## ABSTRACT

Infectious canine tracheobronchitis (ICT) or canine infectious respiratory disease, commonly known as kennel cough, is an acute, highly contagious respiratory disease that affects the larynx, trachea, bronchi, and occasionally the parenchyma of the lower respiratory tract. Several pathogens have been implicated in ICT including viruses, bacteria and mycoplasma. Little is known about the prevalence of canine respiratory pathogens in New Zealand. Hence, the aim of this study was to identify potential respiratory pathogens from dogs that are affected by ICT in New Zealand, and compare agents found in diseased dogs to those found in healthy dogs. In house (IH) qPCR assays were developed for the detection of canine adenovirus type 2 (CAdV-2), canine herpesvirus (CHV) and canine parainfluenza (CPIV).

A total of 96 dogs were sampled, including 47 healthy and 49 diseased dogs, which comprised three different groups of dogs: greyhounds, pet dogs, and working farm dogs. A questionnaire was included for each dog sampled. The samples collected were then subjected to the following tests: virus isolation, haemagglutination assay for CPIV, IH qPCR for CAdV-2 and CHV, as well as IDEXX RealPCR respiratory disease panel, and bovine respiratory coronavirus ELISA to detect antibody to canine respiratory coronavirus (CRCoV).

Based on IDEXX qPCR, CPIV (7.3%), *Bordetella bronchiseptica* (7.3%) and *Mycoplasma cynos* (17.0%) were the most common agents detected in samples from diseased dogs, whereas CAdV-2 (10.6%) was the most common pathogen amongst healthy dogs. Based on IH qPCR, CAdV-2 infection was very common among all dogs sampled, with 34/47 (72%) positive diseased dogs and 37/47 (78.6%) positive healthy dogs.

A total of 47/92 (51%) of dogs were positive for CRCoV antibodies, including 32/46 (69.6%) of diseased dogs and 14/46 (30.4%) of healthy dogs. In addition, acute serum samples from diseased dogs were significantly more likely to be positive for CRCoV antibodies compared to sera from healthy dogs (RR 5.22, CI 1.972, 14.115, p=0.0003).

The results of this study suggest that CRCoV, *M.cynos* and potentially CPIV may have a role in ICT in New Zealand, however further investigation is required to support these findings. In addition, if one excluded dogs positive for CAdV-2 (as there was no difference in levels of detection of this virus between healthy and diseased dogs), then only 13/47 (27.6%) of diseased dogs were positive for at least one agent via IDEXX and IH qPCR. This suggests that

other aetiological agents, not examined in this study, may have contributed to respiratory disease in sampled dogs. Techniques such as next generation sequencing may help to identify these pathogens.

## ACKNOWLEDGMENTS

Firstly, I would like to thank the Centre for Service and Working Dog Health and Research, Massey University, and the Greyhound Racing Association for providing the funding for this research project. Also thank you to IVABS at Massey University for providing the facilities to carry out my research.

A huge thank you to my supervisors Magdalena Dunowska and Nick Cave for all the help, support and guidance they have kindly given me throughout my years of study on this project. In addition, I would like to thank all the dog owners for their time and cooperation in collecting samples for this study, as well as the various vets around the country who kindly provided us with samples. A big thank you to Kruno Bojanic and Sara Azarpeykan who assisted me with the sampling of working farm dogs for this study. Also thank you to Gaya Gopakumar for all of your technical assistance during my study.

Thank you to all the staff and students at Massey University who assisted me in my study and thank you to all my friends who have supported me along the way. A special thanks to Fiona Given for her unwavering support and encouragement right to the very end, and to Gareth Weeds for his wise words and encouragement.

Finally, I would like to thank my family, in particular my Mum, for all their love and support throughout my study, and for never losing hope that I would, one day, complete my Master's thesis.

## Table of Contents

Pathogens associated with acute infectious canine tracheobronchitis in New Zealand.....	i

2.4.2: Results.....	47
2.5: Discussion .....	48
2.5.1: CAdV-2 qPCR IH assay .....	48
2.5.2: CHV IH assay.....	49
2.5.3: CPIV qPCR IH assay.....	50
2.6: Conclusion.....	51
Chapter 3: Virological survey of viruses associated with infectious canine tracheobronchitis.....	52
3.1: Introduction .....	52
3.2: Materials and methods.....	53
3.2.1: Animals.....	53
3.2.2: Sampling.....	55
3.2.3: Processing of samples .....	56
3.2.4: Virus Isolation .....	56
3.2.5: Haemagglutination assay (HA) for CPIV.....	57
3.2.6: Real time (q) PCR .....	59
3.2.7: Enzyme linked immunosorbent assay (ELISA) for canine respiratory coronavirus antibody .....	61
3.2.8: Statistical analyses .....	62
3.3: Results.....	62
3.3.1: Data distribution .....	62
3.3.2: Detection of live virus .....	66
3.3.3: IDEXX qPCR canine respiratory disease panel .....	66
3.3.4: In-house qPCR .....	70
3.3.5: Comparison of IDEXX qPCR and inhouse qPCR results .....	79
3.3.7: Coronavirus ELISA results.....	80
3.4 Discussion.....	89
3.4.1: Absence of live virus in samples .....	90
3.4.2: Canine adenovirus infections are common among New Zealand dogs.....	91

3.4.3 Canine herpesvirus circulates among New Zealand dogs but is unlikely to be important for ICT .....	93
3.4.4 Canine parainfluenza virus circulates among New Zealand dogs, and may contribute to ICT .....	94
3.4.5: CRCoV infection is common among New Zealand dogs and has likely contributed to ICT observed in the sampled population .....	95
3.4.6: The role of other pathogens .....	99
Chapter 4: General Discussion and Concluding remarks .....	101
Appendices.....	103
Appendix 1: Questionnaires.....	103
1.1: Questionnaire for dogs with suspected acute tracheobronchitis .....	103
1.2: Racing greyhound questionnaire .....	105
1.3: Pet dog questionnaire.....	106
1.4: Working farm dog questionnaire.....	108
Appendix 2: Database for healthy and diseased dogs .....	109
2.1: Diseased dogs: Signalment and medical history.....	109
2.2: Healthy dogs: Signalment and medical history.....	110
2.3: Diseased dogs: clinical signs reported .....	112
Appendix 3: Real time qPCR3.1 IH qPCR optimisation .....	113
3.1.1: CAdV-2 annealing temperature optimisation.....	113
3.1.2: CHV annealing temperature optimisation .....	115
3.1.3: CPIV annealing temperature optimisation .....	117
3.2: In-house qPCR results .....	118
3.2.1: CAdV-2: .....	118
3.2.2: CHV:.....	123
3.3: IDEXX and IH qPCR results .....	128
3.3.1: Diseased dogs .....	128
3.3.2: Healthy dogs .....	129
