Personality Differences of First-Year Law Students Using the Theory of Mental Self-Government

Charles Angelo Licata
University of Tennessee - Knoxville

To the Graduate Council:

I am submitting herewith a thesis written by Charles Angelo Licata entitled "Personality Differences of First-Year Law Students Using the Theory of Mental Self-Government." I have examined the final electronic copy of this thesis for form and content and recommend that it be accepted in partial fulfillment of the requirements for the degree of Master of Arts, with a major in Psychology.

<div align="right">Michael G. Johnson, Major Professor</div>

We have read this thesis and recommend its acceptance:

Accepted for the Council:

Dr. Anne Mayhew
Vice Provost and Dean of Graduate Studies

(Original signatures are on file in the Graduate Student Services office.)

Personality Differences of First-Year Law Students Using the Theory of Mental Self-Government

A Thesis
Presented for the
Masters of Arts Degree
The University of Tennessee, Knoxville

Charles Angelo Licata
December, 2001

DEDICATION

The following thesis is dedicated to all those who have been involved in my live. For good or bad, you have contributed to who I am today.

ABSTRACT

Thinking styles are described as ones conscious attempt to develop an awareness of stimuli within the surrounding environment. They reflect on the way we perceive, interpret, and integrate information, as well as influence the quality of information we supply to others. At the same time, personality traits have become important factors in understanding the preferences people may feel towards their careers, lifestyles, and quality of life. Furthermore, Myers and Briggs (1984) linked personality to the way we perceive and think about the environment by developing a new model of personality and thinking, which was based on the research and theories of Carl Jung (1927). However, some researchers view personality and thinking styles as being two separate and unrelated entities. Though both are significant to an individual's ability to thrive, they have often been treated as mutually exclusive.

This study explores the relationship between personality and thinking styles, and to what effect the relationship may have on the individual ability to succeed within an environment. The study examined if significant personality differences exist between subjects who have high usage scores in cognitive attributes when compared to those who do not.

The study used Sternberg's theory of mental self-government to determine the strength of the subject's thinking style functioning and Cattell's 16PF to rate the individual personality factors. The instruments were administered to a 73 first-year law students at the University of Tennessee. For analysis, the subjects were divided into two groups. The low usage group (n=50) contained subjects having a usage score of 5 or greater in one or none of the three different thinking style functions. The high usage

group (n=23) contained subjects having high usage scores in two or more thinking style functioning categories. Analysis was performed on the 16PF primary and global personality factors. The results showed the groups as having significantly different scores the 16PF Factor E, Q1, and independence.

A second series of analysis was performed by creating two new groups from the study population. The low usage group (n=20) contained subjects having usage scores of 4 or lower in all of the thinking style functions. The high usage group (n=53) contained all the subjects who had a usage score of 5 or greater in one or more thinking style functions. The results of the analysis produced no significant differences between 16PF scores. This would imply that the strength of certain personality traits may have a direct influence on an individual's ability to readily and effectively obtain information from the environment around them.

CHAPTER I: INTRODUCTION

Cognitive styles as defined by Keefe (1979) are the "characteristic cognitive, affective, and physiological behaviors that serve as relatively stable indicators of how learners perceive, interact with, and respond to the learning environment". Furthermore, Badenoch (1986) states that cognitive styles are a subset of learning style theories, since learning style theories concentrate on the identification of the processes associated with learning and the learning environment.

During the 1950's and early 1970s, numerous researchers introduced large numbers of theories addressing styles (Zhang, 2001). A few of the style theories proposed have been Adult Learning Theory (Cross, 1981), Aptitude-Treatment Interaction (Cronbach and Snow, 1977), Cognitive Dissonance Theory (Festinger, 1957), Cognitive Flexibility Theory (Spiro and Jeng, 1990), Information Pickup Theory (Gibson, 1977), Information Processing Theory (Miller, 1957), Structural Learning Theory (Scandura, 1984), Structure of Intellect (Guilford, 1967), and the Triarchic Theory of Intelligence (Sternberg, 1983). By 1984, Messick had identified 19 different style constructs underlying the existing theories of the time, with this number increasing to 30 by 1991 (Riding and Cheema, 1991). In 1997, Sternberg proposed that all style theories could be categorized into one of three different approaches: cognitive-center, personality-centered, and activity-centered.

The cognitive-centered approach deals with the investigation of "the characteristic, self-consistent modes of functioning, which individuals show in their perceptual and intellectual activities" (Witkin and associates, 1971). An example is Field Dependence-Independence (Witkin and associates, 1971). Personality-centered

approaches use personality types (or factors) to identify an individual's desired way of processing information (Zhang, 2000). Myers and Myers (1980) proposed one of the most recognized personality-centered theories, resulting in the widely used Myers-Briggs Type Indicator. The last approach, activity-centered, focuses on the tasks and environmental factors associated with the processing of information. Kolb (1984) developed the theory of experiential learning which identifies two tasks: the processing continuum and perception continuum. Dunn and Dunn (1978) used preferred elements in a learning situation, such as environment, to identify the individuals preferred ways of learning.

Field Dependence - Independence

According to Witkin, individual cognitive styles can be identified as field-dependent or field independent. Witkin and associates (1977) define field independence as "the extent to which a person perceives part of a field as being discrete from the surrounding field as a whole, rather than embedded in the field". Field-dependent individuals are those who rely on external cues and find difficulty in identifying a hidden figure in a surrounding field (Reiff, 1992). The two types are viewed as end points on a continuum, with an individual falling somewhere between the two.

Four paper-and-pencil tests have been developed to identify a persons field-dependence/independence: the Adult Embedded Figure Test (Witkin, Moore, Goodenough, and Cox, 1977); a Preschool Embedded Figure Test (Coates, 1972); the Children's Embedded Figure Test designed for children between the age of 5 to 10 (Karp and Konstadt, 1971); and the Group Embedded figure test (Oltman, Raskin, and Witkin, 1971).

Can you find this shape   in this design?

Figure 1: Example of an embedded figure question.

Source: Reiff, 1992
An embedded figure test asks the subject to identify a simple figure located in a more complex image field (figure 1). The field-dependent person will have difficultly locating the figure due to the distraction of the larger field, while the field-independent is able to separate the figure from the items around it.

Another test used is called the Rod-and-Frame (Witkin and associates, 1971). With this test the subject is placed in a darken room and asked to orientate a rod so it is in a vertical position. Some distance away, an individual holds a lighted frame at an angle. The subject is field dependent if they align the rod's vertical position based on the angle of the frame. If the rod is aligned based on the subject's body position they are considered field-independent.

The similarity of results obtained from orientation tasks and embedded tests are stated by Witkin and associates (1971): "Reflecting in each case the strong influence of the immediately surrounding field upon the way in which one of its parts is perceived, the person who takes very long to discover the simple figure in the complex EFT design is also likely to tilt the rod far toward the tilted frame …".

A positive aspect of the rod-and-frame and embedded figure tests are the non-verbal design allowing the instruments to be used cross-culturally (Ramirez, Castaneda,

and Herold, 1974). Furthermore, field-dependence/independence has also been associated with social and personality factors (Long, 1974; Saracho, 1988; Messick and associates, 1976; Witkin and Goodenough, 1981). The field-dependent person learns material more easily if it has a human or social context, and is influenced by expressions of confidence or doubt from those they view as authority figures. Contrary, the field-independent person learns better from materials that are inanimate and impersonal, and are not often affected by the opinions of others (Anderson and Maurianne, 1992).

Experiential Learning Model

Kolb (1984) describes his Experiential Learning Model as the way individuals are influenced when engaged in different steps of a learning cycle (figure 2). A person's style is based on the perception and processing tasks used in learning. Each task lies along a continuum with the anchors for perception being concrete and abstract, and processing being active experimentation and reflective observation.

Sims and Sims (1995) described concrete perception as one getting fully involved with a new experience without the affect of bias. Reflective observation is the reflection on new experiences while interpreting them with different perspectives. Abstract conceptualization allows for concepts used in the integration of observations into logically theories. Lastly, active experimentation will use the theories for decision-making and problem solving, which ultimately leads to new experiences.

The four ends represent preferred ways of dealing with information. Depending on where the individual lands on the two separate bisecting continuums, the person will lean towards one of four separate learning types: divergers, convergers, accommodators, and assimilators.

4

Figure 2: Kolb's Experential Learning Model

Source: Kolb, 1984
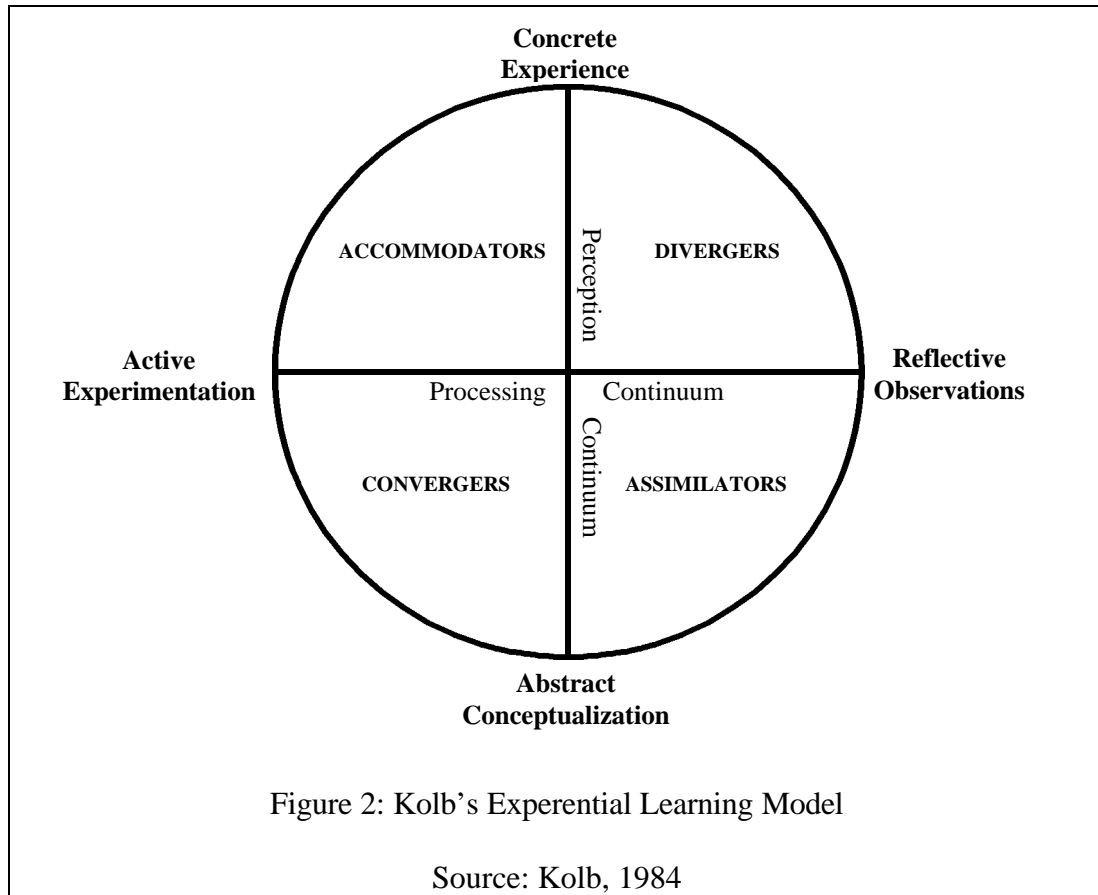

Claxton and Murrell (1987) describe divergers as those who "grasp the experience through concrete experience and transform it through reflective observation. Assimilators are described as those "grasp the experience through abstract conceptualization and transform it through reflective observation." Convergers will "grasp the experience through abstract conceptualization and transform it through active experimentation.", while accommodators "grasp the experience through concrete experience and transform it through active experimentation."

Dunn and Dunn Learning Style Model

Dunn and Dunn (1978) proposed a theory containing five categories of stimuli containing various elements influencing the way individuals perceive, interact, and

5

respond to a learning environment.   The elements are environmental, emotional, sociological, physiological, and psychological.

The stimuli and associated elements are:

- Environmental Factors:

  Sound, Light, Temperature, Room design (example: furniture or seating).

- Emotional Factors:

  Motivation, Persistence (whether the student works on one task until completion as opposed to working on several tasks simultaneously), Responsibility (conformity v. nonconformity), Structure (Need for either externally imposed structure or the opportunity to do things in their own way).

- Sociological Factors (Learning best when):

  Alone, paired, in a peer group, part of a team, learning from an adult who is authoritative or collegial, using a variety rather then consistent pattern of learning.

- Physiological Factors:

  Perceptual strengths (auditory, visual, tactual, and/or kinesthetic preferences), Time (Time-of-day energy levels), Intake (Food or liquid intake), Mobility needs.

- Psychological Factors:

  Global versus analytic processing (determined through correlations among sound, light, design, persistence, sociological preferences,

and intake), Right/left brain hemisphericity, Impulsive versus reflective.

Dunn and Dunn suggests that learning will be more successful for a larger number of people if the learning environment is designed to account for varying individual styles. In support of this argument, Dunn and associates (1995) performed a meta-analysis of thirty-six studies using the Dunn and Dunn Learning Style Model between. The studies were conducted between 1980 and 1990, and included data from 3,181 participants. The results indicated students whose learning style characteristics were accommodated could be expected to achieve a grade 75 percent of a standard deviation higher than students whose styles were not accommodated.

Dunn and associates (1995) summarized the results as:

1. Students with strong learning-style preferences showed greater academic gains as a result of congruent instructional interventions than those students who had mixed preferences or moderate preferences.

2. Studies conducted with small sample sizes showed greater academic gains than those with large or medium sample sizes.

3. College and adult learners showed greater gains than elementary school learners or secondary school learners.

4. Examination of socioeconomic status indicated that middle-class students were more responsive to learning-style accommodations than were lower middle-class or upper middle-class or lower class students.

5. Academic-level moderators indicated that average students were more responsive to learning-style accommodations than were high, low, or

mixed groups of students.

6. Instructional interventions that were conducted for more than one year showed stronger results than those conducted for several days, weeks, or months.

7. The content area most responsive to learning-style accommodation was mathematics, followed by other subjects and language arts.

Myers-Briggs Type Indicators

Jung's (1927) theory of personality types is considered one of the earliest attempts in defining cognitive styles in a modern way. His theory of Psychological Types laid the groundwork for his studies where he noted the differences in the way students perceived, formulated decisions, and interacted with the information they obtained.

In its most basic form, Jung's theory states an individual's personality lies within the domain of three separate continuums composed of attitudes, perceptual functions, and judgment functions (table1). The attitude continuum is comprised of introversion and extroversion and it describes a person's way of relating to others. The perceptual function continuum is whether one perceives the world more through sensing or by

intuition. Lastly, the judgment continuum refers to either thinking or feeling as the preferred way for individuals to reach conclusions.

Myers and Myers (1980) expanded on Jung's work by developing the Myers-Briggs Type Indicator (MBTI), which included the addition of a fourth dimension: attitude toward the outer world. The dimension is divided into either perceiving or judging as the individual's way of approaching the world.

Furthermore, Myers and Briggs changed the familiar dimensions from continuums into dichotomies. In each dimension a person will prefer one approach to the other, and from the combining of these preferences a person can identify their personality as being one of 16 types (table 2). Out of the four approaches identified as a person's

style, there are 2 approaches will that will dominate. The resulting dominant functions are used to identify the thinking methods associated with the individual's personality type (table 3).

Theory of Mental Self-Government

According to Sternberg's (1997) theory, everyone's cognitive thinking processes are a combination of 13 different styles, which reflect the natural way humans facilitate social governments. Each style falls into one of 5 separate dimensions called functions, forms, levels, scopes, and leanings (table 4). A person will have a varying degree of each style and by determining the combination of styles used by an individual, one can recognize under what situations an individual learns and performs best.

In the theory there are three functions of governing used to accomplish a cognitive task. The legislative function is what defines a task, with the executive taking action based upon the definitions. Lastly, once the task is completed the outcome is critically reviewed by the judicial function. By using the functions of government as a

Table 4: Dimensions and Styles of the Theory of Mental Self-Government.

	Dimensions				
	Functions	**Forms**	**Levels**	**Scopes**	**Leanings**
Styles	Legislative	Monarchic	Local	Internal	Liberal

	Judicial	Oligarchic			
		Anarchic			

Source: Sternberg, 1997.

model of thinking, individuals who have legislative leanings tend to be creative, idea driven people. Executives would be the rule-oriented people who enjoy having a structured way of getting a task done, while judicial people would be those who find satisfaction in being critical of the final outcome.

The next dimension of the theory is based on the forms a government can take. The monarchic form focuses on one task at a time, while the hierarchic form is able to distribute attention to various prioritized tasks. Similarly, the oligarchic form can also focus on more than one task, however there exists difficulty with prioritizing them. Lastly, the anarchic form prefers to approach a task in a flexible way in regards to how it will be performed.

The third dimension is level and it reflects whether a government treats the elements of a task at a local or global level. The local level will direct attention to the specific details of the task, while a global will view the task's structure in a large, abstract way.

The fourth dimension a government will utilizes when performing a task is the scope used to reach a final outcome. The internal scope will attempt to perform the task independently of everyone else, while an external scope will have a desire to interact with people in order to get the task done.

The final dimension is the leaning of a government towards being liberal or conservative. The liberal will lean towards tasks involving ambiguity in an attempt to have the opportunity to perform beyond any existing rules. The conservative is the exact opposite, wishing primarily to adhere to the rules, minimize any change, and avoid as much ambiguity as possible.

Sternberg (1995) claims an individual's thinking is comprised of varying levels of each style with some being highly utilized, while others not. By assessing the specific styles of a person, one can determine how well they may respond to a given task. Sternberg (1997) argues how essential this is to learning, since students of equal ability will perform differently based on how information is delivered to them.

The theory of mental self-government has been operationalized through inventories, including the Thinking Styles Inventory (TSI; Sternberg & Wagner, 1992), which have been shown to be reliable and valid for U.S. and Hong Kong samples (Zhang, 1999; Grigorenko and Sternberg, 1995).

Sternberg and Grigorenko (1995) reported that there are significant relationships between students' thinking styles and demographic data. In 1997, Grigorenko and Sternberg performed a study showing thinking styles as contributing significantly to the prediction of academic performance. The results indicated the TSI as being a better predictor of academic success then using scores from ability test. A further study by Zhang and Sternberg (1998) of 622 Hong Kong university students found thinking styles could be used as accurate predictors of academic achievement.

Sternberg (1994) performed a study to determine the correlates of the TSI with the Myers-Briggs Type Indicator. He reported that 30 of 128 correlation coefficients were statistically significant, which is higher than what would be expected by chance. In 2001, Zhang administered the TSI and the Short-version Self-directed Search (based on Holland's theory of vocational/personality types) to 600 Hong Kong university students and found two constructs from both theories overlapped one another.

Hypothesis

The following study examines the differences in individual personality factors and the usage of thinking style functions as described in the theory of mental self-government (table 5). The primary and global factors of the 16PF are examined for significant differences between students who are grouped based on their function usage scores. The study had two separate analysis performed, with each analysis containing all participants divided into low and high function usage groups. The criteria for the high function usage in the first analysis was any student with two or more function usage scores above a score 4. For the second analysis, any student with one or more function usage scores above a score 4 were placed into the high function usage group.

Hypothesis 1: High function usage group of the first analysis will show significantly higher scores then the low function usage group in 16PF Factor E.

Hypothesis 2: High function usage group of the first analysis will show significantly lower scores then the low function usage group in 16PF Factor O.

Hypothesis 3: High function usage group of the first analysis will show significantly higher scores then the low function usage group in 16PF Factor Q1.

Hypothesis 4: High function usage group of the first analysis will show no significant difference in scores of 16PF secondary factors when compared to the low function usage group.

Hypothesis 5: High function usage group of the second analysis will show no

significant difference in any 16PF primary and global factors when compared to the low function usage group.

Summary of 16PF Instrument

In 1946, Cattell introduced a model containing the underlying dimensions of personality. The model was derived using the research of Allport and Odbert's (1936) collection of 17,953 English trait words for personality. The collection of words were further reduced by Cattell to derive a group of 171 descriptor words.

Cattell then obtained data on subjects who rated themselves based on the descriptor words and ratings from informants who knew the subjects well. The self-

Low Score Description	Factor	High Score Description

** 4 primary factors added later.

Source: Adapted from Cattell, 1989

reported information collected was called Q-data and the information reported information was referred to as L-data. Through a series of factor analysis Cattell found that the descriptors fell into 12 specific personality traits (table 5). However, through continuing research, Cattell was able to identify 4 more personality traits which were eventually added to the model, giving the familiar total of 16 (Cattell, 1989).

In 1949, Cattell released the 16PF questionnaire for the determination of an individual's primary personality factors. Currently in its 5th edition, the questionnaire is comprised of 185 questions that when scored result in "standardized ten" (STEN) scores for each primary factor (Conn and associates, 1994). The STEN scores are valued from 1 to 10, with a mean of 5.5 and a SD of 2. A score between 1 and 3 is considered in the low range, 4 and 7 in the average range, while 8 and 10 is high.

During the scales development the 16 primary factors were also intercorrelated to uncover small clusters of the primary scales. These eight clusters became referred to as second-order factors of personality (Conn and Reich, 1994) which consists of Extraversion, Anxiety, Tough Poise, Independence, Control, Adjustment, Leadership,

Table 6. 16PF (5th edition) Global Factors.

and Creativity.

However, with the introduction of the 16PF 5th edition the second-order factors are referred to as "global factors" in order to reflect the broad personality domains they are comprised of (Conn and Reich, 1994). Furthermore, the 5th edition concentrates only on the largest five of the second-order factors, which are Extraversion, Anxiety, Tough Minded, Independence, and Self-Control (table 6).

CHAPTER II: METHODS AND RESULTS

Participants

In 1999, 177 students who had accepted offers to attend law school at the University of Tennessee were asked to participate in the study and sent study packets to complete at home. Thirty of the packets were completed and returned. In 2000, 182 packets were sent out to students who had accepted offers. Ultimately, 163 of the students enrolled in the law program, with 51 of the students returning completed packets. Seventy-three of the completed and returned packets were included in the study, while 8 were removed due to instruments not being filled out completely (1 from 1999, and 7 from 2000).

Setting

Participants were mailed a study packet for them to complete at their convenience. Once completed the student was requested to enclose the information into a provided metered envelope and mail it to the University of Tennessee's Law School Administration Office.

Materials

The study packet mailed to each participant included the following surveys and inventories: biographical information form, lawyer sentence completion survey, cognitive thinking styles survey, 16PF, lawyer career survey, and an informed consent form (Appendix XII). For the purpose of this study only the biographical information form, the cognitive thinking styles survey, and the 16PF was used. Also included in the packet was a metered return envelope addressed to the Law School's Admission's office.

The biographical information page (Appendix X, Subsection I) contained

questions designed to collect a wide variety of demographic information including a brief academic history, however only gender, age, and ethnicity was reported in the study.

The cognitive thinking styles inventory (Appendix X, Subsection II) was a modified version of Sternberg's Thinking Style inventory (TSI). The original inventory contained 13 categories with 8 questions in each, for a total of 104 questions. The inventory was reduced to ask questions that strongly related to the law career. For the purpose of this study only the function categories were used: Legislative, Executive, and Judicial. Each was represented with 5 questions from the original inventory. A reliability analysis was performed on the function categories (Appendix I), and the alphas for executive items were found to be 0.78. The alpha for executive items was found to be 0.66 and judicial items were 0.68. The alphas for executive and judicial functions are low, but still considered high enough for the current study.

The 16PF was administered in its entirety (Appendix X, Subsection III). The participants were asked to answer all of the inventory's 185 standard questions. Each survey was used to obtain scores for the instruments primary factors and four of the global factors: A, B, C, E, F, G, H, I, M, N, O, Q1, Q2, Q3, Q4, Anxiety, Tough Minded, Self Control, and Independent.

Procedure

All individuals who had accepted offers to attend law school at the University of Tennessee for academic year 1999 and 2000 were sent survey packets. The individuals were identified by the law school's admissions office, which assigned and recorded a unique identifier to each individual in order to maintain student confidentiality. The packets were mailed out to an individual's home 3 months prior to their expected

attendance at the law school, with instructions to fully fill out each inventory at their earliest convenience and mail the completed package to the admissions office. Once received by the admissions office, the package was sent to the law clinic for data entry and analysis.

For the purpose of this study a partial part of the TSI and full version of the 16 PF was scored. The responses for each inventory were entered and scored in separate SPSS 9.0 files, with the final results merged into a single file for analysis.

The TSI functions were scored using the method given by Sternberg (1997) in his book "Thinking Styles". Each item has a value numbered 1 to 7 based on how strongly the subject believes the item reflects the way they are. A response of 1 = "Not at all well"; 2 = "Not very well"; 3 = "Slightly well"; 4 = "Somewhat Well"; 5 = "Well"; 6 = "Very Well"; and 7 = "Extremely Well". The response to the items were totaled for each function and then divided by 5 to obtain a raw score for each function category.

Once the raw scores were obtained the subjects were further classified by placing each function score into a usage category rated 1 thru 6 (Category 1 = "very low"; 2 = "Low"; 3 = "Low Middle"; 4 = "High Middle"; 5 = "High"; and 6 = "Very High"). The cutoffs used convert a function score to a usage category was defined by using information provided by Sternberg (Appendix XI). The cutoff tables used were based on a subject being a student and by their gender.

The 16PF factors were scored using the standard algorithms provided by Cattell.

Before analysis of the SPSS main data file (containing the final scored inventories) two extra variables were created: analys1 and analys2 (table 7). Both were used to divide the students into two groups represented by values of 1 or 2. Analys1 had

a strict criterion, which divides students who had high usage scores in at least two TSI functions from those who had high usage scores in one or less TSI function. Analys2 criterion differs by dividing the subjects into two groups by means of one group containing any students with one function having a high usage score and those with no high usage scores into the other group.

The variable Analys1 was created by categorizing the subjects based on the TSI function usage scores. Any individual who had at least two TSI function usage scores of 4 or less were given a value of 1. Any individual who had at least two TSI function usage scores of 5 or more were given a value of 2.

The variable Analys2 was also created by categorizing the subjects based on the TSI function usage scores. Any individual who had all three TSI function usage scores of 4 or less were given a value of 1. Any individual who had at least one TSI function usage score of 5 or more were given a value of 2.

Using the analys1 variable, an independent t-test was used to compare the 16PF factor scores for each group. The same was done for the 16PF factor scores using the analys2 variable.

Determination of Normal Distributions

For the purpose of this study, normal distribution is considered true if the skewness and kurtosis is between ±2.00. However, any distribution between with a skewness and kurtosis above ±1.00 is also mentioned.

Demographics for Subject Population

The 73 participants consisted of 37 males (16 from 1999 and 21 from 2000) and 36 females (13 from 1999 and 23 from 2000).

20

The age of the participants were not distributed normally (=24.67, SD=6.21, skewness=3.014, kurtosis=8.473, range=30). Male participants also had distributions that were not normal (=24.59, SD=5.24, skewness=3.207, kurtosis=10.579, range=24), as well as the female participants (=24.75 SD=7.16, skewness=2.869, kurtosis=7.359, range=30).

The 1999 participant ages were not distributed normally (=25.55, SD=7.57, skewness=2.52, kurtosis=5.358, range=29). Male participants also had distributions that were not normal (=24.44, SD=5.73, skewness=3.474, kurtosis=12.893, range=24), as well as the female participants (=26.92, SD=9.44, skewness=2.014, kurtosis=2.945, range: 21-50, quartiles: 22, 22, and 27.5).

The 2000 participant ages were not distributed normally (=24.09, SD=5.14, skewness=3.552, kurtosis=13.398, range=27). Male participants also had distributions that were not normal (=24.71, SD=4.97, skewness=3.224, kurtosis=11.939, range=22), as well as the female participants (=23.52, SD=4.19, skewness=4.187, kurtosis=18.870, range=27).

The ethnicity of the participants was 67 Caucasian (35 males, 32 females), 2 African American (1 male, 1 females), 1 Hispanic (1 male), and 2 who responded as "other" (2 females). One female participant did not disclose their ethnic background.

The 1999 participants consisted of 27 Caucasian (15 males, 12 females), 1 Hispanics (1 male), and 1 who responded as "other" (1 female). The 2000 participants had 40 Caucasian (20 males, 26 females), 2 African American (1 male, 1 females), and 1 who responded as "other" (1 females), with one female participant not disclosing their ethnic background.

Results of TSI Raw Scores for Subject Population

All of the analysis results for the TSI raw scores found distributions to be normal using the criterion of skewness and kurtosis being between ±2.00 (Appendix II). The following function raw scores are not normally distributed if the criterion of skewness and kurtosis being between ±1.00 is used:

All Male Participants:

Legislative (=5.34, SD=0.79, skewness=-.227, kurtosis=-1.018).

All Male Participant Enrolled in 1999:

Judicial (=4.28, SD=0.66, skewness=-.188, kurtosis=-1.257).

All Female Participant Enrolled in 1999:

Legislative (=4.77, SD=1.08, skewness=-.088, kurtosis=-1.062).

All Male Participant Enrolled in 2000:

Legislative (=5.36, SD=0.89, skewness=-.084, kurtosis=-1.378).

Results of TSI Usage Scores for Subject Population

TSI usage scores are ordinal and the frequencies of the each TSI function usage score are reported in the Appendix III.

Normality of 16PF scores for Subject Population

All 16PF scores had normal distribution (skewness and kurtosis between ±2.00) except the following (Appendix IV):

All Male Participants Enrolled in 1999:

Extroversion (=5.65, SD=1.482, skewness=-1.863,

kurtosis=4.825)

All Female Participants Enrolled in 1999:

Factor C (=5.31, SD=1.378, skewness=-1.56, kurtosis=2.120).

Factor Q3 (=6.62, SD=1.85, skewness=-1.102, kurtosis=2.347).

All Male Participants Enrolled in 2000:

Factor M (=5.10, SD=1.70, skewness=0.916, kurtosis=2.505).

16PF scores with a skewness or kurtosis falling out of the ±1.00 range, but within the ±2.00 range are:

All Male Participants:

Extroversion (=5.60, SD=1.59, skewness=-.971, kurtosis=1.039).

All Participants Enrolled in 1999:

Factor Q3 (=5.83, SD=2.12, skewness=0.002,

kurtosis=-1.133).

Extroversion (=5.91, SD=1.99, skewness=0.366, kurtosis=1.191).

Tough Minded (=4.92, SD=1.94, skewness=0.154,

kurtosis=1.066).

All Male Participants Enrolled in 1999:

Factor F (=6.19, SD=1.17, skewness=0.450, kurtosis=1.316).

Factor I (=5.69, SD=1.78, skewness=0.704, kurtosis=1.212).

Tough Minded (=5.21, SD=2.06, skewness=0.288,

kurtosis=1.825).

All Female Participants Enrolled in 1999:

Factor A (=5.92, SD=2.75, skewness=0.463, kurtosis=-1.194).

Factor I (=6.62, SD=2.29, skewness=-.028, kurtosis=-1.156).

23

Factor M (=5.92, SD=1.93, skewness=-.036,

kurtosis=-1.383).

Factor N (=5.15, SD=2.67, skewness=-.132,

kurtosis=-1.479).

All Male Participants Enrolled in 2000:

Factor B (=8.62, SD=1.16, skewness=-1.061, kurtosis=0.817).

All Female Participants Enrolled in 2000:

Factor M (=6.00, SD=2.26, skewness=-.390,

kurtosis=-1.069).

Factor O (=6.35, SD=1.70, skewness=0.379, kurtosis=-1.083).

Factor Q2 (=5.74, SD=1.81, skewness=0.076, kurtosis=

-1.111).

Factor Q3 (=5.74, SD=1.81, skewness=-.074, kurtosis=-1.148).

Independent T-test for Subject Population based on Gender

Independent t-tests were conducted on the TSI and 16PF raw scores to determine

if any significant differences existed between male and female subjects (Appendix V).

Males to have a significantly higher score then females in Factor J score (α=0.05,

t=2.021, p=0.047), legislative function raw scores (α=0.05, t=3.555, p=0.001), and

judicial function raw scores (α=0.05, t=2.865, p=0.005).

Pearson's Correlation Between 16PF Factors and TSI Scores

Correlations were performed using all 80-study participants (Appendix VIII).

Significant correlations were found between the Legislative raw scores and 16PF Factor

C (α=0.01, r=0.384, p=0.001), O (α=0.05, r=-.298, p=0.011), Q1(α=0.05, r=0.276, p=0.018), Anxiety (α=0.05, r=-.254, p=0.030), and Independence (α=0.05, r=0.246, p=0.036). Executive raw scores significantly correlated with 16PF Factor Q3 (α=0.01, r=0.386, p=1.000) and Self Control (α=0.01, r=0.326, p=0.005). Judicial raw scores significantly correlated with 16PF Factor E (α=0.01, r=0.380, p=0.001), G (α=0.05, r=-.234, p=0.046), Q1G (α=0.05, r=0.289, p=0.013), and Independence (α=0.01, r=0.445, p<.000).

Correlations were also performed for the 16PF Factors using the TSI Usage categories. Legislative raw scores correlated significantly with 16PF Factor C (α=0.01, r=0.432, p<.000), O (α=0.01, r=-.331, p=0.004), Q1(α=0.05, r=0.294, p=0.012), Anxiety (α=0.05, r=-.296, p=0.011), and Independence (α=0.05, r=0.272, p=0.020). Executive raw scores significantly correlated with 16PF Factor Q3 (α=0.01, r=0.361, p=0.002) and Self Control (α=0.05, r=0.272, p=0.020). Judicial raw scores significantly correlated with 16PF Factor E (α=0.05, r=0.297, p=0.011), G (α=0.05, r=-.280, p=0.017), Q1 (α=0.05, r=0.290, p=0.013), and Independence (α=0.01, r=0.391, p=0.002).

Results for Variable Analys1, Group 1 (Low Function Usage)

Out of the 73 participants, 50 were placed into the group containing one or less TSI function usage category scores of 5 or greater (low function usage). The mean age was 24.52 and was highly skewed by an outlier (skewness=3.241, kurtosis= 10.374). The group consisted of 46 Caucasians, 1 Hispanic, 2 who identified "other", and 1 who chose not to answer. Twenty of the participants were male and 30 were female.

Running a test on normality for the group's 16PF scores it was found that Factor J

(=6.16, SD=1.72, skewness=0.094, kurtosis=-1.063) and Factor O (=6.26, SD=1.72, skewness=0.152, kurtosis=-1.083) were not normal, however the values were well within the ±2.00 range.

Tables for the group can be found in Appendix V, Subsection I.

Results for Variable Analys1, Group 2 (High Function Usage)

Out of the 73 participants, 23 were placed into the group containing two or more TSI function usage category scores of 5 or greater (high function usage). The mean age was 25.00 and was highly skewed by an outlier (skewness=2.774, kurtosis=7.012). The group consisted of 21 Caucasians and 2 African Americans. Seventeen of the participants were male and 6 were female.

Running a test on normality for the group's 16PF scores it was found that Factor B (=7.91, SD=1.41, skewness=0.061, kurtosis=-1.181), Factor Q3 (=5.87, SD=2.03, skewness=-0.128, kurtosis=-1.053), and Extroversion (=6.19, SD=1.88, skewness=-0.275, kurtosis=1.490) were not normal, however the values were well within the ±2.00 range.

Tables for the group can be found in Appendix V, Subsection II.

Independent t-Test for 16PF Factors Grouped by Variable Analys1

A 2-tailed independent t-Test was performed on each 16PF factor with the participants grouped by variable "analys1" (as described in the methods section). Significant differences were found with E (α=0.05, t=-2.408, p=0.019), Q1 (α=0.05, t= -2.392, p=0.019), and Independence (α=0.05, t=-3.164, p=0.002). Results are listed in Appendix IX, Subsection I.

Results for Variable Analys2, Group 1 (Low Function Usage)

Out of the 73 participants, 20 were placed into the group containing no TSI function usage category scores of 5 or greater (low function usage). The mean age was 24.35 and was highly skewed by an outlier (skewness=3.463, kurtosis= 13.489). The group consisted of 17 Caucasians, 2 who identified "other", and 1 who chose not to answer. Five of the participants were male and 15 were female.

Running a test on normality for the group's 16PF scores it was found that all scores were had a normal distribution.

Tables for the group can be found in Appendix VI, Subsection I.

Results for Variable Analys2, Group 2 (High Function Usage)

Out of the 73 participants, 53 were placed into the group containing one or more TSI function usage category scores of 5 or greater (high function usage). The mean age was 25.79 and was highly skewed by an outlier (skewness=2.950, kurtosis=7.982). The group consisted of 50 Caucasians, 2 African American, and 1 Hispanic. Thirty-two of the participants were male and 6 were female.

Running a test on normality for the group's 16PF scores it was found that Factor F (=6.20, SD=1.24, skewness=-0.972, kurtosis=1.241), Factor J (=5.85, SD=1.93, skewness=0.186, kurtosis=-1.096), Factor N (=5.85, SD=2.30, skewness=-1.036, kurtosis=0.407), and Factor O (=6.20, SD=1.93, skewness=0.174, kurtosis=-1.161) was not normal, however the values were well within the ±2.00 range.

Tables for the group can be found in Appendix VI, Subsection II.

Independent t-Test for 16PF Factors Grouped by Variable Analys2

A 2-tailed independent t-Test was performed on each 16PF factor with the

participants grouped by variable "analys2" (as described in the methods section). No

significant differences were found. Results are listed in Appendix IX, Subsection II.

CHAPTER III: DISCUSSION

Through various theories and research personality has been shown to be one of the key factors when analyzing styles (Dunn and Dunn, 1979; Jung, 1927; Myers and Myers, 1980; Zhang, 1999; Sternberg, 1997; Gregorc, 1984; Miller, 1987). However, in the development of the TSI, Sternberg and Wagner (1992) chose to concentrate on a cognitive-centered approach in identifying styles. A number of studies have been conducted to show the value of the TSI in determining educational outcomes, however recent research has also focused on identifying the TSI's connection with personality-centered theories (Sternberg, 1994; Zhang, 2001).

The results of the current study showed participants who highly utilized more than one TSI function had significantly different scores in certain personality factors when

Table 7: Hypothesis				
	First Analysis Function Usage Grouping		**Second Analysis Function Usage Grouping**	
	Low (LUG)	**High (HUG)**	**Low (LUG)**	**High (HUG)**
	None or 1 function usage scores of 5 or 6	2 or more function usage scores of 5 or 6	No function usage scores of 5 or 6	1 or more function usage scores of 5 or 6
Hypothesis 1	H_0: HUG Factor E <= LUG Factor E H_1: HUG Factor E > LUG Factor E			
Hypothesis 2	H_0: HUG Factor O <= LUG Factor O H_1: HUG Factor O > LUG Factor O			
Hypothesis 3	H_0: HUG Factor Q1 <= LUG Factor Q1 H_1: HUG Factor Q1 > LUG Factor Q1			
Hypothesis 4	H_0: HUG Global Factors <> LUG Global Factors H_1: HUG Global Factors = LUG Global Factors			
Hypothesis 5			H_0: HUG of any Factor <> LUG of any Factor H_1: HUG of any Factor = LUG of any Factor	

compared to participants who highly utilized one or less functions (Table 7). To further support the findings a second set of analyses were performed which showed no significantly different personality scores when comparing students with one or more highly utilized functions to participants with no highly utilized functions

As expected, students with two or more highly utilized functions had significantly higher scores in the 16PF primary factors E (α=0.05, t=-2.408, p=0.019) and Q1 (α=0.05, t=-2.392, p=0.019), which confirms hypothesis 1 and 3. Hypothesis 2 was not confirmed since no significant difference was found for Factor O (α=0.05, t=-1.616, p=0.110). Unexpected was the significant difference found in the 16PF global factor of Independence (α=0.05, t=-3.164, p=0.002), which means hypothesis 4 was incorrect. The indication is that students with high usage in more then one function tend to be more dominant, self-assured, open to change, and independent when compared to students who do not highly utilize more then one TSI function. Lastly, when 16PF scores were compared in the second analysis, it was found that no significant differences existed between groups, supporting hypothesis 5 (Appendix VII, Subsection II).

In 1975, Pandey studied student dropout rates be administering the 16PF to 350 college freshman. The researcher found dropouts, as well as those on probation, to have the high Factor E and independence scores. Though not being viewed as a direct predictor of whether a student will dropout, it does present the personality trait as being a potential underlying aspect. Other research has shown how high Factor E scores can be associated with academic achievement (Odom and Shaughnessy, 1984). Odom and Shaughnessy reported that advanced placement high school math students showed a significantly high rating in Factor E.

In studies using the NEO-PI, "Openness" has been shown to be a recurring predictor of academic success (Dollinger and Orf, 1991: Musgrave, Bromley, and Dalley, 1997: Stewart and associate, 1999). In a 1991 study of 90 undergraduate students Dollinger and Orf found openness was a contributing factor in explaining course grades, as well as performance on objective tests. Musgrave and associates (1997) reported openness as one of a number of predictors for determining a students GPA. The importance of openness to academic success was further display through research performed on Asian and Western students. Stewart and associates (1999) found that academic achievement could be predicted based on students valuing openness to change.

The current study suggests that the importance of particular 16PF factors to academic success may be in part due to certain traits acting as driving forces for an individuals increased ability in utilizing multiple thinking style dimensions within a learning environment.

However, two issues remain unclear. Sternberg (1997) claims an individual's thinking style may change over time and situation, and a style is neither good nor bad, but instead a preferred way of processing information. No studies to date have been performed to determine the consistency of thinking styles over time or situation, however if Sternberg's assumption is true, then the association of certain personality factors are in question since they are considered to remain mostly stable over time. If thinking styles are stable over time and the personality factors associated with high function usage do potentially affect academic outcome, then certain combinations of styles within the TSI may be more desirable then others.

The current study has limitations due to the small sample size used. The dividing

of the participants into 2 different groups for analysis created small comparison groups. Furthermore, the entire TSI was not used for the study. To fully understand the association between thinking style and 16PF scores, it would be necessary to administer the complete TSI. However, for this study, function scores were used since they are the foundation styles of the TSI. Finally, the sample population was limited to first year law students. As seen by the demographics of the study population, the students were very homogenous and most likely poorly reflected a normal student body at the University of Tennessee and most other universities.

Future research on the association of thinking styles and personality factors needs to address the following issues: increase sample population size, administer the instrument to a more general population of the student body, use the complete TSI inventory, correlate academic performance with the varying factors and styles, and obtain completed TSI during follow-up administrations to determine if the student's thinking styles change over time.

Lastly, future research may explore the significant correlations found between certain function usage scores and 16PF factors (Appendix IV). Specifically, legislative usage scores significantly correlated with factor C ($\alpha=0.01$, $r=0.432$), O ($\alpha=0.01$, $r=0.-$ .331), Q1 ($\alpha=0.05$, $r=0.294$.), anxiety ($\alpha=0.05$, $r=-.296$), and independence ($\alpha=0.05$, $r=0.272$). This would suggest that participants with higher legislative usage scores tend to have greater emotional stability, self-worth, openness to change, lower anxiety, and independence. The question to be asked is if this is related to an individual using a thinking style requiring creative design as part of its primary action.

Executive usage scores correlate significantly with factor Q3 ($\alpha=0.01$, $r=0.361$)

and self-control (α=0.05, r=0.299). Participants with higher executive usage scores tend to have more self-control and a need for social approval. Since people who highly utilize executive functions take actions based upon given definitions they may have a greater desire for approval from peers or colleagues.

Finally, the judicial usage scores correlate with factor E (α=0.05, r=0.297), G (α=0.05, r=-.280), Q1 (α=0.05, r=0.290), and independence (α=0.01, r=0.390). Participants with higher judicial usage scores tend to be more dominant, expedient, open to change, and independent. These personality factors may be necessary for an individual who likes to utilize the critical nature of the judicial function.

The TSI offers an interesting insight into our cognitive processes. Its use, combined with different personality tests, gives us an opportunity to understand how one's personality may influence the way they choose to perceive and process information from their environment.

Appendix X: Instruments

Subsection I – Biographical Information Questions

1. Gender.

2. Ethnicity.

3. Age.

4. College GPA.

5. Graduate GPA.

6. College Major.

7. Best College Subject.

8. Worst College Subject.

9. Favorite College Subject.

10. Best Law School Subject.

11. Worst Law School Subject.

12. Favorite Law School Subject.

13. Describe your strengths.

14. Describe areas that you would like to improve.

15. Leisure time interests/hobbies.

16. Memberships.

17. Offices held.

18. Volunteer Activities.

19. Honors and Awards.

20. In the past what type of employment have you primarily had?

21. Are any of your family members of friends lawyers?

22. Why did you decide to go to law school?

23. Ideally, where would you like to see your career go in the next

    5 to 10 years?

24. Realistically, where would you like to see your career go in the

    next 5 to 10 years?

25. What type of law do you plan to practice after law school?

Subsection II – Thinking Styles Questions (TSI)

Rate yourself by selecting the following answers that corresponds to how well the statement describes you:

1. Not at all well.
2. Not very well.
3. Slightly well.
4. Somewhat well.
5. Well.
6. Very well.
7. Extremely well.

1. When making decisions, I tend to rely on my own ideas and ways of doing things.

2. When discussing or writing down ideas, I follow formal rules of presentation.

3. When discussing or writing down ideas, I like criticizing others' ways of doing things.

4. When faced with a problem, I use my own ideas and strategies to solve problems.

5. I am careful to use the proper method to solve any problem.

6. When faced with opposing ideas, I like to decide which is the right way of doing something.

7. I like to play with my ideas and see how far they go.

8. I like projects that have a clear structure and a set plan and goal.

9. I like to check and rate opposing points of view or conflicting ideas.

10. I like problems where I can try my own way of solving them.

11. Before starting a task or project, I check to see what method or procedure should be used.

12. I like projects where I can study and rate different views and ideas.

13. When working on a task, I like to start with my own ideas.

90

14. I like situations in which my role or the way I participate is clearly defined.

15. I prefer tasks or problems where I can grade the design or methods of others.

16. When talking or writing about ideas, I stick to one main idea.

17. I like to set priorities for the things I need to do before I start doing them.

18. When I undertake some task, I am usually equally open to starting by working on any of several things.

19. When I have many things to do, I do whatever occurs to me first.

20. I like to deal with major issues or themes, rather than details or facts.

21. In talking or writing down ideas, I like to have the issues organized in order of importance.

22. When there are competing issues of importance to address in my work, I somehow try to address them simultaneously.

23. I can switch from one task to another easily, because all tasks seem to me to be equally important.

24. When trying to finsh a task, I tend to ignore problems that come up.

25. Before starting a project, I like to know the things I have to do and in what order.

26. I like to tackle all kinds of problems, even seemingly trivial ones.

27. I use any means to reach my goal.

28. In dealing with difficulties, I have a good sense of how important each of them is and what order to tackle them in.

29. Usually when I have things to do, I split my time and attention equally among them.

30. When discussing or writing down ideas, I use whatever comes to mind.

31. I try to have several things going at once, so that I can shift back and forth between them.

32. If there are several important things to do, I do the one most important to me.

33. I sometimes have trouble setting priorities for multiple things that I need to get done.

34. When trying to make a decision, I take all points of view into account.

35. When there are many things to do, I have a clear sense of the order in which to do them.

36. I like situations and tasks in which I am not concerned with details.

37. I prefer to deal with specific problems rather than general questions.

38. I like to control all phases of a project, without having to consult others.

39. When starting a task, I like to brainstorm ideas with friends or peers.

40. I enjoy working on projects that allow me to try novel ways of doing things.

41. I like to do things in ways that have been used in the past.

42. I care more about the general effect than about the details of a task I have to do.

43. I like problems where I need to pay attention to detail.

44. When trying to make a decision, I rely on my own judgement of the situation.

45. I like projects in which I can work together with others.

46. I like tasks and problems that have fixed rules to follow in order to complete them.

Subsection III – 16PF

1. I'd enjoy more being a counselor than being an architect.
   - a. true
   - b. ?
   - c. false

2. When something upsets me, I usually get over it quite soon.

   - a. true
   - b. ?
   - c. false.

3. When people do something that bothers me, I usually:
   - a. let it go
   - b. ?
   - c. mention it to them.

4. I believe more in:
   - a. being properly serious in everyday life
   - b. ?
   - c. the saying " laugh and be merry" most of the time.

5. I'd rather see a home that:
   - a. has strict standards of behavior
   - b. ?
   - c. doesn't have too many rules.

6. I usually enjoy spending time talking with friends about social events of parties.
   - a. true
   - b. ?
   - c. false

7. I admire more:
   - a. a person who has average abilities, but strict morals
   - b. ?
   - c. a person who is very talented, but is sometimes not very responsible.

8. When I was a child, I spent more free time:
   - a. making or building something
   - b. ?
   - c. reading or daydreaming.

9. In joining a new group, I usually seem to fit in right away.
   - a. true
   - b. ?
   - c. false

10. I get excited about good plays or novels.
    - a. true
    - b. ?
    - c. false.

11. There's usually a big difference between what people will say they will do and what they actually do.
    - a. true
    - b. ?
    - c. false.

12. My friends think I'm slightly absentminded and not always practical.
    - a. true
    - b. ?
    - c. false.

          a. 20
          b. 25
          c. 32.

182. Which should come next at the end of this row of letters: A B D G?
          a. H
          b. K
          c. J

183. Which should come next at the end of this row of letters: E I L?
          a. M
          b. N
          c. P

184. Which number should come next at the end of this series: 1/12, 1/6, 1/3, 2/3?
          a. 3/4
          b. 4/3
          c. 3/2

185. Which should come next at the end of this series of numbers:

       a. 5
       b. 4
       c. -3

Appendix XI: Scoring Tables for TSI Function Usage

Source: Sternberg, 1997

(College Students Adults)

Raw Scores for Legislative Function

Usage Score	Category	Male	Female
Very High = 6	(Top 1%-10%)	6.0-7.0	6.0-7.0
High = 5	(Top 11%-25%)	5.3-5.9	5.6-5.9
Middle High = 4	(Top 26%-50%)	5.1-5.5	5.1-5.5
Middle Low = 3	(Top 51%-75%)	4.4-5.0	4.5-5.0
Low = 2	(Top 76%-90%)	4.0-4.3	4.1-4.4
Very Low = 1	(Top 91%-100%)	1.0-3.9	1.0-4.0

Raw Scores for Executive Function

Usage Score	Category	Male	Female
Very High = 6	(Top 1%-10%)	5.5-7.0	5.1-7.0
High = 5	(Top 11%-25%)	5.0-5.4	4.9-5.0
Middle High = 4	(Top 26%-50%)	4.2-4.9	4.2-4.8
Middle Low = 3	(Top 51%-75%)	3.6-4.1	3.7-4.1
Low = 2	(Top 76%-90%)	3.1-3.5	3.1-3.6
Very Low = 1	(Top 91%-100%)	1.0-3.0	1.0-3.0

Raw Scores for Judicial Function

Usage Score	Category	Male	Female
Very High = 6	(Top 1%-10%)	5.3-7.0	5.6-7.0
High = 5	(Top 11%-25%)	4.6-5.2	5.0-5.5
Middle High = 4	(Top 26%-50%)	4.2-4.5	4.6-4.9
Middle Low = 3	(Top 51%-75%)	3.9-4.1	4.2-4.5
Low = 2	(Top 76%-90%)	3.5-3.8	3.2-4.1
Very Low = 1	(Top 91%-100%)	1.0-3.4	1.0-3.1

Appendix XII: Informed Consent Letter

[Date]

Dear [Particpant's Name]:

We have been authorized by the University of Tennessee College of Law to ask your help in an important research project. The study we are inviting you to participate in is part of a long-term longitudinal investigation into the possible relationship between personal traits or characteristics and a) the attainment of expertise in legal practice, and b) the choice of different areas of professional practice in the law. Our purpose at this point in the investigation is to collect some baseline data, using some standard assessment instruments, and to invite you to become part of our long-term study. Your participation at this time does not obligate you to any future participation, but we hope for, and would welcome, your help in subsequent phases of the project. To the best of our knowledge, this research is unique, and we anticipate that it will make an important contribution to the improvement of legal education and professional development.

In this part of the study, you will be asked to fill out a brief biographical survey, take a standard personality inventory known as the 16-PF, and then respond to an inventory of our own design. This should take no more than one hour of your time.

Although we can't promise any personal benefits in return for your participation, we will keep you informed of the results of our work, which will lead to a better understanding of lawyers and the legal profession.

There is no risks associated with this research, and we have adopted a procedure which will guarantee the complete confidentiality and anonymity of your participation. We have asked the College of Law to provide you with a personal identification code number, which has been placed on the enclosed materials. This is a procedure which is analogous to the assignment of code numbers in law school examinations for purposes of anonymous grading. A list matching your name with the code number will be maintained in the Student Records Office for the duration of this study, which may be several years. This list will <u>never</u> be available to any person involved with the coding and analysis of the data. We may in the future ask the Records Office to supply
us with archival data, such as GAP information, but this will be done in a manner that will ensure complete anonymity. No one in the Records Office will ever have access to coded research data, and no one with access to the research data will ever be able to ascertain your identity. We will also ask the Records Office to assist in contacting you to invite your future participation, or to provide you with feedback based upon your personal or general research results.

If you have any questions about this study, please feel free to contact one of us. Your participation in this research is voluntary, and your return of the enclosed materials constitutes your consent to take part. We would greatly appreciate your assistance in this important endeavor.

[Signature of University of Tennessee personal left off of form].

VITA

Charles Licata was born in Bay Shore, New York in 1964. In 1985 he obtained his Associates Degree in Data Processing from Suffolk Community College, and then his Bachelors of Science in Information Science from Dowling College in 1987. He began his corporate career in 1988 with AT&T, where he remained for 8 years as a system analyst. In 1996, he began to consult privately in the East Tennessee area while beginning a new academic endeavor. Returning to college full-time in 1997 to obtain a degree in Psychology, Carles attended East Tennessee State College to complete courses in undergraduate psychology. His academic career at the University of Tennessee Psychology department began in the fall of 1999. Currently, Charles is enrolled in the Experimental and Comparative Medicine Ph.D. program at the University of Tennessee Medical School. His current research includes the study of fMRI techniques with Alzheimer's subjects, instrument development for anosognosia scales, and treatment compliance of sleep disorder patients.
