PERMISSION TO USE

In presenting this thesis in partial fulfillment of the requirement for a postgraduate degree from Universiti Utara Malaysia, I hereby agree that Universiti Library may make it unreservedly available for inspection. I further agree that permission for copying of this thesis in any manner, in whole or in part, for studious purposes may be granted by my supervisor, in their absence, the Dean of the Faculty of Information Technology Dean of Graduate Studies. It is understood that any copying or publication or use of this thesis or parts thereof for any financial gain shall not be allowed without my written consent. It is also understood that due recognition shall be given to my and to Universiti Utara Malaysia for any scholarly use which may be made of any material from this work.

Requests for the grant of permission to copy or to make other use of material in this thesis, in whole or in part, should be addressed to:

**Dean Faculty of Information Technology
Universiti Utara Malaysia
06010 Sintok
Kedah Darul Aman, Malaysia**

ABSTRACT

Dramatic advancements in micro-electro-mechanical and wireless communication technology have heightened the usage of sensor networks. Much interest has been seen towards Sensor Network (SN) routing protocol research; however, lack of research tools preventing more people to endeavor into the routing protocol research. This thesis is an infinitesimal effort to fill this research gap by proposing a framework to analyze the performance of the SN routing protocols. Using content analysis approach to quantitative research and all-embracing study of power aware routing protocols especially LEACH, SPIN, and PEGASIS, several simulation requirement models from both hardware and software perspectives have been studied. These simplified models are further classified into several submodels and simulation classes which can be implemented on widely acclaimed discrete event-driven simulation environment, the ns-2. We believe that our proposed framework for sensor networks routing protocols' appraisal-oriented studies, by all means, provides a preordained research platform to novice researchers to start-off their research endeavor.

ACKNOWLEDGEMENTS

I'm meekly grateful to **ALLAH ALMIGHTY** for all compassion and blessing during the whole tenure of my study. I also would like to express my utmost appreciation to Dr. Suhaidi Hassan for devoting his valuable time while supervising me in this assignment. His guidance and resourceful ideas have been enormous help throughout the process this work. Dr. Suhaidi has peculiar way of simplifying complex subjects and has translated much of my youthful enthusiasm towards the assignment into a matured and professional perspective. He is not only a profound thinker and admirable academic, but also helpful friend as well. His unique style of encouragement fueled me to start-off my research. I do believe that without his kind guidance, I'd have tracked a number of cul-de-sac streets.

I'm highly indebted to Dr. Wendi Heinzelman, Mr. Ahmad Sobeih, and Mr. Dr. Kavin Fall (United States), and Dr. Gulmakkhan Singh (Ludhiana, India) for unconditional support and answering me whenever queried. I'm greatly thankful to Ms. Ng Phei Yong for her consistent support, love, and appreciation during my studies.

I would like to own the favor to thank my beloved parents and other family members for backing me up especially Mr. Zia Ullah Hashmi for all his support, encouragement, and provision.

Finally a very special thanks also go to all concerns those directly or indirectly support me here in MALAYSIA.

Chapter 1

Introduction

Sensor Networks (SNs) are becoming smart choice of small and large organizations alike; Micro-electromechanical-systems (MEMS) based sensor technology has impudence to perform variety of functions. Cost effective, and easy to maintain sensor technology is being deployed largely in variety of milieus such as in the fields (e.g. vehicle, personals and wild life tracking), the workshop floors (e.g. motors, robotic devices, computer integrated manufacturing (CIM)), and other uncountable environments.

Since SNs are becoming popular from management and economic point of view, their use is subject to some certain constraints such as limited computing strength, less storage and battery capacity, scalability, connectivity, task dynamics and details, reachability, and device failure and other challenges.

One of the main challenges faced by the sprouting technology of SNs is power compactness and consumption. The energy efficiency of the SNs is further constrained by several other things e.g. node's distance from the base station, storage capacity of the base station, and the most importantly efficiency of routing protocols in transferring data packets from a sensor node the base station in question.

The main functionality of the routing protocols is to transfer data from one sensory node to another and to the BS in efficient and stout manners. Recently, there has
