ABSTRACT: We compute the leading double-soft behavior for gluons and for the scalars obtained by dimensional reduction of a higher dimensional pure gauge theory, from the scattering amplitudes of gluons and scalars living in the world-volume of a D p -brane of the bosonic string. In the case of gluons, we compute both the double-soft behavior when the two soft gluons are contiguous as well as when they are not contiguous. From our results, that are valid in string theory, one can easily get the double-soft limit in gauge field theory by sending the string tension to infinity.

1 Introduction and results

Soft theorems were in the 1950s and 1960s studied for photons [1–9] and gravitons [5, 6, 10, 11], when they were recognized to be important consequences of local gauge invariance.¹ More recent discussions of the generic subleading behavior of soft gluons and gravitons were given in refs. [13–15]. The very recent interest in the soft behavior of gravitons and gluons has arisen after work by Strominger and collaborators [16–18], showing that the soft-graviton behavior follows from Ward identities of extended Bondi, van der Burg, Metzner and Sachs (BMS) symmetry [19–23], and that tree-level graviton amplitudes in four spacetime dimensions have a universal behavior through second subleading order in the soft-graviton momentum [24]. This has stimulated the study of the subleading soft behavior in amplitudes with gluons and gravitons, which we will briefly summarize.

For gluons in arbitrary number of dimensions soft theorems were obtained in various ways at tree level [25–31], and discussed for quark-gluon amplitudes in QCD in ref. [32]. Poincaré and gauge invariance as well as a condition arising from the distributional nature of scattering amplitudes have been used in ref. [33] to strongly constrain the soft behavior for gluons and gravitons, while in ref. [34] gauge invariance is shown to completely fix the first two leading terms (up to terms $\mathcal{O}(q^0)$) in the case of a gluon, and the first three leading terms (up to terms $\mathcal{O}(q^1)$) in the case of a graviton, for any number of space-time dimensions (q being the soft momentum).

Further study of the subleading soft-graviton theorems in arbitrary number of dimensions were performed in refs. [35–41]. Soft theorems were also studied in the ambitwistor string [42, 43], and their connection with effective field theories was discussed in ref. [44]. As discussed in refs. [34, 45–47], one should note that soft gluon and graviton behaviors are in general modified by loop corrections.

Finally, soft gluon and graviton behavior have also been studied in the framework of string theory in refs. [29, 48–50]. In particular, soft theorems for the dilaton were

¹For a discussion of low-energy theorem for photons see chapter 3 of ref. [12].

discussed in refs. [50–54] and for the anti-symmetric tensor in ref. [50], while soft behavior in amplitudes with massive states was discussed in ref. [55].

Double-soft theorems are now receiving increasing interest, and have been studied for scalars and gluons. The interest in the double-soft behavior arises originally from the analysis of the spontaneously symmetry breaking of a group G keeping a subgroup H unbroken. The presence of Nambu-Goldstone bosons, living in the coset space G/H , implies the vanishing of the scattering amplitude with a single soft Goldstone boson, giving rise to the famous Adler’s zeros, while leading to a peculiar nonzero universal behaviour of the amplitude with two soft Goldstone particles [56, 57]. The double-soft theorems for different kinds of scalars were computed in ref. [58] using the CHY representation of the scattering amplitude [59]. The double-soft theorems for gluons were computed in refs. [60, 61] in four dimensions using the spinor helicity formalism and the BCFW recursion relations, and this result has since been confirmed in ref. [60] by a calculation in an arbitrary number of spacetime dimensions, using the CHY representation of the scattering amplitude. Ref. [60] also uses superstring theory obtaining agreement with field theory results without extra string corrections. Finally, in ref. [62] the so-called CSW method is used to compute the double-soft behavior in four dimensions.

In this work we compute the leading double-soft limit for gluons and scalars directly on the scattering amplitudes for gluons and scalars in the bosonic string. The corresponding result in the limiting field theory is then obtained by performing the field theory limit ($\alpha' \rightarrow 0$). Our results are valid for any number of space-time dimensions and without fixing a particular gauge. In particular, we consider scattering amplitudes of massless open strings on a Dp -brane in the bosonic string and use them to derive double-soft theorems for both gauge fields and scalars. In fact, in the presence of a Dp -brane, the original Lorentz symmetry $SO(1, d - 1)$ is broken into $SO(1, p) \otimes SO(d - 1 - p)$ and the original d -dimensional gauge field gives rise to a $(p + 1)$ -dimensional gauge field that we in the following, for the sake of simplicity, call gluon, and $d - p - 1$ massless scalars.² They all live on the $(p + 1)$ -dimensional world-volume of the Dp -brane.

We start by computing the color-ordered amplitude with $(n + 2)$ gluons. We keep only the leading term when two contiguous gluons with momenta q_1 and q_2 become simultaneously soft, while the momenta $k_1 \dots k_n$ of the other gluons are kept finite. In this case, where the gluons are ordered as $k_1 \dots k_{n-1} q_1 q_2 k_n$, we find that the leading term in the double-soft limit behaves as $\frac{1}{q_{1,2}^2}$ and is given by:

$$\begin{aligned} M_{2g;ng} = \frac{g_{p+1}^2}{q_1 q_2} & \left\{ -\frac{1}{2} (\epsilon_{q_1} \epsilon_{q_2}) \left[\frac{k_n(q_2 - q_1) + q_1 q_2}{k_n(q_1 + q_2) + q_1 q_2} + \frac{k_{n-1}(q_1 - q_2) + q_1 q_2}{k_{n-1}(q_1 + q_2) + q_1 q_2} \right] \right. \\ & + \frac{(\epsilon_{q_1} q_2)(\epsilon_{q_2} k_n) - (\epsilon_{q_2} q_1)(\epsilon_{q_1} k_n)}{(k_n(q_1 + q_2) + q_1 q_2)} - \frac{(\epsilon_{q_1} q_2)(\epsilon_{q_2} k_{n-1}) - (\epsilon_{q_2} q_1)(\epsilon_{q_1} k_{n-1})}{(k_{n-1}(q_1 + q_2) + q_1 q_2)} \\ & + \frac{(\epsilon_{q_1} k_n)(\epsilon_{q_2} k_n)(q_1 q_2)}{(k_n q_2)(k_n(q_1 + q_2) + q_1 q_2)} + \frac{(\epsilon_{q_1} k_{n-1})(\epsilon_{q_2} k_{n-1})(q_1 q_2)}{(k_{n-1} q_1)(k_{n-1}(q_1 + q_2) + q_1 q_2)} \\ & \left. - \frac{(\epsilon_{q_1} k_{n-1})(\epsilon_{q_2} k_n)(q_1 q_2)}{(k_{n-1} q_1)(k_n q_2)} \right\} M_{ng}, \end{aligned} \quad (1.1)$$

²Here and in the following we keep d arbitrary although for the bosonic string we need to take $d = 26$.

where g_{p+1} is the gauge coupling constant of the gauge theory living on the D p -brane and

$$M_{ng} = \frac{(2\alpha')^{\frac{n-2}{2}}}{\alpha'} g_{p+1}^{n-2} \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle \quad (1.2)$$

is the scattering amplitude of n gluons in the bosonic string. As we explicitly show in the next sections the dependence on α' in the soft factor drops out, while it is still present in the n -gluon amplitude. The field-theory limit, corresponding to $\alpha' \rightarrow 0$, leaves the soft factor unchanged and acts only on M_{ng} giving then just the n -gluon amplitude of Yang-Mills theory. Notice also that, unlike the case of a single soft behavior, the double-soft behavior cannot be written as the difference of two terms, one depending on k_{n-1} and the other on k_n , because of the presence of the last term in eq. (1.1) that contains both momenta.

Eq. (1.1) reproduces eqs. (2.25) and (2.28) of ref. [60] in the gauge chosen there, namely $(\epsilon_{q_2} k_n) = (\epsilon_{q_1} k_{n-1}) = 0$ for an arbitrary $(p+1)$ -dimensional space-time. When we restrict to a four-dimensional space-time, one can use the four-dimensional helicity formalism and, in this case, one reproduces eqs. (2.1), (2.10) and (2.12) of ref. [60] and eqs. (39) and (40) of ref. [61].

We then consider the double-soft limit for two identical scalars in an amplitude with n gluons and we get the following double-soft behavior:

$$M_{2s;ng} = -\frac{g_{p+1}^2}{2q_1 q_2} \left[\frac{k_n(q_2 - q_1) + q_1 q_2}{k_n(q_1 + q_2) + q_1 q_2} + \frac{k_{n-1}(q_1 - q_2) + q_1 q_2}{k_{n-1}(q_1 + q_2) + q_1 q_2} \right] M_{ng} \quad (1.3)$$

where M_{ng} is again given in eq. (1.2). Finally, we get the same double-soft behavior for a scattering amplitude with $n+2$ identical scalars when two contiguous scalars become soft:

$$M_{2s;n_s} = -\frac{g_{p+1}^2}{2q_1 q_2} \left[\frac{k_n(q_2 - q_1) + q_1 q_2}{k_n(q_1 + q_2) + q_1 q_2} + \frac{k_{n-1}(q_1 - q_2) + q_1 q_2}{k_{n-1}(q_1 + q_2) + q_1 q_2} \right] M_{ns} \quad (1.4)$$

where M_{ns} is the n -scalar amplitude in the bosonic string. This equation agrees with eqs. (11) and (12) of ref. [58] for the special case of $m = -1$.

Notice that in our three main results we have kept terms involving $q_1 q_2$ because they come naturally out of our calculations,³ although there are other terms of the same order that we have not computed.

The three previous formulas are valid in an arbitrary $(p+1)$ -dimensional space-time and all follow from a d -dimensional gauge theory that, because of the presence of a D p -brane, gives rise to a gauge theory in a $(p+1)$ -dimensional space-time coupled to $(d-p-1)$ scalar fields, which correspond to the components of the original d -dimensional gauge field along the directions outside the world-volume of the D p -brane. Because of this, eqs. (1.3) and (1.4) follow from eq. (1.1) by neglecting the terms where the polarizations of the soft gluons are contracted with the momenta of all particles. This is a consequence of the fact that the scalars correspond to the components of the gluons in the directions orthogonal to the D p -brane.

³See also ref. [58].

It is also interesting to note that the previous three soft amplitudes all involve the factor in the squared bracket of eqs. (1.3) and (1.4) that is typical of the double-soft limit of Goldstone bosons [56]. Unlike the case of Goldstone bosons, however, in this case we get an additional singular factor $\frac{1}{q_1 \cdot q_2}$.

We have also computed the leading double-soft behavior of a color-ordered amplitude with $n+2$ gluons in the case where the two soft gluons are not next to each other as before, but have a hard gluon between them, which we take to be the one with momentum k_{n-1} . When the gluons are ordered as $k_1, k_2 \dots q_1 k_{n-1} q_2 k_n$, the leading double-soft behavior is given by

$$M_{2g;ng} = g_{p+1}^2 \left[\frac{k_{n-2}\epsilon_{q_1}}{k_{n-2}q_1} \left(\frac{k_{n-1}\epsilon_{q_2}}{k_{n-1}q_2} - \frac{k_n\epsilon_{q_2}}{k_nq_2} \right) + \frac{k_{n-1}\epsilon_{q_1}}{k_{n-1}q_1} \frac{k_n\epsilon_{q_2}}{k_nq_2} - \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_{n-1})}{k_{n-1}(q_1+q_2)+q_1q_2} \left(\frac{1}{k_{n-1}q_1} + \frac{1}{k_{n-1}q_2} \right) \right] M_{ng} \quad (1.5)$$

Finally, for the color-ordered amplitude where the two soft gluons have more than one hard gluon between them, the double-soft behavior is just given by the product of two single-soft behaviors.

The paper is organized as follows. In section 2 we discuss the double-soft limit for gluons in an amplitude with n gluons. Section 3 is devoted to the double-soft limit for two scalars in an amplitude with n gluons, while in section 4 we discuss the leading double-soft limit for two scalars in an amplitude with n scalars. The last section is left for conclusions. In the appendix we compute the double-soft limit of some double integrals used for computing the double-soft limits.

2 Double-soft behavior with $n+2$ gluons

In this section we consider the color-ordered scattering amplitude involving $(n+2)$ gauge fields living on the world-volume of a Dp -brane of the bosonic string and we compute the leading double-soft behavior when two contiguous gluons become simultaneously soft.

We denote with (ϵ_{q_1}, q_1) and (ϵ_{q_2}, q_2) the polarizations and momenta of the gluons that eventually will become soft and with (ϵ_i, k_i) the polarizations and momenta of the remaining gluons. We consider the color-ordered amplitude corresponding to the following permutation: $k_1, k_2, \dots, k_{n-1}, q_1, q_2, k_n$ for which the Koba-Nielsen variables of the various gluons are ordered as $z_1 \geq z_2 \geq z_3 \dots \geq z_{n-1} \geq w_1 \geq w_2 \geq z_n$.

It is convenient to write the amplitude with $(n+2)$ gluons by exponentiating the derivative part of the vertex operators by introducing for each vertex operator a Grassmann variable, called θ_i , $i = 1 \dots n$ and ϕ_a , $a = 1, 2$, and by writing the scattering amplitude as

follows:⁴

$$\begin{aligned} M_{2g;ng} &= \frac{(\sqrt{2\alpha'})^n}{\alpha'} g_{p+1}^n \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \int d\phi_1 d\phi_2 \\ &\times \langle 0 | \prod_{i=1}^{n-1} e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i)} X(z_i) \\ &\times e^{i(\phi_1 \epsilon_{q_1} \partial_{w_1} + \sqrt{2\alpha'} q_1)} X(w_1) e^{i(\phi_2 \epsilon_{q_2} \partial_{w_2} + \sqrt{2\alpha'} q_2)} X(w_2) e^{i(\theta_n \epsilon_n \partial_{z_n} + \sqrt{2\alpha'} k_n)} X(z_n) \rangle, \end{aligned} \quad (2.1)$$

where g_{p+1} is the $(p+1)$ -dimensional gauge coupling constant.⁵ Using the contraction

$$X_\mu(z) X_\nu(w) \sim -\eta_{\mu\nu} \log(z-w) \quad \text{with} \quad \eta_{\mu\nu} = (-++\cdots+) \quad (2.2)$$

we can contract the vertex operators of the states with momenta q_1 and q_2 , with those of the other states getting

$$\begin{aligned} M_{2g;ng} &= \frac{(\sqrt{2\alpha'})^n}{\alpha'} g_{p+1}^n \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i)} X(z_i) | 0 \rangle \\ &\times \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \int d\phi_1 d\phi_2 \\ &\times \prod_{i=1}^{n-1} ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) (w_1 - z_n)^{2\alpha' q_1 k_n} (w_2 - z_n)^{2\alpha' q_2 k_n} \\ &\times (w_1 - w_2)^{2\alpha' q_1 q_2} \prod_{i=1}^n \left(e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_1}{z_i - w_1}} e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_2}{z_i - w_2}} \right) e^{-\phi_1 \phi_2 \frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2}} \\ &\times e^{\phi_1 \left[\sum_{i=1}^n \frac{\theta_i (\epsilon_{q_1} \epsilon_i)}{(z_i - w_1)^2} - \sum_{i=1}^n \frac{\sqrt{2\alpha'} (k_i \epsilon_{q_1})}{z_i - w_1} + \frac{\sqrt{2\alpha'} (\epsilon_{q_1} q_2)}{w_1 - w_2} \right]} \\ &\times e^{\phi_2 \left[\sum_{i=1}^n \frac{\theta_i (\epsilon_{q_2} \epsilon_i)}{(z_i - w_2)^2} - \sum_{i=1}^n \frac{\sqrt{2\alpha'} (k_i \epsilon_{q_2})}{z_i - w_2} - \frac{\sqrt{2\alpha'} (\epsilon_{q_2} q_1)}{w_1 - w_2} \right]}. \end{aligned} \quad (2.3)$$

We can now perform the Grassmann integrals over ϕ_1 and ϕ_2 arriving at

$$\begin{aligned} M_{2g;ng} &= \frac{(2\alpha')^{\frac{n-2}{2}}}{\alpha'} g_{p+1}^{n-2} \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i)} X(z_i) | 0 \rangle \\ &\times (2\alpha' g_{p+1}^2) \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^{n-1} ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) \\ &\times (w_1 - z_n)^{2\alpha' q_1 k_n} (w_2 - z_n)^{2\alpha' q_2 k_n} (w_1 - w_2)^{2\alpha' q_1 q_2} \prod_{i=1}^n \left(e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_1}{z_i - w_1}} e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_2}{z_i - w_2}} \right) \\ &\times \left\{ \frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2} + \left[\sum_{i=1}^n \frac{\theta_i (\epsilon_i \epsilon_{q_1})}{(z_i - w_1)^2} - \sum_{i=1}^n \frac{\sqrt{2\alpha'} (k_i \epsilon_{q_1})}{z_i - w_1} + \frac{\sqrt{2\alpha'} (\epsilon_{q_1} q_2)}{w_1 - w_2} \right] \right. \\ &\quad \left. \times \left[\sum_{j=1}^n \frac{\theta_j (\epsilon_j \epsilon_{q_2})}{(z_j - w_2)^2} - \sum_{j=1}^n \frac{\sqrt{2\alpha'} (k_j \epsilon_{q_2})}{z_j - w_2} - \frac{\sqrt{2\alpha'} (\epsilon_{q_2} q_1)}{w_1 - w_2} \right] \right\} \equiv M_{ng} * G_n, \end{aligned} \quad (2.4)$$

⁴Here and in the following we assume that $z_n = 0$.

⁵In order to have a bosonic quantity in the exponents, we assume that also the polarization vectors are Grassmann variables.

where by $*$ a convolution of the integrals is understood,

$$M_{ng} = \frac{(2\alpha')^{\frac{n-2}{2}}}{\alpha'} g_{p+1}^{n-2} \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle \quad (2.5)$$

is the scattering amplitude of n gluons, and

$$\begin{aligned} G_n = & (2\alpha' g_{p+1}^2) \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^n ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) \\ & \times (w_1 - w_2)^{2\alpha' q_1 q_2} \prod_{i=1}^n \left(e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_1}{z_i - w_1}} e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_2}{z_i - w_2}} \right) \\ & \times \left\{ \frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2} + \left[\sum_{i=1}^n \frac{\theta_i (\epsilon_i \epsilon_{q_1})}{(z_i - w_1)^2} - \sum_{i=1}^n \frac{\sqrt{2\alpha'} (k_i \epsilon_{q_1})}{z_i - w_1} + \frac{\sqrt{2\alpha'} (\epsilon_{q_1} q_2)}{w_1 - w_2} \right] \right. \\ & \left. \times \left[\sum_{j=1}^n \frac{\theta_j (\epsilon_j \epsilon_{q_2})}{(z_j - w_2)^2} - \sum_{j=1}^n \frac{\sqrt{2\alpha'} (k_j \epsilon_{q_2})}{z_j - w_2} - \frac{\sqrt{2\alpha'} (\epsilon_{q_2} q_1)}{w_1 - w_2} \right] \right\}. \end{aligned} \quad (2.6)$$

This expression contains two kinds of terms. The first one is without any dependence on the variables θ_i and acts in the convolution at the end of eq. (2.4) as a factor that multiplies the n -gluon amplitude M_{ng} , while the second one contains the terms with θ_i that, when acting in the convolution in eq. (2.4), modify the structure of the n -gluon amplitude M_{ng} . It can be shown that the first kind of terms is the leading one in the double-soft limit, while the second one is subleading. In this paper we compute only the leading one that is equal to

$$\begin{aligned} G_n^{(1)} = & g_{p+1}^2 (2\alpha') \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 (w_1 - w_2)^{2\alpha' q_1 \cdot q_2} w_1^{2\alpha' q_1 \cdot k_n} w_2^{2\alpha' q_2 \cdot k_n} \\ & \times (z_{n-1} - w_1)^{2\alpha' q_1 \cdot k_{n-1}} (z_{n-1} - w_2)^{2\alpha' q_2 \cdot k_{n-1}} \\ & \times \left\{ \frac{\epsilon_{q_1} \cdot \epsilon_{q_2}}{(w_1 - w_2)^2} + \left[\frac{\sqrt{2\alpha'} (k_{n-1} \epsilon_{q_1})}{w_1 - z_{n-1}} + \frac{\sqrt{2\alpha'} (k_n \epsilon_{q_1})}{w_1} + \frac{\sqrt{2\alpha'} (q_2 \epsilon_{q_1})}{w_1 - w_2} \right] \right. \\ & \left. \times \left[\frac{\sqrt{2\alpha'} (k_{n-1} \epsilon_{q_2})}{w_2 - z_{n-1}} + \frac{\sqrt{2\alpha'} (k_n \epsilon_{q_2})}{w_2} + \frac{\sqrt{2\alpha'} (q_1 \epsilon_{q_2})}{w_2 - w_1} \right] \right\} \end{aligned} \quad (2.7)$$

It is convenient to introduce two new variables $z_{n-1} \hat{w}_a = w_a$ for $a = 1, 2$. We get

$$\begin{aligned} G_n^{(1)} = & g_{p+1}^2 (2\alpha') z_{n-1}^{2\alpha' [q_1 q_2 + (k_{n-1} + k_n)(q_1 + q_2)]} \int_0^1 d\hat{w}_1 \int_0^{\hat{w}_1} d\hat{w}_2 (\hat{w}_1 - \hat{w}_2)^{2\alpha' q_1 \cdot q_2} \\ & \times \hat{w}_1^{2\alpha' q_1 \cdot k_n} \hat{w}_2^{2\alpha' q_2 \cdot k_n} (1 - \hat{w}_1)^{2\alpha' q_1 \cdot k_{n-1}} (1 - \hat{w}_2)^{2\alpha' q_2 \cdot k_{n-1}} \\ & \times \left\{ \frac{\epsilon_{q_1} \cdot \epsilon_{q_2}}{(\hat{w}_1 - \hat{w}_2)^2} + \left[-\frac{\sqrt{2\alpha'} (k_{n-1} \epsilon_{q_1})}{1 - \hat{w}_1} + \frac{\sqrt{2\alpha'} (k_n \epsilon_{q_1})}{\hat{w}_1} + \frac{\sqrt{2\alpha'} (q_2 \epsilon_{q_1})}{\hat{w}_1 - \hat{w}_2} \right] \right. \\ & \left. \times \left[-\frac{\sqrt{2\alpha'} (k_{n-1} \epsilon_{q_2})}{1 - \hat{w}_2} + \frac{\sqrt{2\alpha'} (k_n \epsilon_{q_2})}{\hat{w}_2} - \frac{\sqrt{2\alpha'} (q_1 \epsilon_{q_2})}{\hat{w}_1 - \hat{w}_2} \right] \right\} \end{aligned} \quad (2.8)$$

We want to extract from the previous sum of integrals the most singular term in the double-soft limit. In this limit, we can approximate $z_{n-1}^{2\alpha' [q_1 q_2 + (k_{n-1} + k_n)(q_1 + q_2)]}$ with 1. The

double-soft behavior of the various integrals is computed in appendix A. Here we give only the final result:

$$\begin{aligned} G_n^{(1)} = g_{p+1}^2 \Bigg\{ & -\frac{(\epsilon_{q_1}\epsilon_{q_2})}{2q_1q_2} \left[\frac{k_n(q_2-q_1)+q_1q_2}{k_n(q_1+q_2)+q_1q_2} + \frac{k_{n-1}(q_1-q_2)+q_1q_2}{k_{n-1}(q_1+q_2)+q_1q_2} \right] \\ & \times \frac{1}{q_1q_2} \left[\frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_n) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_n)}{k_n(q_1+q_2)+q_1q_2} - \frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_{n-1}) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_{n-1})}{k_{n-1}(q_1+q_2)+q_1q_2} \right] \\ & + \frac{(\epsilon_{q_1}k_n)(\epsilon_{q_2}k_n)}{q_2k_n[k_n(q_1+q_2)+q_1q_2]} + \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_{n-1})}{q_1k_{n-1}[k_{n-1}(q_1+q_2)+q_1\cdot q_2]} \\ & - \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_n)}{(q_1k_{n-1})(q_2k_n)} \Bigg\}. \end{aligned} \quad (2.9)$$

In conclusion, the leading double-soft behavior is given by:

$$\begin{aligned} M_{2g;ng} = \frac{g_{p+1}^2}{q_1q_2} \Bigg\{ & -\frac{1}{2}(\epsilon_{q_1}\epsilon_{q_2}) \left[\frac{k_n(q_2-q_1)+q_1q_2}{k_n(q_1+q_2)+q_1q_2} + \frac{k_{n-1}(q_1-q_2)+q_1q_2}{k_{n-1}(q_1+q_2)+q_1q_2} \right] \\ & + \frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_n) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_n)}{(k_n(q_1+q_2)+q_1q_2)} - \frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_{n-1}) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_{n-1})}{(k_{n-1}(q_1+q_2)+q_1q_2)} \\ & + \frac{(\epsilon_{q_1}k_n)(\epsilon_{q_2}k_n)(q_1q_2)}{(k_nq_2)(k_n(q_1+q_2)+q_1q_2)} + \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_{n-1})(q_1q_2)}{(k_{n-1}q_1)(k_{n-1}(q_1+q_2)+q_1q_2)} \\ & - \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_n)(q_1q_2)}{(k_{n-1}q_1)(k_nq_2)} \Bigg\} M_{ng}, \end{aligned} \quad (2.10)$$

which behaves as $\frac{1}{q_1q_2}$ in the double-soft limit, i.e. when both q_1 and q_2 simultaneously go to zero. M_{ng} is the n -gluon amplitude in the bosonic string. We see that, in the double-soft limit, the dependence on α' of the soft factor in eq. (2.9) cancels, while it is still kept in the n -gluon amplitude in eq. (2.5).

One can check gauge invariance of the soft factor in eq. (2.9) by substituting ϵ_{q_1} with q_1 . One gets:

$$-g_{p+1}^2 \left(\frac{(q_1\epsilon_{q_2})}{k_{n-1}(q_1+q_2)+q_1q_2} + \frac{(q_1q_2)(\epsilon_{q_2}k_n)}{(k_nq_2)(k_n(q_1+q_2)+q_1q_2)} \right) \sim q_{1,2}^0. \quad (2.11)$$

The original amplitude behaves as $\frac{1}{q_{1,2}^2}$. Saturating with q_1 , we find that the terms of order $\frac{1}{q_{1,2}}$ cancel and we are left with a term of order $q_{1,2}^0$ that should be cancelled by the next to the leading term, which we have not yet computed.

One can also check gauge invariance with respect to the other soft particle by substituting ϵ_{q_2} with q_2 . One gets:

$$-g_{p+1}^2 \left(\frac{(\epsilon_{q_1}q_2)}{k_n(q_1+q_2)+q_1q_2} + \frac{(\epsilon_{q_1}k_{n-1})(q_1q_2)}{(k_{n-1}(q_1+q_2)+q_1q_2)(k_{n-1}q_1)} \right), \quad (2.12)$$

which is equal to the expression in eq. (2.11) by the substitutions $k_{n-1} \leftrightarrow k_n$ and $q_1 \leftrightarrow q_2$.

In order to see the pole structure of the amplitude, it is convenient to write eq. (2.10) as follows:

$$\begin{aligned} M_{2g;ng} = & \frac{2g_{p+1}^2}{(q_1+q_2)^2} \left\{ \left[-(\epsilon_{q_1}\epsilon_{q_2}) \frac{k_n(q_2-q_1)+q_1q_2}{(k_n+q_1+q_2)^2} + 2 \frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_n) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_n)}{(k_n+q_1+q_2)^2} \right. \right. \\ & + 2 \frac{(\epsilon_{q_1}k_n)(\epsilon_{q_2}k_n)(q_1+q_2)^2}{(k_n+q_2)^2(k_n+q_1+q_2)^2} \\ & - \left. \left[-(\epsilon_{q_2}\epsilon_{q_1}) \frac{k_{n-1}(q_1-q_2)+q_1q_2}{(k_{n-1}+q_1+q_2)^2} + 2 \frac{(\epsilon_{q_1}q_2)(\epsilon_{q_2}k_{n-1}) - (\epsilon_{q_2}q_1)(\epsilon_{q_1}k_{n-1})}{(k_{n-1}+q_1+q_2)^2} \right. \right. \\ & \left. \left. + 2 \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_{n-1})(q_1+q_2)^2}{(k_{n-1}+q_1)^2(k_{n-1}+q_1+q_2)^2} \right] - 2 \frac{(\epsilon_{q_1}k_{n-1})(\epsilon_{q_2}k_n)(q_1+q_2)^2}{(k_{n-1}+q_1)^2(k_n+q_2)^2} \right\} M_{ng} \end{aligned} \quad (2.13)$$

This expression shows a non-trivial pole structure and the various pole singularities are all consistent with the structure of a color-ordered amplitude. In figure 1 we sketch the various pole structures appearing in the previous equation. Notice that the final expression in eq. (2.13) is symmetric under the simultaneous change of $k_{n-1} \leftrightarrow k_n$ and $q_1 \leftrightarrow q_2$.

Finally, eq. (2.10) reproduces eqs. (2.25) and (2.28) of ref. [60] in the gauge chosen there, namely $(\epsilon_{q_2}k_n) = (\epsilon_{q_1}k_{n-1}) = 0$.

In the final part of this section we discuss the case of a color-ordered amplitude where the two soft gluons are not next to each other. In particular, we consider the color-ordered amplitude where a hard gluon, say the one with momentum k_{n-1} , is between the two soft. The gluons are then ordered as $k_1 k_2 \dots k_{n-2} q_1 k_{n-1} q_2 k_n$. The complete amplitude is equal to

$$\begin{aligned} M_{2g;ng} = & \frac{(2\alpha')^{\frac{n-2}{2}}}{\alpha'} g_{p+1}^{n-2} \int \frac{\prod_{i=1}^{n-2} dz_i dz_n}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle (2\alpha' g_{p+1}^2) \\ & \times \int_0^{z_{n-2}} dw_1 \int_0^{w_1} dz_{n-1} \int_0^{z_{n-1}} dw_2 \prod_{i=1}^{n-3} (z_i - w_1)^{2\alpha' k_i q_1} \prod_{i=1}^{n-2} (z_i - w_2)^{2\alpha' k_i q_2} (z_{n-2} - w_1)^{2\alpha' q_1 \cdot k_{n-2}} \\ & \times (w_1 - z_{n-1})^{2\alpha' q_1 k_{n-1}} (z_{n-1} - w_2)^{2\alpha' q_2 k_{n-1}} w_1^{2\alpha' q_1 \cdot k_n} w_2^{2\alpha' q_2 \cdot k_n} (w_1 - w_2)^{2\alpha' q_1 q_2} \\ & \times \prod_{i=1}^n \left(e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_1}{z_i - w_1}} e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_2}{z_i - w_2}} \right) \\ & \times \left\{ \frac{(\epsilon_{q_1}\epsilon_{q_2})}{(w_1 - w_2)^2} + \left[\sum_{i=1}^n \frac{\theta_i(\epsilon_i\epsilon_{q_1})}{(z_i - w_1)^2} - \sum_{i=1}^{n-2} \frac{\sqrt{2\alpha'}(k_i\epsilon_{q_1})}{z_i - w_1} \right. \right. \\ & \quad \left. + \frac{\sqrt{2\alpha'}(k_{n-1}\epsilon_{q_1})}{w_1 - z_{n-1}} + \frac{\sqrt{2\alpha'}(k_n\epsilon_{q_1})}{w_1} + \frac{\sqrt{2\alpha'}(\epsilon_{q_1}q_2)}{w_1 - w_2} \right] \\ & \times \left. \left[\sum_{j=1}^n \frac{\theta_j(\epsilon_j\epsilon_{q_2})}{(z_j - w_2)^2} - \sum_{j=1}^{n-1} \frac{\sqrt{2\alpha'}(k_j\epsilon_{q_2})}{z_j - w_2} + \frac{\sqrt{2\alpha'}(k_n\epsilon_{q_2})}{w_2} - \frac{\sqrt{2\alpha'}(\epsilon_{q_2}q_1)}{w_1 - w_2} \right] \right\}. \end{aligned} \quad (2.14)$$

Since we are interested in the leading double-soft behavior, we can neglect the terms with θ_i in the last four lines of the previous expression and keep in the curly bracket only the terms with momenta. It can be seen that the leading double-soft behavior is obtained by

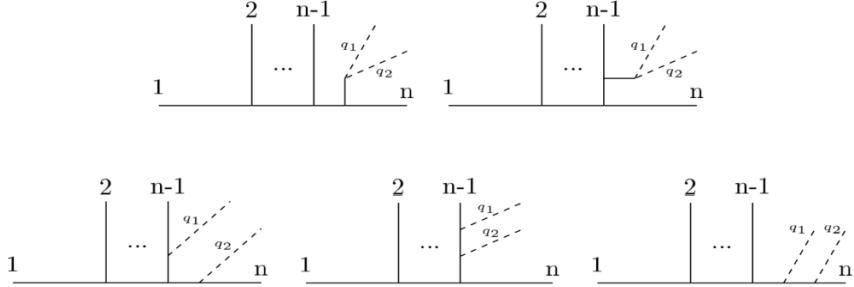

Figure 1. Sketchy diagrams of the color-ordered $n+2$ gluon amplitude, where solid lines are the hard gluons and dashed lines are the soft gluons. Each term in eq. (2.13) corresponds to one of the diagrams, and shows that all poles allowed in the color-ordered amplitude contribute to the double-soft limit.

restricting ourselves to the following expression:

$$\begin{aligned}
 M_{2g;ng} = & \frac{(2\alpha')^{\frac{n-2}{2}}}{\alpha'} g_{p+1}^{n-2} \int \frac{\prod_{i=1}^{n-2} dz_i dz_n}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle \\
 & \times (2\alpha')^2 g_{p+1}^2 \int_0^{z_{n-2}} dw_1 \int_0^{w_1} dz_{n-1} \int_0^{z_{n-1}} dw_2 (z_{n-2} - w_1)^{2\alpha' q_1 k_{n-2}} \\
 & \times (w_1 - z_{n-1})^{2\alpha' q_1 k_{n-1}} (z_{n-1} - w_2)^{2\alpha' q_2 k_{n-1}} w_2^{2\alpha' q_2 k_n} (w_1 - w_2)^{2\alpha' q_1 q_2} \\
 & \times \left[-\frac{(k_{n-2} \epsilon_{q_1})}{z_{n-2} - w_1} + \frac{(k_{n-1} \epsilon_{q_1})}{w_1 - z_{n-1}} \right] \left[-\frac{(k_{n-1} \epsilon_{q_2})}{z_{n-1} - w_2} + \frac{(k_n \epsilon_{q_2})}{w_2} \right]. \quad (2.15)
 \end{aligned}$$

In order to study the double-soft behavior of the four terms that appear in the last line of the previous equation, it is convenient to go to the variables x_i with $i = 1, 2, 3$ that run from 0 to 1:

$$w_1 = z_{n-2} x_1; \quad z_{n-1} = z_{n-2} x_1 x_2; \quad w_2 = z_{n-2} x_1 x_2 \quad (2.16)$$

The Jacobian of the transformation is equal to $z_{n-2}^3 x_1^2 x_2$ and the last three lines of eq. (2.15) become:

$$\begin{aligned}
 & (2\alpha')^2 g_{p+1}^2 \int_0^1 dx_1 \int_0^1 dx_2 \int_0^1 dx_3 [z_{n-2}(1-x_1)]^{2\alpha' q_1 k_{n-2}} [z_{n-2} x_1(1-x_2)]^{2\alpha' q_1 k_{n-1}} \\
 & \times [z_{n-2} x_1 x_2(1-x_3)]^{2\alpha' q_2 k_{n-1}} [z_{n-2} x_1 x_2 x_3]^{2\alpha' q_2 k_n} [z_{n-2} x_1(1-x_2 x_3)]^{2\alpha' q_1 q_2} \\
 & \times z_{n-2} \left[-x_1 \frac{k_{n-2} \epsilon_{q_1}}{1-x_1} + \frac{k_{n-1} \epsilon_{q_1}}{1-x_2} \right] \left[-\frac{k_{n-1} \epsilon_{q_2}}{1-x_3} + \frac{k_n \epsilon_{q_2}}{x_3} \right] \quad (2.17)
 \end{aligned}$$

Let us consider the first term of the square bracket in the last line of the previous equation. The leading double-soft limit is obtained for $x_1 \sim 1$ and $x_3 \sim 1$ and $x_2 \sim 0$ for the two terms in the second square bracket, respectively. In this corner of the integration region $z_{n-1} \equiv x_2 z_{n-2}$ and therefore we get

$$\begin{aligned}
 & (2\alpha')^2 g_{p+1}^2 z_{n-2} \int_0^1 dx_2 \frac{k_{n-2} \epsilon_{q_1}}{2\alpha' q_1 k_{n-2}} \left[\frac{k_{n-1} \epsilon_{q_2}}{2\alpha' q_2 k_{n-1}} - \frac{k_n \epsilon_{q_2}}{2\alpha' q_2 k_n} \right] \\
 & = g_{p+1}^2 \frac{k_{n-2} \epsilon_{q_1}}{q_1 k_{n-2}} \left[\frac{k_{n-1} \epsilon_{q_2}}{q_2 k_{n-1}} - \frac{k_n \epsilon_{q_2}}{q_2 k_n} \right] \int_0^{z_{n-2}} dz_{n-1} \quad (2.18)
 \end{aligned}$$

When multiplied with the first line of eq. (2.15), one gets the two soft terms in eq. (2.18) times the amplitude with n gluons.

The leading double-soft behavior of the product of the second terms of the two square brackets in the last line of eq. (2.17) is obtained for $x_2 \sim 1$ and $x_3 \sim 0$. Therefore, one gets:

$$(2\alpha')^2 g_{p+1}^2 z_{n-2} \int_0^1 dx_1 \frac{k_{n-1}\epsilon_{q_1}}{2\alpha' k_{n-1} q_1} \frac{k_n \epsilon_{q_2}}{2\alpha' k_n q_2} = g_{p+1}^2 \frac{k_{n-1}\epsilon_{q_1}}{k_{n-1} q_1} \frac{k_n \epsilon_{q_2}}{k_n q_2} \int_0^{z_{n-2}} dz_{n-1} \quad (2.19)$$

where we have used that, for $x_2 \sim 1$, we can write $z_{n-1} = z_{n-2}x_1$. When multiplied with the first line of eq. (2.15), one gets again the soft term in eq. (2.19) times the amplitude with n gluons.

The leading double-soft behavior of the last term is a bit more complicated to extract. The relevant terms of eq. (2.17) that one needs to consider, are:

$$\begin{aligned} & - (2\alpha')^2 g_{p+1}^2 z_{n-2} (k_{n-1}\epsilon_{q_1})(k_{n-1}\epsilon_{q_2}) \int_0^1 dx_1 \int_0^1 dx_2 x_2^{2\alpha'(k_{n-1}+k_n)q_2} (1-x_2)^{2\alpha'q_1k_{n-1}-1} \\ & \times \int_0^1 dx_3 (1-x_3)^{2\alpha'q_2k_{n-1}-1} x_3^{2\alpha'q_2k_n} (1-x_2x_3)^{2\alpha'q_1q_2} \end{aligned} \quad (2.20)$$

The dominant contribution comes from the region of the integrals around $x_2 \sim 1$ and $x_3 \sim 1$. It is convenient to first change variables to $y_i = 1 - x_i$ for $i = 2, 3$ and then to $y_2 = tu$ and $y_3 = t(1-u)$ with Jacobian equal to t . Then, eq. (2.20) becomes

$$\begin{aligned} & - (2\alpha')^2 g_{p+1}^2 z_{n-2} (k_{n-1}\epsilon_{q_1})(k_{n-1}\epsilon_{q_2}) \int_0^1 dx_1 \int_0^\epsilon dt t^{2\alpha'(k_{n-1}(q_1+q_2)+q_1q_2)-1} \\ & \times \int_0^1 du u^{2\alpha'k_{n-1}q_1-1} (1-u)^{2\alpha'q_2k_{n-1}-1} (1-tu)^{2\alpha'q_2(k_n+k_{n-1})} (1-t(1-u))^{2\alpha'k_nq_2} \\ & = - (2\alpha')^2 g_{p+1}^2 z_{n-2} (k_{n-1}\epsilon_{q_1})(k_{n-1}\epsilon_{q_2}) \int_0^1 dx_1 \frac{1}{2\alpha'(k_{n-1}(q_1+q_2)+q_1q_2)} \\ & \times \left[\frac{1}{2\alpha'k_{n-1}q_1} + \frac{1}{2\alpha'k_{n-1}q_2} \right] \end{aligned} \quad (2.21)$$

where we have neglected irrelevant factors that go to 1 in the double-soft limit and, by introducing a cutoff ϵ , we have restricted the region of integration for t to a small interval around $t = 0$. Eq. (2.21) is equal to

$$- g_{p+1}^2 \int_0^{z_{n-2}} dz_{n-1} \frac{(k_{n-1}\epsilon_{q_1})(k_{n-1}\epsilon_{q_2})}{(k_{n-1}(q_1+q_2)+q_1q_2)} \left[\frac{1}{k_{n-1}q_1} + \frac{1}{k_{n-1}q_2} \right] \quad (2.22)$$

where, for $x_2 \sim 1$, we have used that $z_{n-1} = z_{n-2}x_1$. When we insert the result in eq. (2.22) in eq. (2.17), we get again the double-soft factor times the amplitude with n gluons.

In conclusion, the double-soft behavior is given by the sum of the previous three terms:

$$\begin{aligned} M_{2g;ng} = g_{p+1}^2 & \left[\frac{k_{n-2}\epsilon_{q_1}}{k_{n-2}q_1} \left(\frac{k_{n-1}\epsilon_{q_2}}{k_{n-1}q_2} - \frac{k_n \epsilon_{q_2}}{k_n q_2} \right) + \frac{k_{n-1}\epsilon_{q_1}}{k_{n-1}q_1} \frac{k_n \epsilon_{q_2}}{k_n q_2} \right. \\ & \left. - \frac{(\epsilon_{q_1} k_{n-1})(\epsilon_{q_2} k_{n-1})}{k_{n-1}(q_1+q_2)+q_1q_2} \left(\frac{1}{k_{n-1}q_1} + \frac{1}{k_{n-1}q_2} \right) \right] M_{ng} \end{aligned} \quad (2.23)$$

It is easy to check that the soft factor is gauge invariant up to terms of order $q_{1,2}^0$ as in the case of two contiguous soft gluons.

Finally, the double-soft behavior when the two soft gluons are separated by more than one leg is just the product of two single soft behaviors.

3 Double-soft behavior with 2 scalars and n gluons

In this section we compute the double-soft behavior of two scalars in an amplitude with n gluons. The amplitude with two scalars and n gluons can be obtained from that computed in the previous section by noticing that, in this case, we have to impose:

$$(\epsilon_i \epsilon_{q_1}) = (\epsilon_i \epsilon_{q_2}) = (\epsilon_{q_1} k_i) = (\epsilon_{q_2} k_i) = (\epsilon_{q_1} q_2) = (\epsilon_{q_2} q_1) = 0. \quad (3.1)$$

We then get

$$M_{2s;ng} = M_{ng} * H_n \quad (3.2)$$

where M_{ng} is given in eq. (2.5) and

$$\begin{aligned} H_n = & (2\alpha' g_{p+1}^2) \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^n (|z_i - w_1|^{2\alpha' k_i q_1} |z_i - w_2|^{2\alpha' k_i q_2}) \\ & \times (w_1 - w_2)^{2\alpha' q_1 q_2} \prod_{i=1}^n \left(e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_1}{z_i - w_1}} e^{\sqrt{2\alpha'} \frac{\theta_i \epsilon_i q_2}{z_i - w_2}} \right) \frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2}. \end{aligned} \quad (3.3)$$

Proceeding as in the previous section we get the integral in eq. (A.1) computed in eq. (A.25). Inserting it in the previous equation, we get

$$H_n = -\frac{g_{p+1}^2}{2q_1 q_2} \left[\frac{k_n(q_2 - q_1) + q_1 q_2}{k_n(q_1 + q_2) + q_1 q_2} + \frac{k_{n-1}(q_1 - q_2) + q_1 q_2}{k_{n-1}(q_1 + q_2) + q_1 q_2} \right], \quad (3.4)$$

that implies

$$M_{2s;ng} = -\frac{g_{p+1}^2}{2q_1 q_2} \left[\frac{k_n(q_2 - q_1) + q_1 q_2}{k_n(q_1 + q_2) + q_1 q_2} + \frac{k_{n-1}(q_1 - q_2) + q_1 q_2}{k_{n-1}(q_1 + q_2) + q_1 q_2} \right] M_{ng}. \quad (3.5)$$

4 Double-soft behavior with $n + 2$ scalars

In this section we compute the double-soft behavior of two scalars in an amplitude with n additional scalar particles instead of gluons. The set-up and the procedure is as in the section for gluons. The scattering amplitude is given by:

$$\begin{aligned} M_{2s;ns} = & \frac{(\sqrt{2\alpha'})^n}{\alpha'} g_{p+1}^n \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \int d\phi_1 d\phi_2 \\ & \times \langle 0 | \prod_{i=1}^{n-1} e^{i(\theta_i \epsilon_i \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} \\ & e^{i(\phi_1 \epsilon_{q_1} \partial_{w_1} + \sqrt{2\alpha'} q_1) X(w_1)} e^{i(\phi_2 \epsilon_{q_2} \partial_{w_2} + \sqrt{2\alpha'} q_2) X(w_2)} e^{i(\theta_n \epsilon_n \partial_{z_n} + \sqrt{2\alpha'} k_n) X(z_n)} | 0 \rangle. \end{aligned} \quad (4.1)$$

Contracting the vertex operators of the states with momenta q_1 and q_2 and remembering that, in this case, all momenta are orthogonal to all polarizations, we get

$$\begin{aligned} M_{2s;ns} &= \frac{(\sqrt{2\alpha'})^n}{\alpha'} g_{p+1}^n \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle \\ &\times \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^{n-1} ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) \\ &\times (w_1 - z_n)^{2\alpha' q_1 k_n} (w_2 - z_n)^{2\alpha' q_2 k_n} (w_1 - w_2)^{2\alpha' q_1 q_2} \\ &\times \int d\phi_1 d\phi_2 e^{-\phi_1 \phi_2 \frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2}} e^{\phi_1 \sum_{i=1}^n \frac{\theta_i (\epsilon_i \epsilon_{q_1})}{(z_i - w_1)^2}} e^{\phi_2 \sum_{i=1}^n \frac{\theta_i (\epsilon_i \epsilon_{q_2})}{(z_i - w_2)^2}}. \end{aligned} \quad (4.2)$$

We can now integrate over ϕ_1 and ϕ_2

$$\begin{aligned} M_{2s;ns} &= g_{p+1}^{n-2} \frac{(\sqrt{2\alpha'})^{n-2}}{\alpha'} \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle \\ &\times 2\alpha' g_{p+1}^2 \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^n ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) \\ &\times (w_1 - w_2)^{2\alpha' q_1 q_2} \left[\frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2} + \sum_{i,j=1}^n \frac{\theta_i \theta_j (\epsilon_{q_1} \epsilon_i)(\epsilon_{q_2} \epsilon_j)}{(z_i - w_1)^2 (z_j - w_2)^2} \right] \equiv M_{ns} * S_n, \end{aligned} \quad (4.3)$$

where

$$M_{ns} = g_{p+1}^{n-2} \frac{(\sqrt{2\alpha'})^{n-2}}{\alpha'} \int \frac{\prod_{i=1}^n dz_i}{dV_{abc}} \prod_{i=1}^n d\theta_i \langle 0 | \prod_{i=1}^n e^{i(\theta_i \epsilon \partial_{z_i} + \sqrt{2\alpha'} k_i) X(z_i)} | 0 \rangle, \quad (4.4)$$

and

$$\begin{aligned} S_n &= 2\alpha' g_{p+1}^2 \int_0^{z_{n-1}} dw_1 \int_0^{w_1} dw_2 \prod_{i=1}^n ((z_i - w_1)^{2\alpha' k_i q_1} (z_i - w_2)^{2\alpha' k_i q_2}) \\ &\times (w_1 - w_2)^{2\alpha' q_1 q_2} \left[\frac{(\epsilon_{q_1} \epsilon_{q_2})}{(w_1 - w_2)^2} + \sum_{i,j=1}^n \frac{\theta_i \theta_j (\epsilon_{q_1} \epsilon_i)(\epsilon_{q_2} \epsilon_j)}{(z_i - w_1)^2 (z_j - w_2)^2} \right]. \end{aligned} \quad (4.5)$$

Similar to the case of gluons, we keep only the leading terms in the double-soft limit. It is also convenient to introduce the new variables $w_1 = z_{n-1} \hat{w}_1$ and $w_2 = z_{n-1} \hat{w}_2$. Then, the previous expression becomes

$$\begin{aligned} S_n &= 2\alpha' g_{p+1}^2 z_{n-1}^{2\alpha' [q_1 q_2 + (k_n + k_{n-1})(q_1 + q_2)]} \int_0^1 d\hat{w}_1 \int_0^{\hat{w}_1} d\hat{w}_2 \\ &\times (1 - \hat{w}_1)^{2\alpha' k_{n-1} q_1} (1 - \hat{w}_2)^{2\alpha' k_{n-1} q_2} \hat{w}_1^{2\alpha' k_n q_1} \hat{w}_2^{2\alpha' k_n q_2} (\hat{w}_1 - \hat{w}_2)^{2\alpha' q_1 q_2} \\ &\times \left[\frac{(\epsilon_{q_1} \epsilon_{q_2})}{(\hat{w}_1 - \hat{w}_2)^2} + z_{n-1}^2 \sum_{i,j=1}^n \frac{\theta_i \theta_j (\epsilon_{q_1} \epsilon_i)(\epsilon_{q_2} \epsilon_j)}{(z_i - z_{n-1} \hat{w}_1)^2 (z_j - z_{n-1} \hat{w}_2)^2} \right]. \end{aligned} \quad (4.6)$$

Also in this case we have two kinds of terms. The first one is without any dependence on the variables θ_i and the convolution multiplies the amplitude with n scalars, while the second

term contains terms with θ_i that modify the structure of M_{ns} . Also in this case it can be shown that only the first term contributes to the leading double-soft limit. Therefore, here we concentrate on the first term taking the term $z_{n-1}^{2\alpha'[q_1q_2+(k_n+k_{n-1})(q_1+q_2)]} = 1$. We get the integral in eq. (A.1) that has been computed in eq. (A.25) and therefore for the first term in the squared bracket in eq. (4.6), one gets:

$$S_n^{(1)} = -\frac{g_{p+1}^2}{2q_1q_2} \left[\frac{k_n(q_2-q_1)+q_1q_2}{k_n(q_1+q_2)+q_1q_2} + \frac{k_{n-1}(q_1-q_2)+q_1q_2}{k_{n-1}(q_1+q_2)+q_1q_2} \right]. \quad (4.7)$$

This means that the double-soft behavior in an amplitude with $n+2$ scalars is given by

$$M_{2s;ns} = -\frac{g_{p+1}^2}{2q_1q_2} \left[\frac{k_n(q_2-q_1)+q_1q_2}{k_n(q_1+q_2)+q_1q_2} + \frac{k_{n-1}(q_1-q_2)+q_1q_2}{k_{n-1}(q_1+q_2)+q_1q_2} \right] M_{ns}. \quad (4.8)$$

5 Conclusions

In this paper we have computed the leading double-soft behavior of the scattering amplitudes with gluons and scalars living in the world-volume of a Dp -brane of the bosonic string. The corresponding field-theory results can be obtained by just sending α' to zero. Our results are valid in any number of space-time dimensions and for an arbitrary gauge choice. We have also for the first time considered and provided the results for the double-soft limit of two gluons that are not contiguous, but separated by a hard gluon in the color-ordered amplitude.

We thank Massimo Bianchi, Andrea Guerrieri and Congkao Wen for discussions.

A Computation of various integrals to the leading order in the double-soft limit

In this appendix we compute the contribution of various integrals in the double-soft limit.

Let us start considering the first integral appearing in eq. (2.8):

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &\equiv \int_0^1 dw_1 \int_0^{w_1} dw_2 w_1^{2\alpha' q_1 k_3} w_2^{2\alpha' q_2 k_3} (1-w_1)^{2\alpha' k_2 q_1} (1-w_2)^{2\alpha' k_2 q_2} \\ &\times (w_1 - w_2)^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.1})$$

and let us show that it is symmetric under the simultaneous exchange of $k_2 \leftrightarrow k_3$ and $q_1 \leftrightarrow q_2$. It is convenient to introduce the variables:

$$x_4 \equiv w_2; \quad x_3 \equiv 1 - w_1 \quad (\text{A.2})$$

The integral becomes:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 dx_3 (1-x_3)^{2\alpha' q_1 k_3} x_3^{2\alpha' q_1 k_2} \int_0^{1-x_3} dx_4 x_4^{2\alpha' q_2 k_3} (1-x_4)^{2\alpha' k_2 q_2} \\ &\times (1-x_3 - x_4)^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.3})$$

It is possible to give an equivalent expression of the integral (A.1):

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 dw_2 w_2^{2\alpha' q_2 k_3} (1 - w_2)^{2\alpha' k_2 q_2} \int_{w_2}^1 dw_1 w_1^{2\alpha' q_1 k_3} (1 - w_1)^{2\alpha' q_1 k_2} \\ &\quad \times (w_1 - w_2)^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.4})$$

Introducing again the variables in eq. (A.2), we get

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 dx_4 x_4^{2\alpha' q_2 k_3} (1 - x_4)^{2\alpha' k_2 q_2} \int_0^{1-x_4} dx_3 (1 - x_3)^{2\alpha' q_1 k_3} x_3^{2\alpha' q_1 k_2} \\ &\quad \times (1 - x_3 - x_4)^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.5})$$

Both representations can be collected in the formula:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 \prod_{i=1}^3 dx_i \delta(1 - x_2 - x_3 - x_4) x_4^{2\alpha' q_2 k_3} (1 - x_4)^{2\alpha' k_2 q_2} (1 - x_3)^{2\alpha' q_1 k_3} \\ &\quad \times x_3^{2\alpha' q_1 k_2} x_2^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.6})$$

Let us now keep the variable x_2 and solve the delta function by eliminating either x_3 or x_4 . By eliminating $x_3 = 1 - x_2 - x_4$ one gets:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 dx_2 \int_0^{1-x_2} dx_4 x_4^{2\alpha' q_2 k_3} (1 - x_4)^{2\alpha' k_2 q_2} \\ &\quad \times (x_2 + x_4)^{2\alpha' q_1 k_3} (1 - x_2 - x_4)^{2\alpha' q_1 k_2} x_2^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.7})$$

Introducing the variables $x_2 = \rho\omega$; $x_4 = \rho(1 - \omega)$ one gets:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 d\rho \rho \int_0^1 d\omega \rho^{2\alpha' q_2 k_3} (1 - \omega)^{2\alpha' q_2 k_3} (1 - \rho(1 - \omega))^{2\alpha' k_2 q_2} \\ &\quad \times \rho^{2\alpha' q_1 k_3} (1 - \rho)^{2\alpha' q_1 k_2} \rho^{2\alpha' q_1 q_2 - 2} \omega^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.8})$$

By changing variable $t = 1 - \omega$, one gets:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 d\rho \rho^{2\alpha'(q_2+q_1)\cdot k_3 + 2\alpha' q_1 q_2 - 1} (1 - \rho)^{2\alpha' q_1 k_2} \int_0^1 dt t^{2\alpha' q_2 k_3} \\ &\quad \times (1 - \rho t)^{2\alpha' k_2 q_2} (1 - t)^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.9})$$

Let us now eliminate instead $x_4 = 1 - x_2 - x_3$. One gets:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 dx_2 \int_0^{1-x_2} dx_3 (1 - x_2 - x_3)^{2\alpha' q_2 k_3} (x_2 + x_3)^{2\alpha' k_2 q_2} (1 - x_3)^{2\alpha' q_1 k_3} \\ &\quad \times x_3^{2\alpha' q_1 k_2} x_2^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.10})$$

By defining again $x_2 = \rho\omega$; $x_3 = \rho(1 - \omega)$ one gets:

$$\begin{aligned} I(k_2, q_1; k_3, q_2) &= \int_0^1 d\rho \rho \int_0^1 d\omega (1 - \rho)^{2\alpha' q_2 k_3} \rho^{2\alpha' k_2 q_2} (1 - \rho(1 - \omega))^{2\alpha' q_1 k_3} \rho^{2\alpha' q_1 k_2} \\ &\quad \times (1 - \omega)^{2\alpha' q_1 k_2} \rho^{2\alpha' q_1 q_2 - 2} \omega^{2\alpha' q_1 q_2 - 2} \end{aligned} \quad (\text{A.11})$$

This equation is obtained from eq. (A.8) by changing $q_1 \leftrightarrow q_2$ and $k_2 \leftrightarrow k_3$ and we get

$$I(k_2, q_1; k_3, q_2) = I(k_3, q_2; k_2, q_1) \quad (\text{A.12})$$

Let us now compute it in the double-soft limit. Let us first change variables $w_1 = z$ and $w_2 = xw_1$ in eq. (A.1) getting

$$I = \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'k_2q_1} \int_0^1 dx x^{2\alpha'q_2k_3} (1-x)^{2\alpha'q_1q_2-2} (1-xz)^{2\alpha'k_2q_2} \quad (\text{A.13})$$

Then, we use the following equation

$$\int_0^1 dt t^{b-1} (1-t)^{c-b-1} (1-ty)^{-a} = \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(c)} {}_2F_1(a, b; c; y) \quad (\text{A.14})$$

to rewrite eq. (A.13) as follows

$$I = \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(c)} \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'k_2q_1} {}_2F_1(a, b; c; z) \quad (\text{A.15})$$

with

$$\begin{aligned} b &= 1 + 2\alpha'q_2k_3; & a &= -2\alpha'k_2q_2 \\ c - b &= 2\alpha'q_1q_2 - 1; & c &= 2\alpha'(q_1 + k_3)q_2 \end{aligned} \quad (\text{A.16})$$

Then we can use

$${}_2F_1(a, b; cz) = (1-z)^{-a} {}_2F_1\left(c-b, a; c; \frac{z}{1-z}\right) \quad (\text{A.17})$$

to get

$$\begin{aligned} I &= \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(a)\Gamma(c-a)} \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'k_2(q_1+q_2)} \\ &\quad \times \int_0^1 dx x^{a-1} (1-x)^{c-a-1} \left(1 - \frac{zx}{z-1}\right)^{b-c} \\ &= \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(a)\Gamma(c-a)} \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'k_2(q_1+q_2)} \\ &\quad \times \int_0^1 dt (1-t)^{a-1} t^{c-a-1} \left(\frac{1-zt}{1-z}\right)^{b-c} \end{aligned} \quad (\text{A.18})$$

It is equal to

$$\begin{aligned} I &= \frac{\Gamma(b)\Gamma(c-b)}{\Gamma(a)\Gamma(c-a)} \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'(k_2(q_1+q_2)+q_1q_2)-1} \\ &\quad \times \int_0^1 dt (1-t)^{-2\alpha'k_2q_2-1} t^{2\alpha'q_2(k_2+k_3+q_1)-1} (1-zt)^{1-2\alpha'q_1q_2} \end{aligned} \quad (\text{A.19})$$

Introducing, for the sake of simplicity, the momentum $k_1 = -k_2 - k_3 - q_1 - q_2$, yields

$$\begin{aligned} I &= \frac{\Gamma(b)\Gamma(2\alpha'q_1q_2-1)}{\Gamma(-2\alpha'k_2q_2)\Gamma(-2\alpha'q_2k_1)} \int_0^1 dz z^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-z)^{2\alpha'(k_2(q_1+q_2)+q_1q_2)-1} \\ &\quad \times \int_0^1 dt (1-t)^{-2\alpha'k_2q_2-1} t^{-2\alpha'q_2k_1-1} (1-zt)^{1-2\alpha'q_1q_2} \end{aligned} \quad (\text{A.20})$$

Keeping only the term with 1 in the exponent of the last term, we can easily compute the two integrals. One gets:

$$\begin{aligned} I &= \frac{\Gamma(b)\Gamma(2\alpha'q_1q_2-1)}{\Gamma(-2\alpha'k_2q_2)\Gamma(-2\alpha'q_2k_1)} \left[\frac{\Gamma(2\alpha'(k_3(q_1+q_2)+q_1q_2))\Gamma(2\alpha'(k_2(q_1+q_2)+q_1q_2))}{\Gamma(2\alpha'((k_3+k_2)(q_1+q_2)+2q_1q_2))} \right. \\ &\quad \times \frac{\Gamma(-2\alpha'k_2q_2)\Gamma(-2\alpha'q_2k_1)}{\Gamma(-2\alpha'q_2(k_1+k_2))} - \frac{\Gamma(2\alpha'(k_3(q_1+q_2)+q_1q_2)+1)\Gamma(2\alpha'(k_2(q_1+q_2)+q_1q_2))}{\Gamma(2\alpha'((k_3+k_2)(q_1+q_2)+2q_1q_2)+1)} \\ &\quad \left. \times \frac{\Gamma(-2\alpha'k_2q_2)\Gamma(1-2\alpha'q_2k_1)}{\Gamma(1-2\alpha'q_2(k_1+k_2))} \right] \end{aligned} \quad (\text{A.21})$$

It can be rewritten as follows

$$\begin{aligned} I &= \frac{\Gamma(b)\Gamma(2\alpha'q_1q_2+1)}{(2\alpha'q_1q_2)(2\alpha'q_1q_2-1)\Gamma(-2\alpha'q_2k_1)} \frac{\Gamma(1-2\alpha'q_2k_1)}{\Gamma(1-2\alpha'q_2(k_1+k_2))} \\ &\quad \times \frac{\Gamma(1+2\alpha'(k_3(q_1+q_2)+q_1q_2))\Gamma(1+2\alpha'(k_2(q_1+q_2)+q_1q_2))}{\Gamma(1+2\alpha'((k_3+k_2)(q_1+q_2)+2q_1q_2))} \\ &\quad \times \left[\frac{q_2(k_1+k_2)}{2\alpha'q_2k_1} \left(\frac{1}{(k_3(q_1+q_2)+q_1q_2)} + \frac{1}{(k_2(q_1+q_2)+q_1q_2)} \right) \right. \\ &\quad \left. - \frac{1}{2\alpha'(k_2(q_1+q_2)+q_1q_2)} \right] \end{aligned} \quad (\text{A.22})$$

that is equal to

$$\begin{aligned} I &= \frac{\Gamma(b)(-1)\Gamma(2\alpha'q_1q_2+1)}{(2\alpha'q_1q_2)(2\alpha'q_1q_2-1)\Gamma(1-2\alpha'q_2k_1)} \frac{\Gamma(1-2\alpha'q_2k_1)}{\Gamma(1-2\alpha'q_2(k_1+k_2))} \\ &\quad \times \frac{\Gamma(1+2\alpha'(k_3(q_1+q_2)+q_1q_2))\Gamma(1+2\alpha'(k_2(q_1+q_2)+q_1q_2))}{\Gamma(1+2\alpha'((k_3+k_2)(q_1+q_2)+2q_1q_2))} \\ &\quad \times \left[\frac{q_2(k_1+k_2)}{(k_3(q_1+q_2)+q_1q_2)} + \frac{k_2q_2}{k_2(q_1+q_2)+q_1q_2} \right] \end{aligned} \quad (\text{A.23})$$

In the double-soft limit one gets:

$$I^{ft} = \frac{1}{2\alpha'q_1q_2} \left[-\frac{q_2(k_3+q_1)}{k_3(q_1+q_2)+q_1q_2} + \frac{k_2q_2}{k_2(q_1+q_2)+q_1q_2} \right] \quad (\text{A.24})$$

Because of the symmetry in eq. (A.12), we must symmetrize the previous expression getting:

$$I^{ft} = -\frac{1}{4\alpha'q_1q_2} \left[\frac{k_3(q_2-q_1)+q_1q_2}{k_3(q_1+q_2)+q_1q_2} + \frac{k_2(q_1-q_2)+q_1q_2}{k_2(q_1+q_2)+q_1q_2} \right] \quad (\text{A.25})$$

In the second part of this section we compute the remaining nine integrals in eq. (2.7) in the double-soft limit (q_1 and q_2 going simultaneously to zero).

The term with the denominator $\frac{1}{w_1(w_1-w_2)}$ can be written as follows after having taken $w_2 = w_1x$:

$$\begin{aligned} I_{w_1;w_1-w_2} &\equiv \int_0^1 dw_1 \int_0^1 dx w_1^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-x)^{2\alpha'q_1q_2-1} (1-w_1)^{2\alpha'k_2q_1} \\ &\quad \times (1-w_1x)^{2\alpha'k_2q_2} w_1^{2\alpha'q_1k_3} x^{2\alpha'q_2k_3} \\ &\sim \frac{1}{(2\alpha'q_1q_2)2\alpha'(k_3(q_1+q_2)+q_1q_2)} \end{aligned} \quad (\text{A.26})$$

The term with the denominator $\frac{1}{w_2(w_1-w_2)}$ can be written as follows after having taken $w_2 = w_1 x$:

$$\begin{aligned}
I_{w_2;w_1-w_2} &\equiv \int_0^1 dw_1 \int_0^1 dx w_1^{2\alpha'((q_1+q_2)k_3+q_1q_2)-1} (1-x)^{2\alpha'q_1q_2-1} \\
&\quad \times (1-w_1x)^{2\alpha'k_2q_2} (1-w_1)^{2\alpha'k_2q_1} x^{2\alpha'q_2k_3-1} \\
&\sim \frac{1}{2\alpha'((q_1+q_2)k_3+q_1q_2)} \frac{\Gamma(2\alpha'k_3q_2)\Gamma(2\alpha'q_1q_2)}{\Gamma(2\alpha'(q_1q_2+k_3q_2))} \\
&\sim \frac{1}{2\alpha'((q_1+q_2)k_3+q_1q_2)} \frac{2\alpha'(q_1q_2+k_3q_2)}{(2\alpha'q_1q_2)(2\alpha'k_3q_2)} \\
&= \frac{1}{(2\alpha'q_1q_2)2\alpha'(k_3(q_1+q_2)+q_1q_2)} \tag{A.27}
\end{aligned}$$

The term with the denominator $\frac{1}{(1-w_2)(w_1-w_2)}$ can be written as follows:

$$\begin{aligned}
I_{1-w_2;w_1-w_2} &\equiv \int_0^1 dw_2 \int_{w_2}^1 dw_1 (w_1-w_2)^{2\alpha'q_1q_2-1} (1-w_1)^{2\alpha'k_2q_1} \\
&\quad \times (1-w_2)^{2\alpha'k_2q_2-1} w_1^{2\alpha'q_1k_3} w_2^{2\alpha'q_2k_3} \tag{A.28}
\end{aligned}$$

Introducing the new variables $w_1 = 1 - x_1$ and $w_2 = 1 - x_2$, one gets

$$\begin{aligned}
I_{1-w_2;w_1-w_2} &\equiv \int_0^1 dx_2 \int_0^{x_2} dx_1 (x_2-x_1)^{2\alpha'q_1q_2-1} x_1^{2\alpha'k_2q_1} x_2^{2\alpha'k_2q_2-1} \\
&\quad \times (1-x_1)^{2\alpha'q_1k_3} (1-x_2)^{2\alpha'q_2k_3} \tag{A.29}
\end{aligned}$$

By introducing the variable $x_1 = x_2 x$ we get

$$\begin{aligned}
I_{1-w_2;w_1-w_2} &\equiv \int_0^1 dx_2 \int_0^1 dx x_2^{2\alpha'(q_1q_2+k_2(q_1+q_2))-1} (1-x)^{2\alpha'q_1q_2-1} x^{2\alpha'k_2q_1} \\
&\quad \times x_2^{2\alpha'k_2q_2-1} (1-x_2x)^{2\alpha'q_1k_3} (1-x_2)^{2\alpha'q_2k_3} \\
&\sim \frac{1}{(2\alpha'q_1q_2)2\alpha'(q_1q_2+k_2(q_1+q_2))} \tag{A.30}
\end{aligned}$$

The term with the denominator $\frac{1}{(1-w_1)(w_1-w_2)}$ can be written as:

$$\begin{aligned}
I_{1-w_1;w_1-w_2} &\equiv \int_0^1 dw_2 \int_{w_2}^1 dw_1 (w_1-w_2)^{2\alpha'q_1q_2-1} (1-w_1)^{2\alpha'k_2q_1-1} \\
&\quad \times (1-w_2)^{2\alpha'k_2q_2} w_1^{2\alpha'q_1k_3} w_2^{2\alpha'q_2k_3} \tag{A.31}
\end{aligned}$$

Introducing the variables $w_1 = 1 - x_1$ and $w_2 = 1 - x_2$, one gets:

$$\begin{aligned}
I_{1-w_1;w_1-w_2} &\equiv \int_0^1 dx_2 \int_0^{x_2} dx_1 (x_2-x_1)^{2\alpha'q_1q_2-1} x_1^{2\alpha'k_2q_1-1} x_2^{2\alpha'k_2q_2} \\
&\quad \times (1-x_1)^{2\alpha'q_1k_3} (1-x_2)^{2\alpha'q_2k_3} \tag{A.32}
\end{aligned}$$

Changing variable $x_1 = x_2x$, we get

$$\begin{aligned}
I_{1-w_1;w_1-w_2} &\equiv \int_0^1 dx_2 \int_0^1 dx x_2^{2\alpha'(k_2(q_1+q_2)+q_1q_2)-1} (1-x)^{2\alpha'q_1q_2-1} \\
&\quad \times x^{2\alpha'k_2q_1-1} (1-x_2x)^{2\alpha'q_1k_3} (1-x_2)^{2\alpha'q_2k_3} \\
&\sim \frac{1}{2\alpha'(k_2(q_1+q_2)+q_1q_2)} \frac{\Gamma(2\alpha'q_1q_2)\Gamma(2\alpha'k_2q_1)}{\Gamma(2\alpha'q_1(q_2+k_2))} \\
&\sim \frac{1}{2\alpha'(k_2(q_1+q_2)+q_1q_2)} \frac{2\alpha'(k_2(q_1+q_2))}{(2\alpha'q_1q_2)(2\alpha'k_2q_1)} \\
&= \frac{1}{2\alpha'(k_2(q_1+q_2)+q_1q_2)} \frac{1}{2\alpha'q_1q_2}
\end{aligned} \tag{A.33}$$

After the change of variable $w_2 = w_1x$, the term with the denominator $\frac{1}{w_1w_2}$ is given by:

$$\begin{aligned}
I_{w_1;w_2} &\equiv \int_0^1 dw_1 w_1^{2\alpha'(k_3(q_1+q_2)+q_1q_2)-1} (1-w_1)^{2\alpha'k_2q_1} \int_0^1 dx x^{2\alpha'q_2k_3-1} \\
&\quad \times (1-x)^{2\alpha'q_1q_2} (1-xw_1)^{2\alpha'k_2q_2} \\
&\sim \frac{1}{2\alpha'(k_3(q_1+q_2)+q_1q_2)(2\alpha'k_3q_2)}
\end{aligned} \tag{A.34}$$

The term with the denominator $\frac{1}{(1-w_1)(1-w_2)}$ after the change of variables $w_1 = 1-x_1$ and $w_2 = 1-x_2$ is equal to:

$$\begin{aligned}
I_{1-w_1;1-w_2} &\equiv \int_0^1 dx_1 x_1^{2\alpha'q_1k_2-1} (1-x_1)^{2\alpha'q_1k_3} \int_{x_1}^1 dx_2 (1-x_2)^{2\alpha'q_2k_3} x_2^{2\alpha'k_2q_2-1} (x_2-x_1)^{2\alpha'q_2q_1} \\
&= \int_0^1 dx_2 x_2^{2\alpha'k_2q_2-1} (1-x_2)^{2\alpha'q_2k_3} \int_0^{x_2} dx_1 x_1^{2\alpha'q_1k_2-1} (1-x_1)^{2\alpha'q_1k_3} (x_2-x_1)^{2\alpha'q_2q_1}
\end{aligned} \tag{A.35}$$

After changing variable $x_1 = x_2x$ we get

$$\begin{aligned}
I_{1-w_1;1-w_2} &\equiv \int_0^1 dx_2 x_2^{2\alpha'(k_2(q_1+q_2)+q_1q_2)-1} (1-x_2)^{2\alpha'q_2k_3} \int_0^1 dx x^{2\alpha'q_1k_2-1} \\
&\quad \times (1-x)^{2\alpha'q_1q_2} (1-x_2x)^{2\alpha'q_1k_3} \\
&\sim \frac{1}{2\alpha'(k_2(q_1+q_2)+q_1q_2)(2\alpha'q_1k_2)}
\end{aligned} \tag{A.36}$$

It is obtained from the one in eq. (A.34) with the substitution $k_3 \leftrightarrow k_2$ and $q_1 \leftrightarrow q_2$.

The term with the factor $(1 - w_1)w_2$ in the denominator is given by

$$\begin{aligned}
I_{1-w_1;w_2} &\equiv \int_0^1 dw_1 \int_0^{w_1} dw_2 w_1^{2\alpha' k_3 q_1} (1-w_1)^{2\alpha' k_2 q_1 - 1} \\
&\quad \times w_2^{2\alpha' k_3 q_2 - 1} (1-w_2)^{2\alpha' k_2 q_2} (w_1 - w_2)^{2\alpha' q_1 q_2} \\
&= \int_0^1 dw_1 w_1^{2\alpha' (k_3(q_1+q_2)+q_1 q_2)} (1-w_1)^{2\alpha' k_2 q_1 - 1} \\
&\quad \times \int_0^1 dt t^{2\alpha' k_3 q_2 - 1} (1-t)^{2\alpha' q_1 q_2} (1-t w_1)^{2\alpha' k_2 q_2} \\
&\sim \frac{1}{(2\alpha' k_2 q_1)(2\alpha' k_3 q_2)}
\end{aligned} \tag{A.37}$$

where we have kept only the first term (1) of the expansion of the last term in the previous equation. The last integral to compute is the one with the terms $w_1(1-w_2)$ in the denominator:

$$\begin{aligned}
I_{w_1;1-w_2} &\equiv \int_0^1 dw_1 \int_0^{w_1} dw_2 (1-w_1)^{2\alpha' q_1 k_2} w_1^{2\alpha' q_1 k_3 - 1} (w_1 - w_2)^{2\alpha' q_1 q_2} (1-w_2)^{2\alpha' q_2 k_2 - 1} w_2^{2\alpha' q_2 k_3} \\
&= \int_0^1 dw_1 \int_0^{w_1} dw_2 (1-w_1)^{2\alpha' q_1 k_2} w_1^{2\alpha' q_1 k_3 - 1} \\
&\quad \times (w_1 - w_2)^{2\alpha' q_1 q_2} \left(-\frac{1}{2\alpha' q_2 k_2} \frac{\partial}{\partial w_2} \right) (1-w_2)^{2\alpha' q_2 k_2} w_2^{2\alpha' q_2 k_3} \\
&= \int_0^1 dw_1 \int_0^{w_1} dw_2 (1-w_1)^{2\alpha' q_1 k_2} w_1^{2\alpha' q_1 k_3 - 1} (w_1 - w_2)^{2\alpha' q_1 q_2} \\
&\quad \times (1-w_2)^{2\alpha' q_2 k_2} w_2^{2\alpha' q_2 k_3} \left[\frac{q_2 \cdot k_3}{q_2 k_2} w_2^{-1} - \frac{q_1 q_2}{q_2 k_2} (w_1 - w_2)^{-1} \right] = 0
\end{aligned} \tag{A.38}$$

as one can see from eqs. (A.34) and (A.26). Finally, the term involving $I_{w_1-w_2;w_1-w_2}$ is directly seen to be subleading in the double-soft limit, due to the explicit factor of $q_1 q_2$ that multiplies this integral, and is thus not needed.
