**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers. L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

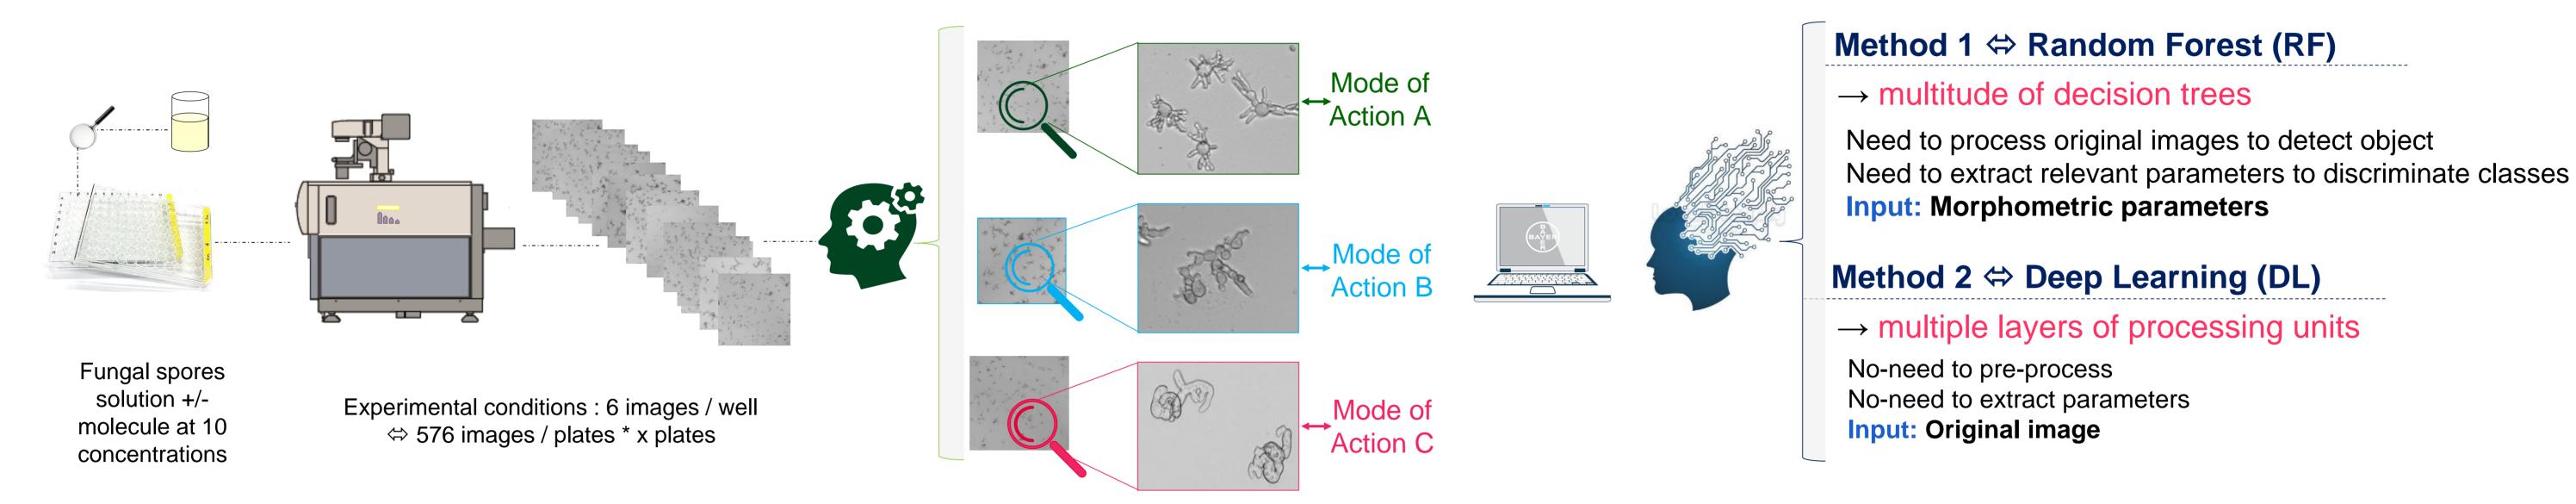

# **MACHINE-LEARNING ASSISTED PHENOTYPING: FROM FUNGAL MORPHOLOGY TO MODE OF ACTION HYPOTHESIS**

### Introduction

Beyond growth inhibition, fungicides can also trigger specific morphological modifications visualized under transmitted light microscopy. These morphological changes result from the activity of a given compound via the inhibition of a molecular target, commonly named as its mode of action (MoA). We are hence able to classify different molecules into their respective MoA by observing their phenotypic signature, and even to detect new MoA with unknown phenotypic effect for further deconvolution. The aim of the presented work is to develop a robust method for automated recognition and classification of these phenotypic signatures in order to lead to a Mode of Action hypothesis. We compare two machine-learning methods (Random forest and Convolutional Neural Network) for direct processing of images generated on the grey mold *Botrytis cinerea* subjected to different antifungal molecules.

From morphology recognition to Mode of Action prediction :

the power of artificial intelligence to automatize fungal precision phenotyping.

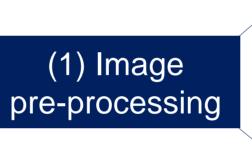

#### Method 1 Morphometric parameters extraction and **Random Forest-based classification** FIND CONTOUR (from OPT MASK) FINAL MASK + CELL BY OBJECT DETECTION INARY IMAGE CREATION CELL LABEL SOBEL GRADIENT OPTIMIZATION 0. 7-12 h

(1) Object detection and individualization

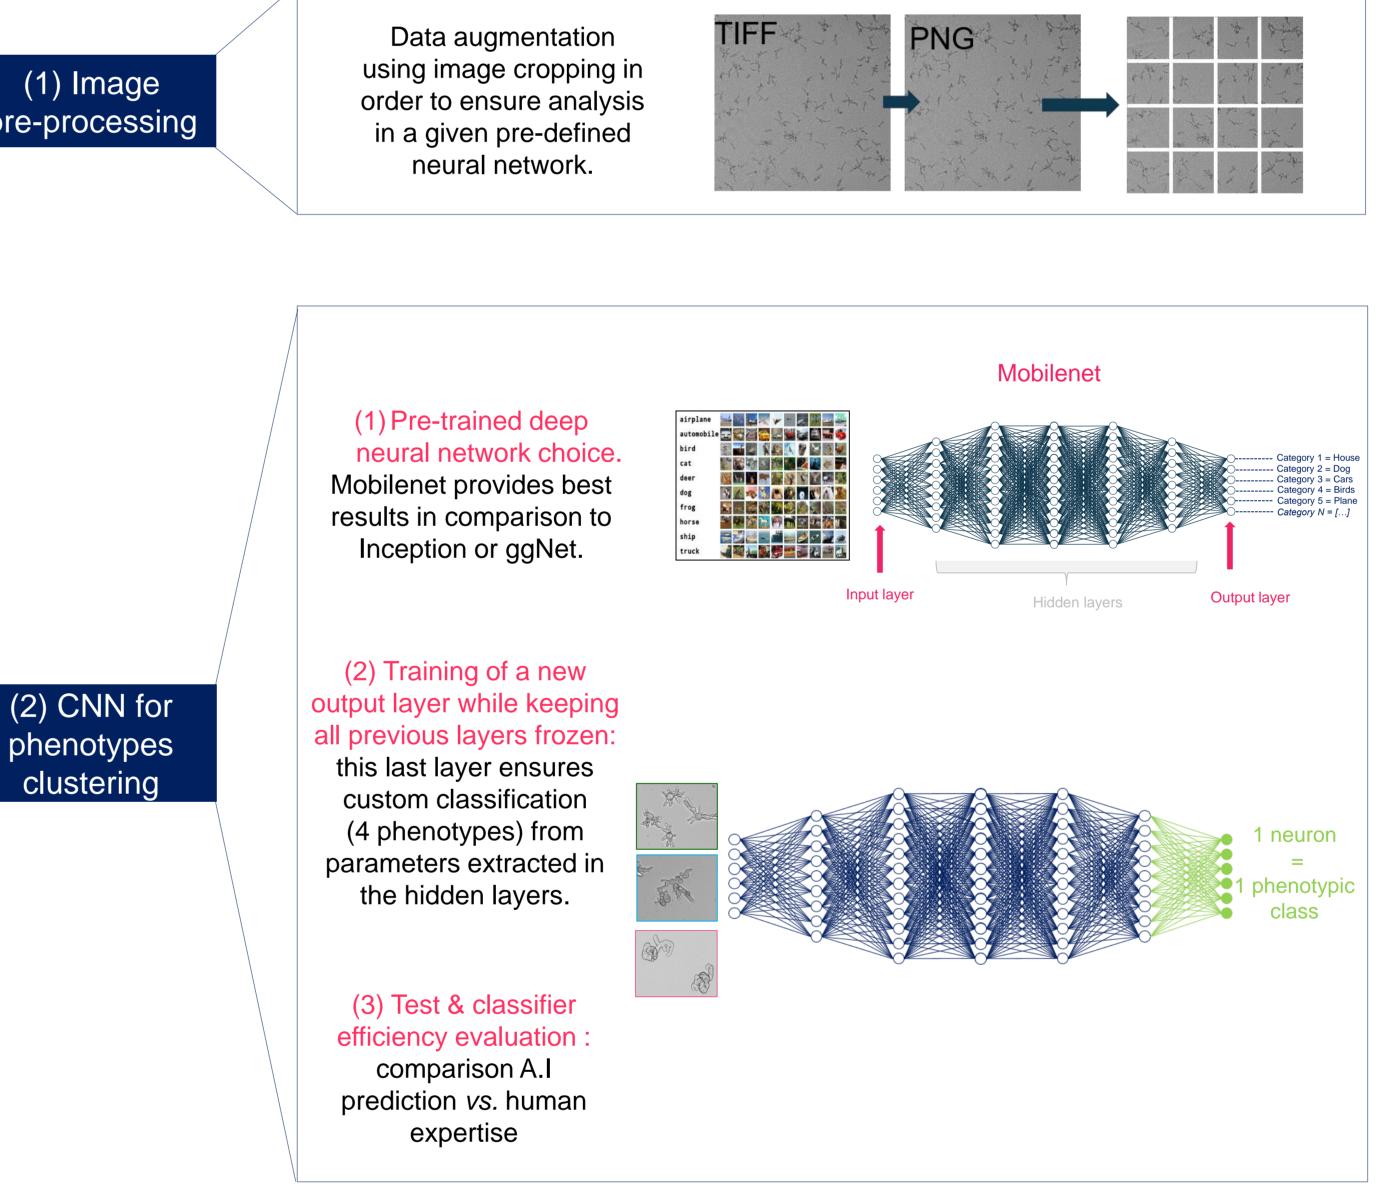

### Object Total Area Filtration

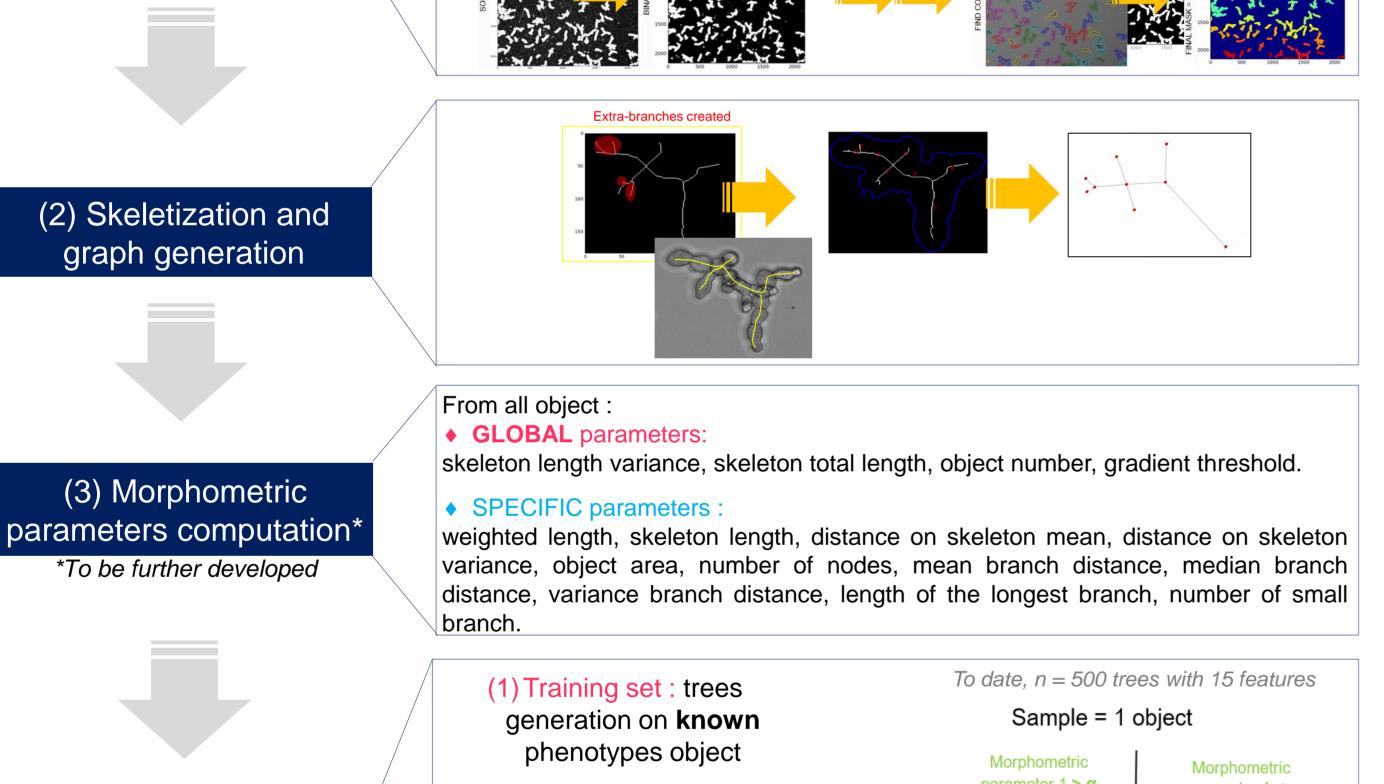

### Method 2

**Application of a pre-trained image recognition Convolutional Neural Network (CNN) for phenotype classification** 

Data augmentation neural network.

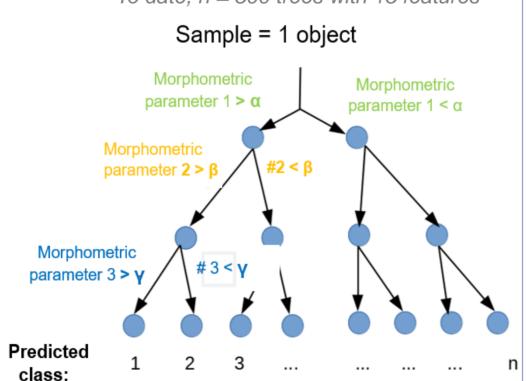

for phenotypes clustering

(3) Classifier efficiency evaluation : comparison A.I prediction vs. human expertise

(2) Test set : trees application

on **sample** phenotypes

object ⇔ Prediction

In summary :

Precise analysis and classification of cellular objects within images. Access to known and defined morphometric features values. Limited number of morphometric features.

#### In summary :

Global analysis and object classification of the entire image. Access to **unknown features** (morphometric or others ?) **High number** of features (~million)

## **Results & Conclusions**

To date, CNN provides better phenotype classification than Random-Forest based method. We are going to further investigate respective approaches in order to evaluate which one, or a combination, will permit to ensure a robust automation of phenotyping recognition in a larger number of phenotype.
