ATLAS OF FISHES OF THE UPPER TOMBIGBEE RIVER DRAINAGE, ALABAMA-MISSISSIPPI

Herbert Boschung

Department of Biology
The University of Alabama
Tuscaloosa, Alabama 35487-0344

ABSTRACT: The original upper Tombigbee River proper was destroyed to accommodate the Tennessee-Tombigbee Waterway (TTW). What was once a relatively shallow, meandering, gravel-bottomed river is now a series of pools connected by canals and channels. Presently, 116 species of fishes are definitely known to occur in the upper Tombigbee drainage and 13 others are of unusual or questionable occurrence. Lists of fishes from 352 described sites are included. Species accounts contain comments on habitats and the author's opinions of the impact of the TTW on most species. Those species most adversely affected by the TTW depend on large, free-flowing rivers. A dot distribution map is provided for each of the 116 species. A brief section on stream capture lists the species captured by the Tennessee River drainage immediately following completion of the TTW and the potential immigrants from Tennessee.

INTRODUCTION

The upper Tombigbee River was the last of the major river systems of the Mobile basin to lose its integrity of wildness and free flow. From Demopolis, Alabama, to its headwaters, the main channel of the Tombigbee River has been severely altered by a series of dams, channelization, and canalization. What was once a free flowing, meandering stream is now a series of pools, severed bendways, channels, and canals. The river was, for the most part, broad and shallow. During low water, numerous gravel bars and islands were exposed. The main channel supported a large assortment of fishes, many of them now rare, such as the shovelnose sturgeon, the Alabama shad, the speckled chub, the frecklebelly madtom, and the crystal darter. Upper Tombigbee fishes that depend on large, free-flowing streams with substrates of clean sand and gravel are destined for extirpation. Their only hope for survival is to find refuge in the main channels of large tributaries. Squeezed into less than ideal habitat, or denied of habitat, the fishes must remain offended by our transgressions.

The foremost purpose of this Atlas is to document the distribution of the 116 species of fishes known to occur in tributaries of the upper Tombigbee River system and the river proper when it flowed freely. The Atlas also includes post-impoundment records in the Tennessee-Tombigbee Waterway (TTW), as well as speculation on the effects of the waterway on the fishes. This documentation will serve as baseline data for a meaningful comparison of the upper Tombigbee fish fauna of the future.

Acknowledgments

Dale Caldwell (1969), University of Alabama, made the first comprehensive survey of the fishes of the entire upper Tombigbee drainage system in anticipation of the Tennessee-Tombigbee Waterway. Dale's unpublished records are included herein. Free use was made of the unpublished dissertation of James Padgett Kelley, Jr. (1975), Mississippi State University, who made numerous collections in lower Luxapallila River in Mississippi and Alabama. The Noxubee River system was thoroughly surveyed by Walter Hubbard (1987), Mississippi Game and Fish Commission. Walter's records are exceptionally valuable for the Noxubee system was heretofore a little-known area. C. A. Schultz's (1969) study added many additional records of the walleye, as well as other species, especially those from the large streams. Glenn Clemmer, during his tenure at MSU, made invaluable contributions to our knowledge of upper Tombigbee fishes. Malcolm Pierson and C. A. Schultz made numerous collections, especially in Buttahatchee River and Bull Mountain Creek (Pierson and Schultz, 1984; Pierson et al., 1986). Tom Timmons (1982) surveyed Gainesville and Aliceville pools and confirmed the presence of three species in the upper Tombigbee that I had some doubts about occurring there. A paper by Mettee et al. (1986) provided information regarding the fishes of Yellow Creek, a tributary of the Luxapallila. Glendon Coffee provided information regarding the chronology of the TTW construction. Data

relative to the introductions of hybrid bass (*Morone*) and exotic species were furnished by Jerry Moss and James McHuge. The U.S. Fish and Wildlife Service, by way of Tom Thornhill and Celeste South, shared data on the study of cutoff bendways on the TTW.

My graduate students aided sponsored surveys in 1972-73, and 1983, and randomly collected for "the love of it": Eugene Beckham, Dale Caldwell, Hector Harima, Mike Howell, Thomas Jandebeur, Rick Kasprzak, Maurice Mettee, Phillip Mundy, David Nieland, Benjamin Wall, and James Williams. Further field assistance was provided by Paul and Ralph Boschung, Robert Hanley, David Mills, Larry Overstreet, Jim Parrish, Roy Lee Smith, Harvey Stackman, and Don Woods.

Stephen Ross shared his records of Mississippi fishes obtained from INHS, MMNS, NLU, UMMZ, UNO, USM, UMS, USNM, and UT, many of which I otherwise probably would not have obtained. Henry Bart (AUM), Neil Douglas and Rob Wood (NLU), William Fink (UMMZ), Carter Gilbert and George Burgess (UF), and Frank Pezold (MSU) provided data from their respective institutions (abbreviations identified below). Discussions with David Etnier, Carter Gilbert, Rick Mayden, Stephen Ross, and Jim Williams led to a better understanding on my part of the undescribed species in the upper Tombigbee. Benjamin Wall confirmed the identifications of the

Erimyzon.

Jack Mallory (U.S. Corps of Engineers, Mobile) had the foresight to sponsor a pre-disturbance survey of the entire drainage system and post-impoundment surveys in the drainage area associated with the Demopolis, Gainesville, and Aliceville pools.

In addition to their helpful suggestions during the construction of the Atlas, Rick Mayden and Bernard Kuhajda critiqued the manuscript and provided valuable commentary. The critiques of the Editorial Committee were especially valuable. Craig Remington and Marita Schumacher did the cartography. Tom Kallsen provided maps. Michael Macrander and Larry Bowen guided me over hurdles going from my old computer system to a more modern one. Robert Haynes performed yeoman's service in converting the manuscript to camera-ready printout. Michael Stevenson, editor of the Proceedings SFC, graciously accepted the idea of a large paper; Robert Jenkins, former Chairman of SFC, approved the idea; and Werner Weiland, Treasurer, found the funds to publish the Atlas. My wife, Elaine, served as proof reader and companion, and provided nourishment and encouragement throughout the process of compiling this Atlas.

To each of you I give heartfelt thanks. None of you deserves credit for any shortcoming of the Atlas or for any mistake therein.

SITE LOCATIONS AND SPECIES LISTS

The upper Tombigbee River drainage lies in northwest Alabama and northeast Mississippi and covers an area of approximately 8900 square miles (Fig.1).

Sites are numbered sequentially (1 through 352) from the lowermost part of the system to the upper. In the site descriptions, the name of the stream is given first, followed by county, state, topographic map, township, range and section, and, lastly, additional information helpful in locating the site on a map or in the field. A 10/m line represents site information repeated immediately above. T - Township, R - Range, and Sec - Section. Regarding Section divisions, usually the quarter section or the quarter/quarter section is given. SW,NE, for example, reads southwest quarter of the northeast quarter. The usual compass abbreviations are used. Occasionally, it is convenient to place a site in the central, or N-, E-, S-, W-central area of a section. Regarding road designations, US = a Federal Highway; Hwy = a State Highway; and CoRd = a secondary State Road or County Road. Distances are in miles: mi - miles by road or up and down a stream, airmi - air miles, rmi - river miles from Government Street, Mobile, Alabama. Periods following standard abbreviations are usually omitted. Prepositions are omitted in phrases stating directions; for example, "2 mi NE Amory," instead of "2 mi NE of Amory." Names of streams are spelled as they appear on USGS maps, 1:24,000 series.

Museum abbreviations are: AUM - Auburn University Museum; INHS - Illinois Natural History Survey; MMNS - Mississippi Museum of Natural Sciences; MSU - Mississippi State University; NLU - Northeastern Louisiana

University Museum of Zoology; TU - Tulane University, Belle Chasse; UAIC - University of Alabama Ichthyological Collection; UF - University of Florida, Florida State Museum; UMS - University of Mississippi; UMMZ - University of Michigan Museum of Zoology; UNO - University of New Orleans; USM - University of Southern Mississippi; USNM - United States National Museum; and UT - University of Tennessee. WDH and CAS - the collections of Walter D. Hubbard and C. A. Schultz, respectively, Mississippi Department of Conservation. TTW - Tennessee-Tombigbee Waterway.

Included in each site description is a list of museums that house the voucher specimens and the date (by year) of the collections. Comments are occasionally made concerning the physical changes of a site as a result of the TTW.

A list of the species known to occur at each site follows the site description. With very few exceptions, the species listed are documented by voucher specimens in the various museums. Collections date from 1931 to 1988, with the great majority between 1963 and 1983. To my knowledge, no significant collections were made in the "main channel" or in the pools and canals above Columbus Lock and Dam since 1980, except for an ongoing study by the U.S. Fish and Wildlife Service for the Corps of Engineers (Table 1.)

The number of species collected at a given site ranges from one to 92 (Site 223). Equal effort was not expended at each site and the list of fishes for some sites is a composite result of numerous repetitions. Likewise, equal

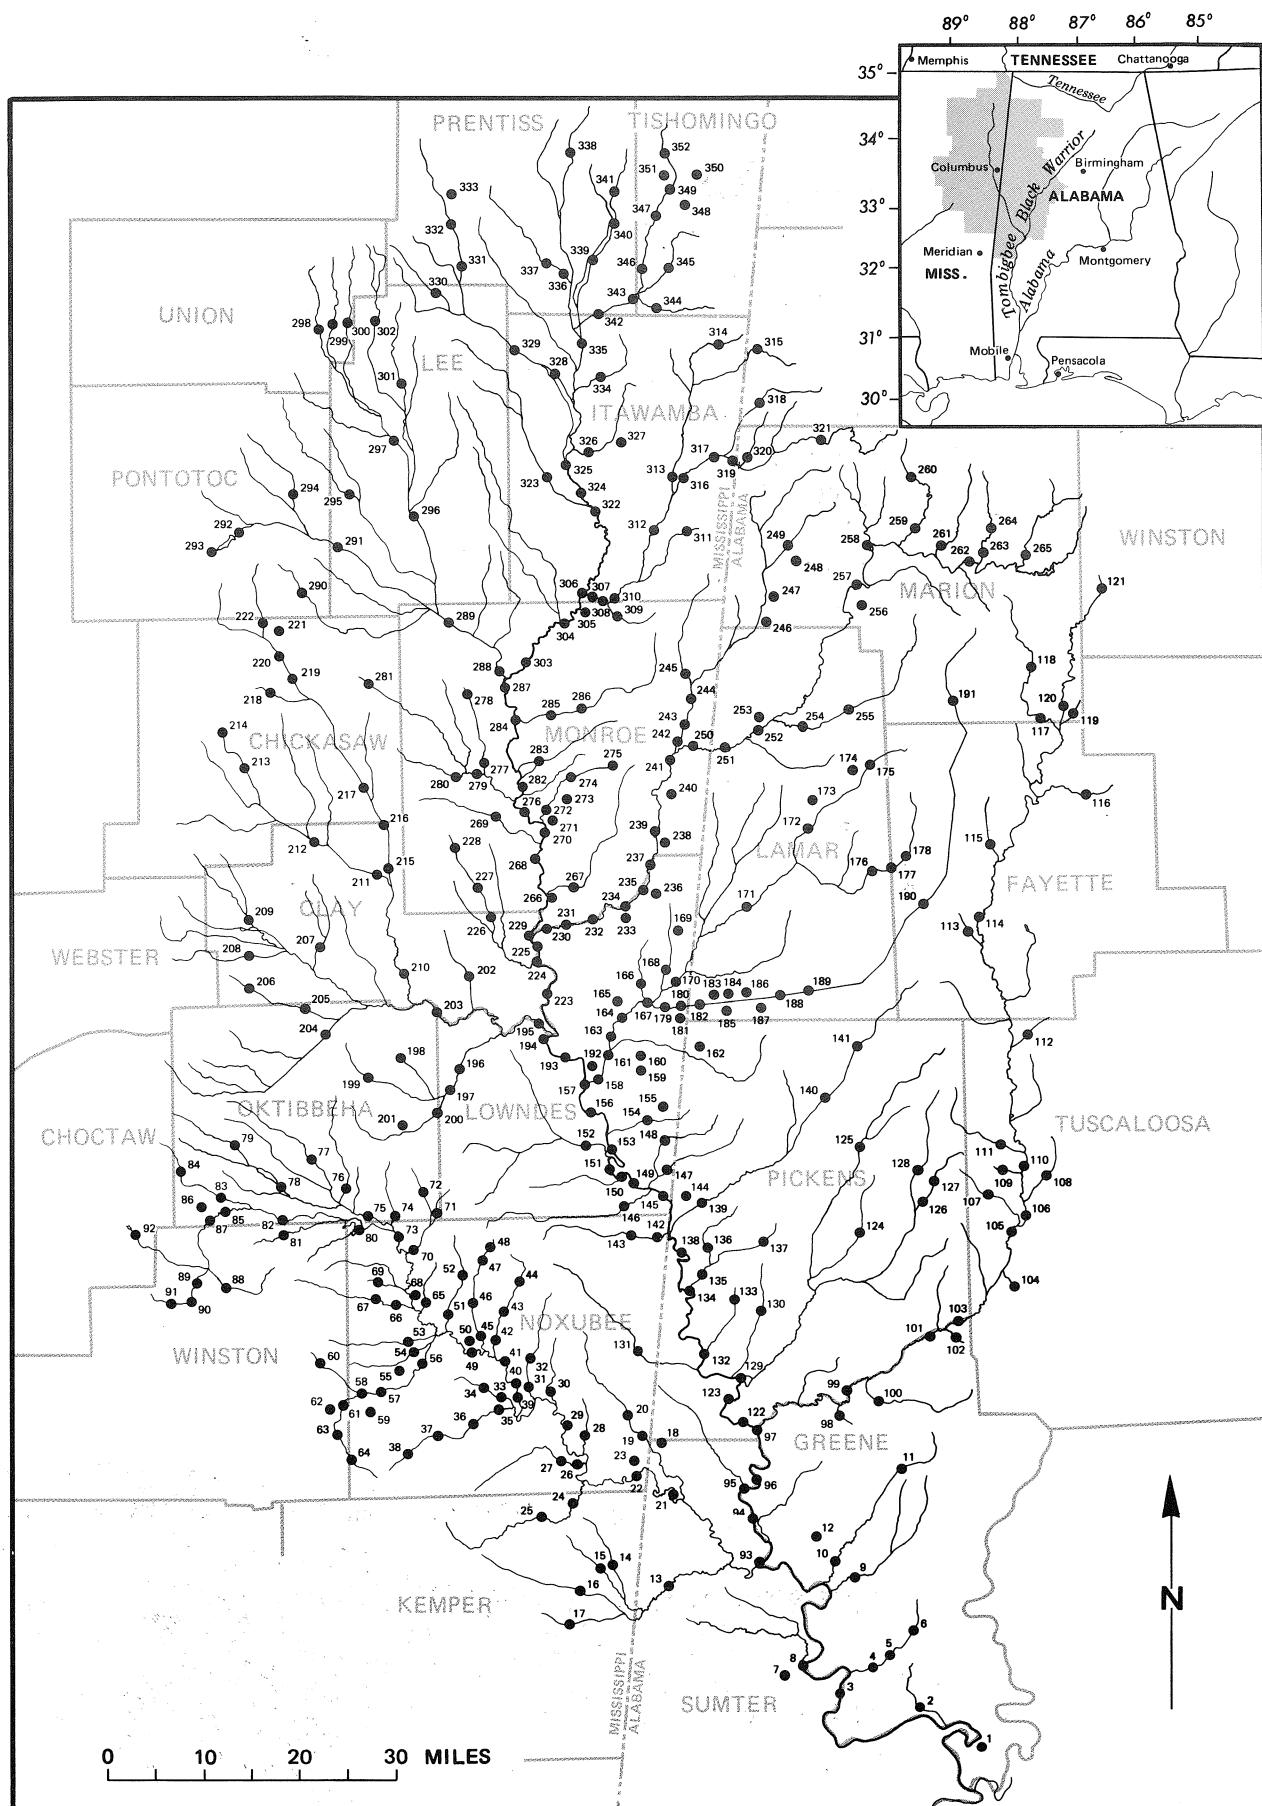

Fig. 1. The upper Tombigbee River system. The numbered dots represent the location of the sites collected.

effort was not given to geographical areas. Some streams, such as those typical of the Black Belt physiographic region, are not particularly species rich and tend to be neglected. The total number of dots on the distribution maps is 7971. Given that the same species may have been collected from a site on several occasions, the total number of voucher lots in the museums cited above probably would exceed 20,000.

1. Birdine Creek. Greene County, Ala. Demopolis Quad. T19S, R2E, Sec 25 NE. About 3.5 mi N Warrior River bridge on US 43. UAIC '51. Inundated by Demopolis Pool in 1955.

11 Species: *Anguilla rostrata*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Notropis baileyi*, *Aphredoderus sayanus*, *Fundulus olivaceus*, *Gambusia affinis*, *Lepomis cyanellus*, *L. macrochirus*, *L. marginatus*, and *L. microlophus*.

2. McConnico Creek. Greene County, Ala. Forkland Quad. T19N, R2E, Sec 7 N-central. About 2.5 mi SW Forkland on CoRd 4. TU '72.

27 Species: *Esox americanus*, *Cyprinella venusta*, *Luxilus chryscephalus*, *Notropis candidus*, *N. maculatus*, *N. texanus*, *Opsopoeodus emiliae*, *Erimyzon suetta*, *Minytrema melanops*, *Ictalurus punctatus*, *Aphredoderus sayanus*, *Fundulus notatus*, *F. notti*, *F. olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Lepomis cyanellus*, *L. gulosus*, *L. macrochirus*, *L. marginatus*, *L. microlophus*, *L. punctatus*, *Micropterus salmoides*, *Etheostoma chlorosomum*, *E. proeliare*, *E. whipplei*, and *Aplodinotus grunniens*.

3. Tombigbee River. Sumter County, Ala. Epes Quad. T20N, R1W, Sec 35 SE. About 2 mi below mouth of Taylor Creek. AUM '80; UAIC '68. Site not collected previous to its inundation by Demopolis Pool in 1955.

9 Species: *Cyprinella venusta*, *Notropis atherinoides*, *N. candidus*, *N. edwardranei*, *Carpioles velifer*, *Ictiobus bubalus*, *Strongylura marina*, *Mugil cephalus*, and *Aplodinotus grunniens*.

4. Taylor Creek. Greene County, Ala. Forkland Quad. T20N, R1E, Sec 21 Central. On CoRd 9. TU '72; UAIC '66, '83.

23 Species: *Campostoma oligolepis*, *Cyprinella venusta*, *Hybognathus nuchalis*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Notropis edwardranei*, *N. texanus*, *Pimephales notatus*, *Semotilus atromaculatus*, *Moxostoma poecilurum*, *Noturus gyrinus*, *Fundulus notatus*, *Gambusia affinis*, *Lepomis cyanellus*, *L. gulosus*, *L. humilis*, *L. macrochirus*, *L. megalotis*, *Micropterus salmoides*, *Etheostoma chlorosomum*, *E. nigrum*, *E. proeliare*, and *E. whipplei*.

2 Species: *Cyprinella venusta*, and *Luxilus chryscephalus*.

156. Tombigbee River. Lowndes County, Miss. Columbus South Quad. T19S, R18E, SEC 16. About 2.5 mi below mouth of Luxapallila River at rmi 326. AUM '79, '80; CAS '63; MMNS '63, '79; MSU '72, '73, '80; UAIC '72, '83. Inundated by Aliceville Pool in 1979.

66 Species: *Lepisosteus oculatus*, *Anguilla rostrata*, *Alosa chrysochloris*, *Dorosoma cepedianum*, *D. petenense*, *Hiodon tergisus*, *Esox niger*, *Campostoma oligolepis*, *Cyprinella callistia*, *C. venusta*, *Cyprinus carpio*, *Extrarius* sp. cf. *aestivalis*, *Hybognathus hayi*, *H. nuchalis*, *Hybopsis winchelli*, *H. sp. cf. longirostris*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Macrhybopsis storriana*, *Notemigonus crysoleucas*, *Notropis atherinoides*, *N. edwardraneyi*, *N. stilius*, *N. texanus*, *N. volucellus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *P. vigilax*, *Carpoides cyprinus*, *C. velifer*, *Hypentelium etowanum*, *Ictiobus bubalus*, *Moxostoma erythrurum*, *Ameiurus melas*, *Ictalurus furcatus*, *I. punctatus*, *Noturus leptacanthus*, *N. munitus*, *Pylodictis*

olivaris, *Fundulus notatus*, *F. olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Lepomis humilis*, *L. macrochirus*, *L. megalotis*, *L. microlophus*, *Micropterus punctulatus*, *M. salmoides*, *Pomoxis annularis*, *P. nigromaculatus*, *Ammocrypta asprella*, *A. meridiana*, *Etheostoma histrio*, *E. nigrum*, *E. rupestris*, *E. stigmaeum*, *E. swaini*, *E. whipplei*, *Percina nigrofasciata*, *P. sciera*, *P. shumardi*, *P. vigil*, *P. sp. cf. caprodes*, *Stizostedion vitreum*, and *Aplodinotus grunniens*.

157. _____. Columbus South Quad. T18S, R18W, Sec 5. At mouth of Luxapallila River 0.75 mi above to 0.75 mi below. AUM '79; CAS '68, '69; MMNS '79; UAIC '72; UMS '63; UT '72. Inundated by Aliceville Pool in 1979.

40 Species: *Lepisosteus oculatus*, *Dorosoma cepedianum*, *Campostoma oligolepis*, *Cyprinella callistia*, *C. venusta*, *Extrarius sp. cf. aestivalis*, *Hybognathus hayi*, *H. nuchalis*, *Lythrurus bellus*, *Notropis atherinoides*, *N. edwardraneyi*, *N. stilius*, *N. texanus*, *N. volucellus*, *Pimephales vigilax*, *Carpoides velifer*, *Hypentelium etowanum*, *Noturus munitus*, *Strongylura marina*, *Labidesthes sicculus*, *Lepomis humilis*, *L. macrochirus*, *L. megalotis*, *L. microlophus*, *Micropterus punctulatus*, *M. salmoides*, *Ammocrypta asprella*, *A. beani*, *A. meridiana*, *Etheostoma histrio*, *E. rupestris*, *E. stigmaeum*, *E. swaini*, *Etheostoma sp.*, *Percina sciera*, *P. shumardi*, *P. vigil*, *P. sp. cf. caprodes*, *Stizostedion vitreum*, and *Aplodinotus grunniens*.

SITES 158 THRU 191 ARE IN THE LUXAPALLILA RIVER SYSTEM

158. Luxapallila River. Lowndes County, Miss. Columbus South Quad. T18S, R18W, Sec 33 NE. Area from 1 to 2 mi above mouth. CAS '68, '69; MSU '73, '74, '75 '76. Numerous collections were made at this site by Kelly (1975) in 1974-75. Inundated by Aliceville Pool in 1979.

69 Species: *Dorosoma cepedianum*, *D. petenense*, *Esox americanus*, *E. niger*, *Cyprinella venusta*, *Extrarius aestivalis*, *Hybognathus hayi*, *H. nuchalis*, *Hybopsis winchelli*, *H. sp. cf. longirostris*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Macrhybopsis storriana*, *Nocomis leptocephalus*, *Notemigonus crysoleucas*, *Notropis edwardraneyi*, *N. maculatus*, *N. stilius*, *N. texanus*, *N. volucellus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *P. vigilax*, *Semotilus atromaculatus*, *Carpoides velifer*, *Moxostoma carinatum*, *M. erythrurum*, *M. poecilurum*, *Ictalurus punctatus*, *Noturus gyrinus*, *N. leptacanthus*, *N. munitus*, *Pylodictis olivaris*, *Aphredoderus sayanus*, *Strongylura marina*, *Fundulus notatus*, *F. notti*, *F. olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Elassoma zonatum*, *Ambloplites ariommus*, *Centrarchus macropterus*, *Lepomis cyanellus*, *L. gulosus*, *L. humilis*, *L. macrochirus*, *L. marginatus*, *L. megalotis*, *L. microlophus*, *L. punctatus*, *Micropterus punctulatus*, *M. salmoides*, *Pomoxis annularis*, *P. nigromaculatus*, *Ammocrypta meridiana*, *Etheostoma chlorosomum*, *E. fusiforme*, *E. nigrum*, *E. proeliare*, *E. stigmaeum*, *E. swaini*, *E. whipplei*, *E. zoniferum*, *Percina maculata*, *P. sciera*, *P. vigil*, and *P. sp. cf. caprodes*, and *Stizostedion vitreum*.

159. McCrary Creek. Lowndes County, Miss. New Hope Quad. T18S, R17W, Sec 30 NW,NW. About 2.5 mi upstream from Luxapallila River. MSU '73.

14 Species: *Esox niger*, *Notropis texanus*, *Opsopoeodus emiliae*, *Erimyzon suetta*, *Ameiurus melas*, *Labidesthes sicculus*, *Elassoma zonatum*, *Centrarchus macropterus*, *Lepomis gulosus*, *L. macrochirus*, *L. megalotis*, *L. punctatus*, *Micropterus salmoides*, and *Etheostoma proeliare*.

160. Vernon Branch, trib of McCrary Creek. Lowndes County, Miss. New Hope Quad. T18S, R17W, Sec 18/19, and R18W, Sec 13/24. E edge Columbus at US 82. AUM '68.

6 Species: *Fundulus olivaceus*, *Gambusia affinis*, *Lepomis cyanellus*, *L. gulosus*, *L. macrochirus*, and *L. megalotis*.

161. Luxapallila River. Lowndes County, Miss. Columbus North Quad. T18S, R18W, Sec 14 NW. Near mouth of Magby Creek. CAS '67; AUM '79; MSU '79; UAIC '66, '79, '83.

27 Species: *Lepisosteus osseus*, *Amia calva*, *Campostoma oligolepis*, *Cyprinella venusta*, *Hybopsis sp. cf. longirostris*, *Lythrurus bellus*, *Notropis texanus*, *Pimephales notatus*, *P. vigilax*, *Hypentelium etowanum*, *Ameiurus natalis*, *Noturus leptacanthus*, *N. munitus*, *Fundulus olivaceus*, *Lepomis macrochirus*, *L. megalotis*, *Micropterus salmoides*, *Ammocrypta meridiana*, *Etheostoma chlorosomum*, *Etheostoma nigrum*, *E. rupestris*, *E. stigmaeum*, *E. swaini*, *E. whipplei*, *Etheostoma sp.*, *Percina sciera*, and *Stizostedion vitreum*.

162. Little Magby Creek, trib of Magby Creek. Pickens County, Ala. New Hope Quad. T18S, R16W, Sec 18 W-central. About 0.33 mi above confluence with Magby Creek. UAIC '72.

26 Species: *Esox americanus*, *E. niger*, *Campostoma oligolepis*, *Hybopsis sp. cf. longirostris*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Nocomis leptocephalus*, *Notemigonus crysoleucas*, *Notropis baileyi*, *N. texanus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *Semotilus atromaculatus*, *Erimyzon oblongus*, *Moxostoma poecilurum*, *Noturus funebris*, *Fundulus olivaceus*, *Gambusia affinis*, *Lepomis cyanellus*, *L. gulosus*, *L. macrochirus*, *L. megalotis*, *Etheostoma nigrum*, *E. whipplei*, *Percina maculata*, and *P. nigrofasciata*.

163. Luxapallila River. Lowndes County, Miss. Columbus North Quad. T18S, R18W, Sec 11 W-central. At Hwy 50. CAS '68; MSU '68, '73, '74, '75, '76, '80; UAIC '71; UF '73.

72 Species: *Lepisosteus oculatus*, *L. osseus*, *Dorosoma cepedianum*, *Esox niger*, *Campostoma oligolepis*, *Cyprinella callistia*, *C. venusta*, *Extrarius sp. cf. aestivalis*, *Hybognathus hayi*, *H. nuchalis*, *Hybopsis winchelli*, *H. sp. cf. longirostris*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Macrhybopsis storriana*, *Nocomis leptocephalus*, *Notemigonus crysoleucas*, *Notropis baileyi*, *N. edwardraneyi*, *N. stilius*, *N. texanus*, *N. volucellus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *P. vigilax*, *Carpoides velifer*, *Hypentelium etowanum*, *Minytrema melanops*, *Moxostoma carinatum*, *M. erythrurum*, *M. poecilurum*, *Ictalurus punctatus*, *Noturus gyrinus*, *N. leptacanthus*, *N. nocturnus*, *Aphredoderus sayanus*, *Fundulus notatus*, *F. notti*, *F. olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Elassoma zonatum*, *Ambloplites ariommus*, *Lepomis cyanellus*, *L. gulosus*, *L. humilis*, *L. macrochirus*, *L. megalotis*, *L. microlophus*, *Micropterus punctulatus*, *M. salmoides*, *Pomoxis annularis*, *P. nigromaculatus*, *Ammocrypta asprella*, *A. meridiana*, *Etheostoma chlorosomum*, *Etheostoma fusiforme*, *E. nigrum*, *E. proeliare*, *E. rupestris*, *E. stigmaeum*, *E. swaini*, *E. whipplei*, *Etheostoma sp.*, *Percina maculata*, *P. nigrofasciata*, *P. sciera*, *P. shumardi*, *P. vigil*, *P. sp. cf. caprodes*, *Stizostedion vitreum* and *Aplodinotus grunniens*.

164. _____. Steens Quad. An area about halfway between Columbus and Steens. MSU '75, '76, '80. Supra Kelly, 1975.

40 Species: *Dorosoma cepedianum*, *Hiodon tergisus*, *Esox niger*, *Campostoma oligolepis*, *Cyprinella venusta*, *Hybognathus nuchalis*, *Hybopsis*

winchelli, *Luxilus chryscephalus*, *Lythrurus bellus*, *Macrhybopsis storriana*, *Nocomis leptocephalus*, *Notropis baileyi*, *N. stilius*, *N. texanus*, *Pimephales notatus*, *P. vigilax*, *Semotilus atromaculatus*, *Hypentelium etowanum*, *Moxostoma carinatum*, *M. erythrurum*, *M. poecilurum*, *Ictalurus punctatus*, *Noturus funebris*, *N. gyrinus*, *N. leptacanthus*, *N. munitus*, *Fundulus olivaceus*, *Lepomis macrochirus*, *Micropterus punctulatus*, *M. salmoides*, *Ammocrypta beani*, *A. meridiana*, *Etheostoma rupestre*, *E. stigmaeum*, *E. swaini*, *Percina nigrofasciata*, *P. sciera*, *P. vigil*, *Stizostedion vitreum*, and *Aplodinotus grunniens*.

165. Unnamed tributary. Lowndes County, Miss. Columbus North Quad. T17S, R18W, Sec 25 SW,SW. At Hwy 12 about 0.75 mi upstream from Luxapallila River. UAIC '72, '83.

22 Species: *Esox americanus*, *E. niger*, *Campostoma oligolepis*, *Cyprinella venusta*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Notropis texanus*, *Noturus gyrinus*, *Fundulus olivaceus*, *Gambusia affinis*, *Elassoma zonatum*, *Centrarchus macropterus*, *Lepomis cyanellus*, *L. gulosus*, *L. macrochirus*, *L. marginatus*, *L. megalotis*, *L. punctatus*, *Micropterus salmoides*, *Etheostoma proeliare*, *E. swaini*, and *Percina sciera*.

166. Howard Creek. Lowndes County, Miss. Steens Quad. T17S, R17W, Sec 17 W-central. At Hwy 12. MMNS '79; UAIC '72, '79, '83.

24 Species: *Esox americanus*, *Ericymba buccata*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Nocomis leptocephalus*, *Notemigonous crysoleucas*, *Notropis baileyi*, *N. texanus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *P. vigilax*, *Semotilus atromaculatus*, *Fundulus olivaceus*, *Gambusia affinis*, *Lepomis cyanellus*, *L. macrochirus*, *L. megalotis*, *L. punctatus*, *Micropterus salmoides*, *Etheostoma chlorosomum*, *Etheostoma proeliare*, *E. stigmaeum*, *E. swaini*, and *Etheostoma sp.*

167. Luxapallila River. Lowndes County, Miss. Steens Quad. T17S, R17W, Sec 21 SE,SW. About 0.5 mi W Steens near confluence with Yellow Creek. CAS '68, '69; MMNS '80.

24 Species: *Alosa chryschloris*, *Dorosoma cepedianum*, *Hiodon tergisus*, *Cyprinella venusta*, *Hybognathus nuchalis*, *Notropis baileyi*, *N. stilius*, *N. texanus*, *Pimephales notatus*, *Carpoides velifer*, *Ictiobus bubalus*, *Ictalurus punctatus*, *Noturus leptacanthus*, *Fundulus olivaceus*, *Lepomis macrochirus*, *Ammocrypta beani*, *Etheostoma rupestre*, *E. stigmaeum*, *E. swaini*, *Percina nigrofasciata*, *P. sciera*, *P. vigil*, *Stizostedion vitreum*, and *Aplodinotus grunniens*.

168. Cooper Creek, trib of Yellow Creek. Lowndes County, Miss. Steens Quad. T17S, R17W, Sec 10. On Vaughn Robertson Road about 2.5 airmi N Steens. MSU '76; UMS '79.

28 Species: *Esox americanus*, *Campostoma oligolepis*, *Cyprinella venusta*, *Ericymba buccata*, *Hybognathus nuchalis*, *Hybopsis sp. cf. longirostris*, *Luxilus chryscephalus*, *Lythrurus bellus*, *Nocomis leptocephalus*, *Notropis baileyi*, *N. stilius*, *N. texanus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *Noturus funebris*, *N. gyrinus*, *N. leptacanthus*, *Fundulus olivaceus*, *Gambusia affinis*, *Elassoma zonatum*, *Lepomis cyanellus*, *L. megalotis*, *Etheostoma nigrum*, *E. rupestre*, *E. swaini*, *E. whipplei*, *Percina maculata*, and *P. nigrofasciata*.

169. Mayhew Creek, trib of Cooper Creek. Lowndes County, Miss. Caledonia Quad. T16S, R17W, Sec 26 NW. At Hwy 12 about 1.25 mi from confluence with Cooper Creek. UAIC '72, '83.

18 Species: *Campostoma oligolepis*, *Hybopsis sp. cf. longirostris*,

Luxilus chryscephalus, *Lythrurus bellus*, *Nocomis leptocephalus*, *Notemigonous crysoleucas*, *Notropis baileyi*, *N. texanus*, *Pimephales notatus*, *P. vigilax*, *Erimyzon oblongus*, *Fundulus olivaceus*, *Gambusia affinis*, *Lepomis macrochirus*, *L. megalotis*, *Etheostoma nigrum*, *E. stigmaeum*, and *E. whipplei*.

170. Yellow Creek. Lowndes County, Miss. Steens Quad. T17S, R17W, Sec 11, 14/15. About 3 mi from confluence with Luxapallila River. MMNS '48, '80; UAIC '71.

32 Species: *Cyprinella venusta*, *Hybopsis winchelli*, *H. sp. cf. longirostris*, *Lythrurus bellus*, *Macrhybopsis storriana*, *Notropis atherinoides*, *N. maculatus*, *N. texanus*, *N. volucellus*, *Opsopoeodus emiliae*, *Pimephales notatus*, *Semotilus atromaculatus*, *Hypentelium etowanum*, *Minytrema melanops*, *Moxostoma poecilurum*, *Ictalurus punctatus*, *Noturus gyrinus*, *Aphredoderus sayanus*, *Fundulus olivaceus*, *Gambusia affinis*, *Elassoma zonatum*, *Ambloplites ariommus*, *Lepomis gulosus*, *L. macrochirus*, *L. megalotis*, *Ammocrypta meridiana*, *E. swaini*, *Percina maculata*, *P. nigrofasciata*, *P. shumardi*, *P. vigil*, and *P. sp. cf. caprodes*.

171. _____ Lamar County, Ala. Millport N W Quad. T16S, R16W, Sec 12 NW. At CoRd 9 about 5 mi SW Vernon. UAIC '66; UMMZ '32.

17 Species: *Lythrurus bellus*, *Notemigonous crysoleucas*, *Notropis texanus*, *Opsopoeodus emiliae*, *Pimephales vigilax*, *Erimyzon oblongus*, *Minytrema melanops*, *Noturus leptacanthus*, *Fundulus olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Elassoma zonatum*, *Lepomis gulosus*, *L. macrochirus*, *Etheostoma nigrum*, *E. proeliare*, and *E. swaini*.

FISH DATA FOLLOWING COMPLETION OF TTW

The Tennessee-Tombigbee Waterway was opened for traffic in January, 1985. From this time forward, fishes potentially could immigrate to the upper Tombigbee from the Tennessee River system, or emigrate from the Tombigbee to the Tennessee. In 1987 the U.S. Fish and Wildlife Service (Daphne, Alabama) initiated an ongoing

study of the fishes in the waterway for the U.S. Corps of Engineers (Mobile, Alabama). A compilation of species collected at the selected sites (as of Spring, 1989) is presented in Table 1. The sites, located on bendways, are identified by names on Fig. 2 and Table 1.

SPECIES ACCOUNTS AND DISTRIBUTION MAPS

The following annotated list of fish species is in two parts. The first list (Upper Tombigbee Fishes) includes fishes that I consider to be typical residents; that is, native and introduced species represented by reproductive populations that sustain themselves in the upper Tombigbee River system, and species that are catadromous or anadromous on a regular basis. Species of the second list (Unusual or Questionable Species) are not considered part of the native fish fauna for reasons given in the annotations.

The arrangement of taxonomic categories and common names follows Robins et al. (1980).

Debates persist regarding the classification of North American fishes. I choose to follow recent revisions in the classification of cyprinids made by Mayden (1989). The bullhead catfishes are placed in the genus *Ameiurus*, following the analysis of Lundberg (1982). I follow Parenti (1981) and Johnson (1984) in recognizing the families Fundulidae and Moronidae respectively. *Elassoma* is

placed in Elassomatidae following Branson and Moore (1962), an action substantiated by Johnson (1984). Species names following the title line are references to recent literature when the symbol "—" precedes the author's name. Although I have not established a synonymy, certain synonyms are given, as proper, without intervening punctuation between the scientific name and its author. References to original descriptions are readily available (Lee et al., 1980).

Dots on the distribution maps represent the best approximations of the locality of a collection site. Each dot corresponds to a numbered site on Figure 1. A dot on the species distribution maps covers an area approximately 1.5 mi in diameter, consequently nearby sites are lumped under one dot. For example, in large river collections there are no sharp lines of demarcation between sites, so, for convenience and clarity, all collections made within 0.75 mi above and below a given point are indicated by a single dot.

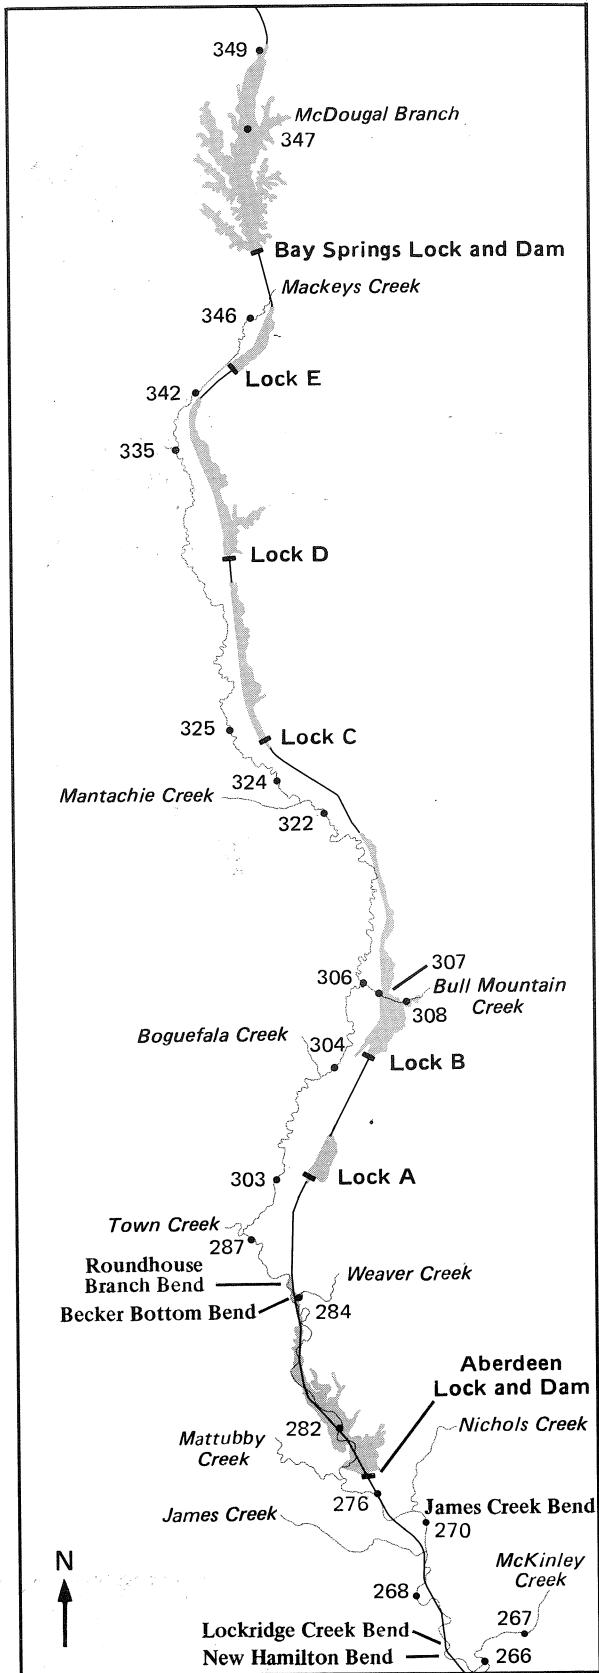

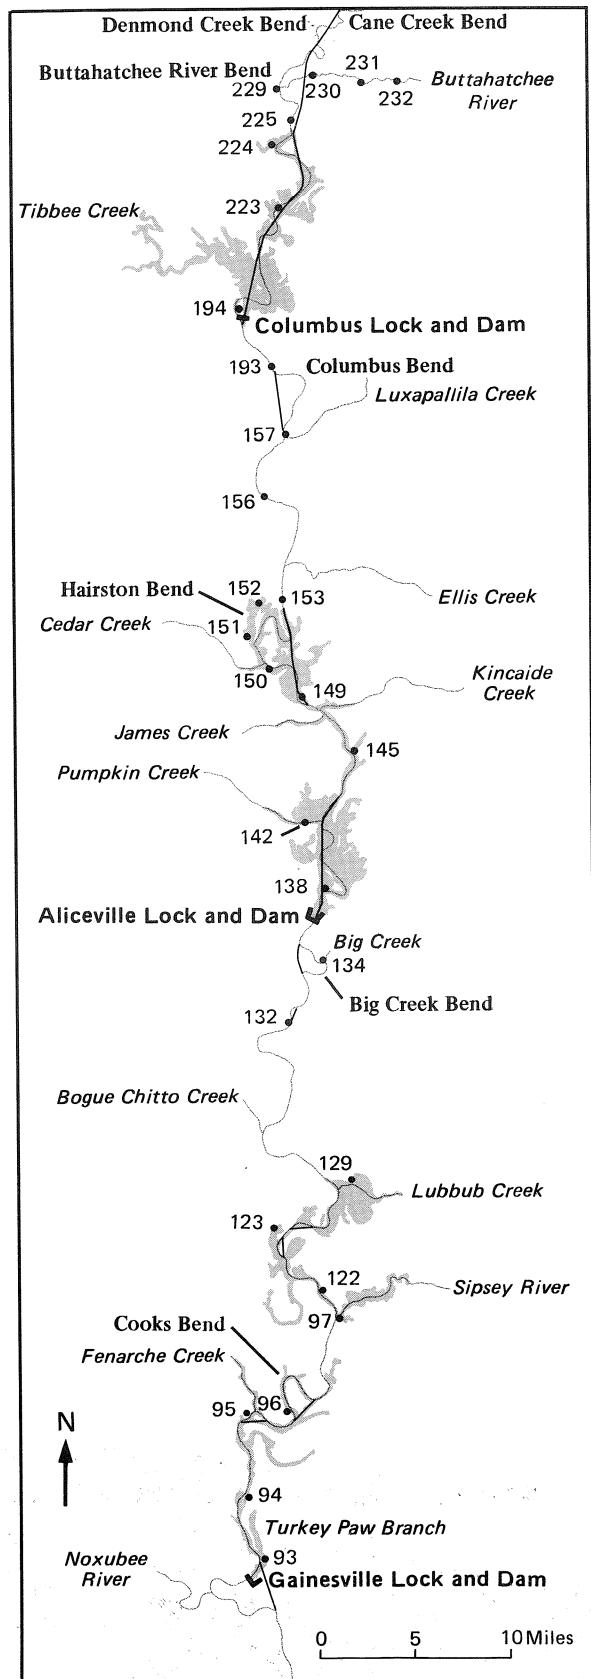

Fig. 2. The Tombigbee River and the Tennessee-Tombigbee Waterway. The original Tombigbee River is represented by the thin meandering line. Bendway cutoffs are shown as relatively heavy solid lines. Shaded areas represent impoundments. Numbered dots correspond to the sites in Figure 1. The named bends are the locations of the sites referred to in Table 1.

Upper Tombigbee Fishes

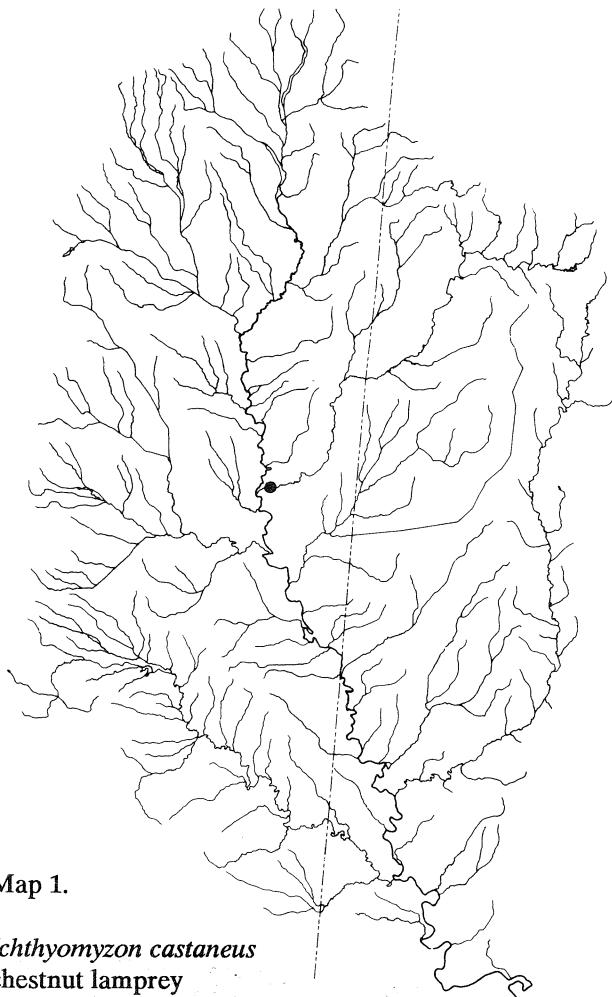

PETROMYZONTIDAE — lampreys

Ichthyomyzon castaneus Girard chestnut lamprey

The type locality is Galena, Illinois, not Galena, Minnesota, as generally stated in the literature (Starrett et al., 1960).

The only record of the chestnut lamprey in the upper Tombigbee is that of Cook (1959) who reported two specimens, collected in March 1955, from the Buttahatchee River in Lowndes County, Mississippi. One of the specimens was attached to a buffalo fish, probably *Ictiobus bubalus*.

1 Site: 230. Map 1.

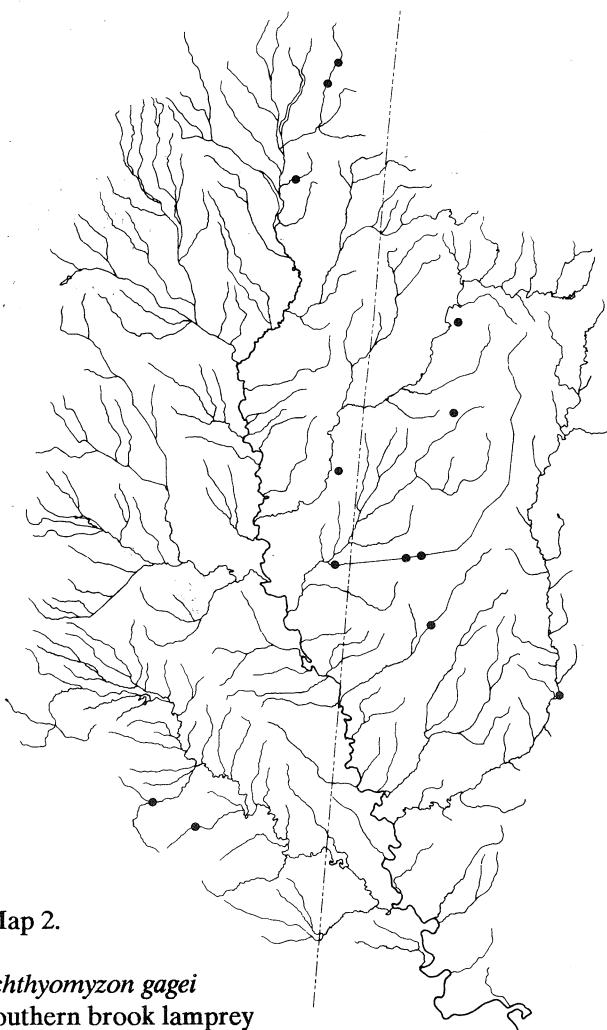

Ichthyomyzon gagei Hubbs and Trautman

southern brook lamprey

As elsewhere in Alabama and Mississippi, the southern brook lamprey seems to avoid streams of the Upper Coastal Plain. In the Noxubee drainage, it is in relatively high-gradient streams.

13 Sites: 37, 58, 106, 140, 174, 179, 188, 189, 238, 256, 334, 347, and 349. Map 2.

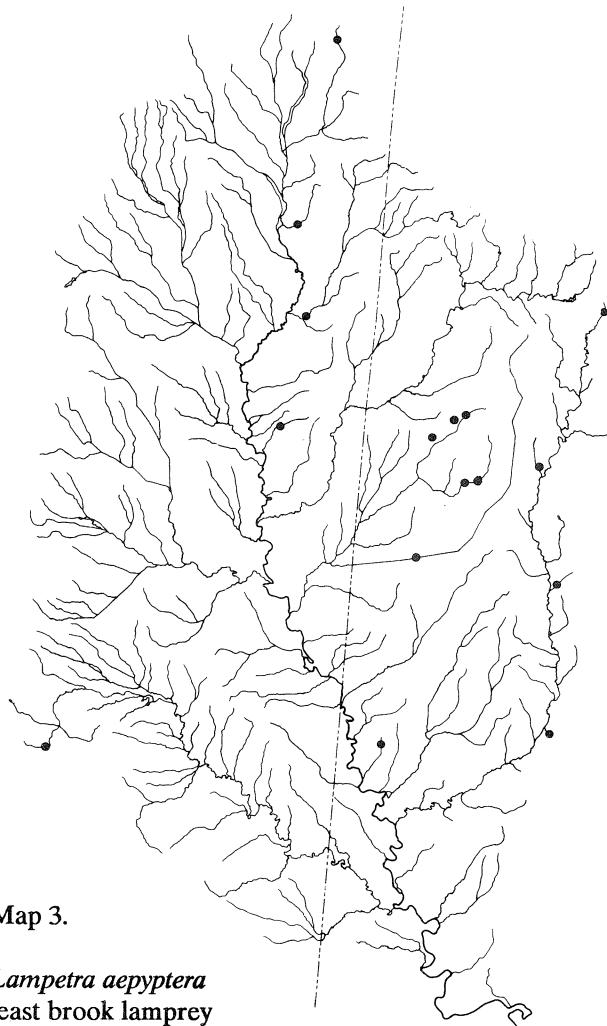

Lampetra aepyptera (Abbott)

Lethenteron meridionale Vladkyov, Kott and Pharand-Coad 1975

Lampetra meridionale.— Rohde, 1980

Lethenteron meridionale is considered a synonym of *Lampetra aepyptera* by Bailey (1980, 1982) and Walsh and Burr (1981) who maintain the posterior circumoral teeth, a principal character that separates *Lethenteron* (Vladkyov and Follett, 1967; Vladkyov et al., 1975) from *Lampetra*, is quite variable and, therefore, unreliable for distinguishing genera.

16 Sites: 90, 104, 112, 115, 121, 133, 173-177, 189, 274, 310, 326, and 352. Map 3.

least brook lamprey

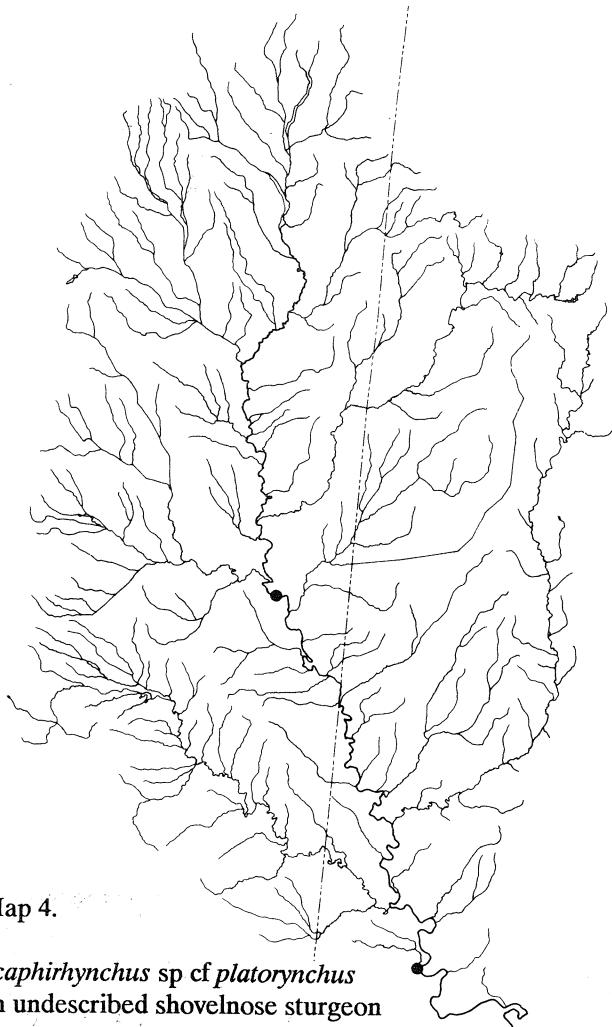

ACIPENSERIDAE — sturgeons

Scaphirhynchus sp cf platorynchus (Rafinesque)

Alabama shovelnose sturgeon

The Alabama shovelnose sturgeon is an undescribed species endemic to Mobile basin and similar to the shovelnose sturgeon, *Scaphirhynchus platorynchus* of mid-America, but differs in eye size and other morphometrics. It is being described by Glenn H. Clemmer and James D. Williams. Records from the upper Tombigbee are rare. The only extant museum specimen (UAIC 401.01) was captured in 1953 near Epps, Alabama (Chermock, 1955). One specimen from near Columbus, Mississippi, (date of capture unknown) is missing from the Mississippi Museum of Natural History in Jackson (James D. Williams, pers. comm.). Denzel Ferguson identified a specimen from Columbus in the mid or late 1960s (Glenn Clemmer, pers. comm.). For a detailed compilation of the biological and geographical knowledge of the Alabama shovelnose sturgeon, see Burke and Ramsey (1985).

2 Sites: 8 and 193. Map 4.

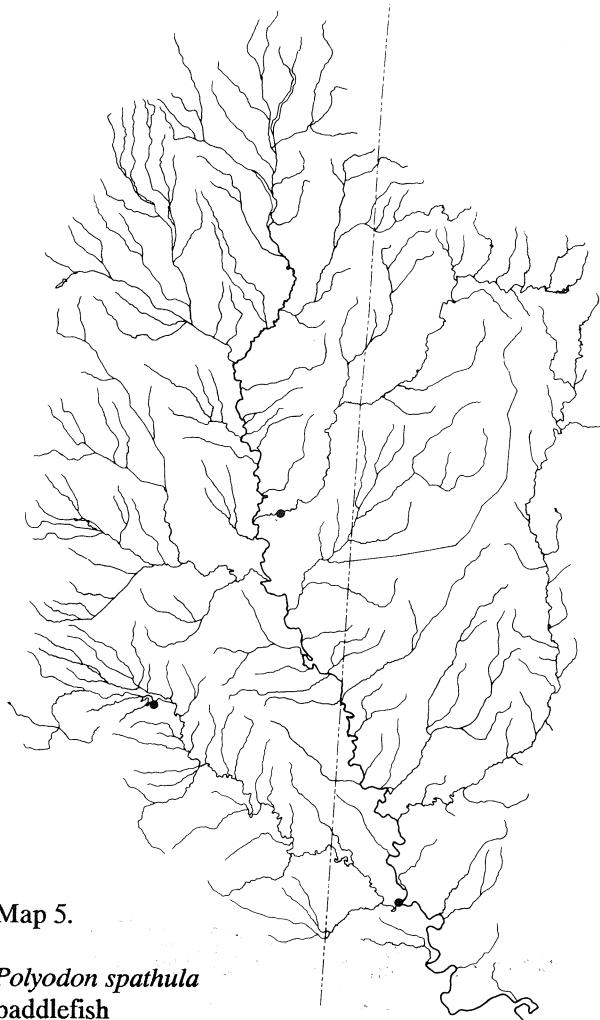

POLYODONTIDAE — paddlefishes

Polyodon spathula (Walbaum)

Once common in main streams of Mobile basin, the numbers of paddlefish are declining (Deacon et al., 1979; Gengerke, 1986), and museum records from the upper Tombigbee River drainage are rare. Paddlefish literature is extensive (Graham and Bonislawsky, 1978), and the general consensus is that paddlefish spend most of their lives in bendways and oxbow lakes near large rivers, but, for spawning, they require free-flowing rivers with shallow silt-free gravel bars, a habitat hardly available in the upper Tombigbee. In addition, paddlefish need an increase flow of warm water (60 degrees F) to trigger spawning (Russell, 1986).

3 Sites: 80, 93, and 231. Map 5.

Map 5.

Polyodon spathula
paddlefish

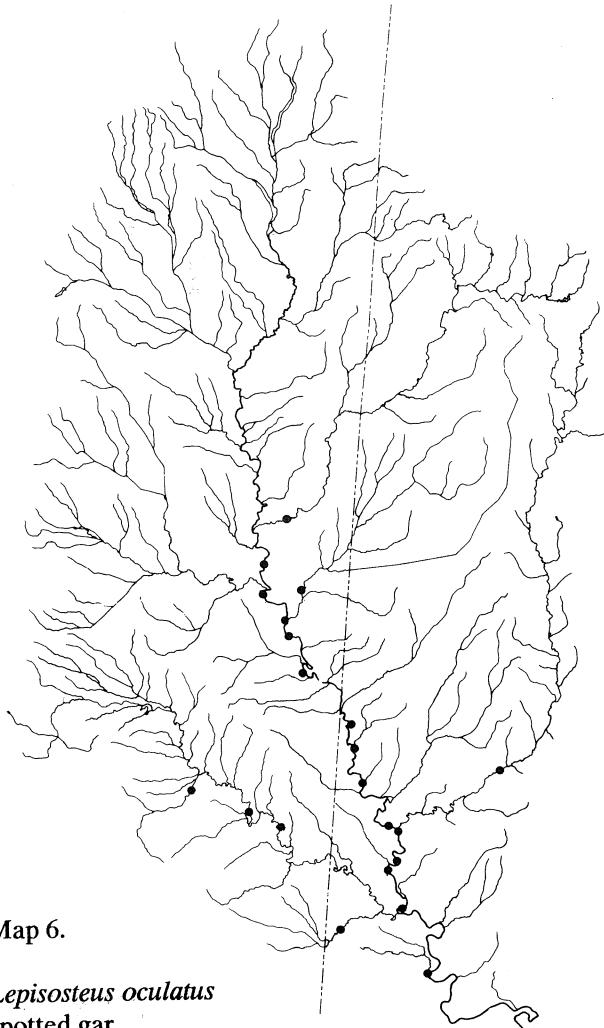

LEPISOSTEIDAE — gars

Lepisosteus oculatus Winchell

spotted gar

The spotted gar is less tolerant of continuous turbidity than is the longnose gar, *Lepisosteus osseus*, and it shows a greater affinity for rooted aquatic vegetation. Although the altered upper Tombigbee provides ample shallow, vegetated pools, it is the reproductive habitat that is critical. The spawning habitat varies from clear pools to rapid-flowing water coming from flooded timberland (Pflieger, 1975). A 26 mm TL specimen was captured June 6, 1972 over a gravel bar in the river proper near Big Creek (Site 134), and others measuring 32 to 77 mm were collected May 30, 1972 in an isolated pool off the the main channel near Coulmbus (Site 157).

21 Sites: 8, 13, 29, 39, 56, 93, 95-97, 101, 122, 132, 134, 138, 151, 156, 157, 163, 194, 223, and 232. Map 6.

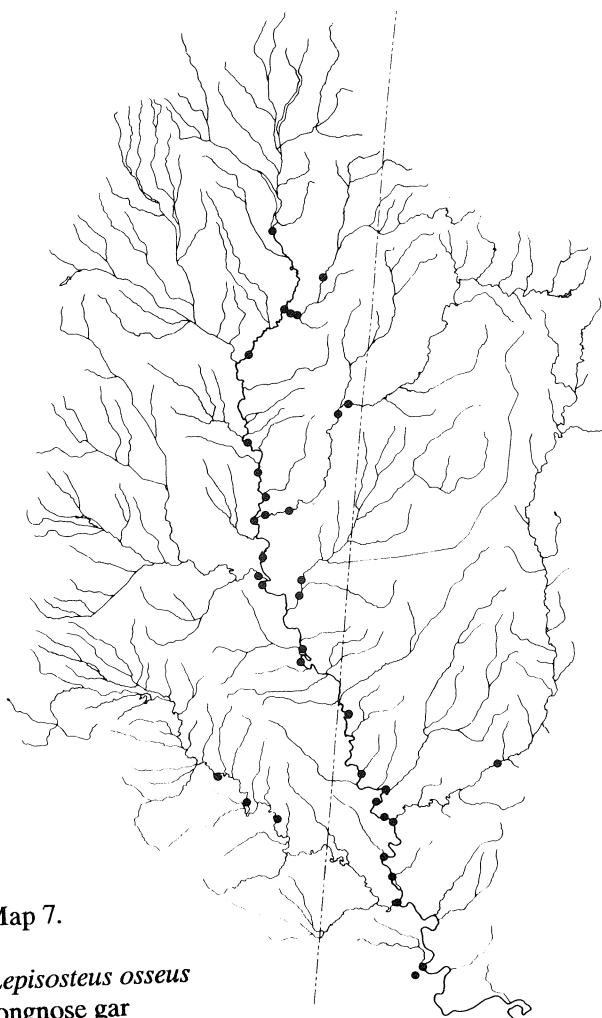

Map 6.

Lepisosteus oculatus
spotted gar

***Lepisosteus osseus* Linnaeus**

The longnose gar occupies the quiet water of the main channel and, more so than the spotted gar, the high-gradient areas of large tributaries. Adults will make rather long migrations to spawning sites in streams that have clear water and relatively high gradient. Consequently, we probably will see fewer longnose and relatively more spotted gar in the future upper Tombigbee.

36 Sites: 7, 8, 29, 39, 49, 93-95, 97, 101, 122, 123, 129, 132, 138, 151, 153, 161, 163, 194, 195, 223, 229, 230, 232, 241, 250, 266, 268, 276, 303, 306, 308, 312, and 325. Map 7.

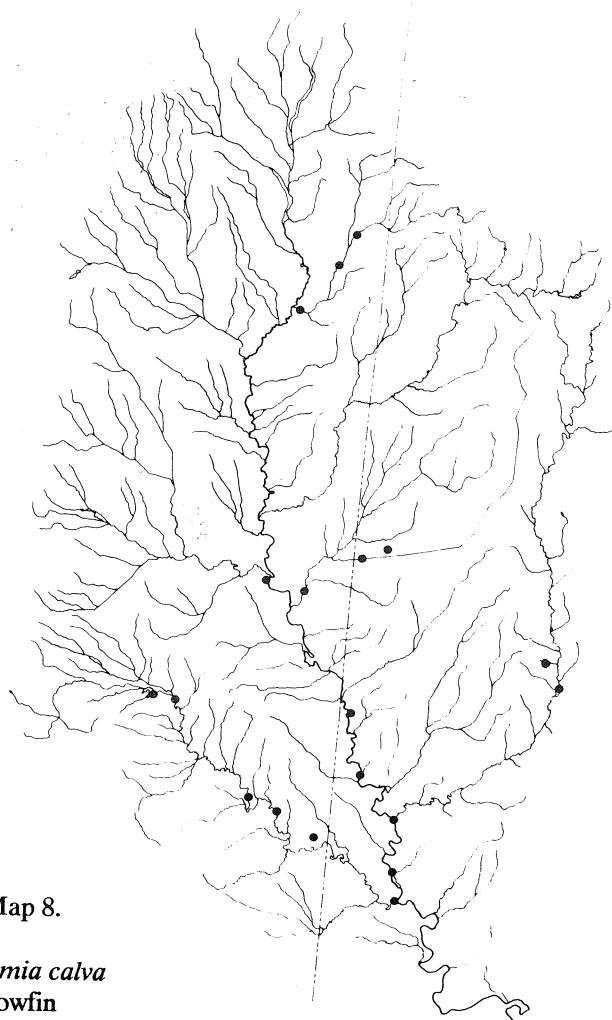

Map 7.

Lepisosteus osseus
longnose gar

longnose gar**AMIIDAE — bowfins*****Amia calva* Linnaeus****bowfin**

Historically, the bowfin has decreased in abundance throughout its range, even extirpated in places due to excessive siltation and high turbidity. In preparation for spawning, it builds nests in sand and gravel, or occasionally in mats of soft rootlets.

19 Sites: 23, 29, 39, 73, 80, 93, 94, 97, 106, 109, 132, 138, 161, 182, 186, 194, 307, 312, and 316. Map 8.

Map 8.

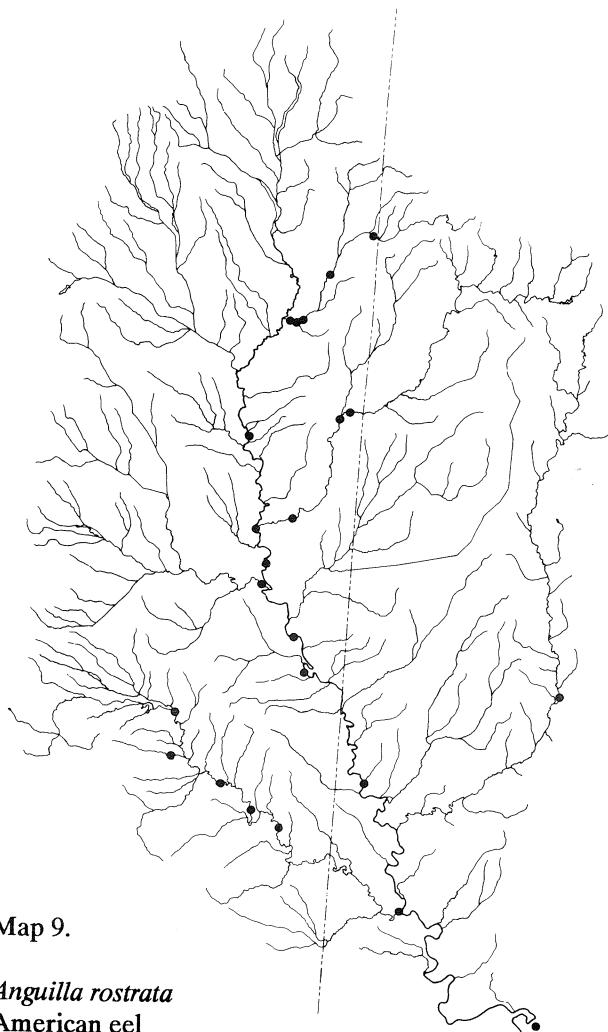

Amia calva
bowfin

ANGUILLIDAE — freshwater eels

***Anguilla rostrata* (Lesueur)**

The increase in number of obstacles will decrease the chances of the eel reaching the headwaters of the Tombigbee.

23 Sites: 1, 29, 39, 49, 66, 73, 93, 106, 132, 151, 156, 195, 223, 229, 232, 241, 250, 282, 307, 308, 310, 312, and 319. Map 9.

Map 9.

Anguilla rostrata
American eel

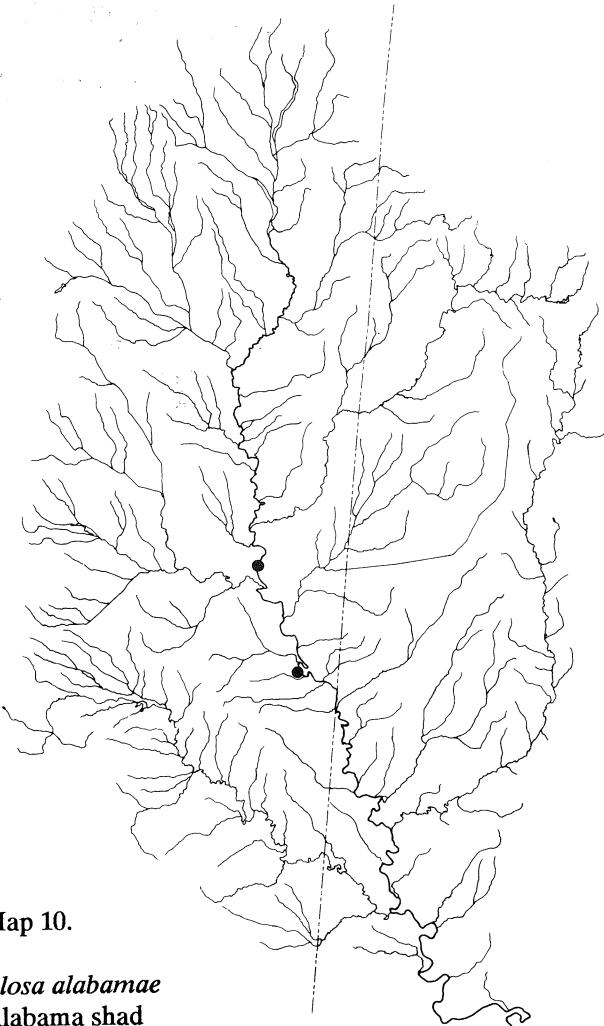

American eel

CLUPEIDAE — herrings

Alosa alabamae* Jordan and Evermann*Alabama shad**

I identified some small *Alosa* collected during the 1972-1973 TTW survey as *A. alabamae*. The specimens have been reexamined and tagged *A. chrysocloris*. Specimens MSU 541, 1089, and 6329 (collected in 1969), and MSU 7898 (collected in 1971) are from Sites 151 and 223. These may represent the last of the Alabama shad in the upper Tombigbee River. Migration is now made more difficult by barrier dams, and the spawning habitat, characterized as coarse sand and gravel swept by moderate currents, is greatly impoverished.

2 Sites: 151 and 223. Map 10.

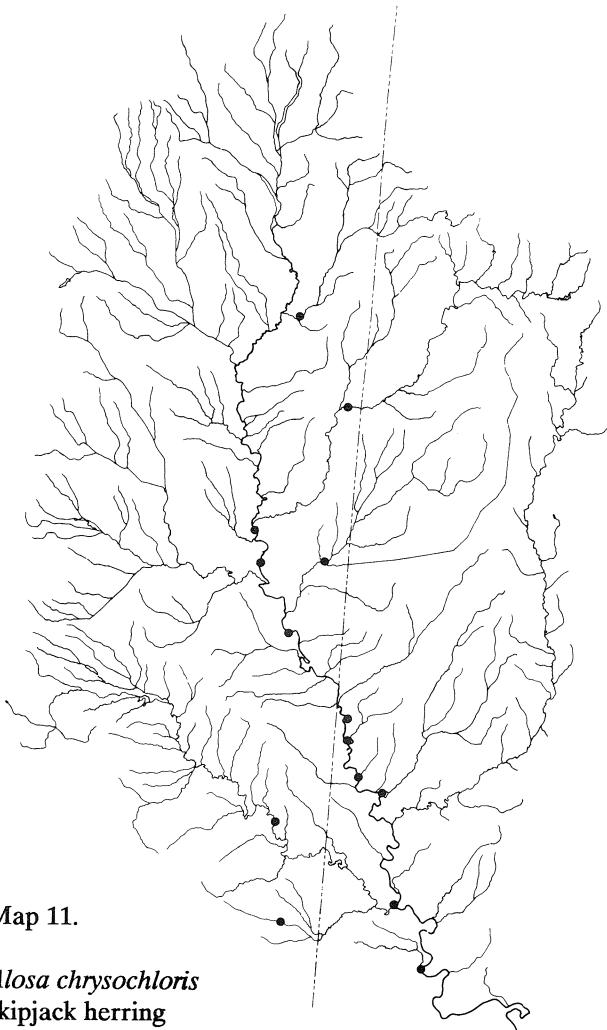

Map 10.

Alosa alabamae
Alabama shad

***Alosa chrysochloris* (Rafinesque) skipjack herring**

Although landlocked populations have become established in impoundments (Coker, 1930), I see little reason to assume that the fate of the skipjack herring in the upper Tombigbee will not follow that of the Alabama shad. Current-swept gravel is the spawning habitat (Wolfe, 1969).

14 Sites: 8, 16, 29, 93, 129, 132, 134, 138, 156, 167, 223, 225, 250, and 310. Map 11.

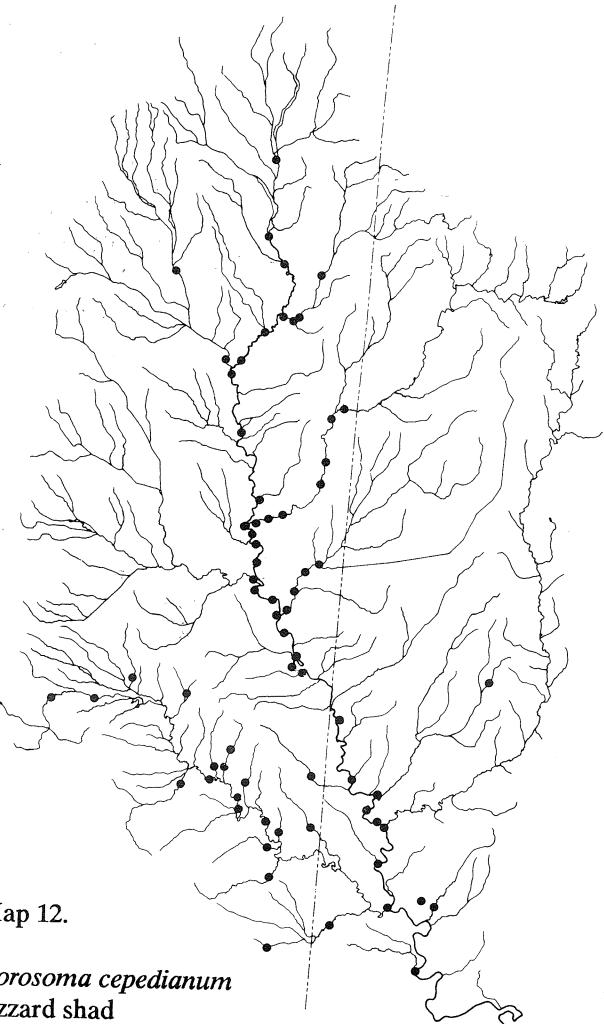

Map 11.

Alosa chrysochloris
skipjack herring

***Dorosoma cepedianum* (Lesueur) gizzard shad**

Requirements for success of this species are provided in the TTW.

69 Sites: 8, 10, 12, 13, 17, 20, 24, 27-29, 32, 39, 40, 42, 43, 45, 49, 56, 71, 76, 82, 87, 93, 95, 97, 122, 123, 126, 129, 131, 132, 138, 150, 151, 153, 156-158, 163, 164, 167, 193-195, 223-225, 229-232, 237, 239, 241, 250, 266, 282, 287, 288, 296, 303, 304, 307, 308, 310, 312, 322, 325, and 335. Map 12.

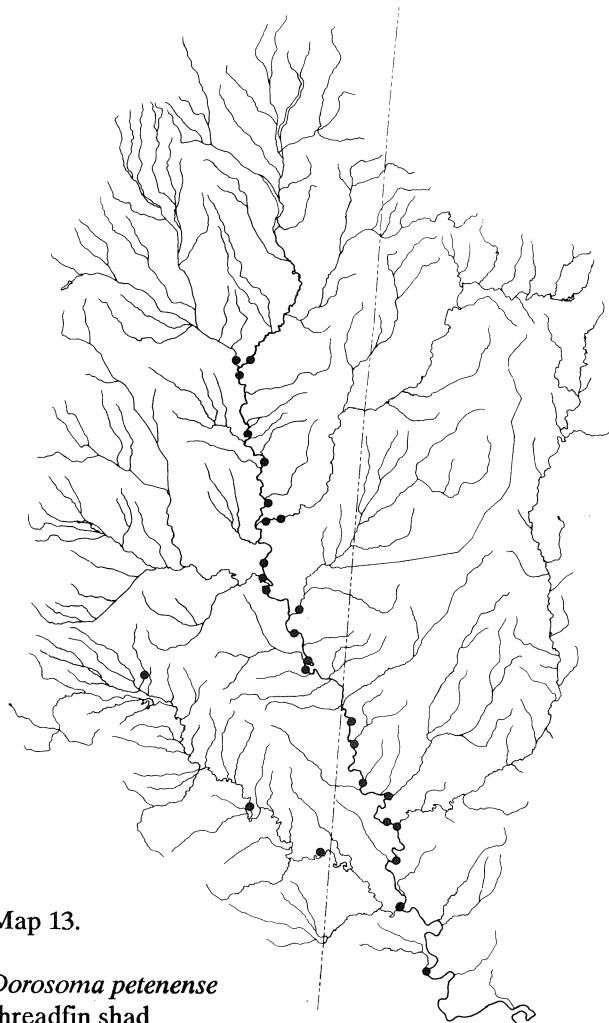

Map 12.

Dorosoma cepedianum
gizzard shad

Dorosoma petenense (Gunther)

Like the gizzard shad, the threadfin shad will be successful in the impoundments of the TTW. Its high biotic potential, rapid growth, feeding strategy, and small size make it a desirable forage fish.

27 Sites: 8, 22, 39, 76, 93, 96, 97, 122, 129, 132, 134, 138, 151, 153, 156, 158, 194, 195, 223, 230, 231, 266, 270, 282, 287, 288 and 303. Map 13.

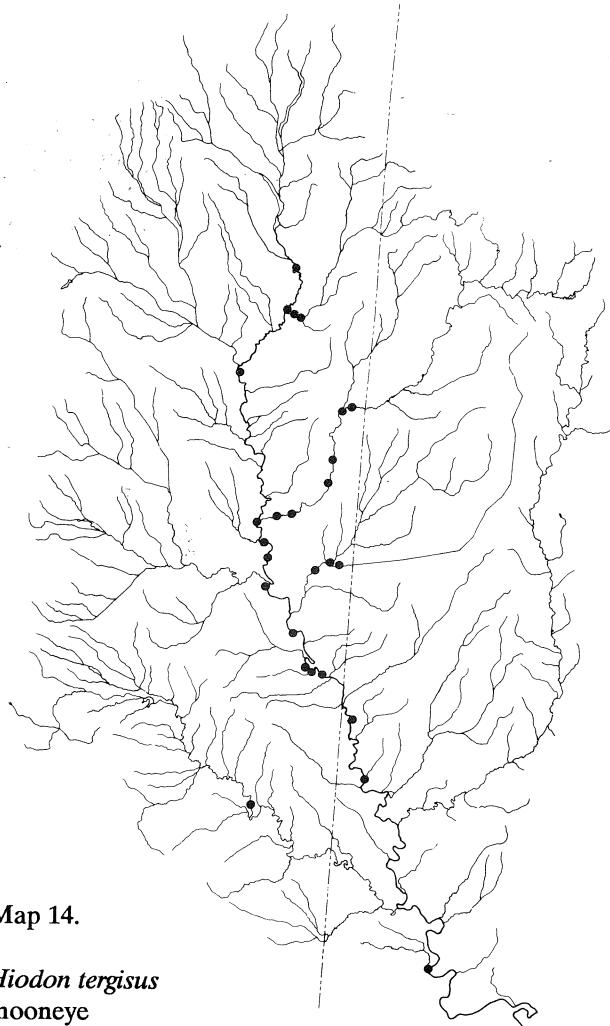

Map 13.

Dorosoma petenense
threadfin shad

threadfin shad**HIODONTIDAE — mooneyes*****Hiodon tergisus* Lesueur****mooneye**

The mooneye is not very tolerant of turbidity (Scott and Crossman, 1973). Its success in the upper Tombigbee will probably depend on the availability of large clear tributaries for spawning.

26 Sites: 8, 39, 132, 138, 149-151, 156, 164, 167, 179, 194, 223, 224, 229, 231, 232, 237, 239, 241, 250, 287, 306-308, and 322. Map 14.

Map 14.

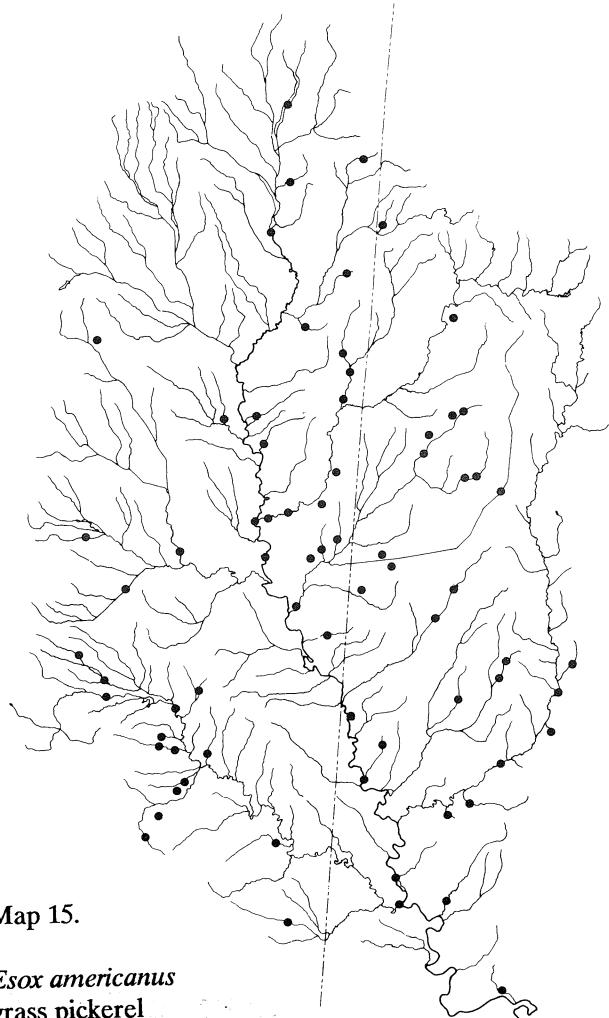

Hiodon tergisus
mooneye

ESOCIDAE — pikes

Esox americanus Gmelin

The upper Tombigbee is the western edge of the area of intergradation between *E. a. americanus*, the redfin pickerel, and *E. a. vermiculatus*, the grass pickerel (Crossman, 1966). The habitat of *E. americanus* is such that it should not be adversely affected by the TTW. This pickerel is often associated with *Justicia*.

72 Sites: 2, 10, 16, 27, 51, 54, 55, 59, 64, 66, 67, 69, 71, 73, 78, 79, 82, 93, 94, 98, 100, 101, 104, 106, 108, 124, 126, 127, 132, 133, 138, 140, 141, 154, 158, 162, 165, 166, 168, 172-177, 186, 187, 190, 204, 208, 210, 221, 223, 229, 230, 232, 233, 238, 242, 244, 245, 256, 272, 277, 283, 309-311, 314, 320, 325, 334, and 339. Map 15.

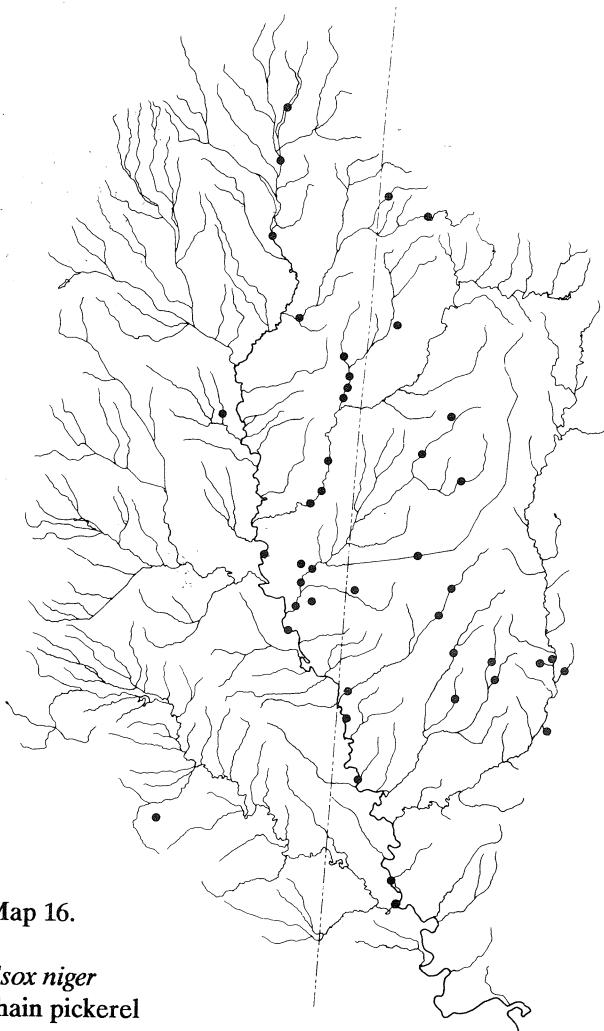

Esox niger Lesueur

chain pickerel

The habitat of the chain pickerel seems to be more variable than that of the redfin pickerel. Nevertheless, the chain pickerel is far less common. It may be found in heavily vegetated impoundments to large, high-gradient streams.

43 Sites: 59, 93, 94, 101, 104, 108-110, 124-126, 128, 132, 138-141, 156, 158, 159, 162-165, 172, 174, 176, 189, 223, 234, 235, 239, 242-246, 277, 310, 318, 321, 325, 335, and 339. Map 16.

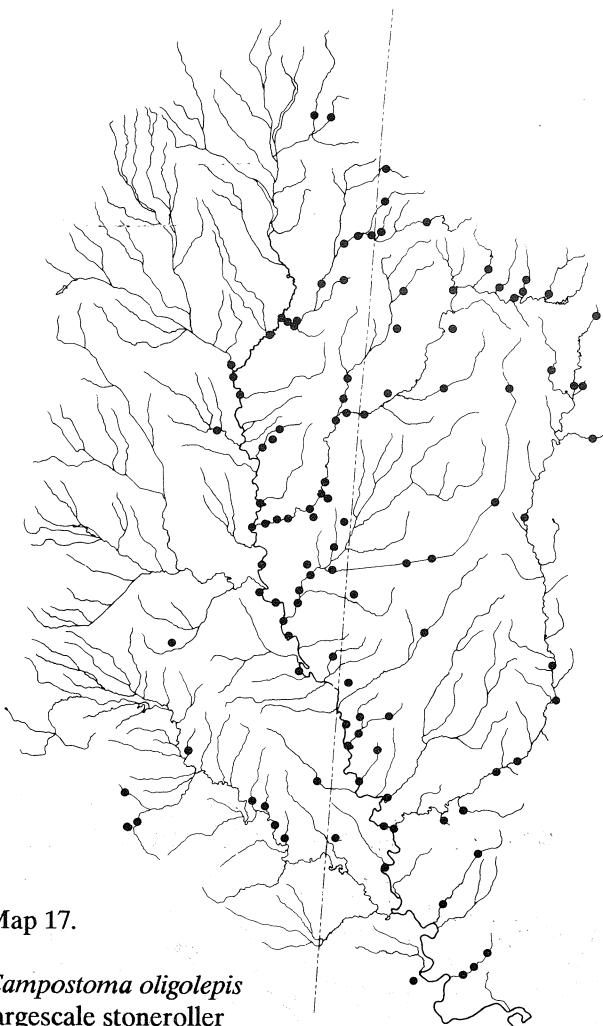

CYPRINIDAE — carps and minnows

Campostoma oligolepis Hubbs and Greene
largescale stoneroller

Campostoma anomalum (Rafinesque)

Campostoma oligolepis was originally described as a subspecies of *Campostoma anomalum*. It was redescribed and elevated to species status by Pflieger (1971), and later confirmed by Burr and Smith (1976). Distributional status of the species in southeastern United States was clarified by Burr and Cashner (1983). Literature pertaining to *Campostoma oligolepis*, especially upper Tombigbee populations, should be searched under *C. anomalum*. This species is affected by the TTW to the extent that its habitat is inundated.

111 Sites: 4-7, 10, 11, 18, 28-31, 60-62, 65, 95, 97, 98, 100, 101, 103, 106, 110, 114, 116, 118-122, 129, 131-138, 140, 144, 148, 151, 156, 157, 161-165, 168, 169, 179, 188-191, 193, 194, 201, 223, 229-237, 241, 243, 244, 246, 249-251, 253, 255, 256, 258, 259, 261, 262-266, 272-274, 279, 284, 287, 288, 304, 306-308, 310-312, 315-321, 345, and 346. Map 17.

Cyprinella callistia (Jordan)

Alabama shiner

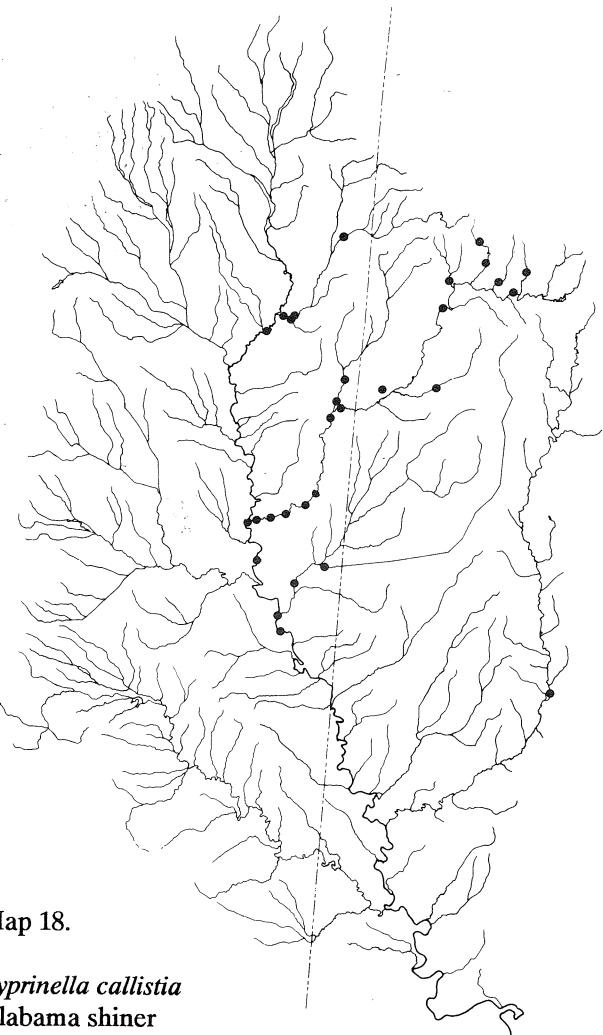

Photogenus callistius Jordan

Notropis callistius (Jordan).— recent authors

Cyprinella callistia.— Mayden, 1989

The habitat of the Alabama shiner is typically clear, free-flowing, rubble- or gravel-bottomed upland streams of moderate size. The TTW will exclude the species from the lower reaches of the larger tributaries.

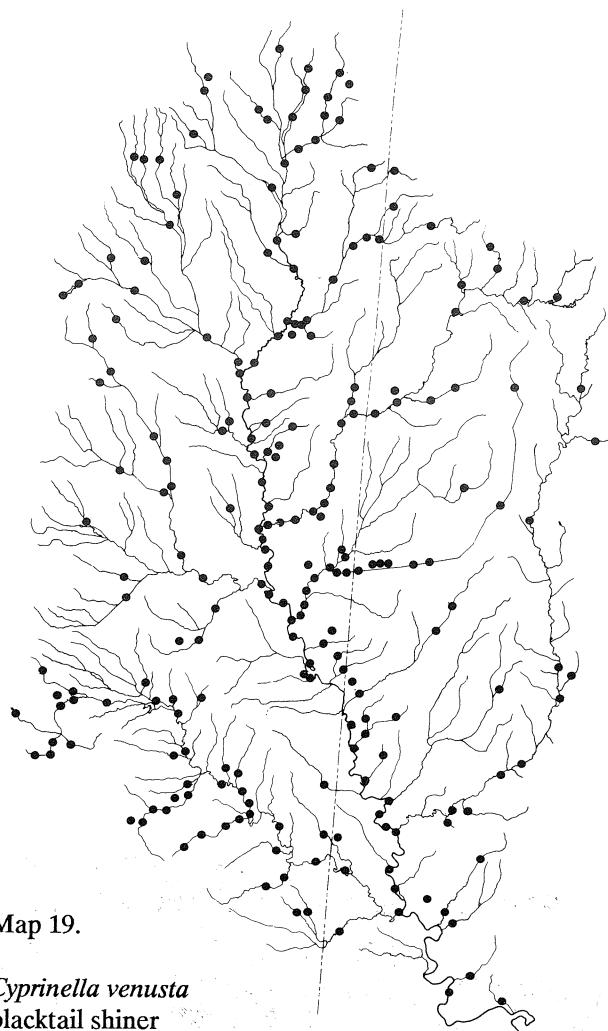

30 Sites: 106, 156, 157, 163, 179, 223, 229-232, 234, 235, 241, 242, 244, 250, 253, 255, 257-262, 264, 304, 307, 308, 310, and 316. Map 18.

Cyprinella venusta Girard**blacktail shiner***Notropis venustus* (Girard).— recent authors*Cyprinella venusta*.— Mayden, 1989

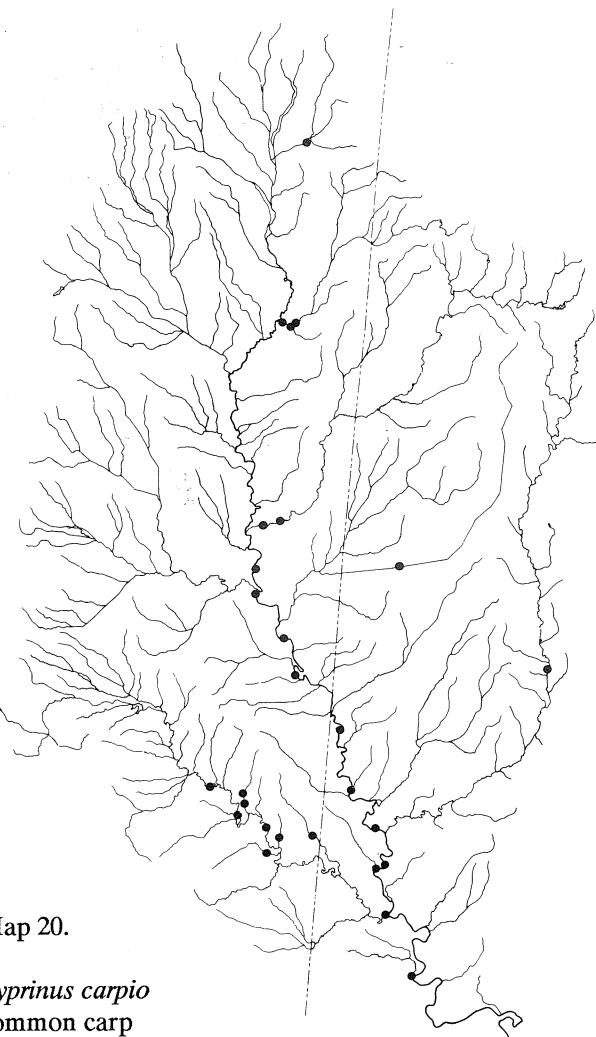

The most common habitat of the blacktail shiner is clear, sand-bottomed streams of moderately large size, but upland populations occur over substrates with more gravel and rubble (Gilbert and Burgess, 1980). In some areas, it is found in the placid waters of lakes and bayous (Douglas, 1974). The species should not be adversely affected by the TTW.

224 Sites: 2, 3, 4, 9-15, 18, 19, 21, 22, 24, 25, 27, 29, 35-42, 45, 49, 54-58, 61, 62, 66, 68, 71, 73-76, 82-95, 97-101, 103, 106, 108, 110, 114, 116, 120, 122, 123, 126, 129, 131-141, 144, 147, 148, 150, 151, 153-158, 161, 163, 164, 165, 167, 168, 170, 176, 179, 180, 182-184, 186, 188-191, 193-196, 200, 201, 203-205, 209-212, 215-219, 222-226, 229-235, 237, 239, 241, 243, 244, 250-255, 257-260, 262, 265, 266, 268, 271-274, 276, 277, 279, 282, 283-285, 287-295, 297, 299-310, 312, 314-319, 321-323, 325, 326, 328, 330, 332, 333, 335-343, and 345-349. Map 19.

**Cyprinus carpio Linnaeus****common carp**

The common carp, a native of Asia, was introduced into Europe about 600 years ago, and into the United States in 1831 according to Smallwood and Smallwood (1929). Common carp have increased greatly due to the favorable habitat provided by the TTW. The common carp spawns by broadcasting eggs over submerged rooted vegetation, logs, or debris. It is likely that, in the future, we will see more commercial use of the species as its numbers increase.

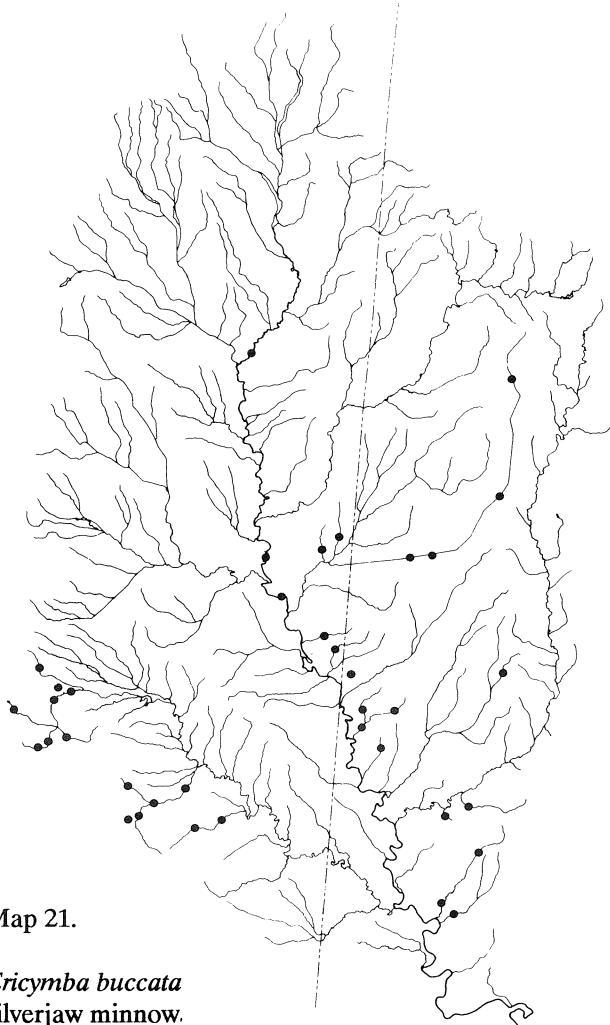

27 Sites: 8, 19, 27-29, 31, 32, 39, 49, 93, 95, 96, 110, 122, 132, 138, 151, 156, 188, 194, 223, 231, 232, 307, 308, 310, and 343. Map 20.

***Ericymba buccata* Cope**

The silverjaw minnow is limited to streams with shifting sand substrates. The effect of the TTW on the species depends on the extent that the minnow's habitat is inundated.

37 Sites: 9-11, 36, 56, 58, 60-62, 84-88, 90-92, 98, 100, 127, 133, 135-137, 144, 148, 154, 166, 168, 188-191, 193, 223, and 303. Map 21.

Map 21.

Ericymba buccata

silverjaw minnow***Extrarius* sp cf *aestivalis*****an undescribed chub**

Hybopsis sp cf *aestivalis* (Girard)

Extrarius sp cf *aestivalis*.— Mayden, 1989

Carter Gilbert is revising the *aestivalis* complex. He recognizes two physiographically-separated species in Mobile basin. Above the Fall Line, the complex is characterized by having 1,4-4,1 pharyngeal teeth, dorsal fin farther back, shorter snout, scales crossing posterior part of belly, and a darker and more heavily speckled body. The species below the Fall Line has 0,4-4,0 pharyngeal teeth, dorsal fin farther forward, longer snout, scales not crossing posterior part of belly, and lighter in color. It is highly likely that only the latter species occurs in the upper Tombigbee. The habitat of the speckled chub is sand or fine gravel in the current of channels of large streams. Spawning occurs in deep, swift water, and the eggs develop rapidly as they drift in the stream current (Bottrell, 1964). This chub is severely jeopardized by the TTW; however, there is some indication that it is moving into the large tributaries of the upper Tombigbee.

28 Sites: 29, 93-95, 97, 122, 132, 138, 151, 156-158, 163, 193, 194, 223, 224, 229-231, 270, 276, 284, 287, 288, 304, 306, and 322. Map 22.

Map 22.

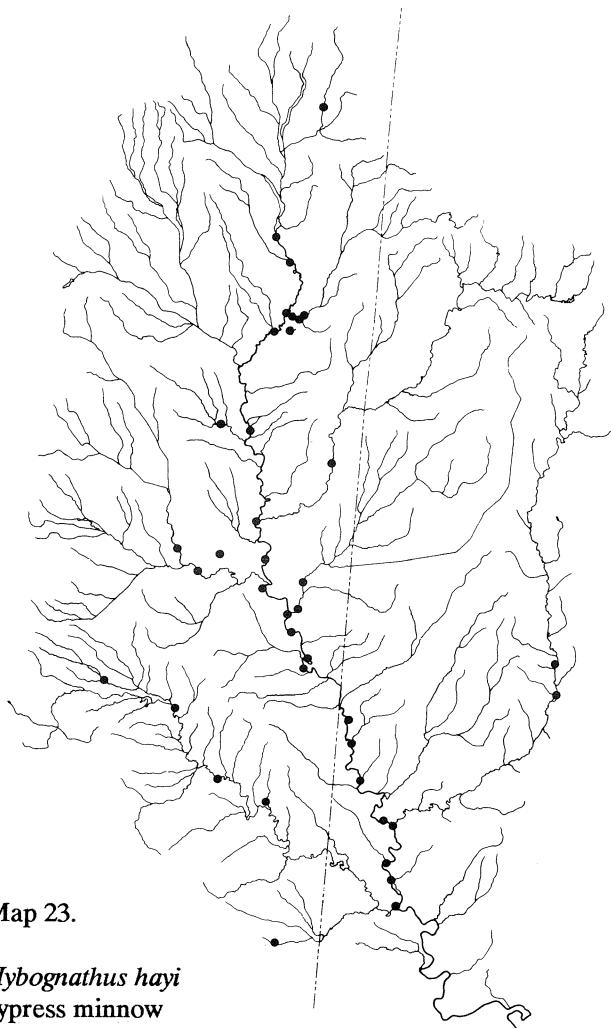

Extrarius sp cf *aestivalis*
an undescribed speckled chub

Hybognathus hayi Jordan

The habitat of the cypress minnow is sluggish pools and backwaters of low-gradient portions of medium and large rivers of the Coastal Plain. *Hybognathus hayi* sometimes is difficult to distinguish from *H. nuchalis*; aid in their identification is provided by Fingerman and Suttkus (1961) and Burr and Mayden (1982a). Preliminary indications are that the TTW has drastically affected the occurrence and abundance of *H. hayi* in the upper Tombigbee (Boschung, 1987).

39 Sites: 17, 30, 49, 73, 78, 93-95, 97, 106, 110, 122, 132, 134, 138, 151, 153, 156-158, 163, 194, 202, 203, 210, 223, 229, 239, 279, 282, 304-308, 310, 322, 325, and 346.

Map 23.

Map 23.

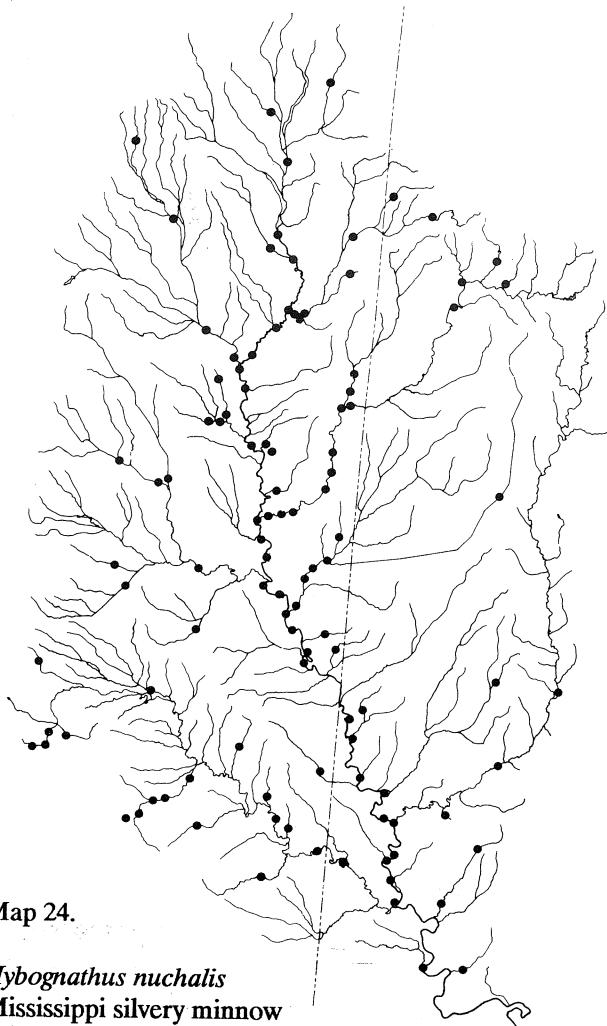

Hybognathus hayi
cypress minnow

Hybognathus nuchalis Agassiz

Mississippi silvery minnow

The habitat is similar to that of *H. hayi*, but *H. nuchalis* is less tolerant of turbid waters, and it occupies small streams as well as the large ones (compare maps 23 and 24). This minnow has declined greatly in numbers or disappeared entirely from several large areas, such as parts of the upper Missouri (Pflieger, 1975; Becker, 1983), southern Ohio (Trautman, 1957), and the Tennessee River (Etnier et al., 1979). The role of the large rivers and streams in the life cycle of *H. nuchalis* is not known. Preliminary studies (Boschung, 1987) indicate that the TTW has adversely affected the distribution and abundance of *H. nuchalis* in the upper Tombigbee.

107 Sites: 4, 8, 10, 11, 21, 22, 25, 28-30, 37, 43, 56-58, 61, 62, 75, 84, 88-91, 93-98, 101, 106, 122, 126, 129, 131, 132, 134, 136, 138, 148, 151, 153, 154, 156-158, 163, 164, 167, 168, 190, 193, 194, 200, 203, 204, 205, 211, 212, 215, 223, 224, 229, 230-232, 235, 237, 239, 241, 243, 244, 250, 257-259, 261, 267, 271, 272, 276-280, 284, 287-289, 297, 299, 303, 304, 306-308, 310, 311, 316, 318, 321-323, 325, and 335-347. Hybopsis winchelli (Girard)

Hybopsis amblops (Rafinesque)

Hybopsis winchelli.— Clemmer, 1971.— Clemmer, 1980

Considered for many years a subspecies of *H. amblops*, the clear chub was elevated to species status by Clemmer (1971). Generally, it is in major streams and large tributaries over mixed sand and silt of pools adjacent to riffles (Clemmer, 1980). The clear chub will be affected by the TTW to the extent that its habitat is inundated.

57 Sites: 8, 10, 56-58, 62, 93-97, 101, 122, 132, 135, 138, 150, 151, 153, 156, 158, 163, 164, 170, 180, 189, 190, 194, 223, 229-232, 239, 241, 244, 250, 251, 258, 266, 270, 276, 284, 287, 288, 303, 304, 306-308, 310, 317, 322, 325, 336, 343, and 346. Map 25.

Hybopsis sp of longirostris

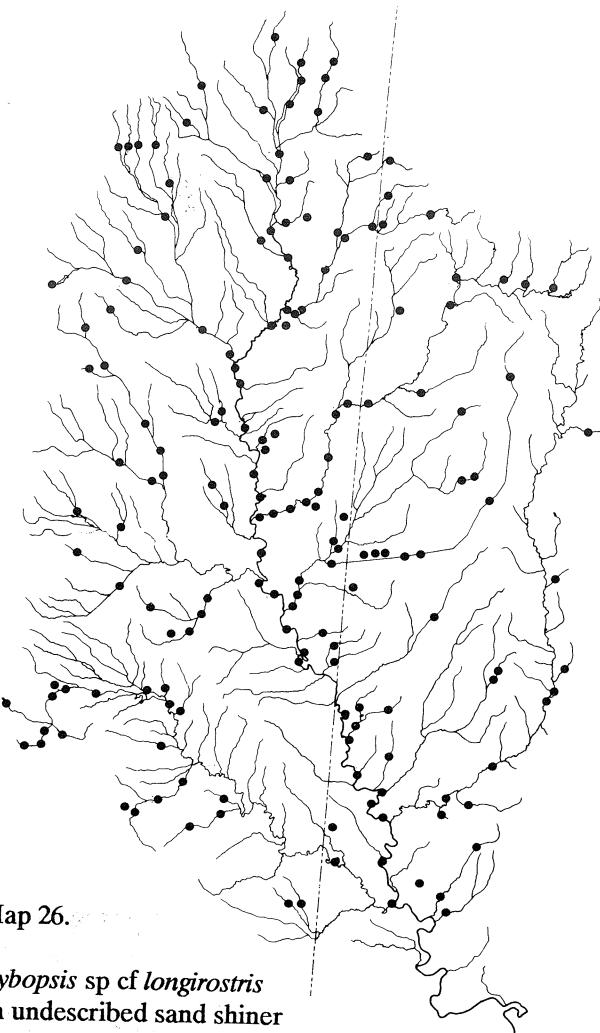

Alburnops longirostris Hay

Notropis longirostris (Hay)

Hybopsis sp of longirostris.— Mayden, 1989

This shiner is limited in distribution to Mobile basin (mostly below the Fall Line); Yellow Creek, a tributary to the Tennessee in northeast Mississippi; and the headwaters of Hatchie River in north Mississippi. It has 0,4-4,0 pharyngeal teeth and 7 anal rays. The habitat is clear, small to moderate size streams with clean sand or sand and gravel substrates. It is rarely found above the Fall Line, but not uncommon in the main river pre-TTW.

169 Sites: 9-12, 14, 15, 18, 21, 34, 36, 37, 56, 57, 61, 62, 67, 70, 73-75, 82, 85-93, 95, 98-101, 105, 106, 108, 112, 116, 122, 123, 126, 127, 129, 130, 132, 134-138, 140, 147, 148, 151, 153, 154, 156, 158, 161-163, 168-170, 175-177, 179, 183, 184, 186, 188-191, 193-197, 199-201, 204, 206, 207, 209, 211, 212, 215-219, 222, 223, 226, 227, 230-235, 239, 241, 247, 250, 251, 254, 257, 258, 261, 263, 265, 266, 268, 271-273, 277, 279, 282, 284, 287-291, 293, 295, 297-302, 304, 305, 307, 308, 310, 312-316, 318-323, 325-328, 330, 332, 334-336, 338-341, 346, 347, and 349. Macrhybopsis storeriana* (Kirtland)Rutilus storerianus* Kirkland*Hybopsis storeriana* (Kirkland).— recent authors*Macrhybopsis storeriana*.— Mayden, 1989

The silver chub is a large stream fish that inhabits quiet pools and backwaters. Its drastic reduction in Gainesville and Aliceville pools (Boschung, 1987) may be attributable to difficulty in seining the pools and channels rather than an effect of the TTW.

42 Sites: 8, 10, 29, 39, 40, 68, 82, 93-95, 97, 106, 122, 129, 132, 135, 138, 150, 151, 156, 158, 163, 164, 170, 179, 193, 194, 210, 223, 224, 229-231, 237, 239, 241, 250, 284, 310, 316, 322, and 325. Map 29.

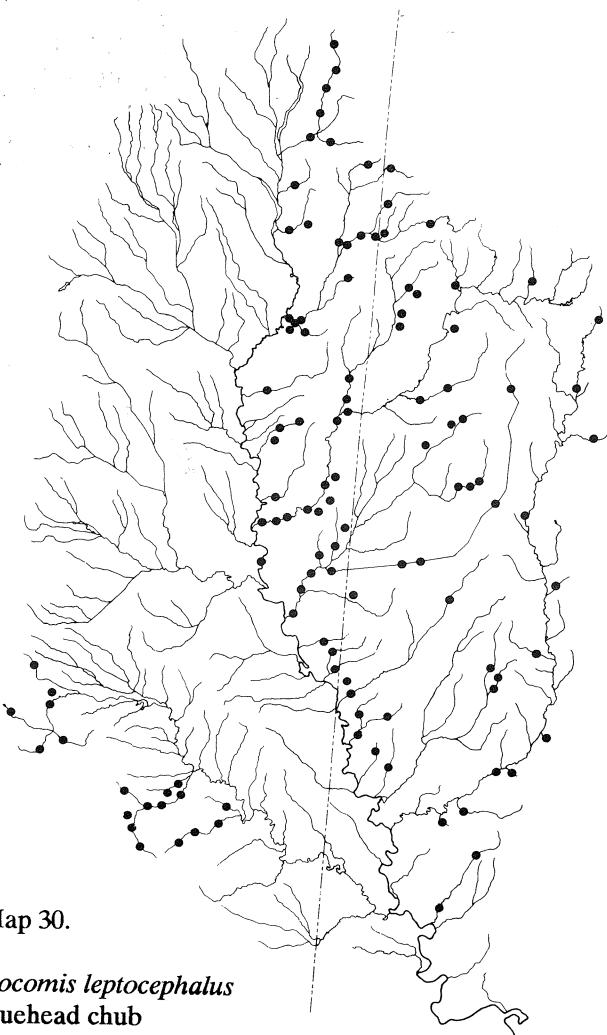

Map 29.

Macrhybopsis storeriana
silver chub

silver chub***Nocomis leptocephalus* (Girard)****bluehead chub**

The bluehead chub occurs in clear to turbid, small to medium-sized streams, and over substrates varying from bedrock to mud. For spawning, it requires gravel riffles (Jenkins and Lachner, 1980). Their upland distribution removes them, for the most part, from adverse affects of the TTW.

115 Sites: 10, 11, 34, 36-38, 54-58, 60, 62-64, 84, 86-88, 90, 92, 98, 100-102, 104, 111, 112, 114, 116, 120, 121, 126-128, 130, 133, 135-137, 139, 141, 144, 147, 148, 154, 158, 162-164, 166, 168, 169, 173-179, 188-191, 223, 230-234, 236-238, 241, 243, 244, 246-250, 254-256, 258, 264, 267, 273-275, 285, 305, 307-311, 313-321, 326, 327, 334, 343, 344, 346, 347, 349, and 352. Map 31.

Notemigonus crysoleucas
golden shiner

Notropis atherinoides* Rafinesque*emerald shiner**

In the upper Tombigbee of pre-TTW days, the emerald shiner was virtually limited to open channels of the river and the largest tributaries. Indications are that the species will be adversely affected by the TTW.

31 Sites: 3, 8, 10, 22, 29, 40, 56, 93, 95, 97, 122, 134, 138, 151, 153, 156, 157, 170, 194, 210, 223, 230, 232, 237, 268, 284, 287, 289, 303, 322, and 323. Map 32.

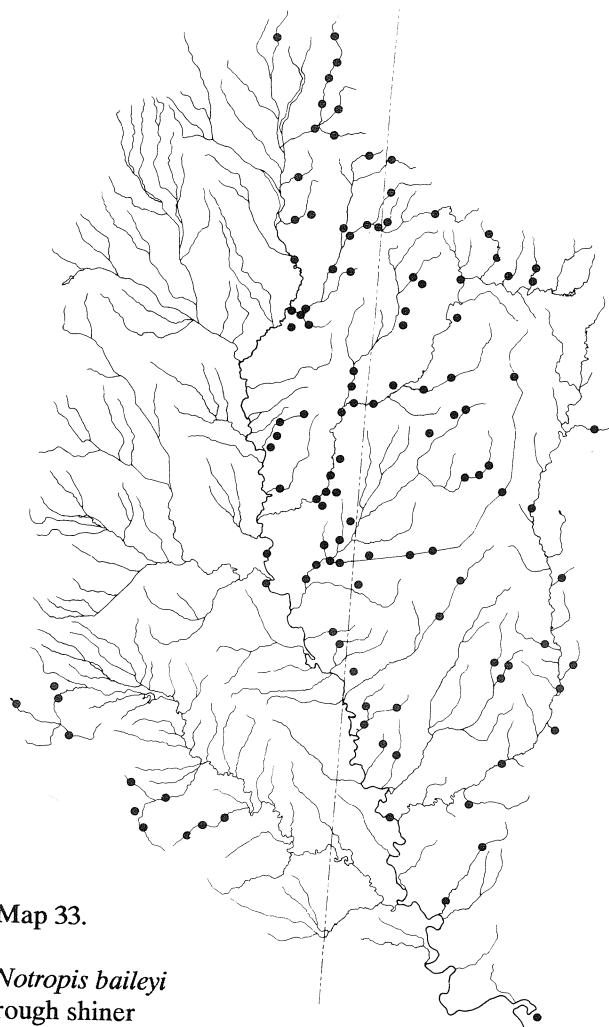

Map 32.

Notropis atherinoides
emerald shiner

Notropis baileyi* Suttkus and Raney*rough shiner**

The habitat of the rough shiner — small, moderate- to high-gradient streams with clean sand or gravel substrates — is, for the most part, unaffected by the TTW.

115 Sites: 1, 10, 11, 36-38, 57, 60, 62, 63, 86-88, 92, 100, 101, 104, 106, 108, 111, 112, 114, 116, 122, 126-128, 130, 133, 135-137, 140, 141, 144, 148, 154, 162-164, 166-169, 173-179, 183, 188-191, 194, 223, 233-238, 241, 243, 244, 246-251, 253-256, 258-261, 263, 264, 267, 271, 273-275, 305, 307-322, 326, 327, 334, 338, 343-347, 349, and 352. Map 33.

Map 33.

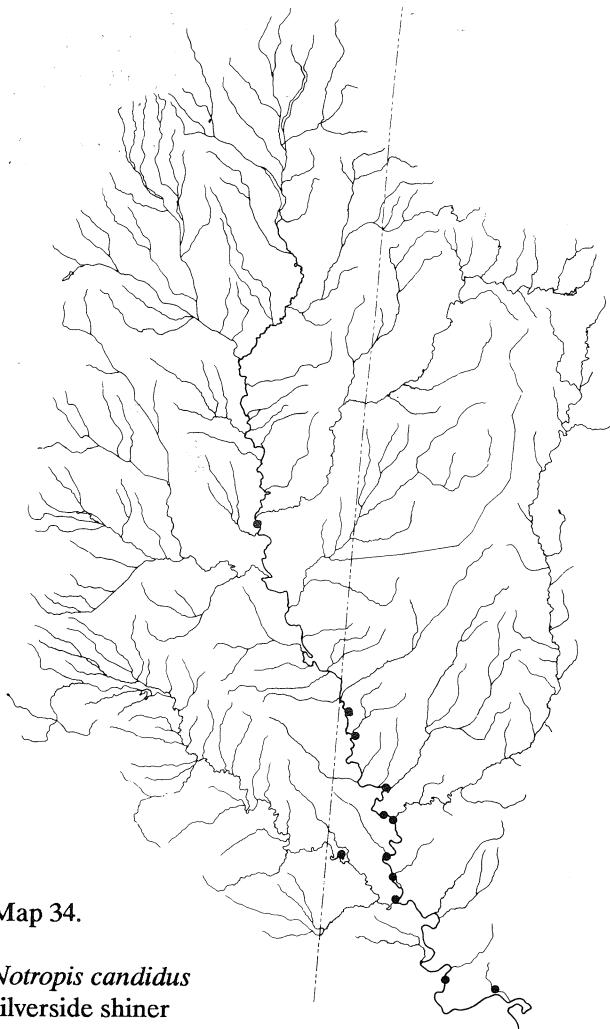

Notropis baileyi
rough shiner

Notropis candidus* Suttkus*silverside shiner**

Notropis shumardi (Girard), in part.

Schultz (1969) reported the "silverband shiner" from the Tombigbee River about 1.5 mi below the mouth of Buttahatchee River (Site 225). Silverband shiner is the common name for *N. shumardi*, the name then given to what is now known in Mobile basin as *N. candidus* (Suttkus, 1980). This record extends the known range of the silverside shiner well into Mississippi. *Notropis candidus* inhabits the main channel of rivers and the lower sections of large tributaries. Its success in the upper Tombigbee is in jeopardy.

12 Sites: 2, 3, 21, 93-95, 97, 122, 129, 134, 138, and 225. Map 34.

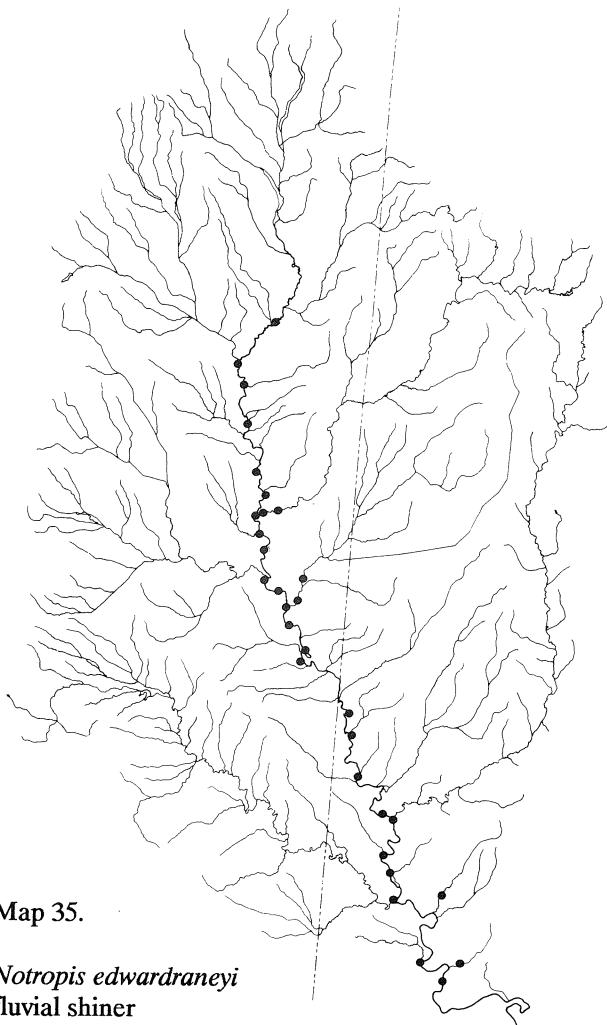

Map 34.

Notropis candidus
silverside shiner

***Notropis edwardraneyi* Suttkus and Clemmer**
fluvial shiner

The fluvial shiner inhabits main river channels where there is moderate current and substrate of sand, gravel, and silt. It may be able to tolerate some modifications imposed by the TTW if ample accumulations of sand are available for spawning sites; however, their numbers greatly decreased in Gainesville and Aliceville pools (Boschung, 1987).

31 Sites: 3, 4, 8, 10, 93-95, 97, 122, 132, 134, 138, 151, 153, 156-158, 163, 193, 194, 223, 224, 229-231, 266, 268, 282, 284, 287, and 304. Map 35.

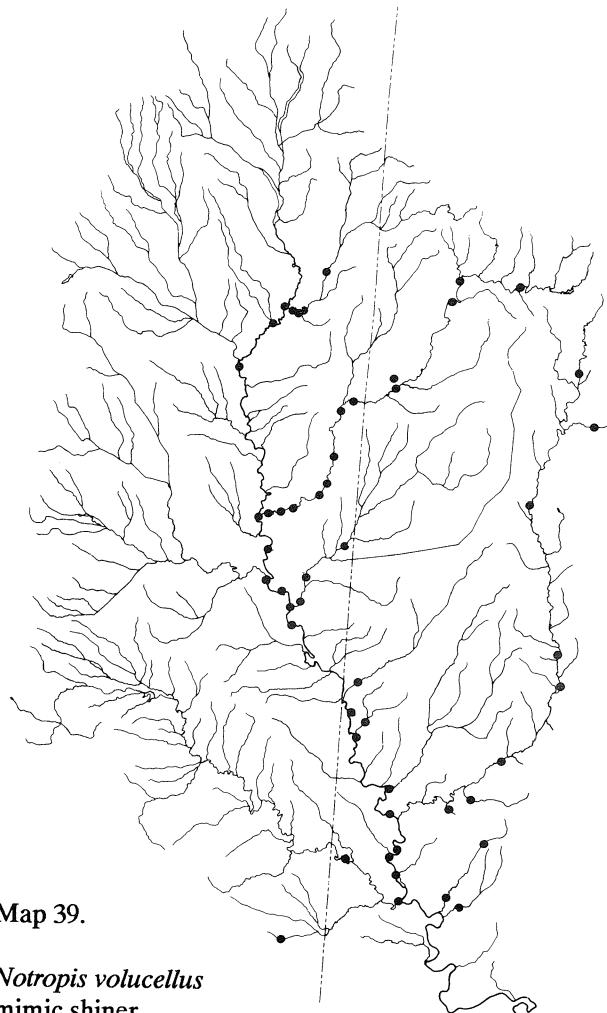

Map 38.

Notropis texanus
weed shiner

***Notropis volucellus* (Cope)**

The mimic shiner inhabits clear streams ranging in size from medium-sized creeks to large rivers. Its omnivorous feeding habits and simple reproductive strategy protect it somewhat against adversity imposed by the TTW.

52 Sites: 9-11, 17, 21, 93-96, 98, 100, 101, 106, 110, 114, 116, 120, 122, 129, 134, 135, 138, 139, 156-158, 163, 170, 193, 194, 223, 229-232, 234, 235, 239, 241, 250, 252, 253, 257, 258, 262, 287, 304, 306-308, 310, and 312. Map 39.

Map 39.

Notropis volucellus
mimic shiner

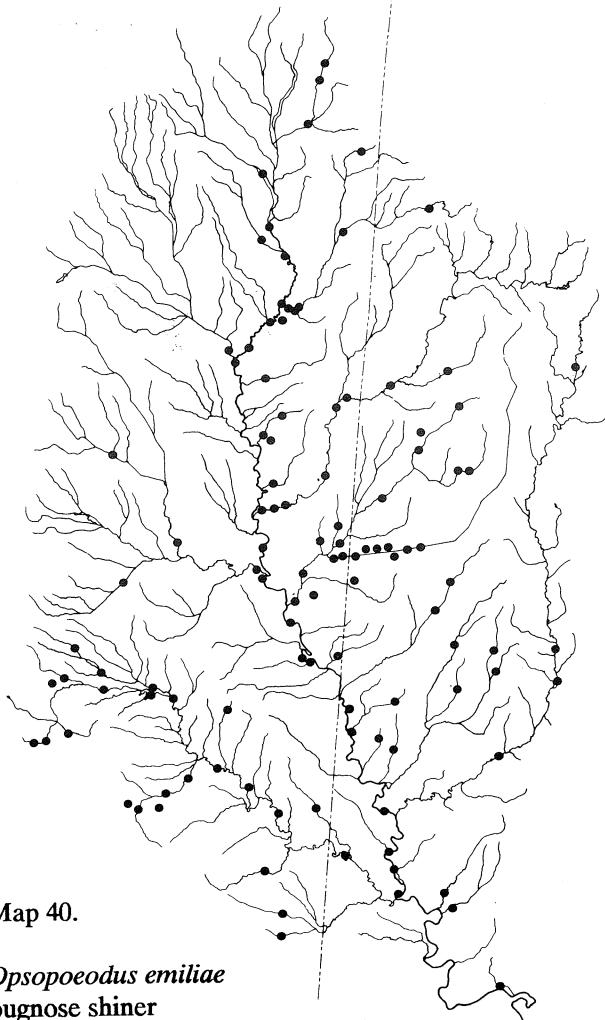

mimic shiner***Opsopoeodus emiliae* Hay**

Notropis emiliae (Hay).—recent authors

Type locality Horsehunter Creek, near Noxubee River, Macon, Mississippi.

The pugnose minnow occurs in clear, sluggish, often weedy water (Gilbert, 1980) to sluggish, turbid streams with muddy a bottom and no vegetation (Becker, 1983). It occupies a variety of habitats in the upper Tombigbee, and there are no indications that the species will be adversely affected by the TTW.

111 Sites: 2, 9, 10, 16, 17, 20, 21, 25, 29, 40, 48, 49, 56, 57, 59, 61, 62, 73, 75, 78-80, 82, 83, 86, 88, 90, 91, 93-95, 101, 106, 110, 120, 122, 124-126, 128, 130, 133, 134, 137, 138, 140, 141, 147, 150, 151, 156, 158, 159, 162, 163, 166, 168, 170-173, 175-177, 179, 180, 182-184, 186-189, 194, 195, 204, 210, 212, 223, 230-232, 237, 241, 250, 252, 255, 267, 271, 272, 274, 285, 287, 288, 303-308, 310, 314, 316, 321-323, 325, 328, 343, 347, and 349. Map 40.

Map 40.

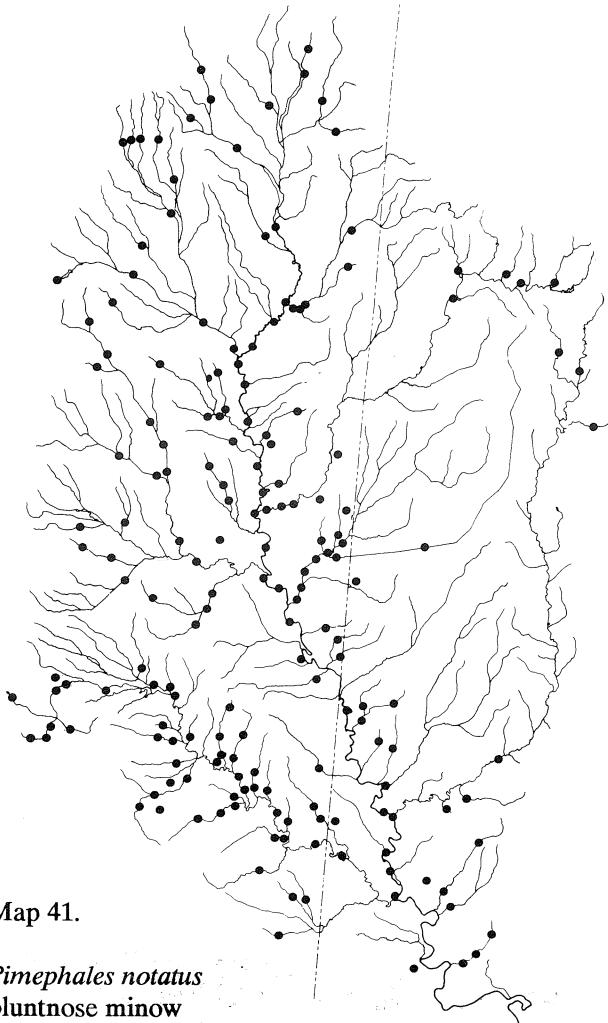

Opsopoeodus emiliae
pugnose shiner

pugnose minnow

Pimephales notatus (Rafinesque)**bluntnose minnow**

The bluntnose minnow is often found in large schools in low-gradient rivers and streams. It should continue to be successful outside the main channel and canals of the upper Tombigbee. Although the bluntnose minnow is tolerant of a rather high degree of turbidity, its habit of making cavity nests under flat objects would be severely hampered by heavy siltation.

189 Sites: 4-7, 9-12, 14, 15, 17-22, 25-33, 35-37, 40-43, 45, 46, 48, 50, 53, 55, 56, 58, 59, 61, 65-67, 69, 73-76, 82, 85-95, 97, 98, 100, 101, 116, 118, 120, 122, 129, 130, 131, 133, 135-138, 146-148, 151, 154, 156, 158, 161-164, 166-170, 179, 189, 193, 194, 196, 197, 199, 200, 202-208, 210-212, 215-220, 222, 223, 226-233, 238, 257, 258, 261, 262, 265-269, 271, 272, 275, 277-282, 284, 287-291, 293, 295, 297-304, 306-308, 310, 311, 316, 323, 325, 329-332, 336, 340, 341, 344, and 346. Map 41.

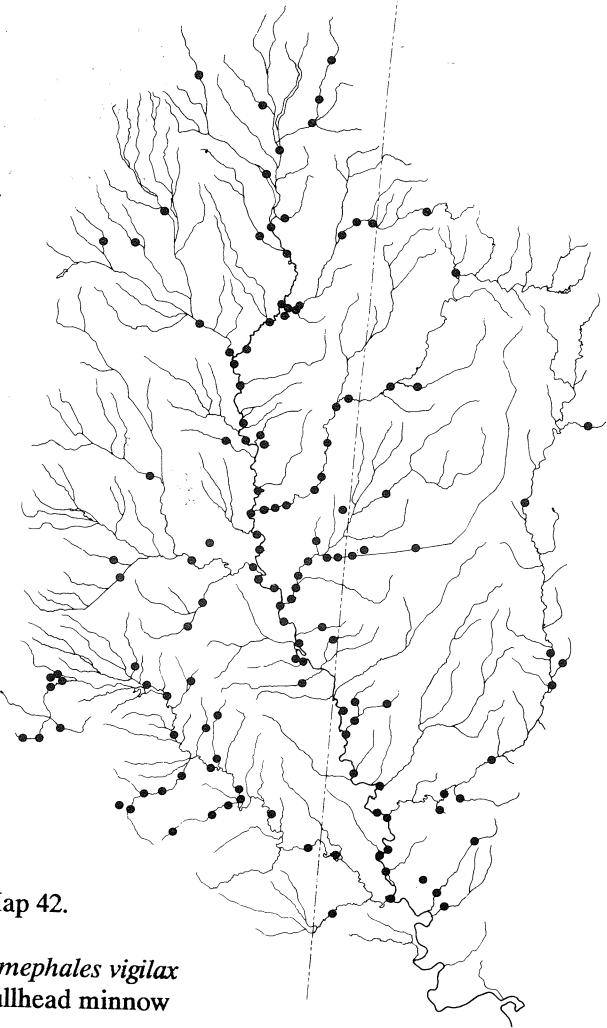

Map 41.

Pimephales notatus
bluntnose minnow

Pimephales vigilax (Baird and Girard)**bullhead minnow**

The habitat and reproductive strategy of *Pimephales vigilax* are similar to that of *P. notatus*, but the former prefers high-gradient portions of streams.

135 Sites: 9-13, 21, 22, 29, 35, 36, 38-40, 45, 47, 49, 52, 56-58, 61, 62, 68, 71, 73, 75, 76, 83, 85-88, 90, 91, 93-101, 106, 108, 110, 114, 116, 122, 129, 132, 134, 135-138, 146, 148, 150, 151, 153, 154, 156-158, 161, 163, 164, 166, 169, 171, 179, 180, 182, 183, 189, 193-195, 197, 200, 202-205, 211, 223, 224, 229-232, 234, 235, 239, 241, 250, 252, 254, 258, 266, 269, 271, 272, 276, 282, 284, 287-289, 294, 295, 297, 303-308, 310, 316, 317, 319, 321-323, 325, 326, 328, 332, 335, 336, 343, 346, and 349. Pteronotropis welaka (Evermann and Kendall)
bluenose shiner

Notropis welaka Evermann and Kendall.— recent authors

Pteronotropis welaka.— Mayden, 1989

Fannye Cook (1959) poetically wrote in reference to the bluenose shiner, "It inhabits weedy streams with beds of deep dark fetid mire." Gilbert (1980) suggests that its spotty distribution and uncommon occurrence may be due to difficulty in sampling suitable habitat. I also suggest that the uncommonness of *P. welaka* results from draining swamps throughout much of its former range.

4 Sites: 110, 125, 126, and 128. Map 43.

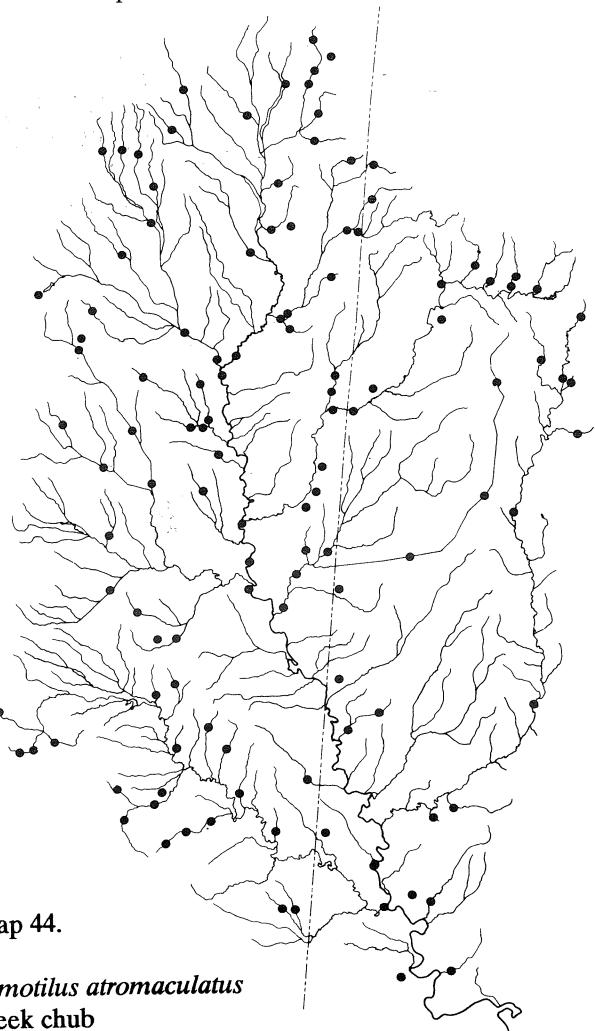

Map 43.

Pteronotropis welaka
bluenose shiner

Semotilus atromaculatus (Mitchill) creek chub

The creek chub occurs in small clear streams. It will be affected by the TTW to the extent that small first and second order streams are inundated.

119 Sites: 4, 7, 10, 12, 14, 15, 18, 28, 31, 36-38, 43, 47, 55, 57, 60, 61, 65, 72, 74, 88, 90, 91-93, 95, 98, 100, 105, 114, 116, 118-121, 131, 135, 137, 144, 158, 162, 164, 166, 170, 189-191, 194, 199-201, 204, 207, 212, 213, 215, 217, 220, 221, 223, 227, 229, 233, 236, 238, 243, 244, 250, 251, 253, 256, 258, 259, 261, 263-265, 269, 277-281, 287-290, 293, 295, 297, 298, 300-303, 308-311, 314, 315, 317-319, 323, 326, 327, 330, 332, 334, 336, 340, 344, 345, 347, 349, 350, and 352. creek chub

Semotilus thoreauianus Jordan*Semotilus atromaculatus* (Mitchill), in part

Semotilus thoreauianus was recently exhumed from the synonymy of *S. atromaculatus* by Johnston and Ramsey (in press). The species is, to my knowledge, limited in the upper Tombigbee to the upper Luxapallila River system. It is distinguished from *S. atromaculatus* by its smaller but more robust body form, a wider and more diffused lateral stripe, dorsal-fin origin behind pelvic-fin origin, larger scales, fewer head tubercles, absence of tubercles from the opercle and first dorsal fin ray and caudal fins, and yellow fins of breeding males.

5 Sites: 173, 174, 175, 176, and 177. Map 45.

CATOSTOMIDAE — suckers

Carpioles cyprinus (Lesueur)

quillback

Apparently, the quillback has never been common in the upper Tombigbee. Pre- and post-TTW specimens were from the main river channel.

11 Sites: 8, 93, 97, 122, 132, 138, 149, 156, 194, 223, and 322. Map 46.

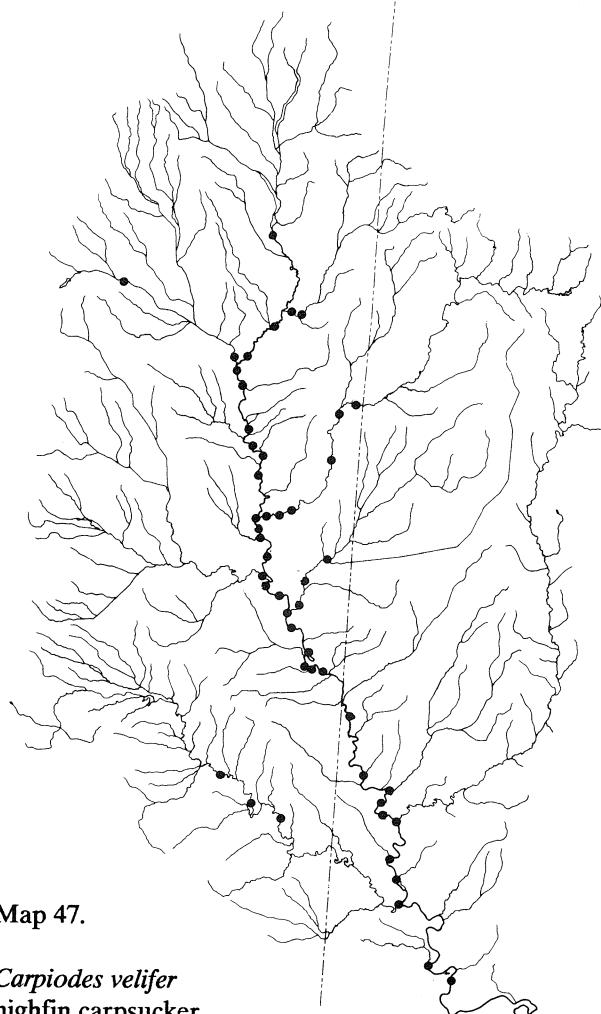

Map 46.

Carpioles cyprinus
quillback

***Carpioles velifer* (Rafinesque)**

In preimpoundment collections, the frequency of occurrence of *Carpioles velifer* was somewhat greater than that of *C. cyprinus*. This trend is expected to reverse in that *C. velifer* appears to be less tolerant of siltation and turbidity (Pflieger, 1975).

49 Sites: 3, 8, 29, 39, 49, 93-95, 97, 122, 123, 129, 132, 138, 149, 150, 151, 153, 156-158, 163, 167, 193-195, 223-225, 229-232, 239, 241, 250, 268, 270, 276, 282, 284, 287, 288, 291, 303, 304, 307, 310, and 325. Map 47.

highfin carpsucker

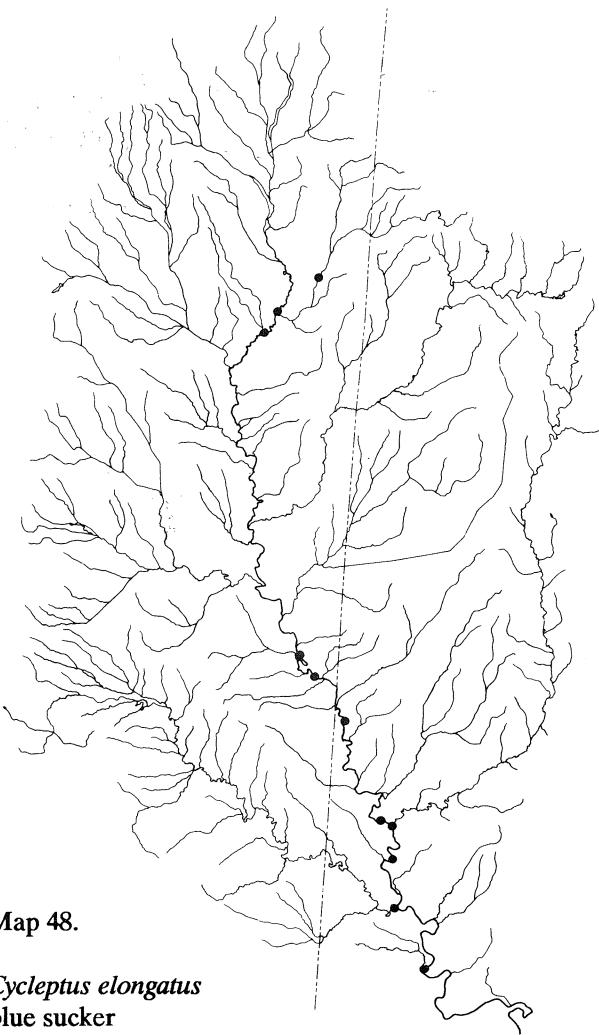

Map 47.

Carpioles velifer
highfin carpsucker

Cycleptus elongatus* (Lesueur)*blue sucker**

The blue sucker is limited to large rivers and lower parts of major tributaries. It usually inhabits channels and flowing pools with moderate current, but seems to do well in some artificial impoundments (Gilbert, 1980). Apparently, it has never been abundant in the upper Tombigbee and its future appears jeopardized. Dams that block spawning migrations (Coker, 1930; Cross, 1967) and decrease current velocity, permitting sediments, are unfavorable to the blue sucker (Pflieger, 1975).

11 Sites: 8, 93, 96, 97, 122, 138, 149, 153, 304, 306, and 312. Map 48.

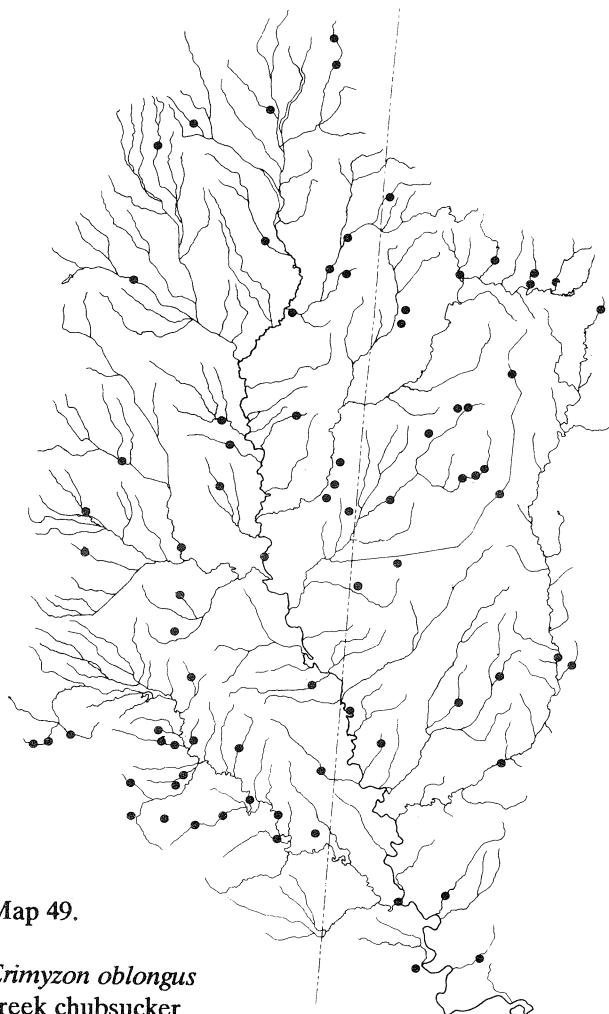

Map 48.

Cycleptus elongatus
blue sucker

Erimyzon oblongus* (Mitchill)*creek chubsucker**

The effect of the TTW on the creek chubsucker depends on the extent that first and second order tributaries are inundated. Adults are usually not taken in large series and the young are typically in headwater rivulets. Populations apparently decline in streams subject to siltation (Wall and Gilbert, 1980).

79 Sites: 5, 7, 10, 23, 27, 29, 36, 37, 39, 43, 54, 55, 59, 60, 62, 65-67, 69, 72, 88, 90, 91, 93, 101, 108, 110, 121, 124, 126, 131, 133, 138, 146, 162, 169, 171, 173-178, 187, 190, 191, 198, 201, 206, 209, 210, 212, 223, 227, 233, 236, 238, 246, 247, 258, 259, 263-265, 269, 275, 279, 291, 302, 307, 311, 312, 316, 318, 323, 330, 336, 349, and 352. Map 49.

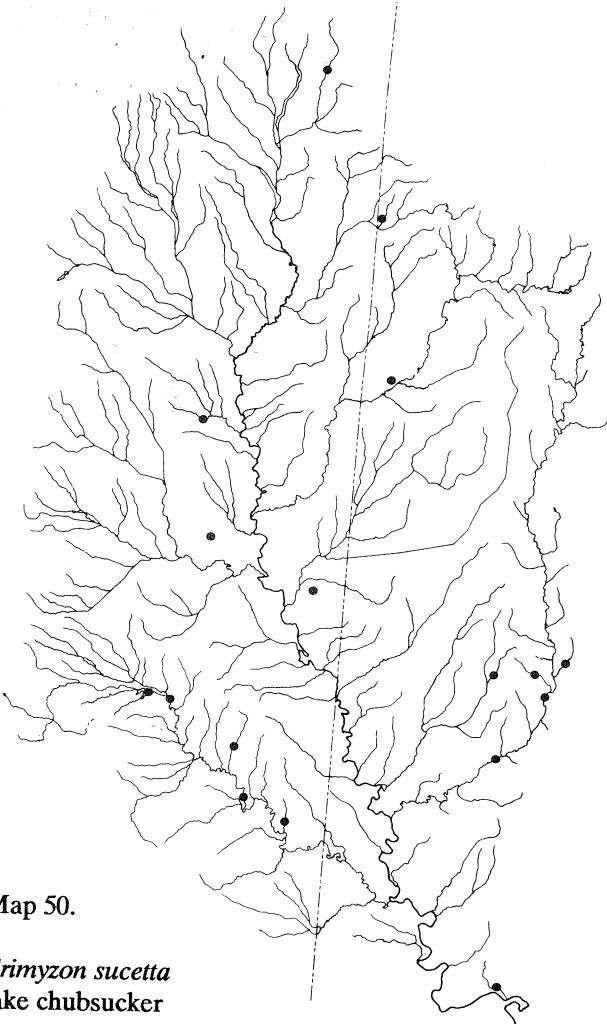

Map 49.

Erimyzon oblongus
creek chubsucker

Erimyzon suetta* (Lacepede)*lake chubsucker**

The habitat of *E. suetta* — ponds, oxbows, sloughs, impoundments, and waters of no flow that are clear and have bottoms of sand and silt mixed with organic debris, and aquatic vegetation (Wall and Gilbert, 1980) — is such that the species may meet with some success in the silt free areas of impoundments associated with the TTW. However, we are reminded that the species has decreased in number or disappeared entirely over much of its range. It is extirpated in Iowa (Harland and Speaker, 1956), and has decreased in Illinois (Smith, 1979), Missouri (Pfleiger, 1975), and Ohio (Trautman, 1957).

17 Sites: 2, 28, 39, 43, 73, 80, 101, 105, 107, 108, 126, 159, 202, 253, 280, 320, and 347. Map 50.

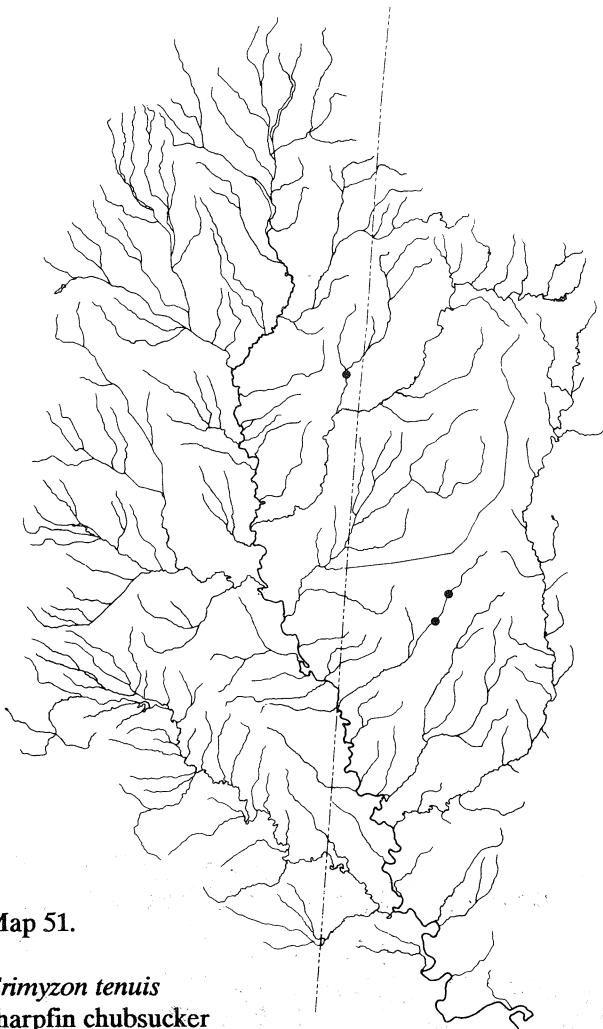

Map 50.

Erimyzon suetta
lake chubsucker

***Erimyzon tenuis* (Agassiz)**

To my knowledge, only one adult specimen of *Erimyzon tenuis* is known from the upper Tombigbee. It is a tuberculate specimen (MSU 1860) collected in the Buttabahatchee, near the confluence with Sipsey Creek (Site 241). Previous reports of *E. tenuis* in the upper Tombigbee (Boschung, 1973, 1984, 1987; Caldwell, 1969) are based on difficult-to-identify juvenile specimens, which are easily confused with either *E. suetta* or *E. oblongus*. However, *E. tenuis* does occur in Coal Fire Creek. One small specimen, 28 mm SL, was collected at Site 140 (UAIC 2184) in 1966; and 10 specimens (21-61 mm SL) were collected at Site 141 (UAIC 4410.08) in 1972. The presence of *E. tenuis* is one of several examples of typically coastal species having somewhat disjunct, small populations in the upper Coastal Plain. Other examples are the swamp darter, *Etheostoma fusiforme*, and the bluenose shiner, *Pteronotropis welaka*.

3 Sites : 140, 141, and 241. Map 51.

Map 51.

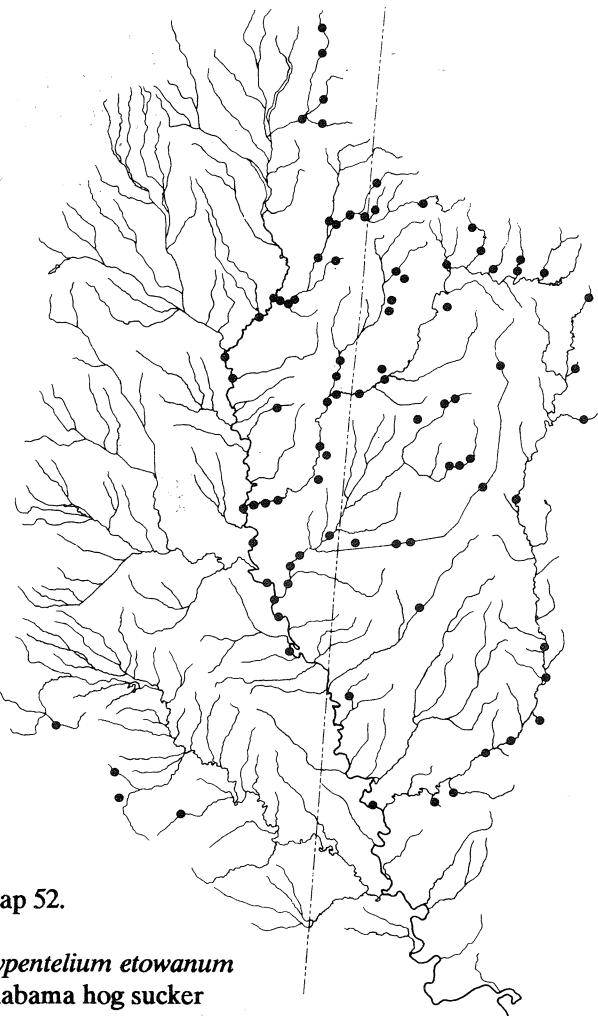

Erimyzon tenuis
sharpfin chubsucker

sharpfin chubsucker***Hypentelium etowanum* (Jordan)**

The Alabama hog sucker inhabits clear, high-gradient streams. The effect of the TTW on its success depends on the extent that the habitat is inundated. In the upper Tombigbee, its preferred substrate of bedrock and gravel is virtually limited to the Fall Line Hills.

86 Sites: 37, 60, 62, 88, 98, 100, 101, 103, 104, 106, 110, 114, 116, 119, 121, 122, 136, 140, 151, 156, 157, 161, 163, 164, 170, 173-178, 183, 188-191, 193, 223, 229-232, 236, 238, 239, 241, 243, 244, 246-253, 256, 258-261, 263-265, 274, 284, 287, 304, 306-308, 310-313, 316-321, 343-345, 349, and 352.

Map 52.

Minytrema melanops* (Rafinesque)*spotted sucker**

The effects of the TTW on the spotted sucker depends on the extent that the habitat is inundated.

53 Sites: 2, 8, 10, 16, 27, 29, 33, 39, 71, 73, 77, 88, 92, 93, 96, 99, 101, 105, 117, 122, 124, 126, 129, 132, 133, 137, 138, 163, 170-172, 175, 182, 217, 232, 237, 239, 242, 255, 284-286, 307-310, 312, 317, 319, 323, 339, 342, and 347. Map 54.

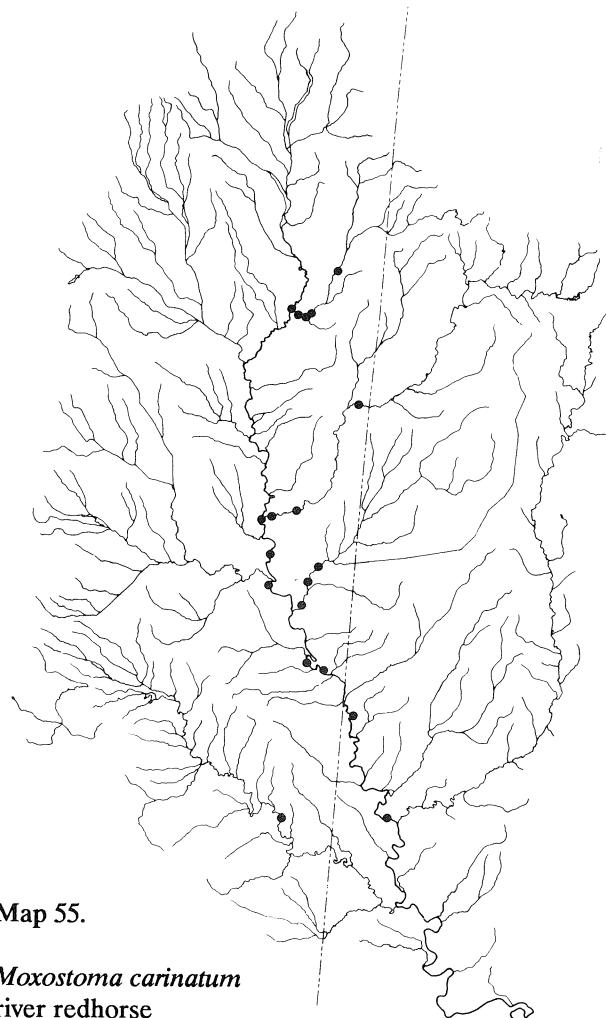

Map 54.

Minytrema melanops
spotted sucker

***Moxostoma carinatum* (Cope)**

The future of the river redhorse in the upper Tombigbee will depend on the success the fish has in using the larger tributaries for spawning. Impoundment of rivers and the subsequent loss of gravel shoals contribute significantly to the demise of the river redhorse (Hackney et al., 1968).

19 Sites: 29, 122, 138, 149, 151, 158, 163, 164, 194, 223, 229, 230, 232, 250, 306-308, 310, and 312. Map 55.

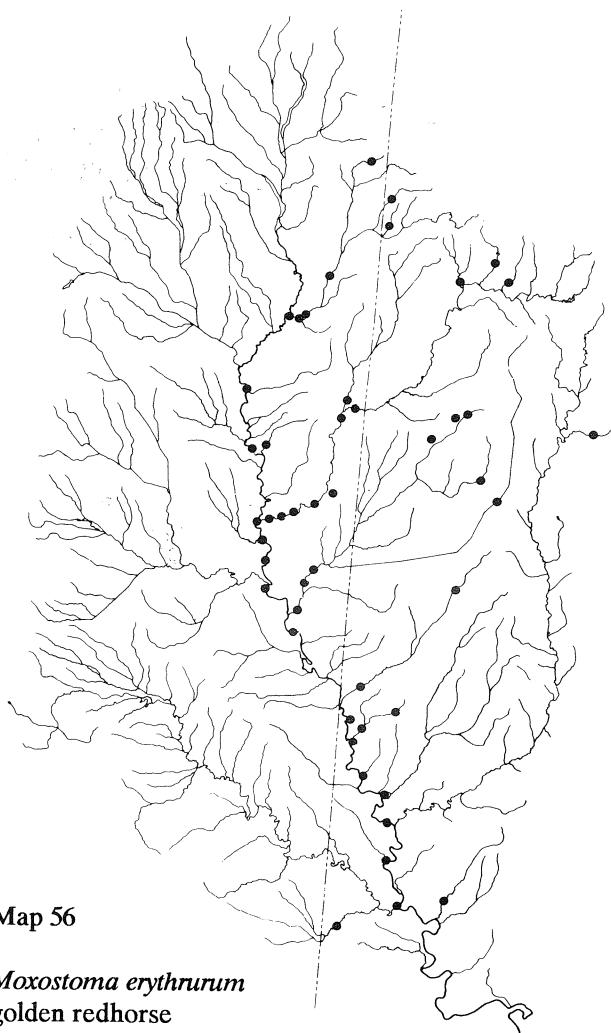

Map 55.

Moxostoma carinatum
river redhorse

river redhorse***Moxostoma erythrurum* (Rafinesque)**

The golden redhorse inhabits a variety of habitats, but typically pools in river bends with undercut banks and fallen trees, where vegetation is almost nonexistent (Becker, 1983). It ascends medium-sized rivers and small streams to spawn on gravel riffles.

48 Sites: 10, 13, 93, 95, 116, 122, 129, 132, 134, 135, 137-139, 141, 156, 158, 163, 164, 173-175, 177, 190, 194, 223, 224, 229-232, 234, 236, 241, 242, 250, 258, 259, 261, 272, 276, 284, 307, 308, 310, 312, 314, 318, and 320. Map 56.

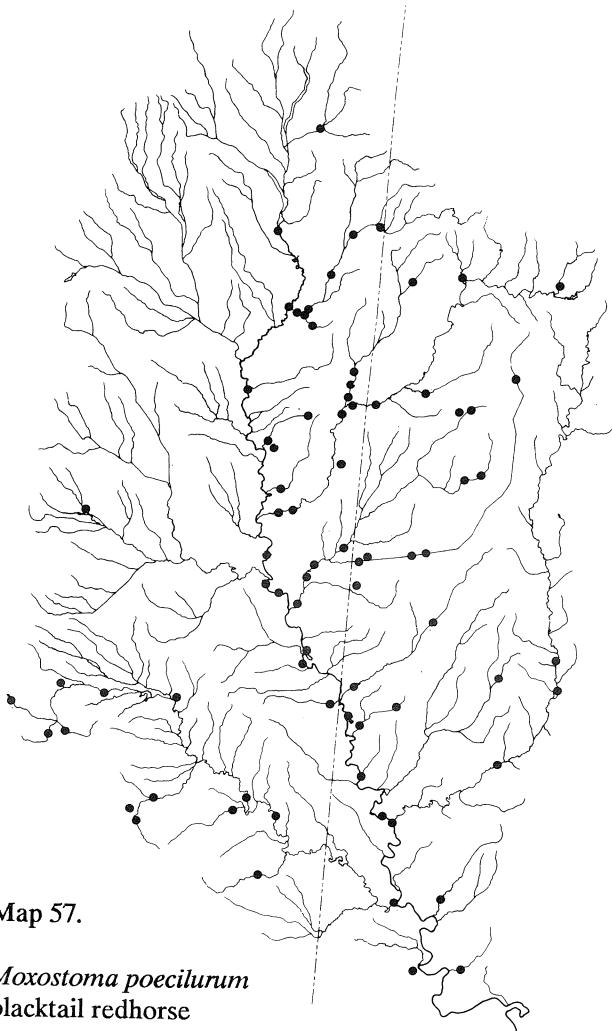

Map 56

Moxostoma erythrurum
golden redhorse

Moxostoma poecilurum* (Jordan)*blacktail redhorse**

Moxostoma poecilurum is more common and widespread than either of the other *Moxostoma* in the upper Tombigbee, where it appears to be better adapted to the small, high-gradient streams; however, it is no less at home in the main river and the large tributaries.

79 Sites: 4, 7, 10, 25, 29, 35, 39, 58, 62, 63, 73, 82, 86, 88, 89, 92, 93, 97, 101, 106, 110, 122, 126, 132, 135, 137-140, 142, 151, 153, 158, 162-164, 170, 174-177, 182, 183, 188, 189, 191, 193, 194, 209, 223, 231, 232, 238, 241-244, 249-251, 254, 258, 265, 267, 271, 272, 275, 284, 306-310, 312, 316, 319, 322, 325, and 343. ICTALURIDAE — bullhead catfishes***Ameiurus melas* (Rafinesque)****black bullhead**

Ictalurus melas (Rafinesque).— recent authors

Ameiurus melas (Rafinesque).— Lundberg, 1982

The black bullhead occurs in a variety of habitats, but most often in quiet, turbid pools with a silt or muddy bottom. Nest building and parental care places the black bullhead in good stead for survival. It is in jeopardy in the upper Tombigbee where impoundments have covered its habitat.

22 Sites: 7, 15, 16, 18, 29, 39, 43, 46, 71-73, 82, 93, 131, 138, 156, 159, 177, 210, 238, 258, and 271. Map 58.

Map 58.

Ameiurus melas
black bullhead

Ameiurus natalis (Lesueur)

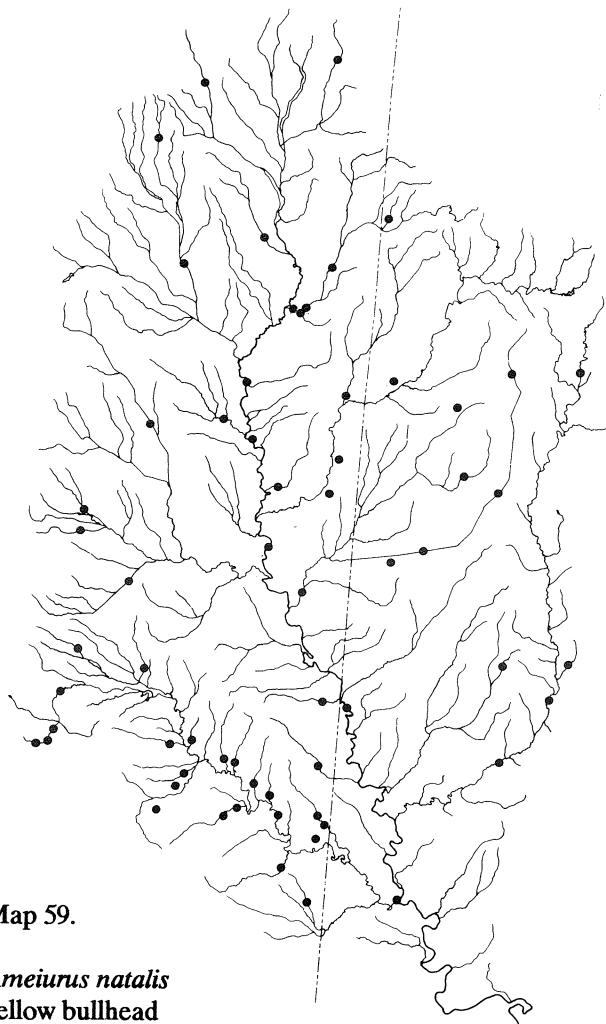

yellow bullhead

Ictalurus natalis (Lesueur).— recent authors

Ameiurus natalis (Lesueur).— Lundberg, 1982

The habitat is clear water over a variety of substrates, but less so over heavy silt and mud. The reproductive strategy of *Ameiurus natalis* is similar to that of *A. melas*.

62 Sites: 14, 19, 20, 23, 24, 29-31, 35, 36, 42, 45, 54, 55, 59, 65, 66, 76, 79, 87, 89-91, 93, 101, 105, 108, 120, 127, 131, 138, 143, 161, 174, 176, 187, 189-191, 204, 208, 209, 217, 223, 233, 238, 242, 253, 267, 276, 279, 284, 296, 302, 307, 308, 310, 312, 320, 323, 332, and 349. Map 59.

Ameiurus nebulosus (Lesueur)

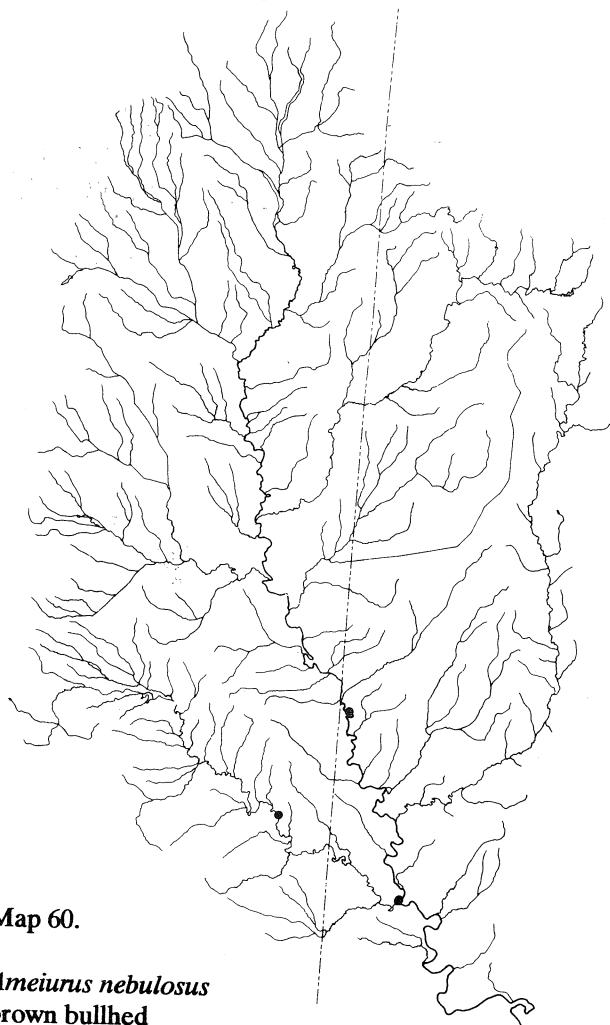

brown bullhead

Ictalurus nebulosus (Lesueur).— recent authors

Ameiurus nebulosus (Lesueur).— Lundberg, 1982

The brown bullhead occurs in the larger streams where vegetative cover is abundant. This fish was not known by me in the upper Tombigbee until Timmons (1982) found it in Gainesville and Aliceville pools. Hubbard (1987) subsequently collected it in the Noxubee system.

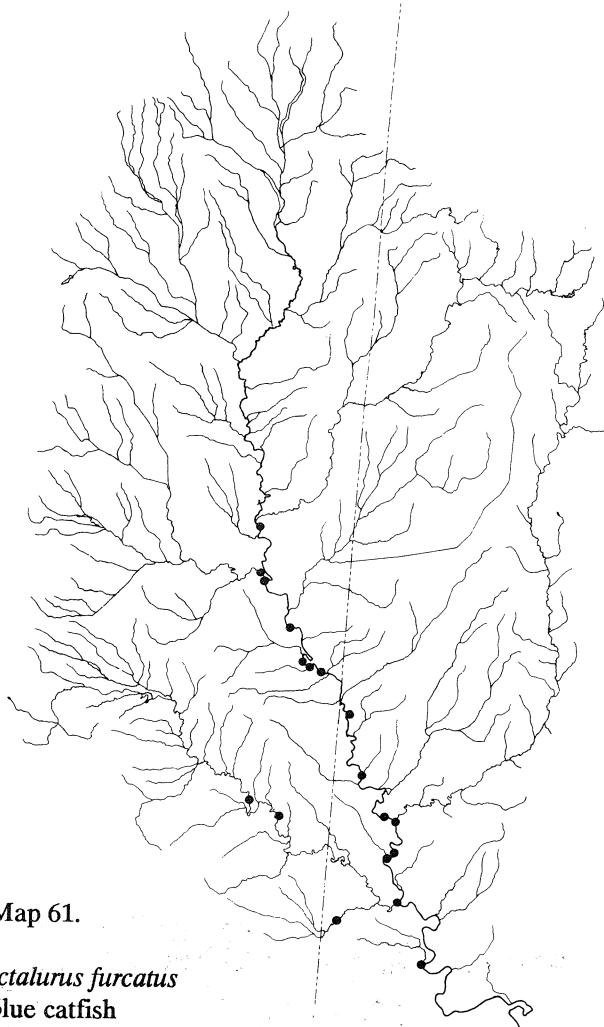

3 Sites: 29, 93, and 138. Map 60.

Ictalurus furcatus* (Lesueur)*blue catfish**

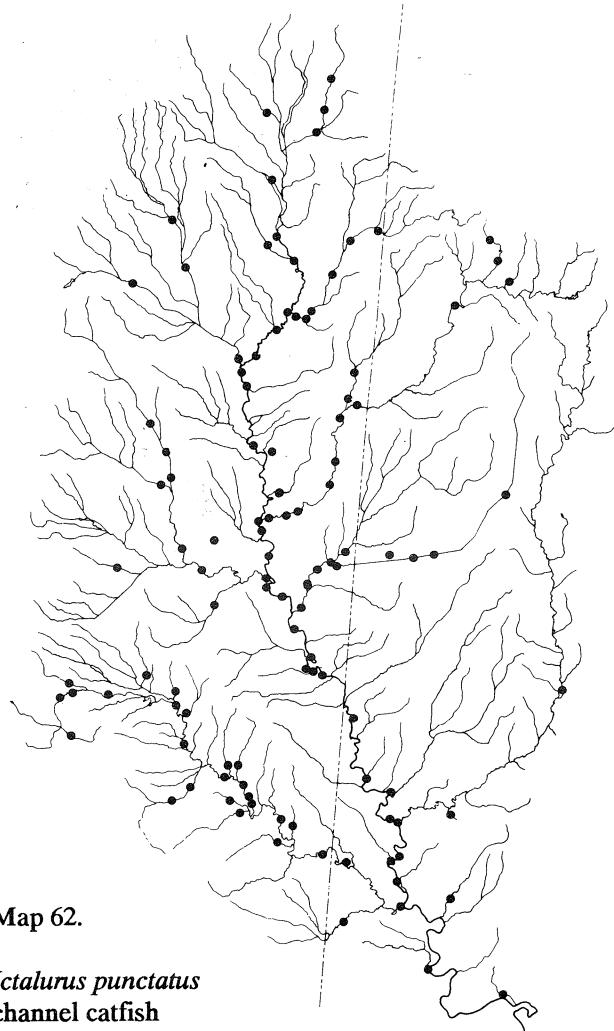

The life history of the blue catfish is similar to that of the channel catfish, *Ictalurus punctatus*, with the distinction that blue catfish prefer larger rivers (Kelley, 1969). The habitat is generally considered to be moderately swift to swift chutes in large rivers, or pools that have at least moderate current. Based on this, and the fact that the blue catfish has disappeared from the upper Mississippi and other major rivers due to what has been attributed to impoundment of its riverine habitat (Pflieger, 1975), I (1973) predicted that it would be adversely affected by the TTW; however, in the Gainesville and Aliceville pools, gill and trammel net collections indicated a tremendous increase in blue catfish (Boschung, 1987).

18 Sites: 8, 13, 29, 39, 93, 95-97, 122, 132, 138, 149-151, 156, 194, 195, and 225. Map 61.

***Ictalurus punctatus* (Rafinesque)****channel catfish**

The channel catfish seems to be resourceful enough to adapt to a variety of habitats; however, its most typical natural habitat is clear, medium to large rivers with swift current over sand, gravel, or rocky bottoms (Glodek, 1980).

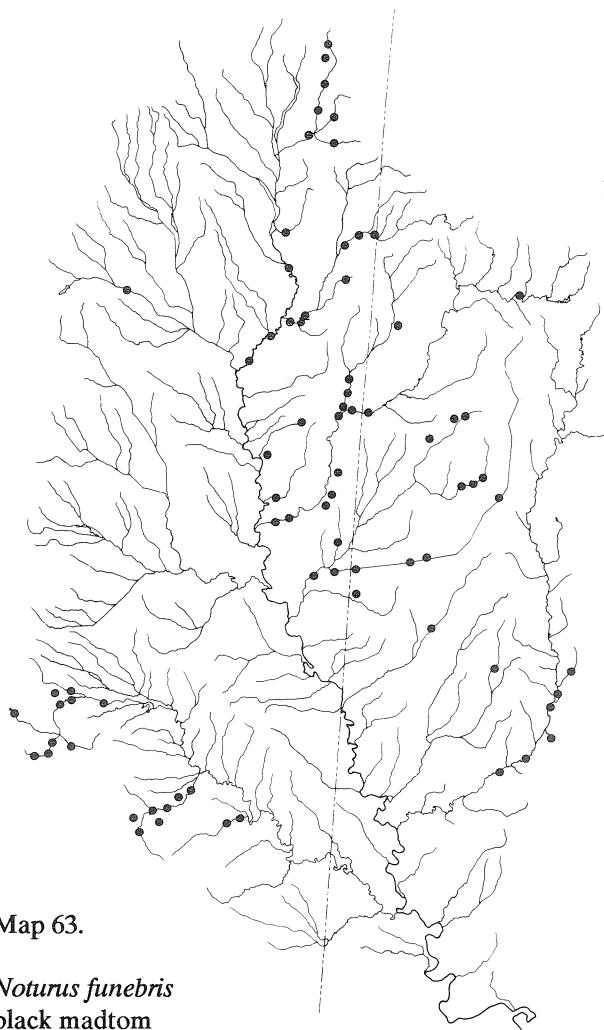

109 Sites: 2, 8, 10, 13, 21, 22, 27-29, 34, 35, 39-42, 45, 49, 56, 57, 68, 70, 73, 74, 76, 82, 83, 85, 87, 88, 93-98, 106, 122, 129, 132, 138, 149-151, 153, 156, 158, 163, 164, 167, 170, 179, 186, 188-190, 193-196, 202, 203, 205, 210, 211, 215-217, 223, 225, 229-232, 237, 239, 241, 242, 244, 250, 257, 259-261, 267, 271, 276, 284, 287, 288, 291, 296, 297, 303, 304, 306-308, 310, 312, 316, 319, 322, 323, 325, 336, 343, 346, and 347. Map 62.

***Noturus funebris* Gilbert and Swain**

The black madtom prefers small streams with moderate flow, gravel or coarse sand bottom, and some vegetation. It is affected by the TTW in those areas where small streams are inundated.

76 Sites: 35, 36, 55-59, 62, 63, 82, 83, 85-92, 101, 103-106, 108, 128, 140, 162, 164, 168, 173-179, 182, 188-190, 231-233, 236, 238, 241-244, 246, 250, 251, 262, 267, 271, 275, 291, 303, 304, 307, 308, 310, 311, 316, 317, 319, 322, 326, 343-347, 351, and 352. Map 63.

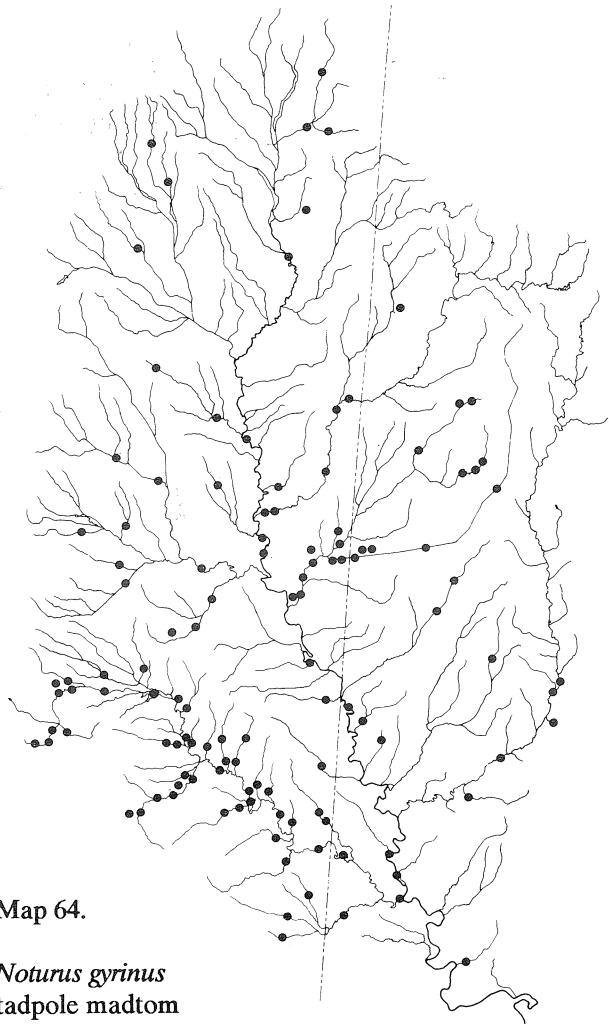

Map 63.

Noturus funebris
black madtom

black madtom***Noturus gyrinus* (Mitchill)**

The tadpole madtom prefers extensive vegetation in small streams with soft, muddy bottoms and little current. For aspects of life history, see Whiteside and Burr (1986). It is affected by the TTW where small streams are inundated.

118 Sites: 4, 13, 14, 16, 17, 19-22, 24, 27-31, 35, 36, 39, 40, 42, 43, 45, 46, 49, 51, 54-58, 61, 62, 65-68, 70, 73, 75, 76, 78, 82, 83, 85-91, 93-95, 100, 101, 104-106, 128, 131, 133, 135, 138, 140, 141, 143, 150, 158, 163, 164, 165, 168, 170, 172, 174-180, 182-184, 189, 190, 192, 196, 200, 201, 203-205, 207, 208, 211, 212, 223, 224, 227, 230, 231, 237, 241, 247, 250, 267, 276, 279, 281, 295, 301, 302, 322, 327, 343, 344, and 347. Map 64.

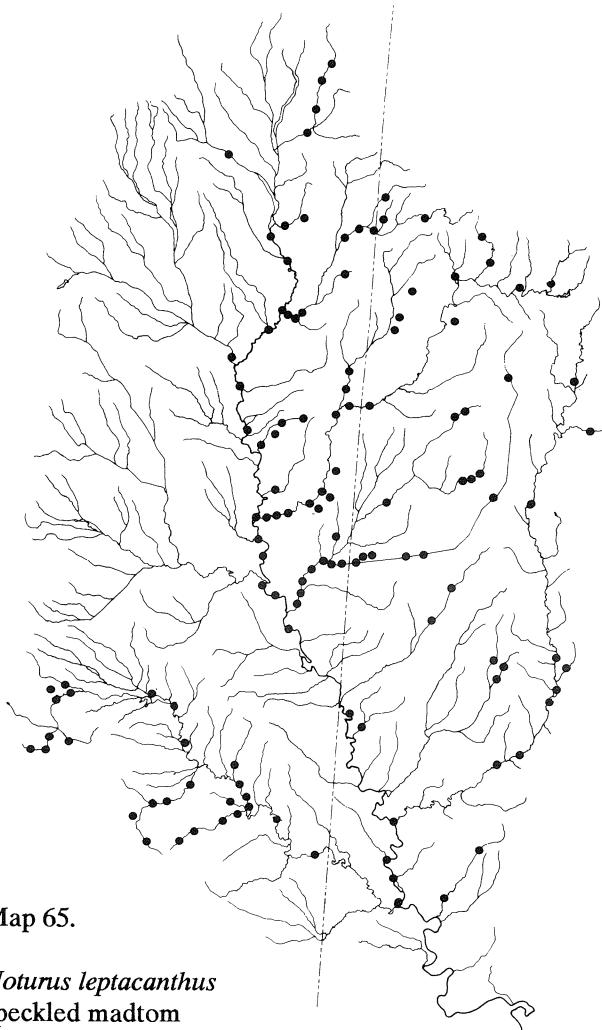

Map 64.

Noturus gyrinus
tadpole madtom

***Noturus leptacanthus* Jordan**

The speckled madtom may be locally common in small to moderate-sized creeks, usually in moderate current over coarse sand or gravel (Rohde, 1980). It is affected by the TTW to the extent that its habitat is inundated.

125 Sites: 10, 11, 22, 29, 34-42, 56-58, 62, 64, 68, 73, 75, 83, 85-91, 93-95, 97, 101, 103, 105, 106, 108, 110, 114, 116, 126-128, 135, 138, 140, 141, 156, 158, 161, 163, 164, 167, 168, 171, 174-180, 182-184, 188-191, 193, 194, 223, 224, 229-236, 238, 241, 243, 244, 246-248, 250, 251, 256, 258-260, 262, 265, 267, 272-275, 282, 284, 288, 304, 306-308, 310, 311, 316-322, 325-327, 329, 343, 346, 347, and 349. Map 65.

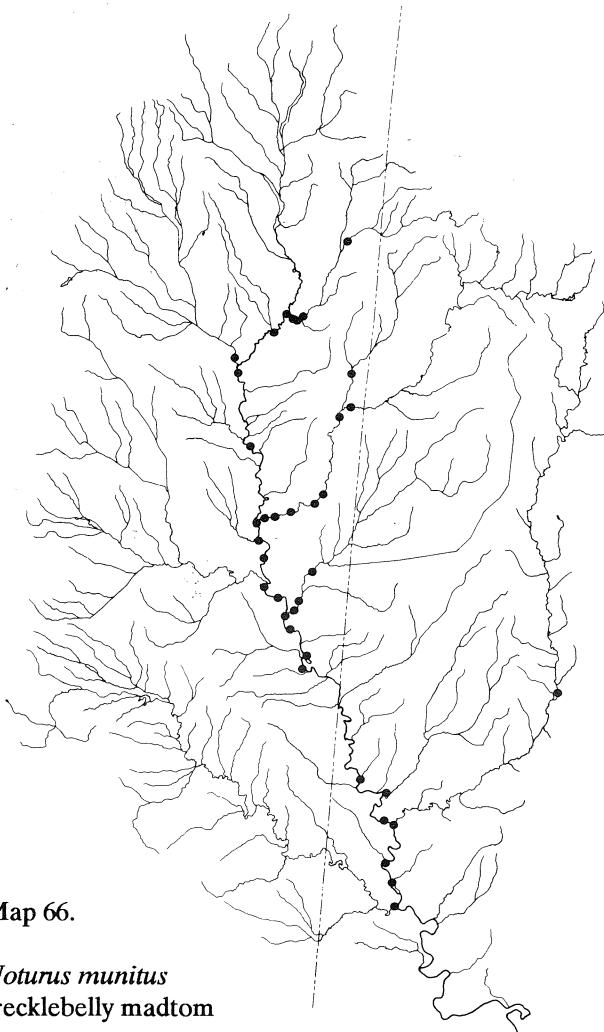

Map 65.

Noturus leptacanthus
speckled madtom

speckled madtom***Noturus munitus* Suttkus and Taylor frecklebelly madtom**

Noturus munitus was rather common on the gravel bars throughout the main channel of the upper Tombigbee. There is little hope for the frecklebelly madtom's survival in the modified channel, but it has been collected in large tributaries of the Fall Line Hills.

37 Sites: 93-95, 97, 106, 122, 129, 132, 151, 153, 156-158, 161, 164, 193, 194, 223, 224, 229-232, 234, 235, 241, 244, 250, 256, 276, 287, 288, 304, 306-308, 310, and 316. Map 63. Map 66.

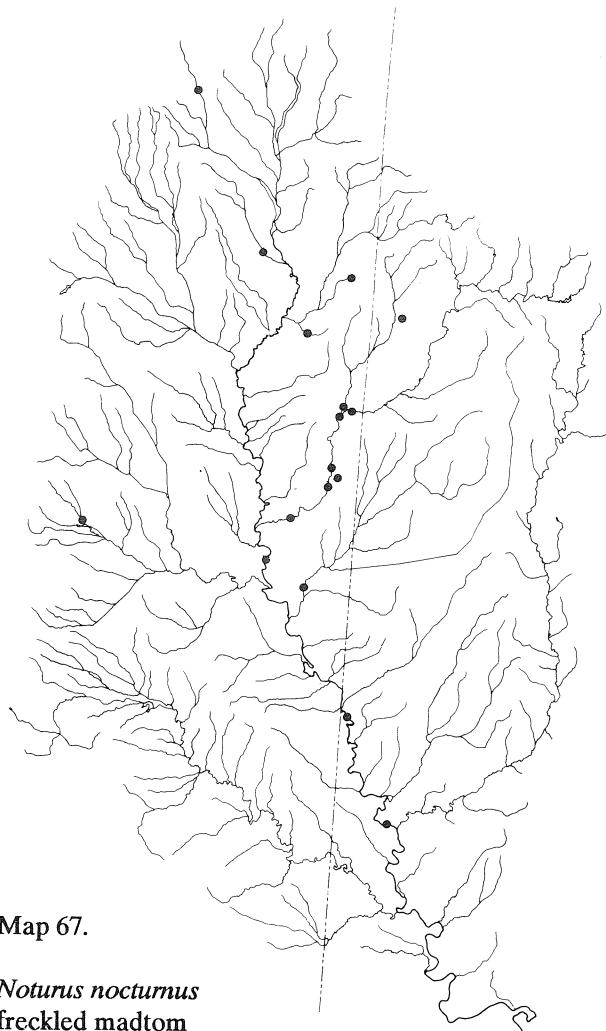

Map 66.

Noturus munitus
frecklebelly madtom

Noturus nocturnus Jordan and Gilbert freckled madtom

Young freckled madtoms occur primarily in mixed gravel and sand riffles with accumulations of sticks, leaves, trash, and other debris, often at heads of riffles where the current is strong. Adults are found primarily in riffles throughout most of the year, but sometimes in mud-bottomed pools (Burr and Mayden, 1982b). It is virtually absent in the upper Tombigbee outside the Fall Line Hills. It is affected by the TTW to the extent that its habitat is inundated.

17 Sites: 122, 138, 163, 209, 223, 232, 237-239, 241, 242, 247, 250, 309, 311, 323, and 332. Map 67.

Map 67.

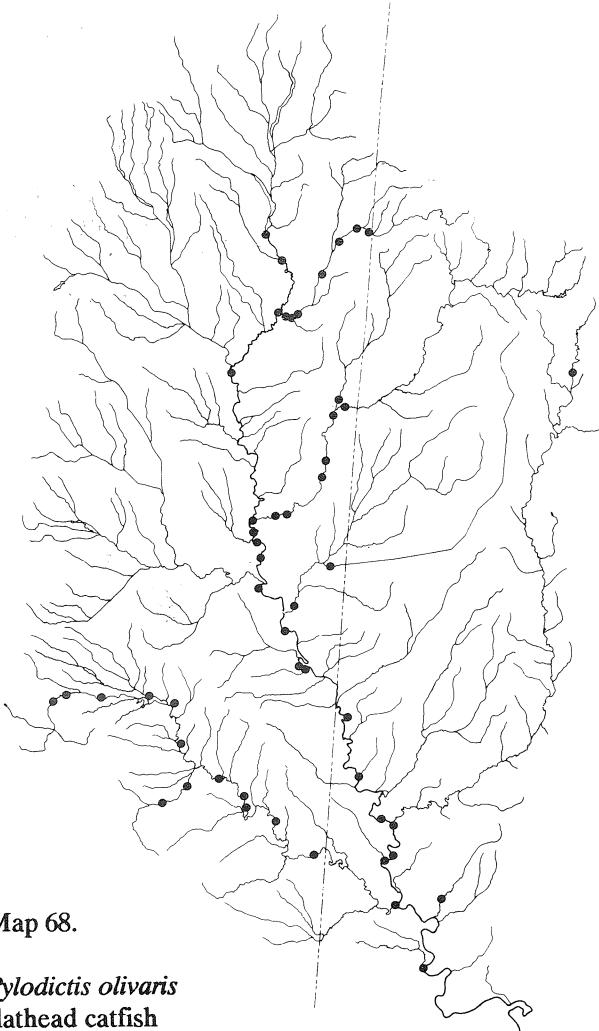

Noturus nocturnus
freckled madtom

***Pylodictis olivaris* (Rafinesque)**

flathead catfish

The flathead catfish is primarily limited to the main channels of the river and the large tributaries. It prefers deep water and may be found frequently in muddy areas. It is not expected to be adversely affected by the TTW.

51 Sites: 8, 10, 22, 29, 39, 40, 49, 56, 57, 68, 73, 75, 82, 85, 87, 93, 95-97, 120, 122, 132, 138, 150, 151, 156, 158, 179, 194, 223-225, 229, 231, 232, 237, 239, 241, 242, 250, 287, 306-308, 310, 312, 316, 317, 319, 322, and 325. Map 68.

Map 68.

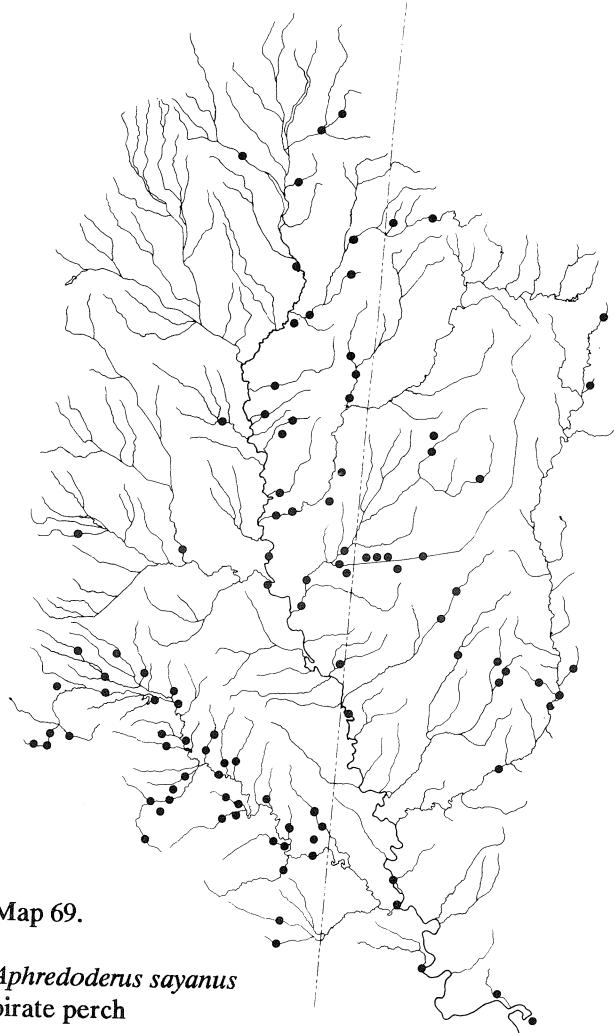

Pylodictis olivaris
flathead catfish

APHREDODERIDAE — pirate perches

Aphredoderus sayanus (Gilliams)

The pirate perch is found in a variety of places, such as pools of low-gradient streams, sloughs, marshes, ditches, and almost always where there is good vegetative cover and debris on the bottom.

103 Sites: 1, 2, 8, 16, 17, 19, 20, 22-24, 26-28, 30, 33-36, 42, 45, 49, 51, 52, 54, 55, 57-59, 64, 67, 68, 69, 73, 74, 76-80, 82, 86, 88-91, 93, 94, 101, 105-108, 119, 121, 125-128, 138, 140, 141, 147, 158, 163, 170, 172, 173, 177, 179, 181, 183, 184, 186, 187, 189, 194, 208, 210, 223, 231-233, 238, 242, 244, 245, 267, 273, 274, 279, 283, 285, 305, 310, 311, 316, 320-322, 329, 334, 343, and 345. Map 69.

Map 69.

Aphredoderus sayanus
pirate perch

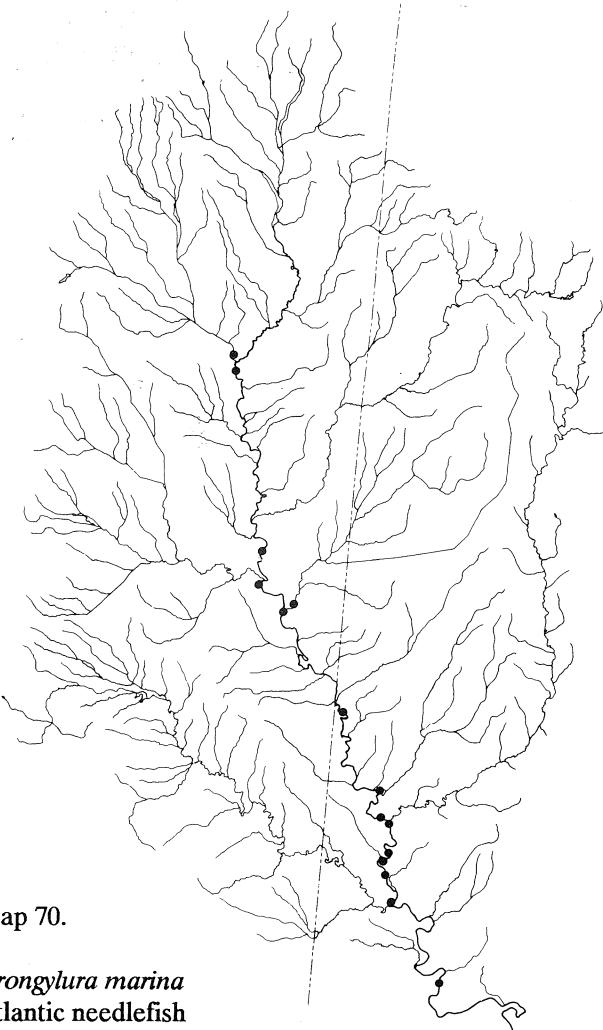

BELONIDAE — needlefishes

Strongylura marina (Walbaum)

Atlantic needlefish

The needlefish is a regular migrant into the upper Tombigbee and other drainages of Mobile basin. Needlefish containing well-developed eggs, and juveniles only 42.0 to 67.6 mm TL were collected near Amory, Miss., a point over 370 rmi from the head of Mobile Bay. Undoubtedly, the species spawns in freshwater. The increase in number of obstacles to its migration may decrease its frequency of occurrence in the upper Tombigbee. Adverse effects of the TTW are not anticipated.

15 Sites: 3, 93-97, 122, 129, 138, 157, 158, 194, 223, 287, and 288. Map 70.

Map 70.

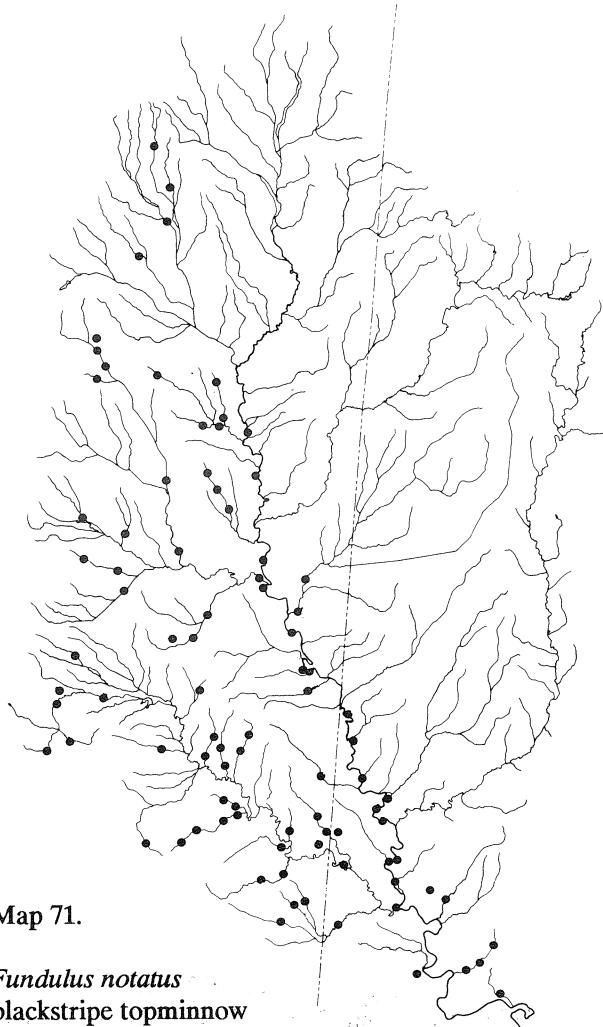

Strongylura marina
Atlantic needlefish

FUNDULIDAE — killifishes

Fundulus notatus (Rafinesque) blackstripe topminnow

Fundulus notatus prefers the slow low-gradient streams characteristic of the physiographic areas west of the river. It is occasionally syntopic with *F. olivaceus*, and the two are known to hybridize (Tomerson, 1967; Setzer, 1970). Howell and Black (1981) found hybridization in Trussels Creek (Site 10); they also noted that the Tombigbee River sports a chromosomal race of *F. notatus* where $2n = 44$, instead of $2n = 40$. No adverse effects of the TTW are expected.

89 Sites: 2, 4-7, 10, 12-16, 18-21, 23-26, 28, 33-38, 43-46, 51, 52, 64, 67, 71, 79, 82, 86, 87, 88, 90, 93-96, 122, 123, 129, 131, 132, 138, 146, 150, 151, 156, 158, 163, 194, 195, 197, 200, 201, 204-207, 209, 210, 215, 218-221, 223, 226-228, 268, 277-282, 295, 297, 301, and 302. Map 71.

Map 71.

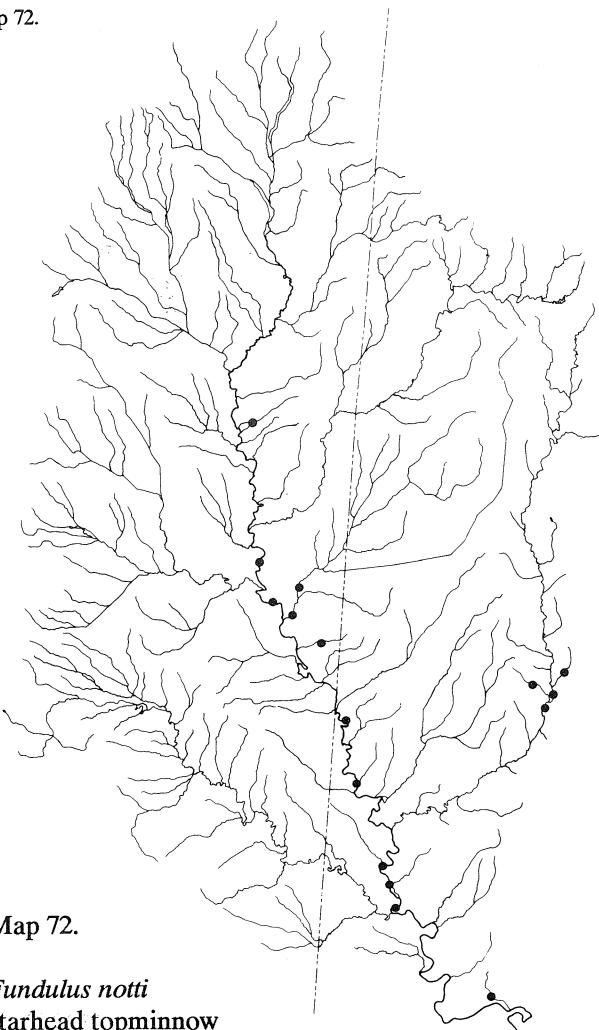

Fundulus notatus
blackstripe topminnow

Fundulus notti (Agassiz)

starhead topminnow

The records reported herein represent the first published notice of *Fundulus notti* in the upper Tombigbee. Field notes in UAIC pertaining to about 75 collections of *F. notti* in Alabama, Mississippi, and Louisiana reveal that the fish occurs in a variety of habitats. Water is described as clear, slightly stained, tea color, dark, dark tea color, murky, turbid, and black; the bottom may be mud, sand, gravel, clay, rock, silt, detritus, leaves, or combinations of these; the current was either none, very slow, slow, moderate, moderately fast, and swift; vegetation ranged from none to dense, and varying from algae to various species of attached vascular plants. The typical *F. notti* stream has clear or tea-colored water, a sandy bottom, slow to moderate current, and submerged vascular plants. It appears that the mid-Sipsey River will serve as the citadel of this species in the upper Tombigbee.

16 Sites: 2, 93-95, 105-108, 132, 138, 154, 158, 163, 193, 223, and 283. Map 72.

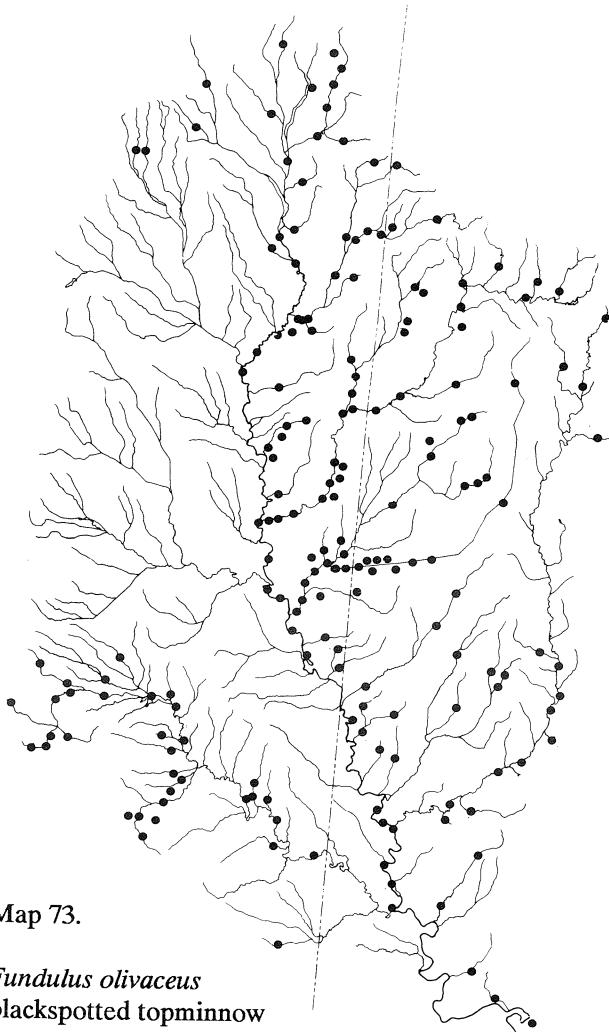

Map 72.

Fundulus notti
starhead topminnow

Fundulus olivaceus (Storer)**blackspotted topminnow**

In the upper Tombigbee, *Fundulus olivaceus* prefers the faster flowing water typical of high-gradient streams of the Fall Line Hills, and high elevations west of the river proper.

186 Sites: 1, 2, 5, 10, 11, 17, 22, 27, 29-32, 40, 53, 54, 55, 57, 59, 61, 62, 63, 66, 68, 69, 73-75, 77, 78, 82-85, 87-95, 97-101, 103-106, 110, 111, 116, 118, 120-128, 130, 133, 135-141, 147, 148, 153, 154, 156, 158, 160-180, 182-191, 193, 194, 223, 229-236, 238, 239, 241, 243-252, 255-259, 262, 264, 265, 267, 271-275, 285, 287, 299, 300, 303-305, 307-317, 319-323, 325, 326, 330, 332, 334-336, 338, 340, 343, 344, 346, 347, 349, and 351. Map 73.

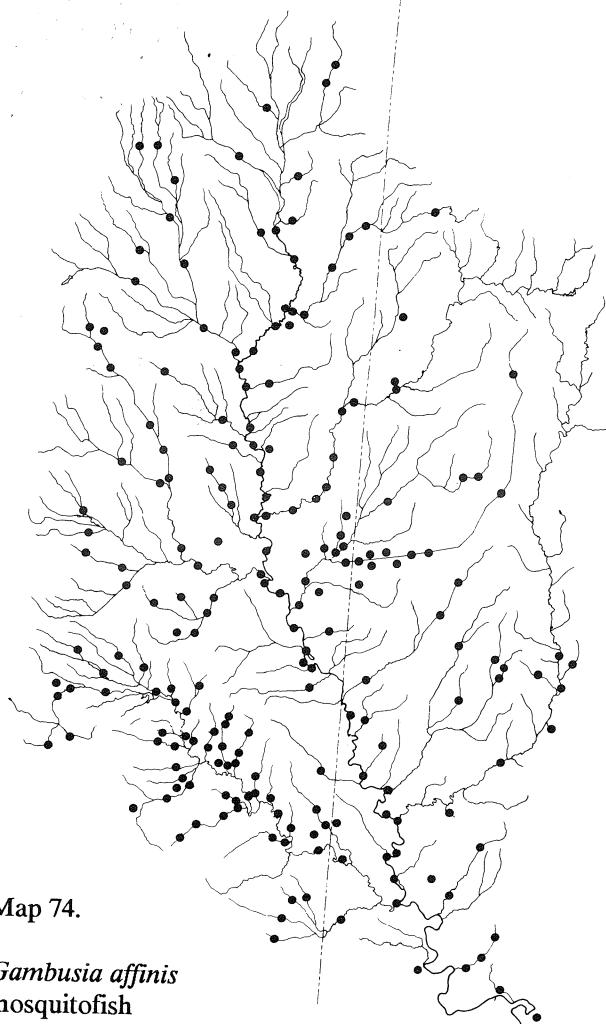

Map 73.

mosquitofish

ATHERINIDAE — silversides

Labidesthes sicculus* (Cope)*brook silverside**

Labidesthes sicculus occupies microhabitats similar to that of *Fundulus olivaceus*, a difference being an almost total absence of aquatic vegetation. The species is affected by the TTW to the extent that its habitat is inundated.

51 Sites: 2, 10, 70, 93, 94, 100, 101, 106-108, 110, 113, 122, 124-126, 128, 132, 138, 141, 142, 154, 156-159, 163, 171, 172, 176, 187-189, 193, 194, 204, 210, 223, 230, 232, 234, 235, 241, 250, 272, 284, 306, 310, 316, 322, and 349. Map 75.

Map 75.

ELASSOMATIDAE — pygmy sunfishes

Elassoma zonatum* Jordan*banded pygmy sunfish**

This little fish is usually encountered in well-vegetated pools associated with sluggish streams below the Fall Line. For aspects of the life history of *Elassoma zonatum*, see Walsh and Burr (1984). It is affected by the TTW to the extent that its habitat is inundated.

84 Sites: 11, 16, 17, 21, 22, 24, 26, 29, 33-35, 42, 53, 54, 57, 63, 64, 68-70, 73, 74, 77-80, 83, 86-95, 102, 105-108, 110, 124-128, 132, 138, 141, 146, 158, 159, 163, 165, 168, 170, 171, 173-177, 181, 185, 187, 193, 208, 209, 217, 223, 237, 243-245, 253, 267, 271, 283, 303, 305, 310, and 316. Map 76.

Map 76.

Elassoma zonatum
banded pygmy sunfish

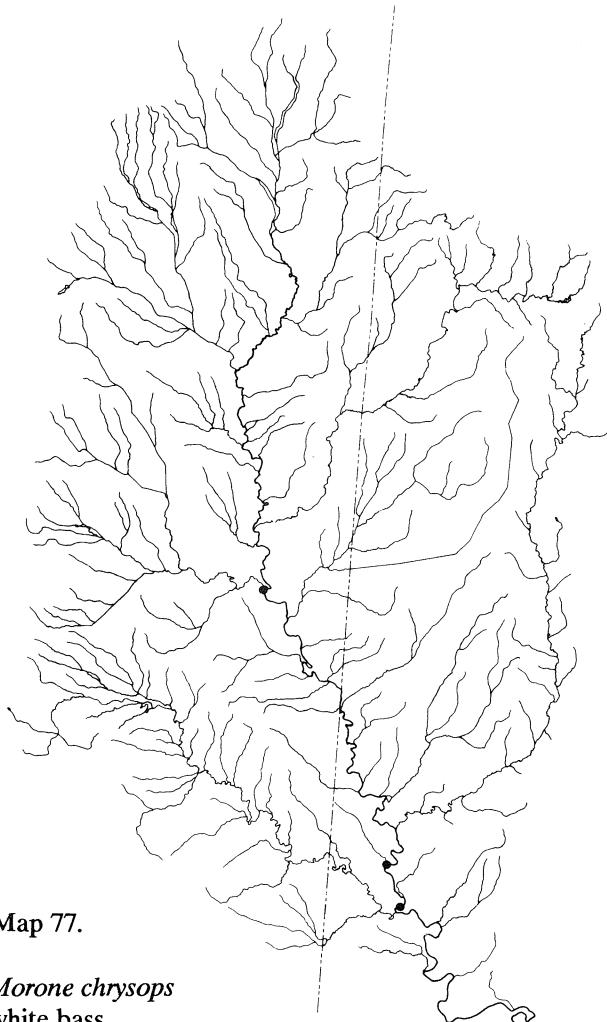

MORONIDAE — striped basses

CENTRARCHIDAE — sunfishes

Morone chrysops* (Rafinesque)*white bass**

The white bass, an introduced fish in the upper Tombigbee, does well in reservoirs of the Ozarks and the Missouri River (Pflieger, 1975). Robert Wood (1988) collected a specimen on the artificial gravel bar below Columbus Dam in August 1987. Recent reports of large catches by anglers in Aliceville Pool, near the mouth of the Luxapallila River, have come to my attention (Phil Fishella, pers. comm.). The white bass is listed here in anticipation of it becoming established in the TTW.

2 Sites: 157 and 194. Map 77.

Map 77.

Morone chrysops
white bass

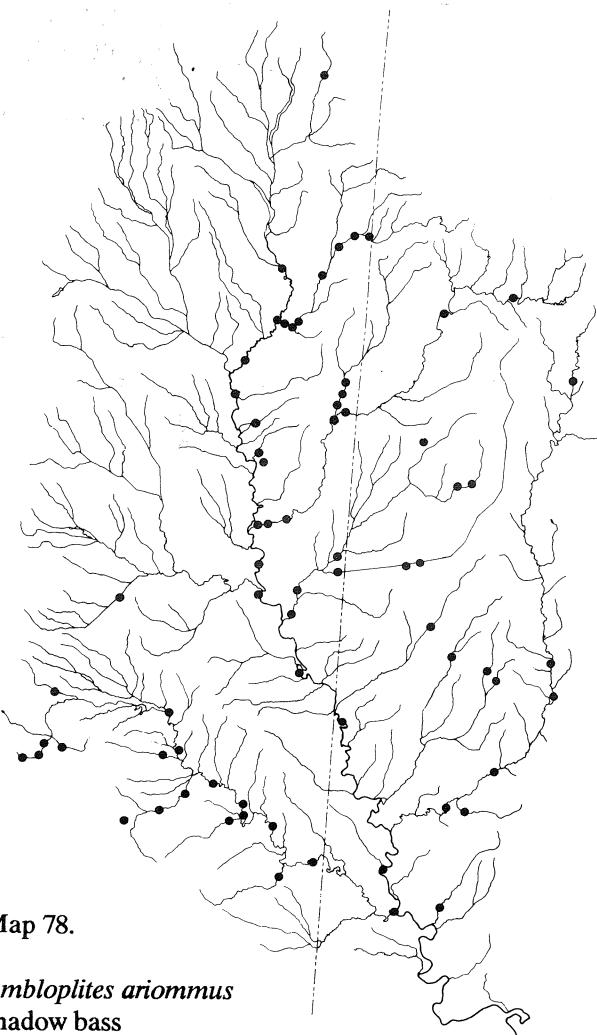

Ambloplites ariommus* Viosca*shadow bass**

Ambloplites rupestris (Rafinesque), in part

Ambloplites ariommus.— Cashner and Suttkus, 1977

This smallest member of the genus, rarely exceeding 180 mm SL (Cashner, 1980), has a reproductive strategy like most other sunfishes. The effect of the TTW on the shadow bass depends on the extent to which the habitat is inundated.

70 Sites: 10, 22, 24, 29, 35, 39, 40, 49, 56, 57, 62, 66, 68, 73, 83, 88-91, 93, 95, 99-101, 106, 110, 120, 125, 127, 128, 138, 140, 151, 158, 163, 170, 173, 176, 177, 180, 188, 189, 194, 204, 223, 230-232, 241-244, 250, 257, 262, 271, 272, 283, 284, 303, 306-308, 310, 312, 316, 317, 319, 322, and 349. Map 78.

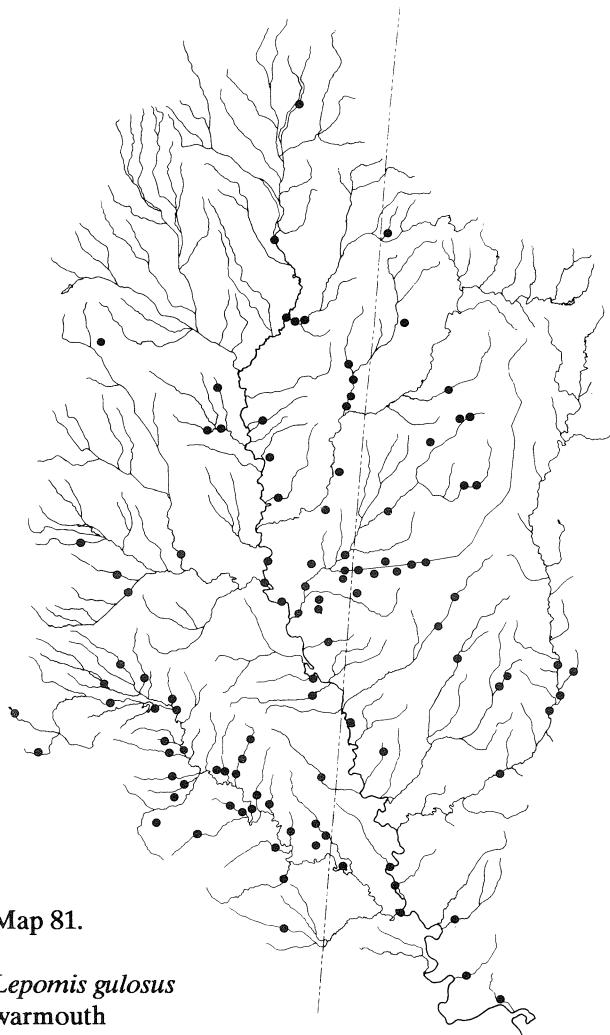

Map 80.

Lepomis cyanellus
green sunfish

Lepomis gulosus* (Cuvier)Chaenobrytus gulosus* (Cuvier)

The warmouth has a strong preference for dense cover over a mud bottom in quiet backwater areas. It is affected by the TTW to the extent that its habitat is inundated.

105 Sites: 2, 4, 9, 16, 19-21, 23, 24, 27, 28, 30, 31, 33, 34, 37, 39, 42-45, 50, 53-55, 59, 66, 68, 69, 73, 74, 76, 77, 78, 80, 82, 91-95, 101, 105, 106, 108, 110, 125-127, 131, 133, 138, 140, 141, 146, 150, 154, 158-160, 162, 163, 165, 170, 171, 173-177, 180, 181, 182, 185-189, 193, 195, 204, 205, 208, 210, 221, 223, 233, 238, 242-245, 247, 255, 267, 271, 278-280, 283, 306, 307, 310, 320, 325, and 339. Map 81.

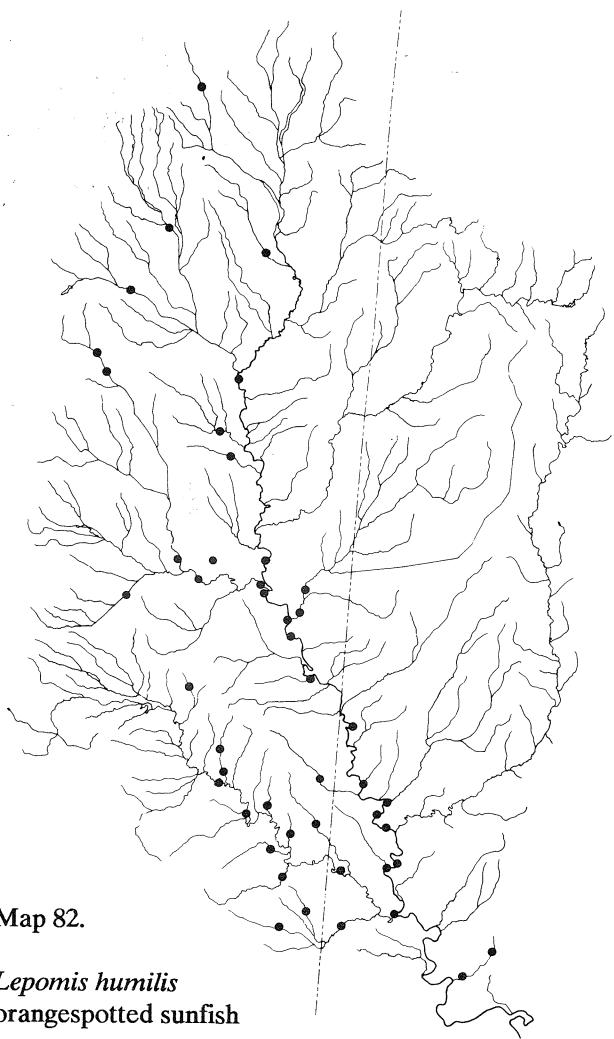

Map 81.

Lepomis gulosus
warmouth

warmouth***Lepomis humilis* (Girard)****orangespotted sunfish**

As the distribution map clearly shows, the orangespotted sunfish avoids high-gradient streams of the Fall Line Hills. It is tolerant of siltation and continuous high turbidity and is commonly found in streams with low or intermittent flow (Pfleiger, 1975). The presence of *Lepomis humilis* in coastal drainages east of the Mississippi River is the result of introductions (Smith-Vaniz, 1968).

46 Sites: 4, 6, 13, 14, 16, 20, 21, 24, 27, 28, 30, 39, 45, 46, 49, 72, 93, 95, 96, 122, 123, 129, 131, 132, 138, 150, 156-158, 163, 194, 195, 202-204, 210, 219, 220, 223, 269, 279, 287, 291, 297, 323, and 332. Map 82.

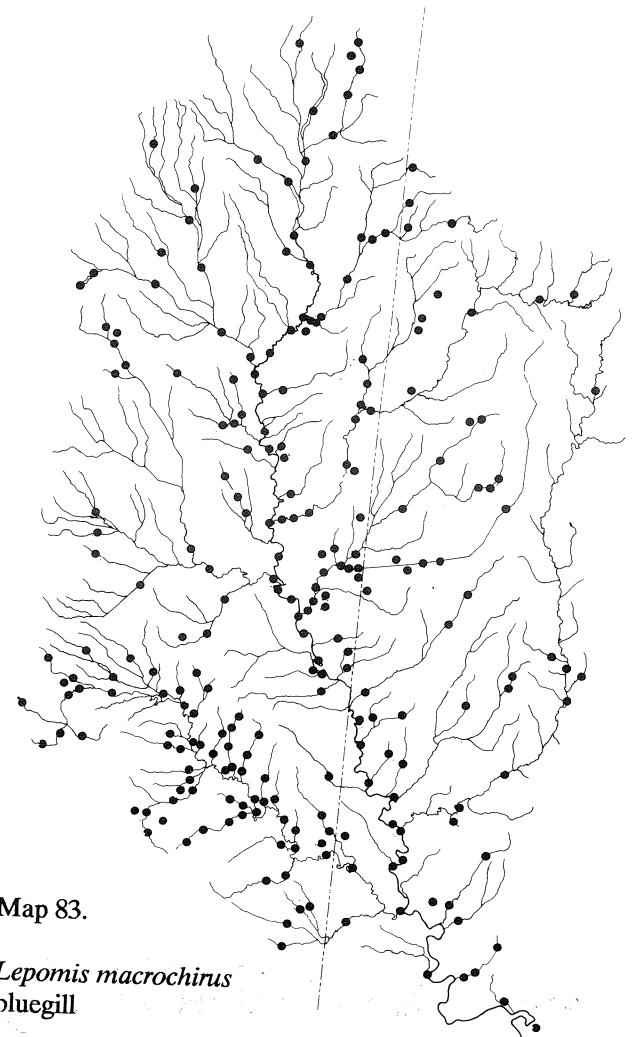

Map 82.

Lepomis humilis
orangespotted sunfish

***Lepomis macrochirus* Rafinesque**

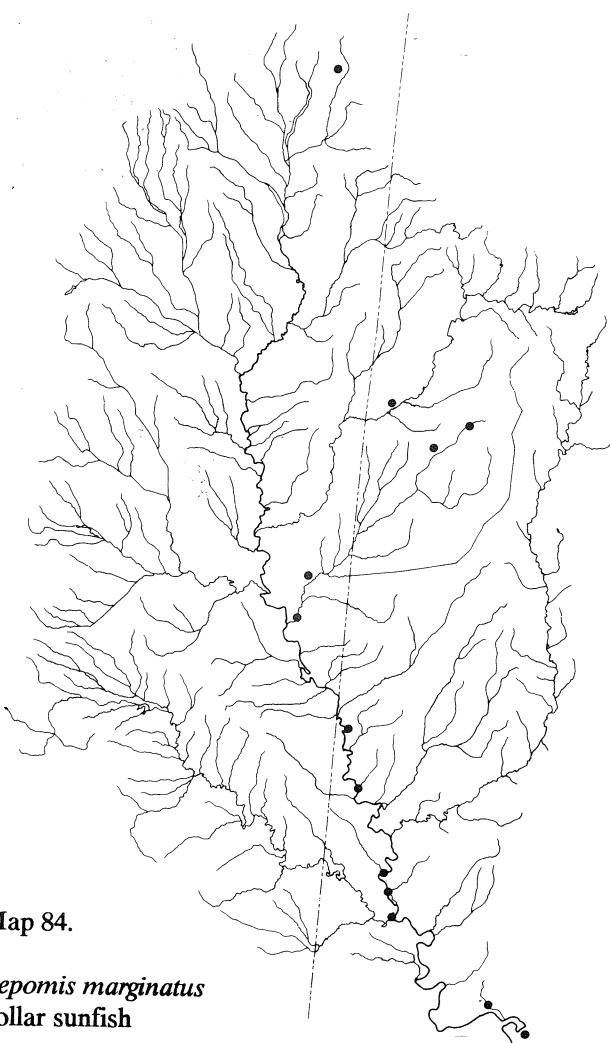

The bluegill has been so widely introduced that it now occurs in all of North America from northern Mexico to southern Canada. It inhabits lakes, oxbows, ponds, reservoirs, and the slower portions of rivers and streams of all sizes, preferably where aquatic vegetation abounds. It is affected by the TTW to the extent that the breeding habitat is inundated.

237 Sites: 1, 2, 4-6, 8-40, 42-48, 50-57, 59, 61-63, 65-79, 82-89, 91-93, 95-99, 101, 106, 108, 110, 111, 120, 122, 124, 126, 127, 129-134, 136-141, 146-148, 150, 151, 153, 154, 156-167, 169-172, 174-181, 186-190, 193-196, 200, 201, 203, 204, 206, 208-210, 218-223, 226-232, 238, 239, 241, 242, 244-248, 250, 253, 257, 262, 265, 267, 269, 271, 272, 276-282, 284, 285, 287-289, 291-293, 295-297, 299, 301, 303, 304-308, 310, 312, 313, 315-318, 320-323, 325, 328, 329, 335, 338, 339, 343, 347, 349, 351, and 352. Map 83.

**bluegill*****Lepomis marginatus* (Holbrook)****dollar sunfish**

So little is known about this uncommon sunfish that trying to predict the effects of the TTW on its life would be rather hazardous. Lee and Burr (1985) made observations on its life history in a man-made pond in North Carolina. The first records known by me of *Lepomis marginatus* in the upper Tombigbee were those of Timmons (1982). Subsequently, a few earlier records were discovered. *L. marginatus* is similar to *L. megalotis* and the two are easily confounded.

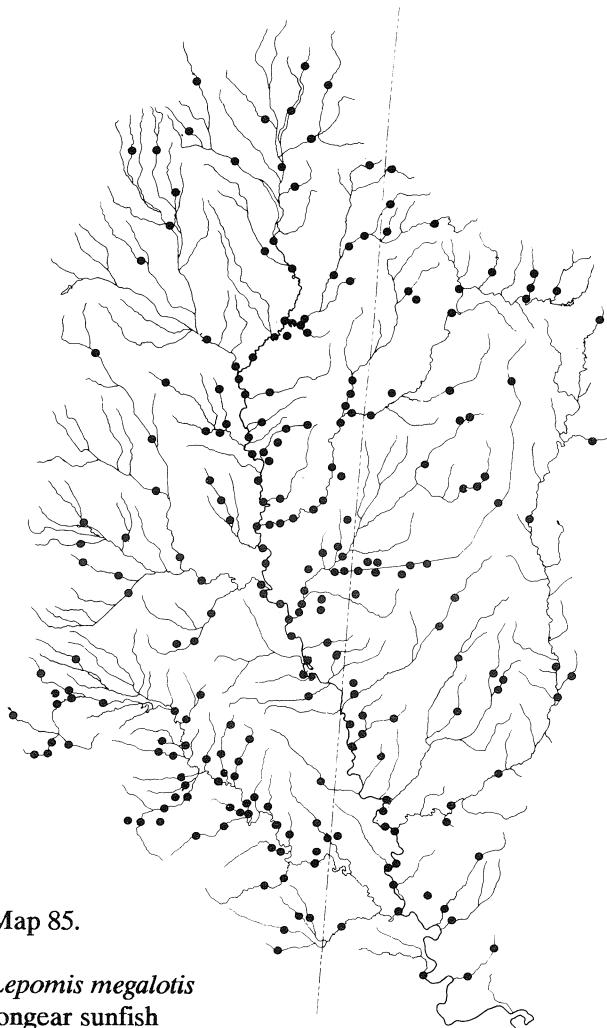

13 Sites: 1, 2, 93-95, 132, 138, 158, 165, 173, 175, 253, and 351. Map 84.

Lepomis megalotis* (Rafinesque)*longear sunfish**

The longear and bluegill sunfishes are the two most ubiquitous fishes in the Upper Tombigbee. The longear thrives in reservoirs, but typically inhabits small streams and upland parts of rivers (Bauer, 1980).

238 Sites: 4, 6, 8-20, 22-31, 33, 34, 36, 37, 39, 40, 42-46, 48, 49, 51, 53-57, 59, 61, 62, 66-71, 73, 79, 82-99, 101, 106, 108, 110, 114, 116, 121-129, 131, 133-141, 144, 146, 148, 150, 151, 153, 154, 156-163, 165, 166, 168-170, 172, 174-180, 182-185, 187-191, 193-196, 200, 201, 203-211, 217, 220, 223, 224, 226-232, 234, 235, 238, 239, 241-244, 248-251, 253, 255, 257-259, 262-268, 271-285, 287-289, 295, 297, 299, 301-312, 314-318, 320-323, 325, 329, 330, 332, 334-336, 339, 341, 343, and 347. Map 85.

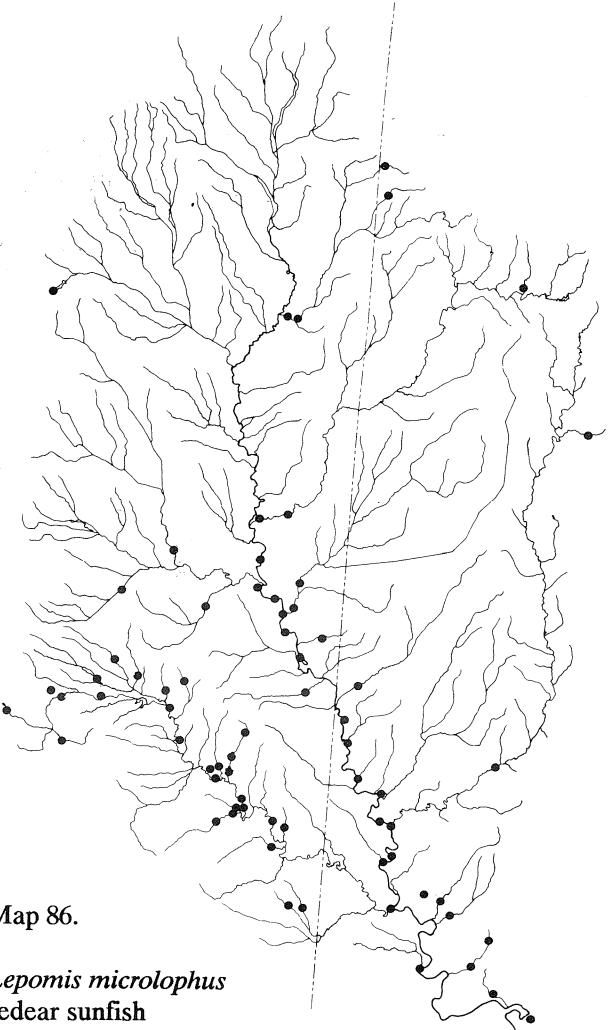

Map 85.

Lepomis megalotis
longear sunfish

Lepomis microlophus* (Gunther)*redear sunfish**

The redear sunfish is found most frequently in clear, slow-moving streams where aquatic vegetation is abundant. It is affected by the TTW to the extent that its habitat is inundated.

69 Sites: 1, 2, 5, 6, 8-10, 12, 14, 15, 27-29, 33, 35, 36, 39, 40, 42-45, 49, 50, 68, 72-74, 76-78, 82, 85, 86, 88, 92, 93, 95-97, 101, 116, 122, 129, 132, 134, 138, 139, 146, 153, 154, 156-158, 163, 193, 194, 196, 204, 210, 223, 230, 232, 263, 293, 307, 310, 315, and 318. Map 86.

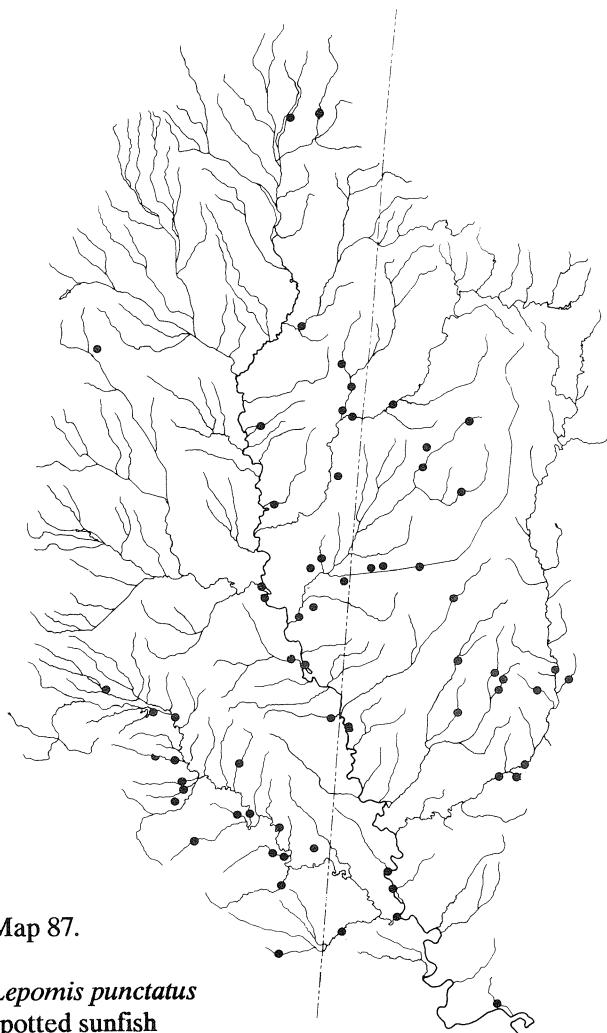

Map 86.

Lepomis microlophus
redear sunfish

Lepomis punctatus (Valenciennes) spotted sunfish

The usual habitat of the spotted sunfish is sluggish portions of clear streams where submerged vegetation or other cover is present. It is affected by the TTW to the extent that its breeding habitat is inundated.

65 Sites: 2, 13, 17, 23, 24, 26, 27, 29, 33, 37, 39, 43, 53, 54, 55, 66, 67, 73, 78, 80, 93-95, 101-103, 107, 108, 110, 124-128, 138, 141, 142, 152, 153, 158, 159, 165, 166, 172, 173, 175, 176, 181, 184, 186, 189, 194, 195, 221, 238, 242, 244, 245, 250, 252, 267, 283, 310, 339, and 346. Map 87.

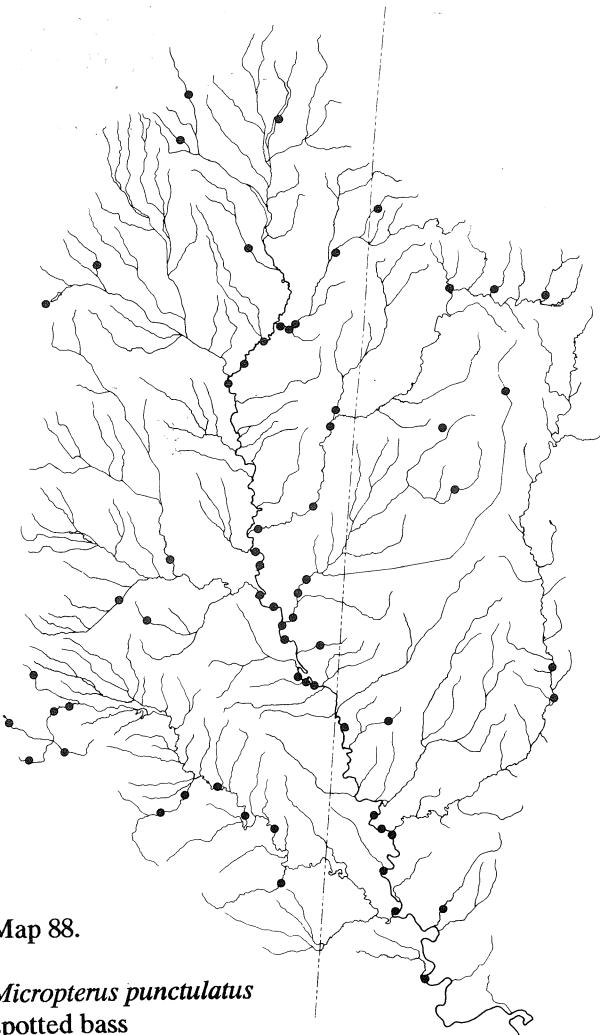

Map 87.

Lepomis punctatus

Micropterus punctulatus (Rafinesque) spotted bass

Three subspecies of spotted bass are generally recognized. The local one is *M. p. henshalli* Hubbs and Bailey (1940), commonly known as the Alabama spotted bass. The book, *Black Bass Biology and Management* (Stroud and Clepper, eds., 1975), summarizes much of the copious literature pertaining to *Micropterus*. The Alabama spotted bass is common in streams (Lawrence, 1954), as well as reservoirs (Brown and Tatum, 1962).

63 Sites: 8, 10, 24, 29, 39, 49, 56, 57, 84, 85, 87, 88, 91-93, 95, 97, 106, 110, 122, 123, 137, 138, 149-151, 154, 156-158, 163, 164, 174, 176, 191, 193, 194, 199, 204, 210, 223, 224, 230, 234, 241, 242, 258, 261, 265, 287, 293, 294, 303, 304, 307, 308, 310, 316, 318, 323, 330, 332, and 339. Map 88.

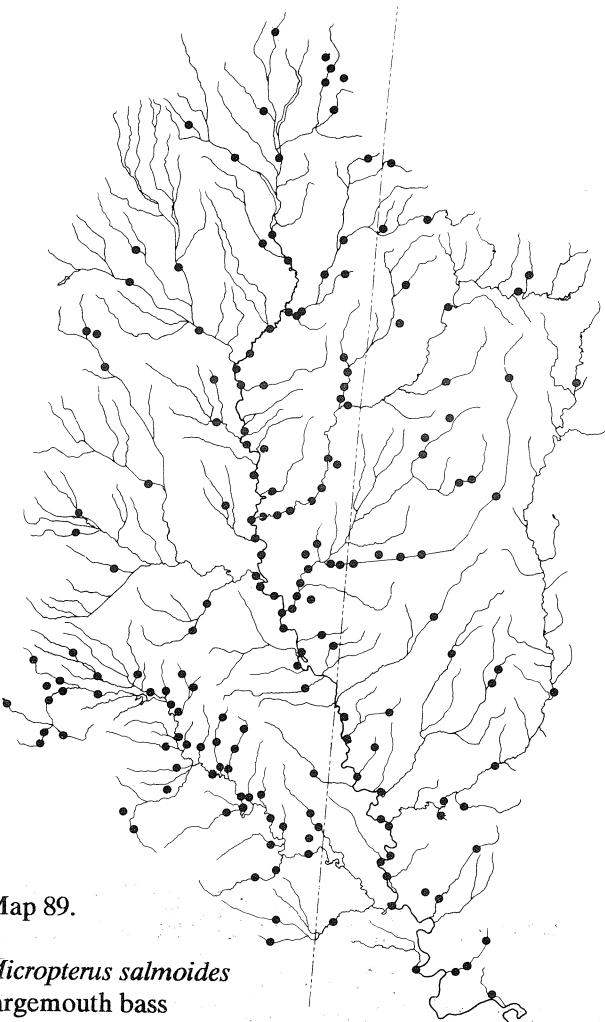

Map 88.

Micropterus punctulatus
spotted bass

Micropterus salmoides* (Lacepede)*largemouth bass**

The largemouth bass, considered by many to be the single most important freshwater sport fish in North America, is ecologically adaptable, as attested by its successful introduction around the world in temperate and tropical zones. The Demopolis, Gainesville, and Aliceville pools are periodically stocked with largemouth bass, including the Florida strain, by the Alabama Department of Conservation and Natural Resources.

182 Sites: 2, 4-6, 8, 10-13, 16, 17, 19, 20, 22-25, 27-31, 35, 39, 40, 42-47, 49, 51, 53, 55, 62, 63, 65, 66, 68, 70-76, 78, 79, 82-90, 92-101, 106, 120, 122, 125-127, 129, 131-134, 137, 138, 140, 146, 148, 151, 153, 154, 156-159, 161, 163-166, 172-174, 176, 177, 179, 180, 182, 186, 188-191, 193-196, 200, 205, 208, 209, 211, 219, 221-224, 226, 229-232, 234, 235, 238, 239, 242-246, 249, 250, 255, 257, 262, 264, 267, 268, 271, 276, 278, 279, 282, 284, 285, 287, 289, 291, 295, 296, 303, 304, 307, 308, 310-312, 314-316, 320-323, 325, 329, 330, 335, 336, 338, 345, 347, 348, 349, and 351. Map 89.

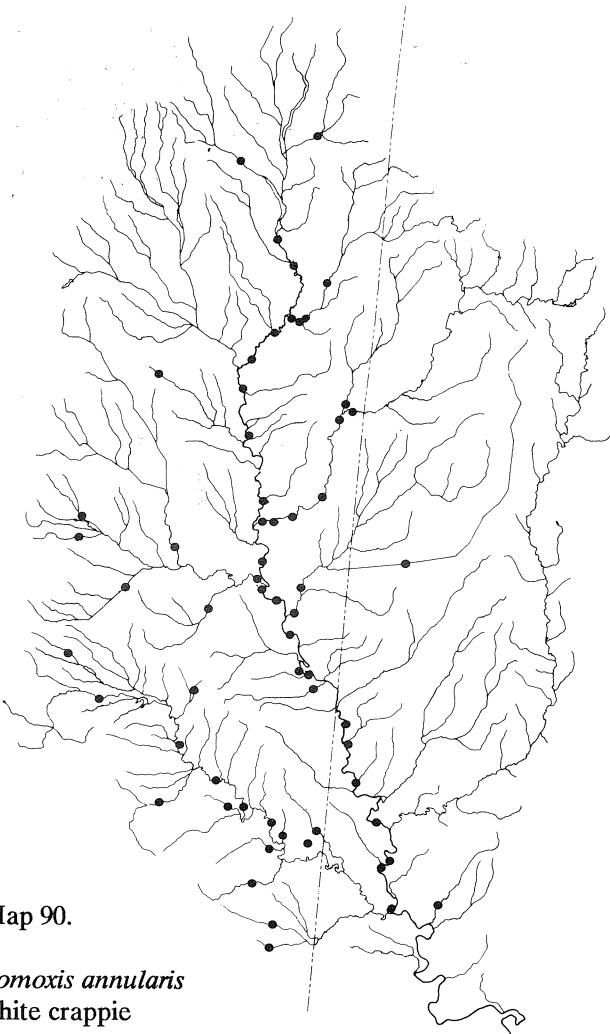

Map 89.

Micropterus salmoides

Pomoxis annularis* Rafinesque*white crappie**

The white crappie occurs in quiet waters of the large streams and impoundments, and in deep pools of small streams. Its numbers increased considerably in the lower part of the upper Tombigbee following impoundment by the TTW, especially in the pool at Pickensville (Boschung, 1984; 1987).

61 Sites: 10, 16, 17, 19, 23, 25, 27-29, 33, 39, 49, 57, 68, 71, 79, 82, 93, 95, 96, 122, 132, 134, 138, 146, 150, 151, 156, 158, 163, 188, 193-196, 204, 208-210, 223, 230-232, 235, 241, 242, 250, 266, 281, 282, 284, 303, 304, 307, 308, 310, 312, 322, 325, 329, and 343. Map 90.

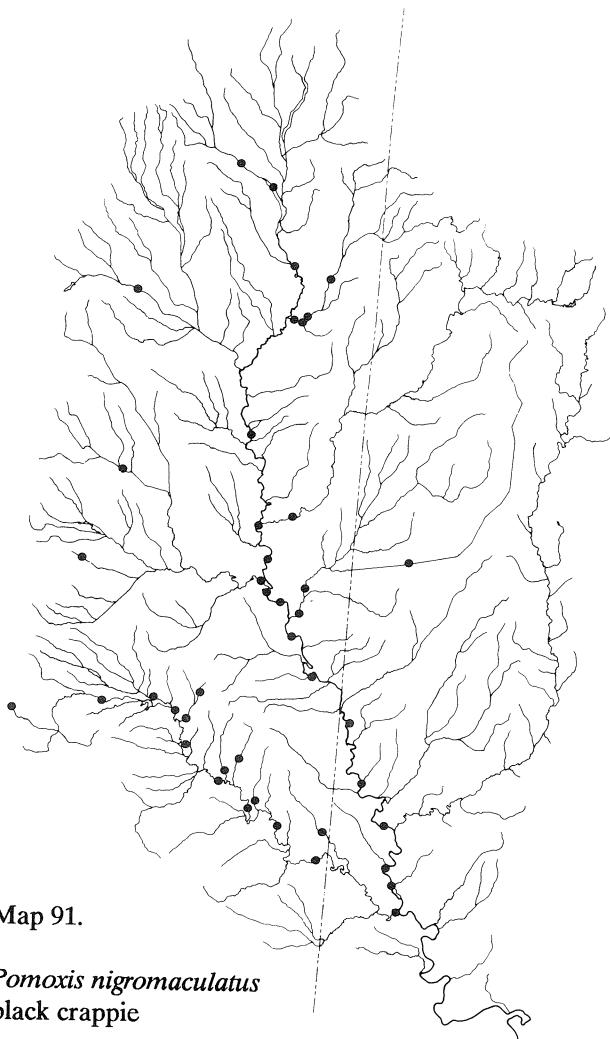

Map 90.

Pomoxis annularis
white crappie

Pomoxis nigromaculatus (Lesueur)

The black crappie occupies habitats similar to that of the white, but is less tolerant of turbidity and siltation. Its numbers are not expected to increase to the same extent as those of the white crappie.

43 Sites: 19, 22, 29, 31, 39, 43, 45, 49, 68, 70, 71, 73, 75, 82, 92-95, 122, 132, 138, 150, 156, 158, 163, 188, 193-195, 206, 212, 223, 229, 232, 282, 291, 307, 308, 310, 312, 322, 328, and 329. Map 91.

PERCIDAE — perches

Ammocrypta asprella (Jordan)

crystal darter

Ammocrypta asprella is a darter of large clear streams that have shifting sand or gravel bottoms. With the impoundment of the river proper, essentially all of the preferred habitat of the crystal darter in the upper Tombigbee was destroyed. The sites of the few records in the lower-most parts of the Luxapallila, Buttahatchee, and Bull Mountain creeks were inundated by the TTW. Even if small populations do survive in tributaries, they will be isolated by the pool barriers. There is little expectation that the crystal darter will survive in the upper Tombigbee. Bauer and Clemmer (1983) compiled a comprehensive status report on the crystal darter.

29 Sites: 93-95, 122, 132, 134, 135, 156, 157, 163, 193, 194, 223, 224, 229-232, 234, 266, 268, 270, 276, 287, 306-308, 310, and 335. Map 92.

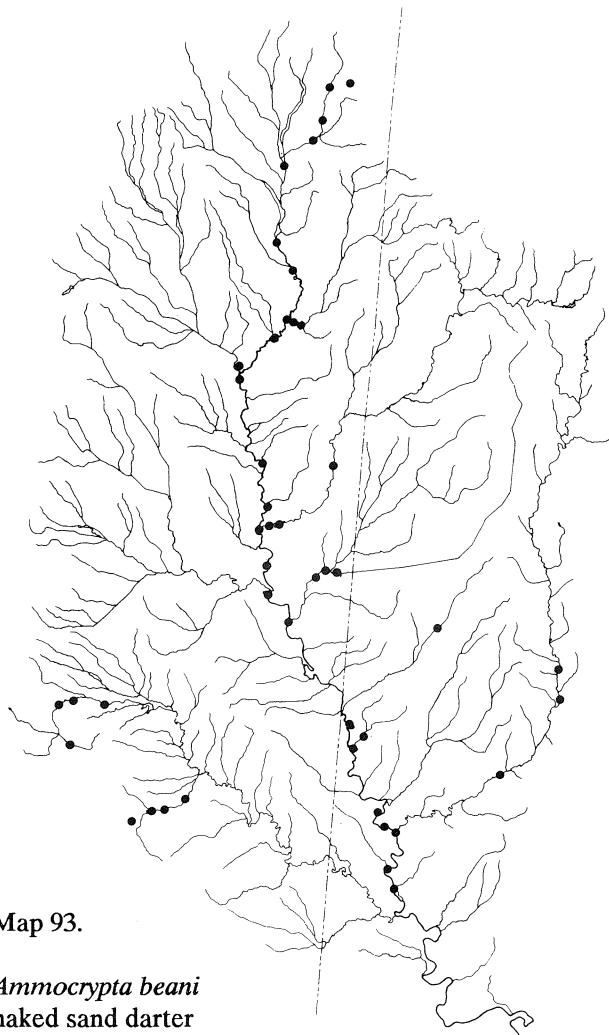

Map 92.

Ammocrypta asprella
crystal darter

Ammocrypta beani Jordan

The habitat of *Ammocrypta beani* is small and medium-sized streams and rivers that have clean water, moderate current, and shifting sand. The life history of the naked sand darter was treated in Heins and Rooks (1984). The main channel habitat was destroyed by the TTW; additional effects of the TTW depend upon the extent to which the habitat is inundated.

45 Sites: 56-58, 62, 82, 85, 87, 88, 94, 95, 97, 101, 106, 110, 122, 123, 134, 135, 138, 140, 157, 164, 167, 179, 194, 223, 229-231, 239, 266, 270, 287, 288, 304, 306-308, 322, 325, 335, 343, and 346-348. Map 93.

Map 93.

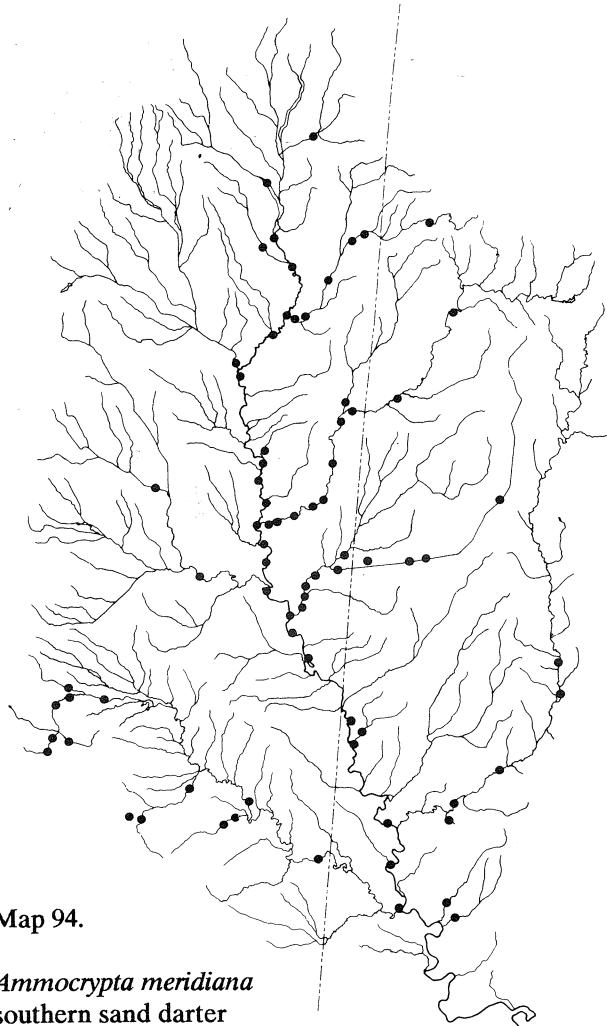

Ammocrypta beani
naked sand darter

naked sand darter**Ammocrypta meridiana Williams**

Ammocrypta vivax Hay, in part

Ammocrypta meridiana and *A. beani* have similar habitat and often occur at the same sites in the upper Tombigbee. The effects of the TTW on this species depends upon the extent that the habitat is inundated.

76 Sites: 9, 10, 22, 35, 36, 40, 56, 61, 62, 82, 83, 85, 87-90, 93, 95, 98, 99, 101, 106, 110, 122, 134, 135, 138, 153, 156-158, 161, 163, 164, 170, 179, 183, 188-190, 194, 203, 211, 223, 224, 229-232, 234, 235, 239, 241, 242, 250, 252, 257, 266, 268, 270, 272, 287, 288, 304, 306, 307, 310, 312, 316, 317, 321-323, 325, 328, and 343. Map 94.

Map 94.

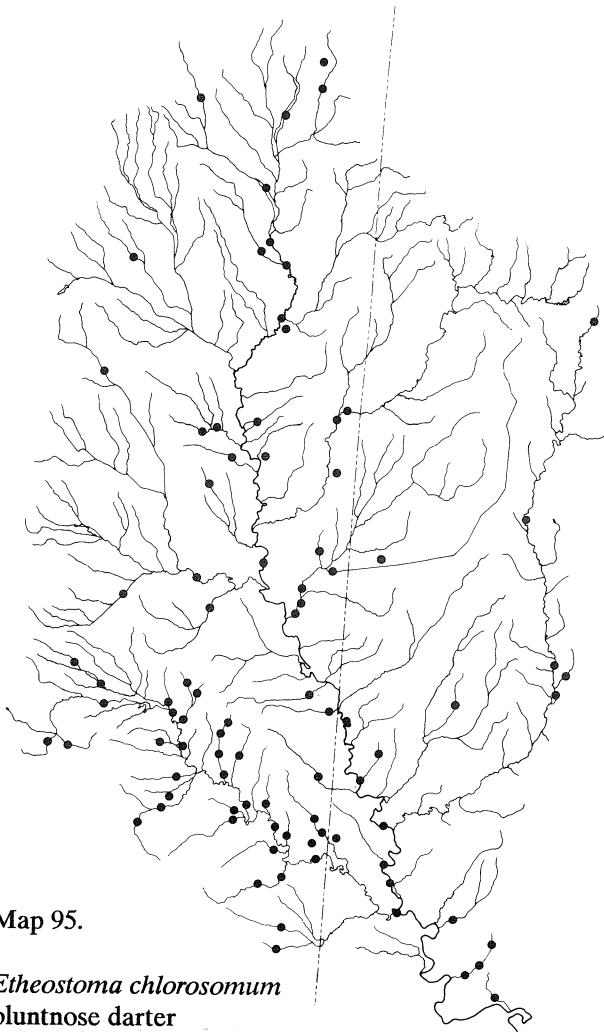

Ammocrypta meridiana
southern sand darter

southern sand darter

Etheostoma chlorosomum* (Hay)*bluntnose darter**

The bluntnose darter inhabits sluggish, low-gradient streams, lower channels of large rivers, sloughs, backwaters and small lakes where the current is slow and the bottom varies from mud to sand (Bart and Cashner, 1986). Eggs are laid on plants and other materials over a sandy bottom (Page and Retzer, 1982). The species is affected by the TTW to the extent that its breeding habitat is inundated.

89 Sites: 2, 4-6, 9, 16-20, 22-25, 27-30, 33, 35, 40, 43, 45-48, 53, 55, 57, 61, 68-74, 78, 79, 82, 88, 89, 93-95, 106, 108, 110, 114, 121, 122, 124, 131-133, 138, 142, 146, 158, 161, 163, 166, 179, 186, 196, 203, 204, 219, 223, 228, 238, 241, 250, 269, 271, 279, 280, 283, 295, 305, 306, 322, 323, 325, 328, 332, 339, 347, and 351. Map 95.

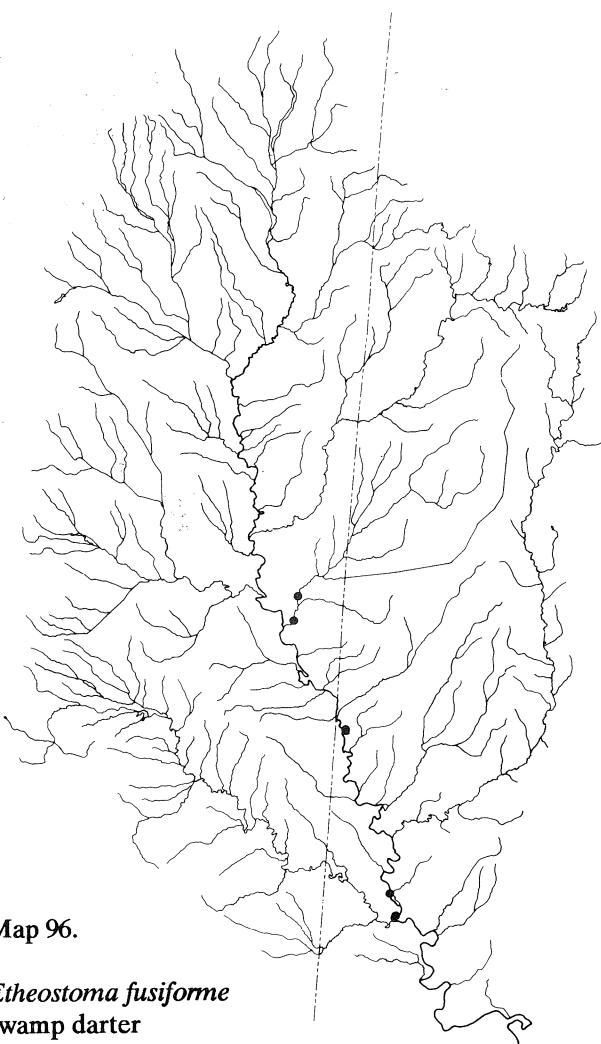

Map 95.

Etheostoma chlorosomum
bluntnose darter

Etheostoma fusiforme* (Girard)*swamp darter**

The records herein extend the known range of the swamp darter in the Tombigbee system by about 248 rmi. Based on UAIC specimens, Bassetts Creek in Washington County, Alabama, was heretofore the farthest point up the Tombigbee that the species was known to occur. In the upper Tombigbee, *E. fusiforme* is known only from the lower Luxapallila (Kelly, 1975) and from the Gainesville and Aliceville pools where "they are abundant in some littoral areas..." (Timmons, 1982).

5 Sites: 93, 94, 138, 158, and 163. Map 96.

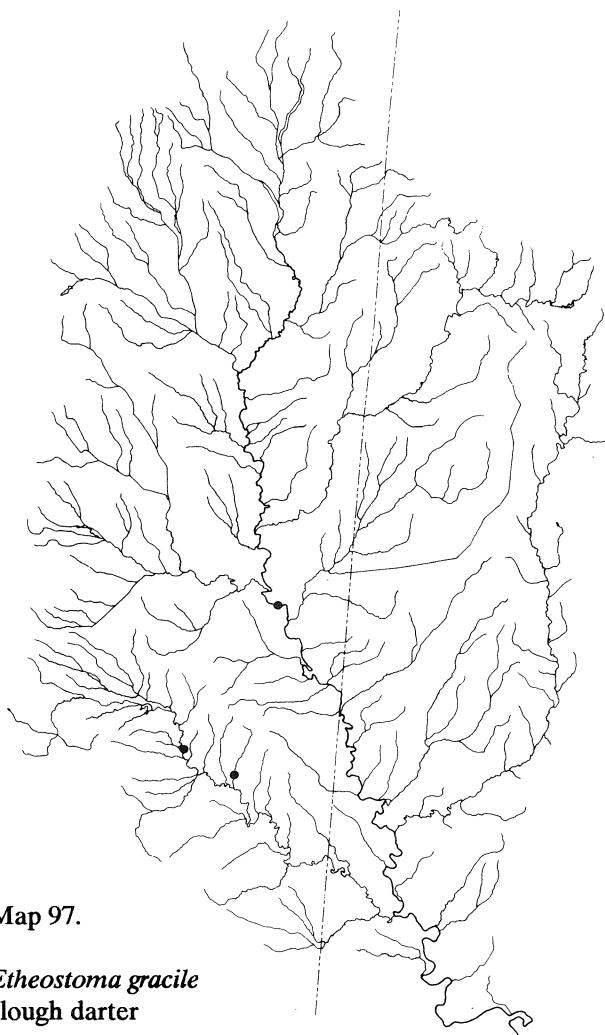

Map 96.

Etheostoma fusiforme
swamp darter

***Etheostoma gracile* (Girard)**

The slough darter, long thought to be extirpated from Mobile basin, was rediscovered in the Noxubee system by Walter Hubbard (1987). The record at Site 193 dates to August 18, 1931 (MMNS). *Etheostoma gracile* inhabits slow or moderately flowing waters with little or no aquatic plants and with predominant mud, silt, or sand substrate (Collette, 1962).

3 Sites: 42 and 68. and 193. Map 97.

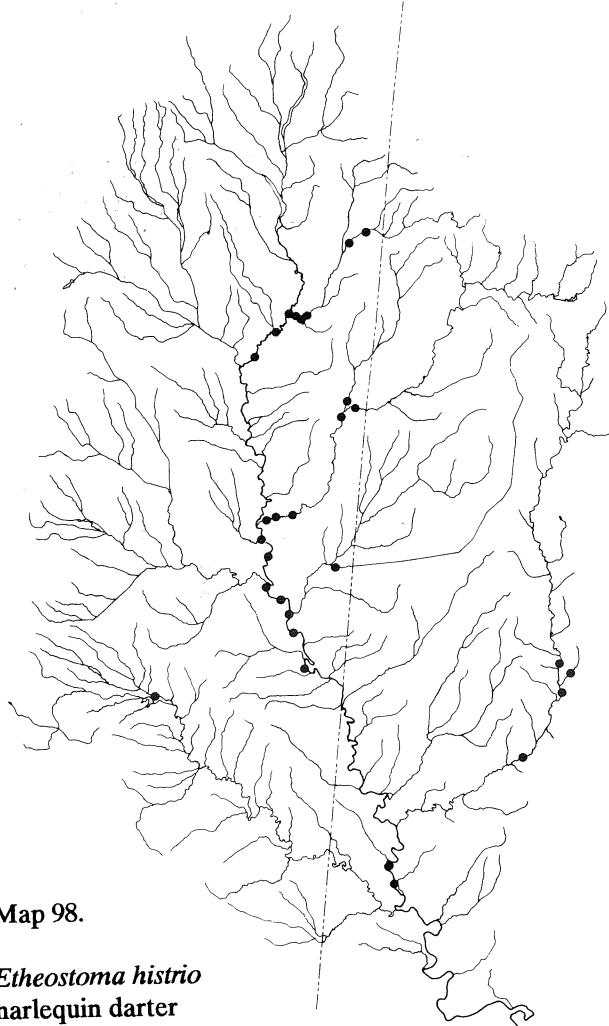

Map 97.

Etheostoma gracile
slough darter

***Etheostoma histrio* Jordan and Gilbert** harlequin darter

Etheostoma histrio inhabits the sluggish parts of large to medium-sized streams having a variety of bottom types. It is often found in heavy detritus. The harlequin darter has apparently disappeared from the main channel area following impoundment by the TTW (Timmons, 1982; Boschung, 1984, 1987).

29 Sites: 75, 94, 95, 103, 106, 108, 110, 151, 156, 157, 179, 193, 194, 223, 224, 230-232, 241, 242, 250, 303, 304, 306-308, 310, 316, and 317. Map 98.

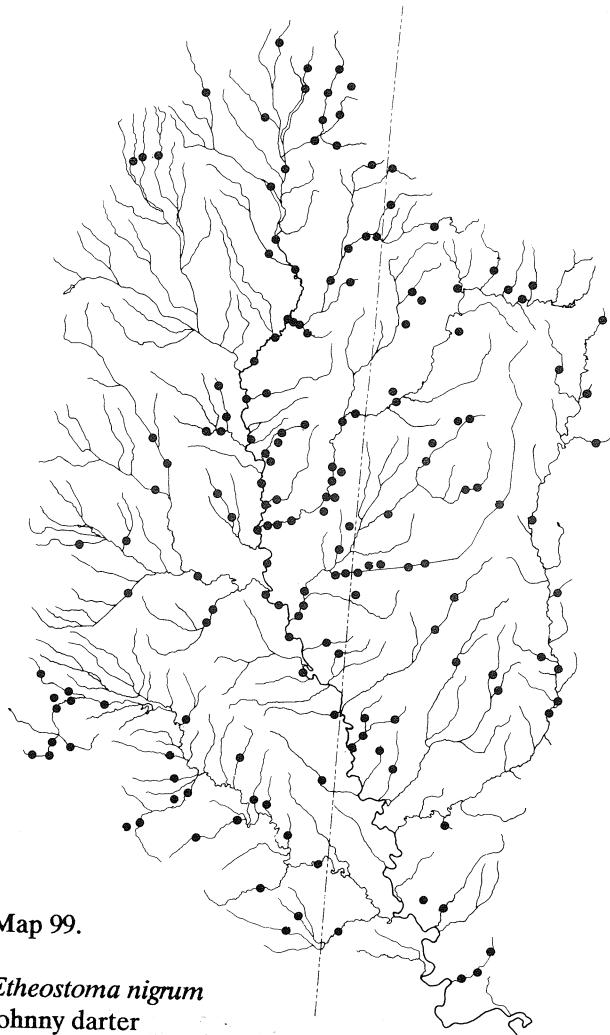

Map 98.

Etheostoma histrio
harlequin darter

Etheostoma nigrum* Rafinesque*johnny darter**

Etheostoma nigrum is the most ubiquitous darter in the upper Tombigbee. It is abundant in all sorts of habitats with moderately clear water, but typically seems to avoid riffles in favor of sandy pools. It is affected by the TTW to the extent that its habitat is inundated.

169 Sites: 4-6, 10, 12, 13, 15, 16, 22, 25, 28, 30, 31, 35, 37, 43, 53, 55, 56, 61, 62, 66, 70, 82-91, 98, 105, 106, 110-112, 114, 116, 118, 119, 121, 125, 126, 128, 130, 131, 133-137, 140-142, 148, 151, 154, 156, 158, 161-163, 168, 169, 171-177, 179, 180, 182-184, 188-190, 193, 194, 196, 197, 203, 204, 207, 208, 211, 216, 217, 223, 226, 227, 229-233, 235-239, 241, 247-250, 252, 253, 256, 258, 259, 261, 262, 264, 266-268, 271-275, 277-280, 282, 284, 285, 299, 300, 302-304, 306-309, 311, 312, 314-319, 321-323, 325, 328, 332, 335, 337, 338, 340, 341, and 343-349. Map 99.

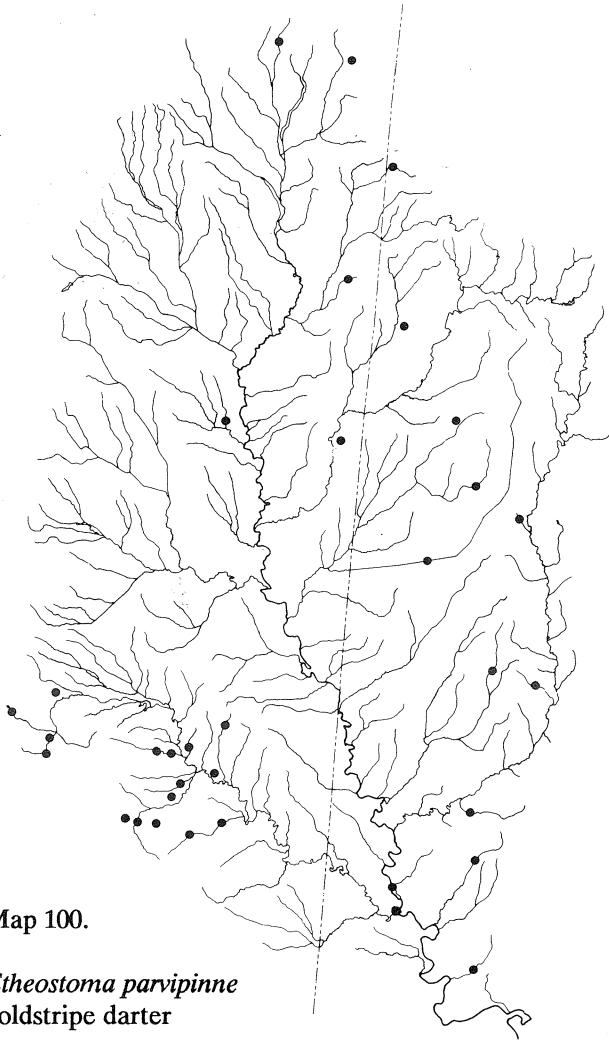

Map 99.

Etheostoma nigrum
johnny darter

Etheostoma parvipinne* Gilbert and Swain*goldstripe darter**

Etheostoma parvipinne is found in the low-order streams, often in springs or small, spring-influenced streams where there is abundant vegetative cover. It should be little influenced by the TTW, as no part of its life cycle requires the larger streams.

34 Sites: 5, 11, 36, 37, 47, 50, 54, 55, 59, 61, 62, 65-86, 89, 90, 92-94, 100, 107, 113, 128, 174, 177, 189, 240, 246, 277, 311, 315, 338, and 350. Map 100.

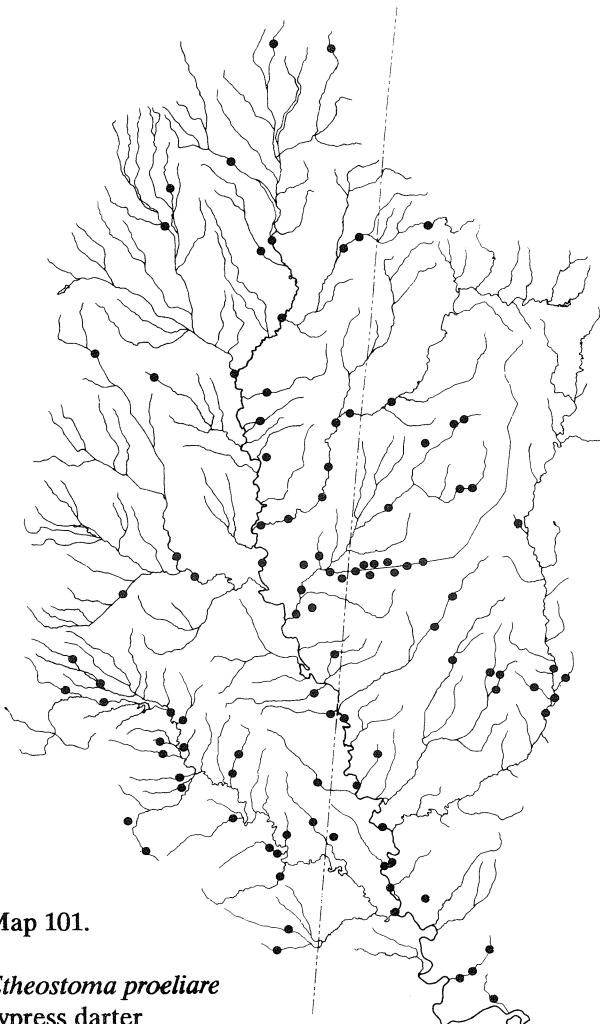

Map 100.

Etheostoma parvipinne
goldstripe darter

Etheostoma proeliare* (Hay)*cypress darter**

The cypress darter is common in streams, swamps, and backwaters where the bottom is soft and detritus and aquatic vegetation abound (Burr, 1980). Burr and Page (1978) stated that it is the presence of leaves and/or vegetation that is important to *E. proeliare*, rather than the physical attributes of pools and riffles.

102 Sites: 2, 4, 5, 6, 12, 16-18, 20, 24, 26-28, 35, 42, 43, 53, 54, 62, 64, 67-70, 73, 78, 79, 82, 83, 93-96, 105-108, 110, 113, 122, 125-128, 131-133, 138, 140-142, 146, 148, 158, 159, 163, 165, 166, 171, 173-177, 179, 181-189, 203, 204, 210, 220, 223, 230, 232, 237, 239, 241, 250, 252, 271, 281, 283, 285, 287, 297, 301, 306, 316, 317, 321, 323, 325, 329, 338, and 352. Map 101.

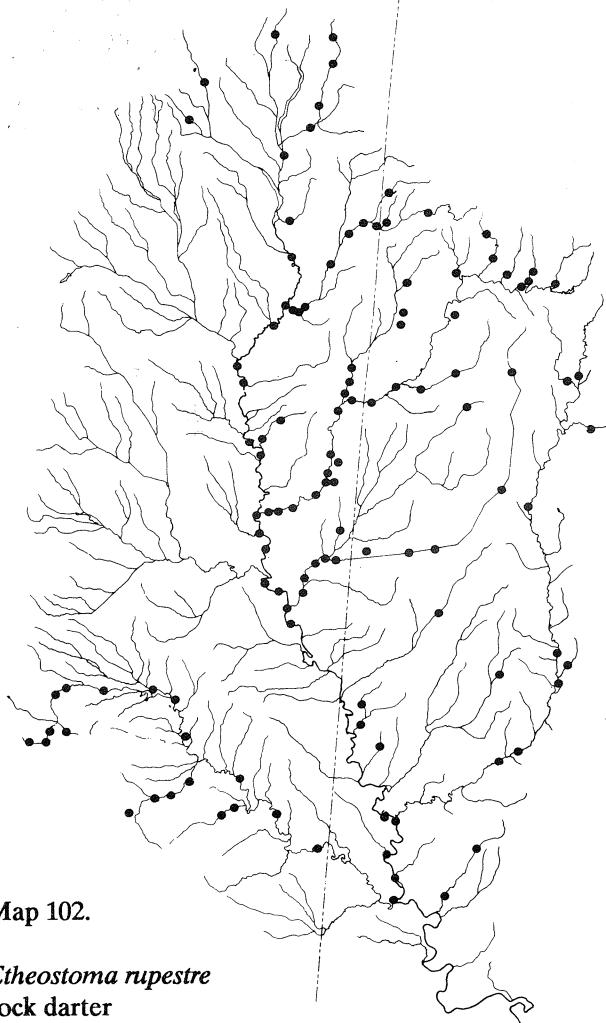

Map 101.

Etheostoma proeliare
cypress darter

Etheostoma rupestre* Gilbert and Swain*rock darter**

The rock darter is endemic to Mobile basin and is present in all systems except the upper Tallapoosa. In the upper Tombigbee, it is common in the Noxubee River system and in all streams of the Fall Line Hills physiographic region. It is usually collected on coarse gravel riffles or slab rock. The species is vulnerable in the TTW to the extent that its habitat is inundated.

117 Sites: 10, 11, 22, 29, 35, 36, 41, 56-58, 62, 68, 73, 75, 82, 85, 87-91, 93-95, 97, 101, 103, 106, 108, 110, 114, 116, 117, 120, 122, 126, 133, 135, 136, 140, 156, 157, 161, 163, 164, 167, 168, 175, 179, 183, 188-191, 193, 194, 223, 224, 229-232, 234-239, 241-244, 246, 247, 249-252, 254-256, 258-265, 270, 272, 274, 276, 284, 287, 304, 306-308, 310, 312, 316-322, 326, 330, 332, 335, 338, 343, 346, 349, and 352. Map 102.

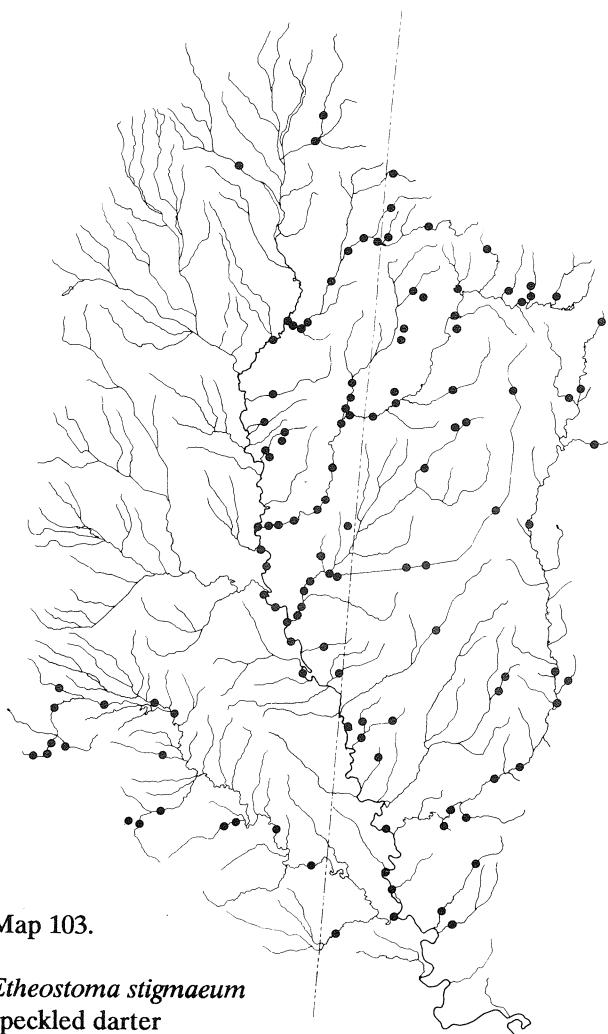

Map 102.

Etheostoma rupestre
rock darter

Etheostoma stigmaeum* (Jordan)*speckled darter**

The speckled darter is most often found in relatively clear water in the sandy parts of pools below riffles. It tends to avoid sluggish, low-gradient streams (Howell, 1980). It is affected by the TTW to the extent that its habitat is inundated.

121 Sites: 9-11, 13, 22, 29, 35, 36, 57, 61, 62, 67, 73, 75, 82, 83, 87-91, 93-95, 98-101, 103, 106, 108, 110, 114, 116, 117, 120-122, 126, 127, 133, 135-138, 140, 147, 151, 154, 156-158, 161, 163, 164, 166, 167, 169, 172, 174, 175, 179, 188-191, 193, 194, 223, 224, 229-232, 234, 235, 239, 241-244, 246-253, 255-258, 260-265, 271-274, 283, 285, 304, 306-308, 310, 312, 315-321, 329, 343, and 346. Map 103.

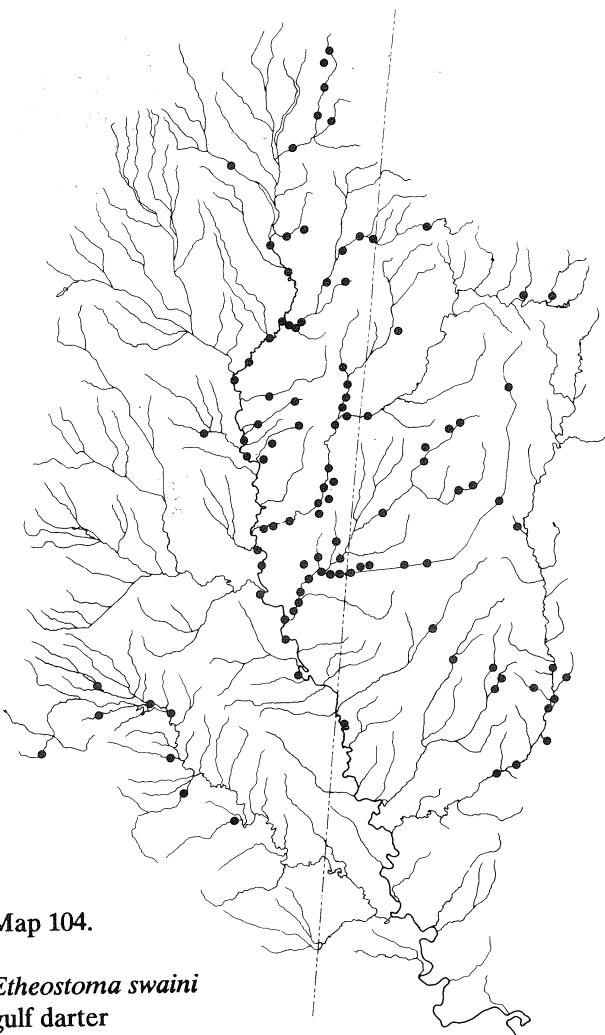

Map 103.

Etheostoma stigmaeum
speckled darter

Etheostoma swaini* (Jordan)*gulf darter**

Etheostoma swaini has a distribution in the upper Tombigbee very similar to that of *E. stigmaeum*. It occupies the riffles and sandy area usually where there is good vegetative cover. The gulf darter is vulnerable in the TTW to the extent that its habitat is inundated.

106 Sites: 35, 56, 66, 73, 75, 78, 81, 90, 101, 103-108, 110, 113, 125-128, 138, 140, 151, 156-158, 161, 163-168, 170-177, 179, 180, 182-184, 188-191, 194, 223, 224, 230-239, 241-246, 250, 251, 263, 265, 271, 273, 275, 276, 280, 282, 283, 285, 287, 303, 304, 306-308, 310-312, 316, 317, 319, 321, 322, 325-327, 329, 342, 345-347, 351, and 352. Map 104.

Map 104.

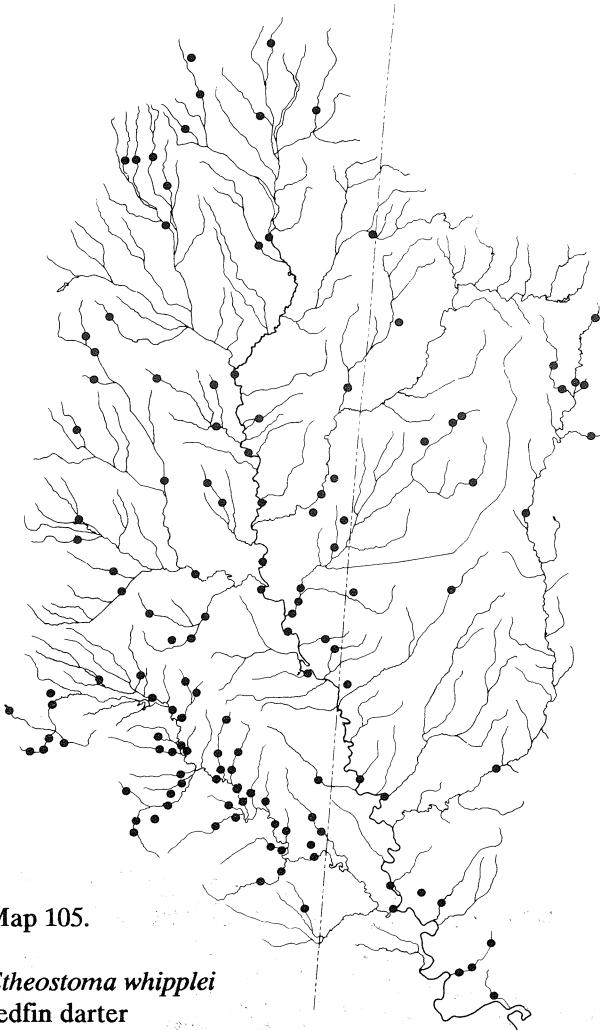

Etheostoma swaini
gulf darter

Etheostoma whipplei* (Girard)*redfin darter**

Hay (1881) described *Poecilichthys artesiae* from Catawba Creek at Artesia, Lowndes County, Miss. It was subsequently considered one of four subspecies of *Etheostoma whipplei* (Hubbs and Black, 1941). The complex is presently considered divisible into two subspecies (Retzer et al., 1986) and the upper Tombigbee form is *E. w. artesiae* (Hay).

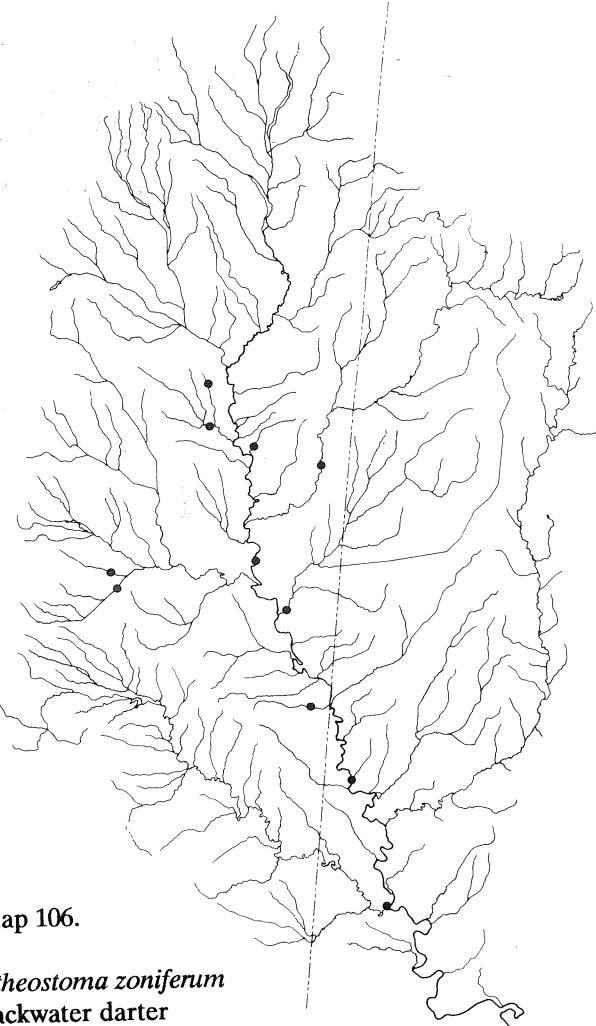

The redfin darter inhabits small to medium-sized riffles of low- to medium-gradient streams where there is a mixture of sand and gravel. *E. whipplei* is affected by the TTW to the extent that its habitat is inundated.

131 Sites: 2, 4-6, 10, 12, 14, 19, 20, 22-31, 34-36, 40-43, 45, 46, 48, 49, 53-55, 57, 59-61, 63, 65-73, 75, 76, 78, 86-94, 101, 114, 116-121, 129, 131, 132, 141, 144, 148, 150, 154, 156, 158, 161, 162, 163, 168, 169, 173-175, 177, 194, 197, 199-201, 203-205, 208, 209, 213, 215, 218, 220, 222, 223, 227, 228, 233, 237, 238, 243, 247, 266, 276, 278, 279, 281, 283, 287, 290, 297, 299-302, 319, 323, 325, 330, 332, 333, 336, 338, and 346. Map 105.

***Etheostoma zoniferum* (Hubbs and Cannon)****backwater darter**

Etheostoma zoniferum, a close relative to *E. gracile*, is endemic to Mobile basin and it ranges in a narrow belt in Alabama and Mississippi below the Fall Line. It inhabits pools in small streams of slow to moderate current. It is usually captured over sand or silt substrates and may be taken in aquatic vegetation (Kuehne and Barbour, 1983). The backwater darter is vulnerable to the TTW to the extent that its habitat is inundated.

11 Sites: 93, 132, 143, 158, 204, 205, 223, 239, 272, 278, and 279. Map 106.

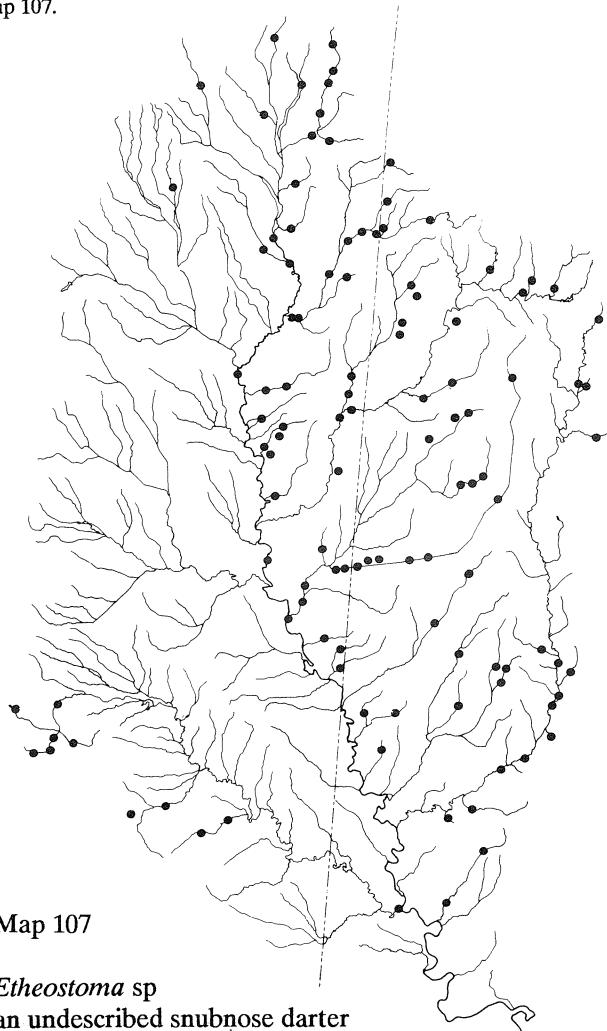

Etheostoma* sp.*an undescribed snubnose darter**

This undescribed darter occurs in a variety of habitats, primarily in the Fall Line Hills physiographic region. It has been collected in slow to moderately fast currents over sand, gravel, hard clay, or bedrock, and in or out of vegetative cover. On several occasions, it was taken in swamps over a mud bottom. It is not expected to seriously suffer adverse consequences of the TTW.

112 Sites: 10, 11, 36, 37, 57, 62, 87-93, 98, 100, 101, 103-106, 108, 110, 111, 116, 119-121, 124-128, 133, 136, 137, 140, 141, 147, 148, 154, 157, 161, 163, 166, 173-180, 182-184, 188-191, 223, 238, 241, 243, 244, 246-250, 254-256, 259, 262, 264, 265, 267, 271-274, 283, 285-287, 301, 307, 308, 311, 312, 315-323, 325, 326, 332, 334, 336, 338, 340, 343, 344, 346, 347, 349, and 352.

Map 107.

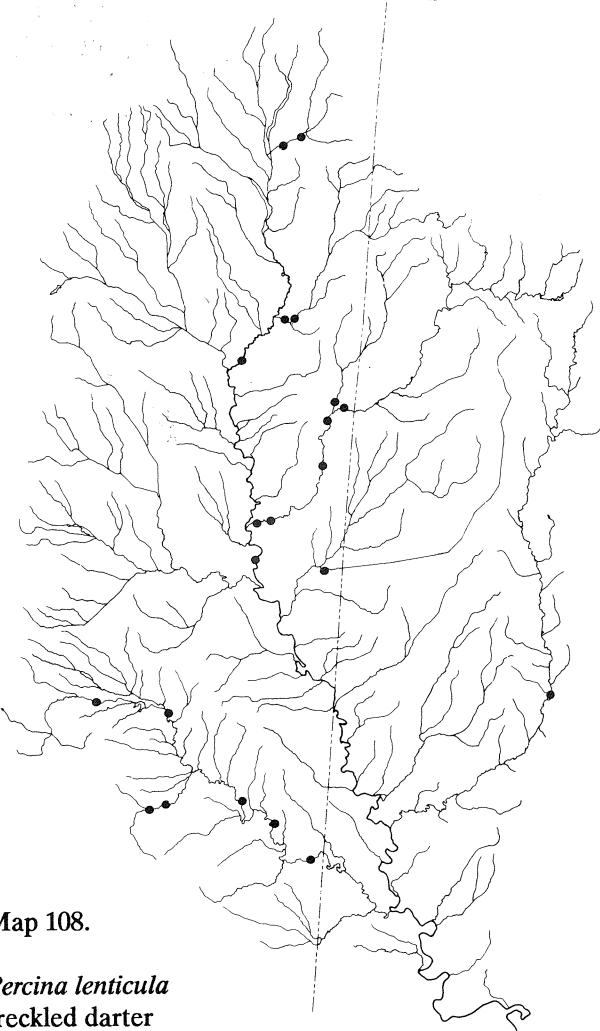

Map 107

Etheostoma sp
an undescribed snubnose darter

Percina* lenticula Richards and Knapp*freckled darter**

The freckled darter occurs in the main channels of large to medium-sized rivers, usually, where the current is strong. It seeks refuge under logs or boulders and is difficult to dislodge. Most of our knowledge concerning the biology of this species is contained in a report by Bauer and Clemmer (ca 1983). The TTW probably has destroyed the habitat of the freckled darter in the upper Tombigbee River proper. Distributional evidence indicates that populations of the darter may be sustained in the larger tributaries.

21 Sites: 22, 29, 40, 57, 58, 73, 82, 106, 179, 223, 230, 231, 239, 241, 242, 250, 303, 308, 310, 342, and 343. Map 108.

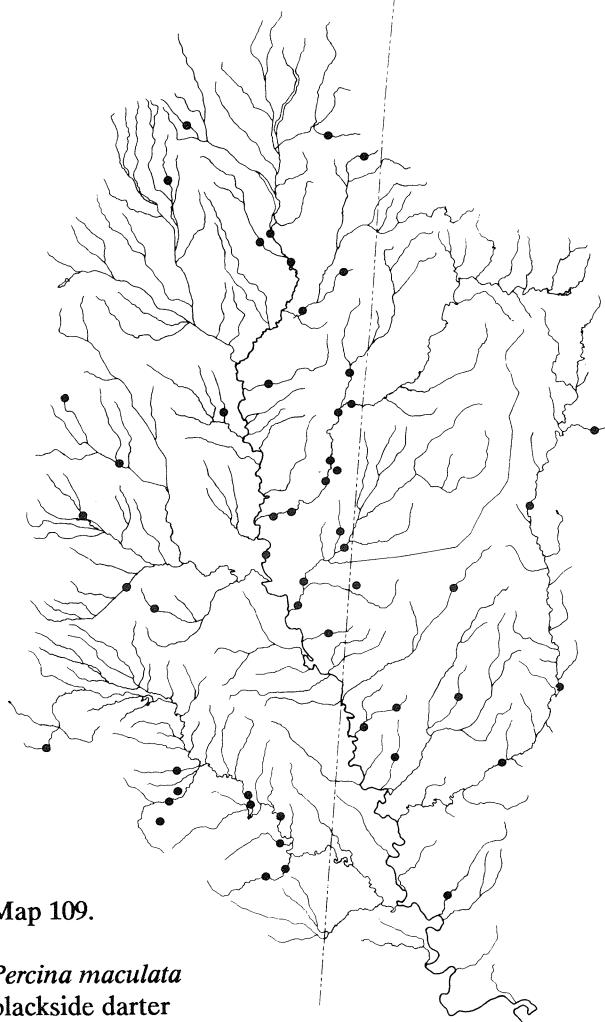

Map 108.

Percina lenticula
freckled darter

Percina maculata (Girard)

blackside darter
 Beckham (1986) published a redescription of *Percina maculata*. The blackside darter is often found in the faster currents of small to medium-sized streams of low to moderate gradient and sand or gravel bottoms; however, it is not uncommon in backwaters among accumulations of sticks, leaves and other debris (Pflieger, 1975). It is affected by the TTW to the extent that its habitat is inundated.

51 Sites: 10, 24, 25, 27, 29, 40, 53, 55, 57, 59, 90, 101, 106, 114, 116, 124, 130, 135, 137, 141, 154, 158, 162, 163, 168, 170, 199, 204, 209, 212, 214, 223, 231, 232, 237-239, 241, 244, 250, 277, 285, 301, 310, 311, 314, 322, 323, 325, 330, and 344. Map 109.

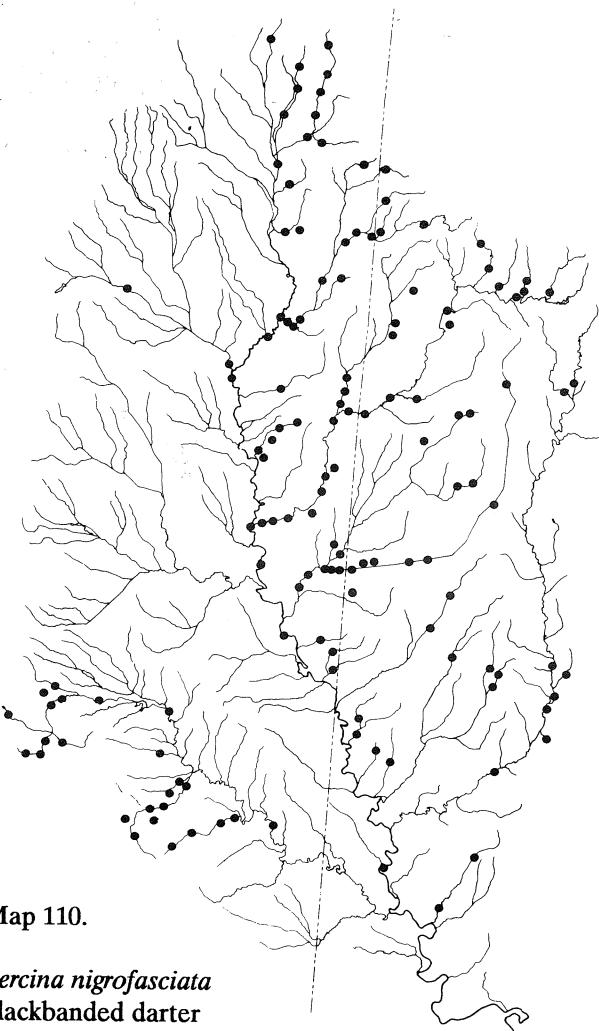

Map 109.

Percina maculata
 blackside darter

Percina nigrofasciata (Agassiz)

blackbanded darter
Percina nigrofasciata is one of the most ubiquitous and common darters in the southeastern United States. Compared with several other members of the genus, it has the greatest niche breadth based on reproduction, habitat preference, and food habits (Wieland, 1983).

137 Sites: 10, 11, 29, 35-38, 54-59, 62, 63, 67, 73, 82, 83, 85-92, 95, 101, 104-106, 108, 110, 117, 120, 125, 126-128, 130, 133, 135, 136, 140, 141, 147, 148, 154, 156, 162- 164, 167, 168, 170, 173-177, 179, 180, 182-184, 188-191, 223, 229-233, 235, 237, 238, 241-244, 246-248, 250-252, 254, 256, 257, 259-265, 271-275, 286-288, 291, 304, 306-308, 310-312, 314-321, 326, 327, 334, 335, 338-341, 343, 344, 346, 347, 349, and 352. Map 110.

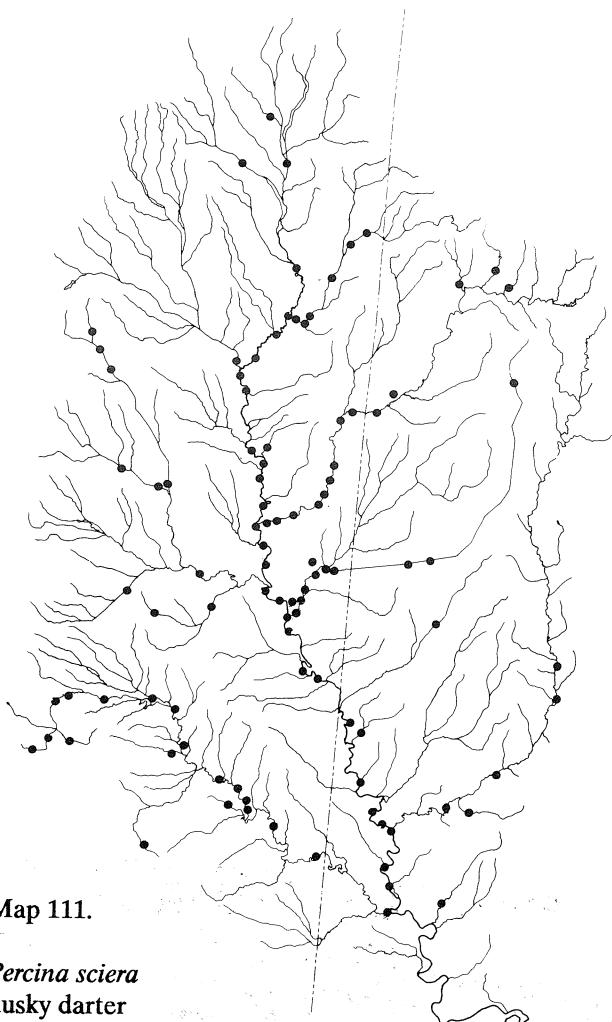

Map 110.

Percina nigrofasciata
 blackbanded darter

Percina sciera (Swain)

In Mobile basin, the dusky darter is limited to the upper Coastal Plain in the Tombigbee River system. It is very similar to *Percina nigrofasciata*; field identifications are made primarily on the basis of color pattern. The dusky darter is usually collected over coarse gravel in deep runs and riffles; however, it tolerates greater ranges of habitat with regards to size of stream compared with *P. nigrofasciata*. Where the two occur together, *P. sciera* is the more abundant (Suttkus and Ramsey, 1967). The TTW is expected to impact adversely on the big river habitat of *P. sciera*.

99 Sites: 10, 22, 29, 34, 39-41, 49, 64, 66, 68, 73, 75, 82, 85, 87-89, 91, 93-95, 97, 99-101, 106, 110, 122, 123, 132, 135, 138, 140, 149, 151, 156-158, 161, 163-165, 167, 179, 188, 189, 191-194, 196, 199, 203, 204, 211, 212, 215, 219, 220, 222-224, 229-232, 234, 235, 237, 239, 241, 250, 251, 253, 258, 259, 261, 266, 268, 270, 272, 276, 284, 287, 288, 303, 304, 306-308, 310, 312, 316, 317, 322, 329, 335, and 336. Map 111.

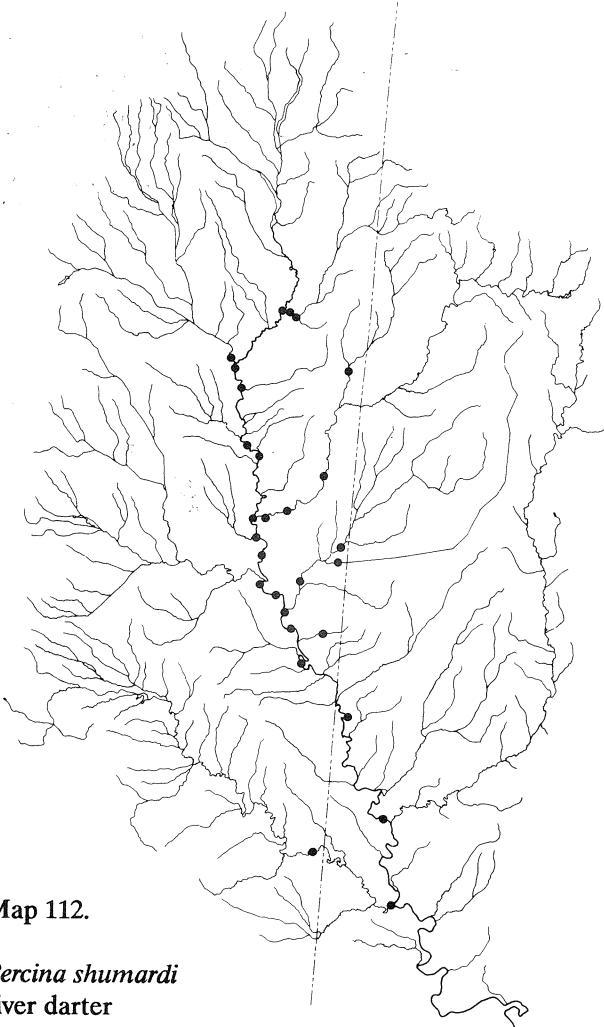

Map 111.

Percina sciera
dusky darter

dusky darter**Percina shumardi (Girard)**

Percina shumardi is a big-river darter. It is almost invariably found in deep chutes and riffles where current is swift and the bottom is composed of coarse gravel or rock (Gilbert, 1980). This habitat is scarce in the tributaries; therefore, the river darter undoubtedly will be extirpated from the upper Tombigbee River proper, perhaps from the entire system.

28 Sites: 22, 93, 122, 138, 151, 154, 156, 157, 163, 170, 179, 193, 194, 223, 224, 229, 230, 232, 237, 244, 270, 276, 284, 287, 288, 306, 307, and 308. Map 112.

Map 112.

Percina shumardi
river darter

Percina vigil (Hay)

Ioa vigil Hay

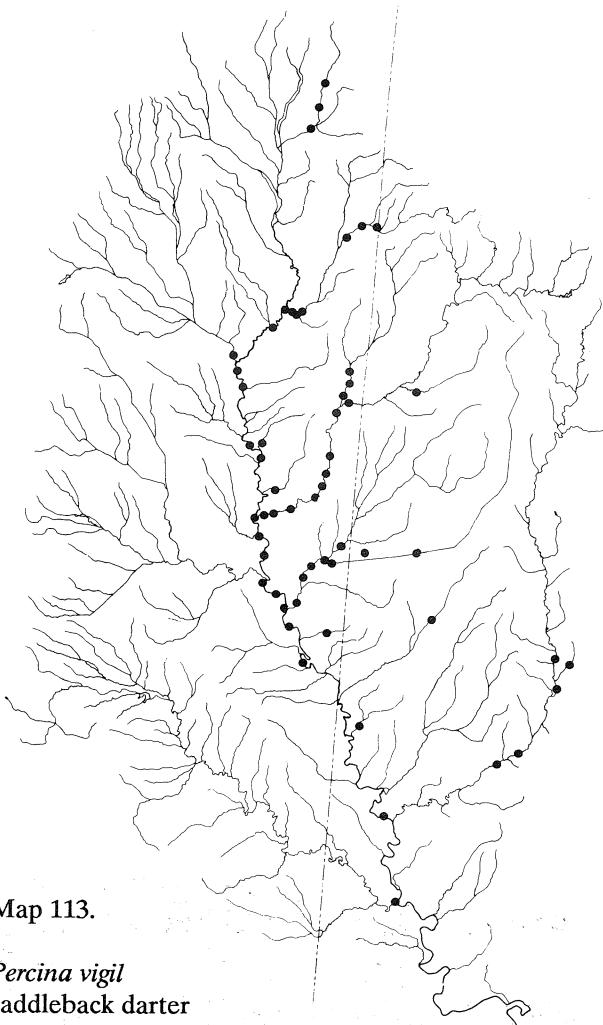

Percina uranidea (Jordan and Gilbert), in part

Percina ouachitae (Jordan and Gilbert).—recent authors

Information regarding this species is retrieved under the name *Percina uranidea*, and, more recently, under *P. ouachitae*; however, Suttkus (1985) argued that the correct scientific name is *P. vigil*.

Percina vigil is usually common on gravel and sand riffles, as well as bedrock of large to medium-sized rivers. It was adversely impacted by the TTW, but it will probably survive in the large Fall Line Hills tributaries in the upper Tombigbee.

57 Sites: 93, 101, 103, 106, 108, 110, 122, 135, 140, 151, 154, 156-158, 163, 164, 167, 170, 179, 183, 189, 193, 194, 223, 224, 229-232, 234, 235, 237, 239, 241-244, 250, 254, 267, 270, 272, 276, 284, 287, 288, 304, 306-308, 310, 316, 317, 319, 343, 346, and 347. Map 113.

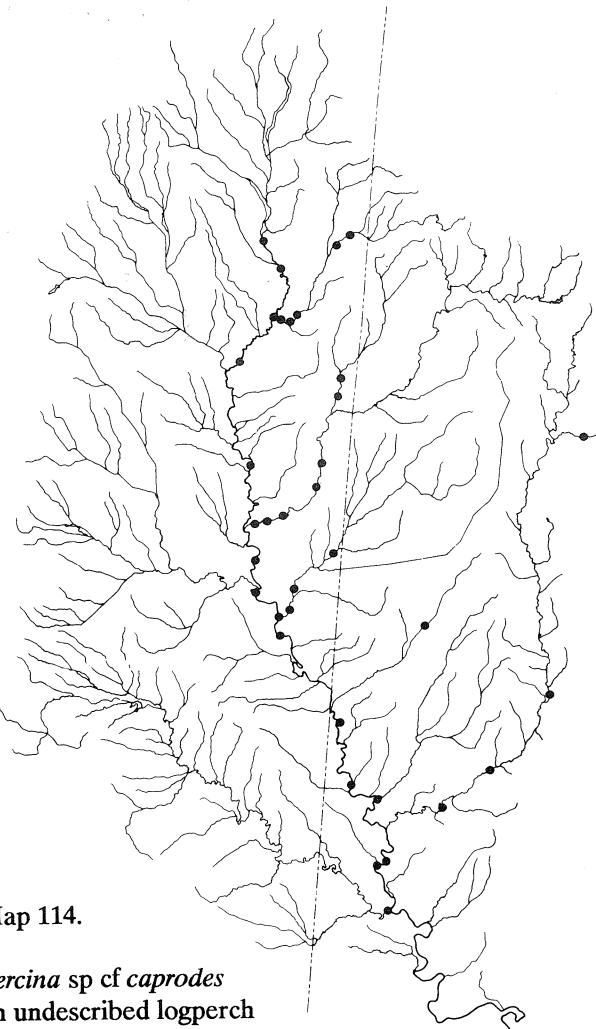

saddleback darter

Percina sp cf caprodes (Rafinesque) undescribed logperch

Steve Ross examined specimens of the *P. caprodes* complex and concluded that both the "Mobile" and "gulf" forms, as defined by Bruce Thompson, occur in the upper Tombigbee. The two forms are not differentiated on the distribution map. The "Mobile" logperch differs from the "gulf" logperch in having wider lateral bars and smaller scales. One or both forms occupy the river proper and the larger tributaries of the Fall Line Hills in the upper Tombigbee. They are syntopic in Bull Mountain Creek and Luxapallila River, and in the Tombigbee proper in Lowndes County, Miss. It is expected that the river populations will be adversely affected by the TTW.

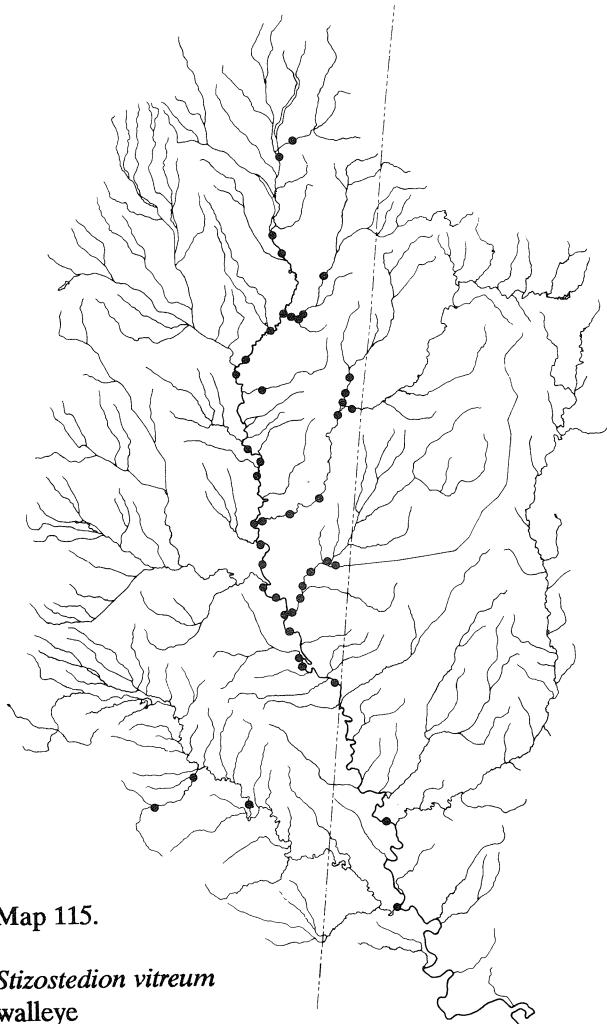

35 Sites: 93, 95, 96, 99, 101, 106, 116, 129, 132, 138, 140, 156-158, 163, 170, 194, 223, 230-232, 237, 239, 243, 244, 270, 303, 306-308, 310, 316, 317, 322, and 325. Map 114.

***Stizostedion vitreum* (Mitchell)**

walleye
Although widely distributed in the upper Tombigbee, especially the river proper and the larger tributaries, the walleye is not abundant anywhere in the system and the numbers have declined over the past 40 years (Schultz, 1969). The data for the distribution map came primarily from Schultz's study. Stocked walleyes often do well in reservoirs; however, the limiting factor for this possibility in the TTW may be suitable tributary streams for spawning.

45 Sites: 39, 56, 58, 93, 122, 145, 151, 152, 156-158, 161, 163, 164, 167, 179, 193, 194, 223, 224, 229, 230, 232, 235, 241-244, 250, 268, 270, 276, 285, 287, 303, 304, 306-308, 310, 312, 324, 325, 335, and 342. Map 115.

Map 115.

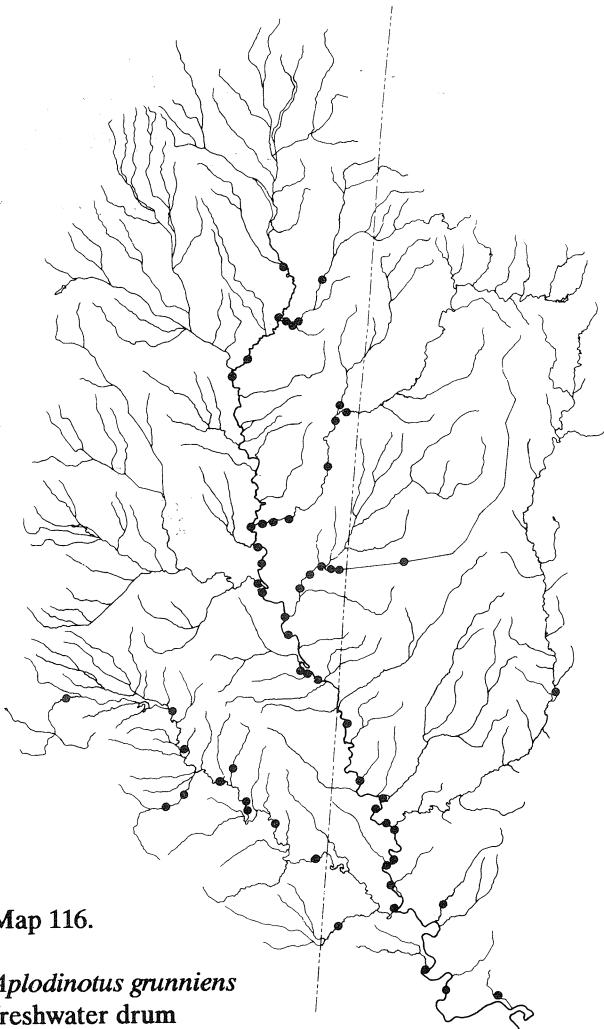

Stizostedion vitreum
walleye

SCIAENIDAE — drums***Aplodinotus grunniens* Rafinesque**

freshwater drum

The freshwater drum occupies a variety of big river habitats, as well as lakes and reservoirs. It is tolerant of silt and turbidity. Adverse effects of the TTW are not anticipated.

58 Sites: 2, 3, 8, 10, 13, 22, 29, 39, 40, 42, 49, 56, 57, 68, 73, 85, 93-97, 106, 122, 123, 129, 132, 138, 149-151, 156, 157, 163, 164, 167, 179, 180, 188, 194, 195, 223, 224, 229-232, 239, 241, 242, 250, 287, 303, 306-308, 310, 312, and 322. Map 116.

Map 116.

Aplodinotus grunniens
freshwater drum

Species of Questionable or Unusual Occurrence

Atractosteus spatula (Lacepede) alligator gar

Lepisosteus spatula Lacepede.— recent authors

Atractosteus spatula (Lacepede).— Wiley, 1977

I (1973, 1983, 1987) included the alligator gar in the lists of fishes of the upper Tombigbee on the strength of a newspaper account related to me by M. F. Mettee. The specimen was caught above the present site of Demopolis Lock and Dam about 35 years ago. Although the alligator gar ascends the Mississippi River and its tributaries, including the Ohio River, rarely is it found far upstream from the delta area in Mobile basin. It is not considered part of the upper Tombigbee fish fauna.

Carassius auratus (Linnaeus) goldfish

The goldfish is assumed to be ubiquitous and sporadically common (Hensley and Countenay, 1980); however, there are no known established populations in the upper Tombigbee. The only record known to me is one reported by Schultz (1969) from Town Creek, about 1.5 mi W Plantersville, Lee County, Miss. (Site 297). There is no reason to think that the goldfish will become a part of this fauna because it is rather intolerant of silt. Since its introduction in North America in the late 1600s (Courtenay et al., 1986), the goldfish, unlike the introduced common carp, has not become well established in the wild.

Ctenopharyngodon idella (Valenciennes) grass carp

The grass carp sporadically escapes from ponds where it is introduced for weed control (Jim McHugh, pers. comm.). To my knowledge, it is not known to reproduce in the wild in the upper Tombigbee.

Cyprinella lutrensis (Baird and Girard) red shiner

Leuciscus lutrensis Baird and Girard

Notropis lutrensis (Baird and Girard).— recent authors

Cyprinella lutrensis.— Mayden, 1989

Timmons (1982) found a single specimen in Gainesville Pool (Site 93) that he considers a bait-bucket introduction. This hardy and prolific minnow could become established as it has elsewhere (Matthews, 1980).

Pimephales promelas Rafinesque fathead minnow

The fathead minnow is rarely encountered; those present are probably bait-bucket escapees, as reproductive populations are not known in the upper Tombigbee.

Carpoides carpio (Rafinesque) river carpsucker

Hubbard (1987) identified two river carpsuckers in a hoop net collection at Site 39 in the Noxubee River. The specimens are 310 and 376 mm TL, ample length that size should not be a factor in their identification. The quillback (*Carpoides cyprinus*), not listed by Hubbard from the Noxubee River, is present elsewhere in the upper Tombigbee.

Moxostoma duquesnei (Lesueur) black redhorse

Specimens catalogued AUM 22096 (Site 230, Buttahatchee River), AUM 22098 (Site 229, Tombigbee at mouth of Buttahatchee), AUM 22099 (Site 316, Bull Mountain

Creek), TU [RDS 5208] (Site 135, Big Creek), and MSU 5034 (Site 306, Tombigbee at mouth of Bull Mountain Creek) are labeled *M. duquesnei*. Schultz (1969) reported the black redhorse in the Tombigbee in the area of Hwy 50 (Site 223) that was collected in 1963. The MSU specimen was collected in 1974; the AUM specimens in 1980 by Piereson and Schultz, but they did not list *M. duquesnei* in their (1984) list of Bull Mountain fishes. Jenkins (1980) regards the Mobile basin population as distinct from all other populations, and according to his map, no form of *M. duquesnei* occurs in the Tombigbee system. Until these specimens can be thoroughly examined, I will regard them as *M. erythrum*.

Mugil cephalus Linnaeus striped mullet

Tom Timmons collected a specimen of the striped mullet (AUM 21122) at Site 3 in May 1980. The fish, in its upstream movement, successfully negotiated Demopolis Lock and Dam, as well as the Jackson Lock and Dam on the lower Tombigbee. Historically, mullets have ascended rivers of Mobile basin, having been observed in the Coosa at the base of Jordan Dam and in the Cahaba at Centreville, Ala. (Boschung, 1961).

Morone mississippiensis Jordan and Eigenmann

yellow bass

The yellow bass has entered the pools and canals between Bay Springs Dam and Aberdeen, Mississippi, presumably from the Tennessee River system (C. A. Schultz, pers. comm.). It was heretofore unknown in the upper Tombigbee.

Morone saxatilis (Walbaum)

striped bass

Historically, the striped bass in Alabama was a anadromous stock that made upstream spawning runs; however, stocks declined as a result of overfishing and the limitation of upstream spawning migrations by dams. Striped bass no longer reproduce in the mainstream reservoirs, but the Alabama Game and Fish Division periodically stocks them in public waters (Moss, 1985).

Morone saxatilis x M. chrysops

hybrid bass

Hybrid bass [*Morone saxatalis* (Walbaum) and *Morone chrysops* (Rafinesque)] have been stocked by the Alabama Department of Conservation in the TTW impoundments in Alabama, and in the Columbus Pool by the Mississippi Game and Fish Commission.

Micropterus dolomieu Lacepede

smallmouth bass

Micropterus dolomieu Lacepede

An unsuccessful attempt by the Mississippi Game and Fish Commission was made in 1982 to stock smallmouth bass in Bull Mountain Creek (C. A. Schultz, pers. comm.).

Stizostedion canadense (Smith)

sauger

Sauger have been introduced from time to time, in Weaver Creek for example, but reproductive populations probably have not been established (C. A. Schultz, pers. comm.). It is in Bay Springs Pool and will have an opportunity to enter the upper Tombigbee.

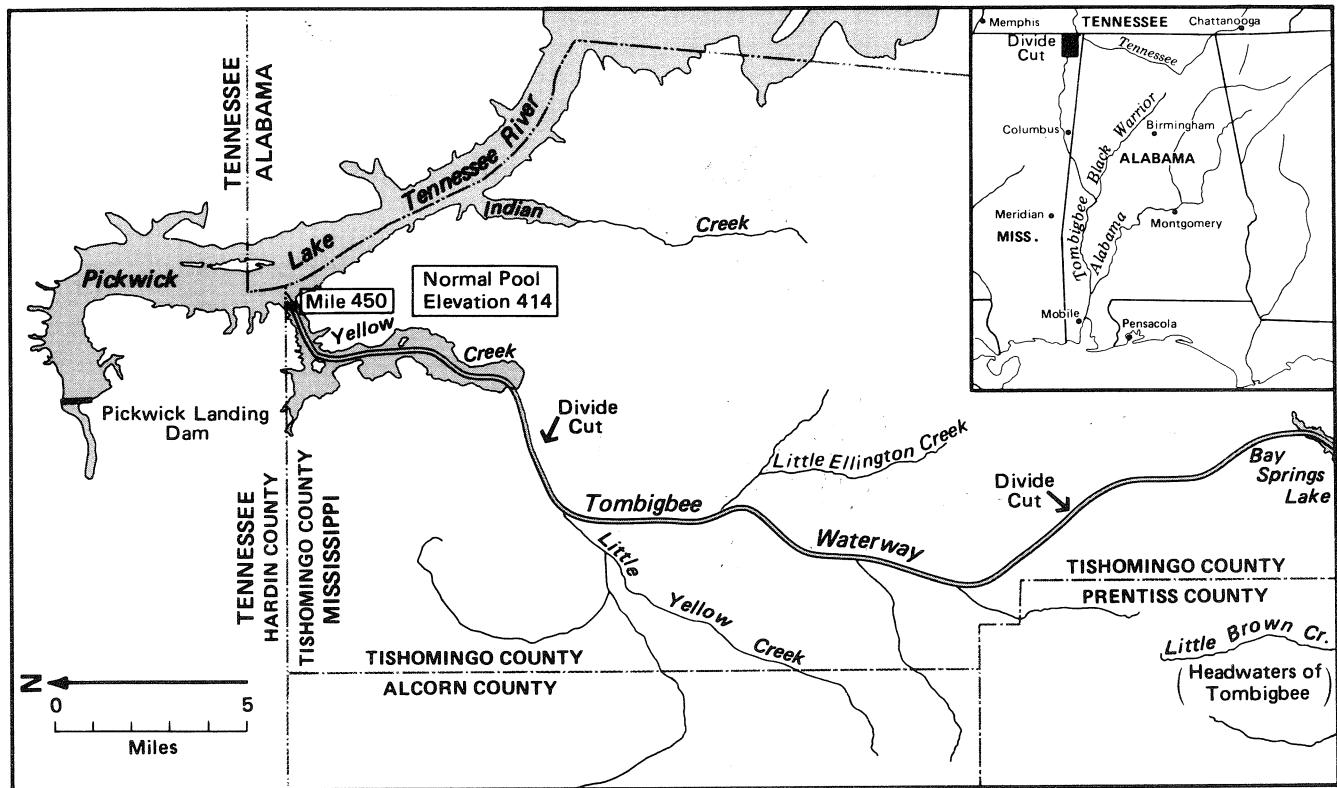

Fig. 3. The divide cut between the upper Tombigbee and Tennessee river systems.

STREAM CAPTURE

The Tennessee-Tombigbee Waterway

The following is a brief description of how one of the few remaining free-flowing major rivers in the Southeastern United States was destroyed. The upper Tombigbee is no longer a river, but a series of pools connected by canals and channels. The chronology of completion of locks and dams and associated channelization and canalization of the Tennessee-Tombigbee Waterway (TTW) is as follows: (1) Demopolis Lock and Dam, just below the confluence of the upper Tombigbee and the Black Warrior rivers, was completed in January 1955. (2) Gainesville Lock and Dam, September 1978. (3) Aliceville Lock and Dam, December 1979. (4) Columbus Lock and Dam, January 1981. (5) Aberdeen Lock and Dam, January 1984. (6) Locks A, B, C, D, and E, December 1984. (7) Bay Springs Lock and Dam, November 1983. (8) Completed waterway; that is, the first opportunity for immigration or emigration of fishes, January 1985.

Three sections of the TTW are identified (Figs. 2 and 3). I. The **River Section** begins at Demopolis Lock and Dam and terminates below Aberdeen Lock and Dam above Site 284. Demopolis Lock and Dam is on the lower Tombigbee River a few miles below its confluence with the Black Warrior River. The River Section consists of a meandering river shortened by numerous cut-offs. A cut-off is defined as a channel that severs a bend in the river (a bendway).

The river and the channels are dredged to a minimum depth of 9 ft and width of 300 ft. II. The **Canal Section** begins at the mouth of Town Creek (rmi 366) and ends at Bay Springs Lock and Dam (rmi 412). This section of the waterway is a canal perched on the east side of the river and contained by a continuous levee. The navigation canal is 12 ft deep and 300 ft wide. Five locks provide a total lift of 140 ft. III. The **Divide Cut** section consists of Bay Springs Pool and approximately 30 miles of navigation canal. The canal is 12 ft deep and 280 ft wide. It cuts through the divide between the upper Tombigbee and Tennessee river systems (Fig. 3). The Bay Springs lift is 84 ft to bring the two bodies of water together at a normal pool level of 414 ft.

With the construction of the Divide Cut, the U.S. Army Corps of Engineers accomplished in an instant on the geological time scales what would have taken eons to accomplish by headwater erosion. A part of Mobile Basin was donated to the Tennessee River system, taking with it a dozen or so species of fishes heretofore unknown in the Tennessee system.

Species Captured

Bay Springs Lock and Dam sits atop Site 347 (Figs. 1 and 2). From this point, Mackeys Creek watershed was inundated by the Bay Springs Pool and actually became a part

of Pickwick Pool on the Tennessee River. The following species, definitely known to occur in the captured part of Mackeys Creek, are documented by specimens in museums (Sites 347-352): *Ichthyomyzon gagei*, *Lampetra aepyptera*, *Campostoma oligolepis*, *Cyprinella vnustra***, *Hybognathus hayi*, *H. nuchalis*, *Hybopsis winchelli***, *H. sp. cf longirostris***, *Luxilus chrysocephalus isolepis***, *Lythrurus belius**, *Nocomis leptcephalus**, *Notropis baileyi**, *N. stilbius**, *N. texanus***, *Opsopoeodus emiliae*, *Pimephales notatus*, *P. vigilax*, *Semotilus atromaculatus*, *Erimyzon oblongus*, *E. suetta***, *Hypentelium etowanum***, *Minytrema melanops*, *Ameiurus natalis*, *Ictalurus punctatus*, *Noturus funebris***, *N. gyrinus***, *N. leptacanthus**, *Fundulus olivaceus*, *Gambusia affinis*, *Labidesthes sicculus*, *Ambloplites ariommus***, *Lepomis cyanellus*, *L. macrochirus*, *L. marginatus*, *L. megalotis*, *L. punctatus*, *Micropterus salmoides*, *Ammocrypta beani***, *Etheostoma chlorosomum*, *E. nigrum*, *E. parvipinne*, *E. proeliare*, *E. rupestre***, *E. stigmaeum*, *E. swaini**, *E. whipplei**, *Etheostoma* sp**, *Percina nigrofasciata***, and *P. vigil*. Of course, there may be other species that have escaped collectors in the Mackeys Creek area.

Those identified by double asterisk (**) were previously unknown in the Tennessee River system, and those marked by a single asterisk (*) were previously known only in Yellow Creek and/or Bear creeks of the Tennessee River system. The *Notropis stilbius* record in Bear Creek is based on one specimen collected in 1952.

Potential Emmigrants from Tennessee

Thus far, there are no records of Tennessee River system fishes in the upper Tombigbee, with the possible ex-

ception of *Morone mississippiensis*, mentioned above. There is no doubt that, with time, some Tennessee River system fishes will find their way out of Pickwick Pool, through the canals and locks, and into the upper Tombigbee. It is highly unlikely that some of the fishes on the following list could make their way into the Tombigbee, and even if some did, it is unlikely that they would find ecological conditions suitable to their life style. The species most likely to emigrate with success from the Tennessee are the big river forms. Potential immigrants, based on the fishes known to occur in the south bend of the Tennessee system, are: *Ichthyomyzon bdellium*, *I. greeleyi*, *Lampetra appendix*, *Acipenser fulvescens*, *Scaphirhynchus platorynchus*, *Lepisosteus platostomus*, *Hiodon alosoides*, *Clinostomus funduloides*, *Hemitremia flammula*, *Hybopsis amblops*, *H. dissimilis*, *H. insignis*, *Nocomis micropogon*, *Notropis ariommus*, *N. blennius*, *N. buchanani*, *N. c. chryscephalus*, *N. coccogenis*, *N. fumeus*, *N. galacturus*, *N. leuciodus*, *N. lirus*, *N. telecopus*, *N. whipplei*, *Phenacobius mirabilis*, *P. uranops*, *Phoxinus erythrogaster*, *Pimephales promelas*, *Rhinichthys atratulus*, *Carpio carpio*, *Catostomus commersoni*, *Hypentelium nigricans*, *Ictiobus cyprinellus*, *Moxostoma anisatum*, *Moxostoma duquesnei*, *M. macrolepidotum breviceps*, *Noturus elegans*, *N. exilis*, *N. flavus*, *N. miurus*, *Fundulus catenatus*, *Morone mississippiensis*, *Ambloplites rupestris*, *Micropterus dolomieu*, *Etheostoma blennioides*, *E. blennius*, *E. caeruleum*, *E. duryi*, *E. flabellare*, *E. jessiae*, *E. kennicotti*, *E. rufilineatum*, *E. simoterum*, *E. spectabile*, *E. sp cf squamiceps*, *E. zonale*, *Perca fulvescens*, *Percina burtoni*, *P. caprodes*, *P. evides*, *P. phoxocephala*, *Stizostedion canadense*, *Cottus bairdi*, and *C. carolinae*.
