## Supplementary Information

**S1:** The Heatmap was created with R (BioconductR) to show the significant differently expressed genes between CBX2.1 treatments and to visualize the similarity between treatments. The color key is given as a Row Z-score (centered and normalized expression as  $\times$  standard deviations from the mean). si: cells treated with siRNA against CBX2.1; Scr: cells treated with scrambled siRNA (siRNA control); Over: cells transfected with CBX2.1; EV: cells transfected with an empty vector (overexpression control). A through C are the triplicate repetitions.

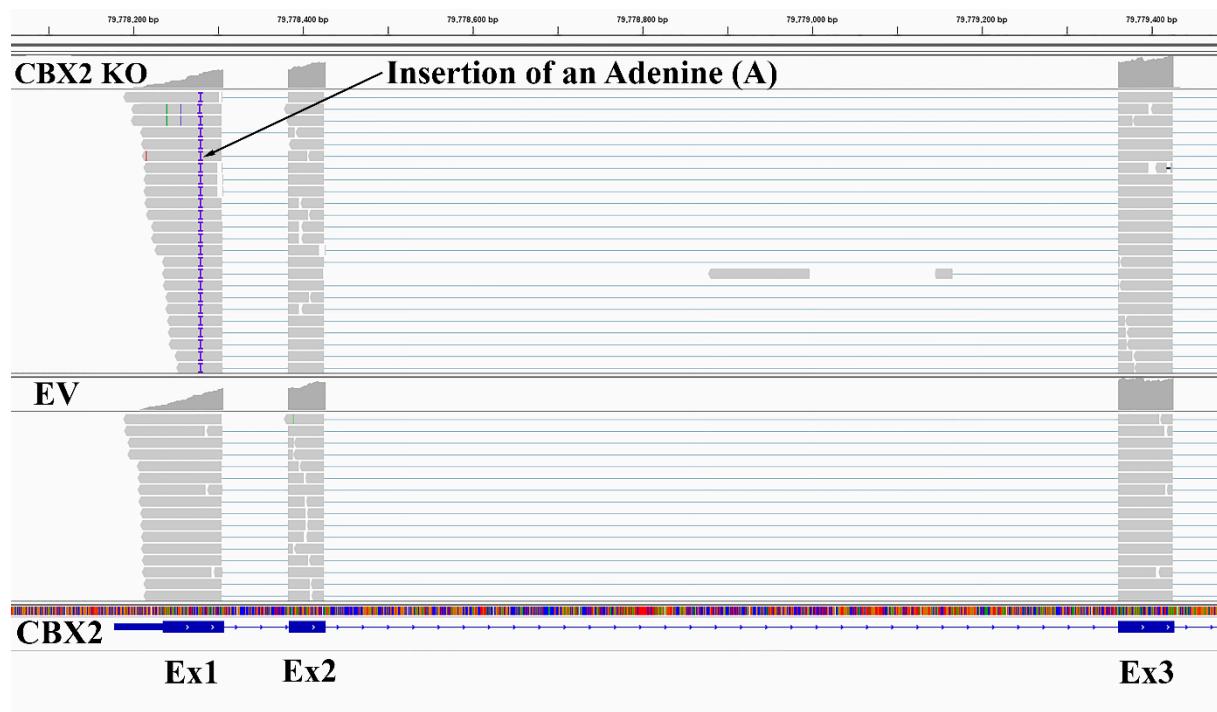

**S2: A.** Confirmation western blot for absence of CBX2.1 expression in CBX2 CRISPR/Cas9 NT2-D1 cells with all the appropriate controls (CBX2.1 overexpression, siRNA against CBX2.1 and EV CRISPR/Cas9).  
**B.** Immunofluorescence of NT2-D1 cells transfected with CRISPR/Cas9 against CBX2 and cells transfected with EV CRISPR/Cas9.

**S3:** Analysis of the RNA-Seq data with the help of the IGV viewer.

CRISPR/Cas9 treatment of NT2-D1 cells led to the insertion of an Adenine (c.44insA), which led to a frameshift mutation and a premature stop codon (p.Glu15Glufs25Ter), which is not present in the EV.

**S4:** Supplemental table for Fig. 3 “Venn diagram comparing gene regulation”.

<b>A. Genes common between CBX2.1 knockdown and CBX2.1 overexpression</b>
