

# Running decision support logic retrospectively to determine guideline adherence: a case study with diabetes

Vojtech Huser, MD<sup>a,b</sup>

<sup>a</sup> Intermountain Healthcare, Salt Lake City, UT <sup>b</sup> Biomedical Informatics, University of Utah, Salt Lake City, UT

## Introduction

Requiring additional clinicians' input in a new decision support system (DSS) is often a major implementation obstacle. Another limitation is the process of fine tuning the exact logic of the new DSS, which is often done in the production environment. Our approach was to utilize only currently available Electronic Health Record data (EHR), not requiring any additional data entry by clinicians. The main objective of this study is to demonstrate the use of an analytical suite called RetroGuide (RG) [1-5]. RG provides an environment for beta testing of potential decision support logic using only retrospective data and assessing its impact.

## Methods

- Intermountain Healthcare's Enterprise Data Warehouse (EDW) is used as the source of EHR data (only terminology-coded data, no free text).
- Analyzed patients: From primary care diabetes data mart, insured via affiliated health plan, death certificate present (1846 patients). At least two manually recorded blood pressure measurements 11 months apart and 2 years after diabetes diagnosis (194 patients).
- RetroGuide analytical suite:
  1. *data extraction phase*: assembly of chronologically ordered coded EHR event data for each cohort patient from various sources.
  2. *scenario modeling phase*: creation of graphical executable model representing analytical steps. Scenario flowchart layer mimics a manual chart review process. Modeling constructs include use of nodes with links to external applications (code layer) and ability to use conditions on flowchart transition arrows.
  3. *execution phase*: sequential execution of the scenario on each cohort patient, creation of output reports
  4. *reports review phase*: hierarchy of linked reports showing execution of the modeled scenario on real EHR data

## Results

#	NODE NAME			PATIENTS	RATE (%)
010	(CSC) (m01) (AGE1) DM control hospitalization (ICD Dg) anywhere [jump 2 years]		jump 2 years	194 / 194	100.0
011	(v01) Blood pressure, systolic (BPS)		jump 11 months	194 / 194	100.0
012	(v02) Blood pressure, systolic (BPS)		sum	194 / 194	100.0
017	sBP decreased			92 / 194	47.42268
018_1	both v01 and v02 over 130		H02	78 / 194	40.206184
018_2	both v01 and v02 over 140			31 / 194	15.979381
018_3	v01 was over 130 but v02 is under 130	achieved control	no	32 / 194	16.494844
018_3	v01 was under 130 but v02 is over 130	controlled became uncontrolled	no	31 / 194	15.979381

## 1. DataGet applications

- Find\_Diagnosis
- Find\_Lab
- Find\_Medication
- Find\_Exam
- Find\_Coded\_Value\_under\_Exam
- Find\_Coded\_EHR\_Event

## 2. Analytical applications

- Jump\_Forward\_X\_Months
- Jump\_to\_First\_EHR\_Event
- Jump\_to\_Last\_EHR\_Event
- Jump\_to\_Timestamp
- Get\_Pt\_Age\_at\_Current\_Position
- Patient is Male
- Remember\_Timestamp
- Remember\_Numeric\_Value
- Evaluate\_Two\_Timestamp\_Difference\_Criterion
- Track\_Patient\_Count
- Generate\_Custom\_Pt\_List
- Capture\_Statistical\_Data\_Item

Fig.5: List of selected RG external applications which can be used inside flowchart nodes (parameters not shown)

## Conclusion

With RetroGuide, we were able to model and execute a scenario which operates on the individual patient level and tracks blood pressure control over time. RG splits the traditional code-only representation format into two distinct layers - graphical flowchart layer and hidden code layer (Figure 5).

#	DATE	EVENT	DESCRIPTION	VALUE	UNIT
416	2004-01-01	Standard Lab Data	Prottime INR	1.024	
417	2004-01-01	Standard Lab Data	Prottime INR	1.024	
418	2004-01-01	Clinical Text Data	Lab Annotation		
419	2004-01-01	Pat Obs Event	Standard Vital Signs Panel		
420	2004-01-01	Pat Obs Event	Standard Vital Signs Panel		
421	2004-01-01	Clinical Text Data	CAC Progress Note		
422	2004-01-01				

Fig.6: Individual patient view (chronologically ordered EHR coded events)

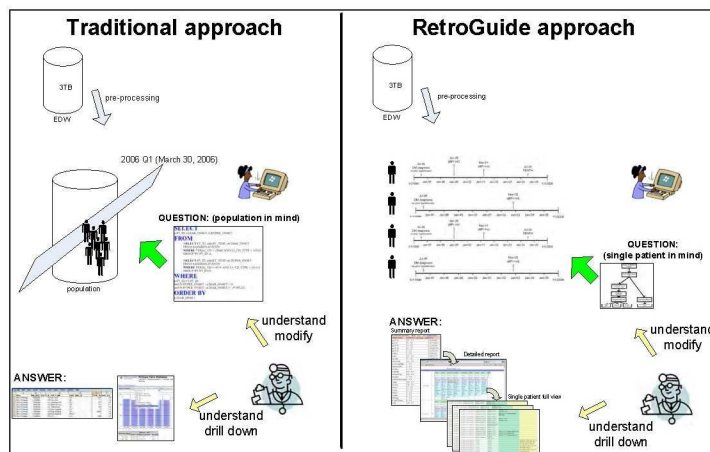

Fig.1: Comparison of the traditional vs. RetroGuide analytical approaches

ID	DETAILS	VAL	UNIT
010: (CSC) (m01) (AGE1) DM control hospitalization (ICD Dg) anywhere [jump 2 years]			
011: (v01) Blood pressures, systolic (BPS) [jump 11 months] (EHR)			
012: (v02) Blood pressures, systolic (BPS) (EHR)			
017: sBP decreased			
040_1: (ICD) HYPERTENSION NOS (after m01) (m40_hypert)			
050: (ICD) DM type 1 (a)			
p01: death (AGE2) (m03)			
p01: death2			
p01: death3			
p01: death4			
p01: death5			
p01: death6			
p01: death7			
p50: death cause: DM: a UNSPECIFIED DIABETES MELLITUS: Unspecified diabetes mellitus without complications			
p52: death cause: Heart dis: c HEART FAILURE: Congestive heart failure			
age_80: diabetes mellitus (EHR coded entry)			
0180_1: m01_dm to m03_death Under (10 years?)			
0180_3: m01_dm to m03_death Under (5 years?)			
0180_1_HBP m01_DM to m40 Under (2 years?)			
0180_2 m01 to m40 Under (1 hour?) same as m01			
019_2 sBP decreased

## Discussion

In contrast with a comparable study investigating blood pressure control in diabetics [6] our methodology enables easy integration of additional temporal restrictions on the considered blood pressure values or other events of interest. Additional advantages of RetroGuide when compared to traditional SQL-based database tools for retrospective data analysis are:

- a user-friendly flowchart model as a shared logic formalism between the data analyst and clinicians (Figure 1 and 3)
- ability to use variables and constructs like "time jump" and "current EHR position"; procedural modeling approach resembling manual chart review process
- support for extensive "drill-down" capability into available EHR data via a hierarchy of customizable reports: detailed execution trace report (Figure 4) and individual patient view (Figure 6).
- single-patient execution model
