## Declaration

I certify that this thesis submitted for the degree of Master is the results of my own research, except where otherwise acknowledged, and that this thesis has not been submitted for a higher degree to any other university or institution.

## Signed:

Sawsan Aref Mohammed Salameh

## Date:

18/1/2005

## Acknowledgement

I would like first of all to take the opportunities to appreciate and express my personal and sincere gratitude to my supervisor Dr.Mohammad $\mathcal{A} b u[\mathcal{H a j}$ for his special concern and recommendation on my experiments and analysis whom I respect and admire the most. I would also like to thanks my supervisor Dr. Omar Deeb and all the staff members and all my colleagues in Chemistry department at $\mathcal{A l}$-Quds University for their help and advice during my study period.

The contribution that Granada University -Spain- has made in hefping me in characterization and results analysis was wonderful and helpful therefore I would like to extend my thanks and appreciation.

Finefy I don't want to forget to thank, all the members of my famify especially my parents and all my friends whom where by my said through my study period.

## To all of you I owe special thanks.

#### Abstract

The condensation of 1,2,4-triazole and a pyrimidine ring gives rise to the formation of bicyclic heterocycles known as 1,2,4- triazolopyrimidines. Four different possibilities exist for the relative orientation of both rings, so four different isomeric families of compounds are defined. Among these, 1,2,4-triazolo[1,5-a]pyrimidine derivatives are the thermodynamically more stable and, thus, the most studied ones. Revisions surveying the synthesis, reactivity, spectroscopic characterization and crystallographic studies of 1,2,4-triazolo[1,5-c]pyrimidines, 1,2,4-triazolo[4,3-a]pyrimidine and 1,2,4-triazolo[4,3-c] pyrimidines have also been published.

The studies about the coordination chemistry of triazolopyrimidines have exclusively focused till now in the 1,5 -a series. These compounds, which are structurally similar and may be regarded as mimic of isomeric purines, have displayed a rich coordination chemistry, a considerable number of new compounds with interesting structural features having been characterized, including simple mononuclear compounds with monodentately coordinated ligands and di or polynuclear compounds in which either the triazolopyrimidine ligand, or other auxiliary ligands bridge the metal atoms.

On the other hand, we have not found in the bibliography any reference for a coordination compound of any of the other arrangements (1,5-c, 4,3-a or 4,3- c), despite the fact that the different relative orientation of the nitrogen atoms inside the heterocycles could generate a wide number of new structure, specially if dimeric or polynuclear species are formed with bridging heterocycles. A difficulty that has to be taken into account in a study of this type is the lowest stability of these compounds if compared with the $1,5-\mathrm{a}$ derivatives, isomerization processes (Dimroth rearrangement) may take place on heating, possibly catalyzed by acidic or basic pH .

This research and investigation of the coordination chemistry of triazolopyrimidine were the center of our thesis. Following this line of investigation a new derivative 7,8 dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine was synthesized and characterized, In this thesis we chose the best method through the synthesis and modification to obtain maximum yield. The compound was characterized by usual methods and the results
indicated that the most stable tautomer form is this when the acidic hydrogen was on N8 position, this result was supported by the theoretical study, ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}$ NMR spectra. pka value was determined and it was more acidic than analogues purine bases, also from MO calculation there was no preference site of coordination.

This thesis is the first exploration in the coordination chemistry of 1,2,4-triazolo[4,3a]pyrimidines. This compound comparing with the corresponding $1,5-\mathrm{a}$ isomers, has the change in the position of one of the nitrogen atoms in the triazole ring which is now placed as separated as possible from the pyrimidine ring, with less steric hindrance and contiguous to the other external imidazole nitrogen. Synthesis of metal complexes of the first and second raw transition metals $(\mathrm{Cu}, \mathrm{Ni}$, and Ag$)$ was carried out, some of these complexes were isolated in pure crystal form, others need further investigation, the complexes were characterize by X-ray crystallography showing that the ligand retain 4,3-a isomer which is less favored thermodynamically. With Cu the ligand form two complexes $\mathrm{CuL}_{2} \mathrm{Cl}_{2}(\mathrm{H} 2 \mathrm{O})_{3}$, and $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ these complexes were not isolated in crystal form.

Also two nickel complexes were obtained $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ and $\mathrm{Ni}_{9} \mathrm{~L}_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ cluster, for this complex cluster the ligand coordinated in its anionic form through $\mathrm{N} 1, \mathrm{~N} 2$ and O without preference of one site over another, this cluster had showed ferromagnetic and antiferromagnetic interaction at lower temperature and also need further investigation since this type of compounds be could used in the field of electronics as data storage materials. Silver crystal complex $\mathrm{AgL}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ were isolated and characterize by X-ray. The coordination mode in N 1 and N 2 atoms, the acidic hydrogen was situated on N 8 the same as in the free ligand.

The most stable thermodynamic 1,5-a compound was also obtained during one of the reaction to prepare cobalt complex with the desired ligand an organic compound had precipitate and the isolated in the form of single crystal, product is in agreement with Dimroth rearrangement

مركبات التريازولوبيرميدين (Triazolopyrimidine) هي مركبات عطرية غير متجانسة وتتكون من حالقتين الاولى هي حقة سداسية البرميدين ( pyrimidine) والاخرى حلقة خماسية تريازول ( triazoles), ينتج عن ارتباط الحقتين اربع مجمو عات من المتشكلات تختلف بترتيب ذرات النيتروجين داخل الحلقة السداسية 4,3-a \& 4,3-c و وهي (Kinetically favor) و وهي الخماسية اثثين من هذه المتثكلات هي مركبات تتكون بسر عة مع العلم انها غير مستقرة من ناحية الايناميكا الحركية, المجمو عتان الاخريان 1,5-a \& 1,5-c هما مستقرتان حراريا ( thermodynamically stable).
احد هذه المتتككلات ( 1,5-a) تم در استها بشكل مستففض من ناحية التحضير العضوي للمركبات ودراسة
تأتير اتها البيولوجية وتحضير معقدات من المركبات وقد وجدت كيمياء التناركية ثرية بالتنكيلات المختلفة التي
تم تحضير ها بسبب أن المركب يمكن أن يتشارك المعدن بطرق وأماكن ارتباط مختلفة تم تحضير ها بسبب أن
المركب يمكن أن يكون رو ابط بطرق وأماكن ارتباط مختلفة مما أدى إلى تحضير مركبات أحادية, ثثائية,
ومركبات متسلسلة. بعض هذه المركبات كحان له تأثّثيرات بيولوجية واضحة وبعضها كان له أهية من ناحبة

> فيزيائية.

7,8-dihydro-7-oxo-1,2,4-triazolo[4,3في هذه الرسالة قمنا بتحضير ودراسة المركب ,a]pyrimidine سابقة في هذا الموضوع و هذه تعتبر بداية مسار بحثي جديد في الكيمياء التثناركية لهذا المتنكّل سيما أن هذ المركب يعتبر غير مستقر من ناحية الليناميكا الحركية, خلال هذا البحث قمنا بدر اسة بداية هذا المركب من ناحية نظرية باستخدام طريقة (الأكثر استقرارا وتم احتساب توزيع (tautomer (Computational chemistry) الثشنات, الكتافة الإلكترونية و وحسابات الأفلاك الجزيئية لهذا المركب ومن هذه الار اسة تبين انه لا يوجد مكان ارتباط مفضل لعمل روابط تنـاركية في المعقدات.

بعد تحضير المركب استخدم في تحضبر عدد من المعقدات لبعض لمعادن من الاورة الرابعة و الخامسة للعناصر X الانتقالية و كنتيجة لذلك حصلنا على عدد من المركبات بشكل بلوري مما سمح لنا تشخيصها بواسطة أشعةة

> ومن هذه المركبات التي تم تحضير ها (H2O) ${ }_{16}$ شكل بلوري.
 نيكل وجد أن ligand ارتبط معه بثلاث أماكن مختلفة N1,N2 \& O بدون تفضيل احدها على الآخر و هذا ferromagnetic \& بتفق مع الار اسة النظرية, وبعد الار اسات المغناطيسية وجد أن له صفات antiferromagnetic و هذه المركبات لها تطبيقات في الالكترونيات في مجال تخزين المعلومات في الحاسوب. وخلال محاولتتا تحضير معقد للكوبال ت فصلت مادة على شكل بلوري شخصت باستخدام أشعة X وتبين انه المركب المتنكل الآخر وهو a-1,5-a تحول خلال عملية التحضير وذلك حسب الطريقة التي ذكرت هذه العملية
. (Dimroth rearrangement)

## CHAPTER ONE

## INTRODUCTION

## I. 1 Historical background

The chemistry of 1, 2, 4-triazolopyrimidines derivatives started in 1909 when Bulow and Hass ${ }^{(1)}$ reported the synthesis of 5-methyl-1,2,4-triazolo[1, 5-a]pyrimidine-7-one (Scheme 1).

Scheme 1: Structure of 5-methyl-1, 2, 4-triazolo [1, 5-a] pyrimidine-7-one

Many efforts have been directed toward the synthesis of triazolopyrimidines, because of their chemistry which showed many biological activities as well as medicinal, agrochemical applications and photographic stabilizer emulsions.

Over the next 50 years, only a few papers and patents on triazolopyrimidine were published, which were included in Mosby`s comprehensive monograph on "Heterocyclic systems with Bridgehead Nitrogen Atoms" ${ }^{(2)}$.

The systematic studies reported since 1958 include those of the groups of Sirakawa (1958-1960) ${ }^{(3)}$, Makisumi (1958-1964) ${ }^{(4)}$, Allen and Williams (1959-1962) ${ }^{(5)}$, Levin (1963-1964) ${ }^{(6)}$, Kreutzberger (1966-1979) ${ }^{(7)}$, Reimlinger (1970-1971) ${ }^{(8)}$, Reiter (19871993) ${ }^{(9)}$, and the most complete recent revision are those by G. Fischer ${ }^{(10)}$.

Special aspects of syntheses and reactivity have been covered in reviews by Babichev and Kovtunenko ${ }^{(11)}$, Tisler ${ }^{(12)}$, Ivashchenko and Gaaricheva ${ }^{(13)}$, Shaben et al. ${ }^{(14)}$, G.Fischer ${ }^{(10)}$, Maury ${ }^{(15)}$ and in a valuble comparative study of certain azaindolzines by Al ashry ${ }^{(16)}$.

Fusion of 1,2,4-triazolo ring onto a pyrimidine nucleus to form 1,2,4-triazolopyrimidine systems may take place in four different modes that lead
to the following isomeric structures, all of which possess a nitrogen bridgehead atom as seen in (Scheme2).

i 1,2,4-triazolo[4, 3-a] pyrimidine
ii. 1,2,4-triazolo[1,5-a] pyrimidine

iii. 1,2,4-triazolo[4,3-c]pyrimidine

iv. 1,2,4-triazolo[1,5-c]pyrimidine

Scheme 2: Four possible isomer of triazolopyrimidine

## I. 2 Synthesis

Most synthesis of triazolopyrimidines start either from a 1,2,4-triazolo derivatives or from a pyrimidine residue and need annulations of a second heterocyclic ring. Preferably 5-amino-1,2,4-triazololes and 2-hydrazinopyrimidines. According to the reaction type, these synthesizes may be classified as cyclocondensation, cycloadditions, or oxidative cyclizations ${ }^{(12)}$. To some extent triazolopyrimidines are prepared by other transformations of the five-and/or six membered rings.

In some cases, the kinetically favored [4,3-a] and [4,3-c] product is formed initially, this being transformed into the thermodynamically more stable $[1,5-\mathrm{a}]$ and $[1,5-\mathrm{c}]$ pyrimidines, respectively by the means of Dimroth rearrangement ${ }^{(18)}$.

## I.2.1 Synthesis of 1,2,4-triazolo[4,3-a]pyrimidine

## I.2.1.1 Synthesis from Pyrimidines

The synthesis of this ring system may be achieved by building the diazole onto a preformed pyrimidine ring. Cyclization of a 2-hydrazinopyrimidine with one-carboninserting reagents serves as a general route to this ring. Thus, cyclization of 2hydrazinopyrimidines $\mathbf{1}$ with formic acid ${ }^{(17)}$, carbon disulfide in boiling pyridine, carbon disulfide in acetonitrile at room temperature ${ }^{(18)}$,ethyl dithioacetate ${ }^{(19)}$,or cyanogen bromide afforded the triazolo[4,3-a]pyrimidines 2. Reaction of $\mathbf{1}$ with aldehydes followed by cyclization with diethyl azodicarboxylate (DEAD) gave 2. Cyclization of 2hydrazinopyriinidines $\mathbf{1}$ with ethyl imidate hydrochlorides afforded the 3 -substituted 1,2,4-triazolo[4,3-a]pyrimidines 2. However, when the 2-hydrazinopyrimidine $\left(\mathbf{1}, \mathrm{R}^{1}=\mathrm{R}^{2}=\mathrm{R}^{3}=\mathrm{H}\right.$ ) and 4,6-dimethyl-2-hydrazinopyrimidine ( $\mathbf{1}, \mathrm{R}^{1}=\mathrm{R}^{3}=\mathrm{Me}, \mathrm{R}^{2}=\mathrm{H}$ ) were cyclized with the imidate hydrochlorides, the isomeric triazolo[1,5-a]pyrimidines were formed ${ }^{(20)}$ (Scheme 3).

Scheme 3

Reaction of $\mathbf{3}$ with ethyl dithioaectate $\mathbf{4}$ gave a mixture of 3,7(3,5)-dimethyltriazolo[4,3a]pyrimidinones 5 and $\mathbf{7}^{(21)}$, whereas the reaction with formic acid gave $\mathbf{6}^{(22)}$ (Scheme 4).

## Scheme 4

Cyclization of 2-hydrazino-6-methylpyrimidin-4-one $\mathbf{8}$ with formic acid represents an interesting case, mixtures of products were obtained which varied in number, structures, and relative amounts depending upon the reaction conditions (time, temperature, and pH ) ${ }^{(23)}$. The reaction of $\mathbf{8}$ was carried out with formic acid at $50-60^{\circ} \mathrm{C}$ for 1 hour and obtained a mixture of the formylhydrazine 9, (43.5\%), 7-methyl-5-oxo-1,2,4-triazolo[4,3a]pyrimidine ( $\mathbf{1 0}, 42 \%$ ), and 5-methyl-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine (11, 14.5\%). Compounds 10 and 11 were formed as a result of dehydrocyclization of hydrazide 9 through nucleophilic attack of the pyrimidine N 1 or N 3 , respectively, onto the formylhydrazino carbonyl carbon (Scheme 5). When this reaction was performed at $100^{\circ} \mathrm{C}$ for 2 hours, the isolated products were 10 (29\%), 11 (34\%), and 7-methyl-5-oxo-1,2,4-triazolo[1,5-a] pyrimidine $(\mathbf{1 2}, 37 \%){ }^{(23)}$. The last was formed as a result of acidinduced Dimroth-like rearrangement of 10 (Scheme 6).

Scheme 5

Longer reaction time ( 12 hours) in the presence of excessive amounts of formic acid gave $11(24 \%)$ and $12(76 \%)$. Under such reaction conditions, 10 completely isomerized to 12 while 11 did not ${ }^{(23)}$ (Scheme 7).

Scheme 7

The 4 -aminopyrimidines 13 and $\mathbf{1 4}$ were prepared by the reaction of the benzylidene malononitriles with thiourea or $S$-methylisothiourea, respectively. Nucleophilic substitution at the 2 -position of $\mathbf{1 4}$ with hydrazine gave the 2 -hydrazino derivative $\mathbf{1 5}$, whose treatment with carbon disulfide yielded the triazolopyrimidine 19 rather than its isomeric compound ${ }^{(24)}$. Heating 15 with benzoyl chloride anhydrous dioxane, afforded the $N$-benzoyl derivative 16, whose ring closure took place upon heating in DMF to give 5-amino-6-cyano-3,7-diphenyl-1,2,4-triazolo[4,3-a]pyrimidine 18. The latter can also be obtained by direct reaction of $\mathbf{1 4}$ with benzoylhydrazine in DMF ${ }^{(25)}$. The isomeric 1,2,4-triazolo-[4,3-a]pyrimidin-3-one 21 was obtained from 14 by reaction with semicarbazide ${ }^{(26)}$. Reaction of $\mathbf{1 5}$ with isocyanates gave thiosemicabazides $\mathbf{1 7}$ whose cyclodesulfurization with DCC gave $20{ }^{(27)}$. Similarly, cyclocondesulfurization of 22 gave 23. Cyclization of the dihydropyrimidinethione 24 with acetylhydrazine or pchlorobenzoylhydrazine gave the triazolopyrimidine $25{ }^{(28)}$ (Scheme 8).

Scheme 8

## I.2.1.2 Synthesis from triazoles

Cyclocondensation of symmetrically substituted 1,3-diketones with 3-amino-5-substituted-1,2,4-triazoles 26 produced the expected 3,5,7-trisubstituted-1,2,4-triazolo[4,3-a]pyrimidines $27{ }^{(29)}$. This reaction has been successfully applied to 3-amino-1-benzyl-1,2,4-triazolium perchlorates $\mathbf{2 8}$; the products were the 2-benzyl-1,2,4-triazolo[4,3-a]pyrimidinium perchlorates $30{ }^{(30)}$ (Scheme 9).

Scheme 9

Theoretically, the reaction of 3-amino-1,2,4-triazoles $\mathbf{2 6}$ with 1,3-keto-esters may afford the four possible isomeric 1,2,4-triazolopyrimidines 32, 33, 35, and 36. Formation of these isomers may be explained on the basis of whether the amino group of $\mathbf{2 6}$ initially condenses with the keto or ester function of the ketoester to produce the enamine $\mathbf{3 1}$ or amide $\mathbf{3 4}$ intermediates, respectively ${ }^{(5)}$. Heterocyclization of the enamine intermediates 31a and 31b by nucleophilic attack of the triazole N 4 or N 1 onto the ester carbonyl would afford 32 and/or 33, respectively. Comparable cyclization of the amide intermediates 34a and 34b would lead to the formation of 35 and 36. However, in practice cyclocondensations of 26 with ethyl acetoacetate ${ }^{(31)}$, ethyl 2-haloacetoacetate ${ }^{(32)}$, or ethyl benzoylacetate ${ }^{(31)}$ were found to afford only the corresponding 5-oxo-1,2,4-triazolo[4,3-a]pyrimidine 32 (Scheme 10).

Scheme 10

Reaction of diethyl malonate with 3 -amino-1,2,4-triazole 37 give the 1,2,4-triazolo[4,3-a]pyrimidine-5,7-diones $\mathbf{3 8}{ }^{(31)}$ (Scheme 11).

37

Scheme 11

Similarly, cyclization of 3-amino-1,2,4-triazoles 37 with methyl propiolate or methyl phenylpropiolate gave a mixture of the 1,2,4-triazolo[4,3-a]pyrimidin-7-ones $\mathbf{4 0}$ and the 1,2,4-triazolo[1,5-a]pyrimidin-7-ones 41. In addition, methyl trans-3-(3-amino-1,2,4-triazol-1-yl)acrylates 42 were also obtained. Production of the 1,2,4-triazolopyrimidines 40 and $\mathbf{4 1}$ started by condensation of the ester function with the amino group of 37, followed by cycloaddition of the triazole N 4 or N 1 of the two tautomeric intermediates 39a and 39b, respectively, onto the carbon-carbon triple bond of the side chain. In contrast, formation of the triazolyl acrylates $\mathbf{4 2}$ took place through addition only of the triazole N 1 onto the propiolate carbon-carbon triple bond. The relative amounts of the products were found to depend on the reaction conditions (temperature, solvent, and time) ${ }^{(8)}$ (Scheme 12).

Scheme 12

## I.2.2 Synthesis of 1,2,4-Triazolo[1,5-a]pyrimidines

Synthesis of these compounds is achieved by building of one of the heterocycles followed by using it as a basis to built the other ring onto it or by Dimroth rearrangement of 1,2,4-triazolo[4,3-a] pyrimidines. 1,2-Diaminopyrimidines are generated from 1-amino or 2-aminopyrimidines. The 3-and 5-amino-1,2,4-triazoles are alternative precursors that can act as a source of three carbons to complete the pyrimidine ring.

## I.2.2.1 Synthesis from 1-Aminopyrimidines

Cyclization of 1-(acylamino)pyrimidine hydroiodides $\mathbf{4 3}$ with alkyl ammonium acetates gave $3 H, 5 H-1,2,4-$ triazolo[1,5-a]pyrimidines $44{ }^{(33)}$. Condensation of the 1 (acylamino)pyrimidinium salt $\mathbf{4 5}$ with hydrazine hydrate gave 46, which upon cyclization
with acetic acid in the presence of perchloric acid afforded the 3-amino-1,2,4-triazolo[1,5-a]pyrimidinium salt $47{ }^{(34)}$ (Scheme 13).

Scheme 13

The 1-amino-2-hydrazinopyrimidine 48 can be cyclized with triethyl orthoformate to 49 ${ }^{(35)}$ (Scheme 14).

Scheme 14

## I.2.2.2 Synthesis from 2-Aminopyrimidines

Amination of 2-aminopyrimidine $\mathbf{5 0}$ with $O$-mesitylenesulfonylhydroxyamine $\left(\mathrm{NH}_{2} \mathrm{OMes}\right)$ gave the $N$-aminopyrimidinium salt 51, which can be transformed into $1,2,4-$ triazolo[1,5-a]pyrimidines $\mathbf{5 2}$ by heating with formic acid, acetic anhydride, and benzoyl chloride ${ }^{(36)}$ (Scheme 15).

The synthesis of triazolopyrimidines may be achieved by the cyclization of 2aminopyrimidines by fusion of a $\mathrm{C}-\mathrm{N}$ fragment. Thus, the triazolopyrimidines $\mathbf{5 6}$ have been prepared by the sequential condensation of 2 -aminopyrimidines 53 with $(\mathrm{MeO})_{2} \mathrm{CR}^{2} \mathrm{NMe}_{2}$ followed by reaction of the resulting derivative $\mathbf{5 4}$ with $\mathrm{NH}_{2} \mathrm{OH}$ to give the hydoxyiminomethyleneaminopyrimidine 55, which was cyclized by the action of polyphosphoric acid (PPA) ${ }^{(37)}$. In the case of 2-amino-4-methylpyrimidine as a starting compound, cyclization involved either an $\mathrm{N}-1$ or $\mathrm{N}-3$ atom of the pyrimidine, whereby both isomers were formed in a ratio of $1: 5$; the major one has $\mathrm{R}^{1}=\mathrm{Me}^{(38)}$ (Scheme 16).

Scheme 16

## I.2.2.3 Syntheses from 5(3)-Amino-1,2,4-triazoles

5-Amino-1 H -1,2,4-triazole and its derivatives are frequently used as precursors for this ring via their reaction with suitable carbonyl compounds. The 5-amino-1,2,4-triazoles 57 prepared from calcium cyanide by hydrolysis to cyanamide followed by condensation with hydrazine ${ }^{(39)}$, reacted with the appropriate acetophenone in the presence of $\mathrm{ZnCl}_{2}$ to
give the dihydrotriazolopyrimidines 58 and $59{ }^{(40)}$. Cyclocondensation of 57 with acetophenone in DMF gave the triazolopyrimidines $58(\mathrm{Ar}=\mathrm{Ph})$ and 61 via the intermediate 60 by participation of either a second acetophenone molecule or a DMF molecule, respectively. The reaction of 57 with $\mathrm{PhCMe}=\mathrm{CHCOPh}$ in the absence of a catalyst afforded the dihydrotriazolopyrimidines $59(\mathrm{Ar}=\mathrm{Ph})^{(41)}$ (Scheme 17).

## Scheme 17

## I.2.2.4 Dimroth Rearrangement of 1,2,4-Triazolo[4,3-a]pyrimidines

Dimroth rearrangement of 1,2,4-triazolo[4,3-a]pyrimidines (A) gave the 1,2,4-triazolo[1,5a]pyrimidines (B) the triazolopyrimidines with various substituents on the ring, as in 62, 64, or 66, underwent rearrangement to give 63, 65. and 67 respectively, upon treatment with acid, alkali, or triethyamine, or upon fusion ${ }^{(18)}$ (Scheme 18).

66
Scheme 18

Dimroth rearrangement may be considered to be a disadvantage during the synthesis of the [4,3-a] ring, because this ring system cannot he isolated. However, it is advantageous in cases in which the [1,5-a] ring system is required. Thus, reaction of the hydrazine 68 with formic acid gave 70 via $69{ }^{(5)}$ (Scheme 19).

Scheme 19

Cyclization of the diamidine $\mathbf{7 2}$ with acetyl- or benzoyl-acetone 71 gave 1,2,4-triazolo[1,5-a]pyrimidine $\mathbf{7 4}$ via the formation of $\mathbf{7 3}{ }^{(7)}$. Alternatively, $\mathbf{7 4}$ can be prepared by the reaction $\mathbf{7 1}$ with the diaminotriazole $75{ }^{(7)}$ (Scheme 20).

## Scheme 20

Reaction of the trifluoromethyl substituted $\beta$-diketone 76 with 72 nitrates gave a mixture of the triazolopyrimidine $\mathbf{7 8}$ and the pyrimidine $\mathbf{8 0}$; whereas reaction with the aromatic $\beta$ diketones 77 gave a mixture of triazolopyrimidines 79 and pyrimidines $81{ }^{(42)}$ (Scheme 21)

81

Scheme 21

## I.2.3 1,2,4-Triazolo[4,3-c]pyrimidines

### 1.2.3.1 Synthesis from pyrimidine

Condensation of 4(6)-hydrazinopyrimidines $\mathbf{8 2}$ with aryl or heterocyclic aldehydes gave the corresponding 4(6)-arylidenehydrazinopyrimidines 83. Oxidative cyclization of $\mathbf{8 3}$ with lead tetraacetate ${ }^{(17)}$, or with ethanolic iron (III) chloride ${ }^{(43)}$ afforded the respective 3 -substituted 1,2,4-triazolo[4,3-c]pyrimidines 84 (Scheme 22).

$\mathrm{R}=4-\mathrm{C}_{6} \mathrm{H}_{4} \mathrm{Y}$,

$\mathrm{R}^{1}=\mathrm{H}, \mathrm{Me}, \mathrm{SMe}, \mathrm{NHPh}, ; \mathrm{R}^{2}=\mathrm{Me}, \mathrm{NH} 2 ; \mathrm{R}^{3}=\mathrm{H}, \mathrm{Me}$

Scheme 22

Nitrozation of 6-benzylidenehydrazino-3-methyluracil $\mathbf{8 5}$ took place with concurrent cyclization to $\mathbf{8 6}$. The latter was also obtained from the nitroso and the nitro derivatives $\mathbf{8 7}$ and $\mathbf{8 8}$ upon treatment with a mixture of sodium or potassium nitrate and acetic and sulfuric acids ${ }^{(44)}$ (Scheme 23).

Scheme 23

Aldehyde acetals have also been utilized to accomplish cyclization of 4(6)hydrazinopyrimidines such as 89 to $90{ }^{(45)}$ (Scheme 24).

Scheme 24

1,2,4-trizolo[4,3-c]pyrimidines $\mathbf{9 3}$ were prepared by cyclization of 4hydrazinopyrimidines carrying various substituents 91 with carboxylic acids. Whereas cyclization with formic acid afforded the 3-unsubstituted $93(\mathrm{R}=\mathrm{H}){ }^{(46)}$, cyclization with other carboxylic acids gave the 3 -substituted $\mathbf{9 3}$ ( $\mathrm{R}=$ alkyl or aryl) ${ }^{(47)}$. This cyclization was also performed with acid chlorides as well as acid anhydrides ${ }^{(47)}$. Occasionally, it was possible to isolate the acylhydrazinopyrimidine intermediates $\mathbf{9 2}{ }^{(47)}$, which were dehydrocyclized in a separate step to $\mathbf{9 3}$ by further heating with the same carboxylic acid ${ }^{(46)}$, a mineral acid, by fusion ${ }^{(47)}$, or by heating with phosphoryl chloride ${ }^{(8)}$ (Scheme 25).

91
92
93
$\mathrm{R}=\mathrm{H}$, alkyl, or $\mathrm{Ph} ; \mathrm{R}^{1}=\mathrm{OH}, \mathrm{SH}$, or $\mathrm{Me} ; \mathrm{R}^{2}$ or $\mathrm{R}^{3}=\mathrm{H}$ or alkyl

## Scheme 25

Reaction of 91 with acid orthoesters gave 93 through cyclocondensation of the occasionally isolable 1-ethoxyalkylidene-2-(pyrimidin-4-yl)-hydrazine intermediates 94 ${ }^{(49)}$. In one case, however, the formation of the 3-alkyl-3-ethoxy-2,3-dihydro-1,2,4-triazolo[4,3-c]pyrimidine $\mathbf{9 5}$ as a result of intramolecular additive cyclization of the corresponding 94 was reported ${ }^{(49)}$. The 2-unsubstituted 1,2,4-triazolo[1,5-c]pyrimidines

96 ( $\mathrm{R}=\mathrm{II}$ ) were sometimes formed as a result of Dimroth rearrangement of the transient 93 ( $\mathrm{R}=\mathrm{H})^{(50)}$ (Scheme 26).

Scheme 26

3-Oxo-1,2,4-triazolo[4,3-c]pyrimidines 99 were prepared by cyclization of the 4-(2ethoxycarbony(hydrazino)pyrimidines 97 by heating with an aqueous solution of sodium hydrogen carbonate ${ }^{(51)}$ or phosphoryl chloride or by heating in dichlorobenzene ${ }^{(52)}$. Compounds 97 were synthesized from 4-hydrazinopyrimidines 91 and ethyl chloroformate ${ }^{(52)}$, or from 2-chloropyrimidines 98 and ethoxycarbonylhydrazine ${ }^{(52)}$ (Scheme 27).

Scheme 27

Cyclocondensation of the 2-amino-5-alkyl-4-chloro-5-phenylpyrimidines $\mathbf{1 0 0}$ with formylhydrazine gave the corresponding 1,2,4-triazolo[4,3-c]pyrimidines $102{ }^{(53)}$ or a mixture of $\mathbf{1 0 2}$ and their [1,5-c] regioisomers $103{ }^{(54)}$ (Scheme 28).

- $\mathrm{H}_{2} \mathrm{O}$

Scheme 28

### 1.2.3.2 Synthesis from Triazole

Treatment of the 8-chloro-3-methyl-1,2,4-triazolo[4,3-c]pyrimidine $\mathbf{1 0 4}$ with aqueous
acids caused pyrimidine ring opening to give the 2-chloro-1-formamido-2-(5-methyl-1,2,4-triazolo-3-yl)ethene $\mathbf{1 0 5}$. The latter underwent thermal dehydrative recyclization to the starting $104{ }^{(55)}$. The corresponding1 ,2,4-triazolo[1,5-c]pyrimidine regloisomer 106 has not been formed during this reaction probably due to the electron-releasing effect of the C 5 methyl group in $\mathbf{1 0 5}$, which renders the adjacent N 4 of the triazole ring more nucleophilic as compared to N2 (Scheme 29).

Scheme 29

### 1.2.3.3 Synthesis by concurrent formation of both of the $1,2,4$-triazole and pyrimidine rings

Cyclization of the 2,2-dichloromalonic acid dipyrrolidine diimidoyl dichloride 107 with hydrazine hydrate caused concurrent double ring closure to afford the 8,8-dichloro-3,5-dipyrrolidino-1,2,4-triazolo[4,3-c]pyrimidin-7( $8 H$ )-one 109 as explained in ${ }^{(56)}$ (Scheme 30).

Scheme 30

Reaction of $N$-[bis(methylthio)methylene]cyanamide 110 with the $\mathrm{N}^{1}$-acylamidrazones 111 at elevated temperature gave directly the corresponding 1,2,4-triazolo[4.3c]pyrimidines 112. Carrying out the reaction between 110 and 111 at ambient temperature in the presence of potassium carbonate afforded the 4-acylhydrazino-
pyrimidines 113, which were dehydratively cyclized to 112 by heating in dimethylsulfoxide ${ }^{(57)}$ (Scheme 31).

113

$$
\mathrm{R}=\mathrm{Me}, \mathrm{Me}_{2} \mathrm{CH}, \mathrm{PhCH}_{2}, 4-\mathrm{ClC}_{6} \mathrm{H}_{4} \mathrm{CH}_{2}, \mathrm{Ph}, 4-\mathrm{O}_{2} \mathrm{NC}_{6} \mathrm{H}_{4}, 4 \text {-pyridyl }
$$

## Scheme 31

## I.2.4 1,2,4-triazolo [1,5-c]pyrimidine

## I.2.4.1 Open Chain Precursors for Synthesis

This ring can be prepared by the Cyclization of 4-[2-cyano-2-(ethoxycarbonyl)vinyl]-3methylisothiosemicarbazones of aromatic aldehydes $\left(\mathbf{1 1 8} ; \mathrm{R}^{2}=\mathrm{H}\right)$, obtained from the reaction of 115 with 116 by heating in $\mathrm{BuOH} / \mathrm{DMF} /$ dioxane or in pyridine to give triazolopyrimidines $\mathbf{1 2 5}$ in moderate yields. Competitive formation of ethyl 4-amino-2-(methylthio)-pyrimidine-5-carboxylate takes place. Treatment of the respective aromatic ketones with hot acetic acid or pyridine gave 2,2,5-trisubstituted 2,3 dihydrotriazolopyrimidine-8-carboxylates $\mathbf{1 2 1}$ by intermolecular cycloaddition of $\mathbf{1 1 8}$ via the intermediate 119. The ring closure of $\mathbf{1 1 8}$ may involve a 10 -electron cyclic transition state ${ }^{(58)}$. Condensation of ethoxymethylenemalonontrile $\mathbf{1 1 4}$ with isothiosemicarbazones 116 gave the dihydrocyano analogs $\mathbf{1 2 0}$, which were readily oxidized in DMSO to the triazolopyrimidines $\mathbf{1 2 4}{ }^{(59)}$. Similarly Condensation of diaminomethylenehydrazones $\mathbf{1 1 7}$
with 115 and 116 in the presence of $\mathrm{MeCN} / \mathrm{Et}_{3} \mathrm{~N}$ gave directly the 2,3-dihydro-1,2,4-triazolo[1,5-c]pyrimidines $\mathbf{1 2 2}$ and $\mathbf{1 2 3}$, respectively. The reaction was initiated by the attack of the amino group of $\mathbf{1 1 7}$ on the ethoxymethine carbon of $\mathbf{1 1 4}$ or $\mathbf{1 1 5}$ followed by an electrocyclic reaction. Compounds $\mathbf{1 2 2}$ and $\mathbf{1 2 3}$ were oxidized with $\mathrm{FeCl}_{3} / \mathrm{AcOH}$ or $\mathrm{I}_{2} / \mathrm{EtOH}$ to give the triazolopyrimidines $\mathbf{1 2 6}$ and 127 respectively ${ }^{(60)}$ (Scheme 32).

$124 \mathrm{R}=\mathrm{CN} ; \mathrm{R}^{3}=\mathrm{SMe}$
$125 \mathrm{R}=\mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{3}=\mathrm{SMe}$
$120 \mathrm{R}=\mathrm{CN} ; \mathrm{R}^{3}=\mathrm{SMe}$
$126 \mathrm{R}=\mathrm{CN} ; \mathrm{R}^{3}=\mathrm{NR}^{4} \mathrm{R}^{5}$
$121 \mathrm{R}=\mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{3}=\mathrm{SMe}$
$127 \mathrm{R}=\mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{3}=\mathrm{NR}^{4} \mathrm{R}^{5}$
$122 \mathrm{R}=\mathrm{CN} ; \mathrm{R}^{3}=\mathrm{NR}^{4} \mathrm{R}^{5}$
$123 \mathrm{R}=\mathrm{CO}_{2} \mathrm{Et} ; \mathrm{R}^{3}=\mathrm{NR}^{4} \mathrm{R}^{5}$

Scheme 32

Condensation of the imidates $\mathbf{1 2 4}$ with hydrazides gave 1,2,4-triazolo[1,5-c]pyrimidines $125{ }^{(61)}$ (Scheme 33).

Scheme 33

## I.2.4.2 Synthesis from pyrimidines

Reaction of amine 126 with DMF/DMA, followed by hydroxylamine and then acetylation gave the acetoxyiminomethyleneaminopyrimidine $\mathbf{1 2 7}$, which subsequently cyclized to $\mathbf{1 2 8}$ by heating in water ${ }^{(45)}$ (Scheme 34).

Scheme 34

Amination of the 4-aminopyrimidine $\mathbf{1 2 9}$ with $O$-mesitylenesulfonylhydroxylamine gave the $N$-aminopyrimidinium salt 130. which was transformed into 1,2,4-triazolo[1,5c]pyrimidines $\mathbf{1 3 1}$ by heating with formic acid, acetic anhydride, or benzoyl chloride ${ }^{(36)}$. Similarly the reactions of 1,6-diaminopyrimidine 132 with benzoyl chloride ${ }^{(62)}$, triamine 134 with formic acid ${ }^{(63)}$, and aminoiminopyrimidine 136 with orthoesters ${ }^{(64)}$ gave the triazole[1,5-c]pyrimidines 133,135, and 137, respectively (Schemes 35-37).

## Scheme 39

Assignment of the 1,2,4-triazolo[1,5-c]pyrimidine structures to the products obtained from the previously described cyclizations and not the alternative [4,3-c] structures has been rationalized and corroborated on the basis of (a) preference of cyclization at the more nucleophilic triazole ring N 2 rather than at its less nucleophilic $\mathrm{N} 4{ }^{(67)}$, (b) inability of the obtained products to undergo acid- or base-catalyzed Dimroth rearrangement, a property characteristic of the thermodynamically less stable [4,3-c] isomers ${ }^{\text {(68) }}$ (c) comparison with unequivocally prepared authentics ${ }^{(67)}$, and (d) X-ray crystallographic analysis of the products ${ }^{(69)}$.

## I.2.4.4 Synthesis by concurrent formation of both of the 1,2,4-triazole and pyrimidine rings

4-Isothiocyanato-3,3,-dimethylbutane-2-one $\mathbf{1 4 6}$ provided the $\mathrm{C}_{4} \mathrm{~N}_{3}$ fragment that gave, upon reaction with 2-ethylthiosemicarbazide ( $\mathrm{CN}_{3}$ fragment) 147, the 3-ethyl-1,6,7,8a-tetrahydro-2,5-dithioxo-8,8,8a-trimethyl-1,2,4-triazolo[1,5-c]pyrimidine $\mathbf{1 4 8}^{(70)}$ (Scheme 40).

Scheme 40

Reaction of ethoxymethylenemalononitriles $\mathbf{1 4 9}$ or ethyl ethoxymethylenecyanoacetates $150\left(\mathrm{C}_{3} \mathrm{~N}\right.$ fragments) with hydrazones 151, derived from aldehydes or ketones and isothiosemicarbazides or aminoguanidines ( $\mathrm{C}_{2} \mathrm{~N}_{3}$ fragment), gave the 2,3-dihydro-1,2,4-triazolo[1,5-c]pyrimidines 153 through the occasionally isolable intermediates $\mathbf{1 5 2}$ Elimination of a hydrogen or the lower alkane molecule from $\mathbf{1 5 3}$ gave the final products $154{ }^{(60)}$. Achieving aromaticity and/or alleviating steric crowding at C 2 is the mobilizing force for the latter elimination ${ }^{(58)}$ (Scheme 41).

## Scheme 41

## I.2.4.5 Dimroth Rearrangement of 1,2,4-Triazolo[4,3-c]pyrimidines

A characteristic feature observed during the cyclization of some hydrazino derivatives of pyrimidines is the rearrangement of the triazolo[4,3-a]pyrimidine intermediate to the triazolo[1,5-c]pyrimidine product.

Cyclization of 5-methoxy(nitro)-4-hydrazinopyrimidines $\mathbf{1 5 5}$ with triethyl orthoformate gave the $1,2,4$-triazolo[4,3-c]pyrimidine intermediate $\mathbf{1 5 6}$, which cannot be isolated due to its conversion to its [ 1,5 -c]isomer 157 by a Dimroth rearrangement. However, the 5benzyloxypyrimidine derivative, under the same conditions, afforded a mixture of the 8 benzyloxy derivatives of both [4,3-c] and [1,5-c]isomers 156 and 157 , respectively ${ }^{(50)}$ (Scheme 42).

## Scheme 42

Heating hydrazinopyrimidine 158 in diethyl oxalate gave 159, which upon chlorination with phosphorus oxychloride yielded (2-ethoxycarbonyl) triazolo[1,5-c]pyrimidine 161. The intermediate hydrazidoyl chloride $\mathbf{1 6 0}$ can he isolated under mild conditions ${ }^{(71)}$ (Scheme 43).

Scheme 43

Although the reaction of hydrazinoazines and triethyl orthoformate unusually gives the unrearranged products, the 4-hydrazinopyrimidine 162 afforded with the same reagent the rearranged product 1,2,4-triazolo[1,5-c]pyrimidine $\mathbf{1 2 8}{ }^{(45)}$. The same heterocycle $\mathbf{1 2 8}$ was obtained from the reaction of 162 with DMF/DMA to give the $N, N-$ dimethylaminomethylenehydrazono derivative 163 , which thermally cyclized to the 1,2,4-triazolo[4,3-e]pyrimidine 164, which immediately rearranged into $\mathbf{1 2 8}^{(72)}$ (Scheme 44).

## I. 3 The Coordination's Chemistry of the 1,2,4-triazolo[1,5-a] pyrimidines derivatives

1,2,4-triazolopyrimidine derivatives are ligands that display a great versatility in their interactions with metal ions, not only because they can bind the metal atom through different positions, but also because their presence influence the behavior of other auxiliary ligands, either by electronic or steric reasons, giving rise in some cases to compounds with interesting metal-metal interactions through these auxiliary ligands.

The studies about the coordination chemistry of triazolopyrimidine derivatives have been focused till now in the $1,5-\mathrm{a}$ series which are examples of purine mimics. This type of compound has been used to elucidate the role of metal ions with nucleic acids biochemistry, on the other hand, we have not found in the bibliography any reference for coordination compound of any of the other arrangements (1,5-c, 4,3-a, or 4,3-c). This
thesis regard as the first exploration in the coordination chemistry of 1,2,4-triazolo[4,3a]pyrimidine isomer.

## I.3.1 Compounds without a direct metal-triazolopyrimidine bond

A few compounds have been described in which there is no direct bond between the metal atom and the triazolopyrimidine derivative. Among these, there are examples with the organic molecule in neutral, cationic (protonated) and anionic form. Thus, three structures have been solved in which tetrakis(thiourea) palladium(II) chloride or tetrakis(thiourea) -platinum(II) chloride cocrystallize with dmtp ${ }^{(73)}$ or $\mathrm{HmtpO}^{(74)}$. In the cases of $\left[\mathrm{Ni}(\mathrm{dmtp})_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]\left(\mathrm{I}_{3}\right)_{2} .(\mathrm{dmtp})_{2}{ }^{(75)}$, and $\left[\mathrm{HgCl}_{2}(\mathrm{HmtpO})\right]_{2} .(\mathrm{HmtpO}) \cdot \mathrm{H}_{2} \mathrm{O}{ }^{(76)}$, both coordinated and non-coordinated triazolopyrimidine molecules coexist in the compound, interacting via stacking or hydrogen bonding.

The protonated form of dmtp has been found as the counterion of complex anions such as $\left[\mathrm{CdBr}_{4}\right]^{-2}(77)$, and $\left[\mathrm{SnCl}_{6}\right]^{-2(78)}$. The protonation of dmtp takes place at N3. On the other hand, a compound has also been described in which the anionic form of HmtpO balances the charge of the $\left[\mathrm{Cu}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}(\text { cis-1,2-diaminocyclohexane })_{2}\right]^{+2}$ cation ${ }^{(79)}$.

## I.3.2 Copper (II) complexes

As it happens with other ligands, copper(II) is the metal ion of which more complexes have been characterized. Many of these compounds are mononuclear, An example of this type of compounds is the $\left[\mathrm{Cu}(\mathrm{dmtp})_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]\left(\mathrm{PF}_{6}\right)_{2}{ }^{(80)}$ which is displayed in (Fig. 1.1).

Fig.1.1. View of the $\left[\mathrm{Cu}(\mathrm{dmtp})_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{2+}$ cation Adapted from Favre et al..

Some of the molecular coordinate complex were characterized to coordinated with the ligand in a bidentate coordination mode $\left[\mathrm{Cu}(\mathrm{mtpO})_{2}(\mathrm{tn})\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}{ }^{(81)}$ is an example for this type (Fig. 1.2).

Fig.1.2. View of Molecular structure of $\left[\mathrm{Cu}(\mathrm{mtpo})_{2}(\mathrm{tn})\right] .2 \mathrm{H}_{2} \mathrm{O}$ Adapted from Navarro et al.

On the other hand, bidentate $\mathrm{N} 3-\mathrm{N} 4$ behavior, has been observed for Cu (II) in the dimeric compound as an example $\left[\mathrm{Cu}_{2}(5 \mathrm{tpO})_{4}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] .2 \mathrm{H}_{2} \mathrm{O}$ (Fig. 1.3). ${ }^{(82)}$, in which a strong antiferromagnetic coupling $\left(2 J=-104.9 \mathrm{~cm}^{-1}\right)$ takes place through the triazolopyrimidine moieties, Dimeric compounds have also been characterized in which the auxiliary anions bridge the metallic atoms this is observed for $\left[\mathrm{Cu}_{2} \mathrm{Br}_{4}(\mathrm{dmtp})_{2}\right] .2 \mathrm{H}_{2} \mathrm{O}^{(83)}$, in which the copper atoms are antiferromagnetically coupled with $2 J=-21.1 \mathrm{~cm}^{-1}$ : in this work, the value of $2 J$ is correlated with the structure for a number of bromine bridged copper dimers.

Fig.1.3: View of the molecular structure of $\left[\mathrm{Cu}(5 \mathrm{tpO})_{4}(\mathrm{H} 2 \mathrm{O})_{2}\right] .2 \mathrm{H}_{2} \mathrm{O}$; atoms are represented as $50 \%$ probability thermal ellipsoide Adapted from M. Abul Haj.

In some cases, $\mathrm{Cu}($ II $)$ complexes have coordinated through N3 and NI to generate twodimensional polymers as an example for this case $\left[\mathrm{CuCl}_{2}(\mathrm{tp})_{2}\right]^{(84)}$ (Fig. 1.4).

Fig.1.4. View of Polymeric structure of $\left[\mathrm{CuCl}_{2}(\mathrm{tp}) 2\right]$. Adapted from Biagini-Cingi et al.

## I.3.3 Manganese, iron, cobalt, nickel, zinc complexes

A number of $\mathrm{Mn}($ II $), \mathrm{Fe}$ (II) $, \mathrm{Co}($ II $), \mathrm{Ni}($ II $)$, and $\mathrm{Zn}($ II $)$, complexes with triazolo-[1,5a]pyrimidine derivatives have been prepared and the crystal structures of some of them have been determined by single crystal X-ray diffraction.

The most frequent geometry found in the structural analysis is octahedral with two (or four) triazolo-[1,5-a]pyrimidine ligands monodentately coordinated via the nitrogen atom in position 3 . The coordination sphere is completed by water molecules, auxiliary amine ligands or $\mathrm{NCS}^{-}$anions, other anions balancing the charge of cationic complexes.

The following compounds are examples obey thos schemes:
$\left[\mathrm{Fe}(\mathrm{NCS})_{2}(5 \mathrm{HtpO})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{(85)}, \quad\left[\mathrm{Co}(\mathrm{NCS})_{2}(5 \mathrm{HtpO})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \quad{ }^{(86)}$, and
$\left[\mathrm{Ni}(\mathrm{NCS})_{2}(5 \mathrm{HtpO})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{(87)}$ (Fig. 1.5).

Fig.1.5: View of molecular structure of $\left[\mathrm{Ni}(\mathrm{NCS})_{2}(5 \mathrm{HtpO})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$ complex. Adapted from Biagini-Cingi et al.

## I.3.4 Mercury(II) and Cadmium(II) complexes

A special case is $\left[\mathrm{HgCl}_{2}(\mathrm{HmtpO})\right]_{2} \cdot \mathrm{H}_{2} \mathrm{O}{ }^{(76)}$, the structure of which is builttrigonal geometry comprising two chlorine atoms and a nitrogen atom NI from a monodentate HmtpO moiety, this coordination mode being unique for this ligand Fig. 1.6.

Fig.1.6. View of Double (left) and single (right) chains present in the crystal structure of $\left[\mathrm{HgCl}_{2}(\mathrm{HmtpO})\right]_{2}$. H 2 O . both chains are linked via hydrogen bonds with the non coordinated HmtpO molecules and the water molecule.Adapted from Salas et al.

Some Heterometallic Hg (II) complex characterized with the ligand dmtp have been described; examples for these complexes are: $\left[\mathrm{FeHg}(\mathrm{NCS})_{4}(\mathrm{dmtp})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]{ }^{(88)}$, $\left[\mathrm{CoHg}(\mathrm{NCS})_{4}(\mathrm{dmtp})_{3}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]_{2}{ }^{(89)}$ and $\left[\mathrm{CuHg}(\mathrm{NCS})_{3}(\mathrm{dmtp})_{2}\right]^{(90)}$.

In all cases, $\mathrm{Hg}-\mathrm{SCN}-\mathrm{M}$ bridges are present which generate either dimeric (cobalt compound) or polymeric structures (the rest, see for example (Fig. 1.7) and the dmtp ligands coordinate monodentately via N3.

Fig.1.7.View of Bidimensional polymeric structure of $[\mathrm{FeHg}(\mathrm{SCN}) 4(\mathrm{dmtp}) 2(\mathrm{H} 2 \mathrm{O})]$. Adapted from Biagini-Cingi et al.

## I.3.5 Silver(l) and copper(l) complexes

The basic structural unit in most of these silver complexes is an eight-member ring -Ag-$\mathrm{N}-\mathrm{C}-\mathrm{N}-\mathrm{Ag}-\mathrm{N}-\mathrm{C}-\mathrm{N}$ - generated by the coordination of two triazolopyrimidine moieties to two silver atoms through the nitrogen atoms in positions 3 and 4 . as an example the crystal structure of silver complex $\left.\left[\mathrm{Ag}_{2}(5 \mathrm{HtpO})_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}{ }^{(91)}$ are binuclear compound with two ligands bridging two silver atoms (Fig. 1.8).

Fig.1.8: View of the molecular structure of $\left.\left[\mathrm{Ag}_{2}(5 \mathrm{HtpO})_{2}\right]\left(\mathrm{ClO}_{4}\right)_{2}\right] .2 \mathrm{H}_{2} \mathrm{O}$ compound. Adapted from M. Abul Haj et al.

Also polymer silver complexes are isolated as an example $\left[\mathrm{Ag}_{3}\left(\mathrm{HSO}_{4}\right)(\mathrm{mtpO})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]$ $\mathrm{H}_{2} \mathrm{O}{ }^{(92)}$, the dimeric units are linked by weak bonds of silver atoms with the NI and O 7 atoms of neighboring units, whereas a third silver atom is present in coordinated to the NI and O7 atoms of two different dimeric units, generating a linear polymer in this way (Fig.

Fig.1.9. View of polymeric chains in $\left[\mathrm{Ag}_{3}(\mathrm{mtpO})_{2}\left(\mathrm{HSO}_{4}\right)\left(\mathrm{H}_{2} \mathrm{O}\right) 2\right] \cdot \mathrm{H}_{2} \mathrm{O}$. Bisulphate anions and water molecules are omitted for clarity. Adapted from Navarro et al.

A heterometallic tetranuclear compound $\left[\mathrm{Pt}_{2} \mathrm{Ag}_{2}(7 \mathrm{tpO})_{4}(\mathrm{bpm})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right] \cdot\left(\mathrm{NO}_{3}\right)_{2} \cdot \mathrm{H}_{2} \mathrm{O}{ }^{(93)}$ is described where the four metal ions are bridge the bpm-bipyrimidine and $7 \mathrm{tpO}{ }^{-}$(Fig. 1.10).

Fig.1.10: View of the $\left[\mathrm{Pt}_{2} \mathrm{Ag}_{2}(7 \mathrm{tpO})_{4}(\mathrm{bpm})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}\right]^{+2}$ cation, as deduced from the X-ray data. Only a few selected atom are labeled for clarity. Adapted from M. Abul. Haj et al.

Finally, there is only one copper(I) compound, the structure of which has been solved, $\left.\left[\mathrm{Cu}_{4} \mathrm{Cl}_{2} \text { (dmtp) }\right)_{4}\right]\left[\mathrm{Cu}_{2} \mathrm{Cl}_{4}\right]{ }^{(94)}$. It is built by two dimeric units, analogous to the silver(I) previously described with a $\mathrm{Cu}-\mathrm{Cu}$ distance of $2.909^{\circ} \mathrm{A}$, linked by two bridging chlorine atoms (Fig. 1.11).

Fig.1.11. View of the $\left[\mathrm{Cu}_{4} \mathrm{Cl}_{2}(\mathrm{dmtp})_{4}\right]_{2}{ }^{2+}$ cation. Adapted from Hassnoot et al.

## I.3.6 Platinum group metal complexes

The study of the interaction of platinum group metals with 1,2,4-triazolo-[1,5a]pyrimidine ligands is dominated by the formation of $\mathrm{Pt}(\mathrm{II})$ and Pd (II) complexes, with only one example for a Ru (III) compound.

For the ligand dmtp, that has not any ionizable hydrogen atom, the structures of only three mononuclear complexes have been reported: mer- $\left[\mathrm{RuCl}_{3}(\mathrm{dmtp})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]{ }^{(95)}$, and $\left[\mathrm{Pt}(\mathrm{dmtp})_{4}\right]\left[\mathrm{Pt}(\mathrm{SCN})_{6}\right]{ }^{(96)}$ (Fig. 1.12).

Fig.1.12. View of molecular structure of $m e r-\left[\mathrm{RuCl}_{3}(\mathrm{dmtp})_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$. Adapted from velders et al.

On the other hand, because of the presence of an ionizable hydrogen at $\mathrm{N} 4, \mathrm{HmtpO}$ is a well suited ligand for the preparation of multinuclear metal complexes, since it provides up to four potential binding sites, N3 and N4 being adequate to coordinate soft atoms such as $\operatorname{Pt}(\mathrm{II})$ and $\mathrm{Pd}(\mathrm{II})$. In a first stage in acidic media, the mononuclear species monodentately coordinated via N 3 are formed, cis- $\left[\mathrm{PtCl}_{2}(\mathrm{HmtpO})_{2}\right] 2 \mathrm{H}_{2} \mathrm{O}{ }^{(97)}$, and cis$\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)(\mathrm{HmtpO})_{2}\right]\left(\mathrm{NO}_{3}\right)_{2} 2 \mathrm{H}_{2} \mathrm{O}{ }^{(98)}$ having been characterized crystallographically.

If the pH is raised up to 7 , deprotonation of HmtpO at N 4 occurs and the monomeric compound cis- $\left[\mathrm{PtCl}_{2}(\mathrm{HmtpO})_{2}\right]$ condensate with itself yielding the dinuclear product $\left[\mathrm{Pt}_{2}(\mathrm{mtpO})_{4}\right]{ }^{(99)}$ (Fig. 1.13).

Fig.1.13. View of molecular structure of the dimmer $\left[\mathrm{Pt}_{2}(\mathrm{mtpO})_{4}\right]$.Adapted from Navarro et al.

The reaction of cis- $\left[\mathrm{Pt}\left(\mathrm{NH}_{3}\right)_{2}(\mathrm{HmtpO})_{2}\right]\left(\mathrm{NO}_{3}\right)_{2} \cdot 2 \mathrm{H}_{2} \mathrm{O}$ with palladium electrophiles of the type $\left[\mathrm{Pt}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}(\mathrm{~L}-\mathrm{L})\right]^{2+}$ (where L-L is a bidentate diamine) affords heterobinuclear complexes of formula $\left[\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Pt}(\mathrm{mtpO})_{2} \mathrm{Pd}(\mathrm{L}-\mathrm{L})\right]\left(\mathrm{NO}_{3}\right)_{2}{ }^{(98)}$ (Fig. 1.14).

Fig.1.14. View of the dinuclear cation $\left[\left(\mathrm{NH}_{3}\right)_{2} \mathrm{Pt}(\mathrm{mtpO})_{2} \mathrm{Pd}(\text { bpy })\right]^{2+}$. Adapted from Navarro et al.

## I. 4 Applications of Triazolopyrimidines

## I.4.1 Pharmaceutical uses

Many triazolopyrimidines have been tested to know their possible biological activity as potential growth inhibitors of microorganisms ranging from antiviral activities (7pyrrolyl(indolyl)triazolopyrimidinum salts) ${ }^{(100)}$, antifungal and antibacterial (6,7-dihydrotetrazolo-[1,5-a]pyrimidine) ${ }^{(16)}$. Some compounds of this system were found to amplify the action of the antibiotic (7-Amino-3-[2-(3,4-dihydroxy-benzenesulfonylmethyl)-5-methyl-1,2,4-triazolo[1,5-a]pyrimidin-7-ylsulfanylmethyl]-8-oxo-5-thia-1-aza-bicyclo[4.2.0]oct-2-ene-2-carboxylic acid) ${ }^{(101)}$, Nucleosides carrying a 1,2,4-triazolo[1,5-c]pyrimidin-5(6H)-one nucleosides base showed antiprotozoal activity against amastigotes of Leishmania donovani ${ }^{(102)}$.

In connection with their medicinal applications and activities to the respiratory system they showed antiallergic (2,5,6-trialkyl-1,2,4-triazolo[1,5-a]pyrimidin-7-ylamine) ${ }^{(16)}$, antihistaminic $\quad 5,7,8$-Trimethyl-[1,2,4]triazolo[1,5-c]pyrimidin-2-one ${ }^{(103)}$, bronchodilatory (8-(4-Chloro-phenyl)- 1,2,4-triazolo[4,3-c]pyrimidine) ${ }^{(104)}$.

Toward the cardiovascular and urinary tract, these compounds offer applications as antiangenal (Diethyl-(5-methyl-1,2,4-triazolo[1,5-a]pyrimidin-7-yl)-amine) ( ${ }^{(1053)}$, anticholestermics (2-Methyl-1,2,4-triazolo[1,5-a]pyrimidine) ${ }^{(106)}$, hypotensive (Diethyl-(5-methyl-2-[(phenyl-propyl-amino)-methyl]-1,2,4-triazolo[1,5-a]pyrimidin-7-yl)-amine) ${ }^{(107)}$, calcium blockers (3-Oxo-2,3,5,8-tetraalkyl-1,2,4-triazolo[4,3-a]pyrimidine-6carboxylic acid) ${ }^{(108)}$, oral antihypertensive ( 8 -aryl-1,2,4-triazolo[1,5-c]pyrimidine-2thiol) ${ }^{(109)}$, angiotensine II receptor antagonist (1,8a-Dihydro-2H-1,2,4-triazolo[4,3-c]pyrimidin-3-one) ${ }^{(109)}$, inhibits aortic smooth muscle proliferation \{2-[4-(4-Chloro-phenyl)-piperazin-1-ylmethyl]-5-methyl-1,2,4-triazolo[1,5-a]pyrimidin-7-yl\}-diethylamine) ${ }^{(107)}$, treatment of circulatory disease such as stroke and arteriosclerosis (5-Butyl-4-(2`-triazolylbiphenylmethyl-1,2,4-triazolo[1,5-a]pyrimidine-7one) \({ }^{(110)}\), and used as cardiac insufficiency and disease of the arterial wall (5-butyl-4(2`-triazolylbiphynyl-methyl)-1,2,4-triazolo[1,5-a]pyrimidine-7-one) ${ }^{(111)}$, increased renal blood flow and urine
output (5-Azido-8-(2-ethoxy-ethyl)-7-phenyl-1,2,4-triazolo[1,5-c]pyrimidine)
diuretics (8-Methyl-7-phenyl-1,2,4-triazolo[1,5-c]pyrimidin-5-ylamine), and also as antiarrythmic disorders (1-(2-hydroxyethyl)triazolo[4,3-c]pyrimidine) ${ }^{(113)}$.

Antiulcer agents (2,5,6-trialkyl-1,2,4-triazolo[1,5-a]pyrimidin-7-ylamine, the amine derivatives of 1,2,4-triazolo[1,5-a]pyrimidine-5,7-diamine have antineoplastic activity. Thus, effects are found for $\left(\mathrm{NR}^{1} \mathrm{R}^{2}=\mathrm{NHBn} ; \mathrm{NR}^{3} \mathrm{R}^{4}=\mathrm{NHNH}_{2}\right)$ against AK755, while $\left(\mathrm{NR}^{1} \mathrm{R}^{2}=\mathrm{NHBn} ; \mathrm{NR}^{3} \mathrm{R}^{4}=\right.$ morpholino) against sarcoma 37 , and $\left(\mathrm{NR}^{1} \mathrm{R}^{2}=\mathrm{NR}^{1} \mathrm{R}^{2}=\right.$ phthalmidoethylthio) against Lewis Lung Cancer ${ }^{(114)}$.

In addition 7-phynoxyalkyl-1,2,4-triazolo[1,5-a]pyrimidines were prepared for possible treatment of seizures and neurological disorder ${ }^{(115)}$. NR'R$^{2}$

Many of the isolated metal complexes of triazolo[1,5-a]pyrimidines complexes were shown to possess very interesting biological activities. In this way, several divalent metal complexes of 5,7-dimethyl-1,2,4-triazolo[1,5-a]pyrimidine have been tested as inhibitors of the growth of different $\operatorname{Gram}(+)$ and $\operatorname{Gram}(-)$ bacteria and the fungus Candida albicans. Some cobalt(II) complexes show an appreciable activity against Micrococcus, Staphylococcus and Proteus ${ }^{(116)}$, and some copper(II) compounds present MIC (minimum inhibitory concentration) values lower than $50 \mu \mathrm{~g} \mathrm{~cm}^{-3}$ towards the Gram (-) bacteria E. coli and Salmonella $S p^{(83)}$. Likewise, MIC values of $20 \mu \mathrm{~g} \mathrm{~cm}{ }^{-3}$ have been found for $\left[\mathrm{Ni}\left(5,7\right.\right.$-dimethyl-1,2,4-triazolo[1,5-a]pyrimidine) $\left.\left(\mathrm{SO}_{4}\right)\left(\mathrm{H}_{2} \mathrm{O}\right)\right] .4 \mathrm{H}_{2} \mathrm{O}$ against Streptococcus Faecslis and $\left[\mathrm{Cd}\left(5,7\right.\right.$-dimethyl-1,2,4-triazolo[1,5-a]pyrimidine) $\left.\mathrm{X}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)\right]$, (where $\mathrm{X}=\mathrm{Cl}, \mathrm{Br}$ ) against Streptococcus faecalis and Bacillus megaterium ${ }^{(77)}$.

The effect of several metal complexes of 4,7-dihydro-5-methyl-7-oxo-1,2,4-triazolo[1,5a]pyrimidine isomer against Phytomonas staheli (promastigote form) ${ }^{(117)}$ has also been studied showing that some of them inhibit parasite growth by nearly $90 \%$; these complexes have also displayed good results against analogous parasites like Trypanosoma cruzi and Leishmania donovani. Transmission electron microscopy studies have been carried out to elevate the morphological changes that these complexes cause in
different cell or ganelles, comparing the cell structure of treated and nontreated $P$. staheli (118)

The effect of (cis-[Pt(4,7-dihydro-7-oxo-1,2,4-triazolo[1,5-a]pyrimidine) $\left.{ }_{2} \mathrm{Cl}_{2}\right]$ ) addition at different concentrations to cultured human cell lines MCF-7 breast carcinoma and A121 ovarian carcinoma has been tested ${ }^{(93)}$. The results indicates a high antitumour activity against the latter, this complex being less active than cisplatin but more than carboplatin. Some 5,7-dimethyl-1,2,4-triazolo[1,5-a]pyrimidinecomplexes with Ru (II) are also being tested for antitumour activity ${ }^{(119)}$.

## I.4.2 Agrochemical Uses

Triazolopyrimidines are used as pesticide, fungicides, nitrification inhibitors, growth regulators, and especially herbicides. 1,2,4-triazolo[1,5-a] pyrimidinesulfonamides are used as herbicides, and plant growth inhibitors ${ }^{(120)}$, and they show activity against acetolactate syntheses ${ }^{(121)}$.

Compound (7-Methoxymethyl-5-methyl-1,2,4-triazolo[1,5-a]pyrimidine-2-sulfonic acid arylamide) acts as a selective herbicide against dicotyledonous weeds, such as Galium, Matricaria, Galinsoga, and Mercurialis Spp ${ }^{(122)}$ in beets (its herbicidal activities vary with the position of the substituent on the phenyl ring). The (2-(Arylthio)-1,2,4-triazolo[1,5-a]pyrimidines 2-(Arylthio)-1,2,4-triazolo[1,5-a]pyrimidines) and (5,7-Dichloro-[1,2,4]triazolo[1,5-a]pyrimidine) are also useful as herbicides ${ }^{(123)}$.

Compounds (2,5,6-trialkyl-1,2,4-triazolo[1,5-a]pyrimidin-7-ylamine) and (5,7-dihalo-1,2,4-triazolo[1,5-a]pyrimidines) act as agrochemical fungicides and cause protection against Plasmopara viticola ${ }^{(124)}$. (7-Amino-2-methyl-[1,2,4]triazolo[1,5-a]pyrimidine-6carbonitrile) compound are superior fungicides ${ }^{(125)}$. (5-Fluoromethyl-7-methoxy-1,2,4-triazolo-[1,5-a]pyrimidine-2-sulfonamides) are useful for the control of pigweed ${ }^{(126)}$. Where (5,7-Dialkyl-[1,2,4]triazolo[1,5-a]pyrimidine-2-sulfonic acid phenylamide) are useful as herbicides and inhibitors of nitrification of amino nitrogen in soil, and they are used for the control of Echinochioa crusgalli without damage to rice ${ }^{(126)}$.

### 1.4.3 Photographic uses

5-methyl-1,2,4-triazolo[1,5-a]pyrimidine-7-one (MOT) discovered by Birr in 1935 ${ }^{(1)}$, and used as "stabilizing" activity, this discovery made it possible for the first time to stabilize the sensitometric properties of photographic materials during storage. Even today MOT is an inherent constituent of nearly every photographic product. numerous derivatives have been synthesized: none is substantially more effective than MOT. 5-or-7-one-1,2,4-triazolo[1,5-a]pyrimidines derivatives adding to silver halide photographic materials to provide high contrast, which is suitable for graphic arts use ${ }^{(101)}$, and good shelf life under high temperature and high humidity ${ }^{(127)}$. Compound 2,5,6-Trialkyl-[1,2,4]triazolo[1,5-a]pyrimidin-7-one were prepared as a photosensitive photographic element ${ }^{(128)}$. Silver halide emulsion layers containing the substituted 5(7)-one-1,2,4-triazolo[4,3a]pyrimidine derivatives are used as a photosensitive photographic materials ${ }^{(127)}$. Comprehensive theory of stabilization does not exist.

## I. 5 Computational Chemistry

Computational chemistry is a new discipline. Its advent and popularity have paralleled improvements in computing power during the last several decades. As with other disciplines in chemistry, computational chemistry uses tools to understand chemical reactions and processes. Scientists use computer software to gain insight into chemical processes. Although computational chemists frequently develop and refine software tools, their primary interest is in applying software tools to enhance chemical knowledge.

In general software program uses two types of methods in calculations: molecular mechanics and quantum mechanics. The quantum mechanics methods include semiempirical and $a b$ initio. The molecular mechanics and semi-empirical quantum mechanics methods have several advantages over ab initio methods. Most importantly, these methods are fast. While this may not be important for small molecules, it is certainly important for biomolecules. Another advantage is that for specific and wellparameterized molecular systems, these methods can calculate values that are closer to experiment than lower level $a b$ initio techniques.

The accuracy of a molecular mechanics or semi-empirical quantum mechanics method depends on the database used to parameterize the method. This is true for the type of molecules and the physical and chemical data in the database. Frequently, these methods give the best results for a limited class of molecules or phenomena. A disadvantage of these methods is that you must have parameters available before running a calculation. Developing parameters is time-consuming. The ab initio method may overcome this problem.

## I.5.1 Quantum Mechanics

$A b$ initio quantum mechanics methods have evolved for many decades. The speed and accuracy of $a b$ initio calculations have been greatly improved by developing new algorithms and introducing better basis functions.

In quantum mechanics, the Schrödinger equation (1) gives the wave functions and energies of a molecule.

$$
\begin{equation*}
\mathrm{H} \Psi=\mathrm{E} \Psi \tag{1}
\end{equation*}
$$

Where H is the molecular Hamiltonian, $\Psi$ is the wave function, and E is the energy. The molecular Hamiltonian is composed of the following operators: the kinetic energy of the nuclei (N) and electrons (E), nuclear-nuclear (NN) and electron-electron repulsions (EE), and the attraction between nuclei and electrons (NE) (equation 2).
$\mathrm{H}=(\text { Kinetic energy })_{\mathrm{N}}+(\text { Kinetic energy })_{\mathrm{E}}+(\text { repulsion })_{\mathrm{NN}}+(\text { repulsion })_{\mathrm{EE}}+$ (attraction $^{\text {NE }}$

Nuclei have many times more mass than electrons. During a very small period of time when the movement of heavy nuclei is negligible, electrons are moving so fast that their distribution is smooth. This leads to the approximation that the electron distribution is dependent only on the fixed positions of nuclei and not on their velocities. This approximation allows two simplifications of the molecular Hamiltonian. The nuclear kinetic energy term drops out (equation 3).
$\mathrm{H}=(\text { Kinetic energy })_{\mathrm{E}}+(\text { repulsion })_{\mathrm{NN}}+(\text { repulsion })_{\mathrm{EE}}+(\text { attraction })_{\mathrm{NE}}$

Since the nuclear-nuclear repulsion is constant for a fixed configuration of atoms, this term also drops out. The Hamiltonian is now purely electronic.
$\mathrm{H}=(\text { Kinetic energy })_{\mathrm{E}}+(\text { repulsion })_{\mathrm{EE}}+(\text { attraction })_{\mathrm{NE}}$

After solving the electronic Schrödinger equation (equation 4), to calculate a potential energy surface, you must add back nuclear nuclear repulsions (equation 5).
$\mathrm{H}_{\text {electronic }} \Psi_{\text {electroni }}=\mathrm{E}_{\text {electronic }} \Psi_{\text {electroni }}$
$\mathrm{V}_{\text {PES }}=\mathrm{E}_{\text {electronic }}+(\text { repulsion })_{\mathrm{NN}}$

Generating the potential energy surface (PES) using this equation requires solutions for many configurations of nuclei. In molecular mechanics, the electronic energy is not evaluated explicitly. Instead, these methods solve the potential energy surface by using a force field equation. The force field equation represents electronic energy

## I.5.2 Molecular Mechanics

Molecular mechanical force fields use the equations of classical mechanics to describe the potential energy surfaces and physical properties of molecules. A molecule is described as a collection of atoms that interact with each other by simple analytical functions. This description is called a force field. One component of a force field is the energy arising from compression and stretching a bond.

This component is often approximated as a harmonic oscillator and can be calculated using Hooke's law.

$$
\begin{equation*}
\mathrm{V}_{\text {spring }}=\frac{1}{2} \mathrm{~K}_{\mathrm{r}}\left(\mathrm{r}-\mathrm{r}_{0}\right)^{2} \tag{6}
\end{equation*}
$$

The bonding between two atoms is analogous to a spring connecting two masses. Using this analogy, equation 7 gives the potential energy of the system of masses, Vspring, and
the force constant of the spring, $\mathrm{K}_{\mathrm{r}}$. The equilibrium and displaced distances of the atoms in a bond are $r_{0}$ and $r$. Both $K_{r}$ and $r_{0}$ are constants for a specific pair of atoms connected by a certain spring. $\mathrm{K}_{\mathrm{r}}$ and $\mathrm{r}_{0}$ are force field parameters.

The potential energy of a molecular system in a force field is the sum of individual components of the potential, such as bond, angle, and van der Waals potentials (equation 8). The energies of the individual bonding components (bonds, angles, and dihedrals) are functions of the deviation of a molecule from a hypothetical compound that has bonded interactions at minimum values.

$$
\begin{equation*}
\mathrm{E}_{\text {Total }}=\text { term }_{1}+\text { term }_{2}+\ldots+\text { term }_{n} \tag{7}
\end{equation*}
$$

The absolute energy of a molecule in molecular mechanics has no intrinsic physical meaning; $\mathrm{E}_{\text {Total }}$ values are useful only for comparisons between molecules. Energies from single point calculations are related to the enthalpies of the molecules. However, they are not enthalpies because thermal motion and temperature dependent contributions are absent from the energy terms (equation 7).

Unlike quantum mechanics, molecular mechanics does not treat electrons explicitly. Molecular mechanics calculations cannot describe bond formation, bond breaking, or systems in which electronic delocalization or molecular orbital interactions play a major role in determining geometry or properties.

## I.5.2.1 Bonding energies

### 1.5.2.1.1 Bonds and Angles

This term is associated with deformation of a bond from its standard equilibrium length. For small displacements from equilibrium, a harmonic function is often used:

$$
\begin{equation*}
\mathrm{E}_{\text {bond }}=\sum_{\text {bonds }} \mathrm{K}_{\mathrm{r}}\left(\mathrm{r}-\mathrm{r}_{0}\right)^{2} \tag{8}
\end{equation*}
$$

A larger value for the stretch force constant Kr leads to a greater tendency for the bond to remain at its equilibrium distance $r_{0}$. Higher powers of $r-r_{0}$, giving cubic, quadric, or higher terms are also common.

## I.5.2.1.2 Bond Angle Bending

This term is associated with the deformation of an angle from its normal value. For small displacements from equilibrium, a harmonic function is often used:

$$
\begin{equation*}
\mathrm{E}_{\text {bond angle }}=\sum_{\text {angles }} \mathrm{K}_{\theta}\left(\theta-\theta_{0}\right)^{2} \tag{9}
\end{equation*}
$$

A larger value for the bending forces constant $\mathrm{K}_{\theta}$ leads to a greater tendency for the angle to remain at its equilibrium value $\theta_{0}$. There may be cubic, quartic, etc. terms as with the corresponding bond stretch term in addition to the quadratic term shown here.

## I.5.2.1.3 Dihedrals (torsion) energy

This term is associated with the tendency of dihedral angles to have a certain $n$-fold symmetry and to have minimum energy for the cis-, gauche-, or trans-conformation, etc.

$$
\begin{equation*}
\mathrm{E}_{\text {dihedral }}=\sum_{\text {dihedral }} \frac{\mathrm{V}_{\mathrm{n}}}{2}\left[1+\cos \left(\mathrm{n} \phi-\phi_{0}\right)\right] \tag{10}
\end{equation*}
$$

The period of the interaction is $360 / \mathrm{n}$. The phase angle $\phi_{0}$ shifts the curve to the left or right. For $\mathrm{n}=1$ and $\Phi=0$, the curve represents the situation where the energy is a minimum for the trans-conformation with a barrier of Vn to the highest energy cis-conformation. A phase angle of $\phi=180$ represents the opposite situation with a minimum at the cisconformation and a maximum at the trans-conformation.

## I.5.2.2 Non-bonding energies

## I.5.2.2.1 Van der Waals energy

This term describes the repulsive forces keeping two nonbonded atoms apart at close range and the attractive force drawing them together at long range.

$$
\begin{equation*}
E_{\text {vanderWaals }}=\sum_{\mathrm{ii} \in \mathrm{vdW}}\left[\frac{\mathrm{~A}_{\mathrm{ij}}}{R_{i j}^{12}}-\frac{\mathrm{B}_{\mathrm{ij}}}{\mathrm{R}_{\mathrm{ij}}}\right] \tag{11}
\end{equation*}
$$

i and j represent two different atoms
Aij and Bij are derived from atomic constants Aii and Bii
Rij is the distance betwwn the two atoms I and j

The first positive term is the short range repulsion energy between two atoms which depends inversely on the distance $\left(\mathrm{r}^{-12}\right)$ while the second negative term is the long range attraction energy between the two atom and is a less sensitive function of the distance $\left(\mathrm{r}^{-6}\right)$.

## I.5.2.2.2 Electrostatic energy

This term describes the classical nonbonded electrostatic interactions of charge distributions.

$$
\begin{equation*}
\mathrm{E}_{\text {electrostatic }}=\sum_{\mathrm{ii} \in \text { electrostatic }}\left[\frac{\mathrm{q}_{\mathrm{i}} \mathrm{q}_{\mathrm{j}}}{\varepsilon \mathrm{R}_{\mathrm{ij}}}\right] \tag{12}
\end{equation*}
$$

The above potential describes the monopole-monopole interactions of atomic charges qi and qj a distance Rij apart. Normally these charge interactions are computed only for nonbonded atoms. The dielectric constant $\varepsilon$ used in the calculation is sometimes scaled or made distance-dependent, as described in the next section. Electrostatic terms other than the simple charge interactions above are commonly included in molecular mechanics calculations, particularly dipole-dipole interactions. More recently, second- order electrostatic interactions like those describing polarizability have been added to some force fields.

So equation (7) can be represented as the sum of these bonding and nonbonding energies as (equation 14):
$\mathrm{E}_{\text {total }}=\mathrm{E}_{\text {bond }}+\mathrm{E}_{\text {bond angle }}+\mathrm{E}_{\text {dihedral }}+\mathrm{E}_{\text {vanderwaals }}+\mathrm{E}_{\text {electrostatic }}$

## I. 6 Objectives

(1) Synthesis of the new derivatives triazolopyrimidine 7,8 dihydro-7 oxo-[1,2,4]-triazolo [4,3-a] pyrimidine, and characterization of this ligands by means of suitable techniques.
(2) Determine the crystal structure by x-ray diffraction of the isolated ligand in the crystal form.
3) Carry out theoretical study of the ligand 7,8-dihydro-7-oxo-[1,2,4]-triazolo[4,3-a] pyrimidine in its molecular form as well in the anionic form, taking in consideration all the tautomeric forms by quantum mechanics calculations of the type RHF/AM1 through the program HyperChem (Hypercube, Inc.). The standard mode geometry to be modelized by the use of the same program, auto consistently with the molecular orbital calculations. The charges over the atoms will be calculated using mulliken method.
(4) Preparation of metal complexes and metal clusters with the previously studied ligand (7,8 dihydro-7-oxo-[1,2,4]-triazolo[4,3-a]pyrimidine)
(5) Characterize this complex by suitable techniques (Infrared spectroscopy, elemental analysis, thermogravametric studies(TG), differential scanning calorimetric(DSC), ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ nuclear magnetic resonance )
(6) Solve X-ray structure of the isolated complex in the crystal form

## CHAPTER TWO

## Synthesis, characterization, and theoretical study of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a] pyrimidine ligand

## II. 1 Introduction

Untill the present the study of the coordination compounds of the triazolopyrimidines had focused on the $1,5-\mathrm{a}$ isomer, many derivatives of the $1,5-\mathrm{a}$ isomer where extensively studied. None of the other triazolopyrimidines arrangements [(1,5-c), (4,3-a), 4,3-c)] where studied for its coordination behavior.

This thesis is the first attent to study the coordination compounds of the 1,2,4-triazolo[4,3-a]pyrimidine derivative. Prior to this study we have to prepare and characterize this derivative by the usual technique; in addition a theoretical study was done to complete the experimental work.

This heterocyclic isomer has a structure similar to that pyrazolo[4,3-d]pyrimidine, their fused ring system differing in having the pyrimidine nitrogen atom in a bridgehead position with disappearance of the acidic H -proton of the five-member ring. Whereas $7,8-$ dihydro -7-oxo-1,2,4-triazolo[4,3-a]pyrimidine isomer may be considered an analogue of the natural occurring nucleobase pyrazolo[4,3-d]pyrimidines, the most outstanding of which is allopurinol. The following (Scheme 45) below compares these two systems, depiciting the IUPAC numbering scheme used for the 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand and the biochemical numbering schemes used for pyrazolo[4,3-d]pyrimidines and allopurinol. Because of the similarity of both systems, coordination compounds of triazolopyrimidin isomers can be considered as model systems for various naturally occurring metal coordination compounds.

1,2,4-triazolo-[4,3-a]pyrimidine

7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine

allopurinol

## Scheme 45

Tautomerism plays an important role in the chemical properties of heterocyclic bases which contain exocyclic oxygen atom. The 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3a]pyrimidine isomer may exist in a one lactim or two lactam forms (Scheme 46) depending on the position to which the acidic protons are attached. Nevertheless, one of these forms usually is much more stable than the others. The relative stabilities of this tautomer in the gaseous state may be estimated by mean of semiemperical calculation. At the end of this chapter a complete study will describe the most stable tatomer.

Scheme 46

The synthesis of 1,2,4-triazolo[4,3-a]pyrimidine (I) and of 1,2,4-triazolo[1,5alpyrimidine (II) can be accomplished by two different routs, either starting with 3-amino-1,2,4-triazolo (III) or with 2-hydrazinopyrimidine (IV) ${ }^{(2)}$. The former of these reactions can, in theory, produce either I or II, or both of these compounds, depending upon whether N 2 or N 4 of the 3 -amino-1,2,4-triazolo is involved in the cyclization reaction ${ }^{(3,5)}$. In some cases, the kinetically favored [4,3-a] product is formed initially, this
being transformed into the thermodynamically more stable [1,5-a] isomer by mean of the Dimroth rearrangement [7], which can also be obtained directly from IV with formic acid (129)

Scheme 47

The major argument in favor of structures of [1,5-a] appears to be based upon the statement that ethyl orthoformate and 2-hydazinopyrimidine yield only the nonrearranged compound 1,2,4-triazolo[4,3-a]pyrimidines which can be rearranged under different conditions to the 1,2,4-triazolo[1,5-a]pyrimidines ${ }^{(3,5)}$.

## II. 2 Experimental

## II.2.1 Materials

3-amino-1,2,4-triazole, hydroquinone, methyl propiolate and absolute ethanol were purchased from Aldrich and used as received. All preparative manipulations were carried out in open atmosphere.

## II.2.2 Synthesis of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine

The synthesis was done as described by Reimlinger et al. ${ }^{(8)}$. 4.2 g of 3 -amino-triazole were dissolved in 40 ml absolute ethanol at $78^{\circ} \mathrm{C}, 0.1 \mathrm{~g}$ of hydroquinone (as catalyst) and 5 g of methyl propiolate were then added and the resulting solution was refluxed on oil bath with vigorous stirring (colorless crystals were appeared after 30 min ) for 24 hr . After cooling down the resulting yellow precipitate was filtered and recrystalized from water. The overall yield $50.8 \%$.

7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine

## The mechanism of the reaction is:

1- Nucleophilic attachment of the amino group to the ester group of the methyl propiolate to form the amid intermediate

2- Intramolecular conjugate addition of the triazole N 4 onto the carbon-carbon triple bond of the side chain

## II. 3 Characterization

## The compound was characterized by:

1. Elemental analysis
2. Infrared spectroscopy (IR)
3. ${ }^{1} \mathrm{H}-\mathrm{NMR}$ and ${ }^{13} \mathrm{C}-\mathrm{NMR}$
4. Thermal analysis study (Thermogravametry (TG) and Differential Scanning Calorimetry (DSC))
5. pKa
6. Crystal study determining by X-ray diffraction)

Also the theoretical study semiemperical study was done to determine molecular orbitals, electron and charge distribution, as well as to predict characteristic bands in the IR, ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra.

## II.3.1 Elemental analysis

Microanalyses of C, H, and N were performed in a Fisons Instruments EA-1008 analyser. Elemental analysis percentage of the $\mathrm{C}_{5} \mathrm{H}_{4} \mathrm{~N}_{4} \mathrm{O} .1 / 2 \mathrm{H} 2 \mathrm{O}$ : Found C, 41.7 ; H, 3.6; N, 39.0, Calculated: C, 41.38; H, 3.45; N, 38.62.

## II.3.2 Infrared Spectroscopy

From the previous study the infrared spectra of 1,2,4-triazolo[4,3-a]pyrimidines bearing a potential hydroxyl group adjacent rather than OH absorptions. This indicated the predomenance of the amide over the imidic acid tautomers of these compounds in the solid state ${ }^{(5)}$. Wherease an amide-carbonyl group attached to the 1,2,4-triazolo[4,3-a]pyrimidin-3-ones was reported to absorb at $1680-1733 \mathrm{~cm}^{-1}(130)$, the amide-carbonyl groups attached to the pyrimidine subunit in 1,2,4-triazolo[4,3-a]pyrimidine-5- or 7 -ones usually absorb in the region $1640-1755 \mathrm{~cm}^{-1}{ }^{(27)}$. Saturation of the pyrimidine ring of 1,2,4-triazolo[4,3-a]pyrimidin-5-ones produces shifts to lower amide absorptions due to lack of conjugation. 1,2,4-triazolo[4,3-a]pyrimidin-5-ones have been differentiated from 1,2,4-triazolo[4,3-a]pyrimidin-7-ones by their amide-carbonyl absorption; the latter absorb at a lower frequency by $\sim 10-15 \mathrm{~cm}^{-1}$ than the former ${ }^{(5)}$. Williams proposed that the infrared spectra of 1,2,4-triazolo[4,3-a]pyrimidin-5-ones contain an extra strong absorption band at $1563-1575 \mathrm{~cm}^{-1(131)}$.

In our experiment IR spectra were recorded in the $4000-500 \mathrm{~cm}^{-1}$ range on a Perkin Elmer 983 spectrophotometer using KBr and polyethylene pellets.

As in (Fig. 2.1) the IR spectrum of the free 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3a]pyrimidine ligand in neutral form displaying an intense band in the region of around $3457 \mathrm{~cm}^{-1}$ assignable to $\mathrm{v}(\mathrm{OH})$ from water and NH of the ligand, a single band at 1314 $\mathrm{cm}^{-1}$ are assignable for the C-O stretching, The presence of the hydrogen bond associated acidic hydrogen atom in the free ligand is reflected in its IR spectrum as a number of bands in the $3100-2300 \mathrm{~cm}^{-1}$ regions are assignable for carbon-carbon bonds.

The vibrational activity of the carbonyl group $(\mathrm{C}=\mathrm{O})$ appeared at $1712 \mathrm{~cm}^{-1}\left(\mathrm{ca} .1800 \mathrm{~cm}^{-1}\right.$ ), whereas the pyrimidine and triazole ring showed at 1577 and $1507 \mathrm{~cm}^{-1}$ (ca. 2571 and $1523 \mathrm{~cm}^{-1}$ ) respectively. Other bands appeared at 755 and $520 \mathrm{~cm}^{-1}$ assignable to rocking and wagging water modes ${ }^{(132) \text {. }}$

Fig.2.1 IR Diagram for 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand

## II.3.3 Nuclear Magnetic Resonance spectroscopy

From the previous study as a rule, the order of chemical shift of the methine protons of 1,2,4-triazolo[4,3-a]pyrimidine was found to be $\delta(\mathrm{ppm}) \mathrm{H} 3>\mathrm{H} 5>\mathrm{H} 7>\mathrm{H}^{(132)}$.

In harmony with this order is also the order of chemical shifts of the methane protons of 3- ${ }^{(133)}, 5-^{(133)}, 6-{ }^{(134)}$, and $7{ }^{(133)}$-substituted-1,2,4-triazolo[4,3-a]pyrimidines

3-Substituted 1,2,4-triazolo[4,3-a]pyrimidines $\delta \mathrm{H} 5>\mathrm{H} 7>\mathrm{H} 6$
5-Substituted 1,2,4-triazolo[4,3-a]pyrimidines $\delta \mathrm{H} 3>\mathrm{H} 7>\mathrm{H} 6$
6-Substituted 1,2,4-triazolo[4,3-a]pyrimidines $\delta \mathrm{H} 3>\mathrm{H} 5>\mathrm{H} 7$
7-Substituted 1,2,4-triazolo[4,3-a]pyrimidines $\delta$ H3 > H5 > H6

The ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra of the 7,8 -dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand were recorded on a Bruker AM300 equipment using DMSO- $\mathrm{d}_{6}$ as solvent.

Theoretically the calculation of ${ }^{1} \mathrm{H}$ NMR spectra were recorded by using chem. draw ultra 7 program ${ }^{(135)}$ (Fig. 2.2) in this figure the spectra show four sets of signals at $\delta 8$, 8.3, 6.5, and 5.7 associated to $\mathrm{H} 8, \mathrm{H} 3, \mathrm{H} 6$ and H 5 respectively.

The spectrum of ${ }^{1} \mathrm{H}$-NMR (Fig. 2.3) display the expected 4 sets of signals, integrated for 4 protons, one singlet at $\delta 8.65$ associated to H 3 , and the two pyrimidine protons H 6 and H 5 split one another into two doublets signals one centered at $\delta 6.15$ other at $\delta 8.35 \mathrm{ppm}$ with a coupling constant equal 7.7 Hz . The most downfield broadening singlet is that at $\delta$ 12.7 for acidic N 8 proton.

The order of chemical shifts for the carbons of 1,2,4-triazolo[4,3-a]pyrimidines was found to vary according to the type and positions of substituents attached to their skeleton.

From the theoretical study ${ }^{13} \mathrm{C}$-NMR spectra which recorded by using chem. Draw ultra 7 (Fig. 2.4) show four set of signal at $108,135,148,148,164 \mathrm{ppm}$ associated for four different carbon atom C6, C5, C3, C8a and C7 respectively.
${ }^{13}$ C-NMR spectrum of the 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand (Fig. 2.5), displayed five signals corresponding to different carbon atom. The pyrimidine ring carbons C5 is found at 136.9 ppm whereas the other carbon C6 found upfield at 109.7 ppm because it is attached to carbonyl group, while the triazole ring carbon C 3 is found at 134.1 ppm . The bridgehead carbon C8a shown at more downfield position ( 148.8 ppm ) due to dieshielding by the nearly pyrimidine ring. The most downfield signal is that at $\delta$ 161.4 ppm is assigned to the carbonyl group carbon. Assignments are straightforward with the aid of the DEPT spectrum, the signals associated to $\mathrm{H} 6, \mathrm{H} 5$, and H 3 integrates clearly for just one proton and that assigned to C6, C5, and C3 appears positive at the DEPT spectrum (as expected for CH ).

## II.3.4 Potentiometer titration

For the determination of the $\mathrm{K}_{\mathrm{a}}$ value of the compound, $1 \times 10^{-3} \mathrm{~mol}(0.145 \mathrm{~g})$ of it were dissolved in the stoichiometric amount of 0.25 M NaOH , distilled water was added to get 10 ml to of 0.1 M solution of the sodium salt. This was titrated at $25^{\circ} \mathrm{C}$ with 0.1 M HCl . The acidity constant of the compound have been determined by titrating the volume of HCl and calculated the $\mathrm{pk}_{\mathrm{a}}$ by best square fit method values $5.6\left(\mathrm{Ka}=2.5 \times 10^{-6}\right)$ this value being appreciably lower than those found for analogous pyrazolo[4,3-d]pyrimidine ${ }^{(136)}$, for example, the $\mathrm{pk}_{\mathrm{a}}$ value for allopurinol is 8.9 . This enhanced acidity of triazolopyrimidine if compared with pyrazolo[4,3-d]pyrimidine can be attributed to better delocalization of the negative charge in their conjugated anion.

Fig.2.6. Potentiometric titration curve for 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a] pyrimidine ligand

## II.3.5 Thermal Analysis

The thermal behavior of the ligand has been studied from the TG and DSC curves (Fig. 2.7 and 2.8), which show that the dehydration process take place in three steps in the $42-$ $700{ }^{\circ} \mathrm{C}$ temperature range, in the first step $1 / 2$ mole $\mathrm{H}_{2} \mathrm{O}$ were lost (experimental weight loss $5.61 \%$ and theoretical weight $6.21 \%$, loss), this process appears in the DSC diagram as a sharp endothermic peak centered at $64.48^{\circ} \mathrm{C}$, with an associated enthalpy change of $5.034 \mathrm{~kJ} / \mathrm{mol}$ of water. Avery weight loss effect appearing in the range $320-710^{\circ} \mathrm{C}$.

Fig.2.7. TG diagrams for 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand

Fig.2.8: DSC diagrams for 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand

## II.3.6 X-Ray

The 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand was not isolated in crystal form. In metal complexes of nickel and silver which were isolated in the crystal form and the structure was dissolved by diffraction method, the structure was obtained, complete description of the expected structure, will be shown in chapter 3.

## II.3.7 Molecular Orbital Calculation

The general approach in theoretical study is as follows: we first construct the molecule by using HyperChem, an interactive molecular graphics program for building and manipulating Molecular mechanical calculations. These are applied in order to improve the molecular geometry (optimization), quantum mechanical calculations are then employed for the improved structures in order to study their electronic properties and to verify the preferences of low energy conformers.

Also a theoretical study "semiemperical" study was done to determine molecular orbitals (MO), electron distribution, charge distribution as well as to predict characteristic bands in the IR, NMR ( ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ ), and UV spectra. Semiempirical molecular orbital calculation types RHF/AM1 have been performed for different tautomeric forms of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine and their conjugated anions. Full geometry optimization was performed with the MO calculation. Net charges on the atoms were calculated according to fits to the molecular electrostatic potential as implemented in the Hyperchem 5.1 program ${ }^{(137)}$, and Chem Draw Ultra $7{ }^{(135)}$, in order to make proper assignments of the IR bands, both AM1 and PM3 Semiempirical methods, were used to calculate the corresponding theoretical vibrational spectrum of the free ligand

7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine have in their molecules an acidic proton there exists the possibility that hydrogen migrates to the basic position of the molecules, either to nitrogen atom or to an oxygen atom, leading to three different tautomeric forms namely N1-H, N8-H, and O-H (Scheme 48). Calculations have been
performed for all these forms as indicated in the experimental section, leading to the values for their heat of formation that have been indicated in (Table 2.1).

Scheme 48
Table 2.1: Theoretical heat of formation energy.

|  | $\mathbf{N 1}-\mathbf{H}$ | N8-H | O-H | Anion |
| :--- | :--- | :--- | :--- | :--- |
| Energy | $378.91 \mathrm{Kj} / \mathrm{mol}$ | $306.13 \mathrm{KJ} / \mathrm{mol}$ | $334.81 \mathrm{KJ} / \mathrm{mol}$ | $164.10 \mathrm{KJ} / \mathrm{mol}$ |

According to these results the most stable tatomeric forms is the $\mathrm{N} 8-\mathrm{H}$ nevertheless the $\Delta \mathrm{H}_{\mathrm{f}}$ value for $\mathrm{N} 1-\mathrm{H}$ tautomer of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine is quite close to that of $\mathrm{N} 8-\mathrm{H}$ tautomer, so we may expect that this could play role in the chemistry of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine.

Theoretically 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine is a ligand which has different possible binding site through $\mathrm{N} 1, \mathrm{~N} 2, \mathrm{~N} 8$ and O 7 . Metal coordination may show mono dentate actuation, bidentate bridging mode in homo and heteronuclear complex. The scheme below (Scheme 49) represents the sequence of the different possible site of coordination in the anionic and neutral form of the ligand.

Scheme 49
(Fig. 2.9) displays the calculated net charges on the atoms of the 7,8 -dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand, theoretically most stable tautomers of the isomer in their neutral and anion forms. According to these data, the negative charge density for neutral form follows the sequence $\mathrm{O} 7>\mathrm{N} 8>\mathrm{N} 4>\mathrm{N} 1$, while for anionic forms it follows O7>N8>N1>N4 sequence. From this result, it would have been expected for the metal binding to follow a similar trend. However, metal binding to oxygen, O7, is less common, as known soft and intermediate metal prefer nitrogen or oxygen as coordination site.

Fig. 2.9: Calculated charges of electrostatic potential for 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand in neutral (top) and anion (bottom) forms

The total charge density is the electron density in the space surrounding the nuclei of a molecule, or the probability of finding electrons in the space around a molecule, which is the best visible representation of a molecule's shape, as determined by its electronic distribution. The Total charge density surface is calculated from scratch for each molecule.

Electron densities show the locations of electrons. Large values of the density will first reveal atomic positions and then chemical bonds, while smaller values will indicate overall molecular sizeMap Property maps a color-coded visualization of a selected property onto the charge density surface. The available properties are Molecular Orbital, Spin Density, Electrostatic Potential, and Partial charges. The color scale uses red for the
highest magnitude and green for the lowest magnitude of the property. Neutral is white (Fig.2.10 and 2.11).

The electrostatic potential describes the interaction energy of the molecular system with a positive point charge. Electrostatic potential is useful for finding sites of reaction in a molecule: positively charged species tend to attack where the electrostatic potential is strongly negative (electrophilic attack).

Atomic charges indicate where large negative values (sites for electrophilic attack) are likely to occur. However, the largest negative value of the electrostatic potential is not necessarily adjacent to the atom with the largest negative charge. So in our ligand, the largest negative atomic charge occurs on the nitrogen, but the most negative values of the electrostatic potential occur at the oxygen lone pair sites. Protonation most favorably occurs at these sites. This illustrates the value of electrostatic potential compared to simple atomic charges in predicting reactivity.

Fig. 2.10: Electrostatic potential diagram of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3a] pyrimidine ligand in the neutral form using HyperChem Pro 5.1.

Fig. 2.11: Total charge density diagram for7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a] pyrimidine ligand in the neutral form using HyperChem Pro 5.1.

Charge densities don't enough to predict the behavior of this compound as a ligand, so we must consider the molecular orbitals more likely to form bonds with atomic orbitals of metal ions. Molecular orbitals, solutions of the approximate quantum mechanical equations of electron motion, are made up of sums and differences of atomic solutions (atomic orbitals), just like molecules are made up of combinations of atoms. Molecular orbitals for very simple molecules may often be interpreted in terms of familiar chemical bonds; unoccupied molecular orbital may also provide useful information.

The MO`s more likely to combine with metal atomic orbitals are those occupied with high energy and $\sigma$ symmetry and we can see in table 2.2 the contribution of atomic orbitals of N and O atoms to the highest occupied molecular orbitals (including also the LUMO) in neutral and anionic forms are indicated that the $\mathrm{N} 1, \mathrm{~N} 2$ and O in neutral form have main contributions to the metal, by mono or bidentate coordination. As we see in the table C atom also has high molecular orbital contributions, which give apossibility to form carbon-carbon, or organometallic compound especially with soft and intermediate metals under certain conditions.

## CHAPTER THREE

## The Coordination Chemistry of <br> 7,8 dihydro-7-oxo-1,2,4-triazolo[4,3-a] <br> pyrimidine ligand with <br> $\mathbf{C u}, \mathrm{Ni}$, and Ag metal

## III. 1 Introduction

The studies about the coordination chemistry of triazolopyrimidine derivatives have been focused till now in the 1,5 -a series, which are examples of purine mimics. This type of compound has been used to elucidate the role of metal ions with nucleic acids biochemistry. On the other hand, we have not found in the bibliography any reference for coordination compound of any of the other arrangements (1,5-c, 4,3-a, or 4,3-c). This study is regarded as the first exploration in the coordination chemistry of $1,2,4-$ triazolo[4,3-a]pyrimidines. These compounds present, comparing with the corresponding $1,5-\mathrm{a}$ isomers, the change in the position of one of the nitrogen atoms in the triazole ring which is now placed as separated as possible from the pyrimidine ring, with less steric hindrance and contiguous to the other external imidazole nitrogen. They are analogous and may be regarded as mimics of pyrazolo[4,3-d]pyrimidines, a family of biologically relevant compounds related to purines, the most outstanding of which is allopurinol. In the continuing studies on metal complexes of pyrimidines derivatives, we have tried to synthesis and characterize of some transition metal complexes of the less stable 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine isomer, including the crystal structure of come metal complexes.

## III. 2 Experimental

## III.2.1 Material

7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ligand (L) was synthesised as described in chapter 2 according to the procedure described by Reimlinger et al. ${ }^{(1)}$, metal salts $\left(\mathrm{CuCl}_{2}, \mathrm{NiCl}_{2}, \mathrm{Ni}\left(\mathrm{NO}_{3}\right)_{2} \mathrm{AgNO}_{3}\right)$ and $\mathrm{NH}_{4} \mathrm{OH}$ and $\mathrm{HNO}_{3}$ solvents were purchased from Aldrich Chemie. And used as received.

## III.2.2 Instrumentation

Microanalyses of C, H, and N were performed in a Fisons Instruments EA-1008 analyzer.
${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ NMR spectra were recorded on a Bruker AM300 equipment using dmso-d $\mathrm{d}_{6}$ as
solvent. IR spectra were recorded in the $4000-500 \mathrm{~cm}^{-1}$ range on a Perkin Elmer 983, Shimadzue DSC-50, and Nicolet spectrophotometers, using KBr pellets. TG and DSC diagrams were studied under air flow in Shimadzu TGA-50 and Shimadzu DSC-50 equipment coupled with an IR instrument. All these equipments are sited at the Center of Scientific Instrumentation of the University of Granada in Spain.

## III.2.3 Crystallography

Data for single crystal of the nickel complex (dimensions, $0.28 \times 0.15 \times 0.06 \mathrm{~mm}$ ) and silver complex (dimensions, $0.49 \times 0.19 \times 0.18 \mathrm{~mm}$ ) were collected at room temperature in a Bruker SMART APEX CCD system with MoK $\alpha$ radiation ( $\lambda=0.7107^{\circ} \mathrm{A}$ ). Data were corrected for absorption (multi-scan, transmission range, 0.6667-0.8775 (Ni), and $0.4965-0.6930(\mathrm{Ag})$ ). Structure solved by the heavy atom method and anisotropically refined in $F^{2}$ using SHELXL-97 ${ }^{2}$. Atom with partial occupancy has been refined isotropically and remaining non- H atoms anisotropically. Hydrogen atoms of the heterocycle were placed in ideal positions and those of the water molecule were refined with fixed $\mathrm{O}-\mathrm{H}$ distance. Isotropic thermal parameters of all H atoms fixed to 1.2 times the equivalent isotropic thermal parameter of their parent atoms.

## III. 3 Results and Discuusion

## III.3.1 Copper(II) complexes

## III.3.1.1 $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex

## III.3.1.1.1 Synthesis

The copper $\mathrm{CuL}_{2} \mathrm{Cl}_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex was prepared by adding a clear solution of 7,8 -dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ( 2 mmol ) in 30 ml water, to a solution of $\mathrm{CuCl}_{2}(1 \mathrm{mmol})$ in a minimum amount of water at room temperature. A Blue precipitates of the complexe were appeared after two days. The solid was filtered off and air dried.

## III.3.1.1.2 Elemental analysis

Elemental analysis \% of $\mathrm{CuL}_{2} \mathrm{Cl}_{2} .\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ : Found: C, 26.89; H, 3.82; N, 24.47 \%. Calculated: C, 26.07; H,3.00; N, $24.32 \%$.

## III.3.1.1.3 Infrared Spectroscopy

Absorption bands in the IR spectra of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex Fig. 3.1 show small variation with respect to the spectrum of free ligand. The spectra of the complex show very broad band centered at $3392 \mathrm{~cm}^{-1}$ characteristic of $v(\mathrm{OH})$ from $\mathrm{H}_{2} \mathrm{O}$ absorption, and a single band at $1642 \mathrm{~cm}^{-1}$ associated to the vibrational activity of carbonyl group, both bands are shifted to lower wavenumber with respect to their position in the IR spectra of the free ligand, this shift is due to coordination both of the ligand and the water molecule.

The characteristic bands of pyrimidine ring skeletal vibration appeared at $1529 \mathrm{~cm}^{-1}$, whereas of imidazole ring skeletal vibrations at $1477 \mathrm{~cm}^{-1}$, (the spectra of free ligand the former band was found at 1577 and $1507 \mathrm{~cm}^{-1}$ respectively), so the two bands are shifted to the lower wavenumber. This shift is due to the new electric and charge distribution over the ligand due to coordination of the triazole and pyrimidine ring

Fig 3.1 Infrared spectrum of $\mathrm{CuL}_{2} \mathrm{Cl}_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex

## III.3.1.1.4 Thermal analysis

Dehydration the $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex has been studied from their TG and DSC curves Fig. 3.2 and 3.3. Which show that the dehydration process occurs in several overlapping steps in the $62-600^{\circ} \mathrm{C}$ temperature range, The first step of the dehydration process appear between $62-650^{\circ} \mathrm{C}$ temperature range, suggesting that the three water molecules were lost in the first step (experimental weight loss percentage $13.7 \%$, and calculated weight loss percentage $11.7 \%$ ) with an associated dehydration enthalpy of 13 $\mathrm{kJ} / \mathrm{mol}$. This process appears in the DSC curves as a broad endothermic effect, the three remaining steps are centered at $94,171,390$ and $503^{\circ} \mathrm{C}$. From the TG diagram the pyrolytic decomposition is completed around $660{ }^{\circ} \mathrm{C}$, leaving $\mathrm{CuCO}_{3}$ as final product (experimental percentage value of the residue $27.08 \%$ is in good agreement with the theoretical value $26.8 \%$ ).

Fig. 3.2: TG diagram of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex

Fig 3.3: DSC diagram of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{3}$ complex

## III.3.1.2 $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

## III.3.1.2.1 Synthesis

Copper $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex was prepared by adding a clear solution of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ( 2 mmol ) in 30 ml water, to a solution of $\mathrm{CuCl}_{2}$ ( 1 mmol ) in a minimum amount of water at room temperature. Blue precipitates of the two complexes were appeared after two days which was filtered off and air dried

## III.3.1.2.2 Elemental analysis

Elemental analysis percentage for $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex: Found C, 24.75; H, 3.40; N, 22.59 \%. Calculated: C, 24.17; H,3.62; N, 22.58 \%.

## III.3.1.2.3 Infrared Spectroscopy

Fig. 3.4 show IR spectra of $\mathrm{CuL}_{2} \mathrm{Cl}_{2} .\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex which show a broad band at 3414 $\mathrm{cm}^{-1}$ characteristic of $\mathrm{v}(\mathrm{O}-\mathrm{H})$ absorption from $\mathrm{H}_{2} \mathrm{O}$. The vibrational activity of the carbonyl group showed at $1697 \mathrm{~cm}^{-1}$, pyrimidine ring absorption appeared at $1533 \mathrm{~cm}^{-1}$, whereas the band of triazolo ring bands occurring at $1475 \mathrm{~cm}^{-1}$.

In addition the presence of aqua-metal bond is demonstrated by the identification of the absorptions associated with the vibrations of $\mathrm{CuOH}_{2}$. In the $800-400 \mathrm{~cm}^{-1}$ region the Cu (II) complex shows two bands around 763 and $519 \mathrm{~cm}^{-1}$, assignable to rocking and wagging water ${ }^{(138)}$.

Fig 3.4 Infrared spectrum of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

## III.3.1.2.4 Thermal Analysis

The thermogravimetric TG and DSC curves (Fig. 3.5 and 3.6) of $\mathrm{CuL}_{2} \mathrm{Cl}_{2} \cdot\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex show the water molecules are lost in two steps, the first weight loss in the 53$150^{\circ} \mathrm{C}$ temperature range, clearly corresponding to the dehydration of the sample (the experimental weight loss $14.3 \%$, are in good agreement with the theoretical one $14.5 \%$ ), corresponding to the loss of four molecules of water, this process appeared in DSC diagram as a sharp endothermic effect centered at $58.8^{\circ} \mathrm{C}$ with an associated dehydration enthalpy of $18.5 \mathrm{~kJ} / \mathrm{mole}$ of water, the other endothermic step occur in the $215-250{ }^{\circ} \mathrm{C}$ temperature range with experimentally weight loss $63.5 \%$. The pyrolysis of the compound finished at $680^{\circ} \mathrm{C}$ with an experimental percentage value of the residue 19.5 $\%$ which is mixture of CuO and $\mathrm{CuCO}_{3}$ as final residue.

Both copper complexes compounds were sent to complete the characterization by magnetic methods (magnetic Susceptibility as a function of temperature and Electron Paramagnetic Resonance (EPR)), till the present day we didn't receive any data about magnetic methods, also we didn't obtain single crystal of the compound to solve it by Xray methods.

Fig. 3.5: TG diagram of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

Fig. 3.6: DSC diagram of $\mathrm{CuL}_{2} \mathrm{Cl}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ comple $x$

## III.3.2 Nickel Complexes

## III.3.2.1 $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

## III.3.2.1.1 Synthesis

2mmole of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine was dissolved in 30 ml distilled water to obtain a clear solution and then mixed with 1 mmole of $\mathrm{NiCl}_{2}$, dissolved in 5 ml distilled water. The solution was stirred at room temperature and left for a week, the blue precipitate was filtered off and air dried.

## III.3.2.1.2 Elemental Analysis

Elemental analysis \% for $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ : Found C, 28.42; H, 3.43; N, 26.49. Calculated: C, 28.67; H, 3.85; N, 26.74.

## III.3.2.1.3 Infrared Spectroscopy

IR spectra of $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex Fig. 3.7 show broad band at around $3394 \mathrm{~cm}^{-1}$ assignable to $v(\mathrm{O}-\mathrm{H})$ of water. The vibrational activity of the carbonyl group appears at $1642 \mathrm{~cm}^{-1}$ shifted $70 \mathrm{~cm}^{-1}$ to lower frequency with respect to the free ligand (the two characteristic bands of pyrimidine and triazole ring were assigned at 1595 and $1533 \mathrm{~cm}^{-1}$ respectively).

In addition the presence of aqua-metal bond is demonstrated by the identification of the absorptions associated with the vibrations of $\mathrm{Ni}(\mathrm{OH})_{2}$. New band at $519 \mathrm{~cm}^{-1}$ are assigned to the $\mathrm{v}(\mathrm{Ni}-\mathrm{Ow})$ (coordinated water) stretching vibrations coupled with chelated ring deformation and water deformation vibration ${ }^{(138)}$.

Bands which shown in the $3100-2300 \mathrm{~cm}^{-1} \mathrm{IR}$ spectra region, do not display in the IR spectra of this complex.

Fig.3.7 IR Spectrum of $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

## III.3.2.1.4 Thermal Analysis

Dehydration of the $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex is reflected by the corresponding weight losses and endothermal effects in the TG and DSC curves Fig. 3.8 and 3.9, these indicate the water molecules are lost in several overlapping steps, water elimination started at $72{ }^{\circ} \mathrm{C}$ with experimental weight loss percentage $11.6 \%$ and the theoretically value of $12.8 \%$, corresponding to the lost of three molecules of water. This step is associated with dehydration enthalpy $20 \mathrm{~kJ} / \mathrm{mole}$. This endothermic step is immediately followed by an exothermic step. The pyrolysis of the complex finishes around $680^{\circ} \mathrm{C}$ leaving 24.3 percentage of residue which is mixture of NiO , and $\mathrm{NiCO}_{3}$.

Fig. 3.8: TG diagrame of $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

Fig. 3.9: DSC diagrame of $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex

## III.3.2.2 $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ Complex

## III.3.2.2.1 Synthesis

The nickel complex was obtained by reaction of a solution of $\mathrm{Ni}\left(\mathrm{NO}_{3}\right)_{2}(1 \mathrm{mmol})$ in a minimum amount of $1 \mathrm{M} \mathrm{NH} \mathrm{N}_{4} \mathrm{OH}$ with 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine ( 2 mmol ) in $30 \mathrm{ml} 1 \mathrm{M} \mathrm{NH}_{4} \mathrm{OH}$. The resulting solution was filtered and left to evaporate at room temperature. Blue crystals of the complex were obtained after 3 days, which were filtered off and air dried. Crystals were suitable for X-ray diffraction.

## III.3.2.2.2 Elemental Analysis

Elemental analysis \% for complex: Found C, 20.66; H, 3.51; N, 24.16. Calculated: C, 20.74; H, 3.28; N, 23.60,

## III.3.2.2.3 Infrared Spectroscopy

The infrared spectra of the complex Fig. 3.10, show broad band at 3368 cm characteristic of $\mathrm{v}(\mathrm{O}-\mathrm{H})$ absorption, shifted $30 \mathrm{~cm}^{-1}$ to lower frequency with respect to $\mathrm{NiL}_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{5}$ complex.

The characteristic strong absorption bands in the IR spectra centered on 1649, 1598, and $1536 \mathrm{~cm}^{-1}$ have been assigned respectively to $\mathrm{v}(\mathrm{C}=\mathrm{O})$, pyrimidine ring and triazole ring stretching vibrations respectively.

In addition the presence of aqua-metal bond is demonstrated by the identification of the absorptions associated with the vibrations of $\mathrm{Ni}(\mathrm{OH})_{2}$. New band at $519 \mathrm{~cm}^{-1}$ are assigned to the $v(\mathrm{Ni}-\mathrm{Ow})$ (coordinated water) stretching vibrations coupled with chelated ring deformation and water deformation vibration ${ }^{(138)}$.

New bands at $1325 \mathrm{~cm}^{-1}$ and $825 \mathrm{~cm}^{-1}$ corresponding respectively to $v_{1}$ and $v_{2}$ vibration modes of a $\mathrm{D}_{3} \mathrm{~h} \mathrm{NO}_{3}{ }^{-}$group. Bands which shown in the $3100-2300 \mathrm{~cm}^{-1} \mathbb{R}$ spectra region, do not display in the IR spectra of this complex.

Fig. 3.10 Infrared Spectroscopy of $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}(\mathrm{H} 2 \mathrm{O})_{16}$ complex

## III.3.2.2.3 Thermal analysis

The thermal behavior of the isolated $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ complex has been studied from the TG and DSC curves (Fig. 3.11 and 3.12). The latter study showed that the dehydration process is rather complicated, involving four steps, the first overlapping with the second and the third overlapping with the fourth. The elimination started at $75{ }^{\circ} \mathrm{C}$ suggesting that 15.5 water molecules are lost, accumulated weight lose are $12.2 \%$ after the third step and with the theoretical value $12.1 \%$. The DSC curve show two endothermic effect appeared at $60.17{ }^{\circ} \mathrm{C}$ and $199.6^{\circ} \mathrm{C}$ followed by an exothermic one centered at $365.4^{\circ} \mathrm{C}$. The pyrolysis is finished around $500^{\circ} \mathrm{C}$ leaving $27.7 \%$ of the residue.

Fig. 3.11: TG diagrame of a $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ complex

Fig. 3.12: DSC diagrame of $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ complex

## III.3.2.2.4 Crystal structure for $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ complex

The nickel cluster is composed of nine atoms of nickel, the central nickel (Ni1) is situated in inversion center and is united to 6 atoms N 2 from six ligands anion. Three of these six ligands are coordinated through N1 with a second nickel atom Ni2 and the other three are related through the symmetry center. In addition every one of these ligands is coordinated through N 8 with other different atoms ( $\mathrm{Ni} 3, \mathrm{Ni4}$ and $\mathrm{Ni5}$ and the symmetry related ones). With this we have the nine atoms. Also Ni2 forms OH bridging with Ni3, Ni4 and Ni5. In addition to the six ligands exists another two ligand in the cluster that are united with Ni 4 and Ni5 through N1 and N 2 .

Fig. 3.13: Ionic structure of $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ clusture according to X-ray analysis, Non $\mathrm{H}_{2} \mathrm{O}, \mathrm{NO}_{3}$ and $\mathrm{NH}_{3}$ molecules are present

Table 3.1: bond lengths [ ${ }^{\mathrm{A}} \mathrm{A}$ ] of $\mathrm{Ni} 9\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ complex

## III.3.2.2.5 Preliminary results of Magnetic Studies.

The magnetic study of the clusters show interesting ferromagnetic and antiferomagnetic interaction at lower temperature, the graph of $\chi$ vs. T (Fig. 3.15) indicate this behavior, the compound is still under farther magnetic studies to enable to calculate coupling constant and give the accurate information about the ferromagnetic and antiferomagnetic behavior.

Fig.3.15: Magnetic susceptibility of $\mathrm{Ni}_{9}\left(\mathrm{C}_{5} \mathrm{H}_{3} \mathrm{~N}_{4} \mathrm{O}\right)_{8}\left(\mathrm{NO}_{3}\right)_{4}\left(\mathrm{NH}_{3}\right)_{4}(\mathrm{OH})_{6}\left(\mathrm{H}_{2} \mathrm{O}\right)_{16}$ cluster as a function of temperature

## III.3.3 Silver complex

## III.3.3.1 Synthesis of $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ complex

$1 \mathrm{mmol}^{2} \mathrm{AgNO}_{3}$ was dissolved in a solution of $10 \mathrm{ml} 5 \mathrm{M} \mathrm{HNO}_{3}$ and added to a clear solution of 1 mmol ligand solid dissolved in $30 \mathrm{ml} 5 \mathrm{M} \mathrm{HNO}_{3}$, the solution was filtered off and allow to stranded at room temperature for 3 days, large colorless crystals suitable for X-ray work, were obtained..

## III.3.3.2 Elemental analysis

Elemental analysis \% for $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ complex: Found C,18.49; H,1.82; $\mathrm{N}, 21.55$. Calculated. C, 18.53; H, 1.85; N, 21.61

## III.3.3.3 Infrared spectroscopy

The IR spectrum of $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ complex $(\mathbf{F i g ~ 3 . 1 6 )}$ is almost identical to that of free ligand $v(\mathrm{O}-\mathrm{H})$ of water and $\mathrm{N}-\mathrm{H}$ of pyrimidine ring showed at $3449 \mathrm{~cm}^{-1}$, the presence of the acidic hydrogen atom is shown in the characteristic set in the 2700-3100 $\mathrm{cm}^{-1}$ region. Comparing with free ligand, the only appreciable difference is a $35 \mathrm{~cm}^{-1}$ shifted to lower frequency of the $\mathrm{C}=\mathrm{O}$ vibration mode and ( at $1678 \mathrm{~cm}^{-1}$ ) and the appearance of new bands at $1384 \mathrm{~cm}^{-1}$ (v. strong) and 857 (weak), corresponding respectively to $v_{3}$ and $v_{2}$ vibration modes of $\mathrm{D}_{3} \mathrm{~h} \mathrm{NO}_{3}{ }^{-}$group.

## III.3.3.4 thermal analysis

Dehydration of $\left[\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\right] \cdot 2 \mathrm{H}_{2} \mathrm{O}$ complex is reflected by the corresponding weight losses and endothermal effect in the TG and DSC curves (Fig 3.17 and 3.18), which shows that the dehydration process takes place at high temperature (DSC endothermic peak at $161^{\circ} \mathrm{C}$ ) due to the strong interaction of the water molecule with the rest of the structure, this dehydration overlapping with another process since the weight loss is much higher than expected and the endothermic effect is immediately followed by and exothermically one. Pyrolytic decomposition of the compound end at $500^{\circ} \mathrm{C}$ leaving silver metals final residue with the experimental weight percentage $35.52 \%$ and calculated percentage $35.49 \%$.

Fig 3.17: TG curve of $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ complex

Fig 3.18: DSC curve of $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ complex

The crystal structure is built by dinuclear centrosymmetric units (Figure 3.19) in which both silver atoms are bridged by two heterocycles, which are linked to the metal atoms through both external nitrogen atoms ( N 1 and N 2 ) of the triazole ring. This defines a hexagonal $\mathrm{Ag}_{2} \mathrm{~N}_{4}$ core for which there are a number of other examples In the bibliography, involving pyrazole ${ }^{(139)}, 1,2,4$-triazolo and tetrazole ${ }^{(140)}$ derivatives as well as piridazines ${ }^{(141)}$, but we have not found any for a $5+6$ byciclic ligand. This behaviour is very different to that of 1,2,4-triazolo[1,5-a]pyrimidines, which also form with $\operatorname{Ag}(\mathrm{I})$ dinuclear compounds but with a N3-N4 (NI-N8 translated to the [4,3-a] numbering
scheme) bridging mode that leads to a eight member $\mathrm{Ag}_{2} \mathrm{C}_{2} \mathrm{~N}_{4}$ core ${ }^{(142)}$. As a consequence, the intermetallic distance (Table 3.2) is much higher in the compound described here.

The geometry of the cluster makes it impossible for the silver atom to adopt its usual linear coordination; instead, a flat trigonal geometry is observed, the third coordination position being occupied by a nitrate anion and the distortion of the triangle not being too severe (see bond distances and angles atoms in (Table 3.3 and 3.4). A weak interaction with second oxygen of nitrate is also indicated in Table 3.3. The $\mathrm{Ag}_{2} \mathrm{~L}_{2}$ moiety is planar within $0.025 \mathrm{~A}^{\circ}$ with $\mathrm{O} 1-\mathrm{N}$ clearly displaced from this plane $\left(0.983(3) \mathrm{A}^{\circ}\right)$ and the water oxygen dose to it $\left(0.223(4) \mathrm{A}^{\circ}\right)$; the nitrate plane is rotated $60.25(8)^{\circ}$ respect to the $\mathrm{Ag}_{2} \mathrm{~L}_{2}$ plane.

The strongly acidic media prevents deprotonation of N8, probably avoiding the formation of species with higher nuclearity (likely to be polymeric). The ligand is clearly in its amido tautomeric form and N8-H forms a rather strong hydrogen bond towards the water molecule which, in turn, forms another hydrogen bond with the nitrate anion defining in this wave an eight member pseudochelate ring. Again, the behaviour is different from that observed for the most similar member of the [1,5-a] series, for which the stability of the $\mathrm{N} 4-\mathrm{Ag}$ bond is able to displace the acidic proton to the exocyclic oxygen atom, giving rise to the formation of the unusual iminophenolic tautomer ${ }^{(143)}$.

Fig. 3.19: Molecular structure of the dinuclear compound $\mathrm{Ag}_{2} \mathrm{~L}_{2}\left(\mathrm{NO}_{3}\right)_{2}\left(\mathrm{H}_{2} \mathrm{O}\right)_{2}$ according to X-ray analysis

## CHAPTER FOUR

## Dimroth rearrangement and the crystal structure <br> of 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a] pyrimidine ligand

## IV. 1 Introduction

The Dimroth rearrangement ${ }^{(144)}$ including 1,2,4-triazolo[4,3-a]pyrimidine generally proceeds rather easily; therefore these compounds, when prepared, are often not isolable (or only by very carefully handling).

This type of Dimroth rearrangement is strongly influenced primarily by inductive to a lesser extent by steric effects; Dimroth reactions, usually reversible, almost always proceed, in the case of triazolopyrimidines, from the kinetically favored [4,3-a] $\mathbf{1}$ product to the thermodynamically more stable $[1,5-\mathrm{a}]$ isomer $2^{(8,12)}$ (Scheme 50). This isomerization may be induced by acids ${ }^{(5,7,18,20,131,145,146)}$, bases ${ }^{(7,18,20,145)}$, or by heating (145).

## Scheme 50

The mechanism of this isomerization in acid media involves protonation of $\mathbf{1}$ followed by pyrimidine-ring opening of $\mathbf{3}$ to form the carbocation $\mathbf{4 a}$. Nucleophilic attack of the triazole N 1 onto the positively charged carbon of the tautomeric structure $\mathbf{4 b}$ gives the protonated cyclic isomer 5, which deprotonates to the 1,2,4-triazolo[1,5-a]pyrimidine $\mathbf{2}$ ${ }^{(146)}$ (Scheme 51).

## Scheme 51

In basic media, the rearrangement of $\mathbf{1}$ most probably occurs by the nucleophilic attack of the base onto C5 causing pyrimidine-ring rupture to form $\mathbf{6 a}$ and $\mathbf{6} \mathbf{b}$. Recyclization of the side-chain carbonyl carbon with the triazole N1of the tautomeric structure $6 c$ and elimination of the base gave 2 (Scheme 52).

Scheme 52

Whereas there is no experimental proof for thermally induced isomerization of $\mathbf{1}$, good arguments suggested to take place through the formation of the zwitterionic intermediate $\mathbf{9}^{(145)}$. Recyclization of the latter gives the isomer 1,2,4-triazolo[1,5-a]pyrimidine $\mathbf{2}^{(18,20)}$
(Scheme 53).

Scheme 53

Brown and Nagamatsu ${ }^{(132)}$ reported kinetic studies on Dimroth rearrangements to triazolopyrimidine in two pH ranges. Isomerization rates in alkali increase steeply in the range $\mathrm{pH} 10-12.5$. In acid, they obtain maxima at pH values corresponding approximately to the $\mathrm{pK}_{\mathrm{a}}$ of each substance (in the range $\mathrm{pH} 1.5-2.5$ ).

## IV. 2 Results and Discussion

During one of the reactions to prepare cobalt complex with the desired ligand, an organic compound had precipitated in the form of mono crystal. This compound was resolved by X-ray diffraction. And came out to be a derivative thermodynamically stable [1,5-a].

The structure contains residues on one of the nitrogen of the pentagon. Carbon in position 2 bonded to hydrogen. The residue is bonded to nitrogen in position 3, this implies that when N 4 lost the hydrogen site of the double bond had changed. El residue $-\mathrm{CH}=\mathrm{CH}-$ CO-O-CH3 came from a second atom of the ligand that was destroyed; these atoms are C7-C6-C5-O5. N4 had been hydrolyzed and in its place a methoxide group had situated (methanol was in the reaction medium). There are four equal and independent in the unit cell.

## CHAPTER FIVE

## CONCLUSION

1. This research and investigation of the coordination chemistry of triazolopyrimidine were the center of our thesis; a complete bibliography revision was done including all previous work of all investigation group in this field ofstudy mainly the work of the group in Granada University (Spain) and Leiden University (Holand). All previous work about the coordination chemistry had focused on 1,5-a derivative, we have not found any reference for the coordination compound of any of any of the other arrangements (1,5-c, 4,3-a, or 4,3-c).
2. Following this line of investigation a new a new derivative 7,8-dihydro-7-oxo-1,2,4-triazolo[4,3-a]pyrimidine was synthesized and characterized, the only references were about the synthesis of this ligand. In this thesis we chose the best method through the synthesis and modification to obtain maximum yield.

The compound was characterize by usual methods and the results indicated that the most stable tautomer form is when the acidic hydrogen was on N 8 position, pka value was determined and it was more acidic than analogues purine bases. On the other hand, theoretical study of the ligand was done in molecular and ionic form. This study indicates that the most stable tautomer is that when the acidic hydrogen is on N 8 .this was supported by ${ }^{1} \mathrm{H}$-NMR and ${ }^{13} \mathrm{C}$-NMR and from MO calculation there was no preference site of coordination. Characterization was completed by IR, elemental analysis, and theoretical studies.
3. Synthesis of metal complexes of the first and second raw transition metals was carried out, some of these complexes were isolated in pure crystal form, others need further investigation, the complexes were characterize by X-ray crystallography showing that the retain 4,3-a isomer which is less favored thermodynamically.
4. For Ni cluster the ligand coordination in its anionic form through $\mathrm{N} 1, \mathrm{~N} 2$ and O 7 without preference of one site over another as was concluded from theoretical
calculation at lower temperature and also need further investigation since this type of compound could be used in the field of electronics as data storage materials.
5. the cation $\mathrm{Ag}^{+}$show dimeric complex with the ligand in its molecular form and coordination mode N1 and N 2 atoms, the acidic hydrogen was situated on N8 the same as in the free ligand.
6. The most stable thermodynamic $1,5-\mathrm{a}$ compound was also obtained during the experiment and the isolated product is in agreement with Dimroth rearrangement
