70% of French population uses vision correction products  
« Les Français et l'optique », Institut Ipsos (2012)

~ 10% contact lenses

~ 60% eyeglasses

→ Ophthalmic lens is a complex system (structure and materials)

## Challenge

- Insufficient adhesion between layers can lead to delamination

Delamination after Process Modification

→ Important margin of safety prior to product launch

***Need of a better understanding of mechanisms of adhesion***

Simplification of the system: Study of Adhesion of  $\text{SiO}_2$  thin film on Hardcoat

1. Context
- 2. Experimental study**
3. Numerical modeling of the test
4. Numerical simulation results
5. Conclusions and perspectives

## Adhesion Characterization by compression test

RESEARCH & DEVELOPMENT

## Description of Numerical model

Geometry | Boundary conditions

## Description of Numerical model

Physical model

- Solving the momentum equation : Instability caused by buckling
- Interface degradation using damage model

## Description of Numerical model

Physical model

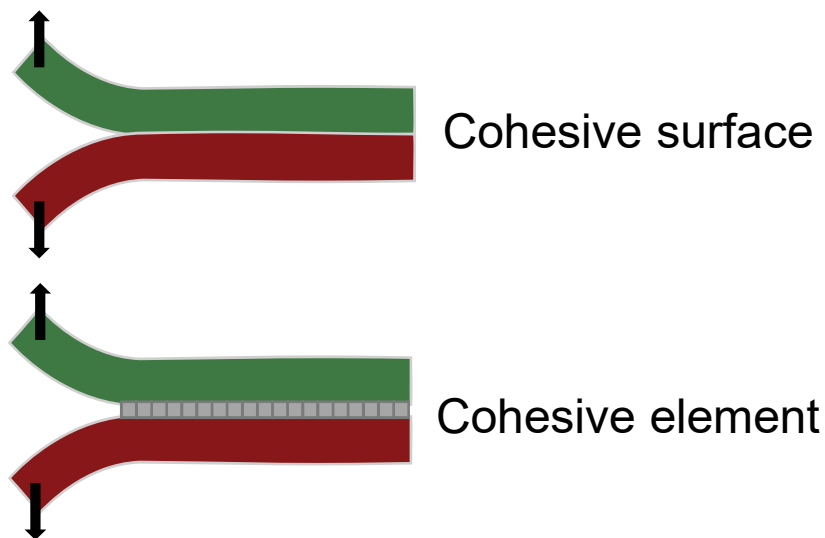

- Solving the momentum equation : Instability caused by buckling

## Description of Numerical model

Physical model

- Solving the momentum equation: Instability caused by buckling
- **Interface degradation using damage model**

Traction – Separation Law

## Description of Numerical model

### Interfacial Properties

### Materials Properties

SiO <sub>2</sub> thin film	<b>E, <math>\nu</math></b>
Hardcoat	<b>E, <math>\nu</math></b>

Cohesive Behavior	$K_I$ $K_{II} = K_{III}$
Tangential Behavior	Frictionless
Damage Initiation	$\sigma_I = \sigma_{II} = \sigma_{III}$
Damage Evolution	Total Displacement
Damage Stabilization	Viscous Stabilization

## Geometry | Boundary conditions | Mesh

- **Homogeneous meshing** near the interface
- **Element Type** : CPS4, CPS3
- **Element Size**
  - Defect :  $x = 10 \text{ nm}$  ;  $y = 0,1 \text{ nm}$
  - $\text{SiO}_2$  layer :  $x = 100 \text{ nm}$  ;  $y = 40 \text{ nm}$
  - First 100 nm of Hardcoat  
 $x = 100 \text{ nm}$  ;  $y = 20 \text{ nm}$

$\text{SiO}_2$  200 nm

1. Context
2. Experimental study
3. Numerical modeling of the test
- 4. Numerical simulation results**
5. Conclusions and perspectives

- Video of simulated buckling

- Interface damage variable CSDMG

➤ Initiation Strain

Experimental : 3,8 % strain

Numerical : 3,9 % strain

➤ Buckle Height

Experimental : 6  $\mu\text{m}$

Numerical : 15  $\mu\text{m}$

➤ Buckle Width

Experimental : 51  $\mu\text{m}$

Numerical : 73  $\mu\text{m}$

1. Context
2. Experimental study
3. Numerical modelling of the test
4. Numerical simulation results
- 5. Conclusions and perspectives**

## ➤ Conclusions

- Model using static calculation with cohesive surface  
→ Buckling obtained with numerical model
- Good match of Initiation strain with experimental results
- Buckle dimensions to be improved upon

## ➤ Perspectives

- Parametric study
- Analysis of energy dissipated
