PERAKUAN KERJA KERTAS PROJEK
(Certification of Project Paper)

Saya, yang bertandatangan, memperakukan bahawa
(I, the undersigned, certify that)

SARAH NAZUHA BT. MOHAMAD NASIR

calon untuk Ijazah Master of Science (IKBS)
(candidate for the degree of)

telah mengemukakan kertas projek yang bertajuk
(has presented his/her project paper of the following title)

NUERAL NETWORK IN BIOMETRICS : A SURVEY IN FINGERPRINT CLASSIFICATION

seperti yang tercatat di muka surat tajuk dan kulit kertas projek
(as it appears on the title page and front cover of project paper)

bahawa kertas projek tersebut boleh diterima dari segi bentuk serta kandungan dan meliputi bidang ilmu dengan memuaskan.
(that the project paper acceptable in form and content and that a satisfactory knowledge of the field is covered by the project paper).

Nama Penyelia : Cik Noraziah Che Pa
(Name of Supervisor)

Tandatangan :

PERMISSION TO USE

In presenting this thesis in partial fulfillment of the requirements for a post graduate degree from Universiti Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this thesis in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor (s) or, in their absence, by the Dean of the Graduate School. It is understood that any copying or publication, or use of this thesis or parts thereof for financial gain shall not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my thesis.

Requests for permission to copy or to make other use of material in this thesis in whole or in part should be addressed to:

Dean of Graduate School

Pengkelasan cap jari telah menjadi satu tajuk kajian yang terkenal kerana kesesuaiannya untuk tujuan pengesahan dan pengecaman. Terdapat beberapa pendekatan yang digunakan di dalam system pengkelasan cap jari iaitu berstruktur, bentuk susunan kata, statistic dan rangkaian neural. Tujuan pengkelasan cap jari adalah untuk mengkategorikan satu cap jari ke dalam kategori tertentu berdasarkan kepada konfigurasi bentuk keseluruhannya. Analisis perbandingan di antara pendekatan rangkaian neural dan bukan rangkaian neural telah menunjukkan kelebihan-kelebihan menggunakan rangkaian neural di dalam pengkelasan cap jari. Keputusan menunjukkan bahawa kombinasi rangkaian neural dan pendekatan pembelajaran mesin mengatasi penggunaan pendekatan rangkaian neural semata-mata dalam konteks ketepatan pengkelasan. Oleh itu kombinasi rangkaian neural dan pendekatan pembelajaran mesin adalah dicadangkan. Kelebihan-kelebihan yang jelas telah ditunjukkan oleh pembelajaran berpandu dan tidak berpandu dalam rangkaian neural untuk tujuan pengkelasan cap jari. Model rangkaian neural yang digabungkan dengan pembelajaran mesin (SOM-LVQ dan MLP) telah dicadangkan di akhir kajian. SOM-LVQ digunakan untuk pra-pengkelasan dan pengkelas MLP digunakan untuk pengkelasan.

ABSTRACT

(English)

Fingerprint classification has become a popular research topic due to its applicability in authentication and identification. There are several approaches in fingerprint classification systems which are structural, syntactic, statistical and neural networks. The purpose of fingerprint classification is to categorize a fingerprint into certain category based on its global pattern configuration. The analysis of comparisons between neural-network and non-neural network approaches have pointed out the advantages of using neural network in fingerprint classification. The results show that the combination of neural networks with other machine learning approach outperforms the neural networks based alone in terms of classification accuracy. Therefore a combination of neural networks and machine learning approach is suggested in this paper. The clear advantages of supervised and unsupervised learning in neural networks methods support the objective of this study that to suggest the neural network approach for fingerprint classification. A model of neural network combined with machine learning approach (SOM-LVQ and MLP) is proposed at the end of this study. SOM-LVQ is used for pre-classification and MLP classifier is used for classification.

ACKNOWLEDGEMENTS

The author would like to thank the entire people who are involved in this study. First and foremost to my supervisor, Cik Noraziah Che Pa, thank you for guiding me throughout the study also for your valuable assistance for me to complete this study.

A special thanks to my friends Nor Fadilah Tahar, Rafikha Aliana A Raof and Chuah Minh Hooi. Thank you for all you supports.

My deepest appreciation goes to my beloved family who has been very supportive, patient and understanding all the time.

Chapter 1

Introduction

1.1 Overview of the study

The study of neural networks is an extremely interdisciplinary field, both in its development and its application (Fausett, 1994). There are various points of view as to the nature of neural networks. This paper will describe the area in which neural networks are being applied, the biometrics applications. The breadth of neural network applicability will be discovered in the survey on fingerprint classification. By doing the comparison between non-neural network and neural networks approach, this study will contribute to the use of neural network in fingerprint classification.

An artificial neural network is an information processing system that has certain performance characteristics in common with biological neural networks (Fausett, 1994). According to Fausett (1994), artificial neural networks have been developed as generalizations of mathematical models of human cognition or neural biology.

The characteristics of neural networks make them a useful tool in processing reliable recognition or identification of complex patterns (Gallinari, 1998). Neural information processing has proven to be a very useful and robust technique in such pattern recognition tasks.

Pattern recognition can be defined as a process that leads to a decision. The quality of this decision can only be measured by statistics relating the number of good and bad classifications (Davallo & Naim, 1991).
