## **PERMISSION TO USE**

In presenting this project in partial fulfilment of the requirements for a postgraduate degree from Universiti Utara Malaysia, I agree that the University Library may make it freely available for inspection. I further agree that permission for copying of this project in any manner, in whole or in part, for scholarly purposes may be granted by my supervisor, in her absence, by the Dean of the Faculty of Information Technology. It is understood that any copying or publication or use of this project or parts thereof for financial gain should not be allowed without my written permission. It is also understood that due recognition shall be given to me and to Universiti Utara Malaysia for any scholarly use which may be made of any material from my project.

Request for permission to copy or to make use of material in this project, in whole or in part should be addressed to:

**Dean of the Faculty of Information Technology**

**Universiti Utara Malaysia**

**06010 UUM Sintok**

**Kedah Darul Aman**

## ABSTRAK

Kajian ini berkaitan dengan pembangunan model ramalan rangkaian neural untuk syarikat yang ingin membuat ramalan tahap syarikat sama ada akan menghadapi kebangkrupan. yang Dalam pada itu, Jumlah 367 data set adalah diperolehi daripada *Kuala Lumpur Stock Exchange (KLSE)* and Bank Negara Malaysia. Data ini seterusnya dianalisis dengan menggunakan asas statistic, *frequency* dan *cross tabulation* untuk mendapatkan lebih banyak maklumat berkaitan data. Pada peringkat awal, data adalah diklasifikan dengan menggunakan *logistic regression*. Seterusnya ianya ditrain dengan rangkaian neural untuk mendapatkan model kebangkrupan. Dimana, capaian menunjukkan adalah lebih sesuai dengan model yang mengandungi 12 nod *input*, 6 nod *hidden layer* dan 1 nod untuk *output*. Model yang dipilih menunjukkan generalisasi 100%. Metodologi ini sepatutnya memperolehi pendekatan baru kepada paten yang wujud dalam data ini. Oleh itu, rangkaian neural amat berpotensi untuk menyokong ramalan kebangkrupan ini.

## **ABSTRACT**

This study involves the development of neural network prediction model to predict the stage of bankruptcy of a company. A total of 367 data was attained from the Registrar of Business and Companies, Kuala Lumpur Stock Exchange (KLSE) and Bank Negara Malaysia (Central Bank of Malaysia). The data was then analyzed by considering the basic statistics, frequency and cross tabulation in order to get more information about the data. Initially, the data was classified using logistic regression. In addition, it was also trained using neural network in order to obtain the bankruptcy model. The findings show that the most suitable prediction model consist of 12 nodes of input , hidden layer 6 node and one output layer. The generalization performance of the selected model is 100%. This methodology should be able to provide some new insight into the type of pattern that exists in the data. Thus, neural network has a great potential in supporting for predicting bankruptcy.

## **ACKNOWLEDGEMENT**

Sincere thanks are due to my both supervisors, Associate Professor Fadzilah Siraj and Puan Nur Azzah Binti Abu Bakar for their patiently navigating and generously sharing their rich source and knowledge with me.

Evenly thanks to my course mate that zealously advice me and helping me all over this project.

Further gratitude must go to my beloved family members who have supporting and encourage me during completing this project.

Last and not least, I would like to express my deep appreciation to all who are helped me to completed this project whether in direct or indirect way.

Thanks

# **CHAPTER 1**

## **INTRODUCTION**

This study focuses on using data mining approach for analysis of bankruptcy. The aim of the study is to alert and give the warning signs in earlier stage to the company's that facing financial problem and almost to bankruptcy.

### **1.0 Background**

Bankruptcy refers to the firms which are unable to pay debts and are either declared bankrupt in terms of Commercial Code (1857, Part 111, Title 1) or dissolved and wound under the Companies Act 1995 (Section 35(c) and Section 214 subsection 2 paragraph (a)(ii)). Bankruptcy is a proceeding in which a court administers the estate (i.e. the property and other assets) of the debtor for the benefit of the creditors. A debtor (i.e. a person or business who owes money to others) may choose to file a bankruptcy proceeding to resolve a hopeless financial situation, or to stave off the collection of debts for a period of time to allow for financial re-organization.

Recently, the number of companies declared as bankrupt due to the recession has increased. Therefore, the development of the bankruptcy prediction model has been considered as important, as bankruptcy prediction can have major impact on lending
