Abstract of thesis presented to the Senate of Universiti Putra Malaysia in fulfilment of the requirement for the degree of Doctor of Philosophy

**MECHANICAL PROPERTIES OF FIBRE METAL LAMINATES  
REINFORCED WITH CARBON, FLAX AND SUGAR PALM FIBRE-BASED  
COMPOSITES**

By

**CHANDRASEKAR MUTHUKUMAR**

**March 2019**

**Chair: Mohamad Ridzwan Bin Ishak, PhD**  
**Faculty: Engineering**

Fibre metal laminate (FML) consists of sheet metal and fibre prepreg stacked alternatively in 2/1 or 3/2 lay-up and cured to form the laminate. The commercially available FML such as CARALL (Carbon fibre reinforced aluminum metal laminate), GLARE (Glass laminate aluminum reinforced epoxy) and ARALL (Aramid fibre reinforced aluminum metal laminate) based on the synthetic fibres have limitations like difficulties in recycling, degradability and disposal problems. These factors push the need for environment friendly material. From the literature review, it has been identified that the studies on the natural fibre reinforced FML and the metal surface treatments other than the standard chromic acid anodizing are limited. Also, the impact of aging effects on the mechanical properties of natural fibre reinforced FML has never been studied. In this research, a new class of FML reinforced with the carbon fibres and natural fibres like flax and sugar palm has been fabricated using the hand lay-up and hot press technique. Their mechanical properties under various loads with respect to the metal surface treatment, fibre stacking sequence, hygrothermal and sub-zero aging effects were studied. Based on the results from the experiments, it could be seen that sanding followed by silane treatment could be used as a metal surface treatment for FML, as it provides superior properties over the FML with sanded metal surface. Among the studied configurations, FML with the pure flax fibres exhibited the highest strength, stiffness and fatigue life. Hybridization of flax with sugar palm also has led to significant improvement in the properties compared to the FML with sugar palm fibres. On the other hand, FML specimens exposed to the aging under the moisture/temperature, failed at lower loads, possessed lower strength and stiffness than the unexposed or dry specimens. The degradation in properties was more severe in case of hygrothermal conditioning than the sub-zero exposure. This is because hygrothermal conditioning resulted in 6-8% increase in thickness swelling due to the moisture absorption by natural fibres in the

laminate, weakening of the interfacial bonding strength and degradation of the natural fibre reinforced composite ply as evident from the presence of multiple cracks in the microstructure of the hygrothermally aged FML specimens. To summarize, FML with the pure flax fibres has shown better mechanical properties; longer fatigue life and fibre bridging effect which is critical to sustain larger number of cycles before the failure. The degradation in mechanical properties and physical changes in the FML due to the aging indicates the need to evaluate their behavior if they are required to use in the structures operating under such environmental conditions.

Abstrak tesis yang dikemukakan kepada Senat Universiti Putra Malaysia sebagai memenuhi keperluan untuk ijazah Doktor Falsafah

**SIFAT MEKANIKAL BAHAN BERLAMINA GENTIAN LOGAM  
BERTETULANG GENTIAN KARBON, FLAKS DAN ENAU BERASASKAN  
KOMPOSIT**

Lapisan logam bergentian (FML) terdiri daripada lapisan logam dan gentian dalam bentuk prepreg yang disusun secara selang-seli dalam susunan 2/1 atau 3/2 telah difabrikasi bagi membentuk susunan lamina. Secara komersialnya, FML sedia ada seperti CARALL (Carbon fibre reinforced aluminum metal laminate), GLARE (Glass laminate aluminum reinforced epoxy) and ARALL (Aramid fibre reinforced aluminum metal laminate) yang terdiri daripada gentian sintetik mempunyai masalah seperti sukar untuk dikitar semula dan diurai bagi tujuan pelupusan. Berdasarkan faktor-faktor ini, ia mendorong kepada keperluan untuk membangunkan bahan mesra alam. Berdasarkan kajian literatur, kajian dan ilmu berkenaan gentian semula jadi FML dan rawatan permukaan logam termasuklah anodizing asid kromik adalah sangat terhad. Selain itu, kesan-kesan penuaan pada sifat mekanik untuk gentian semulajadi dalam FML masih belum dikaji sepenuhnya. Dalam kajian ini, FML yang diperkuat dengan gentian karbon dan gentian semulajadi seperti flaks dan enau telah dihasilkan menggunakan teknik belangai tangan dan teknik tekan panas. Ciri-ciri mekanik di bawah pelbagai beban telah dikaji dengan rawatan permukaan logam, susunan gentian, kesan hygrothermal dan sub-sifar. Berdasarkan keputusan daripada eksperimen, ianya boleh dilihat bahawa pengasaran permukaan logam dan diikuti dengan rawatan silane boleh digunakan sebagai rawatan permukaan logam untuk FML, kerana ia memberikan sifat yang lebih baik untuk FML dengan permukaan logam yang telah dirawat. Berdasarkan konfigurasi di atas, FML dengan gentian flaks tulen menunjukkan sifat kekuatan, kekakuan dan keletihan yang tertinggi. Hibridisasi gentian flaks dengan enau menyebabkan peningkatan yang ketara dalam sifat-sifat berbanding dengan FML dengan gentian enau. Sebaliknya, spesimen FML yang terdedah kepada penuaan di bawah pelbagai kelembapan/suhu menunjukkan ianya gagal pada beban yang lebih rendah dan juga menghasilkan sifat kekuatan dan kekakuan yang lebih rendah daripada spesimen yang tidak terdedah kepada

pelbagai kelembapan/suhu. Degradasi dalam sifat ini akan bertambah sekiranya keadaan hygrothermal terdedah pada keadaan sub-sifar. Ini akan menyebabkan keadaan hygrothermal menghasilkan kenaikan ketebalan terhadap pembengkakan spesimen sebanyak 6-8 % yang disebabkan oleh penyerapan kelembapan oleh gentian semulajadi dalam lamina. Hasilnya, ia melemahkan kekuatan ikatan antara muka dan kemerosotan pada komposit gentian semulajadi yang dibuktikan dengan penghasilan retak yang banyak dalam struktur mikro spesimen FML secara hygrothermal. Sebagai ringkasnya, FML dengan gentian flaks tulen menunjukkan sifat mekanikal yang lebih baik; jangka hayat kelesuan yang lebih panjang dan memberi kesan yang sangat penting terhadap penyambungan gentian untuk mengekalkan jangka hayat bahan sebelum gagal. Input daripada kerosakan dalam sifat-sifat mekanikal dan perubahan fizikal dalam FML yang disebabkan oleh penuaan ini akan menentukan keperluan-keperluan penyelidikan dan pembangunan FML bergentian semula jadi pada masa akan datang bagi menilai sifat-sifatnya di bawah aplikasi persekitaran hygrothermal dan sub-sifar.

## ACKNOWLEDGEMENTS

I would like to take this opportunity to appreciate and thank everyone who has supported me throughout this PhD journey.

I'm greatly indebted to my beloved father, caring mother and wonderful sister for their patience, love and full support during my studies. I would like to convey my sincere gratitude and appreciation to my principal supervisor Dr. Mohamad Ridzwan Bin Ishak for his goodwill, time, guidance and support in my research. I also take this opportunity to extend my deep gratitude and appreciation to my co-supervisors, Prof. SM Sapuan, Dr. Zulkiflile Leman and Dr. Mohammad Jawaid for their support through their valuable inputs in my research work and technical feedback in improving the content.

I would like to thank the technical and non-technical staff from the Faculty of Engineering and Institute of tropical forestry and forest products (INTROP) for their technical assistance and co-operation in using the lab facilities and testing equipment's.

Last but not least, I would like to acknowledge the support and encouragement from my maternal uncle Dr. Arangarajan, my grandparents, Rao Muhammad Shahrize Ali and all my peers in Universiti Putra Malaysia.

I certify that a Thesis Examination Committee has met on 15 March 2019 to conduct the final examination of Chandrasekar Muthukumar on his thesis entitled "Mechanical Properties of Fibre Metal Laminates Reinforced with Carbon, Flax and Sugar Palm Fibre-Based Composites" in accordance with the Universities and University Colleges Act 1971 and the Constitution of the Universiti Putra Malaysia [P.U.(A) 106] 15 March 1998. The Committee recommends that the student be awarded the Doctor of Philosophy.

Members of the Thesis Examination Committee were as follows:

**Mohd Khairol Anuar bin Mohd Ariffin, PhD**

Professor Ir.  
Faculty of Engineering  
Universiti Putra Malaysia  
(Chairman)

**Faizal bin Mustapha, PhD**

Professor Ir.  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Mohamed Thariq bin Hameed Sultan, PhD**

Associate Professor Ir.  
Faculty of Engineering  
Universiti Putra Malaysia  
(Internal Examiner)

**Recep Calin, PhD**

Professor  
Kirikkale University  
Turkey  
(External Examiner)

**RUSLI HAJI ABDULLAH, PhD**

Professor and Deputy Dean  
School of Graduate Studies  
Universiti Putra Malaysia

Date: 23 April 2019

This thesis was submitted to the Senate of Universiti Putra Malaysia and has been accepted as fulfilment of the requirement for the degree of Doctor of Philosophy. The members of the Supervisory Committee were as follows:

**Mohamad Ridzwan Bin Ishak, PhD**

Senior Lecturer  
Faculty of Engineering  
Universiti Putra Malaysia  
(Chairman)

**Mohd Sapuan Bin Salit, PhD**

Professor, Ir  
Faculty of Engineering  
Universiti Putra Malaysia  
(Member)

**Zulkiflle Leman, PhD**

Associate Professor  
Faculty of Engineering  
Universiti Putra Malaysia  
(Member)

**Mohammad Jawaaid, PhD**

Senior Research Fellow  
Institute of Tropical Forestry and Forest Products

## Declaration by graduate student

I hereby confirm that:

- this thesis is my original work;
- quotations, illustrations and citations have been duly referenced;
- this thesis has not been submitted previously or concurrently for any other degree at any other institutions;
- intellectual property from the thesis and copyright of thesis are fully-owned by Universiti Putra Malaysia, as according to the Universiti Putra Malaysia (Research) Rules 2012;
- written permission must be obtained from supervisor and the office of Deputy Vice-Chancellor (Research and Innovation) before thesis is published (in the form of written, printed or in electronic form) including books, journals, modules, proceedings, popular writings, seminar papers, manuscripts, posters, reports, lecture notes, learning modules or any other materials as stated in the Universiti Putra Malaysia (Research) Rules 2012;
- there is no plagiarism or data falsification/fabrication in the thesis, and scholarly integrity is upheld as according to the Universiti Putra Malaysia (Graduate Studies) Rules 2003 (Revision 2012-2013) and the Universiti Putra Malaysia (Research) Rules 2012. The thesis has undergone plagiarism detection software.

## LIST OF FIGURES

| Figure |  | Page |
|--------|--|------|
| 1.1    | 3/2 layup of FML (Lopes, Remmers, & Gürdal, 2008)  | 1    |
| 1.2    | Delamination between the metal/prepreg in FML with smooth metal surface without any treatment (Ostapiuk et al., 2014)  | 4    |
| 2.1    | Tensile failure a) CARALL - specimen 1, b) CARALL – specimen 2, c) GLARE – specimen 1 and d) GLARE – specimen 2 (Rajkumar et al., 2014)  | 8    |
| 2.2    | Tensile failure in SiRAL a) Composite failure without delamination, b) Magnified image showing composite failure without delamination, c) Composite failure with the large delamination and d) Magnified image showing composite failure with the large delamination (Vieira et al., 2017) | 9    |
| 2.3    | Delamination between the metal/prepreg in the FML due to the flexural load (Vieira et al., 2017)   | 9    |
| 2.4    | Buckling failure in CAJRALL a) Global mode, b) Local mode and c) Mixed mode (global+local) (Vasumathi & Murali, 2014a)   | 10   |
| 2.5    | Buckling failure in FML due to compression (Muthukumar Chandrasekar et al., 2018)  | 11   |
| 2.6    | Schematic of sample loaded in a) flexural and b) short beam test (Shenoy, Nayak, Prakash, Awasthi, & Kochhar, 2015)  | 12   |
| 2.7    | Sinusoidal force applied in tension-tension fatigue test   | 13   |
| 2.8    | Fibre bridging effect in FML a) fatigue through crack and b) surface crack (Alderliesten, 2017)  | 14   |
| 2.9    | Phases in fatigue life of the FML from initiation to failure   | 15   |
| 2.10   | Fatigue failure in FML with OPEFB/polypropylene/Al a) 30% fibre weight and b) 40% fibre weight (Sivakumar et al., 2017)  | 16   |
| 2.11   | 2.11 Various factors influencing the mechanical properties of FML  | 16   |
| 2.12   | 2/1 layup in FML   | 17   |
| 2.13   | 3/2 layup in FML   | 17   |
| 2.14   | Fibres obtained from different parts of the sugar palm tree (Huzaifah, Sapuan, Leman, Ishak, & Maleque, 2017)  | 22   |
| 2.15   | SEM images of Al surface with various anodising and exposure time (a) PAA-30 minutes, (b) PAA-60 minutes, (c) SAA-30 minutes, (d) SAA-60 minutes, (e) NAA-60 minutes and (f) NAA-60 minutes (Mohamad et al., 2014)   | 29   |

|      |  |    |
|------|--|----|
| 2.16 | Delamination in CARALL after 10 weeks of exposure to hygrothermal conditions (Damato et al., 2008)         | 37 |
| 3.1  | Experimental design of the research flow in the thesis   | 41 |
| 3.2  | Unidirectional Biotex™ flax fibre in tape form   | 42 |
| 3.3  | Naturally woven sugar palm fibres (a) as obtained and (b) compressed fibre mat                             | 43 |
| 3.4  | 2X2 twill weave carbon prepreg   | 43 |
| 3.5  | Epoxy adhesive layer with blue plastic peel  | 44 |
| 3.6  | 6061-T6 Metal surface a) before sanding and b) after sanding   | 45 |
| 3.7  | Surface preparation of sanded Al sheet with silane solution  | 46 |
| 3.8  | Fabrication process of 2/1 Layup FML   | 46 |
| 3.9  | Schematic of the fabricated 2/1 layup FML  | 47 |
| 3.10 | Fabricated FML samples cut using the band saw  | 48 |
| 3.11 | FML specimens in the hot water bath at 80°C  | 48 |
| 3.12 | Dimension of the specimen for tensile test   | 50 |
| 3.13 | Dimension of the specimen for flexural test  | 50 |
| 3.14 | Dimension of the specimen for compression test   | 51 |
| 3.15 | Dimension of the specimen for short beam test  | 51 |
| 3.16 | Dimension of the specimen for fatigue test   | 52 |
| 4.1  | Longitudinal cut section of the F/FS+S coupon indicating the bonding between the metal and composite layer | 53 |
| 4.2  | Tensile stress-strain curve for FML(S) and FML(S+S)  | 55 |
| 4.3  | Tensile properties of FML(s) and FML(S+S) (a) Tensile strength and (b) Tensile modulus                     | 55 |
| 4.4  | Tensile failure in FML(S) (a) F/F and (b) F/S  | 57 |
| 4.5  | SEM images of tensile failure in FML(S) (a) F/F and (b) F/S  | 58 |
| 4.6  | SEM images of tensile failure in FML(S+S) (a) F/F, (b) F/S and (c) S/S                                     | 58 |
| 4.7  | Flexural stress-strain plot for FML(S) and FML(S+S)  | 59 |

|      |  |    |
|------|--|----|
| 4.8  | Flexural properties of FML(S) and FML(S+S) (a) Flexural strength and (b) Flexural modulus                                    | 60 |
| 4.9  | Flexural failure in FML(S) (a) S/S (b) S/F   | 60 |
| 4.10 | Flexural failure in FML(S+S) (a) S/S (b) S/F   | 61 |
| 4.11 | Compressive strength of FML(S) and FML(S+S)  | 61 |
| 4.12 | Buckling failure under compression in (a) FML(S)-F/F, (b) FML(S)-S/S and (c) FML(S+S)-F/F and (d) FML(S+S)-S/S               | 62 |
| 4.13 | SEM image of compression failure in FML(S+S) (a) F/F and (b) S/S   | 63 |
| 4.14 | Short beam test results of FML(S) and FML(S+S) (a) Maximum load and (b) ILSS   | 63 |
| 4.15 | Fractured FML(S) specimens from the short beam test (a) F/F and (b) F/S  | 64 |
| 4.16 | Fractured FML(S+S) specimens from the short beam test (a) F/F and (b) F/S  | 64 |
| 4.17 | A batch of FML specimens after 120h of exposure (a) FML(S-h) (b) FML(S+S-h)  | 65 |
| 4.18 | De-bonding and delamination in hygrothermally conditioned FML (a) FML(S-h) and (b) FML(S+S-h)                                | 65 |
| 4.19 | Voids in fabricated FML(S+S) specimen a) F/F at 20x magnification and b) Al/composite interface of F/F at 300x magnification | 66 |
| 4.20 | Thickness swelling characteristic a) FML(S-h) and b) FML(S+S-h)  | 67 |
| 4.21 | Tensile stress-strain plot for FML(S-h) and FML(S+S-h)   | 68 |
| 4.22 | Tensile strength (a) FML(S-h) and (b) FML(S+S-h)   | 69 |
| 4.23 | Tensile modulus (a) FML(S-h) and (b) FML(S+S-h)  | 69 |
| 4.24 | Tensile failure in FML(S-h) (a) F/F and (b) S/S  | 71 |
| 4.25 | Tensile failure in FML(S+S-h) (a) F/F and (b) S/S  | 71 |
| 4.26 | Flexural stress-strain plot for FML(S-h) and FML(S+S-h)  | 72 |
| 4.27 | Flexural strength (a) FML(S-h) and (b) FML(S+S-h)  | 72 |
| 4.28 | Flexural modulus (a) FML(S-h) and (b) FML(S+S-h)   | 73 |
| 4.29 | Flexural failure in a hygrothermally exposed FML   | 73 |
| 4.30 | Hygrothermally exposed FML specimens after flexural test   | 74 |

|      |   |    |
|------|---|----|

# CHAPTER 1

## INTRODUCTION

### 1.1 Background

Fibre metal laminate (FML) is an advanced hybrid material that consist of thin sheets of high strength Aluminium alloy (Al) alternatively bonded with the fibre reinforced composite prepregs as shown in Figure 1.1 (Asundi & Choi, 1997). A fibre prepreg is made up of a fibres or fibre fabric impregnated with liquid polymer resin (Saunders, Dickson, Singh, Carmichael, & Lopata, 1988). The prepregs used in aircrafts are made up of epoxy resin and is normally stored in a freezer below 0 °C. Prior to the fabrication, it should be allowed to reach room temperature which in turn gives a sticky texture.

**Figure 1.1: 3/2 layup of FML** (Lopes, Remmers, & Gürdal, 2008)

FML was invented in the Delft University of Technology, Netherlands and patented by Schijve, Vogelesang and Marissen. The first successfully produced FML was based on the aramid fibre prepreg named as ARALL by the Faculty of Aerospace Engineering Delft University of Technology. ARALL was then commercialized by ALCOA in 1984. FML has been widely used in aircraft structures due to their advantages like excellent damage tolerant characteristics such as the longer fatigue life, impact resistance, high strength to weight ratio along with the reduced moisture absorption compared to the composites (Sinmazçelik, Avcu, Bora, & Çoban, 2011). In the initial stages of development, ARALL found applications in the wing structure of F-27 and Fokker 50 and in the C-17 cargo door (Vlot & Gunnink, 2011). Other commercially available FML materials such as CARALL and GLARE are made up of carbon (C) and glass (G) fiber based prepreg sandwiched between Al sheets (Muthukumar

Chandrasekar et al., 2018). Over the years, ARALL has been replaced by GLARE in the wing structures and it was also used in the fuselage, passenger floors and cargo barriers of the aircraft (Vlot & Gunnink, 2011). Applications for CARALL include helicopter struts and aircraft seats (Sinmazçelik et al., 2011). The general production process of FML involves stacking of the metal and prepregs together and curing under the vacuum and high temperature using an autoclave. The combined effect of temperature and pressure allows the excess resin to flow out and consolidates the plies to obtain FML with least amount of voids (Romli et al., 2017). The mechanical properties of FML highly depend on the constituent's individual properties. Variants of FML can be obtained by the use of different alloy grades and various fibre architectures according to the strength requirements of an application. The most commonly used aerospace grade Al alloy in FML include 2024-T3, 7075-T6 and 6061-T6 sheets of thickness 0.2 - 0.5mm.

The interfacial bonding characteristic between the metal/composite plies is one of the main factors influencing the mechanical properties and failure behavior of FML. The smooth surface of Al substrate results in poor interfacial adhesion with the composite plies. Thus, surface treatment of Al prior to the fabrication of FML has been performed. Al substrate to be bonded with composite ply is surface treated by various techniques such as mechanical abrasion, coupling agents, electrochemical and dry surface treatments which ensure good interfacial adhesion.

The aircraft structures are subjected to the static loads like tensile, flexural, compressive, impact and fatigue loading during its lifetime (Almeida, Damato, Botelho, Pardini, & Rezende, 2008). The aircraft also operates in different weather conditions and altitudes with a varying temperature range between -55°C and 70°C. The environmental factors such as temperature, humidity and radiation could also affect the material properties (Ypma & Boronje, 2013).

Vast amount of research works on CARALL, GLARE and ARALL could be found in the literature (Afaghi-Khatibi, Lawcock, Ye, & Mai, 2000; Fan, Guan, & Cantwell, 2011; Kawai, Hachinohe, Takumida, & Kawase, 2001; Khan, Alderliesten, & Benedictus, 2009; GD Lawcock, Ye, Mai, & Sun, 1998; Linde, Pleitner, de Boer, & Carmone, 2004; Mahesh & Senthil Kumar, 2013; Ritchie, Yu, & Bucci, 1989; Rodi & Benedictus, 2010; Schijve, 1993; Shim, Alderliesten, Spearing, & Burianek, 2003; Takamatsu, Matsumura, Ogura, Shimokawa, & Kakuta, 1999; Vašek, Polak, & Kozak, 1997; C. A. J. R. Vermeeren, 1990; G. Wu & Yang, 2005). The factors governing the mechanical properties and failure behavior of FML has been well documented till date. In the past few years, natural fibre reinforced FML has been emerging as a new class of material with the research works on FML has been focused on the use of natural fibres like kenaf (Mohammed et al., 2018; L. F. Ng, Sivakumar, Zakaria, Bapokutty, & Sivaraos, 2017; Lin Feng Ng, Sivakumar, Zakaria, & Selamat, 2017; Sivakumar, Ng, & Selamat, 2017), oil palm (Dhar Malingam, Selamat, Said, & Subramonian, 2016), flax (Afaghi Khatibi, Kandare, & Yoo, 2016; Kandare, Yoo, & Afaghi Khatibi, 2016), sisal (Vieira, dos Santos, Panzera, Rubio, & Scarpa, 2017), jute (Vasumathi & Murali, 2016a), etc.

## 1.2 Problem statement

GLARE, CARALL and ARALL are synthetic fibre based thermoset materials. These synthetic thermoset based materials have limitations due to environmental impacts such as difficulties in recycling, lower degradability, disposal requirements and emission of greenhouse gases associated with the production of synthetic fibres (Pervaiz & Sain, 2003; Ribeiro et al., 2016; Roberts, 2011). Also, widespread application of synthetic fibre reinforced composites in various industrial applications like construction, automobile, wind energy, etc. has led to increase in demand for the synthetic fibres (Beauson, Lilholt, & Brøndsted, 2014; Zaman, Gutub, & Wafa, 2013). These aspects have urged the researchers and manufacturers to focus on the environmentally friendly and cost effective materials which could substitute the synthetic materials. Use of natural fibres in FML could be a promising solution. The research on pure natural fibre based FML and natural/synthetic fibre based FML has been gaining increased attention among the researchers as mentioned in section 1.1. However, till date, the literature on natural fibre based FML is very limited.

Natural fibres have advantages like low density, biodegradability and they are abundantly available (Muralidhar, 2013; J. Sahari, S. Sapuan, E. Zainudin, & M. A. Maleque, 2013; Yan, Chouw, & Jayaraman, 2014). However, the natural fibre and their composites have inferior strength compared to the synthetic fibre and their composites (Begum & Islam, 2013). So, one way to eliminate this limitation is to hybridize with other fibres (Gupta & Srivastava, 2016). Hybrid composites based on the synthetic/natural fibres possess good mechanical properties and they could be implemented in the high performance applications (Jawaid & Khalil, 2011). In this research, flax and sugar palm fibres have been chosen as reinforcements. Among the natural fibres, flax has superior strength and modulus equivalent to E-glass fibres (Céline, Fréour, Jacquemin, & Casari, 2013; Kabir, Wang, Lau, & Cardona, 2012; Phillips, Baets, Lessard, Hubert, & Verpoest, 2013). This makes them a potential candidate for the high performance applications. On the other hand, sugar palm fibres have lower density and are suitable for reinforcement in the composite materials. Since sugar palm is a native crop of Malaysia, their use as reinforcement in composites and FML could be of benefit to the financial point of view in generating income, business opportunities and various products. The fibres can also be extracted without cutting the tree, thereby no damage to the environment (Ishak et al., 2013). To date, sugar palm fibres were not used as reinforcements in FML and their mechanical properties remain unexplored. In order to determine their response to various mechanical loads and their failure behavior under such loads, it is necessary to assess their mechanical performance under various loads.

Interfacial bonding between the metal alloy and the composite ply is crucial for the overall performance of the material. Lack of sufficient bonding between the metal and the composite layers can lead to the delamination and pre-mature failure. Ostapiuk et al fabricated CARALL without any metal surface treatment and found that there was no bonding between the metal layer and the prepregs after curing as shown in Figure 1.2 (Ostapiuk, Surowska, & Bienias, 2014). Similar observation on GLARE was reported by Benedict in his thesis work. GLARE coupons manufactured without any surface preparation displayed delamination post curing while a simple sandblasting of Al

helped in bonding (Benedict, 2012). This implies that smooth surface of Al cannot ensure good bonding with the prepreg.

**Figure 1.2: Delamination between the metal/prepreg in FML with smooth metal surface without any treatment (Ostapiuk et al., 2014)**

Thus, surface preparation of Al before the fabrication process is an important prerequisite. Various metal surface treatment techniques have been used by the researchers and aircraft manufacturers to achieve good interfacial bonding. Those include mechanical abrasion, chemical etching, electrochemical treatment and use of coupling agents (Sinmazçelik et al., 2011).

FML has superior resistance to the combined effect of moisture/temperature due to the presence of Al on the top and bottom surface and it acts as a barrier. The moisture can seep through these damages, micro-cracks, holes, gaps and free edges and this could lead to deteriorating effect on the mechanical properties of FML. A number of research works on the effect of combined moisture/temperature on mechanical properties of the synthetic fibre reinforced FML could be found in the literature. In most of the studies, GLARE and CARALL has been exposed to the freezing temperature (below 0 °C to cryogenic temperature) and hygrothermal conditions (70 °C - 80 °C). Both GLARE and CARALL displayed marginal decrease in the mechanical properties due to these conditions. However, hygrothermal conditioning could have much higher impact on the performance of natural fibre based FML. This is because of the hydrophilic nature of the natural fibres which are susceptible to degradation under hygrothermal conditions (Scida, Assarar, Poilâne, & Ayad, 2013). As per the researcher's knowledge, none of the studies exist on the degradation effects of natural fibre based FML exposed to the freezing temperature and hygrothermal conditions. Hence, it is necessary to understand the impact of such factors on the mechanical properties of the natural fibre based FML.

### 1.3 Research objectives

The general aim of this research is to fabricate and evaluate the mechanical properties of FML with carbon prepreg, flax and sugar palm fibres under various conditions. The study involves the following objectives:

1. To investigate the influence of surface treatments of Al and natural fibre stacking sequence on the mechanical properties of FML.
2. To study the influence of hygrothermal conditions on the physical/mechanical properties and failure behavior of the fabricated FML.
3. To determine the effect of sub-zero temperature on the physical/mechanical properties and failure behavior of the fabricated FML.
4. To study the fatigue properties of unexposed, hygrothermal and sub-zero conditioned FML.

#### **1.4 Scope and Limitations of the study**

The main novelty of the study is credited to the fabrication and characterization of FML with flax and sugar palm fibres through the experimental approach. Variants in FML with pure flax, pure sugar palm, and hybrid combination with flax/sugar palm in the outer layer/core and vice-versa are fabricated by the hand layup and hot press technique. The metal surface has been prepared by sanding as a stand-alone process and sanding & silane surface treatments. Their mechanical properties such as tensile, flexural, compressive, inter-laminar shear and fatigue properties are determined before and after the exposure to the hygrothermal and sub-zero conditions. Hygrothermal conditioning is performed in a water bath at 80 °C for 120 h and sub-zero conditioning was carried out in a freezer at -40 °C for 72 h. The failure behavior is discussed with visual images and scanning electron microscope (SEM) images to understand the failure behavior and changes to microstructure due to the conditioning.

In this research, flax and sugar palm fibre reinforcements are used in FML. Flax fibres are readily available in long fibres, mat and chopped form for reinforcement in the composites as well as in prepreg form impregnated with the epoxy resin from Lineo™, France (Lineo). However, the price range for the material is between 1000 EUR – 2000 EUR for 30 - 60 m<sup>2</sup> roll excluding the excise duty and equivalent to the price of synthetic fibres. Despite of their higher cost, the superior strength and modulus offered by the flax fibres is the driving factor for their use in this research. Thus, with the availability of natural fibre based prepregs at low cost, this limitation could be addressed. Due to the unavailability of sugar palm fibre based prepreg, flax and sugar palm reinforced epoxy composite plies are used for the purpose of consistency and comparison. The objective of the research work is to develop an environment friendly FML without compromising the strength requirements.

#### **1.5 Thesis layout**

Chapter 1 presents the concept of FML, historical development and their current applications. The problems associated with the present material, current research focus, objectives and scope of the study are further discussed.

Chapter 2 provides a detailed literature and critical review on the factors influencing the mechanical properties of FML within the scope of the study. The response of FML to various loads and its failure behaviour under the various conditions are explained.

Chapter 3 covers the details on materials and methodology followed in the fabrication and testing. Material specifications, fabrication procedure, metal surface treatment techniques, exposure conditions, parameters such as dimensions, cross head speed and properties assessed in each testing method has been provided.

Chapter 4 contains the results, observations and discussions from the study. A comparison of the obtained material properties and failure behaviour with the existing literature on the natural fibre reinforced FML and synthetic fibre based FML are made.

Chapter 5 concludes the study with research findings and recommendations for the future research.

## **1.6 Contribution of the Thesis**

The research contributions from the present study are as follows:

- Use of flax and sugar palm fibres in combination with the Al/adhesive layer/carbon to fabricate hybrid FML.
- Fabrication of the 2/1 lay-up hybrid FML with hand lay-up and hot press technique.
- Examine the effect of fibre stacking sequence and metal surface treatment on the mechanical properties of hybrid FML.
- Identify the extent of degradation effects on physical and mechanical properties of hybrid FML due to the hygrothermal conditioning and sub-zero exposure.
- Determine the possibility of using hybrid FML with the natural/synthetic in structural applications of the aircraft.

## BIODATA OF STUDENT

Chandrasekar Muthukumar was born in Cuddalore, Tamilnadu, India. He completed his primary and secondary education in St.Paul's Matriculation Higher Secondary School, Neyveli, Tamilnadu, India. His higher secondary education was from the Ideal Higher Secondary School, Andhiyur, Tamilnadu, India. The author graduated with Bachelor degree in Aeronautical Engineering from Kumaraguru College of Technology, Coimbatore, Tamilnadu, India. He then pursued joint Master's degree in Aerospace Engineering from Nanyang Technological University-TUM ASIA, Singapore. He is presently enrolled as a full-time research scholar in Department of Aerospace Engineering, Faculty of Engineering, Universiti Putra Malaysia, Serdang 43400, Selangor, Malaysia. During his PhD, the author has published book chapters, national level seminar papers, review papers and research articles.
