# Disaster Relief: A Monitoring & Evaluation Framework for Kopan Monastery

Shiva-Nandan Arens - shiva-nandan.arens@umontana.edu - GEOSCIENCES, University of Montana

## 1. Introduction

On April 25, 2015 Nepal suffered a magnitude 7.8 earthquake. The epicenter was 82km northwest of capital city Kathmandu. The event has been followed by hundreds of aftershocks, including events of magnitude 7.3 and 6.3 on May 12, 2015.

Kopan Monastery stands on a low hill north of Kathmandu. It is affiliated with the Foundation for the Preservation of the Mahayana Tradition (FMPT). It accommodates ~400 monks and student monks, and provides lessons in Tibetan buddhism to visitors and tourists on weekends. As a focus point of immediate foreign relief aid, the monastery shifted its focus and sought to provide relief to nearby villagers following the earthquake.

Figure 2: The USGS classified the April 25 Nepal quake as "red alert" for shaking fatalities and economic losses (USGS 2015).

## 2. Methods

- We used USGS earthquake data to assess the extent and impact of the April 25, earthquake
- We looked at Kopan Monastery's response from their online resources
- We applied logical frameworks (LogFrame) and social networks approaches from Imas and Rist (2009) to Kopan Monastery's response as described on their website

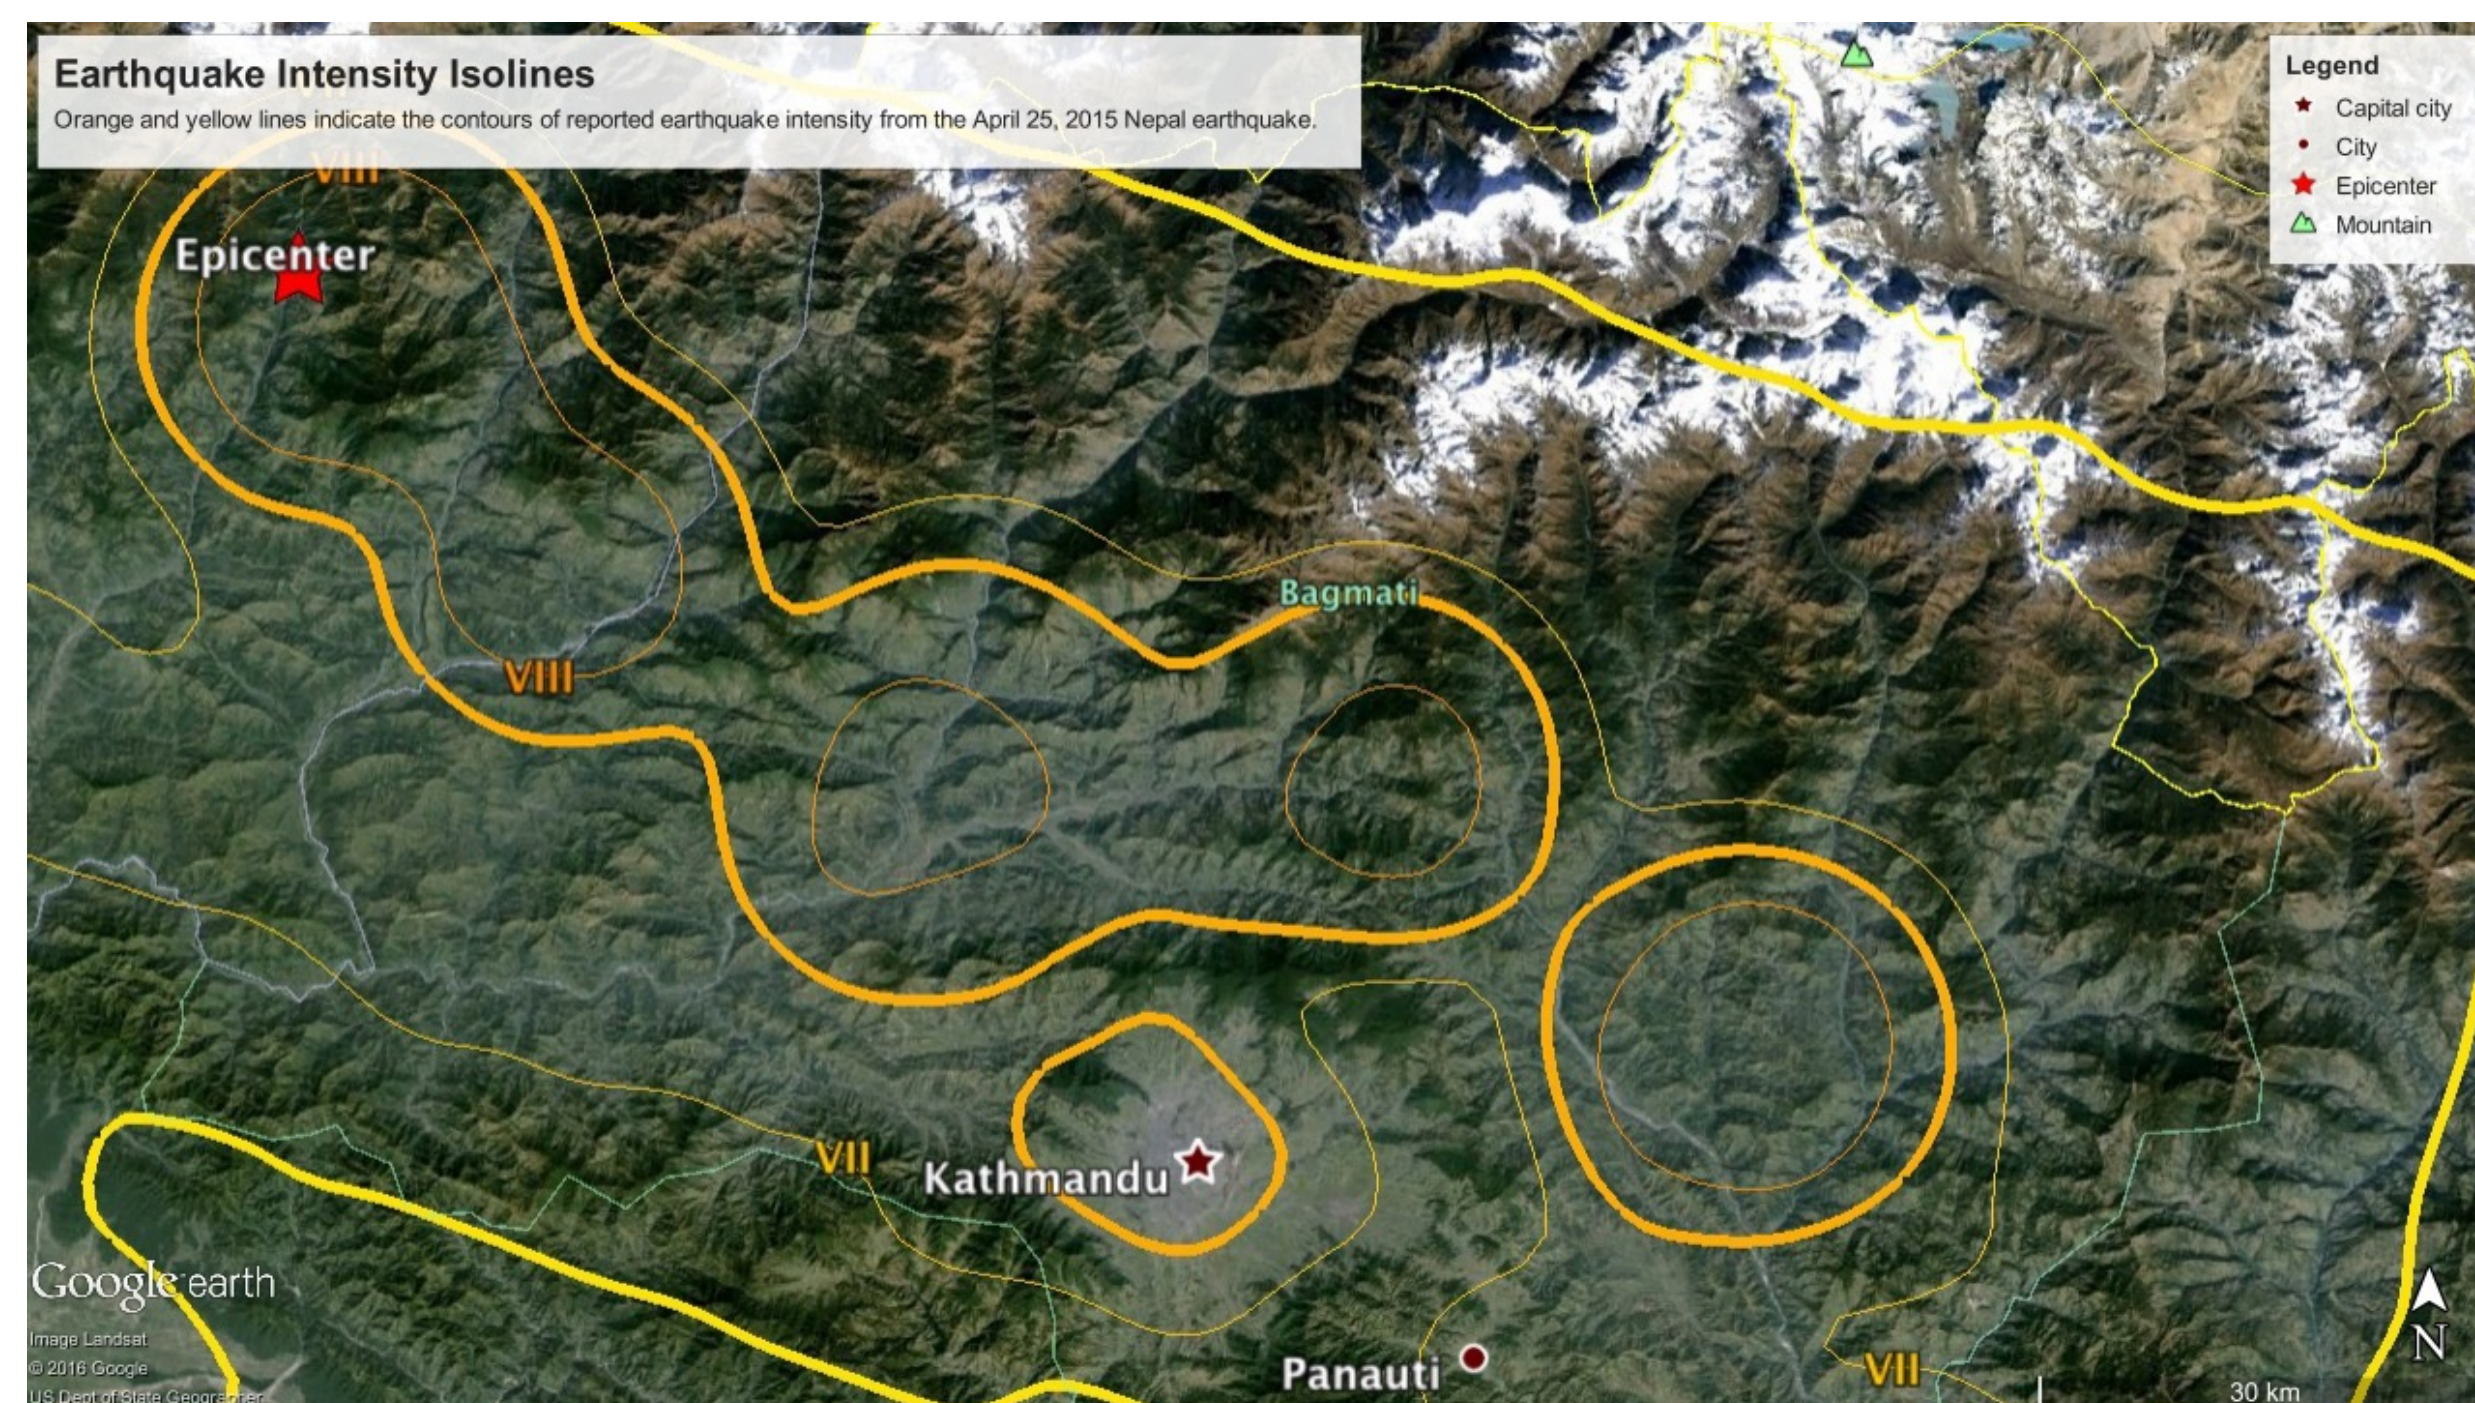

Figure 3: Earthquake shaking intensity contours based on the Modified Mercalli Intensity scale. Table on the left shows approximate Nepal population figures affected by shaking intensities from V Moderate to IX Violent (USGS 2015). Note the VII Very Strong contour around Kathmandu valley.

## Results

- Kopan Monastery fielded a vital earthquake response in the weeks following April 25, 2015. However, this response was not monitored.
- Monitoring and evaluating disaster response can help organizations respond more flexibly and efficiently.
- The monastery provided earthquake relief through existing social connections. A modified LogFrame with social networks analysis is likely the most helpful tool

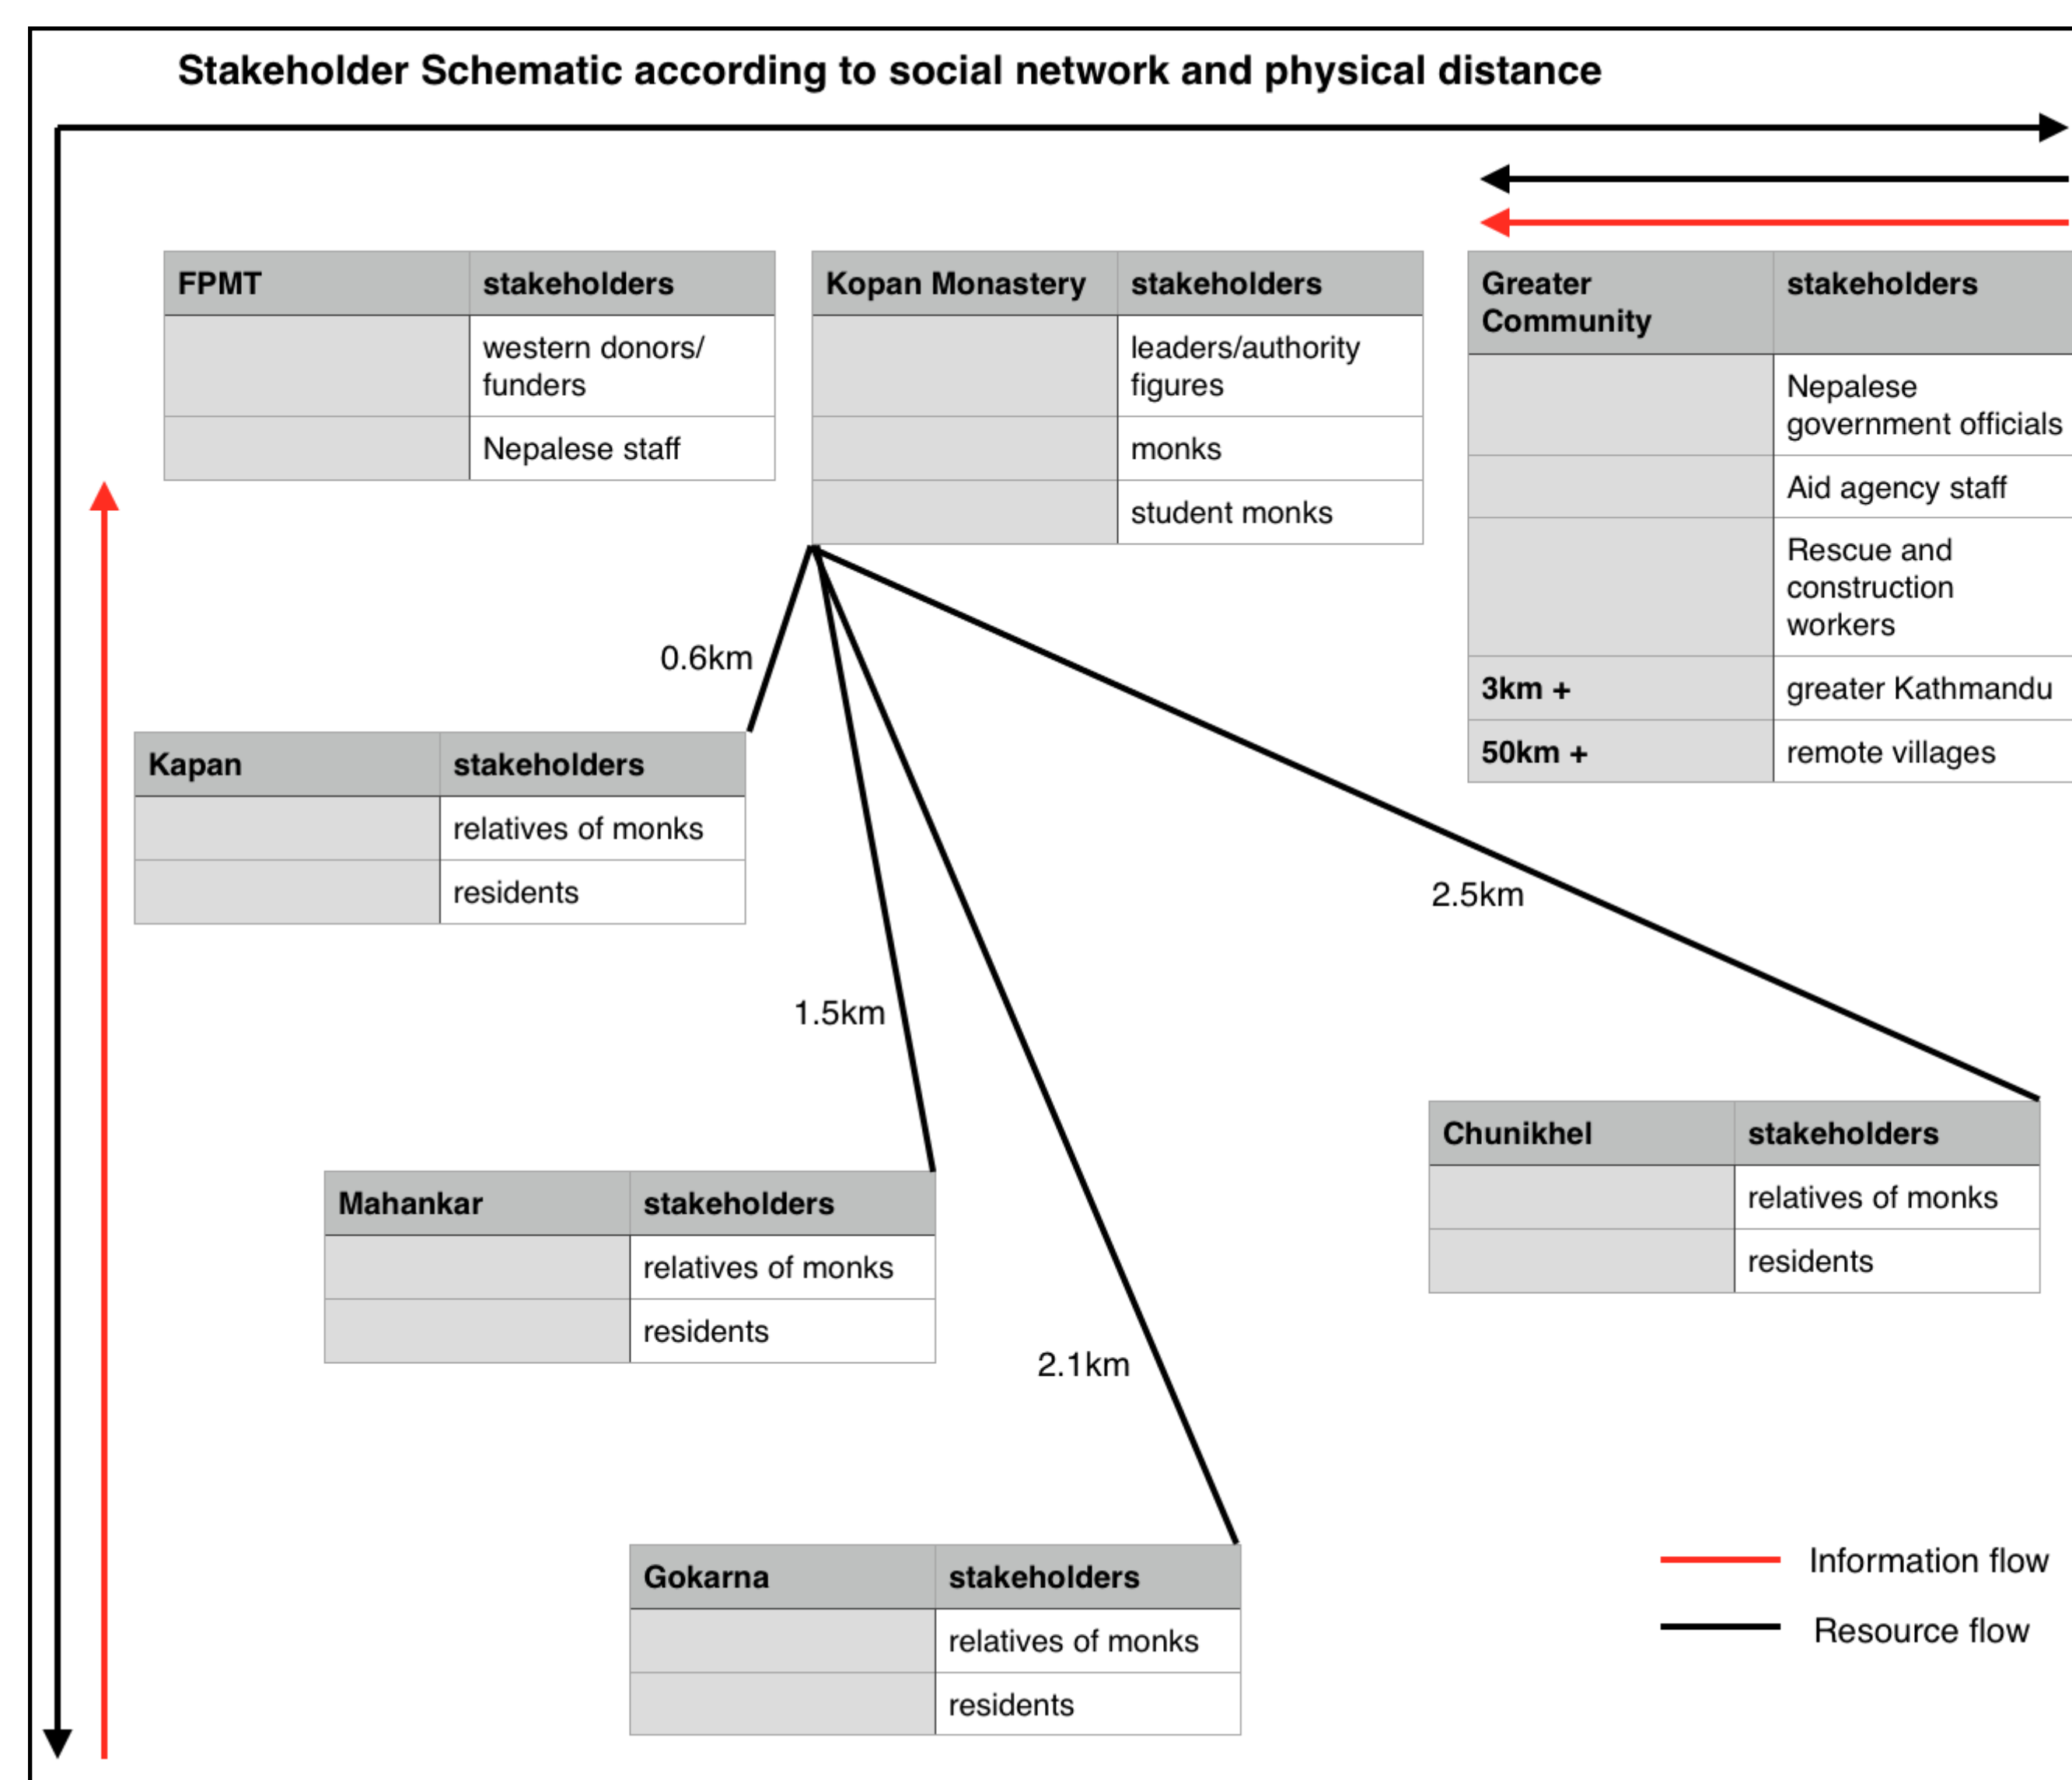

Figure 4: Social network plot of key stakeholders for Kopan Monastery's work following the earthquake.

| Activity  | Responsible party                                    | Event occurs | Week 1 | Week 2 | Week 3 | Week 4 | Week 5 | Week 6 | Week 7 | Week 8 |
|---|--|--------------|--------|--------|--------|--------|--------|--------|--------|--------|
| Accounting of funds and resources                 | Head monks   |              |        |        |        |        |        |        |        | Week 8 |
| Immediate funding outreach                        | FPMT western staff and members                       |              |        |        |        |        |        |        |        |        |
| Immediate protective measures                     | All monks  |              |        |        |        |        |        |        |        |        |
| Needed evacuations                                | All monks  |              |        |        |        |        |        |        |        |        |
| Damage assessment                                 | Physically fit/ technically trained monks, residents |              |        |        |        |        |        |        |        |        |
| Surrounding area damage assessment                | Physically fit/ technically trained monks, residents |              |        |        |        |        |        |        |        |        |
| Family relation outreach (damage snowball effect) | All monks  |              |        |        |        |        |        |        |        |        |
| Reporting system for aid disbursements            | Monastery accountant                                 |              |        |        |        |        |        |        |        |        |
| Reporting system for resource disbursements       | Monastery accountant                                 |              |        |        |        |        |        |        |        |        |
| Short report draft                                | Monastery accountant                                 |              |        |        |        |        |        |        |        |        |
| Sharing data with government                      | Head monks   |              |        |        |        |        |        |        |        |        |
| Sharing data with relief organizations            | Head monks   |              |        |        |        |        |        |        |        |        |
| Repeat  | All monks  |              |        |        |        |        |        |        |        |        |

Figure 5: Proposed 8-week timeline for ongoing monitoring efforts following a catastrophic event.

## Discussion

Smaller institutions like Kopan Monastery do not have explicit contingency plans for disaster relief. Consequently they do not have tools in place to monitor their response to catastrophic events. However, their local role in providing needed supplies and aid is important. A monitoring scheme based on an short-term timeline and the social networks of the monks is likely to provide an unobtrusive, simple, and speedy solution that can be applied to varied catastrophic events.

## Conclusions

- Kopan Monastery did not have a monitoring plan in place for disaster relief.
- The monastery is an important node of aid and relief, with connections to western donors, relative resource wealth, and a leadership role in its community.
- A monitoring scheme based on an 8-week timeline and the social connections of the monks is likely to provide for an unobtrusive, simple, and speedy solution.
- The monitoring process will allow the monastery to operate efficiently with local emergency management officials and other aid groups to maximize distribution of scarce resources.
