

DESIGN AND IMPLEMENTATION OF HUMAN CROWD DENSITY
ESTIMATION SYSTEM WITH ENERGY HARVESTING IN
WIRELESS SENSOR NETWORK PLATFORM

by

SOLAHUDDIN YUSUF BIN FADHLULLAH

Thesis submitted in fulfillment of
the requirements for the degree of
Doctor of Philosophy

May 2017

ACKNOWLEDGMENTS

Science is descriptive but not explanatory. Science explains mathematically the behaviour of nature, but it often does not explain why it is so. It is a wonder that the rules of our complex world can be expressed in mathematical terms. Nature seems to present itself in simple numerical ways.

I am purely devoted to the notion that religion and science are at harmony. God made the nature in a level that human minds can comprehend. And God answered the basis of the 'why' and 'what' questions through religion.

All praise to the One true God; the Most Gracious and Merciful. God, the Creator of all things seen and unseen, the Creator of the biggest of things; the 'Arsh, to the smallest of things; the quarks?, the Creator of life and death, and Most Supreme is His Knowledge and Power. It is by His Will that I have travelled this journey of knowledge enrichment. And I take this utmost opportunity to thank God.

Peace and blessings upon Prophet Muhammad, the Seal of the Prophets. Prophet Muhammad is a blessing to the entire world. He is a man sent for humans to follow towards the straight path. For if a prophet was sent as an Angel, woe to us for we will not be able to exemplify an essence that is not the same as ours. Such is the Wisdom of God, the All-Knower.

I thank my supervisor, Professor Dr. Widad Ismail and my co-supervisor, Associate Professor Dr. Ahmad Shukri Yahaya for their valuable guidance and advice. I thank my family for their relentless support, especially my dearest wife. My specific heartiest thanks to my parents for literally everything they have given me.

I thank my colleagues, USM and its staff for their assistance. And lastly I thank everyone that has prayed for my success, knowingly or not. May all of us find the light of our lives.

ABSTRAK	xx
ABSTRACT	xxii
CHAPTER ONE: INTRODUCTION	
1.1 Background	1
1.2 Problem Statement	3
1.3 Objectives	4
1.4 Research Contributions	5
1.5 Research Scopes	5
1.6 Thesis Layout	6
CHAPTER TWO: LITERATURE REVIEW	
2.1 The Radio Design Problem	7
2.2 Human Crowd Density Estimation	8
2.2.1 Non-Participatory Method: Accuracy and Feasibility	13
2.2.1 (a) Crowd Size-based Algorithm	15
2.2.1 (b) Path loss-based Algorithm	18
2.2.2 Wireless Coverage	20
2.2.3 Human Crowd Properties	22
2.3 Power Issue in Human Crowd Density Estimation System	25
2.3.1 Energy Harvesting	26

2.3.2	Energy Harvesting in Wireless Sensor Network	28
2.3.3	Issues in Developing the Energy Harvesting Mechanism	35
2.4	Summary	36

CHAPTER THREE: METHODOLOGY

3.1	Wireless Sensor Network Platform	40
3.2	Crowd Density Estimation	41
	3.2.1 (a) Algorithm and Estimation Accuracy	43
	3.2.1 (b) Density Classification	44
	3.2.1 (c) Path Loss Model	46
	3.2.2 Statistical Methods	47
	3.2.2 (a) One-way Analysis of Variance	47
	3.2.2 (b) Design of Experiments	50
	3.2.3 Wireless Range Extension	54
3.3	Energy Harvesting Mechanism	58
	3.3.1 System Architecture	58
	3.3.2 Solar cell	59
	3.3.3 Power Management Unit	61
	3.3.4 Maximum Power Point Tracking	67
	3.3.5 Storage Element	68
	3.3.6 Proposed H-CDE System	71
3.4	Summary	72

CHAPTER FOUR: IMPLEMENTATION AND EXPERIMENTATIONS OF THE PROPOSED SYSTEM

4.1	Part A: Implementation of Human Crowd Density Estimation System	75
	4.1.1 Wireless Sensor Network Implementation	76
	4.1.2 The Coordinator	80

4.1.3	The End Nodes	85
4.2	Statistical Methods	87
4.2.1	Implementation of One-way Analysis of Variance	87
4.2.2	Implementation of Design of Experiments	88
4.3	Part B: Implementation of Energy Harvesting Mechanism	89
4.3.1	End Node Power Management Unit	90
4.3.2	Energy Harvesting Design Optimizations	95
4.4	Part C: Experimentation	101
4.4.1	Calibration	101
4.4.2	Stability and Specification Adherence	105
4.4.2 (a)	Latency	105
4.4.2 (b)	Throughput	110
4.4.2 (c)	Self-healing	111
4.4.2 (d)	Antenna Radiation Pattern	113
4.4.2 (e)	Outdoor Range Test	114
4.4.2 (f)	The Effect of Voltage on RF Transmission	116
4.4.2 (g)	Current and Power Consumption	118
4.4.2 (h)	Crowd Density Estimation Accuracy	119
4.4.3	Energy Harvesting Performance	121
4.4.3 (a)	Effect of Solar Cell Alignment	121
4.4.3 (b)	Maximum Power Point Tracker	123
4.4.3 (c)	Energy Harvesting Mechanism Functionality Test	125
4.4.3 (d)	Energy Harvesting Performance in Range Test	126
4.4.3 (e)	Battery Performance	127
4.4.3 (f)	Over- and Under-voltage Protection	128
4.4.3 (g)	Power Efficiency	129
4.4.3 (h)	Energy Harvesting Performance in Actual Deployment	130
4.5	Summary	130

CHAPTER FIVE: RESULTS AND DISCUSSIONS

5.1	Wireless Sensor Network-Radio Frequency Performance Evaluation	132
5.1.1	Calibration	132
5.1.2	Stability and Functionality	136
5.1.2 (a)	Latency	136
5.1.2 (b)	Throughput	144
5.1.2 (c)	Network Self-healing	146
5.1.2 (d)	Antenna Radiation Pattern	148
5.1.2 (e)	Range Test	152
5.1.2 (f)	The Effect of Voltage on RF Transmission	155
5.1.2 (g)	Current and Power Consumption	157
5.2	Human Crowd Density Estimation Evaluation	158
5.2.1	One-way Analysis of Variance	159
5.2.1 (a)	Main Findings	159
5.2.1 (b)	Residuals	161
5.2.2	Design of Experiment	161
5.2.2 (a)	Analysis of the <i>P</i> -values	162
5.2.2 (b)	Main Factor Influencing Signal Attenuation	164
5.2.2 (c)	Interaction factors influencing signal attenuation	165
5.2.2 (d)	Residuals	167
5.2.3	Crowd Density Estimation Classification	168
5.3	Energy Harvesting Performance Evaluation	177
5.3.1	Effect of Solar Cell Alignment	177
5.3.2	Maximum Power Point Tracker	179
5.3.3	Energy Harvesting Performance of the Tags	180
5.3.4	Energy Harvesting Performance in Range Test	183
5.3.5	Battery Performance	185
5.3.6	Over- and Under-voltage Protection	187

5.3.7	Power Efficiency	189
5.3.8	Energy Harvesting Performance in Crowds	190
5.3.8 (a)	Battery Charging	190
5.3.8 (b)	Voltage and Current of H-CDE End Nodes	192
5.3.8 (c)	Power Output	194
5.4	Comparison of the Proposed H-CDE System with the Previous Approaches	195
5.5	Chapter Summary	197

CHAPTER SIX: CONCLUSION

6.1	Conclusion	200
6.2	Suggestions for Future Work	201

**REKA BENTUK DAN IMPLEMENTASI SISTEM PENGANGGARAN
KEPADATAN MANUSIA DENGAN PENUAIAN TENAGA DALAM PLATFORM
RANGKAIAN PENGESAN TANPA WAYAR**

ABSTRAK

Kepadatan yang tinggi dalam khalayak ramai boleh menjadi berbahaya kerana wujudnya potensi untuk pergerakan sekumpulan manusia secara tiba-tiba yang menyebabkan rempuhan dalam kes kecemasan. Untuk mengurangkan kecederaan mahupun kehilangan nyawa dalam kemalangan yang berkaitan dengan isu kepadatan manusia, sistem pengawasan kepadatan manusia berdasarkan frekuensi radio telah dibangunkan sebagai satu alat keselamatan. Sistem yang didapati pada masa kini mempunyai keupayaan pengawasan yang terhad; saiz pengawasan khalayak yang rendah, jarak pengesanan yang rendah, keperluan bilangan alat komunikasi yang tinggi dan jangka hayat operasi yang terhad. Faktor-faktor ini memberi kesan secara langsung kepada unsur praktikal dan ketepatan sistem penganggaran kepadatan manusia tersebut. Untuk mengurangkan kelemahan keupayaan pengawasan, satu sistem untuk mengesan kepadatan khalayak diusulkan berdasarkan kepada teknologi ZigBee dan rangkaian pengesan tanpa wayar yang meningkatkan jarak pengesanan khalayak kepada 30 m dengan hanya satu nod diperlukan setiap 37.5 m^2 . Hal ini dicapai tanpa mengurangkan bilangan khalayak (50 orang) yang boleh dikesan oleh sistem. Untuk menambahbaik ketepatan anggaran, kesan khalayak terhadap isyarat diselidik menggunakan kaedah statistik 'One-way Analysis of Variance' dan 'Design of Experiments'. Hasil dapatan mengesahkan saiz khalayak memberi kesan yang paling besar terhadap kelemahan isyarat. Untuk interaksi di antara sifat-sifat khalayak, didapati saiz khalayak bersama bilangan alat penerima dan bentuk khalayak bersama bilangan alat penerima memberi kesan signifikan terhadap kekuatan isyarat. Faktor-faktor ini kemudian dimasukkan ke dalam algoritma H-CDE yang diusulkan. Algoritma pengesanan khayalak ini dan pengelasannya menunjukkan purata sebanyak 71.2 peratus ketepatan dalam mengenalpasti tahap kepadatan khalayak yang juga

dapatan terbaik berbanding algoritma lain. Untuk mengatasi masalah kuasa yang terhad, mekanisma tuaian tenaga solar diperkenalkan ke dalam sistem H-CDE untuk memanjangkan jangka hayat operasi pengawasan. Kajian menunjukkan mekanisma tuaian tenaga ini mampu untuk memanjangkan operasi sistem pengawasan secara berterusan jika sistem ini mendapat paling kurang 5 hingga 6 jam pendedahan kepada sinaran matahari setiap 33 jam kitaran. Sumbangan kajian ini ialah pada penambahbaikan sistem berdasarkan teknologi frekuensi radio untuk mengesan kepadatan khalayak, penambahbaikan pada ketepatan penganggaran kepadatan khalayak yang didokongi oleh analisis statistik dan lanjutan operasi sistem melalui mekanisma tuaian tenaga.

**DESIGN AND IMPLEMENTATION OF HUMAN CROWD DENSITY
ESTIMATION SYSTEM WITH ENERGY HARVESTING IN WIRELESS SENSOR
NETWORK PLATFORM**

ABSTRACT

A crowd with high density can be dangerous due to the potential of a sudden surge of large moving bodies causing stampede in cases of emergencies. To mitigate casualties in crowd-related disaster, radio frequency-based crowd density estimation and monitoring system is being developed as a safety tool. Current systems have limited monitoring capabilities; low size of crowd monitored, low detection range, high number of transceivers required and finite operational lifetime. These factors directly influence the practicality and prediction accuracy of the system. To mitigate the limited sensing capability, a human crowd density estimation (H-CDE) system based on ZigBee and wireless sensor network technology is proposed that increases the crowd detection range to 30 m with only one transmission node required every 37.5 m². This is achieved without sacrificing the amount of crowd detectable by the system (50 people). To improve the estimation accuracy, the effect of crowd on signal propagation is investigated using One-way Analysis of Variance and Design of Experiments statistical methods. The results verified that the crowd size significantly affects the signal attenuation. In the interactions between the crowd properties, crowd size * number of receiver and crowd pattern * number of receiver were found to significantly affect signal propagation. These factors are then integrated into the proposed H-CDE algorithm. The H-CDE algorithm and its crowd classification yielded an average of 71.2 % accuracy in identifying the level of crowd density, which is the best compared to other algorithms found in the literature. To solve the finite power problem, a solar energy harvesting mechanism is introduced into the H-CDE system to extend the operation of the monitoring system. It is demonstrated that the proposed energy harvesting mechanism could operate perpetually, given that the system is exposed to good sunlight at least for 5 to 6 hours

in every 33-hour cycle. The contribution of the research is on the improved RF-based crowd density detection system, improved crowd estimation accuracy which is backed by statistical analysis and extension of its operations through the energy harvesting mechanism.

CHAPTER ONE

INTRODUCTION

1.1 Background

Human crowd density estimation (H-CDE) is used to predict the magnitude of human concentration in an area. Understanding about the crowd itself is known as crowd science, whereas the estimation effort is an engineering problem and agenda. A highly crowded area has great potential for injuries and accidents. Thus, H-CDE is important to manage human safety and reduce crowd-related disasters.

Conventional H-CDE systems are based on visuals captured from CCTV. The problem with CCTV is that it is resource extensive in terms of labour and financial cost. On the other hand, radio frequency (RF)-based crowd monitoring system could complement the existing system by offering automated and flexible operation.

Crowd density estimation using RF is less developed compared to visual-based systems due to problems related to the unpredictable wireless medium. The wireless medium is susceptible to white noise; random signals where all possible frequencies are present in the atmosphere, which may qualitatively and quantitatively affect a transmission. The behavior of wireless propagation in the shape of reflection, diffraction and scattering, in addition to absorption and multipath, has also created significant problems and challenges to overcome.

Improved techniques have been developed that shows that the RF-based crowd estimation is feasible. The works of Morrison, Bell and Chalmers (2009), Mowafi, Zmily, Abou-Tair and Abu-Saymeh (2013), Yuan, Zhao, Qiu and Xi (2013), Weppner and Lukowicz (2013), Xu et al. (2013), Weppner, Lukowicz, Blanke and Troster (2014), Xi et al. (2014), Yuan (2014), Haochao et al. (2015) and Hiroi, Shinoda and Kawaguchi (2016) on H-CDE is examined. Furthermore, as the H-CDE system requires wireless sensing, the Wireless Sensor Network (WSN) platform is normally adopted as the foundation of the
