	Lattice Higgs models	319
6.1.1	Lattice actions	320
6.1.2	Lattice perturbation theory	326
6.1.3	Phase structure and symmetry restoration	333
6.1.4	Triviality upper bound	339
6.1.5	Weak gauge coupling limit	344
6.2	Lattice Yukawa models	350
6.2.1	Lattice actions	351
6.2.2	The Golterman–Petcher theorem	358
6.2.3	Numerical simulations, phase structure	363
6.2.4	Vacuum stability lower bound	369
7	**Simulation algorithms**	374
7.1	Numerical simulation and Markov processes	374
7.1.1	Updating processes	376
7.1.2	Updating with constraints	380
7.1.3	Error estimates	381
7.1.4	Improved estimators	389
7.2	Metropolis algorithms	391
7.3	Heatbath algorithms	396
7.3.1	Heatbath in lattice gauge theories	399
7.4	Fermions in numerical simulations	403
7.4.1	Fermion matrix inversion	408
7.5	Fermion algorithms based on differential equations	413
7.5.1	Classical dynamics algorithms	413
7.5.2	Langevin algorithms	416
7.6	Hybrid Monte Carlo algorithms	421
7.6.1	HMC for scalar fields	422

7.6.2	HMC for gauge and fermion fields	426
7.7	Cluster algorithms	427
8	**Appendix**	434
8.1	Notation conventions and basic formulas	434
8.1.1	Pauli matrices	434
8.1.2	Dirac matrices	434
8.1.3	Lie algebra generators	435
8.1.4	Continuum gauge fields	436
8.1.5	Lattice notations	437
8.1.6	Free fields	439
8.1.7	Reduction formulas	441
	References	443
	Index	486
