# Synthesis and rhodium complexes of macrocyclic PNP and PONOP pincer ligands $\dagger$ 

Thomas M. Hood, (D) Matthew R. Gyton (1D) and Adrian B. Chaplin (D)*

#### Abstract

The synthesis of macrocyclic variants of commonly employed phosphine-based pincer ligands derived from lutidine (PNP-14) and 2,6-dihydroxypyridine (PONOP-14) is described, where the P-donors are trans-substituted with a tetradecamethylene linker. This was accomplished using an eight-step procedure involving borane protection, ring-closing olefin metathesis, chromatographic separation from the cissubstituted diastereomers, and borane deprotection. The rhodium coordination chemistry of these ligands has been explored, aided by the facile synthesis of 2,2'-biphenyl (biph) adducts $[\operatorname{Rh}(P N P-14)(b i p h)]\left[B A r^{F}\right]$ and $[\operatorname{Rh}(\mathrm{PONOP}-14)(\mathrm{biph})]\left[\mathrm{BAr}_{4}\right]\left(\mathrm{Ar}^{\mathrm{F}}=3,5-\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}\right)$. Subsequent hydrogenolysis enabled generation of dihydrogen, ethylene and carbonyl derivatives; notably the $\nu(\mathrm{CO})$ bands of the carbonyl complexes provide a means to compare the donor properties of the new pincer ligands with established acyclic congeners.

## Introduction

Phosphine-based pincers are an important ligand class in organometallic chemistry and catalysis, enabling a diverse variety of metal-based reactivity. ${ }^{1}$ Their ability to support reactive metal fragments is often exploited in the literature, with notable examples including a $\sigma$-methane complex, ${ }^{2}$ alkane dehydrogenation catalysts, ${ }^{3}$ and complexes capable of enacting the activation of $\mathrm{C}\left(\mathrm{sp}^{3}\right)-\mathrm{F}$ bonds. ${ }^{4}$ Although mer-tridentate donor geometries are in principle highly tuneable and adaptable ligand scaffolds, the majority of phosphine-based pincers employed in the literature feature homoleptic aryl and alkyl phosphine donors, exemplified in the case of lutidine- and 2,6-dihydroxypyridine-derived variants by PNP-tBu and PONOP-tBu (Chart 1). ${ }^{5,6}$ Motivated by the potential to exploit additional reaction control though their unique steric profile, use in the construction of interlocked assemblies, and as an extension of our related work with NHC-based pincer ligands, ${ }^{7,8}$ we became interested in developing the chemistry of macrocyclic phosphine-based pincers. We herein describe the racemic synthesis of the first macrocyclic pincers PNP-14 and PONOP-14, where the chiral P-donors are trans-substituted

[^0]with a tetradecamethylene linker, and some representative complexes with rhodium. ${ }^{9}$

## Results and discussion

## Preparation of borane protected ligands

PNP-14.2 $\mathrm{BH}_{3}$ (trans-1a) and PONOP-14•2BH ${ }_{3}$ (trans-1b) were prepared from commercially available tert-butyldichlorophosphine using the seven-step synthesis outlined in Scheme 1. Amination of the starting material, ${ }^{10}$ enabled selective mono-alkylation ( $2, \delta_{31 \mathrm{P}} 73.3$ ) and following treatment with HCl chloro-tert-butyl-octen-7-yl-phosphine 3 ( $\delta_{3^{31}} 128.7$ ) was obtained in $92 \%$ yield over three steps. Substitution of 3 by nucleophiles derived from the deprotonation of 2,6-dihydroxypyridine hydrochloride or 2,6-lutidine affords acyclic $\mathbf{4 a}\left(\delta_{3^{11}}\right.$ 33.7 ) and $\mathbf{4 b}$ ( $\delta_{3_{11}} 144.7$ ) as inseparable mixtures of diastereomers in $55 \%$ and $72 \%$ yield, respectively, after borane protec-

Scheme 1 Preparation of PNP-14•2BH3 (trans-1a) and PONOP-14•2BH3 (trans-1b).
tion at $-78^{\circ} \mathrm{C}$ and purification by chromatography. Thereafter, olefin metathesis of $\mathbf{4 a} / \mathbf{b}$ under dilute conditions ( $<4 \mathrm{mmol}$ $\mathrm{L}^{-1}$ ) using Grubbs' $1^{\text {st }}$ generation catalyst generated the corresponding macrocycles (cis-5a/b, $\delta_{31 \mathrm{P}} 33.8 / 144.8$; trans-5a/b, $\delta_{31 \mathrm{P}}$ $34.0 / 143.4)$. The component diastereomers of $5 \mathbf{a} / \mathbf{b}$ were separated using column chromatography and subsequently hydrogenated using Wilkinson's catalyst to produce the saturated derivatives (cis-1a/b, $\delta_{3_{11} \mathrm{P}} 33.3 / 145.1$; trans-1a/b, $\delta_{31 \mathrm{P}} 33.9 / 144.1$ ). In this way trans-1a/b were obtained as analytically pure racemates, in practically useful overall yields of $14 / 22 \%$, with their configurations confirmed by single crystal X-ray diffraction (Fig. 1).

## Deprotection

Deprotection of phosphine-boranes is commonly achieved by reactions with excess amine. ${ }^{11}$ Gratifyingly, treatment of trans-1a with neat $\mathrm{Et}_{2} \mathrm{NH}$ at $85{ }^{\circ} \mathrm{C}$ resulted in complete conversion to the free-base PNP-14 ( $\delta_{31 \mathrm{P}} 4.5$ ) within 36 h , which was subsequently isolated in quantitative yield on removal of volatiles. Reactions between trans- $\mathbf{1 b}$ and $\mathrm{Et}_{2} \mathrm{NH}$ under a range of conditions were,
however, characterised by a significant degree of ligand decomposition that we ascribe to rupture of at least one of the P-O bonds. ${ }^{12}$ Evaluation of a range of other deprotection methods ${ }^{13}$ gave similar outcomes (see ESI $\dagger$ ) and consequently we have so far been unable to obtain pure samples of the free-base. Nevertheless, conditions under which PONOP-14 ( $\delta_{31 \mathrm{P}} 146.5$ ) can be generated in situ in 69-83\% purity were identified: prolonged stirring of trans- $\mathbf{1 b}\left(3.8 \mathrm{mmol} \mathrm{L}^{-1}\right)$ in $1: 1 \mathrm{THF}$ : $\mathrm{Et}_{2} \mathrm{NH}$ at $19{ }^{\circ} \mathrm{C}$.

## Rhodium complexes

As convenient $\{\operatorname{Rh}(\text { pincer })\}^{+}$synthons, the synthesis of five coordinate derivatives $[\mathrm{Rh}($ pincer $)(\mathrm{biph})]\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right]$ (pincer $=$ PNP-14, 6a; PONOP-14, 6b; biph $=2,2^{\prime}$-biphenyl; $\mathrm{Ar}^{\mathrm{F}}=3,5-$ $\left(\mathrm{CF}_{3}\right)_{2} \mathrm{C}_{6} \mathrm{H}_{3}$ ) were targeted (Scheme 2). Exploiting a rhodium(III) precursor first described by Jones, ${ }^{14}$ and informed by previous work in our laboratories, ${ }^{7,15,16} \mathbf{6 a} / \mathbf{b}$ were obtained as analytically pure materials in good isolated yield (79/69\%) using a one-pot procedure involving substitution reactions of $[\mathrm{Rh}(\mathrm{biph})(\mathrm{dtbpm}) \mathrm{Cl}]$ (dtbpm $=$ bis(di-tert-butylphosphino)methane) with isolated

Fig. 1 Solid-state structures of trans-1a (left) and trans-1b (right). Thermal ellipsoids drawn at 50\% probability; hexane solvent (trans-1b) omitted for clarity. Selected bond lengths (Å): trans-1a, P2-B2, 1.918(2), P3-B3, 1.922(2); trans-5b, P2-B2, 1.903(3), P3-B3, 1.898(3).

Scheme 2 Preparation of rhodium complexes of PNP-14 and PONOP-14.

PNP-14 or in situ generated samples of PONOP-14 in the weakly coordinating solvent fluorobenzene ${ }^{17}$ and subsequent addition of $\mathrm{Na}\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right]$ as a halide abstracting agent. Complexes $\mathbf{6 a}$ and $\mathbf{6 b}$ are characterised in solution by pairs of ${ }^{31} \mathrm{P}$ resonances centred at $\delta 43.1\left({ }^{1} J_{\mathrm{RhP}}=110 \mathrm{~Hz}\right) / 38.4\left({ }^{1} J_{\mathrm{RhP}}=113 \mathrm{~Hz}\right)$ and $\delta 191.1\left({ }^{1} \int_{\mathrm{RhP}}=\right.$ $110 \mathrm{~Hz}) / 182.9\left({ }^{1}{ }^{\mathrm{RhP}}=121 \mathrm{~Hz}\right)$, which display diagnostic trans-phosphine ${ }^{2} J_{\mathrm{PP}}$ coupling of 339 and 372 Hz , respectively, and indicate adoption of $C_{1}$ symmetry. Whilst the acyclic congeners [ Rh (pincer) (biph) $]\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right]$ (pincer = PNP- $t \mathrm{Bu}, \mathbf{6 a}^{\prime}$; PONOP- $t \mathrm{Bu}, \mathbf{6 b}^{\prime}$ ) highlight the propensity for dynamic pseudorotation of the biph ligand on the NMR timescale, ${ }^{15}$ the tetradecamethylene linker appears to preclude such fluxionality in $\mathbf{6 a} / \mathbf{6 b}$.

The solid-state structures of $\mathbf{6 a} / \mathbf{6 b}$ demonstrate the adoption of distorted square pyramidal metal geometries, inferred from solution (Fig. 2). The methylene chains of the pincer ligands are skewed to one side of the basal plane, presumably to minimise steric buttressing with the biph ligand, and contorted to enable adoption of a weak $\gamma$-agostic interactions $\left(\underline{R h 1} \cdots \mathrm{H}-\mathrm{C} 129=3.184(2) \AA\right.$ Aa; 2.925(5) Å, 6b). ${ }^{18}$ Agostic interactions of comparable magnitude are observed in $\mathbf{6} \mathbf{a}^{\prime} / \mathbf{6} \mathbf{b}^{\prime}$ and closely related rhodium $2,2^{\prime}$-biphenyl complexes of a NHCbased macrocyclic pincer ligand. ${ }^{7,15}$

Reaction of $\mathbf{6 a} / \mathbf{b}$ with dihydrogen ( 1 atm ) in 1,2-difluorobenzene (DFB) $)^{17}$ resulted in hydrogenolysis of the biph ligand
and formation of $7 \mathbf{a} / \mathbf{b}\left[\delta^{3_{11} \mathrm{P}} 65.9\left({ }^{1} J_{\mathrm{RhP}}=120 \mathrm{~Hz}\right) / \delta_{31 \mathrm{P}} 211.5\right.$ $\left.\left({ }^{1} J_{\mathrm{RhP}}=127 \mathrm{~Hz}\right)\right]$, but elevated temperature and prolonged reactions times were required for complete conversion ( $t=2$ days $/ 5$ days at $85^{\circ} \mathrm{C}$, Scheme 2). In both cases, no organometallic intermediates were observed during this reaction and biphenyl was the sole by-product. The spectroscopic characteristics are consistent with formulation of $7 \mathbf{a} / \mathbf{b}$ as $C_{2}$ symmetric rhodium(I) dihydrogen complexes, with broad 2 H resonances at $\delta$ $-10.76 /-8.51$ that exhibit short spin-lattice relaxation $\left(T_{1}=45\right.$ $\pm 11 / 48 \pm 6 \mathrm{~ms})$ at $298 \mathrm{~K}(600 \mathrm{MHz}, \mathrm{Ar})$ the most diagnostic. ${ }^{19}$ Subsequent reaction in situ with ethylene ( 1 atm ) confers the corresponding $C_{2}$ symmetric $\pi$-complexes 8a/8b $\left[\delta_{31 \mathrm{P}} 53.0\left({ }^{1} J_{\mathrm{RhP}}\right.\right.$ $\left.=125 \mathrm{~Hz}) / \delta_{31 \mathrm{P}} 199.1\left({ }^{1} J_{\mathrm{RhP}}=129 \mathrm{~Hz}\right)\right]$, with concomitant formation of ethane, in quantitative spectroscopic yield within 5 min at RT. Coordination of ethylene is substantiated by chemically inequivalent 2 H signals at $\delta 3.70 / 3.52$ and 3.95/ 3.70, and ${ }^{13} \mathrm{C}$ resonances at $\delta 55.0\left({ }^{1} J_{\mathrm{RhC}}=12 \mathrm{~Hz}\right)$ and 59.5 $\left({ }^{1} J_{\mathrm{RhC}}=11 \mathrm{~Hz}\right)$, which display appreciable coupling to ${ }^{103} \mathrm{Rh}$, for $\mathbf{8 a}$ and $\mathbf{8 b}$ respectively. Finally, $C_{2}$ symmetric carbonyl compounds 9a/b [ $\delta_{31 \mathrm{P}} 67.5\left({ }^{1} J_{\mathrm{RhP}}=122 \mathrm{~Hz}\right) / \delta_{31 \mathrm{P}} 210.8\left({ }^{1} J_{\mathrm{RhP}}=\right.$ 128 Hz )] are obtained by substitution of ethylene on reaction of $\mathbf{8 a} / \mathbf{b}$ with carbon monoxide ( $1 \mathrm{~atm}<5 \mathrm{~min}$ at RT ), isolated from solution in 96/72\% yield overall from 6a/b and fully characterised, including in the case of $\mathbf{9 b}$ in the solid state by

X-ray diffraction (Fig. 2). The $\nu$ (CO) bands of rhodium(I) carbonyl derivatives are diagnostic reporter groups for the donor properties of pincer ligands. ${ }^{20,21}$ Comparison of the carbonyl bands of $\mathbf{9 a} / \mathbf{b}$ with those of acyclic congeners $\mathbf{9 a} / \mathbf{b}^{\prime},{ }^{15,22}$ recorded under the same conditions, suggests PNP-14 and PONOP-14 are marginally weaker net donors than PNP- $t \mathrm{Bu}$ and PONOP- $t \mathrm{Bu}$, respectively (Table 1). By reference to IR data reported for $[\mathrm{Rh}(\mathrm{PNP}-i \mathrm{Pr})(\mathrm{CO})]\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right] \quad$ (9a"; ${ }^{\prime}$ PNP- $i \mathrm{Pr}=2,6-$ $\left.\left(i \mathrm{Pr}_{2} \mathrm{PCH}_{2}\right)_{2} \mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}\right)$ and trends established for monodentate phosphines, these minor differences are in line with changes in the phosphine/phosphinite substituents alone. ${ }^{20,23}$

## Conclusions

An eight-step procedure for the synthesis of two macrocyclic phosphine-based pincer ligands, where the P-donors are transsubstituted with a tetradecamethylene linker, has been developed. These ligands are derived from lutidine (PNP-14) and 2,6-dihydroxypyridine (PONOP-14), with key steps involving borane protection, ring-closing olefin metathesis, chromatographic separation from the cis-substituted diastereomers, and borane deprotection. The final step was accomplished by borane transfer to diethylamine, but a non-trivial amount of decomposition could not be avoided in the case of the phosphinite pincer. The rhodium coordination chemistry of these ligands has been explored, with 2,2'-biphenyl (biph) complexes $[\mathrm{Rh}(\mathrm{PNP}-14)$ (biph) $]\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right]$ and $[\mathrm{Rh}(\mathrm{PONOP}-14)(\mathrm{biph})]\left[\mathrm{BAr}^{\mathrm{F}}{ }_{4}\right]$ conveniently accessed by substitution reactions of [Rh(biph)(dtbpm)Cl] (dtbpm $=$ bis(di-tert-butylphosphino)methane), followed by halide abstraction. These five-coordinate rhodium(III) complexes are well-defined synthons for the generation of rhodium( I ) dihydrogen, ethylene and carbonyl derivatives, following hydrogenolysis of the biph ligand that serves as an 'organometallic protecting group'. By comparison with the $\nu(\mathrm{CO})$ bands of rhodium(I) carbonyl adducts, determined by IR spectroscopy in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$, PNP-14 and PONOP-14 can be considered to be marginally weaker net donors than their respective homoleptic tert-butyl substituted congeners PNP- $t \mathrm{Bu}$ and PONOP- $t \mathrm{Bu}$, respectively.

## Experimental

## General methods

All manipulations were performed under an atmosphere of argon using Schlenk and glove box techniques unless otherwise stated. Glassware was oven dried at $150^{\circ} \mathrm{C}$ overnight and
flame-dried under vacuum prior to use. Molecular sieves were activated by heating at $300^{\circ} \mathrm{C}$ in vacuo overnight. Dihydrogen and ethylene were dried by passage through a stainless-steel column of activated $3 \AA$ molecular sieves prior to use. Fluorobenzene and 1,2-difluorobenzene (DFB) were pre-dried over $\mathrm{Al}_{2} \mathrm{O}_{3}$, distilled from calcium hydride and dried twice over $3 \AA$ molecular sieves. ${ }^{17} \mathrm{CD}_{2} \mathrm{Cl}_{2}$ was freeze-pump-thaw degassed and dried over $3 \AA$ molecular sieves. $\mathrm{C}_{6} \mathrm{D}_{6}$ was distilled from sodium and stored over $3 \AA$ molecular sieves. THF, dioxane, diethyl ether and benzene were distilled from sodium/benzophenone and stored over $3 \AA$ molecular sieves. $\mathrm{Et}_{2} \mathrm{NH}$ was distilled from $\mathrm{CaH}_{2} . \mathrm{SiMe}_{4}$ was distilled from liquid $\mathrm{Na} / \mathrm{K}$ alloy and stored over a potassium mirror. Other anhydrous solvents were purchased from Acros Organics or Sigma-Aldrich, freeze-pump-thaw degassed and stored over $3 \AA$ molecular sieves. LiHMDS was resublimed before use. $n$ BuLi was titrated before use. ${ }^{24}$ TMEDA was distilled from sodium/benzophenone and stored over $3 \AA$ molecular sieves. Diethylamino-tert-butyl-chlorophosphine (yield $=98 \%$ ), ${ }^{10}$ $\mathrm{BrMgC}_{8} \mathrm{H}_{15},{ }^{25}$ Wilkinson's catalyst, ${ }^{26} \mathrm{Na}\left[\mathrm{BAr}_{4}{ }_{4}\right],{ }^{27}$ and $[\mathrm{Rh}(\mathrm{biph})(\mathrm{dtbpm}) \mathrm{Cl}],{ }^{14}$ were synthesised according to published procedures. All other reagents are commercial products and were used as received. NMR spectra were recorded on Bruker spectrometers under argon at 298 K unless otherwise stated. Chemical shifts are quoted in ppm and coupling constants in Hz. NMR spectra in DFB and THF: $\mathrm{Et}_{2} \mathrm{NH}$ were recorded using an internal capillary of $\mathrm{C}_{6} \mathrm{D}_{6}$. ESI-MS were recorded on Bruker Maxis Plus (HR) or Agilent 6130B single Quad (LR) instruments. Infrared spectra were recorded on a Jasco FT-IR-4700 using a KBr transmission cell in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. Microanalyses were performed at the London Metropolitan University by Stephen Boyer.

## Preparation of PNP-14-2 $\mathrm{BH}_{3}$ (trans-1a) and PONOP-14•2BH ${ }_{3}$ (trans-1b)

Preparation of diethylamino-tert-butyl-octen-7-yl-phosphine 2. A solution of diethylamino-tert-butyl-chlorophosphine ( $3.19 \mathrm{~g}, 16.3 \mathrm{mmol}$ ) in THF ( 30 mL ) was cooled to $-78{ }^{\circ} \mathrm{C}$ and a solution of $\mathrm{BrMgC}_{8} \mathrm{H}_{15}(43 \mathrm{~mL}, 0.38 \mathrm{M})$ in THF added dropwise over 30 minutes. The suspension was allowed to warm to ambient temperature and stirred for 16 h . The solution was concentrated under vacuum and the product extracted into hexane. Dioxane ( 10 mL ) was added and the resulting suspension filtered, to afford the product on removal of the volatiles in vacuo, which was carried forward without further purification. Yield: 4.21 g (95\%).
${ }^{1} \mathbf{H}$ NMR ( $600 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 5.80\left(\mathrm{ddt},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=16.9,{ }^{3} \mathrm{~J}_{\mathrm{HH}}=\right.$ $\left.10.2,{ }^{3} J_{\mathrm{HH}}=6.7,1 \mathrm{H}, \mathrm{C} \underline{H}=\mathrm{CH}_{2}\right), 5.02-5.08\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right)$, 4.98-5.01 (m, 1H, $\left.\mathrm{CH}=\mathrm{CH}_{2}\right), 2.90-2.97\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{NCH}_{2}\right)$, 1.98-2.04 (m, 2H, CH $\underline{2}_{2} \mathrm{CH}=\mathrm{CH}_{2}$ ), 1.72-1.78 (m, $\left.1 \mathrm{H}, \mathrm{CH}_{2}\right)$, $1.13-1.66\left(\mathrm{~m}, 9 \mathrm{H}, \mathrm{CH}_{2}\right), 1.06\left(\mathrm{~d}, 9 \mathrm{H},{ }^{3} J_{\mathrm{PH}}=11.8, t \mathrm{Bu}\right), 1.00$ $\left(\mathrm{t}, 6 \mathrm{H},{ }^{3} \mathrm{JH}_{\mathrm{HH}}=7.1, \mathrm{NCH}_{2} \mathrm{CH}_{3}\right)$.
${ }^{\mathbf{1 3}} \mathbf{C}\left\{{ }^{1} \mathbf{H}\right\}$ NMR ( $151 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 139.2\left(\mathrm{~s}, \underline{\mathrm{CH}}=\mathrm{CH}_{2}\right), 114.6$ ( $\mathrm{s}, \mathrm{CH}=\underline{\mathrm{CH}}_{2}$ ), $44.5\left(\mathrm{br}, \mathrm{NCH}_{2}\right), 34.2\left(\mathrm{~s}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 32.5(\mathrm{~d}$, $\left.{ }^{1} J_{\mathrm{PC}}=20, t \mathrm{Bu}\{\mathrm{C}\}\right), 31.7\left(\mathrm{~d}, J_{\mathrm{PC}}=12, \mathrm{CH}_{2}\right), 29.5\left(\mathrm{~s}, \mathrm{CH}_{2}\right), 29.4$
$\left(\mathrm{s}, \mathrm{CH}_{2}\right), 27.6\left(\mathrm{~d},{ }^{2} J_{\mathrm{PC}}=16, t \mathrm{Bu}\left\{\mathrm{CH}_{3}\right\}\right), 26.6\left(\mathrm{~d}, J_{\mathrm{PC}}=18, \mathrm{CH}_{2}\right)$, $23.2\left(\mathrm{~d},{ }^{1} J_{\mathrm{PC}}=19, \mathrm{CH}_{2}\right), 15.2\left(\mathrm{~d},{ }^{4} \mathrm{~J}_{\mathrm{PC}}=2, \mathrm{NCH}_{2} \mathrm{CH}_{3}\right)$.
${ }^{31} \mathbf{P}\left\{{ }^{1} \mathbf{H}\right\}$ NMR ( $243 \mathrm{MHz}, \mathrm{C}_{6} \mathrm{D}_{6}$ ): $\delta 73.3$ (s).
Preparation of chloro-tert-butyl-octen-7-yl-phosphine 3. HCl in diethyl ether ( $151 \mathrm{~mL}, 1 \mathrm{M}, 151 \mathrm{mmol}$ ) was added to a solution of $2(20.5 \mathrm{~g}, 75.5 \mathrm{mmol})$ in hexane $(400 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$. The suspension was allowed to warm to ambient temperature, stirred for 2 h and then allowed to stand for 16 h before being filtered. Analysis of the filtrate by ${ }^{31} \mathrm{P}$ NMR spectroscopy indicated the partial formation of $3 \cdot \mathrm{HCl}\left(\delta_{31 \mathrm{P}} 46.9\right)$, which was subsequently deprotonated by addition a stoichiometric amount of LiHMDS ( $0.479 \mathrm{~g}, 2.86 \mathrm{mmol}$ ) suspended in hexane $(10 \mathrm{~mL})$. The resulting suspension was stirred for 1 h before allowing the precipitate to settle out, filtered and the product obtained on removal of the volatiles removed in vacuo, which was carried forward without further purification. Yield: 17.6 g (99\%).

Preparation of $\mathbf{4 a}$. A solution of 2,6 -lutidine $(1.22 \mathrm{~g}$, $11.4 \mathrm{mmol})$ and TMEDA ( $3.40 \mathrm{~mL}, 22.7 \mathrm{mmol}$ ) in diethyl ether $(30 \mathrm{~mL})$ at $0^{\circ} \mathrm{C}$ was treated dropwise with $n \mathrm{BuLi}(13.7 \mathrm{~mL}, 1.66$ $\mathrm{M}, 22.7 \mathrm{mmol}$ ). The reaction was warmed to room temperature and stirred for 16 h resulting in a deep red solution, which was cooled to $-78^{\circ} \mathrm{C}$ and treated with a solution of $3(5.48 \mathrm{~g}$, 23.3 mmol ) in diethyl ether ( 60 mL ), then warmed to room temperature and stirred for 2 days. The suspension was filtered, the filtrate reduced to dryness and the crude product extracted into hexane ( 50 mL ). The resulting solution was washed with degassed water, dried over $\mathrm{MgSO}_{4}$ and the solvent removed in vacuo to afford a colourless oil, which was redissolved in THF ( 150 mL ), cooled to $-78{ }^{\circ} \mathrm{C}$, treated with $\mathrm{BH}_{3} \cdot \mathrm{SMe}_{2}(1.10 \mathrm{~mL}, 11.6 \mathrm{mmol})$ and an aliquot analysed by ${ }^{31} \mathrm{P}$ NMR spectroscopy. Additional $\mathrm{BH}_{3} \cdot \mathrm{SMe}_{2}$ was then added portion-wise ( $0.40 \mathrm{~mL}, 4.2 \mathrm{mmol}$, then $0.60 \mathrm{~mL}, 6.3 \mathrm{mmol}$ ) at $-78{ }^{\circ} \mathrm{C}$ until no free phosphine remained by ${ }^{31} \mathrm{P}$ NMR spectroscopy. In air, the solution was treated with aqueous ammonium chloride ( 150 mL ), extracted into ethyl acetate ( 150 mL ), dried over $\mathrm{MgSO}_{4}$ and the volatiles removed in vacuo. The product was obtained as a colourless oil after repeated purification by column chromatography as a mixture of diastereomers ( $10 \%$ EtOAc in hexane; $R_{\mathrm{F}}=0.19$ ). Yield: 3.30 g (55\%).
${ }^{1} \mathbf{H}$ NMR $\left(500 \mathrm{MHz}, \mathrm{CDCl}_{3}\right): \delta 7.55\left(\mathrm{t},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.7,1 \mathrm{H}, \mathrm{py}\right)$, 7.19-7.24 (m, 2H, py), $5.72-5.85\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right), 4.95-5.01$ $\left(\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}=\mathrm{CH}_{2}\right), 4.91-4.95\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}=\overline{\mathrm{C}}_{2}\right), 3.09-3.20(\mathrm{~m}$, $\left.4 \mathrm{H}, \mathrm{pyCH}_{2}\right), 1.97-2.06\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}=\mathrm{CH}_{2}\right), 1.67-1.85(\mathrm{~m}$, $\left.2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.49-1.62\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right), 1.21-1.38\left(\mathrm{~m}, 14 \mathrm{H}, \mathrm{CH}_{2}\right)$,

## General procedure for the preparation of carbonyl complexes 9

A solution of 8 in DFB ( 0.5 mL ) was freeze-pump-thaw degassed and placed under carbon monoxide (1 atm) within a J Young's valve NMR tube, resulting in an immediate colour change. The volatiles were removed in vacuo, and the resulting yellow solid washed and dried in vacuo.

Preparation of $[\mathbf{R h}(\mathbf{P N P}-14)(\mathbf{C O})]\left[\mathrm{BAr}^{\mathbf{F}}{ }_{4}\right]$ (9a). Following the general procedure using 8a ( $10 \mu \mathrm{~mol}$, generated in situ as described above), washing with hexane afforded the pure product as a yellow solid. Yield: 14.1 mg ( $96 \%$ ).
${ }^{1} \mathbf{H}$ NMR ( $500 \mathrm{MHz}, \mathrm{CD}_{2} \mathrm{Cl}_{2}$ ): $\delta 7.79\left(\mathrm{t},{ }^{3} J_{\mathrm{HH}}=7.8,1 \mathrm{H}, \mathrm{py}\right)$, 7.70-7.76 (m, 8H, Ar $\left.{ }^{\mathrm{F}}\right)$, $7.56\left(\mathrm{br}, 4 \mathrm{H}, \mathrm{Ar}^{\mathrm{F}}\right), 7.42\left(\mathrm{~d},{ }^{3} \mathrm{~J}_{\mathrm{HH}}=7.9\right.$, 2 H, py), 3.70 (dvt, ${ }^{2} J_{\mathrm{HH}}=17.5, J_{\mathrm{PH}}=4,2 \mathrm{H}, \mathrm{pyCH}_{2}$ ), 3.56 (dvt, $\left.{ }^{2} J_{\mathrm{HH}}=17.5, J_{\mathrm{PH}}=4,2 \mathrm{H}, \mathrm{pyCH}_{2}\right), 2.02-2.09\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2}\right)$, 1.78-1.98 (m, 4H, CH 2 ), 1.63-1.75 (m, 2H, CH 2 ), 1.49-1.63 (m, $\left.2 \mathrm{H}, \mathrm{CH}_{2}\right), 1.21-1.49\left(\mathrm{~m}, 16 \mathrm{H}, \mathrm{CH}_{2}\right), 1.13\left(\mathrm{vt}, J_{\mathrm{PH}}=8,18 \mathrm{H}, t \mathrm{Bu}\right)$.

## Conflicts of interest

There are no conflicts to declare.

## Acknowledgements

We thank the European Research Council (ERC, grant agreement 637313) and Royal Society (UF100592, UF150675, A. B. C.) for financial support. High-resolution mass-spectrometry data were collected using instruments purchased through support from Advantage West Midlands and the European Regional Development Fund. Crystallographic data were collected using an instrument that received funding from the ERC under the European Union's Horizon 2020 research and innovation programme (grant agreement no. 637313).
