### **Abstract**

The present paper is devoted to bibliometric analysis of scientific journals presented in JCR:SSE DBs in 1994-1998 period. For I&LS journals this period was extended to 2004. The idea of Standard impact factor (K) which is used for evaluation of journals was to compare the traditional impact factor ( $I_p$ ) of a journal, as indicated in JCR DB, with the average impact factor of the corresponding field of knowledge ( $I_g$ ). Some examples of the results of this study are given in tabular form.

### **Introduction**

Analysis of scientific periodicals is a very popular field of study in Information and Library Science. The very existence of Journal Citation Reports (JCR) provides a unique possibility for this kind of research. New mathematical models for evaluation of journals are introduced, multilevel classifications are elaborated, new fields of knowledge (marine biology, genetics, clinical medicine, information and library science, etc.) are covered [1]-[4].

The evaluation of scientific journals was always at the focus of the attention of bibliometric and webometric studies. On the basis of the Journal Citation Reports quantitative indicators new invariant or integrative were proposed indicators, e.g. the 'discipline impact factor' (*Hirst*) [5], or the 'total citation influence measure' (*Narin*). This contributed to a better understanding of the cognitive structure of the field under study and, as a rule, helped to identify the range of scientific journals of importance in a certain field. On the basis of the total influence measure, *Narin* has advanced the principle of hierarchical structure of scientific periodicals within subject fields [6]. Using JCR data for journals on human and medical genetics A.Pudovkin and E.Garfield calculated their 'relatedness factor (RF)' leading periodical in the field "Genetics".

In present study Standard impact factor K was used for evaluation all journals from DBs JCR:Social Science Edition 1994-1998.

### **Method and results**

To evaluate a particular journal the traditional impact factor  $I_p$  should be compared to the standard impact factor of the corresponding field  $I_g$ . The most obvious and simple indicator would be the ratio of the two measures:

**K= (Ip /Ig) x 100%** - relative (or standard) impact factor of journal.  
If a journal belongs to two or more fields the arithmetic mean of the two or more Ig's may be used [7].

The technique of calculation of the standard impact factor for a field (Ig) is an inherent part of a method, which allows a cross-field evaluation of scientific journals. For each field 5 journals with the highest Ip values were selected. If the total number of papers in those journals (for the two preceding years) was less than 500 for science and 300 for social sciences, the list was extended until the threshold of 500 (or 300) was reached. The ratio of the total number of current year citations (in ISI source journals) of articles in the list journals (for two preceding years) to the total number of source items in the list journals (in the same two years) represents the group standard impact factor of the field:

$$\text{Ig} = \Sigma \Sigma \mathbf{R} / \Sigma \Sigma \mathbf{S}$$

The classification scheme of JCR in this period included 65 fields of social knowledge (nine of them were present only in one or two years, e.g. Neurosciences, Operation research & management science). So, in table 1 there are presented standard impact factors (Ig) for 56 fields of science

Table 1

**Impact factor of fields of science Ig 1985-1999**

The standard indicator K may prove a better measure of a journal's impact factor than the traditional impact factor Ip of a scientific journal. Of course, Ip is the most significant single characteristic of a journal. A sharp increase of Ip a long-standing journal may be a signal of a very important and highly-cited paper appearing on its pages. Selection of journals on Ip alone is a good policy in working with one field of knowledge, but even in this case (as is seen in table 2) the growth of Ip is not always concomitant with the growth of scholarly status of a journal. Our new measure K (relative impact factor) may prove a more accurate indicator. The comparison of *Annual Review of Public Health* and *Transactions of The Institute of British Geographers* is important: K may grow with a decline in Ip and vice versa.

Table 2

<b>TITLE of JOURNAL</b>	<b>1994</b>		<b>1995</b>	
	<b>Ip</b>	<b>K</b>	<b>Ip</b>	<b>K</b>
Medical Care	2.57	112	2.42	125
Annual Review of Public Health	2.55	126	2.64	122
Transaction of the Institute of British Geographers	2.54	123	2.3	136
Cognitive Science	2.45	71	2.38	77
Journal of Legal Studies	2.43	63	2.37	54

The difference, when using this procedure in the evaluation of journals is striking (table 3).

Table 3

<b>Journal</b>	<b>Ip</b>	<b>K</b>
<b>I group</b>		
Food Policy	0.507	8.7
Trans Port Res A – Pol	0.582	89.5
Childhood	0.571	50.1
J Leisure Res	0.488	27.4
Mon Rev	0.563	33.5

Early Dev Parenting	0.500	16.4
<b>2 group</b>		
Am J Phys Antropol	1.749	106.6
Cognitive Psychol	3.737	105.9
Lat Am Res Rev	0.897	113.5

The journals in the first group differ slightly in their  $I_p$  values (within the group), while the differences in  $K$  are sometimes astounding. On the other hand, the journals in the second group differ very much in their  $I_p$ -s, but are quite comparable as far as  $K$  is concerned.

This measure was tested on all journals in social sciences represented in JCR:Social Science Edition (JCR:SSE) for period 1994-1998 [8]. In this period JCR:SSE DBs included 1811 different journals: 1994 - 1402, 1995 – 1455, 1996 – 1512, 1997 – 1672 and 1998 – 1679.

With almost permanent regrouping and reclassification of journals in the ISI DBs, with journals changing their titles, with the introduction of new journals establishing steady statistical characteristics of fields of knowledge becomes quite a challenge. It should be kept in mind that a journal may belong to more than one field, e.g. among 1679 journals in 1998 550 journals belonged to 2 fields simultaneously, 65 – to three fields, 5 – to four fields and one journal ‘RACE CLASS’ (rank 559,  $K=36.2$ ) belonged to 5 fields. It ranks 16 in Anthropology, 5 in Ethnic Studies, 17 in Social Issues, 15 in Social Science, Interdisciplinary and 26 in Sociology. It would rank 559 in the general list of journals in social science. The distribution of journal in accordance with their in the general list of journals  $K$  is as follows:

<b>K</b>	<b>Number of journals</b>
$K > 100$	67
$< 100 \ K > 70$	131
$< 70 \ K > 50$	171
$< 50 \ K > 30$	350
$< 30 \ K > 10$	739
$< 10 \ K > 0$	338
$K = 0$	15

The  $K$  value exceeds 200 for three journals: BEHAV BRAIN SCI (in Biological Psychology), ECONOMIST (in Economics) and ARCH GEN PSYCHIAT (in Psychiatry).

The 198 journals with  $K > 70$  belong to all fields of social sciences (see table 4). Again some of them may belong to three fields at once – e.g. PHILOS PUBLIC AFF ( $K'=137$ ), CHILD ABUSE NEGLECT ( $K'=117$ ), J MED ETHICS ( $K'=97.5$ ), EVOL HUM BEHAV ( $K'=80.4$ ), J HEALTH POLIT POLIC ( $K'=75.6$ ), FUTURE CHILD ( $K'=73.3$ ).

In the field of **Information & Library Science** 5 journals belong to the group with  $K' > 70$  in 1994 – 1998 period of highest  $K$ s: J AM SOC INFORM SCI ( $K'=93.2$ , rank 86), ANNU REV INFORM ( $K'=90.3$ , rank 94), J DOC ( $K'=89.6$ , rank 99), COLL RES LIBR ( $K'=76.8$ , rank 162), LIBR QUART ( $K'=76.5$ , rank 163).

The geographical distribution of those 198 journals with  $K' > 70$  is as follows: USA - 155, UK - 36, The Netherlands - 4, Switzerland – 2, in Australia - 1 (*CHINA J*).

Table 4

### Evaluation of I&LS journals in period 1999-2004

The study was extended for the period of 1999-2004 for I&LS journals. Dynamics of Standard impact factor K of I&LS journals is presented in table 5 for 1999-2004 period.

Table 5

One can follow the long-term changes of K of leading journals in the field of Information & Library Science in three period: 1994-98, 1999-02 and 2002-04 (table 6).

Journal *Information System Research* has shown stable growth K (44 in 1994-98, 58 in 1999-02 and 87 in 2002-04) while *College & Research Libraries* and *Library Quarterly* have demonstrated dramatic decline of their K. Journal *Library Quarterly* has had K =76 in 1994-98, 38 in 1999-01 and only 27 in 2002-04. The *Journal of the American Society for Information Science and Technology* ranked first in 1994-1998, it moved to 4 th place in 1999-2001. The journal *Scientometrics* has had stable Standard impact factor during 1994-2004, its values were close to 45-47.

## Conclusion

The Standard impact factor K introduced in this paper proved its efficiency as a tool of cross-field comparison of scholarly journals. The magnitude of variation of Ip from JCR DBs between fields was reduced significantly by the new measure of influence. The first 50 journals ranked according to Ip belong to 19 fields of science with four fields ( Psychiatry, Psychology, experimental, Law) covering half of journals in the list. The corresponding list of 50 journals ranked by Standard impact factor K covers 45 fields, including such fields in humanities that traditionally show lower impact factors Ip (Ethics, History, History & philosophy of science, Demography, Women's Studies, Urban Studies, etc).
