## Dedication

I would like to dedicate this dissertation to my wife, Rachel, and son, James.

## Acknowledgments

I would like to express my sincere gratitude to my advisor, Dr. David Anderson. I would also like to thank the other professors in the Mathematics Department for their instruction over the last several years. Most importantly I would like to thank my family for their support while writing this dissertation.

## Abstract

The elasticity of a Krull domain $R$ is equivalent to the elasticity of the block monoid B(G,S), where $G$ is the divisor class group of $R$ and $S$ is the set of elements of $G$ containing a heightone prime ideal of $R$. Therefore the elasticity of $R$ can by studied using the divisor class group. In this dissertation, we will study infinite divisor class groups to determine the elasticity of the associated Krull domain. The results will focus on the divisor class groups $\mathrm{Z}, \mathrm{Z}(\mathrm{p}$ infinity $), \mathrm{Q}$, and general infinite groups. For the groups Z and $\mathrm{Z}(\mathrm{p}$ infinity), it has been determined which distributions of the height-one prime ideals will make R a halffactorial domain (HFD). For the group Q, certain distributions of height-one prime ideals are proven to make R an HFD. Finally, the last chapter studies general infinite groups and groups involving direct sums with Z. If certain conditions are met, then the elasticity of these divisor class groups is the same as the elasticity of simpler divisor class groups.

## Chapter 1

## Introduction

Studies of factorization properties usually focus on unique factorization domains (UFD). In a UFD each nonzero nonunit can be factored into a unique (up to associates) product of irreducible elements. The most common factorization problem is factoring integers into prime numbers. The set of integers, denoted $\mathbb{Z}$, is a UFD. The study of nonunique factorization, when an integral domain is not a UFD, began in earnest within the last 50 years. This dissertation will focus on studying the divisor class group of Krull domains to learn about the domain's factorization properties. The distribution of the height-one prime ideals of a Krull domain in the divisor class group determines the factorization properties of the domain. The focus will be on calculating the elasticity of a Krull domain and determining when the Krull domain is a half-factorial domain (HFD). Elasticity is a measure of the difference in length of different factorizations of the same element. A domain is half-factorial if every factorization of an element into irreducibles has the same length. The case when the divisor class group is finite has been studied extensively; so this dissertation will provide results for infinite divisor class groups.

### 1.1 Notation

For this dissertation, we will use $\mathbb{N}, \mathbb{Z}, \mathbb{Q}$, and $\mathbb{R}$ to refer to the natural numbers, integers, rational numbers, and real numbers, respectively. We let $\mathbb{N}_{0}=\{0,1,2,3, \ldots\}$. For any $S \subseteq \mathbb{R}$, we will define $S^{-}=\{s \in S \mid s<0\}$ and $S^{+}=\{s \in S \mid s>0\}$.

Whenever a quotient group is used, an overline will be used to represent the cosets for an element or a set of elements. So if $S \subseteq G$, then $\bar{S}$ will represent the cosets in the quotient group $G / H$ that contain elements of $S$. The same notation will be used for quotients of monoids and quotients of rings. For a ring $R$, define $U(R)=\{r \in R \mid r$ is a unit $\}$.

For $S \subseteq G$, with $G$ a group, define $[S]=\left\{g \in G \mid g=\sum_{i=1}^{k} n_{i} g_{i}\right.$ for some $n_{i} \in \mathbb{N}$ and $g_{i} \in$ $G\}$. We will say the set $[S]$ is generated by $S$ as a monoid. As usual, define $\langle S\rangle$ to be the smallest subgroup of $G$ containing $S$. Then $[S] \subseteq<S>$, and the two may not be equal.

### 1.2 Factorization

We begin the background on factorization theory with the definitions of an irreducible element and a UFD.

Definition 1.1. A nonzero nonunit element $r$ of an integral domain $R$ is called irreducible if whenever $r=r_{1} r_{2}$ for some $r_{1}, r_{2} \in R$, then either $r_{1}$ is a unit in $R$ or $r_{2}$ is a unit in $R$.

Definition 1.2. An integral domain $R$ is a unique factorization domain (UFD) if every nonzero nonunit of $R$ can be factored into irreducibles, and if $x_{1} \cdots x_{n}=y_{1} \cdots y_{m}$ with each $x_{i}$ and $y_{j}$ irreducible elements of $R$, then

1. $n=m$, and
2. there exists $\sigma \in S_{n}$ such that $x_{i}$ and $y_{\sigma(i)}$ are associates for every $1 \leq i \leq n$ (i.e., there exists a unit $u_{i}$ in $R$ such that $\left.x_{i}=u_{i} y_{\sigma(i)}\right)$.

Non-unique factorization is the study of factorization properties of domains that are not UFDs. Most of the research begins with the basic assumption that the domain being studied must be atomic. The definition of atomic is due to Cohn [9]. Atomic domains are integral domains where every nonzero nonunit of the domain can be factored into irreducibles. This is the first assumption in the definition of a UFD. If a domain satisfies the ascending chain condition on principal ideals (ACCP), then the domain is atomic. In [14], Grams provided an example showing the converse does not hold. Once the atomic property is assumed, there are many other factorization properties that can be studied. In [3], many of these properties, such as bounded factorization domains (BFD) and finite factorization domains (FFD), are defined. The paper details the relationships between these factorization properties. The paper also gives a proof that Krull domains, our focus of study, are BFDs. Krull domains are also atomic.

For this dissertation, we will focus on half-factorial domains, which are so named because they fulfill the first "half" of the requirements for a UFD.

Definition 1.3. An atomic domain $R$ is a half-factorial domain (HFD) if whenever $x_{1} \cdots x_{n}=y_{1} \cdots y_{m}$ with each $x_{i}$ and $y_{j}$ irreducible elements of $R$, then $n=m$.

The definition of an HFD is due to Zaks [20]. This paper studied properties of Dedekind domains that were HFDs. Then Zaks [21] expanded his study of HFDs to Krull domains. Skula also published a paper with similar results on Dedekind domains that were proved independently [17].

The elasticity of a domain is a measure of the difference in the number of irreducible factors for different factorizations of the same element.

Definition 1.4. Let $R$ be an atomic domain. For all nonzero nonunits $r \in R$, the elasticity of $r$, denoted $\rho(r)$, is defined as

$$
\rho(r)=\sup \left\{\left.\frac{m}{n} \right\rvert\, r=x_{1} \cdots x_{m}=y_{1} \cdots y_{n} \text { for some irreducibles } x_{i}, y_{j} \in R\right\}
$$

The elasticity of $R$, denoted $\rho(R)$, is defined as

$$
\rho(R)=\sup \{\rho(r) \mid 0 \neq r \in R-U(R)\} .
$$

The term elasticity was coined by Valenza in his paper from 1990 [19]. Valenza studied elasticity in the context of the ring of integers of an algebraic number field. Valenza proved that the elasticity is bounded above by $h / 2$, where h is the class number of the class group of the number field (as long as the class group is nontrivial). The definition of
elasticity (but not the name) first appeared in the literature in a paper by Steffan in 1986 [18]. Steffan proved that a Dedekind domain $R$ with finite divisor class group, $C l(R)$, has $\rho(R) \leq \max \{|C l(R)| / 2,1\}$. Curiously, the paper by Valenza was published in 1990, but submitted in 1980; so it actually predates the 1986 paper of Steffan.

It is clear that the elasticity of a domain is always between 1 and $\infty$. In [2], it was shown that for any $1 \leq r \leq \infty$ there exists a Dedekind domain $R$ with torsion class group such that $\rho(R)=r$. A common question is whether the elasticity of a domain is finite (sometimes called rationally bounded), a rational number, and realizable. An atomic domain $R$ has a realizable elasticity if there exist irreducibles $x_{1}, \ldots, x_{m}, y_{1}, \ldots y_{n}$ in $R$ such that $x_{1} \cdots x_{m}=y_{1} \cdots y_{n}$ and $\rho(R)=\frac{m}{n}$. For Krull domains with only a finite number of divisor classes containing height-one prime ideals, the elasticity is a rational number and realizable [2].

Some factorization work has used commutative, cancellative monoids instead of integral domains. These monoids are defined so that they retain all the properties of an integral domain without having an addition operation. This is a more general approach to factorization than using only integral domains. In this case, HFDs are referred to as being half-factorial since they are not domains. The book by Geroldinger and Halter-Koch [13] is a good reference for factorization in monoids, and factorization in general.

### 1.3 Krull Domains

In 1960, Carlitz [6] proved that the ring of integers of an alegraic number field is an HFD if and only if it has class number 1 or 2 . This paper was used as a starting point for the study of nonnunique factorization. It showed that the divisor class group can be studied to learn about a domain's factorization. In UFDs each nonzero nonunit can be factored into prime elements. A similar property exists for principal ideals in Krull domains. In Krull domains each nontrivial principal ideal can be uniquely factored into a $v$-product of height-one prime ideals. Factorizations of elements in a Krull domain is related to factoring this $v$-product of height-one prime ideal into sub-v-products of height-one prime ideals that are principal ideals. This factoring of the height-one prime ideals can be studied in the divisor class group.

Krull domains were introduced by Krull in 1931 as finite discrete principal orders [16]. Most of the following definitions and theorems on Krull domains can be found in the book "The divisor class group of a Krull domain" by Fossum [10]. Before the definition of a Krull domain is stated, we will recall some basic ring theory definitions. The height of a prime ideal $P$ is defined as

$$
h t(P)=\sup \left\{t \in \mathbb{N} \mid P_{1} \subsetneq \cdots \subsetneq P_{t-1} \subsetneq P \text { for some prime ideals } P_{1}, \ldots, P_{t-1}\right\}
$$

For an integral domain $R$, Define $X^{(1)}(R)$ to be the set of all height-one prime ideals of $R$, i.e., the nonzero minimal prime ideals of $R$. The dimension of an integral domain $R, \operatorname{dim} R$, is $\operatorname{dim} R=\sup \{h t(P) \mid P$ a prime ideal of $R\}$. A discrete valuation ring (DVR) is a local PID. So a DVR has only one maximal ideal, and each ideal is principal.

Definition 1.5. An integral domain $R$ is a Krull domain if and only if

1. The localization $R_{P}$ is a DVR for each height-one prime ideal $P$ of $R$,
2. $R=\cap_{P \in X^{(1)}(R)} R_{P}$, and
3. each $0 \neq r \in R$ is contained in at most finitely many height-one prime ideals.

Krull domains are a generalization of Dedekind domains. Dedekind domains are integral domains which are noetherian, integrally closed, and $\operatorname{dim} R \leq 1$. In fact, a Krull domain $R$ is a Dedekind domain if and only if $\operatorname{dim} R \leq 1$. If $R$ is a Krull domain, then the following are also Krull domains: any localization of $R$, any polynomial ring over a family of indeterminates with coefficients in $R$, and any power series ring with coefficients in $R$. So Krull domains behave nicely under most extensions of the domain. Any UFD is also a Krull domain; so is any integrally closed Noetherian domain.

Before the theorem about factoring principal ideals into height-one prime ideals can be stated, some background on fractional ideals must be provided. Let $R$ be an integral domain with quotient field $K$. A fractional ideal $I$ of a ring $R$ is an $R$-submodule of $K$ such that there exists a nonzero element $x \in R$ such that $x I$ is an integral ideal of $R$. The ideals of $R$ are called integral ideals to avoid confusion. Every integral ideal is a fractional ideal (let $x=1$ ). For a nonzero fractional ideal $I$, define $I^{-1}=\{a \in K \mid a I \subseteq R\}$. Then $I^{-1}$ is a fractional ideal of $R$. Obviously, $I I^{-1} \subseteq R$. If $I I^{-1}=R$, then the ideal is called invertible. Dedekind domains can be defined as a domain where every nonzero ideal is invertible. The $v$-operation is defined as $I_{v}=\left(I^{-1}\right)^{-1}$ for all nonzero fractional ideals of $R$. If $I_{v}=I$, then the fractional ideal $I$ is called divisorial. The set of divisorial ideals is denoted by $\operatorname{Div}(R)$.

We will define an operation on $\operatorname{Div}(R)$ so that it is a monoid. For $I$ and $J$ divisorial ideals, their product $I J$ may not be divisorial. But $(I J)_{v}$ is divisorial, so define the operation on $\operatorname{Div}(R)$ using the function $f: \operatorname{Div}(R) \times \operatorname{Div}(R) \rightarrow \operatorname{Div}(R)$ by $f(I, J)=(I J)_{v}$. Then $\operatorname{Div}(R)$ is a commutative monoid for any integral domain $R$. An integral domain $R$ is completely integrally closed if and only if $\operatorname{Div}(R)$ is a group. In particular, if $R$ is a Krull domain, then $\operatorname{Div}(R)$ is a group. Define $\operatorname{Prin}(R)$ to be the group of prinicipal fractional ideals, and note that $\operatorname{Prin}(R) \subseteq \operatorname{Div}(R)$. Now we can define the divisor class group.

Definition 1.6. The divisor class group of a Krull domain is the abelian group $C l(R)=$ $\operatorname{Div}(R) / \operatorname{Prin}(R)$.

In a Krull domain, any divisorial ideal $I$ can be factored uniquely into height-one prime ideals under the $v$-product. This is the key property for studying the divisor class group to learn about factorization of a Krull domain.

Theorem 1.7. Let $I$ be a divisorial integral ideal of a Krull domain $R$ with $I \neq R$. Then for some height-one prime ideals $P_{1}, \ldots, P_{n}$ of $R$,

$$
I=\left(P_{1} \cdots P_{n}\right)_{v}
$$

and these height-one prime ideals $P_{1}, \ldots, P_{n}$ are uniquely determined.
So if a Krull domain is not a UFD, then a nonzero nonunit $a \in R$ may not have a factorization into a unique (up to associates) product of prime elements. However, the principal ideals are divisorial; so $a R$ has a unique factorization into a $v$-product of height-one prime ideals, $a R=\left(P_{1} \cdots P_{n}\right)_{v}$. This is a generalization of the Dedekind domain property that any nontrivial principal ideal $a R$ can be factored uniquely into a product of prime ideals $a R=P_{1} \cdots P_{n}$. The $v$-product of height-one prime ideals property is strong enough
to study factorization; so the literature has standardized to studying the more general Krull domains instead of Dedekind domains.

Factoring a nonzero nonunit $a \in R$ into irreducibles corresponds to factoring the $v$ product of height-one prime ideals $a R=\left(P_{1} \cdots P_{n}\right)_{v}$ into sub-v-products that are principal ideals. The next theorem illustrates this relationship.

Theorem 1.8. Let $R$ be a Krull domain and $a \in R$ a nonzero nonunit.

1. Let $a=x y$ for some nonunits $x, y \in R$. Since $R$ is a Krull domain, there exists height-one prime ideals $P_{1}, \ldots, P_{k}, Q_{1}, \ldots, Q_{l}$ of $R$ such that $x R=\left(P_{1} \cdots P_{k}\right)_{v}$ and $y R=\left(Q_{1} \cdots Q_{l}\right)_{v}$. Then

$$
a R=\left(P_{1} \cdots P_{k} Q_{1} \cdots Q_{l}\right)_{v},
$$

and this $v$-product of height-one prime ideals is unique.
2. Since $R$ is a Krull domain, there exists height-one prime ideals $T_{1}, \ldots, T_{n}$ in $R$ such that $a R=\left(T_{1} \cdots T_{n}\right)_{v}$. If $b R=\left(T_{1} \cdots T_{m}\right)_{v}$ for some $m<n$ and $b \in R$, then $\left(T_{m+1} \cdots T_{n}\right)_{v}=c R$ and $a=b c u$ for some $c \in R$ and $u \in U(R)$. (If any sub-vproduct of $\left\{T_{1}, \ldots T_{n}\right\}$ is principal, then the ideals can be rearranged so these ideals come first.)

Thus an element of $R$ is irreducible if its corresponding $v$-product of height-one prime ideals has no proper sub-v-product that is principal. Recall, Krull domains are atomic. Therefore each nonzero nonunit $a \in R$ can be factored into irreducible elements $a=x_{1} \cdots x_{n}$ for some $n \in \mathbb{N}$ and each $x_{i} \in R$ irreducible. For each of these irreducible elements $x_{i}$, $x_{i} R=\left(P_{1} \cdots P_{m}\right)_{v}$ for some height-one prime ideals $P_{1}, \ldots, P_{m}$ of $R$. Since each $x_{i}$ is irreducible, then no sub- $v$-product of $\left(P_{1} \cdots P_{m}\right)_{v}$ is principal. Also, the height-one primes in the $v$-product of $a R$ must equal the $v$-product of these $P_{1}, \ldots, P_{m}$ for each $x_{i}$. Therefore factoring an element $a \in R$ into irreducibles corresponds to grouping its unique $v$-product of height-one prime ideals into sub- $v$-products that are principal, and each of these sub-vproducts has no proper sub- $v$-product that is principal.

Theorem 1.9. Let $R$ be a Krull domain. Let $a \in R$ be a nonzero nonunit with $a R=$ $\left(P_{1} \cdots P_{m}\right)_{v}$, where each $P_{i}$ is a height-one prime ideal of $R$. Then $a=x_{1} \cdots x_{n}$, where each $x_{i}$ is irreducible in $R$, if and only if the order of the $P_{i}$ 's can be rearranged so that $x_{1} R=\left(P_{1} \cdots P_{m_{1}}\right)_{v}, \ldots, x_{n} R=\left(P_{m_{n-1}+1} \cdots P_{m_{n}}\right)_{v}$, and $\left(P_{m_{i}+1} \cdots P_{m_{i+1}}\right)_{v}$ has no proper sub-v-product that is principal for each $0 \leq i<n$.

The height-one prime ideals of a Krull domain are divisorial. Thus each height-one prime ideal $P$ can be viewed as an element $\bar{P}$ of the divisor class group (for notation purposes an overline will be used to represent the class for a particular element). Then for a nonzero nonunit $a$ in a Krull domain $R, \overline{a R}=1$ (the identity of the divisor class group). Then $a R=\left(P_{1} \cdots P_{n}\right)_{v}$ for some height-one prime ideals $P_{i}$ of $R$, and in the divisor class group $\overline{P_{1}} \cdots \overline{P_{n}}=\overline{\left(P_{1} \cdots P_{n}\right)_{v}}=1$. Then factoring an element $a \in R$ into irreducibles corresponds to grouping $\overline{P_{1}}, \ldots, \overline{P_{n}}$ into subsets whose $v$-product is 1 and no proper sub- $v$-product is 1 in the divisor class group. Also, if a product of height-one prime ideals is 1 in the divisor class group, then that $v$-product is principal. So if such a product of height-one prime ideals is 1 in the divisor class group, with chosen subsets whose $v$-product is 1 with no proper sub- $v$-product equal to 1 , then there is a corresponding factorization of an element into irreducible elements. Thus studying $v$-products of height-one prime ideals in the divisor
class group yields results about factoring elements into irreducible elements. In general, we will use $S$ to represent the classes of the divisor class group that contain a height-one prime ideal. So for a Krull domain with $C l(R)=G$, we will study the corresponding pair $(G, S)$ to learn about the Krull domain's factorization. The block monoid introduced in the next section provides a convenient notation to study the pair $(G, S)$.

### 1.4 Block Monoids

A good reference for block monoids is [13]. Let $G$ be an abelian group and $S \subseteq G$. Let $\mathcal{F}(S)$ be the free abelian monoid with basis $S$. Then a typical element of $\mathcal{F}(S)$ has the form $B=\prod_{g \in S} g^{v_{g}(B)}$, where $v_{g}(B) \in \mathbb{N}_{0}$ and $v_{g}(B)=0$ for all but finitely many $g \in S$. Then we can define a (monoid) homomorphism $\sigma: \mathcal{F}(S) \rightarrow G$ by $\sigma(B)=\sum_{g \in S} v_{g}(B) g$.

Definition 1.10. For an abelian group $G$ and $S \subseteq G$, define the block monoid to be $\mathcal{B}(G, S)=\operatorname{ker}(\sigma)$, i.e., $\mathcal{B}(G, S)$ is the set of $B \in \mathcal{F}(S)$ such that $\sigma(B)=0$.

To clearly distinguish between the block monoid and the original group $G$, we will use multiplicative notation for the block monoid and additive notation for the group $G$. Elements of $\mathcal{B}(G, S)$ are referred to as blocks. Then a typical block of the block monoid $\mathcal{B}(G, S)$ is of the form $B=\prod_{g \in S} g^{v_{g}(B)}$, where $\sum_{g \in G} v_{g}(B) g=0$ in the group $G$. The identity element for the block monoid is the empty product $B=\prod_{g \in S} g^{0}$; denote the identity by 1 .

The one operation of the block monoid will be treated similarly to multiplication in a ring. So we will talk about factoring the blocks in the block monoid. An element $B=$ $\prod_{g \in S} g^{v_{g}(B)}$ in $\mathcal{B}(G, S)$ is irreducible if no proper subsum of $\sum_{g \in S} v_{g}(B) g$ is 0 in $G$ and $B$ is not the identity. Define $\mathcal{A}(G, S)$ to be the set of irreducible blocks in $\mathcal{B}(G, S)$. Note that for the identity 0 of $G$, if $0 \in S$, then the block $B=0^{1}$ is an irreducible block. Also, the block $B=0^{1}$ is not the identity of the block monoid. Factoring a general block $B=\prod_{g \in S} g^{v_{g}(B)}$ corresponds to grouping the elements into subproducts whose sum is 0 in $G$ with no proper subsum equal to 0 . Suppose we split $B$ into $B=B_{1} B_{2}$ and then $B_{1}$ can be split into $B_{1}=C_{1} C_{2}$, and we continue this process. The factoring cannot continue indefinitely because $B$ cannot equal a product of more than $\sum_{g \in G} v_{g}(B)$ blocks. Thus each block must have a factorization into irreducible blocks. So the block monoid is always atomic (extending the definition of atomic to cover monoids).

The definition of elasticity can be expanded to cover factoring in monoids such as the block monoid.

Definition 1.11. For $B \in \mathcal{B}(G, S)$, define

$$
\rho(B)=\max \left\{\left.\frac{m}{n} \right\rvert\, B=B_{1} \cdots B_{m}=C_{1} \cdots C_{n} \text { and each } B_{i}, C_{j} \in \mathcal{A}(G, S)\right\}
$$

and then

$$
\rho(G, S)=\sup \{\rho(B) \mid B \in \mathcal{B}(G, S)\}
$$

These are called the elasticity of a block and the elasticity of the block monoid, respectively.
Using $\rho(G, S)$ and $\mathcal{A}(G, S)$ instead of the somewhat more appropriate $\rho(\mathcal{B}(G, S))$ and $\mathcal{A}(\mathcal{B}(G, S))$, respectively, is an attempt to make the notation slightly less cumbersome.

For a Krull domain $R$ with the corresponding divisor class group pair $(G, S)$, we will study the block monoid $\mathcal{B}(G, S)$. Let $a \in R$ be a nonzero nonunit and $a R=\left(P_{1} \cdots P_{n}\right)_{v}$ its unique $v$-product of height-one primes ideals. Then $\overline{P_{1}} \ldots \overline{P_{n}}=\overline{a R}=1$ in the divisor class group $G$ (this does not follow the convention mentioned above, since multiplication is being used for the divisor class group and the block monoid). Therefore the product $B=\overline{P_{1}} \ldots \overline{P_{n}}$ is a block in the block monoid $\mathcal{B}(G, S)$ because $\overline{P_{1}} \ldots \overline{P_{n}}=1$ in the divisor class group $G$. Then $\rho(a)=\rho(B)$ since factoring $a$ into irreducibles corresponds to grouping the product $\overline{P_{1}} \cdots \overline{P_{n}}$ into irreducible blocks. Also, for any block $B \in \mathcal{B}(G, S)$, the product of height-one prime ideals is principal; so there is a corresponding element $a \in R$ with $\rho(a)=\rho(B)$. Hence we have the following theorem.

Theorem 1.12. Let $R$ be a Krull domain with $C l(R)=G$ and $S \subseteq G$ the set of classes containing a height-one prime ideal. Then

$$
\rho(R)=\rho(G, S)
$$

Therefore the results of this dissertation will be concerned with finding the elasticity of the block monoid, which then gives the elasticity of the corresponding Krull domain. Similar to expanding the definition of elasticity to cover monoids, the definition of an HFD can be expanded to cover monoids. Since monoids are not domains, we say a monoid is half-factorial if the elasticity of the monoid is one. Then a Krull domain is an HFD if and only if the corresponding block monoid is half-factorial.

Every Krull domain has a corresponding pair $(G, S)$ and block monoid $\mathcal{B}(G, S)$. It is of interest to determine when a pair $(G, S)$ is realizable as a Krull domain, i.e., when there exists a Krull domain $R$ with $C l(R)=G$ and $S \subseteq G$ the set of classes containing a height-one prime ideal. It was originally proved by Claborn that every abelian group is the divisor class group of a Dedekind domain [7]. Claborn then studied what properties $S$ must have if the pair $(G, S)$ has a corresponding Krull domain [8] [10]. Building on this work, Grams showed that if a $S$ generates $G$ as a monoid (elements of $S$ can be added only, not subtracted, to generate $G$ ), then a Dedekind domain exists with pair $(G, S)$. Since Dedekind domains are Krull, then a Krull domain exists with pair $(G, S)$.

The converse also holds. Suppose $R$ is a Krull domain with corresponding pair $(G, S)$. Let $g \in G$. Then there is a divisorial ideal $J$ of $R$ such that $\bar{J}=g$. Since $J$ is a fractional ideal, there exists $0 \neq x \in R$ such that $x J=I$ for some integral ideal $I$ of $R$. Then $I$ is also divisorial. Therefore $\bar{I}=\overline{x R J}=(\overline{x R})(\bar{J})=\bar{J}$ in $G$ since $\overline{x R}=1$. Since any integral divisorial ideal can be written as a product of height-one prime ideals in a Krull domain, then $g=\bar{I}$ can be written as a $v$-product of height-one prime ideals. Therefore $S$ generates $G$ as a monoid. So we have the following theorem.

Theorem 1.13. Let $G$ be an abelian group and $S \subseteq G$. The pair $(G, S)$ has a corresponding Krull domain if and only if $S$ generates $G$ as a monoid.

The study of factorization then focuses on pairs $(G, S)$ and the block monoid $\mathcal{B}(G, S)$, where $S$ generates $G$ as a monoid. However, some results in this dissertation determine the elasticity of $\mathcal{B}(G, S)$ without requiring that $S$ generates $G$ as a monoid. Later results, such as Proposition 3.3, reduce complicated block monoids to simpler block monoids. These simpler block monoids may not have $S$ generating $G$ as a monoid; so it is convenient if some of the theorems can be applied in these situations. In any of these theorems proving results about a block monoid where $S$ may not generate $G$ as a monoid, a corollary could be stated
for the Krull domain case. For example, if a theorem proves that $\mathcal{B}(G, S)$ is half-factorial, a corollary could be added stating that if a Krull domain has the corresponding pair $(G, S)$, then the Krull domain is an HFD.

### 1.5 Block Monoid Lemmas

The following lemmas are easy results concerning block monoids that will be useful later in the dissertation. Many of the papers on block monoids contain similar lemmas, or these lemmas in particular. These results are fairly simple and repeated so frequently in the literature that it is hard to give proper credit to the first author who proved them. The first part of the next lemma concluding $\rho\left(G_{1}, S_{1}\right) \leq \rho\left(G_{2}, S_{2}\right)$ can be found in [2]. This lemma will provide a convenient standard method to show one block monoid has a smaller elasticity or to show that two block monoids have the same elasticity.

Lemma 1.14. Let $f: \mathcal{B}\left(G_{1}, S_{1}\right) \rightarrow \mathcal{B}\left(G_{2}, S_{2}\right)$ be a homomorphism such that $f(B)$ is irreducible whenever $B$ is irreducible. Then $\rho\left(G_{1}, S_{1}\right) \leq \rho\left(G_{2}, S_{2}\right)$. Also, $\rho\left(G_{1}, S_{1}\right)=$ $\rho\left(G_{2}, S_{2}\right)$ if the following hold:

1. $\operatorname{kerf}=\{1\}$.
2. There exists a homomorphism $g: \mathcal{B}\left(G_{2}, S_{2}\right) \rightarrow \mathcal{B}\left(G_{1}, S_{1}\right)$ such that $f g(B)=B$ for all $B \in \mathcal{B}\left(G_{2}, S_{2}\right)$.

In particular, if $f$ is an injective homomorphism such that $f(B)$ is irreducible whenever $B$ is irreducible and for all $B^{\prime} \in \mathcal{A}\left(G_{2}, S_{2}\right)$ there exists a $B \in \mathcal{A}\left(G_{1}, S_{1}\right)$ such that $f(B)=B^{\prime}$, then $\rho\left(G_{1}, S_{1}\right)=\rho\left(G_{2}, S_{2}\right)$.

Proof. Suppose $B_{1} \cdots B_{m}=C_{1} \cdots C_{n}$ are two factorizations of irreducible elements in $\mathcal{B}\left(G_{1}, S_{1}\right)$. Then $f\left(B_{1}\right) \cdots f\left(B_{m}\right)=f\left(C_{1}\right) \cdots f\left(C_{n}\right)$ since $f$ is a homomorphism. Since each $f\left(B_{i}\right)$ and $f\left(C_{i}\right)$ is irreducible, then we have that $\rho\left(G_{2}, S_{2}\right) \geq \frac{m}{n}$. Thus $\rho\left(G_{1}, S_{1}\right) \leq$ $\rho\left(G_{2}, S_{2}\right)$.

Now suppose that $\operatorname{ker} f=\{1\}$ and such a $g$ exists. Let $A \in \mathcal{B}\left(G_{2}, S_{2}\right)$ be irreducible, and assume $g(A)$ is not irreducible. Then there exists some $A_{1}, A_{2} \in \mathcal{B}\left(G_{1}, S_{1}\right)-\{1\}$ such that $g(A)=A_{1} A_{2}$. But then $A=f g(A)=f\left(A_{1} A_{2}\right)=f\left(A_{1}\right) f\left(A_{2}\right)$. Since $A_{1}, A_{2} \neq 1$, then $f\left(A_{1}\right), f\left(A_{2}\right) \neq 1$. Thus, we have that $A$ is not irreducible, which is a contradiction. So if $A \in \mathcal{B}\left(G_{2}, S_{2}\right)$ is irreducible, then $g(A)$ is irreducible. Let $D_{1} \cdots D_{h}=E_{1} \cdots E_{k}$ in $\mathcal{B}\left(G_{2}, S_{2}\right)$ with each $D_{i}, E_{j}$ an irreducible block. Since $g$ is a homomorphism, then $g\left(D_{1}\right) \cdots g\left(D_{h}\right)=g\left(E_{1}\right) \cdots g\left(E_{k}\right)$. Since each $D_{i}$ and $E_{j}$ is irreducible, then each $g\left(D_{i}\right)$ and $g\left(E_{j}\right)$ is irreducible. Then $g\left(D_{1}\right) \cdots g\left(D_{h}\right)=g\left(E_{1}\right) \cdots g\left(E_{k}\right)$ are two factorizations into irreducibles in $\mathcal{B}\left(G_{1}, S_{1}\right)$. Then $\rho\left(G_{1}, S_{1}\right) \geq \frac{h}{k}$; so $\rho\left(G_{1}, S_{1}\right) \geq \rho\left(G_{2}, S_{2}\right)$. Combining this with the first part of the proof, we have shown that $\rho\left(G_{1}, S_{1}\right)=\rho\left(G_{2}, S_{2}\right)$.

For the "in particular" statement, suppose $f$ is injective with the properties listed above. Recall, $\mathcal{B}\left(G_{2}, S_{2}\right)$ is atomic; so each element of $\mathcal{B}\left(G_{2}, S_{2}\right)$ can be written as a product of elements in $\mathcal{A}\left(G_{2}, S_{2}\right)$, the irreducible blocks of $\mathcal{B}\left(G_{2}, S_{2}\right)$. But by assumption, $\mathcal{A}\left(G_{2}, S_{2}\right) \subseteq$ imf. Then each element of $\mathcal{B}\left(G_{2}, S_{2}\right)$ can be written as a product of elements in $\mathcal{A}\left(G_{2}, S_{2}\right) \subseteq$ $i m f$. Therefore, $f$ is surjective, and thus an isomorphism. If $f$ is an isomophism of monoids, then it must have an inverse $g$, and that inverse must be a homomorphism. Also, since $f$ is an isomorphism, then $\operatorname{ker} f=\{1\}$. Therefore, the conditions are satisfied, and $\rho\left(G_{1}, S_{1}\right)=$ $\rho\left(G_{2}, S_{2}\right)$.

Note that the above proof is not stated for general monoids, but only block monoids that have been constructed from an abelian group $G$ and a subset $S$. The fact that $\mathcal{B}(G, S)$ is a block monoid was used twice in the proof. First, the only unit of the block monoid is the identity, 1 , so in the proof $A_{1}, A_{2} \neq 1$ guarantees that $A_{1}, A_{2}$ are not units. Thus, $A=A_{1} A_{2}$ shows that $A$ is not irreducible. If $f: M_{1} \rightarrow M_{2}$ were a homomorphism between general monoids, the first condition would need to state that the preimage of the units of $M_{2}$ equals the units of $M_{1}$. Secondly, for the "in particular" statement, we used the fact that $\mathcal{B}\left(G_{2}, S_{2}\right)$ is atomic to show that $f$ is a surjection. We would only want to apply the theorem to the case $M_{1}$ and $M_{2}$ are atomic, so we would need to add this assumption.

Since we are dealing with monoids, the conditions that $\operatorname{ker} f=\{1\}$ and $f$ is injective are not equivalent. The proof that these are equivalent for groups uses the fact that each element has an inverse which is not true for monoids. For the "in particular" statement, since $f$ was shown to be an isomorphism, then $\operatorname{ker} f=\{1\}$.

On first glance, it seems the condition that for all $B^{\prime} \in \mathcal{A}\left(G_{2}, S_{2}\right)$, there exists a $B \in$ $\mathcal{A}\left(G_{1}, S_{1}\right)$ such that $f(B)=B^{\prime}$ should be enough to obtain equality among the elasticities, without requiring that $f$ is injective. However, this is not true. Suppose we have $B_{1}^{\prime} \cdots B_{h}^{\prime}=$ $C_{1}^{\prime} \cdots C_{k}^{\prime}$ for some irreducible $B_{i}^{\prime}, C_{j}^{\prime}$ in $\mathcal{B}\left(G_{2}, S_{2}\right)$. Then this condition says that there exists $B_{i}, C_{j}$ irreducible blocks in $\mathcal{B}\left(G_{1}, S_{1}\right)$ such that $f\left(B_{i}\right)=B_{i}^{\prime}$ and $f\left(C_{j}\right)=C_{j}^{\prime}$. Then $f$ is a homomorphism, so

$$
\begin{aligned}
f\left(B_{1} \cdots B_{h}\right) & =f\left(B_{1}\right) \cdots f\left(B_{h}\right) \\
& =B_{1}^{\prime} \cdots B_{h}^{\prime} \\
& =C_{1}^{\prime} \cdots C_{k}^{\prime} \\
& =f\left(C_{1}\right) \cdots f\left(C_{k}\right) \\
& =f\left(C_{1} \cdots C_{k}\right)
\end{aligned}
$$

But there is no reason to assume that $B_{1} \cdots B_{h}=C_{1} \cdots C_{k}$ unless $f$ is injective. In many of the applications of this theorem, the function f will not be injective. The conditions that $\operatorname{ker} f=\{1\}$ and the right inverse homomorphism $g$ exist provide a solution to this problem. If these conditions are satisfied, it guarantees that there does exist a choice for each $B_{i}$ and $C_{j}$ using $g$ such that $B_{1} \cdots B_{h}=C_{1} \cdots C_{k}$.

Lemma 1.15. Let $G$ be a group, and $S^{\prime}, S \subseteq G$. If $S^{\prime} \subseteq S$, then $\rho\left(G, S^{\prime}\right) \leq \rho(G, S)$.
Proof. Define a function $f: \mathcal{B}\left(G, S^{\prime}\right) \rightarrow \mathcal{B}(G, S)$ by the identity map on elements of $G$. Thus

$$
f\left(\prod_{s \in S^{\prime}} s^{u_{s}}\right)=\prod_{s \in S^{\prime}} s^{u_{s}}
$$

which is in $\mathcal{B}(G, S)$ since $S^{\prime} \subseteq S$. It is clear that if a block $B$ is irreducible in $\mathcal{B}\left(G, S^{\prime}\right)$, then $f(B)$ is irreducible. This is clearly a homorphism; so Lemma 1.14 gives that $\rho\left(G, S^{\prime}\right) \leq$ $\rho(G, S)$.

The following result is similar to the previous lemma, and will be useful in the sections on $\mathbb{Z}\left(p^{\infty}\right)$ and $\mathbb{Q}$. In these cases, it is easier to break the set $S$ into convenient subsets $S_{i}$ that are finite. The lemma then connects results about these subsets $S_{i}$ to the original set $S$.

Lemma 1.16. Let $G$ be a group and $S_{i} \subseteq G$ such that $S_{i} \subseteq S_{i+1}$ for each $i \in \mathbb{N}$. If $S=\cup_{i \in \mathbb{N}} S_{i}$, then

$$
\rho(G, S)=\lim _{i \rightarrow \infty} \rho\left(G, S_{i}\right)
$$

In particular,

$$
\rho(G, S)=\sup _{i \in \mathbb{N}} \rho\left(G, S_{i}\right)
$$

Proof. Since $S_{i} \subseteq S$, then $\rho(G, S) \geq \rho\left(G, S_{i}\right)$ for all $i \in \mathbb{N}$ by Lemma 1.15. Therefore the sequence $\left\{\rho\left(G, S_{i}\right)\right\}_{i=1}^{\infty}$ is increasing as $i$ increases. Then the sequence $\rho\left(G, S_{i}\right)$ must either converge to a finite number or increase without bound. Suppose that it increases without bound, i.e., $\lim _{n \rightarrow \infty} \rho\left(G, S_{n}\right)=\infty$. Then for all $m \in \mathbb{N}$, there exists an $i \in \mathbb{N}$ such that $\rho\left(G, S_{i}\right)>m$. By Lemma 1.14, $\rho(G, S) \geq \rho\left(G, S_{i}\right)$ for all $i \in \mathbb{N}$. Then $\rho(G, S)>m$ for all $m \in \mathbb{N}$, so $\rho(G, S)=\infty$.

Now suppose that $\lim _{n \rightarrow \infty} \rho\left(G, S_{n}\right)=r$ for some $1 \leq r<\infty$. Since $\rho(G, S) \geq \rho\left(G, S_{i}\right)$ for all $i \in \mathbb{N}$, then $\rho(G, S) \geq \lim _{i \rightarrow \infty} \rho\left(G, S_{i}\right)$. Suppose that $\rho(G, S)>r$. Then there exists two factorizations of irreducible blocks in $\mathcal{B}(G, S), B_{1} \cdots B_{m}=C_{1} \cdots C_{n}$, such that $\frac{m}{n}>r$. Then for each $B_{i}$, there exists an $a_{i} \in \mathbb{N}$ such that the elements of $B_{i}$ are all in $S_{a_{i}}$. Similarly, for each $C_{j}$, there exists a $b_{j} \in \mathbb{N}$ such that the elements of $C_{j}$ are all in $S_{b_{j}}$. Let c be the maximum of the $a_{i}$ and $b_{j}$. Then each $B_{i}, C_{j} \in \mathcal{B}\left(G, S_{c}\right)$; so $\rho\left(G, S_{c}\right)>r$. This is a contradiction. So $\rho(G, S)=r$.

The "in particular" statement follows because the sequence $\rho\left(G, S_{i}\right)$ is increasing; so its limit and its supremum are equal.

Semi-length functions are useful for determining when a domain $R$ or block monoid is half-factorial. We will state the definition of semi-length functions for general monoids. The definition was originally for domains $R$ in [1], but this way it will apply to block monoids as well.

Definition 1.17. Let $M$ be an atomic monoid. A function $f: M \rightarrow \mathbb{R}^{+} \cup\{0\}$ is a semilength function if it satisfies:

- $f(x y)=f(x)+f(y)$ for all $x, y \in R$ with $x$ and $y$ nonunits.
- $f(x)=0$ for all units $x \in R$.

In a block monoid, the condition that $f(B)=0$ for all units $B$ is usually trivial since the only unit is the empty product. Therefore checking this condition is often omitted for block monoids. This is a generalization of a length function, which has the same definition except the range of $f$ is $\mathbb{Z}^{+} \cup\{0\}$. The following theorem uses semi-length functions to provide an easy method for proving monoids are half-factorial. The " $\Leftarrow$ " direction was proven in [21], and the " $\Rightarrow$ " direction is simple. In the result, semi-length function can be replaced with a length function and it will still hold.

Lemma 1.18. Let $M$ be a monoid. Then the elasticity of $M$ is one if and only there exists a semi-length function $f: M \rightarrow \mathbb{R}^{+} \cup\{0\}$ such that $f(m)=1$ for all irreducible elements $m \in M$.

### 1.6 Splittable Sets

When dealing with block monoids, the definition of a splittable set is often important. Splittable sets were introduced by Zaks in [20].

Definition 1.19. A set $M \subseteq \mathbb{N}$ is called splittable if whenever $\sum_{i=1}^{k} r_{i} \frac{1}{m_{i}} \in \mathbb{N}$ for some $m_{i} \in M$ and $r_{i} \in \mathbb{N}$, there exists $0 \leq r_{i}^{\prime} \leq r_{i}$ for each $1 \leq i \leq k$ such that $\sum_{i=1}^{k} r_{i}^{\prime} \frac{1}{m_{i}}=1$.

We next introduce a similar definition that will be pertinent to the later material.
Definition 1.20. A set $\left\{m_{1}, \ldots, m_{k}\right\} \subset \mathbb{N}$ is called $m$-split if whenever $\sum_{i=1}^{k} r_{i} m_{i} \in \mathbb{N} m$, there exists $0 \leq r_{i}^{\prime} \leq r_{i}$ for each $1 \leq i \leq k$ such that $\sum_{i=1}^{k} r_{i}^{\prime} m_{i}=m$.

Note that the set $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split implies that $m_{i} \mid m$ for all $1 \leq i \leq k$.
Lemma 1.21. Suppose that $\left\{m_{1}, \ldots, m_{k}\right\} \subset \mathbb{N}$ and each $m_{i} \mid m$. Then $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split if and only if $\left\{\operatorname{ord}_{\mathbb{Z} / m \mathbb{Z}}\left(\overline{m_{i}}\right) \mid 1 \leq i \leq k\right\}$ is a splittable set.

Proof. The key to this relationship is that $\operatorname{ord}_{\mathbb{Z} / m \mathbb{Z}}\left(\overline{m_{i}}\right)=\frac{m}{m_{i}}$ since $m_{i} \mid m$. Thus $\sum_{i=1}^{k} r_{i} m_{i} \in$ $\mathbb{N} m$ if and only if $\sum_{i=1}^{k} r_{i} \frac{1}{\operatorname{ord}\left(\overline{\bar{m}_{i}}\right)} \in \mathbb{N}$. Hence there exists $0 \leq r_{i}^{\prime} \leq r_{i}$ for each $1 \leq i \leq k$ such that $\sum_{i=1}^{k} r_{i}^{\prime} m_{i}=m$ if and only if there exists $0 \leq r_{i}^{\prime} \leq r_{i}$ for each $1 \leq i \leq k$ such that $\sum_{i=1}^{k} r_{i}^{\prime} \frac{1}{\operatorname{ord}\left(\overline{m_{i}}\right)}=1$.

Geroldinger and Wao [11] proved the following theorem showing when a block monoid is half-factorial for the group $\mathbb{Z} / m \mathbb{Z}$. This result will be used extensively throughout the dissertation. Block monoids for many of the infinite groups that will be studied have the same elasticity as block monoids with a group of the form $\mathbb{Z} / m \mathbb{Z}$.

Theorem 1.22. Let $S \subseteq \mathbb{Z} / m \mathbb{Z}$. Then $\rho(\mathbb{Z} / m \mathbb{Z}, S)=1$ if and only if there exists $\varphi \in$ Aut $(\mathbb{Z} / m \mathbb{Z})$ such that $\varphi(S) \subseteq\{d+m \mathbb{Z} \mid d \in \mathbb{N}$ and $d \mid m\}$ and $\{\operatorname{ord}(s) \mid s \in S\}$ is a splittable set.

Corollary 1.23. Suppose $S=\left\{m_{1}, \ldots, m_{k}\right\} \subseteq \mathbb{N}$ and each $m_{i} \mid m$. Then $\rho(\mathbb{Z} / m \mathbb{Z}, \bar{S})=1$ if and only if $S$ is m-split.

Proof. $(\Rightarrow)$ If $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$, then Theorem 1.22 gives that the set $\left\{\operatorname{ord}\left(\overline{m_{i}}\right) \mid\right.$ $1 \leq i \leq k\}$ is splittable. Thus $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split by Lemma 1.21.
$(\Leftarrow)$ Let $\varphi \in \operatorname{Aut}(\mathbb{Z} / m \mathbb{Z})$ be the identity automorphism. Then $\varphi\left(\overline{m_{i}}\right) \subseteq\{d+m \mathbb{Z} \mid d \in$ $\mathbb{N}$ and $d \mid m\}$ for each $m_{i}$. Since $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split, then $\left\{\operatorname{ord}\left(\overline{m_{i}}\right) \mid 1 \leq i \leq k\right\}$ is splittable by Lemma 1.21 . Thus $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$ by Theorem 1.22 .

The following is a technical lemma for sets that are $m$-split. It shows that if a sum of these elements equals $t m$ for some $t \in \mathbb{N}$, then the coefficients can be reduced so that the sum is equal to $a m$ for any $1 \leq a \leq t$.

Lemma 1.24. Suppose $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$, where each $m_{i} \mid m$. If $\sum_{i=1}^{k} s_{i} m_{i}=t m$ for some $t \in \mathbb{N}$, then there exists $0 \leq s_{i}^{\prime} \leq s_{i}$ for $1 \leq i \leq k$ such that $\sum_{i=1}^{k} s_{i}^{\prime} m_{i}=m$. Also, for all $a \in \mathbb{N}$ with $a \leq t$, there exists $0 \leq a_{i} \leq s_{i}$ for $1 \leq i \leq k$ such that $\sum_{i=1}^{k} a_{i} m_{i}=a m$.

Proof. Since $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$, then by Corollary 1.23 the set $\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}$ is $m$-split. So if $\sum_{i=1}^{k} s_{i} m_{i}=t m$ for some $t \in \mathbb{N}$, then there exists $0 \leq s_{i}^{\prime} \leq s_{i}$ for $1 \leq i \leq k$ such that $\sum_{i=1}^{k} s_{i}^{\prime} m_{i}=m$. Now we can repeat the process on $\sum_{i=1}^{k}\left(s_{i}-s_{i}^{\prime}\right) m_{i}=(t-1) m$ choosing $0 \leq d_{i} \leq\left(s_{i}-s_{i}^{\prime}\right)$ such that $\sum_{i=1}^{k}\left(s_{i}^{\prime}+d_{i}\right) m_{i}=2 m$. We can repeat this process until we have a subsum equal to $a m$ for all $1 \leq a \leq t$.

## Chapter 2

## Common Infinite Groups

In this chapter, the elasticity of several common infinite groups will be studied. The focus will be on determining which subsets $S$ of $G$ will give a half-factorial block monoid. Then any Krull domain with divisor class group $G$ and such an $S$ as its subset of height-one prime ideals will be a half-factorial domain.

## $2.1 \mathbb{Z}$

The first infinite abelian group we will study is $\mathbb{Z}$. Let $R$ be a Krull domain with $C l(R)=\mathbb{Z}$ and $S$ the classes of $C l(R)$ containing a height-one prime ideal of $R$. If the set $S$ is finite, i.e., only a finite number of classes of $C l(G)$ contain height-one primes, then the elasticity of $R$ is rational and realizable [2]. So the elasticity is a rational number, and there exists some irreducibles $x_{i}, y_{j} \in R$ with $x_{1} \cdots x_{m}=y_{1} \cdots y_{n}$ such that $\rho(R)=\frac{m}{n}$. For this section, we will focus on the case when $S$ is an infinite set, which is not as simple. If $S$ is infinite, then [5] provides an example where the elasticity of $R$ is rational, but not realizable. The same paper proves the following theorem about $S$.

Theorem 2.1. Let $R$ be a Krull domain with $C l(R)=\mathbb{Z}$ and $S$ the classes of $C l(R)$ containing a height-one prime ideal of $R$. If $S^{-}$and $S^{+}$are both infinite sets, then $\rho(R)=\infty$.

Therefore, the elasticity when $S^{-}$and $S^{+}$are both infinite has been solved; so we will restrict to the case that one of these sets is finite. We will assume without lose of generality that $\left|S^{-}\right|<\infty$ and $\left|S^{+}\right|=\infty$. So $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\}$ for some $m_{i}, n_{j} \in \mathbb{N}$ for all $i, j \in \mathbb{N}$. By the simple automorphism of multiplication by -1 , these results also apply to the case $\left|S^{+}\right|<\infty$ and $\left|S^{-}\right|=\infty$. The following definition from [4] will be important.

Definition 2.2. Let $\left\{m_{1}, \ldots, m_{k}\right\} \subset \mathbb{N}$ and $p_{1}, p_{2}, \ldots, p_{h}$ be distinct primes such that each $m_{i}=p_{1}^{x_{i, 1}} p_{2}^{x_{i, 2}} \ldots p_{h}^{x_{i, h}}$. Let $I=\left\{i \mid x_{j, i} \neq x_{l, i}\right.$ for some $\left.1 \leq j, l \leq k\right\}$, and define

$$
\ll m_{1}, \ldots, m_{k} \gg=\prod_{i \in I} p_{i}^{\max \left\{x_{1, i}, x_{2, i}, \ldots, x_{k, i}\right\}} .
$$

In short, if a prime number appears in two $m_{i}$ 's a different number of times, then its index is in $I$. Then the product contains the primes with index in $I$ to the maximum power that prime has in the $m_{i}$ 's. The following lemma will be useful in the proofs.

Lemma 2.3. Let $\left\{m_{1}, \ldots, m_{k}\right\} \subset \mathbb{N}, c=\ll m_{1}, \ldots, m_{k} \gg$, and $m=\operatorname{lcm}\left\{m_{1}, \ldots, m_{k}\right\}$. Then $m=d c$ for some $d \in \mathbb{N}$, where $(c, d)=1$ and $d \mid m_{j}$ for all $1 \leq j \leq k$.

Proof. Using the notation from Definition 2.2 of $c=\ll m_{1}, \ldots, m_{k} \gg$,

$$
m=\operatorname{lcm}\left\{m_{1}, \ldots, m_{k}\right\}=\prod_{i=1}^{h} p_{i}^{\max \left\{x_{1, i}, x_{2, i}, \ldots, x_{k, i}\right\}}=c \cdot \prod_{i \notin I} p_{i}^{\max \left\{x_{1, i}, x_{2, i}, \ldots, x_{k, i}\right\}}=c \cdot \prod_{i \notin I} p_{i}^{x_{1, i}}
$$

since $i \notin I$ means $x_{1, i}=\cdots=x_{k, i}$. Let $d=\prod_{i \notin I} p_{i}^{x_{1, i}}$, and thus, $m=d c$. Also, $d \mid m_{j}$ for each $1 \leq j \leq k$. It is clear that $(c, d)=1$ since they have no common prime factors.

Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\}$ and $c=\ll m_{1}, \ldots, m_{k} \gg$. If $c \mid n_{j}$ for all $j \in \mathbb{N}$, then we can establish a relationship between $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$and $\rho(\mathbb{Z}, S)$. The next lemma will be our first such result.

Lemma 2.4. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Suppose $c \mid n_{i}$ for all $i \in \mathbb{N}$. Then

$$
\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right) \leq \rho(\mathbb{Z}, S)
$$

Proof. Let $B \in \mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. Then $B=\prod_{j=1}^{a} t_{j}^{s_{j}}$ for some $t_{j} \in \overline{S^{+}}$and $s_{j} \in \mathbb{N}_{0}$ with $\sum_{j=1}^{a} s_{j} t_{j}=0$ in $\mathbb{Z} / m \mathbb{Z}$. For each $t_{j} \in \overline{S^{+}}$, choose $n_{i_{j}}$ to be the smallest integer in $S^{+}$, that is equivalent to $t_{j}$ in $\overline{S^{+}}$. Then $\sum_{j=1}^{a} s_{j} n_{i_{j}} \equiv 0(\bmod m)$. Therefore $\sum_{j=1}^{a} s_{j} n_{i_{j}}=t m$ for some $t \in \mathbb{Z}$. Since each $n_{i_{j}}>0$ and $s_{j} \geq 0$, then $t \geq 0$. Then $s m_{1}=t m$ for some $s \in \mathbb{N}_{0}$ since $m_{1} \mid m$. Hence $s\left(-m_{1}\right)+\sum_{j=1}^{a} s_{j} n_{i_{j}}=0$. Therefore $C=\left(-m_{1}\right)^{s} \cdot \prod_{j=1}^{a} n_{i_{j}}^{s_{j}}$ is a block in $\mathcal{B}(\mathbb{Z}, S)$. Now we can use this construction to create the following function.

Define $f: \mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right) \rightarrow \mathcal{B}(\mathbb{Z}, S)$ by

$$
f\left(\prod_{j=1}^{a} t_{j}^{s_{j}}\right)=\left(-m_{1}\right)^{s} \cdot \prod_{j=1}^{a} n_{i_{j}}^{s_{j}}
$$

where $n_{i_{j}}$ and $s$ are defined as above. It is clear that $f$ is a homomorphism. Suppose that $B=\prod_{j=1}^{a} t_{j}^{s_{j}}$ is irreducible and $f(B)=\left(-m_{1}\right)^{s} \cdot \prod_{j=1}^{a} n_{i_{j}}^{s_{j}}$ is not irreducible. Since $B$ is irreducible, then $\sum_{j=1}^{a} s_{j} t_{j}=0$ with no proper subsum equal to 0 in $\mathbb{Z} / m \mathbb{Z}$. Since $f(B)$ is not irreducible, there exists an irreducible block $C^{\prime}$ in $\mathcal{B}(\mathbb{Z}, S)$ dividing $f(B)$, and $C^{\prime} \neq f(B)$. Therefore $C^{\prime}=\left(-m_{1}\right)^{s^{\prime}} \cdot \prod_{j=1}^{a} n_{i_{j}}^{s_{j}^{\prime}}$ for some $s^{\prime}, s_{j}^{\prime} \in \mathbb{N}_{0}$ with $0 \leq s^{\prime} \leq s$ and $0 \leq s_{j}^{\prime} \leq s_{j}$ for all $1 \leq j \leq a$. Suppose $s_{j}^{\prime}=s_{j}$ for all $1 \leq j \leq a$. Then $s^{\prime} m_{1}=\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}}$ since $C^{\prime}$ is a block. But then $\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}}=\sum_{j=1}^{a} s_{j} n_{i_{j}}=s m_{1}$ since $f(B)$ is a block. Therefore $s^{\prime} m_{1}=s m_{1}$, and thus $s^{\prime}=s$. Then $C^{\prime}=C$, which is a contradiction. Hence $s_{j}^{\prime}<s_{j}$ for some $1 \leq j \leq a$.

Since $C^{\prime}$ is a block, then $s^{\prime} m_{1}=\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}}$. By Lemma 2.3, there exist a $d \in \mathbb{N}$ such that $m=c d$ with $(c, d)=1$ and $d \mid m_{1}$. Then $d$ divides $s^{\prime} m_{1}$. Since $c$ divides each $n_{i_{j}}$, then $c$ divides $\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}}$. Therefore $m$ divides $s^{\prime} m_{1}=\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}}$ since $(c, d)=1$. Hence $\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}} \in \mathbb{N} m$. But then $\sum_{j=1}^{a} s_{j}^{\prime} n_{i_{j}} \equiv 0(\bmod m)$. Since each $n_{i_{j}}$ is equivalent to $t_{j}$ in $\mathbb{Z} / m \mathbb{Z}$, then $\sum_{j=1}^{a} s_{j}^{\prime} t_{j}=0$ in $\mathbb{Z} / m \mathbb{Z}$. Then $B^{\prime}=\prod_{j=1}^{a} t_{j}^{s_{j}^{\prime}}$ is a block in $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S_{+}}\right)$, and $B^{\prime}$ divides $B$. Since $s_{j}^{\prime}<s_{j}$ for at least on $1 \leq j \leq a$, then $B^{\prime} \neq B$. Hence $B$
is not irreducible, a contradiction. Thus $f(B)$ must be irreducible, and by Lemma 1.14, $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right) \leq \rho(\mathbb{Z}, S)$.

The next theorem builds on the above lemma by additionally assuming a condition about irreducible blocks in $\mathcal{B}(\mathbb{Z}, S)$. The theorem assumes that

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

This assumption shows that we can define a homomorphism, seen in the proof, from $\mathcal{B}(\mathbb{Z}, S)$ to $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$, that will preserve irreducible blocks. Then $\rho(\mathbb{Z}, S) \leq \rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$by Lemma 1.14. Then by Lemma 2.4, these two elasticities are equivalent.

Theorem 2.5. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Suppose that $c \mid n_{i}$ for all $i \in \mathbb{N}$ and

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

Then $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$.
Proof. Define $f: \mathcal{B}(\mathbb{Z}, S) \rightarrow \mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$by

$$
f\left(\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)=\prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} .
$$

Suppose that $B=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{B}(\mathbb{Z}, S)$. Then $\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty} r_{j} n_{j}$. By Lemma 2.3, there exist a $d \in \mathbb{N}$ such that $m=c d$ with $(c, d)=1$ and $d \mid m_{i}$ for all $1 \leq i \leq k$. Therefore $d$ divides $\sum_{i=1}^{k} s_{i} m_{i}$. Each $n_{j}$ is divisible by $c$; so $c$ divides $\sum_{j=1}^{\infty} r_{j} n_{j}$. Since $(c, d)=1$, then $m$ divides $\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty} r_{j} n_{j}$. Thus $f(B)=\prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$ so $f$ is well-defined. This definition is clearly a homomorphism. If $B$ is irreducible, then $f(B)$ is irreducible by assumption. Thus, by Lemma $1.14, \rho(\mathbb{Z}, S) \leq \rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. This combined with Lemma 2.4 concludes the proof.

So for the block monoid $\mathcal{B}(\mathbb{Z}, S)$, if these two conditions are met, then we can factor out by $\mathbb{Z} m$ without changing the elasticity. The next theorem will use this result to determine exactly when $\mathcal{B}(\mathbb{Z}, S)$ is half-factorial. If $\rho(\mathbb{Z}, S)=1$, then the conditions to Theorem 2.5 can be proved to hold. So $\mathcal{B}(\mathbb{Z}, S)$ is half-factorial if and only if those two conditions hold and $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$is half-factorial.

Theorem 2.6. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Then $\rho(\mathbb{Z}, S)=1$ if and only if the following three conditions are true:

1. $c \mid n_{i}$ for all $i \in \mathbb{N}$.
2. $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)=1$.
3. 

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

Proof. $(\Leftarrow)$ Suppose all three conditions are met. Then by the first and third condition and using Theorem 2.5 , we have $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. But then by condition 2 , we know that $\rho(\mathbb{Z}, S)=1$.
$(\Rightarrow)$ Suppose that $\rho(\mathbb{Z}, S)=1$.

1. This was proved in [4].
2. Since $c \mid n_{i}$ for all $i \in \mathbb{N}$, then Theorem 2.5 proves that $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)=\rho(\mathbb{Z}, S)=1$.
3. Let $B \in \mathcal{B}(\mathbb{Z}, S)$. Then

$$
B=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}}
$$

for some $s_{i}, r_{j} \in \mathbb{N}_{0}$ with only finitely many of the $r_{j}$ nonzero. Since $B$ is a block, then

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty} r_{j} n_{j}
$$

Note that $c$ divides the right hand side of this equation because $c \mid n_{j}$ for all $j \in \mathbb{N}$. By Lemma 2.3, $m=d c$ for some $d$ with $(d, c)=1$, and $d \mid m_{i}$ for all $1 \leq i \leq k$. Then $d$ divides the left hand side of the equation. Since $(c, d)=1$, then $m$ must divide both sides of the equation. Therefore we have

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty} r_{j} n_{j} \in \mathbb{N}_{0} m
$$

Hence

$$
B^{\prime}=\prod_{j=1}^{\infty} \bar{n}_{j}^{r_{j}}
$$

is a block in $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. Suppose that $B^{\prime}$ is not irreducible. Since block monoids are atomic, then for some $h \in \mathbb{N}$ with $h>1$, there exist $C_{1}^{\prime}, \ldots, C_{h}^{\prime} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$, with

$$
B^{\prime}=C_{1}^{\prime} \cdots C_{h}^{\prime}
$$

Then for each $1 \leq a \leq h$,

$$
C_{a}^{\prime}=\prod_{j=1}^{\infty} \bar{n}_{j}^{\left(r_{j}^{a}\right)}
$$

for some $r_{j}^{a} \in \mathbb{N}_{0}$ (note the $a$ is an indexing superscript, not a power) and

$$
r_{j}^{1}+r_{j}^{2}+\cdots+r_{j}^{h}=r_{j}
$$

for each $j \in \mathbb{N}$. Now we want to consider $m$ copies of the irreducible block $B$ in $\mathcal{B}(\mathbb{Z}, S)$, and show this can be factored into $h m$ irreducible blocks which means $\rho(\mathbb{Z}, S)>\frac{h m}{m}=$
$h$, a contradiction. Notice that

$$
\begin{aligned}
B^{m} & =\left(\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m} \\
& =\prod_{i=1}^{k}\left(-m_{i}\right)^{m s_{i}} \cdot\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m} \\
& =\left(-m_{1}\right)^{m s_{1}} \cdots\left(-m_{k}\right)^{m s_{k}} \cdot\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m} \\
& =\left(\left(-m_{1}\right)^{m / m_{1}}\right)^{m_{1} s_{1}} \cdots\left(\left(-m_{k}\right)^{m / m_{k}}\right)^{m_{k} s_{k}} \cdot\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m} .
\end{aligned}
$$

Note $\frac{m}{m_{i}} \cdot\left(-m_{i}\right)=-m$ for each $1 \leq i \leq k$. So we can split the product

$$
\left(\left(-m_{1}\right)^{m / m_{1}}\right)^{m_{1} s_{1}} \cdots\left(\left(-m_{k}\right)^{m / m_{k}}\right)^{m_{k} s_{k}}
$$

into $x=m_{1} s_{1}+\cdots+m_{k} s_{k}$ sub-products that when summed equal $m$. Label these as $\alpha_{1}$ to $\alpha_{x}$. So we have

$$
\begin{gathered}
\alpha_{1}=m_{1}^{m / m_{1}}, \ldots, \alpha_{m_{1} s_{1}}=m_{1}^{m / m_{1}} \\
\alpha_{m_{1} s_{1}+1}=m_{2}^{m / m_{2}}, \ldots, \alpha_{m_{1} s_{1}+m_{2} s_{2}}=m_{2}^{m / m_{2}} \\
\ldots \\
\alpha_{x-m_{k} s_{k}}=m_{h}^{m / m_{k}}, \ldots, \alpha_{x}=m_{k}^{m / m_{k}}
\end{gathered}
$$

Then we can rewrite $B^{m}$ as

$$
B^{m}=\alpha_{1} \cdots \alpha_{x} \cdot\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m}
$$

Now we will consider the second half of this equation: $\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m}$. Define $C_{1}, \ldots, C_{h}$ by

$$
C_{a}=\prod_{j=1}^{\infty} n_{j}^{\left(r_{j}^{a}\right)}
$$

for each $1 \leq a \leq h$. Note that the $C_{a}$ and the $\alpha_{i}$ are products, but not blocks. But then

$$
C_{1} \ldots C_{h}=\prod_{a=1}^{h}\left(\prod_{j=1}^{\infty} n_{j}^{\left(r_{j}^{a}\right)}\right)=\prod_{j=1}^{\infty} n_{j}^{r_{j}}
$$

since $r_{j}^{1}+r_{j}^{2}+\cdots+r_{j}^{h}=r_{j}$ for all $j \in \mathbb{N}$ (we can freely interchange any of these sums
and products because only finitely many of the $r_{j}$ 's are nonzero). So we have that

$$
C_{1}^{m} \ldots C_{h}^{m}=\left(\prod_{j=1}^{\infty} n_{j}^{r_{j}}\right)^{m}
$$

So our block $B^{m}$ is equivalent to

$$
B^{m}=\alpha_{1} \cdots \alpha_{x} \cdot C_{1}^{m} \cdots C_{h}^{m}
$$

Now we would like to group the right hand side of this equation into irreducible blocks. Since $C_{j}^{\prime}$ is an irreducible block in $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$for $1 \leq j \leq h$, then

$$
\sum_{j=1}^{\infty} r_{j}^{a} n_{j}=t_{a} m
$$

for some $t_{a} \in \mathbb{N}$ with no proper subsum in $\mathbb{N} m$. Thus,

$$
\alpha_{1} \cdots \alpha_{t_{1}} \cdot C_{1}
$$

is an irreducible block since treating it as a sum we have each $\alpha_{y}$ equals $-m$ and $C_{1}$ sums to $t_{1} m$. Call this irreducible block $D_{1}$. Then we can create an irreducible block $D_{2}$ by the same method; so

$$
D_{2}=\alpha_{t_{1}+1} \cdots \alpha_{2 t_{1}} \cdot C_{1} .
$$

Continuing, we can create up to

$$
D_{m}=\alpha_{(m-1) t_{1}+1} \cdots \alpha_{m t_{1}} \cdot C_{1} .
$$

We can repeat this process for the copies of $C_{2}$ creating $D_{m+1}$ to $D_{2 m}$ :

$$
\begin{gathered}
D_{m+1}=\alpha_{m t_{1}+1} \cdots \alpha_{m t_{1}+t_{2}} \cdot C_{1}, \\
\vdots \\
D_{2 m}=\alpha_{m t_{1}+(m-1) t_{2}+1} \cdots \alpha_{m t_{1}+m t_{2}} \cdot C_{1} .
\end{gathered}
$$

We would like to continue this process up through all $m$ copies of each $C_{a}$ creating irreducible blocks $D_{1}$ up to $D_{h m}$. We need to show that we have the correct number of $\alpha_{j}$ 's to cancel exactly with the $m$ copies of each $C_{a}$. Then we need to have exactly $m t_{1}+m t_{2}+\cdots+m t_{h}$ such $\alpha_{j}$ 's to cancel the m copies of each $C_{a}$. But we have $x=m_{1} s_{1}+m_{2} s_{2}+\cdots m_{k} s_{k}$ such $\alpha_{j}$ 's. So we need to show that

$$
m_{1} s_{1}+m_{2} s_{2}+\cdots m_{k} s_{k}=m t_{1}+m t_{2}+\cdots m t_{h} .
$$

Recall that $B$ is an irreducible block and

$$
B=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}},
$$

so we know that

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty} r_{j} n_{j}
$$

Recall that $\sum_{a=1}^{h} r_{j}^{a}=r_{j}$ by definition of each $C_{a}$. Thus, the right hand side of the equation above can be rewritten as

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{j=1}^{\infty}\left(\sum_{a=1}^{h} r_{j}^{a}\right) n_{j}
$$

Once again we can change the order of summation on the right hand side since only a finite number of these terms is nonzero to get:

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{a=1}^{h}\left(\sum_{j=1}^{\infty} r_{j}^{a} n_{j}\right)
$$

Each $\sum_{j=1}^{\infty} r_{j}^{a} n_{j}$ corresponds to the sum of $C_{a}$ and equals $t_{a} m$. Then the equation becomes

$$
\sum_{i=1}^{k} s_{i} m_{i}=\sum_{a=1}^{h} t_{a} m
$$

Thus we have shown that we have the correct number of $\alpha_{j}$ 's. Therefore we have shown that

$$
B^{m}=D_{1} \cdots D_{m h}
$$

are two equivalent factorizations of irreducible blocks in $\mathcal{B}(\mathbb{Z}, S)$. Since $h>1$, then $\rho(\mathbb{Z}, S) \geq \frac{h m}{m}>1$, a contradiction. Thus

$$
B^{\prime}=\prod_{j=1}^{\infty} \bar{n}_{j}^{r_{j}}
$$

must be an irreducible block in $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$.

Note that condition 3 in the above theorem can also be stated that if $B=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}}$. $\prod_{j=1}^{\infty} n_{j}^{r_{j}}$ is irreducible in $\mathcal{B}(\mathbb{Z}, S)$, then no proper subsum of $\sum_{j=1}^{\infty} r_{j} n_{j}$ is in $\mathbb{N} m$. Condition 3 will always hold if $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split.

Lemma 2.7. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Let $\left\{m_{1}, \ldots, m_{k}\right\}$ be $m$-split. Then

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

Proof. Let $B=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S)$. In the proof of Theorem 2.5 , we already proved that $\prod_{j=1}^{\infty} \bar{n}_{j}^{r} \in \mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. Suppose it is not an irreducible block.

Then there exists $0 \leq r_{j}^{\prime} \leq r_{j}$ for all $j \in \mathbb{N}$ (where at least one such $r_{j}^{\prime} \neq r_{j}$ and at least one $\left.r_{j}^{\prime}>0\right)$, such that $\sum_{j=1}^{\infty} r_{j}^{\prime} n_{j}=a m$ for some $a \in \mathbb{N}$. Since $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$ split, Lemma 1.21 proves there exists $0 \leq s_{i}^{\prime} \leq s_{i}$ such that $\sum_{i=1}^{k} s_{i}^{\prime} m_{i}=a m$. Therefore $B^{\prime}=\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}^{\prime}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}^{\prime}} \in \mathcal{B}(\mathbb{Z}, S)$. But $B^{\prime}$ divides $B$ and $B^{\prime} \neq B$, a contradiction since $B$ is irreducible. Thus $\prod_{j=1}^{\infty}{\overline{n_{j}}}^{r}$ is an irreducible block.

Since $m$ in the previous theorems is defined as the least common multiple of the $m_{i}$ 's, then each $m_{i} \mid m$. Then by Corollary $1.23,\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split is equivalent to $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$. Therefore if $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$, then the condition in the preceding theorems about irreducible blocks will be satisfied. So Theorems 2.5 and 2.6 , can be repeated without this condition. Notice that $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$ is not part of the if and only if in the following theorem. It is possible to have $\rho(\mathbb{Z}, S)=1$ and $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right) \neq 1$.

Corollary 2.8. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Suppose that $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$. If $c \mid n_{i}$ for all $i \in \mathbb{N}$, then $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. In particular, the following are equivalent:

1. $\rho(\mathbb{Z}, S)=1$.
2. $c \mid n_{i}$ for all $i \in \mathbb{N}$ and $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)=1$.

Proof. Since $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$, then Corollary 1.23 gives that $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split. Then Lemma 2.7 proves that

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty} \bar{n}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

Then by Theorem 2.5, if $c \mid n_{i}$ for all $i \in \mathbb{N}$, then $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. Now the "if and only if" statement will be proved. Note that $c \mid n_{i}$ for all $i \in \mathbb{N}$ is being proven, not assumed, for the "if and only if" statement.
$(\Rightarrow)$ This was proven in Theorem 2.6.
$(\Leftarrow)$ Suppose that $c \mid n_{i}$ for all $i \in \mathbb{N}$ and $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)=1$. It has already been shown that

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

Then the three conditions from Theorem 2.6 are satisfied so $\rho(\mathbb{Z}, S)=1$.
When $k=1$ or $k=2$ the theorems and corollaries can be simplified considerably. For any two-element set $\{a, b\}$, if $a \mid c$ and $b \mid c$, the set is always $c$-split, proved in the following lemma.

Lemma 2.9. If $a \mid c$ and $b \mid c$, then $\{a, b\}$ is $c$-split.
Proof. Suppose that $r a+s b=t c$, where $r, s, t \in \mathbb{N}_{0}$. Suppose $r \geq \frac{c}{a}$. Define $r^{\prime}=\frac{c}{a}$ and $s^{\prime}=0$. Then $r^{\prime}<r$ and $s^{\prime}<s$ with $r^{\prime} a+s^{\prime} b=c$. Similary, if $s \geq \frac{c}{b}$ let $r^{\prime}=0$ and $s^{\prime}=\frac{c}{b}$, and we have $r^{\prime} a+s^{\prime} b=c$. Now suppose that both $r<\frac{c}{a}$ and $s<\frac{c}{b}$. Then

$$
t c=r a+s b<\frac{c}{a} \cdot a+\frac{c}{b} \cdot b=2 c .
$$

Therefore, we must have $t=1$. These cases are exhaustive, so we have that $\{a, b\}$ is $c$-split.

Then if $S=\left\{-m_{1},-m_{2}, n_{1}, n_{2}, n_{3}, \ldots\right\}$, the lemma proves that $\left\{m_{1}, m_{2}\right\}$ is always $m$ split. Then by Corollary $1.23, \rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \overline{m_{2}}\right\}\right)=1$ always holds. Thus, when $k=2$, Corollary 2.8 can be rewritten without the assumption that $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \overline{m_{2}}\right\}\right)=1$. So for the case $k=2$, we have the following theorem about the elasticity of $\mathcal{B}(\mathbb{Z}, S)$. The "in particular" part of the theorem was proven in [4].

Theorem 2.10. Let $S=\left\{-m_{1},-m_{2}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, m_{2} \gg$ and $m=\operatorname{lcm}\left(m_{1}, m_{2}\right)$. If $c \mid n_{i}$ for all $i \in \mathbb{N}$, then $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. In particular, the following are equivalent:

1. $\rho(\mathbb{Z}, S)=1$.
2. $c \mid n_{i}$ for all $i \in \mathbb{N}$ and $\rho\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)=1$.

The case $k=1$ is even simpler than $k=2$. In this case $c=\ll m_{1} \gg=1$ by definition. But the requirement that $c \mid d_{i}$ for all $i \in \mathbb{N}$ is then trivially satisfied. Also, $m=m_{1}$ so it is trivial that the set $\left\{m_{1}\right\}$ is $m$-split. So we can again repeat Corollary 2.8, but can now also drop the condition that $c \mid d_{i}$ for all $i \in \mathbb{N}$. This case does not actually require that $S^{+}$ is infinite like all the previous theorems in this section. The following theorem was proved in [5].

Theorem 2.11. Let $S=\left\{-m_{1}\right\} \cup A$ with $m_{1} \in \mathbb{N}$ and $A \subseteq \mathbb{N}$. Then $\rho(\mathbb{Z}, S)=$ $\rho\left(\mathbb{Z} / m_{1} \mathbb{Z}, \bar{A}\right)$. In particular, $\rho(\mathbb{Z}, S)=1$ if and only if $\rho\left(\mathbb{Z} / m_{1} \mathbb{Z}, \bar{A}\right)=1$.

So we can clearly see the conditions that need to be considered as we generalize from 1 , to 2 , to finitely many negative elements in $S$. As we move from 1 to 2 , we need to consider whether $c \mid n_{i}$ for all $i \in \mathbb{N}$. As we move to finitely many negative elements, we then need to consider whether the following condition holds:

$$
\prod_{i=1}^{k}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{A}(\mathbb{Z}, S) \Rightarrow \prod_{j=1}^{\infty}{\overline{n_{j}}}^{r_{j}} \in \mathcal{A}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)
$$

If $\rho\left(\mathbb{Z} / m \mathbb{Z},\left\{\overline{m_{1}}, \ldots, \overline{m_{k}}\right\}\right)=1$ (which is equivalent to $\left\{m_{1}, \ldots, m_{k}\right\}$ is $m$-split), then this condition will be true.

For a torsion group $G$, define $k: \mathcal{B}(G, S) \rightarrow \mathbb{Q}^{+} \cup\{0\}$ by

$$
k\left(\prod_{s \in S} s_{s}^{r}\right)=\sum_{s \in S} \frac{r_{i}}{\operatorname{ord}(s)}
$$

If $B \in \mathcal{B}(G, S)$, then $k(B)$ is called the cross number of $B$. Note that $k$ is a semi-length function. It was proven by Zaks [20] and Skula [17] independently that $\mathcal{B}(G, S)$ has elasticity one if and only if the cross number is 1 for each irreducible block. Theorem 2.6 shows that if the block monoid $\mathcal{B}(\mathbb{Z}, S)$ has elasticity one, then the irreducible blocks exactly correspond to irreducible blocks in the block monoid $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. This group is torsion; so the cross number can be applied. Then we can translate this cross number calculation back to the group $\mathbb{Z}$ to get an analog of the cross number when $G=\mathbb{Z}$. This was already done for
$k=2$ in [4]. That paper also listed $c \mid n_{i}$ as a condition in the if and only if statement, but that is unnecessary since it can be proven. This paper also refers to the function as the Zaks-Skula function, which is another commonly used name. Then we can define a cross number function for block monoids with class group $\mathbb{Z}$.

Definition 2.12. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Define the function $k_{m}: \mathcal{B}(\mathbb{Z}, S) \rightarrow \mathbb{Q}^{+}$by

$$
k_{m}(B)=\sum_{j=1}^{\infty} \frac{r_{j} n_{j}}{\operatorname{lcm}\left(n_{j}, m\right)}
$$

for all blocks $B=\prod_{i=1}^{h}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{B}(\mathbb{Z}, S)$.
Theorem 2.13. Let $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$ and $m=\operatorname{lcm}\left(m_{1}, \ldots, m_{k}\right)$. Then $\rho(\mathbb{Z}, S)=1$ if and only if $k_{m}(B)=1$ for all irreducible blocks $B \in \mathcal{B}(\mathbb{Z}, S)$.

Proof. $(\Rightarrow)$ Suppose $\rho(\mathbb{Z}, S)=1$. Let

$$
B=\prod_{i=1}^{h}\left(-m_{i}\right)^{s_{i}} \cdot \prod_{j=1}^{\infty} n_{j}^{r_{j}} \in \mathcal{B}(\mathbb{Z}, S)
$$

be an irreducible block. Then by Theorem 2.6 we know that

$$
B^{\prime}=\prod_{j=1}^{\infty} \bar{n}_{j}^{r_{j}}
$$

is an irreducible block in $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$. But Theorem 2.6 tells us that this block monoid must have elasticity one. Since $\mathcal{B}\left(\mathbb{Z} / m \mathbb{Z}, \overline{S^{+}}\right)$has a torsion group, then

$$
1=k\left(B^{\prime}\right)=\sum_{j \in I}^{\infty} \frac{r_{j}}{\operatorname{ord}_{\mathbb{Z} / m \mathbb{Z}}\left(\overline{n_{i}}\right)}
$$

Thus

$$
k_{m}(B)=\sum_{j=1}^{\infty} \frac{r_{j} n_{j}}{\operatorname{lcm}\left(n_{j}, m\right)}=1
$$

since

$$
\operatorname{ord}_{\mathbb{Z} / m \mathbb{Z}}\left(\overline{n_{i}}\right)=\frac{\operatorname{lcm}\left(n_{j}, m\right)}{n_{j}}
$$

$(\Leftarrow) k_{m}$ as defined is a semi-length function. Since we have a semi-length function and each irreducible block is sent to 1 , then $\rho(\mathbb{Z}, S)=1$ by Lemma 1.18.

## $2.2 \mathbb{Z}\left(p^{\infty}\right)$

Now we will turn our attention to another infinite abelian group, $\mathbb{Z}\left(p^{\infty}\right)$. This group is the subset of $\mathbb{Q} / \mathbb{Z}$ defined for a prime number $p$ as $\mathbb{Z}\left(p^{\infty}\right):=\left\{\left.\frac{m}{p^{n}}+\mathbb{Z} \right\rvert\, m \in \mathbb{Z}, n \geq 0\right\}$. We
will assume throughout this section that $p \in \mathbb{N}$ is prime. Define $H_{n, p}:=H_{n}=<\frac{1}{p^{n}}+\mathbb{Z}>$. Then

$$
\{0\}=H_{0} \subsetneq H_{1} \subsetneq H_{2} \subsetneq H_{3} \subsetneq H_{4} \cdots
$$

and $\cup_{n=1}^{\infty} H_{n}=\mathbb{Z}\left(p^{\infty}\right)$. We will study $S \cap H_{n}$ to learn about the factorization of the block $\operatorname{monoid} \mathcal{B}(G, S)$. Define $S_{n}=S \cap H_{n}$ for all $n \in \mathbb{N}_{0}$. Since $H_{n} \subsetneq H_{n+1}$, then $S_{n} \subset S_{n+1}$ for all $n \in \mathbb{N}_{0}$. So we can get the following lemma.

Lemma 2.14. Let $S \subseteq \mathbb{Z}\left(p^{\infty}\right)$, and define $S_{n}=S \cap H_{n}$ for all $n \in \mathbb{N}_{0}$. If $m<n$, then $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{m}\right) \leq \rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)$.

Proof. This follows directly from Lemma 1.15 since $S_{n} \subseteq S_{n+1} \subseteq \cdots \subseteq S_{m}$.
Since $\mathbb{Z}\left(p^{\infty}\right)=\cup_{n=0}^{\infty} H_{0}$, then $S=\cup_{i \in \mathbb{N}_{0}} S_{i}$. Then we can compare the elasticity for the block monoid with $S$ to the block monoid for each $S_{n}$ using Lemma 1.16.

Lemma 2.15. Let $S \subseteq \mathbb{Z}\left(p^{\infty}\right)$, and define $S_{n}=S \cap H_{n}$ for all $n \in \mathbb{N}_{0}$. Then

$$
\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right)=\lim _{n \rightarrow \infty} \rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)=\sup _{n \in \mathbb{N}} \rho\left(G, S_{n}\right)
$$

In particular, $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right)=1$ if and only if $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)$ for all $n \in \mathbb{N}_{0}$.
Proof. Since $S_{n} \subseteq S_{n+1}$ for all $n \in \mathbb{N}$ and $S=\cup_{n \in \mathbb{N}} S_{n}$, then

$$
\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right)=\lim _{n \rightarrow \infty} \rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)=\sup _{i \in \mathbb{N}_{0}} \rho\left(G, S_{i}\right)
$$

follows from Lemma 1.16.
The "in particular" statement is simple. Each $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right) \geq 1$. Then $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right)=$ $\sup _{i \in \mathbb{N}_{0}} \rho\left(G, S_{i}\right)=1$ if and only if $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right) \geq 1$ for all $n \in \mathbb{N}_{0}$.

Therefore if $\mathcal{B}\left(\mathbb{Z}\left(p^{\infty}\right), S\right)$ has elasticity one, then each block monoid $\mathcal{B}\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)$ must have elasticity one. But $S_{n} \subseteq H_{n}$, a subgroup of $\left(\mathbb{Z}\left(p^{\infty}\right)\right.$. Then $\mathcal{B}\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)$ and $\mathcal{B}\left(H_{n}, S_{n}\right)$ are essentially the same block monoid. Notice that each $H_{n}$ is isomorphic to $\mathbb{Z} / p^{n} \mathbb{Z}$. The isomorphism is obviously multiplication by $p^{n}$. So $\frac{a}{p^{n}}+\mathbb{Z} \mapsto a+p^{n} \mathbb{Z}$. Now using this isomorphism, define $T_{n}$ to be the image of $S_{n}$ :

$$
T_{n}=\left\{a+p^{n} \mathbb{Z} \left\lvert\, \frac{a}{p^{n}}+\mathbb{Z} \in S_{n}\right.\right\}
$$

Then the following lemma is easy since the groups are isomorphic and that isomorphism sends $S_{n}$ to $T_{n}$.

Lemma 2.16. Let $S \subseteq \mathbb{Z}\left(p^{\infty}\right)$, and define $S_{n}=S \cap H_{n}$ for all $n \in \mathbb{N}_{0}$. The map $\varphi: H_{n} \rightarrow$ $\mathbb{Z} / p^{n} \mathbb{Z}$ defined by $\varphi(h+\mathbb{Z})=p^{n} h$ is an isomorphism. As above, define $T_{n}=\varphi\left(S_{n}\right)$, and therefore $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{n}\right)=\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, T_{n}\right)$.

Combining Lemma 2.16 with Lemma 2.15 , the elasticity of $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right)$ is 1 if and only if the elasticity of each block monoid $\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, T_{n}\right)$ is 1 . So we will turn our attention to determining when a block monoid with divisor class group $\mathbb{Z} / p^{n} \mathbb{Z}$ is half-factorial. If a Krull domain has divisor class group $\mathbb{Z} / p^{n} \mathbb{Z}$, then the set of classes containing a height-one prime ideal must contain an element that is relatively prime to $p$. Otherwise, the set of classes
containing a height-one prime ideal will not generate the group as a monoid. So we will include this assumption in the theorem.

Theorem 2.17. Let $n \in \mathbb{N}$ and $S \subset \mathbb{Z} / p^{n} \mathbb{Z}$ such that $\bar{a} \in S$ with $(a, p)=1$ for some $a \in \mathbb{N}$. Then $\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, S\right)=1$ if and only if $S \subseteq\left\{0, a, p a, p^{2} a, \ldots, p^{n-1} a\right\}$.

Proof. $(\Leftarrow)$ Suppose $B$ is an irreducible block in $\mathcal{B}\left(\mathbb{Z} / p^{n} \mathbb{Z}, S\right)$. Then $B=\prod_{i=0}^{n-1}\left(p^{i} a\right)^{m_{i}}$ for some $m_{i} \in \mathbb{N}_{0}$. Then

$$
\sum_{i=0}^{n-1} m_{i} p^{i} a=r p^{n}
$$

for some $r \geq 0$. Since $(a, p)=1$ and $a \sum_{i=0}^{n-1} m_{i} p^{i}=r p^{n}$, then $p^{n}$ must divide $\sum_{i=0}^{n-1} m_{i} p^{i}$. Then

$$
m_{0}+m_{1} p+\cdots+m_{n-1} p^{n-1}=t p^{n}
$$

where $t=\frac{r}{a}$. We will show that $m_{0}+m_{1} p+\cdots+m_{n-1} p^{n-1} \leq p^{n}$; so $t$ must be 1 . Suppose $m_{n-1} p^{n-1}>p^{n}$, and thus $m_{n-1}>p$. Then $C=\left(p^{n-1} a\right)^{p}$ is a block dividing $B$, and not equal to $B$. But $B$ is irreducible, so this is a contradiction. Therefore, $m_{n-1} p^{n-1} \leq p^{n}$.

Suppose

$$
\sum_{i=k}^{n-1} m_{i} p^{i} \leq p^{n}
$$

and

$$
\sum_{i=k-1}^{n-1} m_{i} p^{i}>p^{n}
$$

Then

$$
\begin{aligned}
m_{k-1} p^{k-1} & >p^{n}-\sum_{i=k}^{n-1} m_{i} p^{i} \\
& =p^{k-1}\left(p^{n-k+1}-\sum_{i=k}^{n-1} m_{i} p^{i-k+1}\right) \\
& =p^{k-1} s
\end{aligned}
$$

for some integer $s$. Since $p^{n}-\sum_{i=k}^{n-1} m_{i} p^{i} \geq 0$, then $s \geq 0$. So $m_{k-1} \geq s$, and we have that

$$
s p^{k-1}+\sum_{i=k}^{n-1} m_{i} p^{i}=p^{n}
$$

Therefore, $s * p^{k-1} a+\sum_{i=k}^{n-1} m_{i} p^{i} a \in \mathbb{Z} p^{n}$. Then $D=\left(p^{k-1} a\right)^{s} \cdot \prod_{i=k}^{n-1}\left(p^{i} a\right)^{m_{i}}$ is a block dividing, but not equal to, B. But $B$ is irreducible, so this is a contradiction. So

$$
\sum_{i=k-1}^{n-1} m_{i} p^{i} \leq p^{n}
$$

By induction we have that

$$
\sum_{i=1}^{n-1} m_{i} p^{i} \leq p^{n}
$$

Then $t=1$ (If $t=0$, we would have an empty sum since the $m_{i}$ 's are nonnegative.) Therefore,

$$
1=\sum_{i=1}^{n-1} \frac{m_{i} p^{i}}{p^{n}}=\sum_{i=1}^{n-1} \frac{m_{i}}{p^{n-i}}=\sum_{i=1}^{n-1} \frac{m_{i}}{\operatorname{ord}\left(p^{i} a\right)}=k(B)
$$

the cross number on $B$. Since the cross number is one for each irreducible block, then $\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, S\right)=1$.
$(\Rightarrow)$ Let $0 \neq \bar{b} \in S$. Then $-b \equiv \operatorname{ra}(\bmod n)$ for some $r \in\left\{1,2,3, \ldots, p^{n}-1\right\}$ since $\bar{a}$ generates the group $\mathbb{Z} / p^{n} \mathbb{Z}$. Therefore, $B=\bar{b} \cdot \bar{a}^{r}$ is a block in $\mathcal{B}\left(\mathbb{Z} / p^{n} \mathbb{Z}\right)$ since $\bar{b}+r \bar{a}=0$. This block is irreducible because the $r$ chosen above is unique. So no proper subproduct containing $b$ will sum to 0 . Also, $r<p^{n-1}$; so no subproduct containing only copies of $a$ can have a sum that is equal to 0 since the order of $\bar{a}$ in $\mathbb{Z} / p^{n} \mathbb{Z}$ is $p^{n}$.

Therefore, $B=\bar{b} \cdot \bar{a}^{r}$ is a irreducible block. Note $|\bar{b}|=p^{i}$ for some $1 \leq i \leq n$. Also, $r=p^{j} r^{\prime}$ for some $1 \leq j<p^{n}$ and $\left(r^{\prime}, p\right)=1$. Then $C=\bar{b}^{p^{i}}$ and $D=\bar{a}^{p^{n}}$ are irreducible blocks. Then $B^{p^{i+n-j}}=C^{p^{n-j}} D^{p^{i} r^{\prime}}$ are two equivalent factorizations into irreducible blocks. Then we must have $p^{i+n-j}=p^{n-j}+p^{i} r^{\prime}$.

Suppose $i>n-j$, then

$$
p^{i+n-j}=p^{n-j}\left(1+p^{i-n+j} r^{\prime}\right) \Leftrightarrow p^{i}=\left(1+p^{i-n+j} r^{\prime}\right),
$$

and thus

$$
1=p^{i}-p^{i-n+j} r^{\prime}=p^{i-n+j}\left(p^{n-j}-r^{\prime}\right)
$$

Since $i>n-j$, then $p \mid 1$, which is a contradiction.
Suppose that $i \leq n-j$. Then

$$
\begin{aligned}
p^{i+n-j}-p^{n-j}=p^{i} r^{\prime} & \Leftrightarrow p^{n-j}\left(p^{i}-1\right)=p^{i} r^{\prime} \\
& \Leftrightarrow p^{n-j-i}\left(p^{i}-1\right)=r^{\prime}
\end{aligned}
$$

If $i<n-j$, then $p \mid r^{\prime}$, which is a contradiction. If $i=n-j$, then $p^{i}-1=r^{\prime}$. Then $-b \equiv r a \equiv p^{j}\left(p^{i}-1\right) a\left(\bmod p^{n}\right)$. Since $|b|=p^{i}$, then $b+\left(p^{i}-1\right) b \equiv p^{i} b \equiv 0\left(\bmod p^{n}\right)$. Thus $\left(p^{i}-1\right) b \equiv-b \equiv p^{j}\left(p^{i}-1\right) a\left(\bmod p^{n}\right)$. Then $\left(p^{i}-1\right) b-p^{j}\left(p^{i}-1\right) a=c p^{n}$ for some $c \in \mathbb{Z}$. Then $\left(p^{i}-1\right)\left(b-p^{j} a\right)=c p^{n}$. Therefore, $p^{n} \mid\left(p^{i}-1\right)\left(b-p^{j} a\right)$. Then $p^{n} \mid\left(b-p^{j} a\right)$ since $p$ is prime and does not divide $p^{i}-1$. Therefore $b \equiv p^{j} a\left(\bmod p^{n}\right)$. Thus we have shown that $S \subseteq\left\{0, a, p a, p^{2} a, \ldots, p^{n-1} a\right\}$.

Now we are able to state the theorem showing when a Krull domain with divisor class group $\left(\mathbb{Z}\left(p^{\infty}\right), S\right)$ is an HFD.

Theorem 2.18. Let $R$ be a Krull domain with divisor class group $\mathbb{Z}\left(p^{\infty}\right)$ and $S \subseteq \mathbb{Z}\left(p^{\infty}\right)$ the set of classes containing a height-one prime ideal of $R$. Then $R$ is an HFD if and only if $S$ is infinite and for all $\frac{a}{p^{n}}+\mathbb{Z}, \frac{b}{p^{m}}+\mathbb{Z} \in S$ with $(a, p)=1=(b, p)$ and $n \leq m$, then $b \equiv a\left(\bmod p^{n}\right)$.

Proof. $(\Rightarrow)$ Suppose $S$ is finite. Then clearly it cannot generate $\left(\mathbb{Z}\left(p^{\infty}\right), S\right)$ as a monoid, so we have a contradiction. Thus $S$ must be infinite. Define $S_{n}=S \cap H_{n}$ for all $n \in \mathbb{N}_{0}$. Suppose there exists such an $\frac{a}{p^{n}}+\mathbb{Z}, \frac{b}{p^{m}}+\mathbb{Z} \in S$ with $n \leq m$ and $(a, p)=1$ and $(b, p)=1$. Then $\frac{a}{p^{n}}+\mathbb{Z}, \frac{b}{p^{m}}+\mathbb{Z} \in S_{m}$, and $p^{m-n} a+p^{n} \mathbb{Z}, b+p^{n} \mathbb{Z} \in T_{m}$. But

$$
1=\rho\left(\mathbb{Z}\left(p^{\infty}\right), S\right) \geq \rho\left(\mathbb{Z}\left(p^{\infty}\right), S_{m}\right)=\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, T_{m}\right)
$$

so $\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, T_{m}\right)=1$. Thus $T_{m} \subseteq\left\{0, c, p c, p^{2} c, \ldots, p^{n-1} c\right\}$ for some $(c, p)=1$ with $c \in T_{n}$ by Theorem 2.17. Since $b \in T_{m} \subseteq\left\{0, c, p c, p^{2} c, \ldots, p^{n-1} c\right\}$ and $(b, p)=1$, then $b \equiv c\left(\bmod p^{n}\right)$. So $T_{m} \subseteq\left\{0, b, p b, p^{2} b, \ldots, p^{n-1} b\right\}$. Then $p^{m-n} \equiv p^{j} b\left(\bmod p^{m}\right)$. Since $(a, p)=1$ and $(b, p)=$ 1 , then $p^{m-n} a$ has order $p^{n}$ and $p^{j} b$ has order $p^{m-j}$ in $\mathbb{Z} / p^{n} \mathbb{Z}$. Thus $p^{n}=p^{m-j}$, so $n=m-j$ which is equivalent to $j=m-n$. So $p^{m-n} a-p^{m-n} b \in p^{m} \mathbb{Z}$. Therefore, $a-b \in p^{n} \mathbb{Z}$, and $a \equiv b(\bmod n)$.
$(\Leftarrow)$ First we need to show $S$ generates $\mathbb{Z}\left(p^{\infty}\right)$ as a monoid. Let $\frac{d}{p^{n}}+\mathbb{Z} \in \mathbb{Z}\left(p^{\infty}\right)$. Suppose there is no $\frac{e}{p^{m}}+\mathbb{Z} \in S$ with $(e, p)=1$ and $m \geq n$. Then when all the fractions of $S$ are reduced, none of the elements have a denominator with a power of $p$ greater than or equal to $n$. But this means that $S$ must be finite since we are in $\mathbb{Z}\left(p^{\infty}\right)$, which is a contradiction. Thus, such an $\frac{e}{p^{m}} \in S$ must exist. Then $d \equiv r e\left(\bmod p^{m}\right)$ for some $r$ since $(e, p)=1$. Thus, $d-r e \in p^{m} \mathbb{Z}$; so $\frac{d}{p^{m}}-r \frac{e}{p^{m}} \in \mathbb{Z}$. Thus, $\frac{d}{p^{n}}-p^{n-m} r \frac{e}{p^{m}} \in \mathbb{Z}$. Therefore, in $\mathbb{Z}\left(p^{\infty}\right), \frac{d}{p^{n}}$ is a positive multiple of an element of $S$, and we have that $S$ generates $\mathbb{Z}\left(p^{\infty}\right)$ as a monoid.

If we show that $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S^{n}\right)=1$ for all $n>0$, then $R$ must be an HFD by 2.15 . Let $n>0$. When all the fractions in $S$ are reduced, one of the elements must have a denominator with a higher power than $n$ as above. So we must have some $\frac{b}{p^{m}}+\mathbb{Z} \in S_{m}$ for some $(b, p)=1$ and $m>n$. Now for all the elements $0 \neq \frac{a}{p^{k}}+\mathbb{Z} \in S$ with $(a, p)=1$ and $1 \leq k \leq m$, we know that $b \equiv a\left(\bmod p^{k}\right)$. But this means that $b-a=t p^{k}$ for some $t$, and thus $\frac{b}{p^{k}}-\frac{a}{p^{k}} \in \mathbb{Z}$. Hence, $\frac{b}{p^{k}}+\mathbb{Z}=\frac{a}{p^{k}}+\mathbb{Z}$ in $\mathbb{Z}\left(p^{\infty}\right)$. So we have shown that all the elements of $S_{m}$ are either 0 or have the form $\frac{b}{p^{k}}+\mathbb{Z}$ for $1<k \leq m$. Therefore, $\frac{b}{p^{m}} \in S_{m}$ and $S_{n} \subseteq\left\{0, \frac{b}{p}, \frac{b}{p^{2}}, \ldots, \frac{b}{p^{m}}\right\}$. Hence $b \in T_{m}$, and $T_{m} \subseteq\left\{0, b, p b, \ldots, p^{m-1} b\right\}$. Therefore, $\rho\left(\mathbb{Z} / p^{n} \mathbb{Z}, T^{m}\right)=1$ by Theorem 2.17. Then using Lemma 2.16, $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S^{m}\right)=1$. Since $S_{n} \subset S_{m}$, then $\rho\left(\mathbb{Z}\left(p^{\infty}\right), S^{n}\right)=1$, by Lemma 2.14.

## $2.3 \mathbb{Q}$

In this section, we will attempt to characterize the distributions of height-one prime ideals in divisor class group $\mathbb{Q}$ that result in the corresponding Krull domain being an HFD. First it is proved which subsets $S \subseteq \mathbb{Q}$ will have a corresponding Krull domain $R$ with divisor class group $\mathbb{Q}$ and $S$ is the set of classes containing a height-one prime ideal of $R$. Recall, when this is true we say the pair $(\mathbb{Q}, S)$ is realizable. The following lemma will be useful. Recall $[S]$ is the set generated by $S$ as a monoid, i.e., $[S]$ is the set containing all sums of elements of $S$ with positive coefficients only. In contrast, $<S>$ is the group generated by the elements of $S$, so elements of $S$ can be subtracted. The first lemma is a technical condition to be used in Theorem 2.20.

Lemma 2.19. Let $S \subseteq G$ where $G$ is an abelian group. Suppose $S$ generates $G$ as a group (i.e., $<S>=G$ ) and for each $0 \neq s \in S$ there exists some $c \in \mathbb{N}$ such that -cs is generated
by $S$ as a monoid (i.e., - cs $\in[S]$ ). Then $S$ generates $G$ as a monoid (i.e., $[S]=G$ ).
Proof. Suppose the conditions are satisfied. Let $g \in G$ and suppose that $g=r_{1} x_{1}+$ $\cdots+r_{n} x_{n}$, where each $x_{i} \in S$ and $r_{i} \in \mathbb{Z}$. If any of the $r_{i}$ or $x_{i}$ are 0 , then drop this term from the sum and renumber. Now suppose some $r_{i}<0$, call it $r_{1}$ without loss of generality. Then there exists $c_{1} \in \mathbb{Z}^{+}$such that $-c_{1} x_{1}=a_{1} y_{1}+\cdots+a_{k} y_{k}$, where each $y_{i} \in S$ and $a_{i} \in \mathbb{N}$. Then choose some $b_{1} \in \mathbb{Z}$ such that $b_{1} c_{1}>-r_{1}$. Then $g=$ $\left(r_{1}+b c_{1}\right) x_{1}+\cdots+r_{n} x_{n}+b a_{1} y_{1}+\cdots+b a_{k} y_{k}$. Note the coefficient of $x_{1}$ and the coefficients of each $y_{j}$ are positive. This method can be repeated so the coefficient of each $x_{i}$ is also positive. Thus, $g \in[S]$, and $G$ can be generated by $S$ as a monoid.

The above lemma gives a simple condition to show that $S$ generates $G$ as a monoid. The condition in the lemma is actually close to Grams' original condition in [15] guaranteeing that a pair $(G, S)$ has a corresponding Dedekind domain. The fact that $S$ generates $G$ as a monoid is an equivalent statement to Grams' condition. Now we will use Lemma 2.19 to prove a result when the pair $(\mathbb{Q}, S)$ is realizable by a Krull domain. The conditions in the following theorem are analagous to the conditions that Grams showed that the pair $(\mathbb{Z}, S)$ must satisfy to be realizable by a Dedekind domain [15].

Theorem 2.20. Let $S \subseteq \mathbb{Q}$. Then $(\mathbb{Q}, S)$ is realizable by a Krull domain if and only if $S$ generates $\mathbb{Q}$ as a group (i.e. $<S>=\mathbb{Q}$ ) and $S$ contains both positive and negative elements.

Proof. $(\Rightarrow)(\mathbb{Q}, S)$ is realizable as a Krull domain implies that $S$ generates $G$ as a monoid by Theorem 1.13. Then clearly $S$ generates $G$ as a group. Also, suppose $S$ had only positive elements. Then each $s \in[S]$ is greater than 0 . So $[S] \neq \mathbb{Q}$, which is a contradiction. Similarly, we get a contradiction if $S$ contains only negative elements, since then each $s \in[S]$ is less than 0 . So $S$ contains both positive and negative elements.
$(\Leftarrow)$ Suppose $<S>=\mathbb{Q}$ and $S$ contains both positive and negative elements. We will use Lemma 2.19 to show that $S$ generates $G$ as a monoid, and then Theorem 1.13 says that $(\mathbb{Q}, S)$ is realizable as a Krull domain. It is assumed that $S$ generates $G$ as a group. Let $a \in S$ with $a>0$. Then $a=\frac{s}{r}$ for some $s, r \in \mathbb{N}$. Then there exists $b \in S$ such that $b<0$. We can write b as $b=\frac{-n}{m}$ for some $n, m \in \mathbb{N}$. Then $-(n r) a=-(n r) \cdot \frac{s}{r}=(m s) \cdot \frac{-n}{m}=(m s) b \in[S]$. The case when $a<0$ is done similarly. Thus the conditions of Lemma 2.19 are satisfied.

Therefore we will focus on the case where $S^{+}=\{q \in S \mid q>0\}$ is infinite and $S^{-}=\{q \in S \mid q<0\}$ contains at least one element. By a simple automorphism switching positives and negatives, the results for this case can also be applied to the case $\left|S^{-}\right|=\infty$ and $S^{+}$has at least one element. The following theorem gives a nice way to construct an HFD with divisor class group $(\mathbb{Q}, S)$ where $\left|S^{+}\right|=\infty$ and $\left|S^{-}\right|=\infty$. This is in sharp contrast to the divisor class group $\mathbb{Z}$. Theorem 2.1 from [5], proved that for $T \subseteq \mathbb{Z}$ if $\left|T^{+}\right|=\infty$ and $\left|T^{-}\right|=\infty$, then the elasticity of $\mathcal{B}(\mathbb{Z}, T)$ is infinite,.

Theorem 2.21. Let $\left\{n_{1}, n_{2}, \ldots\right\} \subseteq \mathbb{N}$ be a splittable set. Then the block monoid $\mathcal{B}(\mathbb{Q}, S)$, where $S^{+}=\left\{\frac{1}{n_{1}}, \frac{1}{n_{2}}, \ldots\right\}$ and $S^{-} \subseteq \mathbb{Z}^{-}$, has elasticity one. If $(\mathbb{Q}, S)$ is realizable by a Krull domain, then any such Krull domain is an HFD.

Proof. Define a semi-length function $f: \mathcal{B}(\mathbb{Q}, S) \rightarrow \mathbb{N}$, where each block is sent to the number of elements in $S^{-}$that it contains. It is clear that $f$ is a homomorphism. Suppose
that $B \in \mathcal{B}(\mathbb{Q}, S)$ is irreducible. Then

$$
B=\prod_{i=1}^{\infty}\left(\frac{1}{n_{i}}\right)^{a_{i}} \cdot \prod_{j=1}^{\infty}(-j)^{b_{j}}
$$

for some $a_{i}, b_{j} \in \mathbb{N}_{0}$ with only finitely many of the $a_{i}, b_{j}$ nonzero. Then

$$
\sum_{i=1}^{\infty} a_{i} \frac{1}{n_{i}}=\sum_{j=1}^{\infty} b_{j}(j)
$$

Suppose that $b_{k} \geq 1$ for some $k \geq 1$. Note that $\sum_{i=1}^{\infty} a_{i} \frac{1}{n_{i}}=\sum_{j=1}^{\infty} b_{j}(j) \in \mathbb{N}, b_{k} j \in \mathbb{N}$, and $\sum_{j=1}^{\infty} b_{j}(j)>b_{k} j$. Since $S^{+}$is splittable, there exists $0 \leq a_{i}^{\prime} \leq a_{i}$ for each $i \in \mathbb{N}$ such that $\sum_{i=1}^{\infty} a_{i}^{\prime} \cdot \frac{1}{n_{i}}=k$. Then $B^{\prime}=(-k)^{1} \cdot \prod_{i=1}^{\infty} a_{i}^{\prime} \cdot \frac{1}{n_{i}}$ is a block dividing $B$. But $B$ is irreducible; so we must have $B^{\prime}=B$. Thus $f(B)=1$. Since $f(B)=1$ for all irreducible blocks $B \in \mathcal{B}(\mathbb{Q}, S)$, then $\mathcal{B}(\mathbb{Q}, S)$ is an HFD by Lemma 1.18.

Before we use this theorem to generate examples, we need the following lemma that was proved by Geroldinger and Wao in [11].

Lemma 2.22. Let $M \subset \mathbb{N}$ be a chain of divisors (i.e., $m, m^{\prime} \in M$ with $m^{\prime}<m$ implies $\left.m^{\prime} \mid m\right)$. Then $M$ is splittable.

Example 2.23. The set $\left\{\left.\frac{1}{n!} \right\rvert\, n \in \mathbb{N}\right\}$ is a splittable set by Lemma 2.22. Then the block monoid $\mathcal{B}(\mathbb{Q}, S)$, where $S^{+}=\left\{\left.\frac{1}{n!} \right\rvert\, n \in \mathbb{N}\right\}$ and $S^{-}=\mathbb{Z}^{-}$has elasticity one by Theorem 2.21. Also, this pair is realizable as a Krull domain, and thus, any corresponding Krull domain is an HFD. This is an example where a Krull domain is an HFD and has divisor class group $(\mathbb{Q}, S)$ and $S$ has infinitely many positive and negative elements.
Example 2.24. Notice that the condition in Theorem 2.21 that $\left\{n_{1}, n_{2}, \ldots\right\} \subseteq \mathbb{Z}^{+}$is a splittable set guarantees (so is a stricter condition than) that $\rho\left(\mathbb{Q}, S^{+} \cup\{-1\}\right)=1$. However, we cannot relax the assumption in the theorem. The following is an example of a pair $(\mathbb{Q}, S)$ with $\rho\left(\mathbb{Q}, S^{+} \cup\{-1\}\right)=1$, and $\rho\left(\mathbb{Q}, S^{+} \cup \mathbb{Z}^{-}\right)>1$. Consider $(\mathbb{Q}, S)$, where $S^{+}=\left\{\left.\frac{1}{n!} \right\rvert\, n \in \mathbb{Z}^{+}\right\} \cup\{5 / 2\}$ and $S^{-}=\mathbb{Z}^{-}$. Using Theorem 2.25, $\rho\left(\mathbb{Q}, S^{+} \cup\{-1\}\right)=$ $\rho\left(\mathbb{Q},\left\{\left.\frac{1}{n!} \right\rvert\, n \in \mathbb{Z}^{+}\right\} \cup\{-1\}\right)$ since both of these $S$ sets are equivalent modulo $\mathbb{Z}$. By Theorem 2.21 this second pair has elasticity one. Therefore $\rho\left(\mathbb{Q}, S^{+} \cup\{-1\}\right)>1$.

Also, by the calculation $\left\{(-2)^{2} \cdot \frac{5}{2} \cdot(1 / 2)^{3}\right\}\left\{-1 \cdot(1 / 2)^{2}\right\}^{3}=\left\{-2 \cdot(1 / 2)^{4}\right\}^{2}\left\{(-1)^{3} \cdot \frac{5}{2} \cdot(1 / 2)\right\}$, we have 4 irreducible blocks equivalent to 3 irreducible blocks in $\mathcal{B}(\mathbb{Q}, S)$ (the braces are used to separate the irreducible blocks). Thus, the elasticity of $(\mathbb{Q}, S)$ is at least $4 / 3$. Note that this example is also realizable as a Krull domain by Theorem 1.13.

The following theorem is analogous to Theorem 2.11 for $\mathbb{Z}$. If $S$ has only one negative element, then we can factor out by $a \mathbb{Z}$, and the elasticity will remain the same.

Theorem 2.25. Let $S \subseteq \mathbb{Q}$ such that $S^{-}=\{-a\}$ for some $a>0$ in $\mathbb{Q}$. Then $\rho(\mathbb{Q}, S)=$ $\rho\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)$.
Proof. Then $S=S^{+} \cup\{-a\}$. Define $f: \mathcal{B}(\mathbb{Q}, S) \rightarrow \mathcal{B}\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)$by

$$
f\left(a^{u_{a}} \cdot \prod_{s \in S^{+}} s^{u_{s}}\right)=\prod_{s \in S^{+}} \bar{s}^{u_{s}},
$$

where $\pi: \mathbb{Q} \rightarrow \mathbb{Q} / a \mathbb{Z}$ is the canonical projection. First we need to show this function actually maps into $\mathcal{B}\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)$. Suppose $B \in \mathcal{B}(\mathbb{Q}, S)$. Then $B=(-a)^{u_{a}} \cdot \prod_{s \in S^{+}} s^{u_{s}}$ for some $u_{s} \in \mathbb{N}_{0}$, where all but finitely many of the $u_{s}=0$, and $u_{a}(-a)+\sum_{s \in S^{+}} u_{s} s=0$. Then $\sum_{s \in S^{+}} u_{s} s \in a \mathbb{Z}$; so $f(B)=\prod_{s \in S^{+}} \bar{s}^{u_{s}}$ is a block in $\mathcal{B}(\mathbb{Q} / a \mathbb{Z}, \bar{S})$.

Now we want to use this function $f$ along with Lemma 1.14 to show that the elasticities are equivalent. Thus, we need to show three things: if $B$ is irreducible, then $f(B)$ is irreducible; $\operatorname{ker} f=\{1\}$; and there exists a homomorphism $g: \mathcal{B}\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right) \rightarrow \mathcal{B}(\mathbb{Q}, S)$ such that $f g$ is the identity homomorphism on $\mathcal{B}\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)$. It is clear that $\operatorname{ker} f=\{1\}$; so we only need to check the other two conditions.

Now suppose $B$ is irreducible, and $f(B)$ is not irreducible. Then there exists $0 \leq u_{s}^{\prime} \leq u_{s}$ for each $s \in S^{+}$such that

$$
\sum_{s \in S^{+}} u_{s}^{\prime} \bar{s}=0
$$

in $\mathbb{Q} / a \mathbb{Z}$ and $u_{s}^{\prime}<u_{s}$ for at least one $s \in S$. Then $\sum_{s \in S^{+}} u_{s}^{\prime} s=t a$ for some $t \in \mathbb{Z}$. Since each $u_{s}^{\prime}, s>0$, then $t \geq 0$. Since $B$ is a block, then

$$
0=u_{a}(-a)+\sum_{s \in S^{+}} u_{s} s \geq u_{a}(-a)+\sum_{s \in S^{+}} u_{s}^{\prime} s=u_{a}(-a)+t a .
$$

Thus $u_{a} a \geq t a$; so $u_{a} \geq t$. Therefore

$$
(-a)^{t} \cdot \prod_{s \in S^{+}} s^{u_{s}^{\prime}}
$$

is a block dividing $B$, but not equal to $B$ since $u_{s}^{\prime}<u_{s}$ for at least one $s \in S$. But this is a contradiction since $B$ is irreducible. Thus, $f(B)$ is irreducible.

Let $C \in \mathcal{B}(\mathbb{Q} / a \mathbb{Z}, \pi(S))$ be a block. Then $C=\prod_{d \in \overline{S^{+}}} d^{v_{d}}$ for some $v_{d} \in \mathbb{N}_{0}$ and all but finitely many of the $v_{d}$ are zero. For each $d \in \pi(S)$, choose a $s_{d} \in S$ such that $\overline{s_{d}}=d$. Then $C=\prod_{d \in \bar{S}}{\overline{s_{d}}}^{v_{d}}$. Therefore

$$
\sum_{d \in \pi(S)} v_{d} s_{d}=r a
$$

for some $r \geq 0$ since $C$ is a block and each $v_{d}, s_{d}>0$. Then $D=(-a)^{r} \cdot \prod_{d \in \pi(S)} s_{d}^{v_{d}}$ is a block in $\mathcal{B}(\mathbb{Q}, S)$ with $f(D)=C$. Using this construction, define $g: \mathcal{B}\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right) \rightarrow \mathcal{B}(\mathbb{Q}, S)$ by $g(C)=D$ as constructed above. The construction clearly makes $g$ a homomorphism, and $g f$ is the identity homomorphism.

The following corollary gives a useful result for the case when $S^{-}$has only one element. The corollary says that every element can be replaced with an element that is in the interval $[0, a)$ without changing the elasticity. This can drastically reduce the size of $S^{+}$for the purposes of calculating the elasticity. For example, let $S=\{-5,2,7,12,17, \ldots\} \subseteq S^{+}$. Then we can calculate the elasticity of $\mathcal{B}(\mathbb{Q},\{-5,2\})$, and it will be the same as $\mathcal{B}(\mathbb{Q}, S)$. Note this simple example is not realizable by a Krull domain.

Corollary 2.26. Let $S \subseteq \mathbb{Q}$ such that $S^{-}=\{-a\}$ for some $a>0$ in $\mathbb{Q}$. Define $T \subseteq \mathbb{Q}$ by $T=\{-a\} \cup\{t \in \mathbb{Q} \mid 0 \leq t<a$ and $t-s \in a \mathbb{Z}$ for some $s \in S\}$. Then $\rho(\mathbb{Q}, S)=\rho(\mathbb{Q}, T)$ (i.e., each element of $S^{+}$can be replaced with an element in $[0, a)$ without changing the elasticity).

Proof. By Theorem 2.25, $\rho(\mathbb{Q}, S)=\rho\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)$and $\rho(\mathbb{Q}, T)=\rho\left(\mathbb{Q} / a \mathbb{Z}, \overline{T^{+}}\right)$. By definition of $T, \overline{S^{+}}=\overline{T^{+}}$in $\mathbb{Q} / a \mathbb{Z}$. Therefore, $\rho\left(\mathbb{Q} / a \mathbb{Z}, \overline{S^{+}}\right)=\rho\left(\mathbb{Q} / a \mathbb{Z}, \overline{T^{+}}\right)$.

Now we would like to prove a theorem for testing exactly when $\mathcal{B}(\mathbb{Q}, S)$, where $S$ has only one negative element, is an HFD. We will begin with $S=\left\{-1, \frac{b_{1}}{d_{1}}, \frac{b_{2}}{d_{2}}, \ldots\right\}$, where each $b_{i}, d_{i} \in \mathbb{N}$ in the following theorem, and the corollary will apply it to a general negative element instead of -1 .

Theorem 2.27. Let $S=\left\{-1, \frac{b_{1}}{d_{1}}, \frac{b_{2}}{d_{2}}, \ldots\right\} \subseteq \mathbb{Q}$, where each $b_{i}, d_{i}>0$ and $\left(b_{i}, d_{i}\right)=1$. Then $\rho(\mathbb{Q}, S)=1$ if and only if there exists an $x_{n} \in \mathbb{N}$ for all $n \in \mathbb{N}$ such that the following hold:

1. $x_{n} \equiv b_{i}^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)$ for all $1 \leq i \leq n$, where $\phi$ is the Euler phi function.
2. $\left\{d_{i} \mid 1 \leq i \leq n\right\}$ is a splittable set.

Proof. Define $S_{n}=\left\{-1, \frac{b_{1}}{d_{1}}, \frac{b_{2}}{d_{2}}, \ldots, \frac{b_{n}}{d_{n}}\right\}$ for all $n \in \mathbb{Z}_{+}$. Then $S=\cup_{i \in I} S_{n}$ and $S_{n} \subseteq S_{n+1}$. Then by Lemma 1.16, $\rho(\mathbb{Q}, S)=\sup _{n \in \mathbb{N}} \rho\left(\mathbb{Q}, S_{n}\right)$. Therefore, $\rho(\mathbb{Q}, S)=1$ if and only if $\rho\left(\mathbb{Q}, S_{n}\right)=1$ for all $n \in \mathbb{Z}$.

Let $n \in \mathbb{N}$. Define $d=d_{1} d_{2} \cdots d_{n}$ and $d S_{n}=\left\{-d, \hat{d}_{1} b_{1}, \hat{d}_{2} b_{2}, \ldots, \hat{d}_{n} b_{n}\right\}$ using the notation $\hat{d}^{i}=d / d_{i}$. Then $\mathcal{B}\left(\mathbb{Q}, S_{n}\right)$ is isomorphic to $\mathcal{B}\left(\mathbb{Q}, d S_{n}\right)$ since multiplication by $d$ is an automorphism of $\mathbb{Q}$. But $d S_{n} \in \mathbb{Z}$ so $\mathcal{B}\left(\mathbb{Q}, d S_{n}\right)$ is the same as $\mathcal{B}\left(\mathbb{Z}, d S_{n}\right)$. Then $\rho\left(\mathbb{Q}, S_{n}\right)=1$ if and only if $\rho\left(\mathbb{Z}, d S_{n}\right)=1$. Since there is only one negative element in $d S_{n}$, we can use Theorem 2.11 that gives $\rho\left(\mathbb{Z}, d S_{n}\right)=1$ if and only if $\rho\left(\mathbb{Z} / d \mathbb{Z}, \overline{d S_{N}}\right)=1$. By Theorem 1.22, $\rho\left(\mathbb{Z} / d \mathbb{Z}, \overline{d S_{N}}\right)=1$ if and only if there exists a $\sigma \in A u t(\mathbb{Z} / d \mathbb{Z})$ such that $\sigma\left(d S_{n}\right) \subseteq\{\bar{s} \mid s \in \mathbb{N}$ and $s \mid d\}$ and $\left\{o r d_{\mathbb{Z} / d \mathbb{Z}} \sigma\left(\hat{d}_{j} b_{j}\right) \mid 1 \leq j \leq n\right\}$ is a splittable set.

Therefore, $\rho(\mathbb{Q}, S)=1$ if and only if for all $n \in \mathbb{N}$ there exists a $\sigma \in A u t(\mathbb{Z} / d \mathbb{Z})$ such that $\sigma\left(d S_{n}\right) \subseteq\{\bar{s} \mid s \in \mathbb{N}$ and $s \mid d\}$ and $\left\{\operatorname{ord}_{\mathbb{Z} / d \mathbb{Z}} \sigma\left(\hat{d}_{j} b_{j}\right) \mid 1 \leq j \leq n\right\}$ is a splittable set. So if we prove these two conditions are equivalent to the two conditions in the theorem, then the proof is finished.

Now for each $1 \leq i \leq n$,

$$
\operatorname{ord}_{\mathbb{Z} / d \mathbb{Z}}\left(b_{j} \hat{d}_{j}\right)=\frac{l c m\left(d, b_{j} \hat{d}_{j}\right)}{b_{j} \hat{d}_{j}}=\frac{\operatorname{lcm}\left(\hat{d}_{j} d_{j}, b_{j} \hat{d}_{j}\right)}{b_{j}}=\frac{\hat{d}_{j} l c m\left(d_{j}, b_{j}\right)}{b_{j} \hat{d}_{j}}=\frac{\hat{d}_{j} d_{j} b_{j}}{\hat{d}_{j} b_{j}}=d_{j}
$$

So $\left\{o r d_{\mathbb{Z} / d \mathbb{Z}} \sigma\left(\hat{d}_{j} b_{j}\right) \mid 1 \leq j \leq n\right\}$ is splittable if and only if $\left\{d_{i} \mid 1 \leq i \leq n\right\}$ is a splittable set.

Now we would like to prove there exists a $\sigma \in A u t(\mathbb{Z} / d \mathbb{Z})$ such that $\sigma\left(d S_{n}\right) \subseteq\{\bar{s} \mid s \in$ $\mathbb{N}$ and $s \mid d\}$ if and only if there exists an $x_{n} \in \mathbb{N}$ such that $x_{n} \equiv b_{i}^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)$ for all $1 \leq i \leq n$.
$(\Rightarrow)$ Suppose that there exists a $\sigma \in \operatorname{Aut}(\mathbb{Z} / d \mathbb{Z})$ such that $\sigma\left(d S_{n}\right) \subseteq\{\bar{s} \mid s \in \mathbb{N}$ and $s \mid d\}$. Then $\sigma$ is multiplication by an element $1 \leq x_{n} \leq n$ such that $\left(x_{n}, d\right)=1$ (in particular, $\left.x_{n}=\sigma(1)\right)$. Let $1 \leq j \leq n$. Recall from above that

$$
\operatorname{ord}_{\mathbb{Z} / d \mathbb{Z}}\left(b_{j} \hat{d}_{j}\right)=d_{j}
$$

Since $\sigma$ is an automorphism, then it must be order preserving. Also, the only number between 1 and $d$ that divides $d$ and has order $d_{j}$ is $\hat{d}_{j}$. Thus,

$$
x_{n} b_{j} \hat{d}_{j} \equiv \sigma\left(b_{j} \hat{d}_{j}\right) \equiv \hat{d}_{j}(\bmod d)
$$

Dividing this equation by $\hat{d}_{i}$, shows that

$$
x_{n} b_{j} \equiv 1\left(\bmod d_{j}\right)
$$

The elements of $\mathbb{Z} / d_{i} \mathbb{Z}$ that are relatively prime to $d_{i}$ form a multiplicative group of order $\phi\left(d_{i}\right)$, where $\phi$ is the Euler phi function. Then in this multiplicative group, $x_{n}$ is equivalent to the multiplicative inverse of $b$, which is equivalent to $b^{\phi\left(d_{i}\right)-1}$. Thus, we have

$$
x_{n} \equiv b^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)
$$

$(\Leftarrow)$ Suppose that for all $n \in \mathbb{N}$ there exists an $x_{n}$ such that $x_{n} \equiv b_{j}^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)$ and $\left\{d_{i} \mid i \in \mathbb{N}\right\}$ is a splittable set. We can define a function $\sigma \in A u t(\mathbb{Z} / d \mathbb{Z})$ by $\sigma(a)=x_{n} a$. We need to show that $\left(x_{n}, d\right)=1$ to prove this is actually an automorphism of $\mathbb{Z} / m \mathbb{Z}$. By assumption $x_{n} \equiv b_{i}^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)$ for all $1 \leq i \leq n$ and $\left(b_{i}, d_{i}\right)=1$. Therefore, $b_{i}^{\phi\left(d_{i}\right)-1}$ is relatively prime to $d_{i}$, and $x_{n}$ is then relatively prime to $d_{i}$ since $x_{n} \equiv b_{i}^{\phi\left(d_{i}\right)-1}\left(\bmod d_{i}\right)$. Then $\left(x_{n}, d\right)=1$ since $\left(x_{n}, d_{i}\right)=1$ for all $1 \leq i \leq n$ and $d=d_{1} \cdots d_{n}$. So $\sigma$ is an automorphism.

Let $a \in d S_{n}$. Then $a=b_{j} \hat{d}_{j}$ for some $1 \leq j \leq n$. So

$$
\sigma(a) \equiv \sigma\left(b_{j} \hat{d}_{j}\right) \equiv x_{n} b_{j} \hat{d}_{j}(\bmod d)
$$

But

$$
x_{n} b_{j} \equiv b_{j}^{\phi\left(d_{j}\right)} \equiv 1\left(\bmod d_{j}\right)
$$

Then $x_{n} b_{j}=1+r d_{j}$ for some $r \in \mathbb{Z}$. Thus $x_{n} b_{j} \hat{d}_{j}=\hat{d}_{j}+r d$. Therefore

$$
x_{n} b_{j} \hat{d}_{j} \equiv \hat{d}_{j}(\bmod d)
$$

So the automorphism $\sigma$ sends each element of $d S_{n}$ to a divisor of $d$.
Corollary 2.28. Let $m, n \in \mathbb{N}$ with $(m, n)=1$. Let $S=\left\{-\frac{m}{n}, \frac{b_{1}}{d_{1}}, \frac{b_{2}}{d_{2}}, \ldots\right\}$, where each $b_{i}, d_{i}>0$ and each $\frac{b_{i}}{d_{i}}$ is reduced. Then $\rho(\mathbb{Q}, S)=1$ if and only if there exists an $x_{n} \in \mathbb{N}$ for all $n \in \mathbb{N}$ such that the following hold:

1. $x_{n} \equiv\left(n_{i} b_{i}\right)^{\phi\left(m_{i} d_{i}\right)-1}\left(\bmod m_{i} d_{i}\right)$, where $n_{i}=\frac{n}{\left(n, d_{i}\right)}$ and $m_{i}=\frac{m}{\left(m, b_{i}\right)}$ for all $i \leq n$, and $\phi$ is the Euler phi function.
2. $\left\{m_{i} d_{i} \mid 1 \leq i \leq n\right\}$ is a splittable set.

Proof. Multiplying by $\frac{n}{m}$, which is an autmorphism of the group $\mathbb{Q}$, this is equivalent to the group with $S=\left\{-1, \frac{n_{1} b_{1}}{m_{1} d_{1}}, \frac{n_{2} b_{2}}{m_{2} d_{2}}, \ldots\right\}$. Then by Theorem 2.27 the corollary holds.

Corollary 2.29. Let $S=\left\{-1, \frac{b_{1}}{d_{1}}, \frac{b_{2}}{d_{2}}, \ldots\right\}$, where each $b_{i}, d_{i}>0$ and each $\frac{b_{i}}{d_{i}}$ is reduced. Then $\rho(\mathbb{Q}, S)=1$ if and only if for all $n \in \mathbb{Z}_{+}$

1. $\rho\left(\mathbb{Z} / d \mathbb{Z}, d S_{n}\right)=1$ where $d=d_{1} \cdots d_{n}$, and
2. $\rho\left(\mathbb{Z} / d \mathbb{Z},\left\{d_{1}, \ldots, d_{n}\right\}\right)=1$.

Proof. This follows directly from the proof of Theorem 2.27.

## Chapter 3

## General Infinite Groups

### 3.1 Subsets of Independent Elements of Infinite Order

In this section, general infinite abelian groups will be studied by finding simpler groups that have the same or a related elasticity. This study was motivated in part by a proposition of Geroldinger and Göbel [12, Proposition 3.7]. In this proposition, a maximal subset of independent elements of infinite order, denoted $X$, is used to study the group. A set of elements is independent if for any $x_{1}, \ldots, x_{n} \in X$ and $r_{1}, \ldots r_{n} \in \mathbb{Z}$ with $r_{1} x_{1}+\cdots+r_{n} x_{n}=$ 0 , then each $r_{i}=0$. The same approach is taken here, but the maximal condition is left off when it is unnecessary. Proposition 3.1 shows that, under certain conditions, the group can be modded out by multiples of the elements of $X$ without changing the elasticity. When the set $X$ is assumed to be maximal, then a group with non-torsion elements will be reduced to a torsion group. Then the cross number can be applied to this torsion group, and thus the original group. This means the cross number has been extended to cover some groups which are not torsion. The result on cross numbers is a corollary to this theorem, Corollary 3.2. The proposition by Geroldinger will be generalized in Proposition 3.3.

Note the last condition in the following theorem, can be replaced with $\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split for all $i \in I$. Also, for the elements $m_{j}^{i}$ in the theorem, the $i$ is an index, not a power.

Proposition 3.1. Let $G$ be an additive abelian group and $X=\left\{x_{i} \mid i \in I\right\} \subseteq G$ a set of independent elements of infinite order.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}\right\} \subset \mathbb{Z}$ with each $m_{j}^{i} \in \mathbb{N}$ for all $i \in I$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Let $G_{0} \subseteq G$ such that $\left[G_{0}\right] \cap<X>\subseteq\left[\left\{c_{i} x_{i} \mid i \in I\right\}\right]$.
- Let $S=G_{0} \cup\left(\cup_{i \in I} S_{i} x_{i}\right)$.
- Suppose that whenever

$$
\prod_{\varepsilon \in \in}\left(\prod_{v \in S_{i}}\left(s_{i} x_{i}^{v_{s}}\right) \cdot \prod_{g \in G_{0}}^{g_{0}^{v_{i}}}\right.
$$

is an irreducible block in $\mathcal{B}(G, S)$, then

$$
\prod_{g \in G_{0}} \bar{g}^{v_{g}}
$$

is an irreducible block in $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$.
Then $\rho(G, S)=\rho\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$.
Proof. Define

$$
f: \mathcal{B}(G, S) \rightarrow \mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)
$$

by

$$
f\left(\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}}\right)=\prod_{g \in G_{0}} \bar{g}^{v_{g}} .
$$

First, we need to show that this function actually maps into $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$. Suppose $B \in \mathcal{B}(G, S)$, and then for some $v_{g}, u_{s_{i}} \in \mathbb{N}_{0}$

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}} .
$$

Since $B$ is a block, then

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(s_{i} x_{i}\right)\right)+\sum_{g \in G_{0}} v_{g} g=0 .
$$

Therefore $\sum_{g \in G_{0}} v_{g} g \in\langle X\rangle$; so by the assumption the sum is in $\left[\left\{c_{i} x_{i} \mid i \in I\right\}\right]$. Then for some $r_{i} \in \mathbb{N}_{0}$,

$$
\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I} r_{i} c_{i} x_{i} .
$$

Then we can replace $\sum_{g \in G_{0}} v_{g} g$ in the earlier equation; so it becomes:

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(s_{i} x_{i}\right)\right)+\sum_{i \in I} r_{i} c_{i} x_{i}=0 .
$$

Since the $x_{i}$ 's are independent, then

$$
\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(s_{i} x_{i}\right)+r_{i} c_{i} x_{i}=0 \text { for all } i \in I .
$$

Because each $x_{i}$ has infinite order, then

$$
\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(s_{i}\right)+r_{i} c_{i}=0 \text { for all } i \in I,
$$

which can be rewritten as

$$
\sum_{j=1}^{k_{i}} u_{\left(-m_{j}^{i}\right)}\left(-m_{j}^{i}\right)+r_{i} c_{i}=0
$$

Therefore

$$
\sum_{j=1}^{k_{i}} u_{\left(-m_{j}^{i}\right)}\left(m_{j}^{i}\right)=r_{i} c_{i}
$$

Now $l_{i}=c_{i} d_{i}$ for some $d_{i} \in \mathbb{N}$ with $\left(c_{i}, d_{i}\right)=1$ by Lemma 2.3. Also, by Lemma $2.3, d_{i} \mid m_{j}^{i}$ for all $m_{j}^{i} \in-S_{i}^{-}$, and therefore, $d_{i}$ divides the left hand side of the equation. The right hand side is a multiple of $c_{i}$ and since $\left(c_{i}, d_{i}\right)=1$, then $l_{i}$ divides both sides of the equation. Thus

$$
r_{i} c_{i} \in \mathbb{N}_{0} l_{i}
$$

So

$$
r_{i} c_{i} x_{i} \in<l_{i} x_{i}>\text { for all } i \in I
$$

Therefore

$$
\sum_{i \in I} r_{i} c_{i} x_{i} \in<\left\{l_{i} x_{i} \mid i \in I\right\}>
$$

But $\sum_{i \in I} r_{i} c_{i} x_{i}=\sum_{g \in G_{0}} v_{g} g ;$ so

$$
\sum_{g \in G_{0}} v_{g} g \in<\left\{l_{i} x_{i} \mid i \in I\right\}>
$$

Then

$$
f(B)=\prod_{g \in G_{0}} \bar{g}^{v_{g}}
$$

is a block in $\left.\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>\right), \overline{G_{0}}\right)$; so the homomorphism $f$ has the correct range. If $B \in \mathcal{B}(G, S)$ is irreducible, then by assumption, $f(B)$ is also irreducible.

Then by Lemma 1.14 it remains to show that $\operatorname{ker} f=\{1\}$, and there exists a homomorphism $g: \mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \bar{T}\right) \rightarrow \mathcal{B}(G, S)$ such that $f g(B)=B$ for all $B \in \mathcal{B}(G, S)$. Let $C \in \mathcal{B}(G, S)$ and $f(C)=0$. Then by the definition of $f$,

$$
C=\prod_{i \in I}\left(\prod_{j=1}^{k_{i}}\left(-m_{j}^{i} x_{i}\right)^{w_{i}(j)}\right)
$$

for some $w_{i}(j) \in \mathbb{N}_{0}$. But $C$ is a block in $\mathcal{B}(G, S)$; so

$$
\sum_{i \in I}\left(\sum_{j=1}^{k_{i}} w_{j}\left(-m_{j}^{i} x_{i}\right)\right)=0
$$

Since the $x_{i}$ 's are independent, then $\sum_{j=1}^{k_{i}} w_{i}(j)\left(-m_{j}^{i} x_{i}\right)=0$ for all $i \in I$. Therefore $\sum_{j=1}^{k_{i}} w_{i}(j)\left(-m_{j}^{i}\right)=0$ for all $i \in I$ because each $x_{i}$ has infinite order. But, each $-m_{j}^{i}<0$ and each $w_{i}(j) \geq 0$; so each term $w_{i}(j)\left(-m_{j}^{i}\right) \leq 0$. Therefore we must have each $w_{i}(j)=0$. So $C$ is the empty product which is the identity in $\mathcal{B}(G, S)$. Therefore $\operatorname{ker} f=\{1\}$.

Now we need to create a right inverse homomorphism $g$ to the homomorphism $f$. Let $D \in \mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$. Then $D=\prod_{a \in \overline{G_{0}}} a^{v_{a}}$ for some $v_{a} \in \mathbb{N}_{0}$. For each $a \in \overline{G_{0}}$, choose $g_{a} \in G_{0}$ such that $\overline{g_{a}}=a$ in $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$. Therefore

$$
D=\prod_{a \in \overline{G_{0}}}{\overline{g_{a}}}^{v_{a}} .
$$

Since D is a block, then

$$
\sum_{a \in \overline{G_{0}}} v_{a} \overline{g_{a}}=0
$$

in $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$. So there exists $t_{i} \in \mathbb{N}_{0}$ for each $i \in I$ such that

$$
\sum_{a \in \overline{G_{0}}} v_{a} g_{a}=\sum_{i \in I} t_{i} l_{i} x_{i} .
$$

Note that for the block $D$, the choice of each $t_{i}$ is unique since the $x_{i}$ 's are independent and have infinite order. Also, it was assumed that positive sums of elements in $G_{0}$ that are in $<\left\{l_{i} x_{i} \mid i \in I\right\}>$ must be in $\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$. Then each $t_{i} \geq 0$ since the $t_{i}$ 's are unique. For each $i \in I, m_{1}^{i} \mid l_{i}$, hence there exists a $w_{i} \in \mathbb{N}_{0}$ such that $t_{i} l_{i}=w_{i} m_{1}^{i}$. Thus the above equation can be rewritten as

$$
\sum_{a \in \overline{G_{0}}} v_{a} g_{a}=\sum_{i \in I} w_{i} m_{1}^{i} x_{i} .
$$

Therefore

$$
E=\prod_{i \in I}\left(\left(m_{1}^{i} x_{i}\right)^{w_{i}} \cdot \prod_{s_{i} \in S_{i}^{+}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{a \in \overline{G_{0}}} g_{a}^{v_{a}}
$$

is a block in $\mathcal{B}(G, S)$ and the powers $w_{i}$ are unique for each block $D$ since each $t_{i}$ is unique. So this construction provides a unique block $E$ for each block $D$. Also, notice that it is clear using this construction of $E$ that $f(E)=D$.

Define

$$
g: \mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \bar{T}\right) \rightarrow \mathcal{B}(G, S)
$$

by $g(D)=E$, where each $E$ is constructed as above. It is clear that $g$ is a homomorphism. Also, since $f(E)=D$, then $f g$ is the identity function on $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$. Therefore, using Lemma 1.14, $\rho(G, S)=\rho\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$.

For the next corollary, we will add the assumption that $X$ is a maximal set of independent elements of infinite order. Then the group $G /\langle X\rangle$ is a torsion group. A block monoid with a torsion divisor class group has elasticity one if and only if the cross number for each irreducible block is one. Then this calculation for each irreducible block in $\mathcal{B}(G /<X\rangle, \bar{S})$ can be applied to the original block monoid $\mathcal{B}(G, S)$. This will give us a cross number for general abelian groups that are not torsion if group satisfies the conditions. The assumptions are the same as Theorem 3.1 except $X$ is now a maximal set of independent elements of infinite order, and a function $k$ is defined.

Corollary 3.2. Let $G$ be an additive abelian group and $X=\left\{x_{i} \mid i \in I\right\} \subseteq G$ a maximal set of independent elements of infinite order.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}\right\} \subset \mathbb{Z}$ with each $m_{j}^{i} \in \mathbb{N}$ for all $i \in I$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Let $G_{0} \subseteq G$ such that $\left[G_{0}\right] \cap<X>\subseteq\left[\left\{c_{i} x_{i} \mid i \in I\right\}\right]$.
- Let $S=G_{0} \cup\left(\cup_{i \in I} S_{i} x_{i}\right)$.
- Suppose that whenever

$$
\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}}
$$

is an irreducible block in $\mathcal{B}(G, S)$, then

$$
\prod_{g \in G_{0}{ }^{T^{0}}}
$$

is an irreducible block in $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$.

- For every block

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}}
$$

in $\mathcal{B}(G, S)$, define the function $k: \mathcal{B}(G, S) \rightarrow \mathbb{Q}^{+}$by

$$
k(B):=\sum_{g \in G_{0}} \frac{v_{g}}{\operatorname{ord}(\bar{g})},
$$

where ord $(\bar{g})$ is the order of $\bar{g} \in G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$.
Then $\rho(G, S)=1$ if and only if $k(B)=1$ for every irreducible block $B \in \mathcal{B}(G, S)$.
Proof. Before the "if and only if" is proven, we need to show that $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$ is torsion to show that $\operatorname{ord}(\bar{g})$ is well-defined. Suppose $g \in G$ has infinite order. Since $X$ is a maximal set of independent elements of infinite order, then we must have

$$
t g=\sum_{i \in I} r_{i} x_{i}
$$

for some $t \in \mathbb{N}$ and $r_{i} \in \mathbb{Z}$, with only finitely many of the $r_{i}$ nonzero. If we define $s=$ $l c m\left\{l_{i} \mid i \in I\right.$ such that $\left.r_{i} \neq 0\right\}$, then

$$
s t g=\sum_{i \in I} s r_{i} x_{i} \in<\left\{l_{i} x_{i} \mid i \in I\right\}>.
$$

Therefore $\bar{g}$ has order less than or equal to st in $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$. If $g \in G$ has finite order, then clearly $\bar{g}$ has finite order in $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$. Hence, $G /<\left\{l_{i} x_{i} \mid i \in I\right\}>$ is torsion.
$(\Leftarrow)$ Suppose that $k(B)=1$ for all irreducible blocks $B \in \mathcal{B}(G, S)$. Since $k$ is a semilength function, then $\rho(G, S)=1$ by Lemma 1.18.
$(\Rightarrow)$ By Proposition 3.1, $\rho(G, S)=\rho\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$. Since $G /<\left\{l_{i} x_{i} \mid\right.$ $i \in I\}>$ is a torsion group, then $\rho\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)=1$ if and only if the cross number of each irreducible block in $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$ is 1 .

Suppose $B \in \mathcal{B}(G, S)$ is irreducible. Then

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}}
$$

for some $u_{s_{i}}, v_{g} \in \mathbb{N}_{0}$. Then using the function $f$ from Proposition 3.1,

$$
f(B)=\prod_{g \in G_{0}} \bar{g}^{v_{g}}
$$

is an irreducible block of $\mathcal{B}\left(G /<\left\{l_{i} x_{i} \mid i \in I\right\}>, \overline{G_{0}}\right)$. Therefore,

$$
1=k(f(B))=\sum_{g \in G_{0}} \frac{v_{g}}{\operatorname{ord}(\bar{g})}=k(B) .
$$

In this equation, $k(f(B))$ is the standard cross number defined on a torsion group.
The next proposition is similar to Proposition 3.1, however, the condition on $G_{0}$ has been strengthened. It will be assumed that $\left[G_{0}\right] \cap\left\langle X>\subseteq\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]\right.$, replacing the $c_{i}$ with $l_{i}$. However, if an element of $G_{0}$ was a positive power of some $x_{i}$, we still only require that it is divisible by $c_{i} x_{i}$. These positive multiples of some $x_{i}$ will then be grouped in with the sets $S_{i}$, instead of $G_{0}$, so they only need satisfy the weaker condition. Under these assumptions, each subgroup $\mathbb{Z} x_{i}$ will act independently from each other, as far as factorization is concerned. Also, the blocks containing elements of $G_{0}$ will only contain multiples of $x_{i}$ 's whose sum is divisible by $-l_{i} x_{i}$. It will not matter which negative multiples of $x_{i}$ add up to this multiple of $-l_{i} x_{i}$. Then it is conjectured that the elasticity of $\mathbb{B}(G, S)$ will be the same as $\sup \left(\left\{\rho\left(G /<X>, \overline{G_{0}}\right)\right\} \cup\left\{\rho\left(\mathbb{Z}, S_{i}\right) \mid i \in I\right\}\right)$. Again, note that the superscript $i$ in $m_{j}^{i}, n_{j}^{i}$ is an index, not a power.
Proposition 3.3. Let $G$ be an additive abelian group and $X=\left\{x_{i} \mid i \in I\right\} \subset G$ a maximal set of independent elements of infinite order.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}, n_{1}^{i}, n_{2}^{i}, n_{3}^{i}, \ldots\right\} \subset \mathbb{Z}$ with each $m_{j}^{i}, n_{j}^{i} \in \mathbb{N}$ for all $i \in I$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Suppose each $s_{i} \in S_{i}^{+}$is divisible by $c_{i}$.
- Let $G_{0} \subseteq G$ such that $\left[G_{0}\right] \cap<X>\subseteq\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$
- Suppose $\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split.

Let $S=G_{0} \cup\left(\cup_{i \in I} S_{i} x_{i}\right)$. Then the following hold for the block monoid $\mathcal{B}(G, S)$ :

1. $\mathcal{B}(G, S)=\left(\cup_{i \in I} \mathcal{B}\left(G, S_{i} x_{i}\right)\right) \cup \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right)$.
2. $\rho\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right)=\rho\left(G /<X>, \overline{G_{0}}\right)$.
3. (Conjecture) $\rho(G, S)=\sup \left(\left\{\rho\left(G /\langle X\rangle, \overline{G_{0}}\right)\right\} \cup\left\{\rho\left(\mathbb{Z}, S_{i}\right) \mid i \in I\right\}\right)$.
4. (Conjecture) $\mathcal{B}(G, S)$ is half-factorial if and only if $\left(G /<X>, \overline{G_{0}}\right)$ is half-factorial and $\mathcal{B}\left(\mathbb{Z}, S_{i}\right)$ is half-factorial for all $i \in I$. Also, if $\mathcal{B}(G, S)$ is half-factorial, then the requirement that each $s_{i} \in S_{i}^{+}$is divisible by $c_{i}$ for all $i \in I$ can be proved without being assumed.

Proof. 1. Suppose that $B \in \mathcal{B}(G, S)$. Then

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}} \cdot \prod_{s_{i} \in S_{i}^{+}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{g \in G_{0}} g^{v_{g}}
$$

for some $v_{g}, u_{s_{i}} \in \mathbb{N}_{0}$ for all $g \in G_{0}$ and $u_{s_{i}} \in S_{i}$ for all $i \in I$, and only finitely many of the $v_{g}$ and $u_{s_{i}}$ are nonzero.
Suppose that $v_{g}=0$ for all $g \in G_{0}$. Then

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}} \cdot \prod_{s_{i} \in S_{i}^{+}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \in \mathcal{B}\left(G, \cup_{i \in I} S_{i} x\right) .
$$

This implies that

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(s_{i} x_{i}\right)+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i} x_{i}\right)\right)=0 .
$$

Since the $x_{i}$ 's are independent from each other, this implies

$$
\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(s_{i} x_{i}\right)+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i} x_{i}\right)=0
$$

for each $i \in I$. Then

$$
B_{i}=\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}} \cdot \prod_{s_{i} \in S_{i}^{+}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}
$$

would be an irreducible block for each $i \in I$. But $B$ is irreducible, so we must have $B_{i}$ is an empty product for all $i \in I$ except for one $j \in I$. Thus, $B=B_{j}$ for some $j \in I$. Hence, $B \in \mathcal{B}\left(G, S_{j} x_{j}\right) \subseteq \cup_{i \in I} \mathcal{B}\left(G, S_{i} x_{i}\right)$.
Suppose $v_{g}>0$ for at least one $g \in G_{0}$. Then we know that

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(s_{i} x_{i}\right)+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i} x_{i}\right)\right)+\sum_{g \in G_{0}} v_{g} g=0 .
$$

Then

$$
\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}}-u_{s_{i}}\left(s_{i} x_{i}\right)+\sum_{s_{i} \in S_{i}^{+}}-u_{s_{i}}\left(s_{i} x_{i}\right)\right) \in\langle X\rangle
$$

Thus, $\sum_{g \in G_{0}} v_{g} g \in\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$ by assumption; so $\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I} a_{i} l_{i} x_{i}$ for some $a_{i} \in \mathbb{N}_{0}$ for each $i \in I$.

Then

$$
\sum_{i \in I} a_{i} l_{i} x_{i}+\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i} x_{i}\right)\right)=\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}}-u_{s_{i}}\left(s_{i} x_{i}\right)\right)
$$

Since the $x_{i}$ 's are independent, then for each $i \in I$ we have

$$
a_{i} l_{i} x_{i}+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i} x_{i}\right)=\sum_{s_{i} \in S_{i}^{-}}-u_{s_{i}}\left(s_{i} x_{i}\right) .
$$

Since each $x_{i}$ has infinite order, then the coefficients above must be equal:

$$
a_{i} l_{i}+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i}\right)=\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i}\right) .
$$

Recall from Lemma 2.3 that $l_{i}=c_{i} d_{i}$ for some $d_{i} \in \mathbb{N}$ with $\left(c_{i}, d_{i}\right)=1$. Also by Lemma 2.3, $d_{i} \mid\left(-s_{i}\right)$ for all $s_{i} \in S_{i}^{-}$; so $d_{i}$ divides the right-hand side of the equation. Since $c_{i} \mid l_{i}$ and, by assumption, $c_{i} \mid s_{i}$ for all $s_{i} \in S_{i}^{+}$, then $c_{i}$ divides the left-hand side of the equation. Since $\left(c_{i}, d_{i}\right)=1$, then $l_{i}$ divides both sides of the equation. Thus $\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i}\right)=t_{i} l_{i}$ for some $t_{i} \in \mathbb{N}_{0}$ (for some $i \in I$ the sum $\sum_{s \in S^{-}} u_{s_{i}} s_{i}$ may equal 0 , but they will not all be 0 ). So the previous equation becomes

$$
a_{i} l_{i}+\sum_{s_{i} \in S_{i}^{+}} u_{s_{i}}\left(s_{i}\right)=t_{i} l_{i} .
$$

Then we must have $t_{i} \geq a_{i}$ since $\sum_{s \in S^{+}} u_{s_{i}} s_{i} \geq 0$. Therefore, $\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}} s_{i}=t_{i} l_{i}>$ $a_{i} l_{i}$. Thus, since $-S_{i}^{-}=\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split, there exists $0 \leq b_{s_{i}} \leq u_{s_{i}}$ for each $s_{i} \in S_{i}^{-}$such that $\sum_{s_{i} \in S_{i}^{-}} b_{s_{i}}\left(-s_{i}\right)=a_{i} l_{i}$ by Lemma 1.24.
Since $\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I} a_{i} l_{i} x_{i}$, then

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} b_{s_{i}} s_{i} x_{i}\right)+\sum_{g \in G_{0}} v_{g} g=0
$$

Hence

$$
B^{\prime}=\prod_{i \in I}\left(\prod_{s \in S^{-}}\left(s_{i} x_{i}\right)^{b_{s_{i}}}\right)+\prod_{g \in G_{0}} g^{v_{g}}
$$

is a block dividing $B$. Since $B$ is irreducible, we must have $B^{\prime}=B$. Therefore $b_{s_{i}}=u_{s_{i}}$ for all $s_{i} \in S_{i}^{-}$for each $i \in I$, and $u_{s_{i}}=0$ for all $s_{i} \in S_{i}^{+}$for each $i \in I$. Thus

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right) \prod_{g \in G_{0}} g^{v_{g}} \in \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right) .
$$

Therefore $\mathcal{B}(G, S) \subseteq\left(\cup_{i \in I} \mathcal{B}\left(G, S_{i} x\right)\right) \cup \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right)$. It is clear that the reverse inclusion holds, so these are actually equal.
2. Define

$$
f: \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right) \rightarrow \mathcal{B}\left(G /<X>, \overline{G_{0}}\right)
$$

by

$$
f\left(\prod_{g \in G_{0}} g^{v_{g}} \cdot \prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right)\right)=\prod_{g \in G_{0}} \bar{g}^{v_{g}} .
$$

This is clearly a homomorphism.
Suppose that $B=\prod_{g \in G_{0}} g^{v_{g}} \cdot \prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}}\right)$ is irreducible, with $u_{s_{i}}, v_{g} \in \mathbb{N}_{0}$ for all $g \in G_{0}$ and $s_{i} \in S_{i}^{-}$for all $i \in I$. Suppose that $f(B)=\prod_{g \in G_{0}} \bar{g}^{v_{g}}$ is not irreducible. Then there exists $0 \leq v_{g}^{\prime} \leq v_{g}$ for each $g \in G_{0}$ with at least one $v_{g}^{\prime}<v_{g}$ such that $\sum_{g \in G_{0}} v_{g}^{\prime} g \in\left\langle X>\right.$. But then by assumption, $\sum_{g \in G_{0}} v_{g}^{\prime} g \in\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$. Therefore $\sum_{g \in G_{0}} v_{g}^{\prime} g=\sum_{i \in I} t_{i} l_{i} x_{i}$ for some $t_{i} \in \mathbb{N}_{0}$ for each $i \in I$.
Since $B$ is a block, then

$$
\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i} x_{i}\right)\right) \in<X>.
$$

Thus $\sum_{g \in G_{0}} v_{g} g=\sum_{i \in I} a_{i} l_{i} x_{i}$ for some $a_{i} \in \mathbb{N}_{0}$ for each $i \in I$, and

$$
\sum_{i \in I} \sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i} x_{i}\right)=\sum_{i \in I} a_{i} l_{i} x_{i} .
$$

We need to establish that $a_{i} \geq t_{i}$ for each $i \in I$. Notice that

$$
\sum_{g \in G_{0}}\left(v_{g}-v_{g}^{\prime}\right) g=\sum_{g \in G_{0}}\left(v_{g}\right) g-\sum_{g \in G_{0}}\left(v_{g}^{\prime}\right) g=\sum_{i \in I} a_{i} l_{i} x_{i}-\sum_{i \in I} t_{i} l_{i} x_{i}=\sum_{i \in I}\left(a_{i}-t_{i}\right) l_{i} x_{i} .
$$

Since $\sum_{g \in G_{0}}\left(v_{g}-v_{g}^{\prime}\right) g \in\left\langle X>\right.$, then $\sum_{g \in G_{0}}\left(v_{g}-v_{g}^{\prime}\right) g \in\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$ by assumption. Thus $\sum_{i \in I}\left(a_{i}-t_{i}\right) l_{i} x_{i} \in\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$, and since each $x_{i}$ has infinite order, then $a_{i}-t_{i} \geq 0$.
Now the $x_{i}$ 's are independent; so

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i} x_{i}\right)\right)=\sum_{i \in I} a_{i} l_{i} x_{i}
$$

means that for each $i \in I$,

$$
\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i} x_{i}\right)=a_{i} l_{i} x_{i} .
$$

Since each $x_{i}$ has infinite order, then $\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}\left(-s_{i}\right)=a_{i} l_{i}$ for each $i \in I$. Now $-\left(S_{i}^{-}\right)=\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split and $a_{i} \geq t_{i}$; so there exist $0 \leq u_{s_{i}}^{\prime} \leq u_{s_{i}}$ for each
$s_{i} \in S_{i}^{-}$such that $\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}^{\prime}\left(-s_{i}\right)=t_{i} l_{i}$. But then

$$
\sum_{g \in G_{0}} v_{g}^{\prime} g+\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}^{-}} u_{s_{i}}^{\prime}\left(s_{i} x_{i}\right)\right)=0
$$

Therefore

$$
\prod_{g \in G_{0}} g^{v_{g}^{\prime}} \cdot \prod_{i \in I}\left(\prod_{s_{i} \in S_{i}^{-}}\left(s_{i} x_{i}\right)^{u_{s_{i}}^{\prime}}\right)
$$

is a block dividing $B$. This block does not equal $B$ since at least one $v_{g}^{\prime}<v_{g}$. Therefore we have a contradiction. So $f(B)$ must be irreducible. Hence $\rho\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x\right)\right) \leq$ $\rho\left(G /<X>, \overline{G_{0}}\right)$ by Lemma 1.14.
Let $C=\prod_{\left(h \in \bar{G}_{0}\right)} h^{w_{h}} \in \mathcal{B}\left(G /<X>, \overline{G_{0}}\right)$ be an irreducible block. We need to find a block $D$ such that $f(D)=C$. For each $h \in \overline{G_{0}}$, choose a $g_{h} \in G$ such that $\overline{g_{h}}=h$. Then $C=\prod_{h \in \overline{G_{0}}}{\overline{g_{h}}}^{w_{h}}$, so $\sum_{\left(h \in \overline{G_{0}}\right)} w_{h} \overline{g_{h}}=0$ in $G /<X>$. Therefore, $\sum_{h \in \overline{G_{0}}} w_{h} g_{h} \in<X>$ so $\sum_{h \in \overline{G_{0}}} w_{h} g_{h} \in\left[\left\{l_{i} x_{i} \mid i \in I\right\}\right]$. Then $\sum_{h \in \overline{G_{0}}} w_{h} g_{h}=$ $\sum_{i \in I} a_{i} m_{1}^{i} x_{i}$ for some $a_{i} \in \mathbb{N}_{0}$ for each $i \in I$ since $m_{1}^{i} \mid l_{i}$. Thus we can define a block

$$
D=\prod_{h \in \overline{G_{0}}} g_{h}^{w_{h}} \cdot\left(\prod_{i \in I}\left(-m_{1}^{i} x_{i}\right)^{a_{i}}\right) \in \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I}\left(S_{i}^{-}\right) x_{i}\right)\right.
$$

and $f(D)=C$.
Now define

$$
g: \mathcal{B}\left(G /<X>, \overline{G_{0}}\right) \rightarrow \mathcal{B}\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x_{i}\right)\right)
$$

defined by $g(C)=D$ using the construction above. It is clear that $g$ is a homomorphism. Then by Lemma 1.14, $\rho\left(G /<X>, \overline{G_{0}}\right) \leq \rho\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x\right)\right)$. Therefore $\rho\left(G, G_{0} \cup\left(\cup_{i \in I} S_{i}^{-} x\right)\right)=\rho\left(G /<X>, \overline{G_{0}}\right)$.
3. This is still a conjecture.
4. This is still a conjecture.

If we let each $S_{i}=\{-1,1\}$ in the previous theorem, then we get the case proved by Geroldinger and Göbel. In this simpler case, each $c_{i}=1$ and $S_{i}^{+}=\{1\}$; so the condition that $c_{1}$ divides each element of $S_{i}^{+}$is always satisfied. Also, each $l_{i}=1$; so the condition for $G_{0}$ becomes, if $G_{0} \in<X>$, then $G_{0} \in[X]$. They also restrict $G_{0}$ so that no two elements in $G_{0}$ are in the same coset after modding out by $<X>=<\left\{l_{i} x_{i} \mid i \in i\right\}>$. This makes the function in the proof of part 2 an isomorphism of the block monoids. Lastly, they assume that $X$ is a maximal set of independent elements of infinite order. Then $G /<X>$ is a torsion group, so $\operatorname{or} d_{G /<X>}(\bar{g})$ is finite for each $g \in G_{0}$. Then the condition that if $G_{0} \in<X>$, then $G_{0} \in[X]$, is actually equivalent to or $d_{G /<X>}(\bar{g}) \cdot g \in[X]$ for each $g \in G_{0}$.

The obvious question about Propositions 3.1 and 3.3 is how reasonable are the assumptions on the set $S$ ? For Proposition 3.3 , if $\mathcal{B}(G, S)$ has elasticity one, then $\mathcal{B}\left(G, S_{i} x_{i}\right)$ must have elasticity one for each $i \in I$ by Lemma 1.15. But this is equivalent to $\mathcal{B}\left(\mathbb{Z}, S_{i}\right)$ having
elasticity one. Then by Theorem 2.6 , the positive elements of $S_{i}$ must be divisible by $c_{i}$, assuming $\left|S_{i}^{+}\right|=\infty$. So if it was assumed that $\rho(G, S)=1$, then it can be proved that each $s_{i} \in S_{i}^{+}$divisible by $c_{i}$. The question is still open on whether any element in $[X]$ must be in $\left[\left\{c_{i} x_{i} \mid i \in I\right\}\right]$. Also, in both of these theorems it was assumed that the only elements in $\left[\left\{-x_{i} \mid i \in I\right\}\right]$ are the elements of the form $-m_{j}^{i} x_{i}$. So elements in $S$ can be a negative multiple of one $x_{i}$, but not the sum of negative multiples of several different $x_{i}$. Also, $G_{0}$ has no elements in $\left[\left\{-x_{i} \mid i \in I\right\}\right]$. It has not been proved that this must be true to have $\rho(G, S)=1$. However, Theorem 3.9, which deals with the simpler case of $G=\mathbb{Z} \oplus \mathbb{Z}$ shows that if there is an element $(a, b) \in S$ with $a, b<0$, then the elasticity is infinite. To get this result, it must be assumed that there are infinitely many elements of $S$ of the form $(c, 0)$ for $c>0$ and $(0, d)$ for $d>0$. Theorem 3.9 suggests our assumption about negative multiples of the $x_{i}$ 's is reasonable, but the assumption has not been proven.

### 3.2 Direct Sums of $\mathbb{Z}$

In Section 3.1, a group $G$ was studied using a set $X \subseteq G$ of independent elements of infinite order. So for each element $x \in X, G$ has a subgroup isomorphic to $\mathbb{Z}$. Now the group splits over the subgroups generated by these independent elements if and only if the group $G$ can be written as a direct sum of copies of $\mathbb{Z}$ with a group $H$. This group $H$ would be isomorphic to $G /<X>$. The number of copies of $\mathbb{Z}$ is the same as the number of $x_{i}$ 's which were indexed by the set $I$. Therefore, we can record the theorems of the previous section for this special case without proof.

Note that the last condition in the following theorem, can be replaced with $\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split. This theorem is the same as Proposition 3.1.

Proposition 3.4. Let I be a nonempty set, H a group, and $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. Label the canonical projections and injections as $\pi_{H}, \pi_{i}, \iota_{H}$, and $\iota_{i}$, respectively.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}\right\} \subset \mathbb{Z}$ with each $m_{j}^{i} \in \mathbb{N}$ for all $i \in I$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Let $A \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$.
- Let $S=A \cup\left(\cup_{i \in I} \iota_{i}\left(S_{i}\right)\right)$.
- Define $\bar{G}=H \oplus\left(\oplus_{i \in I} \mathbb{Z} / l_{i} \mathbb{Z}\right)$.
- Suppose that if

$$
\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(\iota_{i}\left(s_{i}\right)\right)^{u_{s}}\right) \cdot \prod_{a \in A} a^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(G, S)$, then

$$
\prod_{a \in A} \bar{a}^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(\bar{G}, \bar{A})$.

Then

$$
\rho(G, S)=\rho(\bar{G}, \bar{A}) .
$$

Now we can repeat Corollary 3.2 for this case. The corollary required that $X$ was a maximal set of independent elements of infinite order. The corresponding assumption for this case is that $H$ must be torsion. Then the generator for each copy of $\mathbb{Z}$ will represent a a maximal set of independent elements of infinite order.

Corollary 3.5. Let $I$ be a nonempty set, $H$ a torsion group, and $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. Label the canonical projections and injections as $\pi_{H}, \pi_{i}, \iota_{H}$, and $\iota_{i}$, respectively.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}\right\} \subset \mathbb{Z}$ with each $m_{j}^{i} \in \mathbb{N}$ for all $i \in I$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Let $A \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$.
- Let $S=A \cup\left(\cup_{i \in I} \iota_{i}\left(S_{i}\right)\right)$.
- Define $\bar{G}=H \oplus\left(\oplus_{i \in I} \mathbb{Z} / l_{i} \mathbb{Z}\right)$.
- Suppose that if

$$
\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(\iota_{i}\left(s_{i}\right)\right)^{u_{s_{i}}}\right) \cdot \prod_{a \in A} a^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(G, S)$, then

$$
\prod_{a \in A} \bar{a}^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(\bar{G}, \bar{A})$.

- For every block

$$
B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(\iota_{i}\left(s_{i}\right)\right)^{u_{s_{i}}}\right) \cdot \prod_{a \in A} a^{v_{a}}
$$

in $\mathcal{B}(G, S)$, define the function $k: \mathcal{B}(G, S) \rightarrow \mathbb{Q}^{+}$by

$$
k(B):=\sum_{a \in A} \frac{v_{a}}{\operatorname{ord}(\bar{a})},
$$

where ord $(\bar{a})$ is the order of $\bar{a} \in \bar{G}$.
Then $\rho(G, S)=1$ if and only if $k(B)=1$ for every irreducible block $B \in \mathcal{B}(G, S)$.
For the case in this section where $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$, we can add a second corollary to Proposition 3.4. Using Corollary 3.5, we can replace each element of $S$ with an element that is less than or equal to $l_{i}$ in each slot. This is similar to Corollary 2.26 for $\mathbb{Q}$.

Corollary 3.6. Let I be a nonempty set, $H$ a torsion group, and $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. Label the canonical projections and injections as $\pi_{H}, \pi_{i}, \iota_{H}$, and $\iota_{i}$, respectively.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}\right\} \subset \mathbb{Z}$ with each $m_{j}^{i} \in \mathbb{N}$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=l c m\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Let $A \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$.
- Let $S=A \cup\left(\cup_{i \in I} \iota_{i}\left(S_{i}\right)\right)$.
- Define $\bar{G}=H \oplus\left(\oplus_{i \in I} \mathbb{Z} / l_{i} \mathbb{Z}\right)$.
- Suppose that if

$$
\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}}\left(t_{i}\left(s_{i}\right)\right)^{u_{s_{i}}}\right) \cdot \prod_{a \in A} a^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(G, S)$, then

$$
\prod_{a \in A} \bar{a}^{v_{a}}
$$

is an irreducible block in $\mathcal{B}(\bar{G}, \bar{A})$.

- $-S_{i}=\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}-$ split for all $i \in I$ (this assumption can be proven to imply the previous assumption about irreducible blocks in $\mathcal{B}(G, S)$ having a corresponding irreducible block in $\mathcal{B}(\bar{G}, \bar{A}))$.
- Define $A^{*}$ by

$$
\begin{gathered}
A^{*}=\left\{g \in G \mid \text { for some } a \in A, \pi_{h}(g)=\pi_{h}(a) \text { and } \pi_{i}(g) \equiv \pi_{i}(a)\left(\bmod l_{i}\right)\right. \\
\text { with } \left.0 \leq \pi_{i}(g)<l_{i} \text { for all } i \in I\right\}
\end{gathered}
$$

(i.e., for each element in $A$, put the same element element in $A^{*}$, but for each $i \in I$ replace the ith coordinate with the remainder when divided by $l_{i}$ ).

- Define $S^{*}:=A^{*} \cup\left(\cup_{i \in I} l_{i}\left(S_{i}\right)\right)$.

Then $\rho(G, S)=\rho\left(G, S^{*}\right)$.
Proof. First we will show that $\mathcal{B}\left(G, S^{*}\right)$ satisfies the requirements of Proposition 3.4. We will use the same notation as Proposition 3.4, but will use $*$ to denote the notation for the set $S^{*}$. Then $S_{i}^{*}=S_{i}$ and $c_{i}^{*}=\ll S_{i}^{*} \gg=c_{i}$. Also $l_{i}^{*}=l c m S_{i}=l_{i}$.

Then we need to show that $A^{*} \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$. Let $a \in A^{*}$. Then there exists $a \in A$ such that $\pi_{i}(a) \equiv \pi_{i}\left(a^{*}\right)\left(\bmod l_{i}\right)$ for all $i \in I$. It was assumed that $A \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$. Then $c_{i} \mid \pi_{i}(a)$. Recall that Lemma 2.3 shows that $c_{i} \mid l_{i}$. Then $c_{i} \mid \pi_{i}\left(a^{*}\right)$ for all $i \in I$. Now $\pi_{i}(a) \geq 0$ for all $i \in I$. Thus $\pi_{i}(a) \in \mathbb{N}_{0} c_{i}$. Therefore $a^{*} \in H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$ and $A^{*} \subseteq$ $H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} c_{i}\right)$.

Define $\bar{G}=H \oplus\left(\oplus_{i \in I} \mathbb{Z} / l_{i} \mathbb{Z}\right)$. This will be the same factor group in the proposition that we use for $S^{*}$ and $S$. The only other thing we need to show is that if

$$
\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}} \iota_{i}\left(s_{i}\right)^{v_{i}}\right) \cdot \prod_{a \in A^{*}} a^{v_{a}}
$$

is an irreducible block in $\mathcal{B}\left(G, S^{*}\right)$, then

$$
\prod_{a \in A^{*}} \bar{a}^{v_{a}}
$$

is an irreducible block in $\mathcal{B}\left(\bar{G}, \overline{A^{*}}\right)$.
Suppose $B=\prod_{i \in I}\left(\prod_{s_{i} \in S_{i}} \iota_{i}\left(s_{i}\right)^{u_{s_{i}}}\right) \cdot \prod_{a \in A^{*}} a^{v_{a}}$ is an irreducible block in $\mathcal{B}\left(G, S^{*}\right)$. Then

$$
\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}} u_{s_{i}} \iota_{i}\left(s_{i}\right)\right)+\sum_{a \in A^{*}} v_{a} a=0
$$

in G. Let $i \in I$. Then

$$
0=\pi_{i}\left(\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}} u_{s_{i}} \iota_{i}\left(s_{i}\right)\right)+\sum_{a \in A^{*}} v_{a} a\right)=\sum_{s_{i} \in S_{i}} u_{s_{i}} s_{i}+\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right) .
$$

Therefore $\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(-s_{i}\right)=\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right) \in \mathbb{N}_{0} c_{i}$. If the sum is equal to 0 , then $\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right) \in \mathbb{N}_{0} l_{i}$. Otherwise, assume it is not zero. Lemma 2.3 proved that $l_{i}=c_{i} d_{i}$ for some $d_{i} \in \mathbb{N}$ with $\left(d_{i}, c_{i}\right)=1$. Also, $d_{i} \mid\left(-s_{i}\right)$ for all $s_{i} \in S_{i}$ (each $s_{i}$ is negative). Then $\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(-s_{i}\right)$ is divisible by $d_{i}$. It was already shown to be divisible by $d_{i}$ so it is divisible by $l_{i}$. Therefore $\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(-s_{i}\right)=\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right) \in \mathbb{N} l_{i}$.

Also,

$$
\begin{aligned}
0=\pi_{h}(0) & =\left(\sum_{i \in I}\left(\sum_{s_{i} \in S_{i}} u_{s_{i}} \iota_{i}\left(s_{i}\right)\right)+\sum_{a \in A^{*}} v_{a} a\right) \\
& =\pi_{h}\left(s u m_{a \in A^{*}} v_{a} a\right) .
\end{aligned}
$$

Then $\sum_{a \in A^{*}} v_{a} a \in 0 \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} l_{i}\right)$. Therefore $\sum_{a \in A^{*}} v_{a} \bar{a}=0$ in $\bar{G}$. Thus $B^{\prime}=\prod_{a \in A *} \bar{a}^{v_{a}}$ is a block in $\mathcal{B}\left(\bar{G}, \overline{S^{*}}\right)$.

Suppose that $B^{\prime}=\prod_{a \in A_{*}} \bar{a}^{v_{a}}$ is not an irreducible block. Then there exist $1 \leq v_{a}^{\prime} \leq$ $v_{a}$ for each $a \in A^{*}$ such that $\sum_{a \in A^{*}} v_{a}^{\prime} \bar{a}=0$ (and $v_{a}^{\prime}<v_{a}$ for at least one $a \in A^{*}$ ). Then $\sum_{a \in A^{*}} v_{a}^{\prime} a=0 \oplus\left(\oplus_{i \in I} r_{i} l_{i}\right)$ for some $r_{i} \in \mathbb{Z}$ for each $i \in I$. By definition of $A^{*}$, $\pi_{i}(a) \geq 0$ for all $a \in A^{*}$, and $i \in I$. Therefore, each $r_{i}>0$. We already showed that $\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(-s_{i}\right)=\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right) \in \mathbb{N}_{0} l_{i}$ for all $i \in I$. So there exists $t_{i} \in \mathbb{N}_{0}$ for all $i \in I$ such that $\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right)=t_{i} l_{i}$. Then

$$
\begin{aligned}
t_{i} l_{i}-r_{i} l_{i} & =\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right)-\pi_{i}\left(\sum_{a \in A^{*}} v_{a}^{\prime} a\right) \\
& =\left(\sum_{a \in A^{*}} v_{a} \pi_{i}(a)\right)-\left(\sum_{a \in A^{*}} v_{a}^{\prime} \pi_{i}(a)\right) \\
& =\left(\sum_{a \in A^{*}}\left(v_{a}-v_{a}^{\prime}\right) \pi_{i}(a)\right) \\
& \geq 0
\end{aligned}
$$

for each $i \in I$ since $v_{a} \geq v_{a}^{\prime}$ and $\pi_{i}(a) \geq 0$ for all $a \in A^{*}$. Thus $t_{i}>r_{i}$ for all $i \in I$.
Then $\sum_{s_{i} \in S_{i}} u_{s_{i}}\left(-s_{i}\right)=\pi_{i}\left(\sum_{a \in A^{*}} v_{a} a\right)=t_{i} l_{i}>r_{i} l_{i}$. Then since the set $-S$ is $l_{i}$-split, there exists $u_{s_{i}}^{\prime} \leq u_{s_{i}}$ such that $\sum_{s_{i} \in S_{i}} u_{s_{i}}^{\prime} s_{i}=r_{i} l_{i}$. Then

$$
C:=\prod_{i \in I}\left(\sum_{s_{i} \in S_{i}} \iota\left(s_{i}\right)^{u_{s_{i}}^{\prime}}\right) \cdot \prod_{a \in A^{*}} a^{v_{a}^{\prime}}
$$

is a block dividing $B$. And $C^{\prime} \neq B$ since $v_{a}^{\prime}<v_{a}$ for at least one $a \in A^{*}$. This is a contradiction since $B$ is irreducible. Thus $B^{\prime}$ must be irreducible.

Then by Theorem 3.4, $\rho\left(G, S^{*}\right)=\rho\left(\bar{G}, \overline{A^{*}}\right)$. Also, by the theorem $\rho(G, S)=\rho(\bar{G}, \bar{A})$. By definition of $A^{*}, \bar{A}=\overline{A^{*}}$. Therefore $\rho\left(G, S^{*}\right)=\rho(G, S)$.

Proposition 3.3 can also be restated for this case.
Proposition 3.7. Let I be a nonempty set, H a torsion group, and $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. Label the canonical projections and injections as $\pi_{H}, \pi_{i}, \iota_{H}$, and $\iota_{i}$, respectively.

- Let $S_{i}=\left\{-m_{1}^{i}, \ldots,-m_{k_{i}}^{i}, n_{1}^{i}, n_{2}^{i}, n_{3}^{i}, \ldots\right\} \subset \mathbb{Z}$ with each $m_{i}^{i}, n_{j}^{i} \in \mathbb{N}$.
- Define $c_{i}=\ll m_{1}^{i}, \ldots, m_{k_{i}}^{i} \gg$ and $l_{i}=\operatorname{lcm}\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ for all $i \in I$.
- Suppose each $s_{i} \in S_{i}^{+}$is divisible by $c_{i}$.
- Let $A \subseteq H \oplus\left(\oplus_{i \in I} \mathbb{N}_{0} l_{i}\right)$.
- Suppose $\left\{m_{1}^{i}, \ldots, m_{k_{i}}^{i}\right\}$ is $l_{i}$-split.

Define $S=A \cup\left(\cup_{i \in I} \iota\left(S_{i}\right)\right)$. Then for the block monoid $\mathcal{B}(G, S)$ we can conclude the following:

1. $\mathcal{B}(G, S)=\left(\cup_{i \in I} \mathcal{B}\left(\mathbb{Z}, S_{i}\right)\right) \cup \mathcal{B}\left(G, A \cup\left(\cup_{i \in I} S_{i}^{-}\right)\right)$.
2. $\rho\left(G, A \cup\left(\cup_{i \in I} S_{i}^{-}\right)\right)=\rho\left(H, \pi_{H}(A)\right)$, where $\pi_{H}$ is the canonical projection on the first coordinate.
3. (Conjecture) $\rho(G, S)=\sup \{\rho(H, \varphi(A))\} \cup\left\{\rho\left(\mathbb{Z}, S_{i}\right) \mid i \in I\right\}$.
4. (Conjecture) $\mathcal{B}(G, S)$ is an $H F D$ if and only if $\left(H, \pi_{H}(A)\right)$ is an $H F D$ and $\mathcal{B}\left(\mathbb{Z}, S_{i}\right)$ is an $H F D$ for all $i \in I$.

## $3.3 \mathbb{Z} \oplus \mathbb{Z}$

Now we will turn our attention to an example from [4]. The paper studied Krull domains with divisor class group $\mathbb{Z}$. Example 2.6 dealt with the case where the divisor class group is $\mathbb{Z} \oplus \mathbb{Z}$. The example is presented here.

Example 3.8. Let $G=\mathbb{Z} \oplus \mathbb{Z}$ and

$$
S=\{(-1,0),(1,0),(2,0),(3,0), \ldots\} \cup\{(0,-1),(0,1),(0,2),(0,3), \ldots\} .
$$

In this example, $S$ generates $G$ as a monoid so the pair $(G, S)$ is realizable as a Krull domain by Theorem 1.13. The only irreducible blocks are of the form $B_{n}=(-1,0)^{n} \cdot(n, 0)$ and $C_{m}=(0,-1)^{m} \cdot(0, m)$ for some $n, m \in \mathbb{N}$. Using Corollary $3.5, k\left(B_{n}\right)=1$ and $k\left(C_{m}\right)=1$ for all $n, m \in \mathbb{N}$; so $\rho(G, S)=1$. It is easy to prove this without the corollary, which the paper did not have.

Let $S^{\prime}=\{(-1,-1)\} \cup S$. The paper then uses the following proof to show that $\rho\left(G, S^{\prime}\right)=$ $\infty$. Define $A_{n}=(-1,-1)^{n} \cdot(1,0)^{n} \cdot(0, n)^{1}, B_{n}=(-1,-1)^{n} \cdot(n, 0)^{1} \cdot(0,1)^{n}, C_{n}=(-1,-1)^{n}$. $(n, 0)^{1} \cdot(0, n)^{1}$, and $D=(-1,-1)^{1} \cdot(1,0)^{1} \cdot(0,1)^{1}$ for all $n \in \mathbb{N}$. Then each $A_{n}, B_{n}, C_{n}$, and $D$ is clearly an irreducible block in $\mathcal{B}\left(G, S^{\prime}\right)$. Notice that

$$
A_{n} B_{n}=C_{n} D^{n}
$$

are two equivalent factorizations into irreducible blocks for all $n \in \mathbb{N}$. Then $\rho\left(G, S^{\prime}\right)>\frac{n+1}{2}$ for all $n \in \mathbb{N}$. Therefore $\rho\left(G, S^{\prime}\right)=\infty$. So in this case, adding one element to the set of classes containing a height-one prime ideal changed the elasticity from one to infinity.

The next theorem will generalize the above example to an arbitrary group $S \subseteq \mathbb{Z} \oplus \mathbb{Z}$. In the theorem it will be assumed (changing the notation from the example) that $S, S^{\prime} \subseteq \mathbb{Z}$ with $\left|S^{+}\right|=\infty$ and $\left|S^{+}\right|=\infty$. So $S$ and $S^{\prime}$ play the roles of $\{(-1,0),(1,0),(2,0),(3,0), \ldots\}$ and $\{(0,-1),(0,1),(0,2),(0,3), \ldots\}$, respectively. Also, we place no restrictions on $S^{-}$and $S^{\prime-}$. Notice that $(-1,0)$ and $(0,-1)$ were never used to show the elasticity was infinite. Then we assume one class of the form $(-a,-b)$ where $a, b>0$ contains a height-one prime ideal. These assumptions are enough to prove the elasticity is infinite in general. The proof will follow the same basic outline as the example above. However, since $S \neq S^{\prime}$ and $a, b \neq 1$ in general the proof is much more tedious and involves many least common multiples to create irreducible blocks.

Theorem 3.9. Let $S, S^{\prime} \subseteq \mathbb{Z}$ with $S_{+}=\left\{n_{1}, n_{2}, \ldots\right\}$ and $S_{+}^{\prime}=\left\{m_{1}, m_{2}, \ldots\right\}$. Let $R$ be a Krull domain corresponding to $\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(-a,-b)\}\right)$, where $a, b>0$. Then $\rho(R)=\infty$.

Proof. Let $l_{x, y}=\operatorname{lcm}(x, y)$ for any $x, y \in \mathbb{Z}$. Define

$$
A=(-a,-b)^{f} \cdot\left(n_{1}, 0\right)^{x_{1}} \cdot\left(0, m_{j}\right)^{y_{1}}
$$

and

$$
B=(-a,-b)^{g} \cdot\left(0, m_{1}\right)^{x_{2}} \cdot\left(n_{i}, 0\right)^{y_{2}}
$$

where

$$
\begin{aligned}
& f=\operatorname{lcm}\left(\frac{l_{a, n_{1}}}{a}, \frac{l_{b, m_{j}}}{b}\right) \\
& g=\operatorname{lcm}\left(\frac{l_{a, n_{i}}}{a}, \frac{l_{b, m_{1}}}{b}\right),
\end{aligned}
$$

and $x_{1}=\frac{a f}{c}, y_{1}=\frac{b f}{m_{j}}, x_{2}=\frac{b g}{d}$, and $y_{2}=\frac{a g}{n_{i}}$. Now we need to show that $A$ and $B$ are irreducible blocks. $A$ is a block since, by definition of $x_{1}$ and $y_{1}, f \cdot(-a,-b)+x_{1} \cdot\left(n_{1}, 0\right)+$ $y_{1} \cdot\left(0, m_{j}\right)=(0,0)$. Suppose there exists some $f^{\prime} \leq f, x_{1}^{\prime} \leq x_{1}$ and $y_{1}^{\prime} \leq y_{1}$ such that $f^{\prime} \cdot(-a,-b)+x_{1}^{\prime} \cdot\left(n_{1}, 0\right)+y_{1}^{\prime} \cdot\left(0, m_{j}\right)=(0,0)$. Then $f^{\prime} a=x_{1}^{\prime} n_{1}$. so $l_{a, n_{1}} \mid\left(f^{\prime} a\right)$. Therefore, $\left.\left(\frac{l_{a, n_{1}}}{a}\right) \right\rvert\, f^{\prime}$. Similarly, $\left.\left(\frac{l_{b, m_{j}}}{b}\right) \right\rvert\, f^{\prime}$. But then by definition of $f$, we have $f \mid f^{\prime}$. Thus, we must
have $f=f^{\prime}$, and hence $x_{1}^{\prime}=x_{1}$ and $y_{1}^{\prime}=y_{1}$. Thus, $A$ is irreducible. By the same argument, $B$ is irreducible. Using the same idea, we can define 2 more irreducible blocks

$$
C=h(-a,-b) \cdot z_{1}\left(n_{i}, 0\right) \cdot w_{i}\left(0, m_{j}\right)
$$

and

$$
D=k(a, b) \cdot z_{2}\left(n_{1}, 0\right) \cdot w_{2}\left(0, m_{1}\right),
$$

where

$$
\begin{aligned}
& h=l c m\left(\frac{l_{a, n_{i}}}{a}, \frac{l_{b, m_{j}}}{b}\right), \\
& k=l c m\left(\frac{l_{a, n_{1}}}{a}, \frac{l_{b, m_{1}}}{b}\right),
\end{aligned}
$$

and $z_{1}=\frac{a h}{n_{i}}, w_{1}=\frac{b h}{m_{j}}, z_{2}=\frac{a k}{n_{1}}$, and $w_{2}=\frac{b k}{m_{1}}$. Thus, we have

$$
A^{k h g} B^{k f h}=C^{f k g} D^{f h g} .
$$

So the elasticity is greater than

$$
\frac{f k g+f h g}{k h g+k f h}>\frac{f h g}{h k(g+f)}=\frac{f g}{k(g+f)} .
$$

Note that $k$ is fixed with regard to the choice of $i$ and $j$. So if $\frac{f g}{g+f}$ is unbounded as $i$ and $j$ increase, then we are done. The sets $\left\{n_{i}\right\}$ and $\left\{m_{j}\right\}$ are unbounded above; so $f$ and $g$ are unbounded above, as we let $i$ and $j$ vary. Let $M$ be a positive integer. Then there exists $i$ and $j$ such that $f>2 M$ and $g>2 M$. Then $f g=\frac{1}{2} f g+\frac{1}{2} f g>M f+M g$. So $\frac{f g}{f+g}>M$, and we are done.

The concept for the above proof is the same as the example. We let $n_{i}$ and $m_{j}$ become large, but $n_{1}$ and $m_{1}$ remain fixed (small). So in some sense the irreducibles $A$ and $B$ are hiding many copies of $\left(n_{1}, 0\right)$ and $\left(0, m_{1}\right)$ underneath the larger elements $\left(0, m_{j}\right)$ and $\left(n_{i}, 0\right)$. Thus, there is a medium number of these irreducibles in the factorization on the left-hand side of

$$
A^{k h g} B^{k f h}=C^{f k g} D^{f h g} .
$$

Then when we refactor, we group $\left(n_{i}, 0\right)$ and $\left(0, m_{j}\right)$ to create the block corresponding to $C$. But $D$ has $\left(n_{1}, 0\right)$ and $\left(0, m_{1}\right)$ grouped together. We think of $n_{1}$ and $m_{1}$ as being small; so $D$ has few copies of $\left(n_{1}, 0\right)$ and $\left(0, m_{1}\right)$ inside it compared to $A$ and $B$. Thus, we end up with a very large number of $D^{\prime} s$ on the right side to balance the equation. Note that $f, g, h$ all increase to infinity while $k$ is fixed; so the exponent of $D$ increases to $\infty$ much faster than all the other exponents. As $i$ and $j$ increase, this gives us an infinite elasticity. The theorem gives rise to the following corollary.

Corollary 3.10. Let I be a nonempty set, H a group, and $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. Label the canonical projections and injections as $\pi_{H}, \pi_{i}, \iota_{H}$, and $\iota_{i}$, respectively.

- Let $S \subseteq G$.
- Define $T_{i}=\left(\left\{s \in S \mid \pi_{h}(s)=0\right.\right.$ and $\pi_{j}(s)=0$ for all $\left.\left.i \neq j \in I\right\}\right)$ for all $i \in I$.
- Suppose that $\left(\pi_{i}\left(T_{i}\right)\right)^{+}$and $\left(\pi_{j}\left(T_{j}\right)\right)^{+}$are infinite sets for some $i, j \in I$ with $i \neq j$.
- Suppose $c \in S$, where $c=\iota_{i}(-a)+\iota_{j}(-b)$ for some $a, b \in \mathbb{N}$.

Then

$$
\rho(G, S)=\infty
$$

Proof. By Lemma 1.15, $\rho(G, S)>\rho\left(G, T_{i} \cup T_{j} \cup\{c\}\right)$. Define $f:=\left(\pi_{i}, \pi_{i}\right): G \rightarrow \mathbb{Z} \oplus \mathbb{Z}$ by $f(g)=\left(\pi_{i}(g), \pi_{i}(g)\right)$. Then it is clear that by Lemma 1.14, that $\rho\left(G, T_{i} \cup T_{j} \cup\{c\}\right)=$ $\rho\left(\mathbb{Z} \oplus \mathbb{Z}, f\left(T_{i}\right) \cup f\left(T_{j}\right) \cup\{(a, b)\}\right.$. But $f\left(T_{i}\right)$ has infinitely many elements of the form $(x, 0)$, where $x>0$, and $f\left(T_{j}\right)$ has infinitely many elements of the form $(0, y)$, where $y>0$. Then by Theorem 3.9, $\rho\left(\mathbb{Z} \oplus \mathbb{Z}, f\left(T_{i}\right) \cup f\left(T_{j}\right) \cup\{(a, b)\}=\infty\right.$.

Theorem 3.9 shows that if we want a Krull domain with divisor class group $\mathbb{Z} \oplus \mathbb{Z}$ to be an HFD, or even have finite elasticity, then no divisor class of the form $(-a,-b)$ where $a, b>0$ should contain a height-one prime ideal (supposing that there are infinitely many classes of the form $(c, 0)$ and $(0, d)$, where $c, d>0$ containing height-one prime ideals). This corollary applies the result to an arbitrary group $G=H \oplus\left(\oplus_{i \in I} \mathbb{Z}\right)$. If we want the elasticity to be one, or just finite, then no divisor class containing a height-one prime ideal can contain an element negative in two slots and zero everywhere else (assuming there are infinitely many positive elements in those slots). This suggest that similar results should hold for an element that is negative in more than two slots, and there are infinitely many positive elements in the corresponding slots. So in Sections 1 and 2 of chapter 3, we have used this assumption that an element should be negative in one slot only, and zero everywhere else. However little is known for these cases where an element is negative in more than two slots. It certainly has not been proven this must be the case for the Krull domain to be an HFD.

The rest of the section will be concerned with divisor class group $\oplus_{i \in I} \mathbb{Z}$. We will use $\iota_{i}: \mathbb{Z} \rightarrow \oplus_{i \in I} \mathbb{Z}$ and $\pi_{i}: \oplus_{i \in I} \mathbb{Z} \rightarrow \mathbb{Z}$ to be inclusion into the $i t h$ slot and projection out of the $i t h$ slot respectively. In light of the previous lemma, we will restrict to the case that if an element of $S$ is negative in one slot, then then it must be zero in every other slot. In other words, if $s \in S$ with $\pi_{j}(s)<0$, then $\pi_{i}(s)=0$ for all $i \in I$ with $i \neq j$. We will also assume that each slot has exactly one element that is negative in that slot. For a subset $S \subseteq \oplus_{i \in I} \mathbb{Z}$, define $S^{+}:=\left\{s \in S \mid \pi_{i}(s) \geq 0\right.$ for all $\left.i \in I\right\}$. Then our assumptions about $S$ translate to $S-S^{+}=\left\{\iota_{i}\left(-x_{i}\right) \mid i \in I\right\}$, where each $x_{i} \in \mathbb{N}$.

The following proposition will be the basis for the rest of the section. It is the generalization to a direct sum of copies of $\mathbb{Z}$ of a proof in [5] that concerned having only one copy of $\mathbb{Z}$.

Proposition 3.11. Let $T$ be a subset of $G=\oplus_{i \in I} \mathbb{Z}$. Suppose that $\left\{x_{i} \mid i \in I\right\} \subset \mathbb{N}_{0}$ and $T-T^{+}=\left\{\iota_{i}\left(-x_{i}\right) \mid i \in I\right\}$. Then

$$
\rho(G, T)=\rho\left(\oplus_{i \in I}\left(\mathbb{Z} / x_{i} \mathbb{Z}\right), \bar{T}\right)
$$

Proof. This is a trivial corollary to Proposition 3.1. Note that each $c_{i}=1$; so the conditions relative to $c_{i}$ are obviously satisfied.

Now we can list several simple corollaries to Proposition 3.11. Their proofs are easy and will be omitted.

Corollary 3.12. Let $T \subseteq \mathbb{Z} \oplus \mathbb{Z}$ and $(-x, 0)$ and $(0,-y)$ in $T$ with $x, y>0$. Define $T^{+}=\left\{t \in T \mid \pi_{1}(t)>0\right.$ and $\left.\pi_{2}(t)>0\right\}$. If $\mathcal{B}(\mathbb{Z} \oplus \mathbb{Z}, T)$ is half-factorial, then $\rho(\mathbb{Z} /(x \mathbb{Z}) \oplus$ $\left.\mathbb{Z} /(y \mathbb{Z}), \overline{T^{+}}\right)=1$.

Corollary 3.13. Let $S=\left\{-x, n_{1}, n_{2}, \ldots\right\}$ and $S^{\prime}=\left\{-y, m_{1}, m_{2}, \ldots\right\}$, with $x, y, n_{i}, m_{j}>0$. Let $a, b>0$. Then the following are true:

1. If $x \mid a$ and $y \mid b$, then

$$
\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(a, b)\}\right)=\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right)\right)
$$

2. If $y \mid b$, then

$$
\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(a, b)\}\right)=\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(a, 0)\}\right)
$$

3. If $x \mid a$, then

$$
\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(a, b)\}\right)=\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(0, b)\}\right)
$$

4. $\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right)\right)=\max \left(\rho(\mathbb{Z}, S), \rho\left(\mathbb{Z}, S^{\prime}\right)\right)$.
5. If $y \mid b$, then

$$
\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(a, b)\}\right)=\max \left(\rho(\mathbb{Z}, S \cup\{a\}), \rho\left(\mathbb{Z}, S^{\prime}\right)\right)
$$

What if $x$ does not divide $a$, and $y$ does not divide $b$ ? Do we get a relationship between $\rho\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup(a, b)\right)$ and $\rho\left(\mathbb{Z} \oplus \mathbb{Z},((S \cup\{a\}) \oplus 0) \cup\left(0 \oplus\left(S^{\prime} \cup\{b\}\right)\right)\right)$ (which is equivalent to $\left.\max \left(\rho(\mathbb{Z}, S \cup\{a\}), \rho\left(\mathbb{Z}, S^{\prime} \cup\{b\}\right)\right)\right)$ ? The following two examples will prove in general there is no relationship.
Example 3.14. Consider $\mathcal{B}(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup(0 \oplus S) \cup\{(2,2)\})$ with $S=\{-3,1,3,6,9, \ldots\}$. Using Corollary 3.12, this has the same elasticity as $(\mathbb{Z} /(3 \mathbb{Z}) \oplus \mathbb{Z} /(3 \mathbb{Z}),\{(1,0),(0,1),(2,2)\})$. There are only four irreducible blocks: $(2,2)^{3},(1,0)^{3},(0,1)^{3}$, and $(2,2) \cdots(1,0) \cdot(0,1)$. It is clear the the cross number is one for each irreducible block so it is half-factorial. Thus $\mathcal{B}(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup(0 \oplus S) \cup\{(2,2)\})=1$.

Now consider $(\mathbb{Z},(S \cup\{2\}))$. Define $B=-3 \cdot 3, C=(-3)^{2} \cdot(2)^{3}$, and $D=3 \cdot 1 \cdot 2$ which are clearly irreducible blocks in $(\mathbb{Z},(S \cup\{2\}))$. Then $B C=D^{3}$. Then $(\mathbb{Z},(S \cup\{2\})) \geq \frac{3}{2}$ and it is actually equal to $\frac{3}{2}$.

Therefore, $\rho(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup(0 \oplus S) \cup\{(a, b)\})<\max (\rho(\mathbb{Z} \oplus \mathbb{Z}, S \cup\{a\}), \rho(\mathbb{Z}, S \cup\{b\}))$. So in this case $(a, b)=(2,2)$ and $x=y=3$.
Example 3.15. Now consider $\mathcal{B}\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(1,1)\}\right)$ with $S=\{-2,1,2,4,6, \ldots\}$ and $S^{\prime}=\{-3,1,3,6,9, \ldots\}$. Then using the notation above $(a, b)=(1,1), x=2$, and $y=3$. Clearly, $\rho(\mathbb{Z}, S \cup\{a\})=\rho(\mathbb{Z}, S)=1$ and $\rho\left(\mathbb{Z}, S^{\prime} \cup\{b\}\right)=\rho\left(\mathbb{Z}, S^{\prime}\right)=1$. However, in $\left(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(1,1)\}\right)$ we have the following irreducible blocks: $B=$ $(-2,0)^{3} \cdot(0,-3)^{2} \cdot 6 *(1,1), C=(-2,0) \cdot(1,0)^{2}, D=(0,-3) \cdot(0,1)^{3}$, and $E=(-2,0)$. $(0,-3) \cdot(1,0) \cdot(1,1) \cdot(0,1)^{2}$. Then $B C^{3} D^{4}=E^{6}$.

Thus we have 8 irreducible blocks factoring into 6 irreducible blocks so $\rho(\mathbb{Z} \oplus \mathbb{Z},(S \oplus$ $\left.0) \cup\left(0 \oplus S^{\prime}\right) \cup\{(1,1)\}\right) \geq \frac{4}{3}$. It is obvious that $\rho(\mathbb{Z}, S)=\rho\left(\mathbb{Z}, S^{\prime}\right)=1$. So $\rho(\mathbb{Z} \oplus \mathbb{Z},(S \oplus 0) \cup$ $\left.\left(0 \oplus S^{\prime}\right) \cup\{(a, b)\}\right)>\max \left(\rho(\mathbb{Z}, S \cup\{a\}), \rho\left(\mathbb{Z}, S^{\prime} \cup\{b\}\right)\right)$.

## Chapter 4

## Summary and Future Directions

In this dissertation we have studied three specific divisor class groups and general infinite divisor class groups. For a Krull domain $R$ with divisor class group $\mathbb{Z}\left(p^{\infty}\right)$, Theorem 2.18 characterizes exactly when $R$ is an HFD. Future research could attempt to calculate the elasticity of a Krull domain with divisor class group $\mathbb{Z}\left(p^{\infty}\right)$, but the HFD case is finished.

For a Krull domain with divisor class group $\mathbb{Z}$ and $S=\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots\right\} \subseteq$ $\mathbb{Z}$ the set of classes containing a height-one prime ideal, Theorem 2.6 completely characterizes when $R$ is an HFD. Theorem 2.13 provides another characterization using a generalization of the cross number. There are three more cases for the set $S$. The case where $S^{-}$is infinite and $S^{+}$is finite is the same as the case above by a simple automorphism argument. If $S^{+}$and $S^{-}$are both infinite, then Theorem 2.1 showed that the elasticity of the domain is infinite [5].

The last case is $S^{+}$and $S^{-}$are both finite. This is equivalent to $S$ being finite since $S$ must contain both positive and negative elements. In this case, the elasticty is rational and realizable [2]. However, when $R$ is an HFD has not been completely characterized. Let $S=$ $\left\{-m_{1}, \ldots,-m_{k}, n_{1}, n_{2}, n_{3}, \ldots, n_{l}\right\} \subseteq \mathbb{Z}$ with each $m_{i}, n_{j}>0$. Define $c=\ll m_{1}, \ldots, m_{k} \gg$. If $\rho(\mathbb{Z}, S)=1$, then $c$ may not divide each $n_{j}$. The proof in [4] that $c \mid n_{i}$ for all $i \in \mathbb{N}$ required that $S^{+}$is infinite. Let $S^{\prime}=\{-5,-4,-3,-2,-1,1\}$. Then $\mathcal{B}\left(\mathbb{Z}, S^{\prime}\right)$ is an HFD using a simple automorphism argument and Theorem 2.11. Notice that $\ll 5,4,3,2,1 \gg 60$ which does not divide 1 . However $\ll 1 \gg=1$ and this does divide $1,2,3,4$ and 5 . So when $S^{+}$and $S^{-}$are both finite, the value $c$ may need to be calculated using the positive or negative elements of S . We conjecture here that if $\mathcal{B}(G, S)$ is half-factorial then either $c^{-}=\ll m_{1}, \ldots, m_{k} \gg$ divides each $n_{j}$ or $c^{+}=\ll n_{1}, \ldots, n_{l} \gg$ divides each $m_{i}$. This has not been proven. In the special case when $k=1$, Theorem 2.11 does characterize the HFDs without needing any assumptions about $c$.

For a Krull domain $R$ with divisor class group $\mathbb{Q}$, Corollary 2.29 characterizes the HFDs, but only if $S$ contains exactly one negative element. The proof required studying a related block monoid $\mathcal{B}(\mathbb{Z}, T)$ where $T$ contains one negative element and finitely many positive elements. Theorem 2.11 was then applied to the block monoid $\mathcal{B}(\mathbb{Z}, T)$. But this theorem requires that $T$ contains only one negative element. The corresponding theorem when $\left|T^{-}\right|>1$, required that $\left|T^{+}\right|=\infty$. This leaves us with the same problem discussed in the previous paragraph: determining when $\mathcal{B}(\mathbb{Z}, T)$, where $T$ is finite, is half-factorial. Therefore solving this problem will allow us to prove results about Krull domains with divisor class group $\mathbb{Q}$, where $S$ contains more than one negative element.

As mentioned in Chapter 3, future areas of research could study when the conditions
of Proposition 3.1 and 3.3 hold. Let $G$ be a group, $S \subseteq G$, and $X \subseteq G$ a maximal set of independent elements of infinite order. If $\mathcal{B}(G, S)$ is half-factorial, what properties must $S$ satisfy and how does this relate to $X$ ? Also, we could study what properties $S$ must satisfy for the pair $(G, S)$ to be realizable as a Krull domain.

## Vita

Benjamin Ryan Lynch grew up in Knoxville, TN. In 2004, He receieved a Bachelor of Science degree in mathematics from Cedarville University in Ohio. After graduation, he began his study at the University of Tennessee in fall 2004. On a personal level, he married Rachel Marie Goldston in December 2003. She also is receiving her Ph.D from the University of Tennessee. In August 2009, they had their first child, James Thomas Lynch.
