Abstract

China's oil investment in Central Asia from the late 1990s was not driven by energy needs or geopolitical ambitions, like many assumed. The real concern was the safety of its western boundary, while energy was used as an instrument to forge political ties with its neighbours. However, China has become one of the key geopolitical players in Central Asia after more than 20 years engagement, and many observers are keen to find out why has Beijing failed to escape the grand games while focusing on energy diplomacy? And, what is the implications of China's new status in Central Asia on its Belt and Road Initiative (BRI)?

This article attempts to answer the questions via reviewing China's energy diplomacy towards Central Asia, from the lens of geopolitics. Focusing on China's dealing with Kazakhstan and Turkmenistan, as well as the Russian factor, the research has revealed the main reasons that led China into the grand games: the entangling of politics and China's energy engagements; the establishment of the Shanghai Cooperation Organization; and the changes of the pipeline map. China's geopolitical gains have mainly made at the cost of Russia, though the latter chose to accept Beijing's greater presence in Central Asia against the changed circumstances.

The launch of the BRI scheme has amplified China's geopolitical significance in Central Asia, but also triggered various criticisms, including the debt traps and governance-related issues. China's dealing with the Muslims in Xinjiang was also a point of disagreement. Beijing may need to revisit its pragmatic featured diplomacy, and to take a more liberal approach to accommodate different political perspectives. With greater power potential, Beijing should bear more responsibilities to ensure peace and stability in Central Asia, together with other powers, not only for the sake of BRI's success, but also for the interest of the mankind.

Keywords: China, Energy diplomacy, Central Asia, Geopolitics, Belt and Road Initiative.

The author wishes to thank the two anonymous reviewers for their valuable comments which have helped the improvement of the article greatly. My thanks also go to Professor Raphael Heffron for his useful comments, to Paul Payer and Ryan Bausch for their kind logistic assistance.

1. Introduction

The Silk Road is a well-known and legendary network of ancient trade routes in Chinese history, with Central Asia – the so-called “Western Area” (*xi yu*) – being an indispensable territory. Despite the importance of Central Asia in the Silk Road, China has had little direct involvement in the region until the post-Soviet era. In the 1990s China used energy as an instrument to enter Central Asia to ensure the security of its Western border (Andrew-Speed, Liao & Dannreuther, 2002, pp. 58-61), making energy diplomacy effective in its foreign policy agenda. After more than 20 years, Beijing has built four cross-border pipelines from Kazakhstan and Turkmenistan (plus one under construction) and has also become an influential player in the region. China’s trade with Central Asia has grown remarkably from only \$1 billion (bn) in 2000 to \$30bn by 2017 (Oseledko, 2018, April 5). After the proposal by Chinese President Xi Jinping in 2013, to build a “Silk Road Economic Belt” and a “Maritime Silk Road”, Beijing’s dealings in the region became more dynamic and diversified. Between March 2015 and September 2018, China signed about 70 deals with Kazakhstan worth more than \$33bn, concerning a wide range of sectors, such as energy, mining, chemical, mechanical manufacturing, agriculture and infrastructure (*Reuters*, 2017; Altynsarina, 2018, September 27). China has also been the top importer of Turkmen natural gas since 2016, after Russia and Iran cut off all gas imports from Turkmenistan (Lelyveld, 2018).

China’s growing influence has triggered increasing concerns not only over the region’s energy supply routes, but also regarding the great power rivalries within the region. This is especially evident with China’s Belt and Road Initiative (BRI) scheme. A significant amount of literature on China and Central Asia relations has viewed China as an “emerging superpower” in the region (Bohr, 2004; Swanstrom, 2007; Šír & Horák, 2008; Petersen, 2011), and has had geopolitical implications to the region and beyond (Cooley, 2008; Fingar, 2016; Sternberg, Ahearn & McConnell, 2017; Chen & Fazilov, 2018). This article argues that Beijing’s entry to Central Asia was not aimed to fill the power vacuum left by the former Soviet Union, but was to ensure the security of China’s western borders. However, it is obvious that Beijing has become a major player in Central Asia geopolitically and economically, after more than 20 years of engagement with the region. The main question to be asked is that why has Beijing failed to escape the grand games in the Eurasian landmass while focusing on energy diplomacy? And, what is the implications of China’s new status in Central Asia on its Belt and Road Initiative (BRI)?

1
2
3 This article attempts to answer the two questions by reviewing China's energy diplomacy towards
4 Central Asia from the 1990s, in particular with Kazakhstan and Turkmenistan. The key argument
5 is that despite China's lack of interest in geopolitical games in Central Asia, its energy diplomacy
6 over the past 20 years has made Beijing one of the major geopolitical players in the region, against
7 its initial intention. This has not only affected the Sino-Russian relations in Central Asia, but is
8 also crucial to the destiny of the BRI aspiration. The discussion below comprises of five sections.
9 Section 2 sets the context of the geopolitical significance of Central Asia and the old power
10 paradigms China encountered in the wake of the Cold War. Sections 3 and 4 will investigate
11 China's energy cooperation with Kazakhstan and Turkmenistan, respectively, to show the role
12 energy played in Beijing's dealing with the two countries, as well as the interactions with Russia.
13 Session 5 looks at China's policy agenda under the BRI era, to demonstrate the challenges facing
14 Beijing beyond its energy diplomacy, before drawing a conclusion in the final section.

28 **2. China, Central Asia and Geopolitics: The Context**

29
30
31 Central Asia has always been a hot spot in the eyes of geopolitical theorists due to its strategic
32 geographic significance. The region was called by Halford Mackinder (1962) as the "Heartland",
33 of which whoever ruled it would be able to command "the World-Island" and eventually to
34 command "the World". Since Central Asia became a part of Russia from the late 19th Century,
35 Moscow remained the only governor of the region, which made the United States feel that it was
36 in a disadvantageous position during the Cold War era. The United States tried everything to
37 balance against the "Heartland superpower" – the former Soviet Union – including nuclear arms
38 races (Gray, 1977), but was unable to challenge Russia's dominance of Central Asia even after the
39 Soviet disintegration in 1991. Russia wanted to keep Central Asia in its "sphere of influence" on
40 a wide range of aspects, from strategic, economic, security, to cultural and ethnic bonds. These
41 states also longed for Russia's enduring support on economic and security grounds until Boris
42 Yeltsin's Presidency (1991-99), who did not manage well the relationship with the newly
43 independent republics (Sun, 2001, pp. 239-241).

52
53

54 In the eye of Zbigniew Brzezinski, the fall of the USSR offered a wonderful opportunity for the
55 U.S. projecting its power to Central Asia, in order to demonstrate and maintain its status "as the
56
57

1
2
3 sole and, indeed, the first truly global power”. Brzezinski also held that “for America, the chief
4 geopolitical prize is Eurasia ... America’s global primacy is directly dependent on how long and
5 how effectively its preponderance on the Eurasian continent is sustained.” (Brzezinski, 1997, p.
6
7 30) However, the U.S. administration under George H. W. Bush did not make Central Asia as top
8
9 priority due to its “Russia First” policy, which was aimed to ensure Russia’s successful
10 transformation from communism to capitalism. Therefore, apart from a visit paid by the U.S.
11 Secretary of the State, James A. Baker, in February 1992, no U.S. officials visited Central Asia
12 until the new century, and U.S. investment and financial assistance were also limited throughout
13 the 1990s. Only after the “9.11” terrorist attacks, did Central Asia become a pivot territory for
14 America’s anti-terrorism strategy, and the U.S. was allowed to set up airbases in Kyrgyzstan and
15 Uzbekistan, with Russia’s consent. On 12 March 2002, the U.S. and Uzbekistan, again, signed a
16 Declaration on Strategic Partnership and Cooperation Framework (Zhao, 2008, pp. 327-332; Finn,
17 2005), posing challenges to Russia’s overall dominance in the region. What enabled Russia to win
18 back the authoritarian regimes of its former Republics was the Colour Revolutions – the Rose
19 Revolution in Georgia in 2003, the Orange Revolution in Ukraine in 2004, and the Tulip
20 Revolution in Kyrgyzstan in 2005 – where the U.S. was suspected of having a role behind the
21 uprisings (Nichol, 2013, pp. 7-9; Zhao, 2008, pp. 230-35).

22
23
24 In contrast to the U.S.-Russian competitions, Beijing had little interest in, and connection with,
25 Central Asia prior to the 1990s; together with its limited capacity at the time, geopolitics was
26 barely a factor in its initial dealing with the region (Zhao, 2008, pp. 26-33). The Soviet breakdown
27 did remove a principal security threat for China, but also posed new challenges on three aspects.
28 The first was the unsettled boundary. China shared more than 3,000 kilometres (km) of borderline
29 with three out of five Central Asian states – Kazakhstan (1,700km), Kirghizstan (1,000km), and
30 Tajikistan (400km). Negotiations over the Sino-Soviet western boundary were undergoing during
31 the 1980s, but no agreement was reached prior to the Soviet collapse. Therefore, boundary
32 delimitation was the top priority for Beijing in dealing with the newly independent Central Asian
33 Republics (Sun, 2001, pp. 210 & 231). Secondly, due to close ethnic links between the Central
34 Asian nations and minority groups in China’s Xinjiang Province, Islamic resurgence and pan-
35 Turkic nationalism in Central Asia presented serious threats to China’s national unification, which
36 were especially imperative in the early 1990s, when Muslim separatists promoted the Uighurs and
37 Turkestan Liberation Movement in Xinjiang (Walsh, 1993). Finally, having little connection with

3 Central Asia, China had no effective means to engage with the new nations in the immediate post-
4 Soviet era (Zhao 2008, pp. 54-57).
5
6

7
8 In order to guarantee the safety of China's western boundary, Beijing employed two main
9 measures at the time. One was to initiate the "Shanghai Five Forum" to negotiate the border
10 settlement, in April 1996, with Russia, Kazakhstan, Kyrgyzstan and Tajikistan, and a ground-
11 breaking Treaty on Deepening Military Trust in the Border Regions was signed in the end. In June
12 2001, the Shanghai Cooperation Organization (SCO) was established, with Uzbekistan joining the
13 Shanghai Five as a new member. Before long, the SCO was viewed by many as a mechanism to
14 confront the U.S.' "strategic superiority in Central Asia" (Akiner, 2010), and it was also the
15 starting point for China to be drawn into the "Great Games". The other measure Beijing took was
16 to use energy to help create better political connections with the Central Asian neighbours. Some
17 might wish to argue that energy security was the main driver behind China's initial overseas oil
18 investment, including those in Kazakhstan, but this could not be substantiated by statistics at the
19 time. Indeed, despite Kazakhstan's major oil producer's status today, when the China National
20 Petroleum Corporation (CNPC) made its first oil investment there in 1997, Kazakhstan's proven
21 oil reserves were unknown and its annual oil production was only 25.8mts (*BP*, 2007, pp. 6 & 9).
22 China's oil imports from Kazakhstan in 1997 was 44,900 tons, accounting for merely 0.1% of the
23 total imports. Even by 2000, oil from Kazakhstan only accounted for 1% of China's total oil
24 imports, with 724,200 tons (Tian, 2003, p. 26 & 2005, p. 12). Therefore, it makes little sense to
25 suggest that energy supply was the main force driving China's entry to Central Asia, though such
26 energy cooperation did help forge closer political ties with the region. The political linkages had,
27 in return, helped enhance Chinese NOCs' operations in the new century, when energy gained more
28 weight in China's dealings with Central Asia, in particular with Kazakhstan and Turkmenistan.
29 What Beijing might not foresee at the time was that with the growing influence of the Chinese
30 NOCs and the cross-border oil and gas pipelines built, China would soon be drawn fully into the
31 grand geopolitical games of Central Asia.

51 **3. Energy and Politics in China's Cooperation with Kazakhstan**

52

53
54 Kazakhstan was the first Central Asian country where China made oil investment. In June 1997,
55 CNPC outbid a number of international oil majors including Texaco, Amoco and Russia's
56
57

1
2
3 Yuzhnimost to win the rights to develop the Uzen field (with 205mts of reserves) in Kazakhstan,
4 at a cost of \$9.5bn. The deal included the cost of \$3.5bn on building a 2,000km oil pipeline to
5 China, and a \$4.3bn payment for 60.3% of stake in Kazak oil company Aktobemunaigaz (AMG),
6 who had 130mts of reserves. The high price paid by CNPC was believed by many as infeasible
7 economically, which was worsened by the collapse of oil prices following the 1998 Asian
8 Financial Crisis and the mismatch of the oil production (7.6mts/year) and the designed capacity of
9 the pipeline (25mts/year) (*Petroleum Argus*, 198; Downs, 2000). Therefore, the projects did not
10 proceed as planned until a few years later.

3.1 CNPC's Takeover of PetroKazakhstan and Deeper Involvement in Kashagan

18
19
20

21 CNPC resumed operations in Kazakhstan starting 2002, together with its subsidiary CNPC-AMG,
22 which led to a discovery of the Hope oilfield in 2005 in the eastern Pre-Caspian Basin. Between
23 2003 and 2004, CNPC managed to increase its share in CNPC-AMG to 85.42%, and also obtained
24 a 50% of shares of Texaco North Buzachi Inc. located in western Kazakhstan (Parkhomchik, 2016).
25 But the key action that enhanced CNPC's position in Kazakhstan's oil sector was the successful
26 takeover of PetroKazakhstan (PetroKaz) in 2005, after two other Chinese national oil companies
27 (NOCs) – the China National Offshore Oil Corp (CNOOC) and the China Petrochemical
28 Corporation (Sinopec) – were blocked to purchase BG's shares in the Kashagan project by its
29 international partners. Discovered in July 2000, Kashagan is a supergiant oil field in the Caspian
30 Sea with an estimated 9-13bn barrels of recoverable oil. It is also a highly challenging project
31 given the harsh winter conditions and high levels of toxic hydrogen sulphide in the oil. In 2001, a
32 consortium Agip KCO (Agip Kazakhstan North Caspian Operating Company), led by Eni, signed
33 a 40-year production share agreement to operate in the field. The Agip KCO comprised of Eni
34 (with 16.67% of stake), Total, ExxonMobil, BG, Shell (each with 16.67%), Inpex and Phillips
35 (each with 8.33%). When BG announced selling of its shares in March 2003, CNOOC and Sinopec
36 reached a deal with BG to jointly purchase the shares for \$1.23bn. But BG's partners blocked the
37 offer and absorbed the shares themselves. Since there were already three proposed routes for oil
38 pipelines – 1) Russia to the Black Sea; 2) Turkey to the Mediterranean; and, 3) Iran to the Persian
39 Gulf – the oil majors apparently wanted to avoid risks from additional pipeline routes, if the
40 Chinese NOCs were to be involved (Liao, 2006, p. 44; EIU, 2003).

1
2
3 However, the setback did not prevent CNPC from trying to takeover Petrokaz, who was registered
4 in Canada but had all assets in Kazakhstan, with 12 oil fields of proven reserves of 390mts and
5 exploration licenses in 6 blocks (Liao, 2006, p. 45). In June 2005, PetroKaz announced a sale
6 worth of estimated \$3.5bn, which attracted interests from China's CNPC and Sinopec consortium
7 (Sinopec withdrew halfway through), and India's state-owned Oil & Natural Gas Corp (ONGC).
8 For Chinese NOCs, winning the deal could not only boost oil production for the proposed Kazakh-
9 China pipeline, but also serve their long-term strategic interests in Kazakhstan. On his visit to
10 Astana in July 2005, Chinese President Hu Jintao signed an agreement with Kazakh President
11 Nursultan Nazarbayev to develop a "strategic partnership", and it was believed that the two
12 leaderships had probably also approved the deal (*CD*, 2005, July 4; *PE*, 2005, October 1). India
13 was equally keen on the deal to support its boosting economy, and a delegation was sent for a two-
14 day visit to Astana in August 2005, led by Deputy Foreign Minister Rajiv Sikri with ONGC
15 representatives (Yermukanov, 2005). As expected, CNPC won the deal on 23 August 2005, though
16 it was obliged to transfer 33% of the shares to Kazakhstan's state oil company KazMunaiGaz
17 (KMG), which was done on 5 July 2006. The two also held a 50% stake each in the Shymkent
18 refinery for joint management (CNPC in Kazakhstan; Parkhomchik, 2016). CNPC's takeover of
19 PetroKaz was an uplifting victory for China's overseas oil operations, despite the dear cost, making
20 CNPC the second largest oil company in Kazakhstan.

33
34

35
36 Soon after, CNPC won another the deal over the purchase of stake from the U.S. oil company
37 ConocoPhillips (a merger between Conoco and Phillips in 2002), again, with political support from
38 the Kazakh government. In November 2012, ConocoPhillips was reportedly agreed to sell its 8.4%
39 stake in the Kashagan project to India's ONGC for \$5bn (*FT*, 2012, November 26). Yet Astana
40 seemed to prefer offering the deal to the Chinese. In July 2013, KMG was asked by the government
41 to pre-empt the ConocoPhillips stake and sold it to CNPC (Wood Mackenzie, 2013). Delighted
42 with the largest overseas acquisition by CNPC, Chinese President Xi Jinping attended the signing
43 ceremony on his state visit to Kazakhstan in September 2013, during which KMG and CNPC
44 signed a sale and purchase agreement worth \$5bn over the Kashagan stake, as a part of 22 deals
45 inked between the two countries worth of \$30bn. CNPC also agreed to pay \$3bn to help finance
46 Kashagan's Phase 2 development from 2020, which was expected to double oil production to
47 370,000 bpd from 180,000 bpd in Phase 1 (2013-14) (Gordeyeva, 2013, September 7). It was also

7

8 **3.2 The Kazakh-China Oil Pipeline vs Russian-China Oil Pipeline**

9

10 Following the muddling M&A course in accessing Kazakhstan’s oil industry, the building of the
11 Kazakh-Chinese oil pipeline proved a smoother process. In May 2002, construction of the 2,000km
12 Kazakh-China oil pipeline commenced, and it took only seven years to complete from Atyrau in
13 western Kazakhstan to Alashankou in China’s Xinjiang province via three phases (see Map 1).
14 Phase 1 was the westernmost section, 448.8km in length, from Atyrau to Kenkiyak in Kazakhstan.
15 The work was completed in March 2003, with a designed capacity of 5.9mts of annual oil delivery.
16 Construction of Phase 2 began on 28 September 2004, running for 962.2km from Atasu in
17 Kazakhstan to Alashankou in Chinese border, and further connecting to the Alashankou-Dushanzi
18 pipeline inside China. The building work was finished on 16 December 2005 and the pipeline
19 became operational on 29 July 2006, with a designed capacity of 10mts annually and an \$800m
20 investment. Construction of Phase 3 was done between 11 December 2007 and 1st July 2009, ahead
21 of schedule. It became operational in October 2009, stretching for 761km between Kenkiyak and
22 Kumkol with an investment of \$511m. (‘CNPC in Kazakhstan’; *BBC Monitor*, 2009).
23
24
25
26
27
28
29
30
31
32
33

34 **Insert Map 1 here**

35
36

37 The completion of the oil pipeline has enabled Kazakhstan to double its oil exports to China from
38 6mts in 2009 to 12mts in 2013 (Tian, 2010 & 2014), and peaking in 2017 to 12.3mts (*Xinhua*,
39 2018, January 11). As the first cross-border pipeline between Central Asia and China, the Kazakh-
40 China pipeline was not only highly significant for China’s oil security, but also altered pipeline
41 maps in Central Asia and enabled Kazakhstan to reduce its dependence on Russia over energy
42 export routes. In addition, CNPC also helped modernise the Shymkent oil refinery, one of the
43 biggest in Kazakhstan (plus Pavlodar and Atyrau), between 2014 and 2018 via two stages. This
44 had helped Kazakhstan increase its annual refining capacity from 13.8mts to 16.5mts, and also
45 equipped the country to produce a higher quality of fuel (Euro IV–V compared to Euro II
46 previously) and self-refined aviation fuel to supply its domestic market, instead of relying on
47 Russian supplies (*AT*, 2017, November 19; Altynsarina, 2018, September 27).

55
56
57

1
2
3 Interestingly, a closer Sino-Kazak energy cooperation seemed to have stimulated the progress of
4 the Russian-China oil pipeline, as Moscow did not wish to lose the Chinese market. Indeed, as
5 early as in 1998, CNPC and Yukos (a private Russian oil company) had reached an agreement to
6 build a 2,300km oil pipeline (with a capacity of 20mts/year) between Angarsk in East Siberia and
7 Daqing in China. Despite the alternative route proposed by Transneft (Russia's state oil pipeline
8 company), in July 2001, from Angarsk to Nakhodka running for 3,900km (with a capacity of
9 50mts/year), a feasibility study over the Angarsk-Daqing pipeline was signed, in September 2001,
10 at the sixth Sino-Russian Premiers' Regular Meeting, in the presence of Yukos, Transneft and
11 CNPC. Only after Japan showed its interest in Transneft's proposal in January 2003, Moscow
12 changed its mind and made a new decision on 31 December 2004: to build a 4,130km Eastern
13 Siberia-Pacific Ocean (ESPO) pipeline between Taishet to Nakhodka with an annual capacity of
14 80mts oil delivery. In April 2005, Russia further announced that the ESPO pipeline would be built
15 via two phases. The first was from Taishet to Skovorodino near the Chinese border (see Map 2),
16 and would be completed by 2008 with an annual capacity of 30mts (Itoh, 2011, pp. 22-25).

29
30

31 Still, as Moscow was in control of the pipeline negotiations, the new decision did not make things
32 happen for another few years. According to Zhang Guobao, former head of China's National
33 Energy Administration and the key negotiator on ESPO pipeline, the negotiation was a lengthy
34 and frustrating process, with "one step forward, two steps back" (Downs, 2010 & 2018). Not until
35 April 2009, three months before the completion of the Kazakh-China pipeline, did Russia finally,
36 conclude a \$25bn worth of loan-for-oil deal with China. Under the contract, the China
37 Development Bank would lend Russia's state energy companies the funding in need to build and
38 operate a 67km branch line from Russia's Skovorodino to Chinese border city Mohe; and CNPC
39 committed to building a 927km pipeline from Mohe to the refineries located in Daqing. Russia's
40 Rosneft also agreed to supply 300mts of oil through the pipeline over a 20 year period. On 1
41 January 2011, the Russian-China oil pipeline became commercially operational, with an annual
42 capacity of 15mts of oil delivery until 2030 (Weitz, 2011).
43
44
45
46
47
48
49
50
51
52

53 In June 2013, Rosneft and CNPC signed another agreement on expanding the pipeline's annual
54 capacity to 31mts from 2018, and further reached a MoU in October on building a joint venture in
55
56
57

1
2
3 Russia's Far Eastern, each holding a 51% and 49% share. Rosneft also agreed to supply China's
4 Sinopec 200,000 bpd of crude oil for 10 years, starting from 2014 (*S&P Global*, 2014, February
5 7). In August 2016, CNPC started construction on the second ESPO branch line in parallel to the
6 Mohe–Daqing pipeline, which began commercial operation on 1st January 2018. The new line
7 boosted Russian oil exports to China by 19.7% in 2018, totalling 71.5mts, making Russia China's
8 top oil supplier for the third year consecutively (*GT*, 2019, March 24). In the first five months of
9 2019, China's oil imports from Russia were again up 9.8% from a year ago, to 30.54mts, after an
10 80% decline of the U.S. crude imports amid the U.S.-China trade tensions, although no extra tariffs
11 were put on U.S. oil thus far (Meng & Chen, 2019, June 25).

12
13
14
15
16
17
18
19
20 In summary, the Kazakh-China oil pipeline has not only helped Kazakhstan break Moscow's
21 monopsony, but also enhanced China's security of oil supply and CNPC's presence in Kazakhstan.
22 The closer Sino-Kazakh energy bond has as well compelled Russia to revisit its position over the
23 ESPO branch pipeline to China, as it wished to keep China as an important customer. On the other
24 hand, however, the changed pipeline map has drawn China further into the geopolitical games in
25 Central Asia, imposing greater challenges to Russia's overall dominance in the region. Thanks to
26 the SCO that served as a coordination mechanism, the competition between China and Russian
27 over Kazakh oil has not led to bilateral rivalries; and Beijing's stronger economic potential might
28 also have enabled its more prominent existence in Central Asia.

39 **4. China's Energy Cooperation with Turkmenistan**

40
41
42 Turkmenistan is the second-largest natural gas producer among the Commonwealth of
43 Independent States (CIS), after Russia, with 19.5 trillion cubic metres (tcm) of proven reserves at
44 end of 2018 (against 2.5tcm in 1998) (BP, 2019, p. 30). Yet Turkmenistan had no export routes on
45 its own, as its gas exports was dominated by Gazprom not only in the Soviet era but also after its
46 independence in 1991. Gazprom would normally allocate quotas for Turkmen gas exports and
47 charge them transit fees. If there were any disputes, Moscow would close its transit exit for
48 Turkmen gas (Puoketrader, 2016, August 4). Therefore, the post-independent Turkmenistan has
49 pursued a "neutral foreign policy" with the aim to develop multiple export routes to break the
50 Russian monopsony. Shortly after its independence, Turkmenistan agreed with Iran to build a gas
51

1
2
3 pipeline which was completed in 1997, and a second one was launched in 2010 as well. Although
4 Iran has large oil and natural gas reserves of its own, they are not located in the densely populated
5 northeast of the country, while Turkmen gas supply from north of Iran had provided an easy
6 solution for the problem (Shlapentokh, 2017). Turkmenistan also targeted China for a gas pipeline
7 around the time, but it took much longer to materialize the project due to a longer distance, more
8 transit countries and greater cost involved.
9
10
11
12
13
14

15 4.1 Initiation of the Turkmen-China Gas Pipeline

16
17 The Turkmen-China gas pipeline was initiated by Turkmen president Saparmurat Niyazov (1991-
18 2006) during his first visit to China in 1992, but the progress was slow thanks to the high cost and
19 the deteriorating relationship between Turkmenistan and its Central Asian neighbours. The only
20 advancement was a MoU signed on petroleum cooperation during President Jiang Zemin's visit to
21 Turkmenistan in 2000, which allowed CNPC to conduct exploration and service work in the
22 Kumdag oil field in western Turkmenistan – the first time a foreign company was granted the
23 rights to conduct onshore exploration. Sinopec was also allowed to conduct drillings at the oldest
24 Shatlyk gas field on the right bank of the Amu-Darya River (see Map 3) (Cutler, 2015).
25
26
27
28
29
30
31

32 **Insert Map 3 here**

33
34
35 However, three key issues were on the way of the pipeline project. First of all, the political risk.
36 The proposed 6,700km gas pipeline (see Map 4) would go through three countries before reaching
37 China: 188km through Turkmenistan, 530km via Uzbekistan, 1,300km passing Kazakhstan and
38 then running 4,700km on the Chinese territory. Since the newly independent countries were still
39 under economic and social changes, there could be higher political risks and vulnerability caused
40 by transit powers (Stevens, 2000; *Interfax China*, 2008). The second huddle was the uncertainty
41 of Turkmen capacity to fulfil its promised gas supplies to both Russia and China. According to a
42 long-term contract signed with Gazprom in April 2003, Turkmengaz was to supply gas for 25-
43 years, with 5-10bcm in 2004-2006, 60-70bcm in 2007, and 70-80bcm from 2009 onwards. But the
44 Turkmen gas production was only 62bcm of in 2006, it was unlikely for Turkmenistan to fulfil its
45 obligations without increasing gas production substantially (Puoketrader, 2016; *BP*, 2008). The
46 last but most important issue was the unstipulated gas price. Given the unusual length of the
47
48

2
3 pipeline, Beijing was hesitate to firmly commit to the pipeline project without a favourable price
4 guaranteed by Ashgabat.
5
6

7 **Insert Map 4 here**
8
9

10 A breakthrough took place in April 2006 on President Niyazov's third official visit to China, when
11 the two parties sign a "general agreement" on building a cross-border gas pipeline. Under which
12 China would purchase 30bcm/year of Turkmen gas for 30 years, starting from 2009, and the two
13 sides would also jointly explore and develop "all deposits" on the right bank of the Amu-Darya
14 River. Should additional volumes of gas be required to meet the commitment, Turkmenistan
15 promised to "guarantee" supplies from other gas deposits in the country (*BBC Monitor*, 2008,
16 July 3). President Niyazov was delighted to see the progress and called the deal "a modern version
17 of the Great Silk Road, which has connected our countries since ancient times". He also told the
18 cabinet that the pipeline would allow an eastbound route for Turkmen gas export, and boost the
19 Turkmen economy by 40% upon completion. China was equally excited by the development, not
20 least that the negotiations with Russia over a gas pipeline since the mid-1990s had gone nowhere
21 by then (Šír & Horák, 2008; Lelyveld, 2011, December 5).
22
23
24
25
26
27
28
29
30
31

32 Nonetheless, the unexpected passing of President Niyazov due to a heart attack, on 21 December
33 2006, triggered new concerns in China about the fate of the pipeline (*Sina.com*, 2006, December
34 30), while Moscow was quick to lure Turkmenistan to "stay with Russia". When the new Turkmen
35 President Gurbanguly Berdymukhamedov assumed power on 14 February 2007, for instance,
36 Moscow reacted swiftly by inviting him for an official visit on 10 – 11 of April. A month later,
37 President Vladimir Putin paid a return visit to Ashgabat for a summit meeting with his Turkmen
38 and Kazak counterparts, to discuss a pipeline plan to carry Turkmen gas through Kazakhstan and
39 Russia to Europe. As the pipeline could "lock Turkmenistan and Kazakhstan into a gas alliance to
40 improve the gas- and oil- transport infrastructure along the eastern shore of the Caspian Sea to
41 Russia", Putin's trip was viewed "as a victory for Russian energy policies towards Central Asia."
42 (*RFE*, 2007, May 11) A commentary in China's *Business Times* also noted that Gazprom had
43 offered Turkmenistan a new price of \$100 per 1,000m³ for its gas supply, while Kazakhstan
44 requested for \$160 per 1,000m³. If the Kazakh price were to be applied, China would have to face
45 new challenges in settling gas prices with Turkmenistan (*BT* 2007, May 19).

4.2 The Pipeline Project Under the New Turkmen Leadership

Beijing's concern was soon eased by President Berdymukhamedov's official visit on 17-18 July 2007, when he received a warm welcome from Chinese President Hu Jintao. The two leaders signed a joint communique reiterating their willingness to develop political and economic ties, and Berdymukhamedov reassured Hu that his government would remain committed to combat the "three evils" – terrorism, separatism and extremism – and the pipeline project would be pursued according to plan. On 29 August 2007, finally, construction of the Turkmen-China gas pipeline was launched at Bagtyyarlyk area in Lebap Region, where CNPC was granted a license for gas exploration and production. President Berdymukhamedov attended the inaugural ceremony and offered Beijing a favourable price at \$90 per 1,000m³ for Turkmen gas supply, less than what Gazprom paid through 2009 (*TW*, 2007, July 18). China also took this opportunity to inform him that both Kazakhstan and Uzbekistan had agreed to be transit countries. In December 2007, CNPC again announced that it would invest CNY16bn (\$2.16bn) to fund the pipeline construction, and that its subsidiary China National Oil and Gas Exploration and Development Corp. (CNODC) would be responsible for the building work, jointly with two state-owned companies in Kazakhstan and Uzbekistan (*Xinhua*, 2007, December 29).

Unhappy to see China becoming a new customer for Turkmen gas, Moscow was said to have done everything possible to torpedo the Turkmen–China gas pipeline. In November 2007, Gazprom offered a higher price for Turkmen gas supply at \$130 per 1,000m³ in the first half of 2008, and \$150 July-December 2008 (Mityayev, 2007, December 3). A deal was also inked between Gazprom with Kazakhstan and Turkmenistan on 20 December, following President Putin's proposal in April, over the building of a gas pipeline along the Caspian Sea coast. It was to be completed by 2010 with a designed annual capacity of 20bcm of gas supply for European markets. Earlier in August, Putin also ignored Chinese appeal at the annual SCO summit in Bishkek (Kyrgyzstan's capital), that SCO member states should "take advantage of their economic complimentary and geographic affinity to maximise their economic development," the code-words for energy cooperation. According to a commentary of the *The Strait Times*, the Russians actually "hoped to use the SCO as a framework for limiting Chinese penetration in a region which they consider within their sphere of influence." (*ST*, 2007, August 18)

1
2
3 Beijing had no options but to follow suit. In January 2008, CNPC's subsidiary PetroChina signed
4 a "benchmark" agreement with Turkmenistan, to pay \$195 for its gas supply per 1,000m³, plus a
5 \$50 fee for transporting the gas to Western China. Analysts viewed the move as an indication that
6 China was "willing to pay international market prices for the cleaner fuel", but also "a signal to
7 Russia that China is not solely dependent on it for gas." (*Interfax China*, 2008). On 14 December
8 2009, construction of the 1,833-km Central Asia-China Gas Pipeline (CAGP, Line A) was
9 completed, finally, and the celebration ceremony was opened by Chinese President Hu Jintao,
10 Kazakh President Nursultan Nazarbayev, Turkmen President Gurbanguly Berdymukhamedov, and
11 Uzbek President Islam Karimov (*Xinhua*, 2009, December 14). In October 2010 and May 2014,
12 two parallel CAGP Line B and Line C also became operational, making the Turkmen gas delivery
13 to China totalled 28-29 bcm annually (CNPC, 2017, July 15). When Russia and Iran stopped
14 importing Turkmen gas in 2017, China again increased its gas imports from Turkmenistan, to
15 31.7bcm in 2017 and 33.3bcm in 2018 (*BP*, 2018, p. 34; 2019, p. 41). This not only allowed Beijing
16 to speedy its process of moving away from coal, but also helped Turkmenistan avoid a potential
17 revenue crisis upon losing two major customers (Bhutia, 2019, February 4).

32

33 **Central Asia Under the Belt and Road Initiative (BRI)**

34
35

36 Proposed by President Xi Jinping in 2013, the BRI consists primarily of the *Silk Road Economic*
37 *Belt*, linking China to Central and South Asia and onward to Europe, and the *New Maritime Silk*
38 *Road*, linking China to the nations of South East Asia, the Gulf Countries, North Africa, and on to
39 Europe (Umbach, 2019). Given the grand coverage and objectives, BRI was called as China's
40 "Marshall Plan" that sought to promote its "Asia Dream" and to "reshape the world"; some even
41 viewed it as China's "New Great Game" in the old Eurasian Heartland (Callahan, 2016; Yu, 2017;
42 Chen and Fazilov, 2018). Responding to these doubts, Chinese President Xi Jinping held that the
43 BRI was neither a foreign assistance scheme like the "Marshall Plan", nor an instrument of
44 geopolitics, but was simply a platform for multilateral cooperation aimed to build "the community
45 of human destiny" (*Xinhua*, 2018, September 6). Regardless the definition, BRI is truly the most
46 ambitious foreign policy initiative China has ever pursued in modern history, with an estimated \$1
47 trillion of investments to be made on hundreds of infrastructure projects around the world (Mauk,
48
49
50
51
52
53
54
55
56
57
58
59
60

2019, January 30). In order to facilitate implementations of the BRI, China has established a state-run Silk Road Fund, on 29 December 2014, with a total capital of USD 40bn and CNY 100bn. The Fund aims to provide “investment and financing support for trade and economic cooperation and connectivity” under the BRI framework, with four shareholders: the State Administration of Foreign Exchange (65%), the China Investment Corporation (15%), the Export-Import Bank of China (15%), and the China Development Bank (5%) (*Silk Road Fund*).

In January 2016, Beijing again launched the Asian Infrastructure Investment Bank (AIIB), “with a mission to improve social and economic outcomes in Asia”. As of end of September 2019, the AIIB has got 100 approved members and nearly \$100bn pledged capital, accounting for 78 per cent of the world’s population and 63 per cent of the global GDP. Since Beijing holds enough of the bank’s voting rights (26.7%) to block decisions that require three-quarters approval, the AIIB is also labelled as “China’s World Bank” (AIIB.org; Curran, 2018, August 6). China has so far signed cooperation agreements with 126 countries and 29 international organisations, to develop inter-connectivity of infrastructure, including ports, highways, railways and pipelines to increase China’s economic and foreign policy impact. By April 2019, 36 projects had been approved by AIIB involving a total of \$30.12bn investments, and \$7.94bn were AIIB loans. Among which, Tajikistan has got two approved projects, on the Nurek Hydropower Rehabilitation and the Dushanbe-Uzbekistan Border Road Improvement. Uzbekistan has got two projects as well, on Railway Electrification (Bukhara-Urgench-Khiva) and Bukhara Region Water Supply and Sewerage, both pending for approval. On 28 November 2019, AIIB signed a MoU with the Kazakh Energy Ministry to enhance the investing environment for renewable energy in Kazakhstan, and one project under consideration is to build a 100MW wind power plant in Zhanatas (AIIB.org; Curran, 2018, August 6). Undeniably, Kazakhstan has been the most enthusiastic party among the Central Asia nations to embrace Beijing’s BRI ambition, by referring itself the “buckle” of the scheme and linking it to its own development programmes.

The Sino-Kazakhstan Cooperation in the BRI Era

Kazakhstan enjoys a key position in the BRI economic corridors between China and Europe and China to West Asia (Umbach, 2019). Even before the BRI was initiated, President Nazarbayev had already proposed, in May 2012, to make Kazakhstan the largest business and transit hub of

1
2
3 the Central Asian region and a unique bridge between Europe and Asia, in order to revive the old
4 Silk Road routes (Higgins, 2018, January 1). He also made various efforts to weaken the Russian
5 influence in Kazakhstan, such as creating a non-Cyrillic alphabet for the Kazakh language and
6 systematically shifting official media programming away from Russian and into Kazakh, while
7
8 China and the United States were regarded as alternative partners (Wasserman, 2019, March 26).
9
10 Therefore, soon after the launch of the BRI, President Nazarbayev announced his \$9bn national
11 development programme *Nurly Zhol* (Bright Path), in November 2014, seeking to build or upgrade
12 7,000km of roads and 4,000km of railways. Amid the blow of collapse of oil prices since mid-
13 2014, China was naturally viewed as a lifesaver with new capital inflows and technologies required
14 by the plan (Bitabarova, 2018; Russell, 2019). On his visit to China in August 2015, President
15 Nazarbayev successfully persuaded Beijing to align the *Nurly Zhol* with the BRI, and a joint-
16 working group was established in December 2015, between Kazakhstan's Ministry of National
17 Economy and China's National Development and Reform Commission (NDRC), to synergizing
18 the two nations' development strategies. In September 2016, the two governments again inked a
19 deal prioritising three sectors for cooperation: transport infrastructure, trade, and manufacture
20 (Bitabarova, 2018).
21
22
23
24
25
26
27
28
29
30

31
32 During President Xi Jinping's visit to Kazakhstan in June 2017, 24 additional deals were reached
33 worth over \$8bn, in the fields of energy, agriculture and infrastructure. A year later, Kazakhstan
34 launched a new financial hub, the Astana International Financial Centre (AIFC), aiming to become
35 a Luxembourg-style intermediary between large nations and a gateway for foreign investment
36 across Central Asia. China again granted support by making the Shanghai Stock Exchange (SSE)
37 and the Silk Road Fund (SRF) as shareholders of AIFC's Astana International Exchange (AIX),
38 and also allowed AIX to use RMB for trade and settlement (*Reuters*, 2018, July 5). In September
39 2018, at a visit by Kazakh First Deputy Prime Minister Askar Mamin to Beijing, the two
40 governments agreed on 11 new projects worth of \$1.9bn. The bilateral trade also reached a new
41 high in 2018 to nearly \$100bn, making China Kazakhstan's Number Two trading partner, second
42 only to the European Union. Against a more comprehensive and proactive cooperation, many have
43 viewed Kazakhstan as China's ally with the BRI rather than merely a supporter (Altynsarina, 2018,
44 September 27; Bitabarova, 2018, p. 160). However, the affirmative position towards Chinese
45 investments held by political and business elites was not always shared by the Kazakh public, often
46
47
48

59
60

1
2
3 due to the lack of detailed information or stereotypes about China, like what happened with
4 agricultural cooperation (Dave, 2018; Bitabarova, 2018, p. 168).
5
6

7
8 Being the world's No 8 wheat exporter but with an under-developed agriculture sector, the Kazakh
9 government has longed to enhance agricultural development to help diversify its oil-dependent
10 economy. In 2010, Astana decided to lease one million hectares of farmland to Chinese investors,
11 but had to abandon the plan shortly due to public protests (*GAI*, 2016, May 9). In 2016, again,
12 when the government planned to extend the lease of farmlands by foreigners from 10 to 25 years,
13 it sparked the largest public demonstrations since Kazakhstan's independence. Protestors were said
14 to fear of the influx of the Chinese and their "harmful environmental practices", but many also
15 admitted that they had little information of the details of the new law. In order to obtain public
16 acceptance, the Kazakh Deputy Agriculture Minister Gulmira Isayeva had to explain, in May 2016,
17 that the potential Chinese investors would not be allowed to own Kazakh lands, and that they could
18 only invest in the processing of agricultural products in partner with Kazakh counterparts
19 (Bitabarova, 2018, p. 167; *GAI*, 2016). China and Kazakhstan also conducted several pilot projects
20 to demonstrate the benefits of agricultural cooperation. In July 2017, seven new agreements were
21 signed, worth of \$160m, during the Kazakh-Chinese Agriculture Investment Forum in Astana, and
22 a MoU was reached as well aiming at creation of a model zone of agricultural cooperation (*Xinhua*,
23 2017, June 10). These activities had helped Kazakhstan to access the Chinese agriculture market
24 and also promoted people-to-people interactions between the two nations, making agriculture
25 another important sector for bilateral cooperation. In an interview with the *Xinhua News Agency*
26 in May 2018, President Nazarbayev highlighted the benefit of the bilateral agricultural cooperation,
27 which allowed their trade of agricultural products to increase 20% in the past five years (Jiang,
28 2018, August 29).
29
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44

45 Another Kazakh flagship project that directly benefited from the BRI scheme was the "Dry Port"
46 located in Khorgos. Occupying 129.8 hectares of land, the project was proposed by President
47 Nazarbayev in November 2011, to build an Eastern Gate Special Economic Zone in the Kazakh
48 part of Khorgos. The "Dry Port" has a capacity to hold 18,000 containers and seven gantry cranes
49 that will allow horizontal transfer of containers between different rail tracks, and also has logistics
50 zones and industrial zones. With the birth of BRI in 2013, President Nazarbayev seized the
51 opportunity to further reduce reliance on Russia, by linking the "Dry Port" with BRI as a transit
52
53
54
55
56
57

1
2
3 hub (Wasserman, 2019, March 26; Saunders, 2019, April 18). Since the inaugural train passed
4 through the “Dry Port” in 2015, China has obtained great benefits from the shortened journey to
5 Europe in about 14 days, faster than the 40 days of cargo transport by sea and cheaper than the air
6 transportation. According to Zhaslan Khamzin, CEO of the Khorgos Gateway, “in a few years
7 Khorgos Gateway will be the largest dry port in the world” (Mauk, 2019, January 30).
8
9

10
11
12 On 19 March 2019, the 78 years old Kazakh President Nazarbayev resigned unanticipatedly, who
13 had run the country since 1989 when it was still a Soviet Republic (Cheang, 2019, March 22). But
14 the power transition has brought little policy changes so far under the new President Kassym-
15 Jomart Tokayev, who was loyal to Nazarbayev and even suggested a new name – Nursultan – for
16 the capital city Astana in April to honour the former leadership. When meeting with President Xi
17 Jinping in Bishkek on 14 June 2019, President Tokayev reiterated that developing relationship with
18 China remained a priority in Kazakhstan’s foreign policy, echoing President Xi’s call for
19 deepening alignment of the BRI and *Nurly Zhol* strategy to benefit the two countries and the region
20 (*Xinhua*, 2019, June 14). Earlier in March, Foreign Minister Beibut Atamkulov also emphasized
21 that Kazakhstan would be “an indispensable player in the BRI”, and was committed to working
22 with China “to turn the (Khorgos International) centre into an economic driver of the region”
23 (Atamkulov, 2019, March 28).
24
25
26
27
28
29
30
31
32
33

34 Of course, the Kazakh projects linked to BRI were not free from challenges, and the Light Rail
35 Transportation (LRT) project in Nursultan was a recent example. Sponsored by the China
36 Development Bank (CDB) with a loan worth of \$1.9bn to Kazakhstan’s state-owned Astana LRT
37 in 2015, the project was aimed to build a light-rail system in Kazakhstan’s capital city by 2020.
38 Astana LRT hired a consortium of Chinese companies to carry out construction on the light-rail
39 network, but then deposited the funds in Bank of Astana instead of using them for LRT
40 construction. When the Bank of Astana went bankrupt with license revoked by the central bank,
41 the liability for the deposit was transferred to the Finance Ministry’s Problem Loan Fund, CDB
42 then had to stop financing the project in October 2018. Kazakhstan has pledged to repay CDB in
43 line with the loan agreement, and the Problem Loan Fund has reportedly released 3.3bn tenge
44 (\$8.6m) to Astana LRT to pay the contractors in February 2019 (Gizitdinov, 2019, June 3).
45 However, construction was soon frozen in April amid reports of mismanagement and fraud, and
46 the viability of the project was also questioned: the designed rail capacity was for 146,000
47

57

1
2
3 passengers daily, but there were only 2,000 passengers travelling between the airport and the new
4 train station every day, which meant great risk of unprofitability (Umirbekov, 2019, October 11).
5 In order to avoid similar financial risks, some Kazakh companies, such as the Kazakh national rail
6 company, Temir Zholy, who was engaged with the Dry Port projects, had sold a 49% stake of the
7 Dry Port operation to two Chinese companies in 2017. Ben Mauk, a correspondent from the *New*
8 *York Times*, held that such an arrangement would be helpful for Kazakhstan to avoid a one-sided
9 project, although “it’s very unlikely that what happened in Sri Lanka will happen here
10 (Kazakhstan)” (Mauk, 2019, January 30).
11
12
13
14
15
16
17

18 There has also been issues relating to political relationships between China and Kazakhstan,
19 especially over the reports of China’s mass detention of Muslim minorities in Xinjiang. There was
20 no doubt that Xinjiang’s stability and prosperity were crucial for China’s boundary safety and
21 domestic politics, which drove China to enter Central Asia more than two decades ago. With the
22 BRI ambition, Xinjiang’s geopolitical position is even more essential, being the gateway to Central
23 and South Asia. What concerned Beijing the most this time was the exigent political climate in
24 Xinjiang since 2009, especially after the outbreak of Syrian civil war in 2011, when thousands of
25 Uighurs who moved to Syria to fight for militant groups returned to China, and sparked a number
26 of terrorist events, including those in Urumqi (July 2009 & April 2014), Beijing (October 2013)
27 Kunming (March 2014). Since 2016, the Chinese government has reportedly detained more than
28 a million of Muslims, mostly Uighurs, in re-education camps, which were called by Chinese
29 officials as “vocational education and training centres”, to help prevent violence. It has been
30 claimed that Xinjiang and other Chinese cities have not experienced any terrorist attack since
31 December 2016 (*Japan Times*, 2019, April 28; Maizland, 2019, April 11).
32
33
34
35
36
37
38
39
40
41
42

43 Beijing’s approach has been criticised by human right groups and Western governments. On 10
44 July 2019, for instance, 22 Western governments issued a joint statement condemning China’s
45 mass detention of the Xinjiang Muslims. However, Beijing contested such criticisms and
46 attempted to gain supporters elsewhere. Two days later on 12 July, Beijing gathered 37 UN
47 ambassadors from developing countries to sign a letter praising its policy, claiming that “China
48 has made Xinjiang safe and happy”. China’s Central Asian allies, including Russia, Turkmenistan
49 and Tajikistan were among Beijing’s supporters, but Kazakhstan has kept silent (Liu, 2019, July
50 14). Some believed that Chinese investments had constraint Kazakhstan’s position in responding
51
52
53
54
55
56
57

1
2
3 to the issue (Mauk, 2019, January 30), but others argued that the Kazakh authority had taken a
4 quiet diplomatic approach: rather than calling for Kazakh ethnics back “home”, like what
5 happened in the 1990s, Kazakhstan now focused on protecting its own citizens and their families,
6 with Mrs Sairagul Sauytbay and her family being the latest example. As an ethnic Kazakh Chinese
7 but married with a Kazakh citizen, Mrs Sauytbay escaped from a detention camp in Xinjiang in
8 2018 and entered Kazakhstan illegally. She was then arrested in May at Beijing’s behest and was
9 convicted, in August 2018, by a Kazakh court as crossing the border illegally; her asylum request
10 was denied as well. Yet the Kazakh court also refused to order her deportation back to China but
11 instead allowed Mrs Sauytbay and her family to leave for Sweden, on 3 June 2019, to seek asylum
12 (Putz, 2019, June 3; *Japan Times*, 2019, April 28).

13
14
15
16
17
18
19
20
21 Apparently, Nursultan disagreed with Beijing’s handling of the Xinjiang Muslims with whom
22 Kazakhstan shared close ethnic bonds, but has restrained its response in order to avoid
23 antagonising China. According to latest information published by the Kazakh government in
24 September 2019, Beijing has invested US\$27.6bn in 55 projects in Kazakhstan, among which 15
25 have already been implemented, 11 are under construction and 29 are in planning. Approximately
26 half of the investments are in oil and gas, while the rest are in mining and ore processing, machine
27 manufacturing, food production and wind and solar farms (Simonov, 2019, October 29). For the
28 time-being, the Sino-Kazakh relationship has progressed well thanks to their mutual needs and
29 shared strategic interests. China wants to keep Kazakhstan as the transit hub for its RBI scheme,
30 and Nursultan cannot afford to lose Beijing’s financial support to its economic development either.
31 But economic power alone cannot if China wants to keep a sustainable relationship to please both
32 the Kazakh elites and the public, it may need to pursue a more liberal approach to formulate more
33 appealing soft power to the outside world. In contrast to the Kazakh stories that featured mostly
34 with positive notes, the fourth CAGP line to bring Turkmen gas to China – Line D, however, has
35 been less positive and its fate remains yet unpredictable as well.

36 37 38 39 40 41 42 43 44 45 46 47 48 **5.2 CAGP Line D and the Power of Siberia**

49
50
51 Line D is a major energy project proposed under the BRI (see Map 5), with an agreement signed
52 on President Xi’s visit to Central Asia in September 2013. The necessity of a new gas pipeline lay
53 in China’s attempt to improve the country’s environment and fulfil its climate change pledges,
54
55
56
57

1
2
3 which led to a 15-18% annual rise in its gas demand over the past decade, and the CAGP system
4 – with three pipelines already built – was rapidly running out of capacity. The 1,000 km Line D has
5 taken a different route from the other three, through Uzbekistan (200km), Tajikistan (410km) and
6 Kyrgyzstan (215km), and is to carry 25-30bcm of Turkmen gas per year to China upon completion.
7
8 Line D construction of the Tajik section was launched on 13 September 2014, with Tajik President
9 Emomali Rahmon and visiting Chinese President Xi Jinping attending the ceremony (*NT*, 2018,
10 January 31).

16 **Insert Map 5 here**

18
19 However, the project has been accompanied by many misfortunes thanks to the problematic
20 rationale behind. On the one hand, Line D was supposed to help Beijing avoid excessive reliance
21 on the Kazakhstan route and to diversify transit routes via going through Tajikistan and Kyrgyzstan;
22 but this has not enabled Beijing to diversify the source of gas supply from Turkmenistan. For
23 instance, during the winter 2017-18, the CAGP gas volumes dropped by half due to “frequent
24 equipment failures” in Turkmenistan, while LNG supplies from Uzbekistan and Turkmenistan
25 were also sporadic. China was then compelled to increase LNG imports extensively elsewhere,
26 causing LNG prices soaring to record highs. Analysts believed that this was a way for Turkmen
27 and Uzbek governments to press China for better prices, and was also driven by Turkmen resource
28 nationalists in the name of diversifying export routes (Hedge, 2018, February 17; Liu, 2019, March
29 27). On the other hand, the two transit countries – Tajikistan and Kyrgyzstan – both relied on oil
30 and gas imports, yet they would not get gas supply from Line D but only receive transit fees and
31 taxes. Therefore, “The economic justification for Line D was always dubious”, as held by Edward
32 Chow from the Center for Strategic and International Studies in Washington, DC. (Collins & White,
33 2013, June 5; *RFA*, 2017, March 20).

34
35
36
37
38
39
40
41
42
43
44
45
46 Unsurprisingly, the completion date of Line D has been delayed repeatedly, from 2016 to 2020,
47 and now to 2022. There has also been disputes between Kyrgyzstan/Tajikistan and Chinese
48 companies over the formation of a joint venture to build and operate the pipeline, and over the
49 pipeline routes in both countries (*NT*, 2018, January 31; *RFE*, 2017, March 6). On 2nd March
50 2017, CNPC and Uzbekneftgaz announced that the Line D construction on Uzbek territory would
51 be postponed indefinitely, leading to speculations that China would abandon the project altogether.
52
53
54
55
56
57

1
2
3 But soon in December 2017, the Kyrgyz government announced that the Line D work would be
4 resumed in 2019, and construction in Tajik section was also said to be resumed in January 2018
5 (Pannier, 2018, April 27). Uzbekistan was reported to have a discussion with the Chinese over
6 resuming the Line D work, but no substantive action has shown so far, as the Uzbek leadership
7 was believed nervous of China's huge BRI (*bne IntelliNews*, 2019, June 3). Therefore, whether
8 Line D can become operational by 2022 still remains to be seen.
9

10
11
12
13
14 However, the setback of Line D did not seem to bother Beijing greatly, because of the new
15 developments of two other sources: the Turkmen gas via the rest CAGP lines, and the Russian gas
16 via the "Power of Siberia" pipeline. Despite the brief supply disruption in 2017, Turkmenistan had
17 every reason to keep the Chinese market, in particular, after Moscow sharply reduced importing
18 its gas in 2015 and stopped the imports in January 2016, over a dispute regarding gas payments.
19 In early 2017, Turmengaz suspended gas supply to Iran as well over a contract dispute (Lelyveld,
20 2018, October 29; Mackenzie, 2015, July 24). This left China the sole consumer, who imported
21 31.7bcm of Turkmen gas in 2017 and 33.3bcm in 2018, equivalent to 15% of its total gas
22 consumption. In April 2019, Gazprom resumed Turkmen gas imports, and a 5-year contract was
23 signed with Turmengaz in July, to have a 5.5bcm of gas supply annually. The amount was rather
24 symbolic than substantive, but analysts believed that the move was driven either by Gazprom's
25 desire to supplement its own production to boost exports to Europe, or by Russia's attempt to
26 hamper plans for a trans-Caspian pipeline designed for Turkmen gas to reach Europe via the
27 Southern Gas Corridor (Genté, 2018, December 10; Putz, 2019, July 4). Gazprom was obviously
28 willing to maintain control over the Turkmen gas exports, but it seems too late for it to regain such
29 a control: China now buys nearly 80% of Turkmen exports, which are almost entirely natural gas
30 (Bhutia, 2019, October 6).
31
32
33
34
35
36
37
38
39
40
41
42
43
44

45 In the meantime, China and Russia started revisiting their overdue gas pipeline plan, which was
46 signed in 2009 but had little progress for two main reasons: the pipeline routes and gas prices. The
47 route suggested by Russia was from the Altai region to western China, which would make gas
48 supply to China and Europe from the same fields and, thus, enable Russia to play the role of a
49 "swing producer". While the Chinese preference was to build a pipeline between Siberia and
50 Northeast China, to avoid potential blame for 'robbing' gas from the Europeans, as argued by
51 Keun-Wook Paik, Senior Fellow at the Oxford Institute of Energy Studies (Wishnick, 2014). In
52
53
54
55
56
57
58
59
60

1
2
3 terms of gas price, Moscow demanded that Beijing pay the same as European consumers at \$400
4 per bcm, but CNPC insisted on \$350 per bcm as it had already made losses on domestic market
5 with regulated gas prices. Eventually, the puzzle was resolved through close political ties between
6 the two leaderships. In June 2013, at President Xi Jinping's inaugural visit to Russia, the two
7 leaders decided to build the "Power of Siberia" pipeline from East Siberia to China (Luhn &
8 Macalister, 2014, May 21; Wishnick, 2014). On 21 May 2014, during Putin's two-day visit to
9 Beijing, Gazprom and CNPC signed a \$400bn contract on Russian gas supply to China at 38bcm
10 annually for 30 years, in the presence of the two Presidents. The 3,000km pipeline would bring
11 gas to China from the Chayanda and Kovykta gas fields in eastern Siberia through Vladivostok
12 (see Map 6). Russia was to invest \$55bn in developing the project, and China agreed to contribute
13 an additional \$20bn. The contract did not reveal the agreed gas price, but it was speculated that
14 Gazprom accepted the CNPC offer, in return for cheap Chinese credit to develop the project.
15 According to Russia's former deputy energy minister Vladimir Milov, faced with Western
16 sanctions in the post-Crimea crisis, "Putin is ready to diversify gas supplies at any expense because
17 he considers it geopolitically important." (Luhn & Macalister, 2014, May 21; Wishnick, 2014)
18
19
20
21
22
23
24
25
26
27
28
29

30 **Insert Map 6 here**

31
32

33 In September 2014, Gazprom launched construction of the pipeline, while the work on Chinese
34 territory also started in April 2017. Completed in March 2019, the Power of Siberia was launched
35 on 2 December 2019 via video by President Putin from Sochi and President Xi from Beijing,
36 respectively, and is expected to supply 38bcm gas to China annually for 30 years. The 3,000km
37 pipeline will not only boost the bilateral "strategic energy relations" as suggested by President
38 Putin, but has also made Sino-Russian relations "a priority" in China's foreign policy, as claimed
39 by President Xi (*FT*, 2019, December 2). As a matter of fact, Russia has become keener than ever
40 before to serve the huge Chinese gas market, and has reportedly started talks with China on
41 building the Power of Siberia 2 since 2015. However, the two sides have yet agreed on a number
42 of issues so far, such as the pipeline route, the financing of the pipeline, and the gas price. As the
43 existing gas fields would not be sufficient to support the 38bcm annual gas supply to China for 30
44 years, Gazprom had to rely on the giant Bovanenkovskoe gas field on the Yamal Peninsula, far
45 away from the Chinese border. It would also be very expensive to build the pipeline because much
46 of it would have to go through permafrost, where it is tricky to anchor in. The Mongolia option
47
48
49
50
51
52
53
54
55
56
57

1
2
3 could eliminate the permafrost challenge but would pose other problems: it would have to be
4 longer to reach China, making it more costly, and adding transit risks ad cost. With the alternative
5 pipelines from Central Asia and Myanmar (12bcm/year), plus a more competitive LNG market
6 globally, China has got more bargaining power than before (Mammadov, 2019, October 14), which
7 may delay the new line for a while until things become workable for both parties.
8
9

10
11
12 That said, the Power of the Siberia pipeline is the largest gas project between Russia and China. It
13 has allowed Russia to diversify the sole reliance on the European market, and also enabled China
14 to enjoy multiple sources of gas supply, rather than relying mainly on the Central Asian pipelines.
15 Some viewed the pipeline a “global game changer”, as it forced the world’s biggest energy reserve
16 country and the biggest energy consumer – Russia and China – together, which could have
17 economic and political repercussions Europe and America never predicted (Twisdale, 2018, April
18 9). Despite the remaining suspicion over the Sino-Russian relations based on their historical
19 geopolitical rivalries, the Power of the Siberia pipeline has been labelled as “a symbol of Moscow’s
20 diplomatic pivot towards Beijing at a time of worsening relations with the west.” (Akita, 2019,
21 July 29; *FT*, 2019, December 2)
22
23
24
25
26
27
28
29
30

31 **5. Conclusion**

32
33
34 China entered Central Asia in the late 1990s, using energy diplomacy as an instrument to serve its
35 purpose of national security. Although energy security soon became China’s main engagement
36 with the region, politics had never vanished from the scene. Therefore, it could be fair to argue
37 that geopolitics had coloured China’s dealing with the region from the beginning, regardless of its
38 real intention, and the establishment of the SCO in 2001 indicated Beijing’s involvement in the
39 grand games formally. Over the past couple of decades, Chinese national oil companies have
40 established a strong profile in the region despite the defiance from Western and Russian oil majors,
41 and have built several cross-border oil and gas pipelines, jointly with their Central Asian
42 counterparts. The changed pipeline map allowed the main energy-producers, such as Kazakhstan
43 and Turkmenistan, to break off the long-lasting monopsony by Moscow, but had also drawn
44 Beijing further into the geopolitical games in Central Asia while enhancing its energy supply.
45 Eventually, China’s view on regional stability in Central Asia and its own role had also changed.
46 At a media event of the SCO summit in 2012, for example, Chinese Deputy Foreign Minister
47
48
49
50
51
52
53
54
55
56
57

1
2
3 Cheng Guoping claimed that, “The peace and stability of Central Asia is related to China’s core
4 interests, we will not allow the unrest in West Asia and North Africa to spread to Central Asia,”
5 referring to the threat of Arab-style upheavals (Baculinao, 2012, June 7). Up to this point, the term
6 “core interest” was only used to refer to the matters relating to China’s territorial integrity, such as
7 Taiwan, Tibet, and Xinjiang etc.
8
9
10
11

12
13 China’s greater geopolitical presence in Central Asia was unwelcome to the West and was also
14 once viewed by Russia as a challenge to its traditional sphere of influence. Yet being the two most
15 influential powers in Central Asia geopolitically, Russia has eventually accepted China’s new
16 status based on three main factors. Firstly, as discussed above, China’s deeper involvement in the
17 Kazakh and Turkmen energy sectors was not only desired by Chinese NOCs, but was also a policy
18 choice made by the host governments. Secondly, economic disparities between China and Russia
19 has redefined their balance of power in the region. While Russia still holds upper hand on security
20 and political grounds, China has become a leading economic power in the region. In addition to
21 the AIIB, China is the largest donor to the Contingent Reserves Arrangement under the BRICS
22 New Development Bank, with \$41bn donations against \$18bn from Russia (Lain, 2015, July 17).
23 Finally, despite some minor discords – on cross-border pipelines and on whether to establish a
24 SCO Development Bank¹ (Molchanov, 2017, pp. 140 & 144) – the SCO platform has helped
25 facilitate Sino-Russian cooperation over the past 20 years. The post-Crimean sanctions against
26 Russia and the U.S.-China trade war have brought the two countries even closer, as indicated by
27 the Power of Siberia pipeline. This giant gas project has gone beyond the energy arena to drive the
28 two leaders agreeing on developing the bilateral relationship into an “all-encompassing partnership
29 and strategic co-operation entering a new epoch.” (*FT*, 2019, December 2) This kind of statements
30 have rarely occurred since the two countries’ split in the 1960s, but should be good news to Central
31 Asia and the world: as long as Russia and China keep an amiable relationship, few other forces
32 will be able to challenge regional peace and stability in Central Asia.
33

39
40
41
42
43
44
45
46
47

48 Beijing’s BRI aspiration has further amplified its geopolitical significance in Central Asia, via a
49 broader policy agenda in the region and by seeking to project influence beyond the Eurasian
50 chessboard. The scheme was supposed to help relevant countries enhance infrastructure and
51
52
53

54
55 ¹ The idea was first proposed by Chinese Premier Wen Jiabao in 2010, with China contributing \$10bn for its start-up
56 capital and to be based in Beijing, but was declined by Russia.
57

1
2
3 economic development. However, since not all the projects pursued were tailor-made to meet the
4 needs of the parties involved, the BRI scheme has triggered various criticisms including debt traps
5 and governance-related issues. Another feature of the BRI is the pragmatic thinking centred on
6 economic development, which has undermined Beijing's ability to embrace different political
7 voices, including those from the Muslim groups in Xinjiang. It is evident that despite its growing
8 economic potential, Beijing's political approaches have not always been consented even by its
9 "SCO allies"; there thus must be a need for China to revisit its positions and to embrace some
10 universally accepted values to its foreign and domestic policies. With greater power potential,
11 Beijing should bear more responsibilities to ensure peace and stability in Central Asia, together
12 with other powers, not only for the sake of BRI's success, but also for the interest of the mankind.
