FTIR OZONE SPECTRA : FOCUS ON THE $^{16}\text{O}^{18}\text{O}^{18}\text{O}$ C_s SYMMETRY ISOTOPIC SPECIES

M-R. DE BACKER, A. BARBE, VI. G. TYUTEREV, *Groupe de Spectrométrie Moléculaire et Atmosphérique, U.M.R. CNRS 7331, Université de REIMS, Moulin de la Housse, B.P. 1039, 51687 REIMS cedex, FRANCE; E. STARIKOVA, QUAMER, Tomsk State University, 36 Lenine Av., 634050 Tomsk and LTS, V.E. Zuev Institute of Atmospheric Optics SB RAS, 1, Akademician Zuev square, 634021 Tomsk, Russia*

Since many years, the GSMA Reims team is working on high resolution IR spectra of the ozone molecule, including isotopic species. The analyses of the C_{2V} ($^{16}\text{O}_3$, $^{18}\text{O}_3$, $^{16}\text{O}^{18}\text{O}^{16}\text{O}$ and $^{18}\text{O}^{16}\text{O}^{18}\text{O}$) have been performed in the whole 1000-7900 cm^{-1} domain using either the Reims FT spectrometer, or the Grenoble Cavity Ring Down spectrometer, depending on the spectral range under study ^{1 2}

Here, we will focus our attention on the analyses of the $^{16}\text{O}^{18}\text{O}^{18}\text{O}$ spectra recorded with the FTS of Reims between 800 and 5700 cm^{-1} . Thanks to accurate predictions of band centres and rotational parameters ^{3 4} sixteen bands (6986 transitions) have been observed and assigned. We will present parts of the analyses: parameters of the effective Hamiltonian model, number of assigned transitions, statistics of fits and examples of agreement between observed and simulated spectra. We also will present the comparisons between predictions and retrieved of band centres and rotational constants.
