Quantum Chromodynamics

High Energy Experiments and Theory

GÜNTHER DISSERTORI

Institute for Particle Physics, ETH Zürich, Switzerland

IAN G. KNOWLES

Formerly University of Edinburgh, Scotland, U.K.

MICHAEL SCHMELLING

Max-Planck-Institute for Nuclear Physics, Heidelberg, Germany

CLARENDON PRESS • OXFORD

2003

CONTENTS

Notation x

1 Introduction 1

2 The development of QCD 6
- 2.1 Experimental evidence 6
  - 2.1.1 The quark model 6
  - 2.1.2 The quark parton model 8
  - 2.1.3 Colour 15
  - 2.1.4 Other puzzles 19
- 2.2 The QCD Lagrangian 21

3 The theory of QCD 25
- 3.1 QCD as an SU(3) gauge theory 25
- 3.2 The QCD description of basic reactions 31
  - 3.2.1 Electron–positron annihilation 34
  - 3.2.2 Lepton–hadron scattering 38
  - 3.2.3 Hadron–hadron scattering 52
- 3.3 Born level calculations of QCD cross sections 62
  - 3.3.1 e^+e^- annihilation to quarks at $\mathcal{O}(\alpha_s^0)$ 62
  - 3.3.2 e^+e^- annihilation to quarks at $\mathcal{O}(\alpha_s^1)$ 70
  - 3.3.3 Gauge invariance of the QCD Lagrangian 74
  - 3.3.4 The evaluation of colour factors 79
- 3.4 Ultraviolet divergences and renormalization 80
  - 3.4.1 Self-energy and vertex corrections 81
  - 3.4.2 Renormalization 87
  - 3.4.3 The renormalization group equations 93
  - 3.4.4 Calculating the RGE coefficient functions 96
  - 3.4.5 The running coupling and quark masses 98
  - 3.4.6 An explicit example 103
- 3.5 Infrared safety 106
  - 3.5.1 Infrared cancellations 106
  - 3.5.2 e^+e^- annihilation to hadrons at NLO 108
  - 3.5.3 Infrared safe observables 114
- 3.6 The QCD improved parton model 117
  - 3.6.1 DIS at the parton level 118
  - 3.6.2 DIS at leading order 120
  - 3.6.3 A heuristic treatment of factorization 121

3.6.4 DIS at next-to-leading order 128
3.6.5 The evolution of the parton density functions 135
3.6.6 Leading logarithms 139
3.6.7 The analysis of ladder diagrams 144
3.6.8 The Drell–Yan process 149
3.7 The treatment of soft gluons 153
3.8 Hadronization models 157
3.8.1 Space–time structure of multi-hadron events 158
3.8.2 Independent hadronization 161
3.8.3 String hadronization 162
3.8.4 Cluster hadronization 168
3.8.5 A comparison of the main hadronization models 171

4 Monte Carlo models 179
4.1 Fixed-order Monte Carlos 179
4.2 All-orders Monte Carlos 181
4.2.1 The parton evolution equations 182
4.2.2 Branching kinematics 184
4.2.3 Time-like Monte Carlo algorithm 185
4.2.4 Space-like Monte Carlo algorithm 187
4.2.5 Soft gluon logarithms 190
4.2.6 The colour dipole model 196
4.2.7 The soft underlying event model 200
4.3 Multi-purpose event generators 202
4.3.1 Using event generators 202

5 Experimental set-up 206
5.1 Accelerators 206
5.1.1 Accelerator systems 208
5.1.2 Beam optics 211
5.2 Detectors at high energy colliders 213
5.2.1 Tracking detectors 215
5.2.2 Calorimeters 216
5.2.3 Passage of particles through matter 220
5.2.4 Particle identification 221
5.2.5 ALEPH: an example of a LEP detector 223

6 QCD analyses 228
6.1 General concepts 228
6.1.1 Event selection 230
6.2 Observables 235
6.3 Corrections 240
6.3.1 Detector corrections 240
6.3.2 Hadronization corrections 241
6.4 Systematic uncertainties 243

6.5 Examples 244
6.5.1 Structure function measurement at HERA 244
6.5.2 Inclusive jet production at the TEVATRON 250
6.5.3 Jet rates at LEP 255

7 Structure functions and parton distributions 258
7.1 Charged lepton–nucleon scattering 260
7.1.1 Neutral current interactions 260
7.1.2 Charged current interactions 264
7.1.3 The low-x and low-Q^2 region 269
7.1.4 The gluon density in the proton 273
7.2 Neutrino–nucleon scattering 277
7.2.1 Experimental issues 279
7.2.2 Measurements of F_2 and xF_3 280
7.2.3 The gluon distribution 285
7.2.4 The strange quark distribution 285
7.3 Sum rules 288
7.3.1 The Adler sum rule 288
7.3.2 The Gross–Llewellyn Smith sum rule 289
7.3.3 The Gottfried sum rule 290
7.3.4 The momentum sum rule 290
7.3.5 Sum rules for polarized structure functions 291
7.4 Hadron–hadron scattering 292
7.4.1 The Drell–Yan process 292
7.4.2 The W rapidity asymmetry 294
7.4.3 Direct-photon production 295
7.4.4 Inclusive jet production 297
7.5 Global QCD analyses 299

8 The strong coupling constant 305
8.1 Theoretical predictions 306
8.2 Comparison and combination of results 307
8.3 Inclusive measurements 309
8.3.1 The ratios R_γ and R_l 309
8.3.2 Measurement of α_s from R_τ 310
8.3.3 α_s from sum rules 312
8.4 Measurements of α_s from heavy flavours 313
8.4.1 Decays of heavy quarkonia 314
8.4.2 Lattice calculations 315
8.5 Scaling violations 316
8.5.1 Scaling violations in fragmentation functions 316
8.5.2 Scaling violations in structure functions 320
8.6 Measurements at hadron colliders 320
8.7 Global event shape variables 321
8.7.1 Theoretical predictions 321

8.7.2 Event shape variables 322
8.8 Analytical approaches to power law corrections 326
8.9 Jets in deep inelastic scattering 329
8.10 Summary of α_s measurements 329

9 Tests of the structure of QCD 334
9.1 Parton spins 334
9.1.1 The quark spin 334
9.1.2 The gluon spin 336
9.2 Flavour independence of strong interactions 340

10 Tests of the gauge structure of QCD: colour factors 344
10.1 Three-jet variables 346
10.2 Four-jet variables 351
10.3 Combination of three- and four-jet variables 358
10.4 Information from the running of α_s 359
10.5 Information from jet fragmentation 362
10.6 Limits on new physics 363

11 Leading-log QCD 365
11.1 The structure of the parton shower 365
11.2 Momentum spectra 366
11.3 Particle multiplicities 369
11.4 Isolated hard photons 372
11.5 Subjet multiplicities 373
11.6 Breit frame analyses 375

12 Differences between quark and gluon jets 376
12.1 Theoretical expectations 376
12.2 Extracting quark and gluon jet properties 377
12.3 Experimental properties of quark and gluon jets 380
12.3.1 Topology dependence of jet properties 380
12.3.2 Multiplicities 381
12.3.3 Jet profiles 387
12.3.4 Fragmentation functions 388
12.3.5 Particle content 389

13 Fragmentation 392
13.1 Identified particles 394
13.1.1 Multiplicities 394
13.1.2 Momentum spectra 397
13.2 Inter-jet soft gluons and colour coherence 398
13.2.1 The string effect 399
13.2.2 Colour coherence in hadron–hadron collisions 400
13.3 Two-particle correlations 402
13.3.1 Proton–antiproton correlations 402

13.3.2 Strangeness correlations 404
13.3.3 Bose–Einstein correlations 406
13.4 Colour reconnection 410

14 Summary 413

Appendices 415

A Elements of group theory 415
A.1 Basics of Lie groups 415
A.2 The U(N) and SU(N) groups 421
A.3 Colour factors 423

B Building blocks of theoretical predictions 425
B.1 The Feynman rules of QCD 425
B.2 Phase space and cross section formulae 427

C Dimensional regularization 429
C.1 Integration in non-integer dimensions 429
C.2 D-dimensional γ-matrix algebra 433
C.3 D-dimensional phase space 433
C.4 Useful mathematical formulae 435

D R_γ, R_l and R_τ for arbitrary colour factors 436
D.1 The running coupling constant and masses 436
D.2 Theoretical predictions for R_γ 438
D.3 The theoretical prediction for R_l 439
D.4 The theoretical prediction for R_τ 440

E Scaling violations in fragmentation functions 442
E.1 Definitions 442
E.2 The flavour non-singlet case 443
E.3 The flavour-singlet case 444
E.4 Fragmentation functions and hadron spectra 445
E.5 Electroweak weight functions 446

F Solutions 447
