Abstract

Ayurveda is a holistic system of life which focuses the way of living along with treatment aspects. The antiquity of Ayurveda goes back to the Vedas and key points were taken from Darsanas too. The pramanas are the means to get the knowledge but Ayurveda implied the pramanas in a unique way as a examination tool (pareeksha) for diagnosis purpose in Atura and understanding of the individual in Swastha. Several types of pareeksha are available in Ayurvedic classics which include Dasavidha pareeksha, Astasthana pareeksha, Shadvidha pareeksha, Trividha pareeksha and the like. Of these, Dasavidha pareeksha is the most significant as it encompasses all other types of examinations. Many of the diagnostic methods mentioned in Ayurveda are not scientifically practised now a day. Some of the above mentioned examinations were given least importance in case taking and has now turned customary many aspects of examination are neglected. In the present study the prime intention was to formularize a standard separate proforma for diagnosis of diseases, based chiefly on the Dasavidha pareeksha to enable the students and practitioners to have a better procedure for diagnosis.

Key words: Pareeksha, Dasavidha pareeksha, special proforma

Introduction:

Disease is a reflection of abnormalities in the normal structural, physiological or psychological aspects of the body. Treatment is aimed in bringing back the normality. Before application of medication a well organised examination should be carried out, for an explicit diagnosis as also for designing proper line of treatment.

In the classical texts of Ayurveda, different methods of examinations adopted

Of these, Dasavidha pareeksha is the most significant as it encompasses all the other types of examinations. In

Dasavidha pareeksha except the Vikruthi pareeksha, the other nine are applicable to both Swastha and 'Athura', while Vikruthi pareeksha is done solely in a diseased.

The general procedure for case taking now followed in Ayurvedic Institutions is according to the modern pattern. These case sheets if examined would seem to be insufficient in expressing the classical sense. The case sheets usually consist of a part dealing with the history examinations, as prescribed by modern clinical texts, and another part, small as it Ayurvedic allotted for aspects, consisting of Ashtasthana pareeksha, Dasavidha pareeksha, Nidana Samprapthi, which is given least attention during case taking. Moreover, no specific criteria for assessment are being followed. In the little space provided against each variable like Mootra, Pureesha, Satwa etc, the students or physicians mark as NAD or Pravara, Madhyama, Avara and so on as a routine. For example, in the examination of the urine, one gets satisfied by asking a few mandatory questions like frequency, colour or presence of associated complaints like burning sensation to the patients and marks either NAD or normal.

It was hence found necessary to formulate separate examination sheets for assessment of Prakruthi, Sara, Satwa, etc, by collecting the required points from literature as well as practice. When this was done, each assessment proforma was elaborate. It is quite embarrassing to incorporate a bundle of assessment sheets for studying a person. Each and every examination is not necessary for each and every patient. They are to be logically selected according to the condition of the disease and the patient. In a child, the assessment of Sara, Satwa are meaningless as they are not fully developed. So also, in certain specific diseases specific examination methods related to the disease are sufficient. For example, in case of sudden injuries or simple conditions like Acne vulgaris, all the examinations are not

necessary for diagnosis. Hence it has become essential to design a new compendious proforma according to Ayurvedic system by considering various principles of diagnosis, so that a diagnostic procedure better than the existing one, could be adopted by students and practitioners in the field of Ayurveda.

Aims and objectives:

To design a special proforma incorporating all the *pareeksha* mentioned in the classics chiefly *Dasavidha pareeksha* Materials and methods:

STEPS TO DESIGN THE MASTER PROFORMA:

- 1. Master proforma is designed keeping in mind the two conditions ie. *prakrita* (healthy) qualities in part I and *vikrita* ie. *Vikruta* or abnormal qualities in part II
- 2. Part one consists of Dasavidha preeksha (except vikriti pareeksha) and prakruta qualities of Ashtasthana pareeksha. Part two consists of Vikruthi pareeksha. (dosha, dhatu, mala, vruddhi and kshaya lakshanas and srotas)and abnormal qualities of Ashtasthana pareeksha.
- 3. The order followed is physical, physiological and psychological attributes explained sequentially.
- 4. All the individual attributes described under separate *pareeksha* together with their variables are concised together. For example all variables described under heading "Body" in context of *Prakriti pareeksha*, *Sara pareeksha*, *Samhana* etc. are all considered into one unit.
- 5. Any repetition met during such process is eliminated.
- 6. Unpractical points are neglected for example, *alpa sukrata*, red colour of glans penis etc.
- 7. For this concised complete master proforma, key chart is designed

consisting of all the *Dasavidha* and *Ashtasthana pareeksha* bhavas. So by the single master proforma, all 10 fold factors and 8 fold factors to be examined are easily elicited.

A proforma is meant to collect the relevant details pertaining to the topic in a particular order. Thus it starts with collection of personal data as Name, Age, Sex, Address, Occupation etc. which helps one to identify and verify the subject. The detailed evaluation of the subject is obtained through various methods. The quite popular methods often met with are through a questionnaire having scores for its different choices, ticking the appropriate answer for the questions, writing the answers in the columns provided, etc. Some make use of a key chart which helps to reduce the evaluation by tallying the correct or appropriate answers. Here, as the details of each point given in the texts are many and some of them similar, answers have been tabulated in a keychart which helps easy assessment. Thus in this format the relevant details are obtained in a very clear manner. For better understanding of this, a detail purview of one of the factors is undertaken. Here, let us observe the factor 'Sara' .The descriptions related to sara as mentioned in the different classical text were collected and each quality was analysed. The excellence of dhatus as sara represent the state of each dhatu in which the sara of rasadhatu is described in twaksara and the rest to the corresponding name itself. The eighth sara sathwasara relates to the qualities of mind and behavioural patterns. By observing and analysing the sara of a patient, one can come to know about his state of health. The defects or deficiency of each quality in a sara depicts the decrease in the essence of that dhatu and he may be prone to the disease. For example, the physical factor, unctuous skin is in seen both in twak sara and rakta sara; mental quality as happiness twaksara. raktasara, mamsasara,

medosara and sukra sara and so on; And enthusiasm in raktasara, asthisara and satwasara. So as the repetitions are seen in the explanation of sara, it became necessary to arrange each quality and its presence in the saras listed for easy evaluation. Assessment was made much easier by charting the presence of each quality in the eight saras. In this proforma, each sara is described with its qualities and one can observe the presence of a typical quality in many saras as is evident from the latter part of the proforma. All the characters were taken as subheads and the saras were tallied and deduced for convenient evaluation.

The data thus obtained are referred with the key chart and each character is bifurcated at the level of key chart. For example, the happiness quality is seen in mental quality of twaksara, raktasara, mamsasara, medosara and sukrasara while collecting data it is recorded only once and in later state the same "happiness" quality is considered under all such corresponding saras for which happiness is a character such a twaksara, raktasara, mamsasara, medosara and sukrasara. The keychart of the proformas are designed in order to avoid mistake and repetitions are omitted taking care that nothing is being lost. This helps for an easy assessment as one has to just go through the chart during evaluation. By the same method all different characters under each subheadings of sara proforma are looked for and data collected. In the end whole data thus obtained are bifurcated under corresponding sara headings making use of key chart; which give idea about the different saras present.

There are total 63 attributes mentioned under *sara pareeksha*. The key consist of 9 types of *sara*, under which 63 attributes are distributed.

The name and the different *saras* and total number of attributes together with the variables are listed below.

i) Twak sara - 18

ii) Rakta sara - 22

iii) Mamsa sara	- 29
iv) Medo sara	- 23
v) Asthi sara	– 15
vi) Majja sara	– 19
vii) Sukra sara	-24
viii) Satwa sara	– 14
ix) Sarva sara	- 18

Here an attempt is made to furnish minimum essential formats by considering the generally described examination in the classical texts.

MASTER PROFORMA WITH KEYCHART, DESCRIPTION AND DISCUSSION.

CONCLUSION:

This type of construction was necessary and important because -

- 1) Set serves as the reference for the investigator.
- 2) Set is an easy method for understanding all the details related to particular point.
- 3) Set helps in avoiding the unnecessary repetition of the same point.
- 4) Set helps in different along one condition from another.
- 5) Set serves as the best way for assessing the patient within short time with less efforts and with fewer chance of commanding mistaken.
