Opportunities and Challenges of School Collaboration

ollaborative work organizations and related themes ership preparation? (such as community, cooperation, etc.) have become during the past few years. Some may view emphasis on collaboration (or community) in schools as the second stage of the initial "site-based management" movement initiated in the late 1980's. School organizations have begun expanding their democratic governance emphasis with teacher, parent, and community advisory councils, engaging in partnerships with other human service agencies or businesses, or redesigning educators' work to add a group or team emphasis.

Most scholars focus on only one particular type of collaborative work arrangement — such as school-business partnerships, industry-education collaboration, regular educationspecial education collaborations, or even schools as "learning communities." Further, they approach the study of collaboration from a single conceptual or disciplinary framethe complexity of organizing and managing, a single lens, framework, or disciplinary approach is inadequate to understand such complex organizational phenomena. Further, pracfactors when building collaborative schools — such as: 1) ers, counselors, psychologists) overcome their separate role collaborative parties. socializations to build collaborative work relationships within schools? and 6) What are the implications of school collaboration for teaching and learning, school leadership, and lead-

Thus, a couple of years ago, some of my Utah colleagues the focus of both research and practice in education and I wrote a book on collaboration which discusses collaboration research and practice from multiple perspectives, each chapter addressing one of the questions identified above from a specific conceptual or disciplinary framework (see Pounder, 1998a). Each chapter author brought his or her professional and scholarly expertise in a particular disciplinary area to the work, including organizational theory (Bob Johnson), organizational change and development (James Barott & Rebecca Raybould), organizational economics (Patrick Galvin), group work design and personnel administration (Diana Pounder), work roles and professional socialization (Ann Weaver Hart), instructional leadership (Karen Evans Stout), leadership and the school principal (Gary Crow), and leadership preparation (Joseph Matthews).

The challenge for me as the book's editor was to synthework or lens. However, because collaboration may increase size the themes or issues that seemed to cut across the book's multiple perspectives and chapter topics. It is these synthesizing issues and dilemmas that I will present here, in part excerpted from the closing chapter of the collaboration book. ticing administrators and teachers need to consider multiple These dilemmas are framed as collaboration's "promises versus pitfalls" — or opportunities versus challenges for schools. What organizational structure will enhance collaborative The synthesizing issues include: 1) the need for change toschool efforts? 2) What change processes are important in ward more collaborative schools versus the persistence of building school collaboration? 3) What are the costs (in ef-schools; 2) resource gains versus costs of collaboration; 3) fort, energy, time, or other resources) in collaborating with professional interdependence versus professional autonomy other external agencies? 4) How can teachers' work be rede- or discretion (and the related concepts of independence, prisigned to enhance collaboration between teachers and what vacy, and isolation); 4) shared influence (or leadership) verare the outcomes for teachers and students? 5) How can edu-sus shared accountability (or responsibility); and 5) balance cators (e.g. administrators, teachers, special education teach- of influence versus over-control or under-involvement among

The Need for Collaborative Change Versus the Persistence of Schools
