SALIVARY PROGESTERONE AS A BIOCHEMICAL MARKER TO PREDICT PRETERM BIRTH IN ASYMPTOMATIC HIGH RISK WOMEN

Dissertation submitted to The Tamil Nadu Dr.M.G.R Medical University

In partial fulfillment for the award of the Degree of

M.S. (OBSTETRICS AND GYNECOLOGY) BRANCH II

THE TAMIL NADU Dr.M.G.R MEDICAL UNIVERSITY INSTITUTE OF OBSTETRICS AND GYNAECOLOGY, GOVT WOMEN AND CHILDREN HOSPITAL, MADRAS MEDICAL COLLEGE AND RESEARCH INSTITUTE.

APRIL - 2017

BONAFIDE CERTIFICATE

This is to certify that this dissertation entitled "SALIVARY PROGESTERONE AS A BIOCHEMICAL MARKER TO PREDICT PRETERM BIRTH IN ASYMPTOMATIC HIGH RISK WOMEN" is the bonafide work done by Dr.MAHALAKSHMI.M., post graduate in obstetrics and gynaecology under my overall supervision and guidance in the institute of Obstetrics and Gynaecology, GOVT Women and Children Hospital, Madras medical college Chennai, in partial fulfillment of the requirements of The Tamil Nadu Dr.M.G.R University for the award of M.S DEGREE in Obstetrics and Gynaecology

DECLARATION

I, Dr. M. Mahalakshmi, solemnly declare that the dissertation titled, **"SALIVARY PROGESTERONE AS A BIOCHEMICAL MARKER TO PREDICT PRETERM BIRTH IN ASYMPTOMATIC HIGH RISK WOMEN"** has been done by me. I also declare that this bonafide work or part of this work was not submitted by me for any award, degree, diploma to any other university either in India or abroad.

This is submitted to The Tamil Nadu Dr.MGR medical University, Chennai in partial fulfillment of the rules and regulations for the award of M.S Degree (Obstetrics and Gynaecology) held in April 2017.

Place:

Date:

Dr. M. MAHALAKSHMI

ACKNOWLEDGEMENT

I thank God, the Almighty for giving me this golden opportunity to do my postgraduate course in Obstetrics and Gynecology.

I gratefully acknowledge and sincerely thank Dr.M.K.Muralidharan.MS.,MCh.,, Dean, Madras Medical College and Research Institute, Chennai and Dr.S.Baby Vasumathi, M.D., D.G.O., Director and Superintendent, Institute of Obstetrics and Gynaecology, for granting me permission to utilize the facilities of the institute for my study.

I am extremely grateful to our Professor, **Dr. S. Usharani, M.D., D.G.O.,DNB.,** Institute of Obstetrics and Gynaecology, Govt Women and Children hospital, Egmore, Chennai for her motivation, guidance and encouragement given in fulfilling my work.

I thank the former Director of Institute of Obstetrics and Gynaecology, GOVT Women and Children hospital, **Dr.Umashanthi**, **M.D., D.G.O.**, for her valuable guidance.

I thank **Dr. Ramadevi.MD.,** Professor and Head of the Department of Biochemistry, Institute of Biochemistry, Madras medical college, Chennai for granting me permission to do the ELISA test in our Biochemistry laboratory.

I thank **Dr.C.Mythili. MD.**, Assistant Professor of Biochemistry, Institute of Biochemistry, MMC for her valuable guidance in doing the assay.

My sincere thanks to **Dr.N.Mohanram**, **MDRD.**, for his guidance and valuable suggestions which helped me in this assignment.

I am immensely happy to thank **Mr. Padmanaban**, Statistician for helping me in analyzing the results of my study.

I am very grateful to all the patients who have been my main source of learning.

CONTENTS

Introduction

1. INTRODUCTION

Preterm birth is defined as birth between the age of viability and 37 completed weeks of gestation. It includes deliveries between 24 to 36 weeks and 6 days gestation and also includes all births with birth weight above 500gms. The incidence varies from 5% to 8% among most developed and developing countries. Infants between 34 and 36 weeks account for approximately 75 percent of all preterm births.

Preterm birth cause an increased perinatal mortality, long term morbidity and affects health economics. India has the highest number of preterm births and deaths in the world.

The four main reasons for preterm birth are:

- Induction of labor for fetal or maternal causes or the infant is delivered by caesarean delivery before onset of labor – 30 to 35%
- 2. Idiopathic preterm labour with intact membranes -40 to 45%
- 3. Idiopathic preterm premature rupture of membranes -30 to 35%
- 4. Higher order pregnancy. (ovulation induction)

Aims and Objectives

2. AIM OF THE STUDY

To evaluate salivary progesterone as a predictor of preterm birth and compare it with transvaginal cervical length in asymptomatic high risk women.

Overview

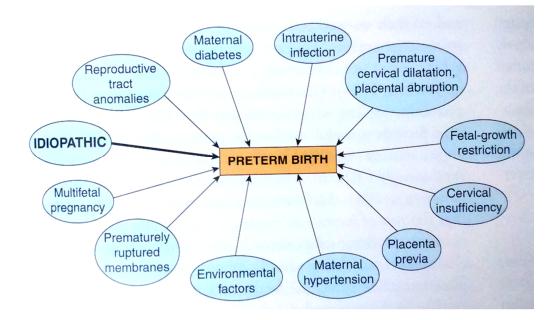

3. OVERVIEW

DEFINITION

Preterm labour is defined as the onset of regular, painful, frequent, uterine contractions causing progressive effacement and dilation of cervix from the period of viability and earlier than gestational age of 37 completed weeks.

RISKS FOR PRETERM BIRTH

Idiopathic preterm birth is the most common cause of preterm birth . Other factors are PPROM, genetic, infection, nutrition, behaviour and the environment.

ANTECEDANTS AND CONTRIBUTING FACTORS FOR PRETERM BIRTH

1. Threatened abortion

Vaginal bleeding in early pregnancy (6 to 13 weeks) were associated with subsequent preterm labor. (Weiss and associates, 2004).

2. Social factors

Lower socioeconomic status, Smoking, less weight gain in pregnancy, advancing maternal age, short stature, certain drugs and deficiency of vitamin C increases the risk of preterm labor.

3. Racial - Ethnic factors

African –American and Afro-caribbean are at higher risk of preterm deliveries (Goldenberg and colleagues, 2008b).

4. Work during pregnancy

Occupational factors like prolonged standing or walking, strenuous work and long weekly hours increases the rsk of preterm labor. (Casnueva, 2005 and all their colleagues).

5. Genetic Factors

Chorioamnionitis is potentiated by immunoregulatory genes in cases of preterm delivery due to infection (varner and Esplin, 2005).

6. Periodontal disease

Periodontal disease increases the risk of preterm birth- odds ratio 2.83 (Goepfert and co-workers, 2004)

7. Birth defects

Congenital anomalies were associated with preterm birth and low birth weight. (First trimester evaluation of risk (FASTER) trial, Delan and colleagues, 2007).

8. Interval between pregnancies

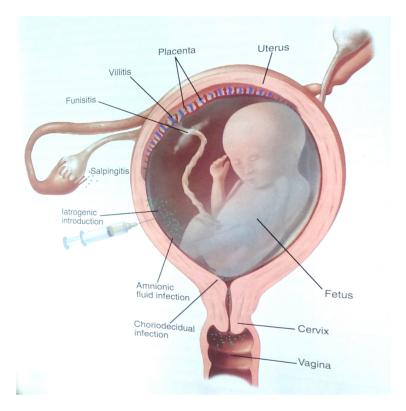

Interpregnancy interval lesser than 18 months and more than 59 months has increased risk of preterm birth (Conde-Agudelo, co-workers, 2006)

9. Prior preterm birth

| Recurrent spontaneous preterm births according to prior outcome | | | |
|---|-----------------------------------|--|--|
| Birth outcome | Second birth ≤34 weeks in percent | | |
| First birth ≥35 weeks | 5 | | |
| First birth ≤34 weeks | 16 | | |
| First and second birth ≤34 weeks | 41 | | |
| Data from 15.692 warman delivaring their first and subsequent programation at | | | |

Data from 15,683 women delivering their first and subsequent pregnancies at Parkland Hospital. Adapted from Bloom and associates (2001) with permission

10. Infection

25-40% of preterm birth is contributed by intrauterine infection.

The two microorganisms implicated , ureaplasma urealyticum and mycoplasma hominis, induce release of inflammatory cytokines like interleukins and tumour necrosis factor (TNF). This in turn, stimulate the production of prostaglandin which stimulates uterine contraction and/or matrix degrading enzymes which results in preterm prelabor rupture of membranes.

11. Bacterial Vaginosis

It leads to preterm labor, preterm prelabour rupture of membranes, chorio amnionitis and amniotic fluid infection (Hiller,1995; larki,1992; Leitich,2003 a,b, and all their colleagues). Chronic stress, ethnic differences and frequent douching cause bacterial vaginosis (Culhane and co-workers, 2002, Ness and associates, 2002)

12. Medical Disorders

Anaemia, liver disease, asthma, hypertensive disorder, renal disease, tuberculosis, cardiac disease, diabetes, hyperthyroidism, malaria, hyperpyrexia also cause preterm birth.

13. Iatrogenic

Elective premature induction due to fetal or maternal indication. Induction with wrong estimation of gestational age also contribute to preterm birth.

14. Miscellaneous

Abdominal surgeries during pregnancy, severe trauma and drugs like quinine increases the risk of preterm birth.

PREDICTORS OF PRETERM BIRTH:

A. WARNING SIGNALS:

- Menstrual like cramps
- Dull low backache
- Abdominal cramps
- Sense of pelvic pressure or heaviness in the vagina,
- Glairy mucoid vaginal discharge

B. TRANSVAGINAL SONOGRAPHY

The application of transvaginal sonography for cervical length has emerged as a recommendation by the American college of Radiology.The cervical length <2.5cm, funneling or widening of cervical canal, (Y, V, U shape), bulging of membranes in cervical canal and thinning of lower uterine segment can be identified..

C. BIOCHEMICAL MARKERS:

1. Fetal fibronectin:

It is a glycoprotein produced by hepatocytes, fibroblast, endothelial cells, and fetal amnion. It is present in amniotic fluid and the extra villous tropho decidual interface. The substance is present in cervicovaginal fluid before 20 weeks of gestation, and reappear only after spontaneous rupture of membranes at term. Fetal fibronectin level of >50 ng/ml estimated by

ELISA is considered as a positive predictor of preterm labour. This test has high sensitivity and high negative predictive value .

- 2. Salivary estriol: values more than 2.3ng/ml predicts preterm labour.
- 3. Serum collagenases.
- 4. Tissue inhibitor of metalloproteinase (TIMP)
- 5. Ferritin/ Iron ratio
- 6. Relaxin.
- 7. Serum triglycerides.
- 8. Corticotrophin releasing hormone (CRH).
- 9. Mediators of inflammation and infection.
 - a. C-Reactive Protein.
 - b. Leucocyte esterase.
 - c. Cytokine.
 - d. Amniotic fluid glucose concentration.
 - e. Zinc.
 - f. Lipocortin-I.
 - g. Positive cultures.
- 10. Salivary progesterone.

D. HOME UTERINE ACTIVITY MONITORING:

Contractions are recorded by telemetry twice a day. It is costly and not an easily available equipment. However it is not useful in reducing the incidence of preterm labour.

E. FOETAL BREATHING MOVEMENT:

Patients are likely to go in preterm labour within 48 hours, if absent fetal breathing movements are detected in real time ultrasonogram.

F. RISK SCORING SYSTEM:

Papiemick (1974) used an elaborate scoring system for detection of patient more prone for spontaneous preterm labour which was later, modified by Creasy et al. Those with 10 or more scores were more prone for preterm labour.

ACOG CRITERIA:

ACOG (1997) criteria to diagnose preterm labour:

Contractions of 4 in 20 minutes with progressive change in the cervix,

Cervical dilation more than or equal to 1cm,

Cervical effacement more than or equal to 80%

PREVENTION OF PRETERM BIRTH:

- 1. Improving the socioeconomic condition.
- 2. Patient education and prepregnancy counseling regarding warning signals.
- 3. Identifying and correcting risk factor whenever possible-1.Proper nutrition, 2. Avoid smoking, alcohol, 3. Adequate rest-avoidance of physical and mental stress, 4. Control of medical diseases, 5. Cervical encirclage in proved case of cervical incompetence.
- 4. Any operation in pregnant woman to be planned during second trimester.
- 5. Proper assessment before induction of labour to avoid iatrogenic prematurity.
- 6. Treat vaginal and cervical infections and asymptomatic bacteriuria in pregnancy .
- 7. Coitus, late in pregnancy should be avoided.
- 8. Prophylactic tocolysis is not indicated.
- 9. Cervical Encerclage A short cervix diagnosed by ultrasound in asymptomatic women might be an indication for cerclage.
- 10.Progesterone- Weekly intramuscular injection of 250mg of 17-OH progesterone caproate from 20 to 36 weeks, to high risk women lowered the rates of preterm birth and perinatal mortality when compared to placebo.

DIAGNOSIS OF PRETERM LABOUR

- 1. Symptoms of preterm labour.
- 2. Clinical examination.
- 3. Ultrasonogram.
- 4. Cardiotocograph

MANAGEMENT OF PRETERM LABOUR

1. Bed rest, hydration

2. Antenatal steroid

12mg of betamethasone- 2 doses of intramuscular injections 24 hours apart or 6mg of dexamethasone - 4 doses of intramuscular injections 12 hours apart can be given between 24 and 34 weeks of gestation to all women who are prone for preterm delivery within 7 days.

3. Tocolysis

Tocolytics are the drugs which inhibit uterine activity. They are

a. **BETA SYMPATHOMIMETICS**

The inhibition of uterine contractions by this drug is short lived.

I generation: Isoxsuprine, orciprenaline, Isoprenaline

II generation: Ritodrine, Terbutaline, Fenoterol

b. MAGNESIUM SULPHATE

MgSO₄ acts by uncoupling the depolarization contraction coupling (Elliott, 1983)

Therapeutic level is 4-8mmol per liters.

c. PROSTAGLANDIN SYNTHETASE INHIBITORS

Drugs like aspirin, indomethacin are used to prevent preterm labour in patients with cardiac disease and hyperthyroidism. They are not routinely used because of fear of PDA closure and pulmonary hypertension in fetus.

d. CALCIUM CHANNEL BLOCKERS

Nifedipine act by inhibiting the influx of extracellular calcium and release of intracellular calcium from the sarcoplasmic reticulum during inward calcium current of action potential, reducing the tone of smooth muscles.

e. OXYTOCIN ANTAGONIST (ATOSIBAN)

This oxytocin analogue competitively blocks the oxytocin receptors and inhibits preterm labour. RCOG guidelines says that if tocolytics is administered, the first choice should be oxytocin antagonists followed by Nifedipine.

IMMEDIATE CONSEQUENCES OF PRETERM LABOUR

Perinatal mortality:

Preterm labor accounts for 85% of deaths in structurally normal

infants.

The survival rates for preterm babies in India are as follows:

| 26-30 Weeks | - | 67% |
|-------------|---|-------|
| 30-34 Weeks | - | 75% |
| 34-38 Weeks | - | 94.3% |

Neonatal morbidity:

The incidence of morbidities in Indian studies are

- 1. Respiratory Distress Syndrome80%
- 2. Patent Ductus Arteriosus 50%
- 3. Intraventricular haemorrhage 31.5%
- 4. Retinopathy of Prematurity 25.2%

Hypothermia and hypoglycemia are common problems in preterm babies. Other major problems related to preterm delivery include intraventricular hemorrhage, periventricular leucomalacia and retinopathy of prematurity.

LONG TERM CONSEQUENCES OF PRETERM LABOR

Cerebral palsy, intellectual impairments and behavioral problems are more frequent in preterm babies.

Refractive errors and strabismus are also common. Deafness occur in 1.5-9% .

There is poor feto-maternal bonding due to the psychological and physical stress it puts. Newborn with membrane disease or who required assisted ventilation may develop chronic pulmonary disease. Infants delivered preterm are more prone for hospitalization in the earlier ages of life. Preterm male infants frequently have inguinal hernia.

Dogye and colleagues (1994) reported that only 20% of preterm infants were actually free of impairment at 5 years of age

ECONOMIC CONSIDERATIONS

The cost of acute hospital care for preterm infants is very high. Antenatal care for these mothers may prove costly as many of them have obstetrical complications. The long hospital stay adds to the economic burden.. After discharge from the hospital, the health care and social service system continue to incur substantial costs for the special needs and special education for these children, more so with long term morbidity. Added to this, the loss of productivity on the part of the parents also increases the economic burden.

Review of Literature

4. REVIEW OF LITERATURE

Prematurity is the most common cause of neonatal and infant mortality and morbidity. The preterm newborns pose a major financial burden. It is for these reasons, strategies for prediction and prevention of preterm labor is necessary. Several biological, clinical and sonographic markers have been suggested as tools for predicting preterm labor. The tested biological markers included cervico-vaginal fetal fibronectin level, human chorionic gonadotropin (hCG) level and serum corticotropin releasing hormone (CRH). Most of these tested markers lack either acceptable validity or feasibility and availability. So a quicker, cheaper, simpler test with greater accuracy for predicting preterm labor is needed, so that one can avoid unnecessary tocolysis and take appropriate intervention or refer earlier to a tertiary care centre.

Goldenberg and colleagues (2008b) related pathogenesis of preterm labour to

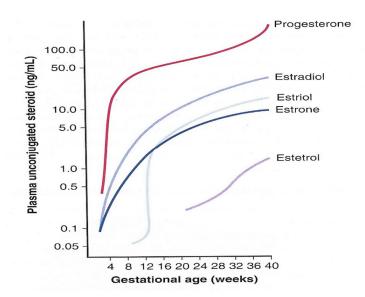

- 1. Withdrawal of Progesterone
- 2. Initiation of Oxytocin
- 3. Activation of decidua.

Role of Progesterone in parturition

The studies conducted in sheep supports progesterone withdrawal theory.

After 6-7 week gestation, the ovary produces very little progesterone (Diczfalwey and Troen, 1961).

After 8 weeks, the placenta secretes progesterone, and there is a progressive increase in serum progesterone levels. About 250mg of progesterone is produced daily in late pregnancy.

The Placental trophoblast produces a large amount of progesterone utilizing maternal plasma cholesterol (Hellig and associates,1970), preferentially LDL cholesterol (simpson and Burkhart, 1980) During pregnancy, the concentration of 5α -dihydro progesterone in the plasma increases disproportionately. It is synthesized by syncytiotrophoblast from precursors got from fetus. (Dombroski and coworker, 1997). This increase in the progesterone metabolite and progesterone causes resistance to pressor agents in pregnancy.

The fall in progesterone level directly precedes the progression of uterine quiescence and cervical competence into uterine activation and cervical ripening of parturition in many species. Supplementing progesterone delays parturition by decreasing the uterine activity and continued maintenance of competency of cervix. (Challis and Lye, 1994). Thus the progesterone deficient myometrium is quiescent.

Teleological evidence reveals that an increased ratio of progesterone to estrogen is necessary for sustaining the pregnancy and that a fall in the progesterone to estrogen ratio results in parturition.

The estrogen acts to promote progesterone responsiveness, and thus, promote uterine quiescence. The estrogen receptor acting via the estrogenresponse element of the progesterone-receptor gene, induces progesteronereceptor synthesis.

19

Progesterone increases uterine quiescence by decreasing the expression of contraction-associated proteins (CAPS) and inhibiting the expression of connexin43.

Functional progesterone withdrawal or antagonism occurs through possible ways:

- 1. Alteration in the expression of the progesterone receptor (PR) protein isoforms, PR-A, PR-B and PR-C in the nucleus.
- 2. Alteration in the expression of membrane-bound progesterone receptors.
- 3. Post translation modification of the receptor, specific to progesterone.
- 4. Changes in progesterone receptor activity through variations in the expression of co-activators or co-repressors that directly influence receptor function.
- 5. Inactivation of progesterone by locally produced steroid-metabolizing enzymes.

PR-B moderates progesterone actions, whereas PR-A and PR-C diminutes progesterone responsiveness. Studies show that there is a transferral in the relative ratio of PR-A to PR-B, late in gestation. The ratio of PR-A and PR-B is altered in decidua and chorion. The receptor isoform in the stroma of cervix also showed variations. PR-C to PR-B ratio is increased in fundus.

20

Studies reveal that 5- α reductase type 1 enzymes when expressed, break down progesterone to by products resulting in failure of cervix to ripen. There is an increase in estrogen and decrease in progesterone level, in deficiency of the enzyme, 20- α -hydroxy steroid dehydrogenase. (Prekorz and associates, 2005). Decrease in 17 β -hydroxy steroid dehydrogenase type 2 in the human cervix at term results in a net increase in estrogen and decrease in progesterone. And finally, glucocorticoids also has antiprogestin activity (Karalis and co-workers, 1996).

With the onset of labor, the fetal-adrenal axis gets sensitized to adrenocorticotrophic hormones, and cortisol secretion is stimulated. Placental 17- α hydroxylase activity is potentiated by cortisol. This, in turn reduces progesterone production and increase estrogen production. This altered estrogen/progesterone ratio results in increased prostaglandin formation, thus inducing labor.

Concentrations of steroids in saliva correlates well with their serum concentrations and reflect the free, unconjugated, and, thus, the biologically active portion of the plasma hormone profile.

Advantages of saliva

- Ultrafiltrate of plasma
- Collection is easy
- Storage is easy

Limitation

- 1. Patient activity/posture, food consumption
- 2. Oral lesions, abrasions, gingivitis

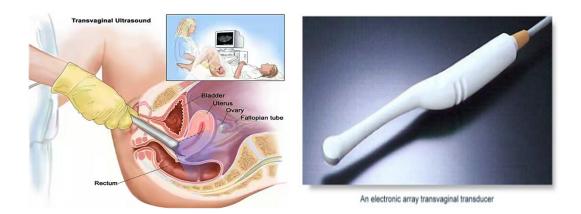

ROLE OF ULTRASONOGRAPHY

The word "cervix" refers to "neck of the womb". It is the distal narrow and cylindrical part of the uterus, which enters the vagina at right angles to it. The ectocervix, the portion projecting into the vagina, also known as "portiovaginalis", is convex and elliptical. It measures 3cm long and 2.5cm wide and opens out through the external os.

The endocervical canal extends between the internal os and the uterine cavity. The internal os is the upper limit of the endocervical canal and opens into the uterine cavity.

TRANSVAGINAL SONOGRAPHY

Transvaginal sonogram can be performed similar to gynaecologic examination. It is simple, cost-effective, reproducible and reliable method to assess and predict the risk of preterm delivery.

Limitations:

- Incomplete or failure to empty the maternal bladder is associated with false measurement.
- Increased pressure on the vaginal probe.
- Any polyp, fibroid, cervical growth, that obscure proper imaging.
- A poorly developed lower uterine segment.

To minimise the intra-observer variability, the below methods are suggested.

The flat dimple or an isosceles triangle seen is the internal os..

The cervix should be visualized as a whole.

The external os gives symmetric appearance.

The distance from the surface of the posterior lip to the cervical canal is equal to the distance from the surface of the anterior lip to the cervical canal.

Trans-vaginal measurement of cervix length.

These conditions when met, ensures visualization of the entire cervix and placement of only minimal pressure on the cervix by the transducer (which may falsely decrease the cervical length and create false funneling. Using these guidelines, the intra-observer variability decreases from 3.04 to 1.24mm.

In primigravida population, the smaller the cervix, they were more prone for preterm labour. However, in the multiparous women, the internal os dilation was a more useful predictor.

Materials and Methods

5. MATERIALS AND METHODS

This prospective study was done in IOG, Egmore, Chennai from January 2015 to March 2016. Informed written consent was obtained from all participants in the study.

Subject selection: They were selected from the AN clinic, IOG

Inclusion Criteria:

- 1. Asymptomatic women with singleton pregnancy with history of previous preterm birth.
- 2. Previous preterm prelabor rupture of membranes.
- 3. Late spontaneous miscarriage (20 to 28 weeks).

Exclusion Criteria:

- 1. Multiple gestation.
- 2. Congenital anomalies of uterus/fetus.
- 3. Antepartum haemorrhage.
- 4. Obstetric complications requiring iatrogenic preterm birth.
- 5. Non -reassuring fetal heart rate pattern.
- 6. Fetal growth restriction.

- Medical disorders like hypertensive disorders of pregnancy, hyperglycemia in pregnancy, renal disorders, cardiac disease, chronic liver disease, vaginal infections, cervical cerclage.
- 8. Medications affecting hormonal concentration-antipsychotics, corticosteroids or progesterone therapy.
- 9. Tocolysis.
- 10. Any addiction-smoking, alcohol.
- 11.Bleeding from the gums.

Screening Procedures/Visits

All AN women recruited were subjected to salivary progesterone estimation at 24 to 28 weeks. At the same time, they were subjected to transvaginal cervical length measurement.

I) Estimation of Salivary progesterone:

Following consent, after overnight fasting, mouth rinsed with water 10 minutes before collecting saliva . A sterile, wide mouthed glass or plastic container was used for collecting samples. 3 unstimulated samples were collected within 2 hours and pooled together. The sample was stored at or below -20° c within 30 minutes until the test.

SAMPLE PROCESSING

Colorless salivary samples without any contaminants like food or blood were collected.

Sample Collection

The container should be made of ultrapure polypropylene. Sample were collected either in the fasting state or after avoiding milk products and food of animal origin. Or else saliva were collected while anticipating a meal. Each sample should be a minimum of 0.5ml.

Sample Storage and Preparation

Saliva samples can be stored for 7 days at ambient temperature. Samples can be stored at at 4^{0} c for a period of up to one month. Samples were stored at a temperature of -20^{0} c. Before proceeding with the test, sample were thawed and centrifuged at least once in order to separate the mucin by centrifugation for atleast 5 – 10 minutes . The clear supernatant layer was be used for assay.

Dilution of Specimen

The highest calibrator was (5000 pg/ml).Samples suspected to have greater progesterone concentrations than the highest calibrator was diluted with the zero calibrator.

METHOD OF ASSAY

General instructions

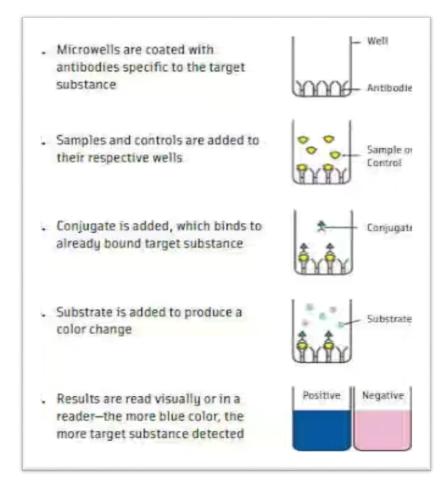

- All samples and test kits were brought to room temperature and mixed in such a way to avoid foaming.
- The entire procedure was carried out uninterruptedly.
- Separate disposable pipette tips were used for each reagents and samples.
- Since absorbance depends on the incubation time and temperature, all containers were kept open and pipette kept ready before starting the procedure.

Steps

- 1. A sufficient microplate wells to accommodate calibrators, controls and patient samples were prepared.
- 2. The wells were filled appropriately with control, sample and 100 microlitres of each calibrator..
- 3. 50 microlitres of enzyme conjugate were pipetted into the wells.
- 4. The microplate well was placed on a mixer and incubated at room temperature for 60 minutes.
- 5. The content in the wells were discarded and the wells rinsed with diluted wash solution atleast 4 times. The wash solution was removed with absorbent paper completely.

- 6. 200 microlitres of substrate solution was added to each of the well.
- 7. Incubated in the dark for 30 minutes without shaking.
- 8. Later, stop solution was added to each well in a quantity of 50 microlitres.
- 9. The absorbance was read within 15 minutes at 450 nm
- 10.Results got in absorbance units were used to draw a standard curve and the concentration of progesterone in each sample got from the calibrator curve.

STEPS OF ELISA TEST

II. Determination of cervical length:

Measurement was done with the patient in dorsal position and with empty bladder by introducing the probe into the anterior fornix. 3 measurements were taken and the shortest measurement was recorded.

I) Follow up:

Salivary progesterone estimation was done again between 29 – 32 weeks.. Cervical length measurement was also done at the same time. They were followed up regularly. Post delivery, records were verified for mode of delivery, gestational age at delivery, neonatal outcome and admission to NICU. Mother and newborn were followed up till discharge.

Analysis of Results

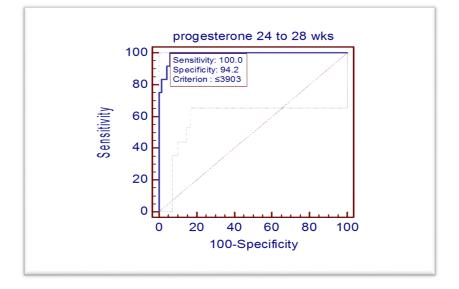

6. ANALYSIS OF RESULTS

| No of patients enrolled in the study | - | 90 |
|--|---|--------|
| No of patients who completed the study | - | 81 |
| No of patients who were excluded | - | 9 |
| Final list of patients | - | 81 |
| Total number of patients delivered preterm | - | 12 |
| Incidence of preterm birth in this study | - | 14.81% |
| No of preterm babies who required NICU admission | - | 12 |

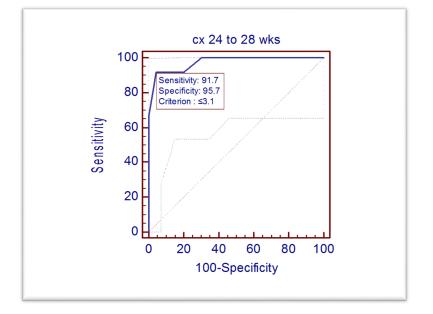

The datas were evaluated using Receiver operator characteristic curve, chi-square test, t-test and linear regression curve.

RECEIVER OPERATOR CHARACTERISTIC CURVE

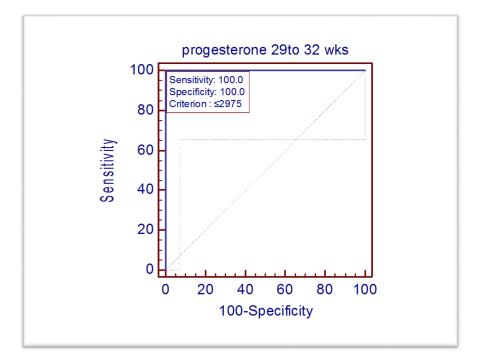

SALIVARY PROGESTERONE VS OUTCOME - 24 TO 28 WKS

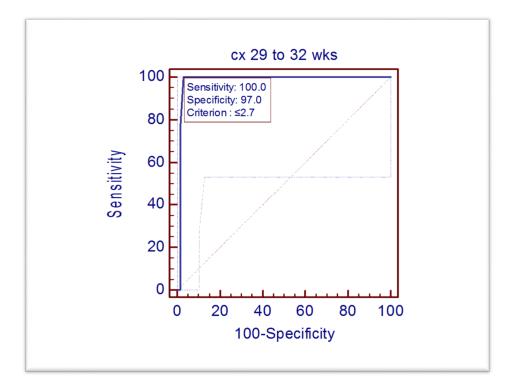

CERVIX LENGTH VS OUTCOME – 24 TO 28 WKS

SALIVARY PROGESTERONE VS OUTCOME - 29 TO 32 WKS

CERVIX LENGTH VS OUTCOME – 29 TO 32 WKS

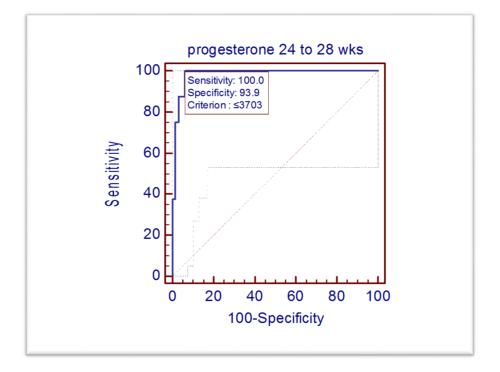

| | Sensitivity | Specificity | AUC | Criterion |
|-----------------------------|-------------|-------------|----------|-----------|
| Progesterone 24-28 Weeks | 100 | 94.2 | 0.990338 | ≤3903 |
| Progesterone 29-32 Weeks | 100 | 100 | 1.0000 | ≤2975 |
| Cervix 24-28 Weeks | 91.7 | 95.7 | 0.973430 | ≤3.1 |
| Cervix 29-32 Weeks | 100 | 98.6 | 0.997585 | ≤2.9 |

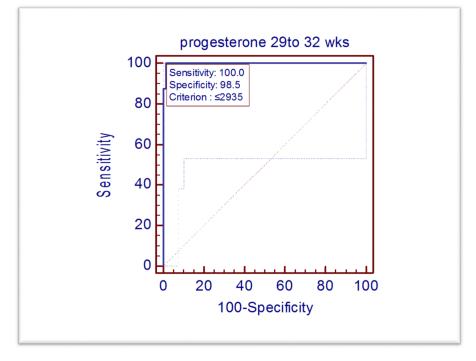

CONCLUSION

There is a statistical significance existing between labour outcome and salivary progesterone and cervical length measured between 24 to 28 weeks and 29 to 32 weeks.

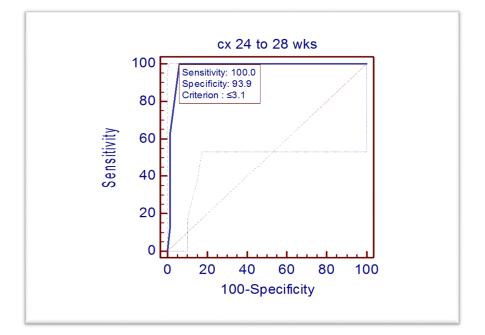

SALIVARY PROGESTERONE AND NEONATAL COMPLICATIONS - 24 TO 28 WEEKS

29 TO 32 WEEKS

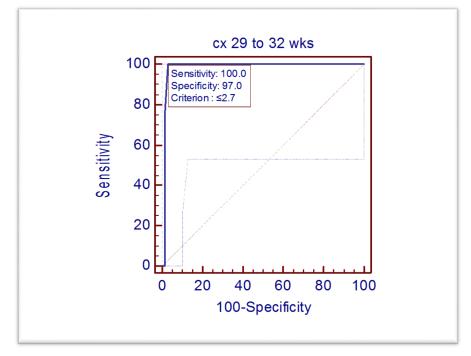

CERVIX LENGTH VS NEONATAL COMPLICATIONS -

24 TO 28 WEEKS

29 TO 32 WEEKS

| | Sensitivity | Specificity | AUC | Criterion |
|-----------------------------|-------------|-------------|----------|-----------|
| Progesterone 24-28 Weeks | 100 | 93.9 | 0.982955 | ≤3703 |
| Progesterone 29-32 Weeks | 100 | 98.5 | 0.998106 | ≤2935 |
| Cervix 24-28 Weeks | 100 | 93.9 | 0.977273 | ≤3.1 |
| Cervix 29-32 Weeks | 100 | 97 | 0.982955 | ≤2.7 |

CONCLUSION

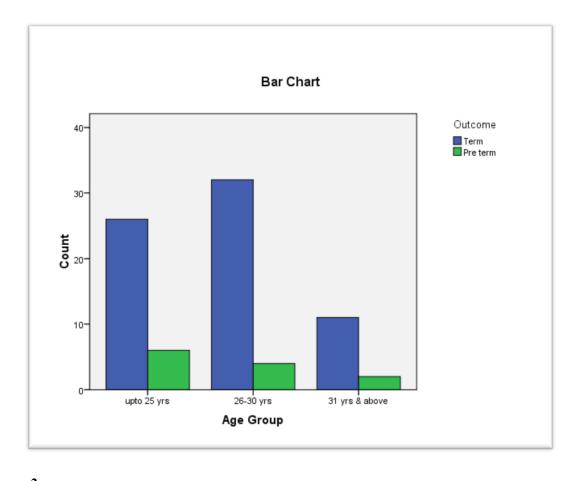

There is a statistical significance existing between salivary progesterone and cervical length measured between 24 to 28 weeks and 29 to 32 weeks with respect to neonatal complications.

The scatter diagram shows that there exists a linear relationship between salivary progesterone level and cervix length with respect to labor outcome.

Discussion

DISCUSSION

A total of 90 women were enrolled in our study. Two women were diagnosed to have Hyperglycemia in pregnancy between 29-32 weeks and were excluded from the study. Three women developed hypertensive disorder of pregnancy and were excluded from the study. One woman was diagnosed by USG to have fetal growth restriction with oligohydramnios and was excluded from the study. Three women did not turn up between 29-32 weeks of gestation due to various reasons and were excluded from the study.

The study analyzed the values of salivary progesterone estimation as a predictor of preterm birth. Salivary progesterone levels were compared with transvaginal cervical length during the same gestational age. Other variables-socioeconomic status, working status, height, weight, body mass index, passive smoking, neonatal complications and neonatal mortality were also analyzed.

• ROC curve was drawn for salivary progesterone between 24-28 weeks and 29-32 weeks with respect to term and preterm deliveries. Sensitivity and specificity of salivary progesterone in predicting preterm labor, when done between 24-28 weeks was 100% and 94.2% respectively,

87

when the criterion was set as \leq 3903pg/ml. The same when repeated between 29-32 weeks, sensitivity and specificity was 100% and 100% respectively when the criterion was set as \leq 2975pg/ml.

- Similarly, ROC curve was drawn for transvaginal cervical length between 24-28 weeks and 29-32 weeks with respect to term and preterm deliveries. Sensitivity and specificity of transvaginal cervical length in predicting preterm labor was 91.7% and 95.7% respectively at 24-28 weeks when the criterion was set as ≤ 3.1cm and 100% and 98.6% respectively, when done at 29-32 weeks, and the criterion set as ≤ 2.9cm.
- The sensitivity and specificity for both salivary progesterone and transvaginal cervical length in prediction of preterm labor were greater when done at a later gestational age.
- ROC curve was drawn for salivary progesterone between 24-28 weeks and 29-32 weeks with respect to neonatal complications. Sensitivity and specificity were 100% and 93.9% respectively when done between 24-28 weeks and criterion set as ≤3703pg/ml. Sensitivity and specificity were 100% and 98.5% respectively when done between 29-32 weeks and criterion set as ≤2935pg/ml.

- ROC curve was drawn for transvaginal cervix length between 24-28 weeks and 29-32 weeks with respect to neonatal complications. Sensitivity and specificity were 100% and 93.9% respectively when done between 24-28 weeks and criterion set as ≤3.1cm. Sensitivity and specificity were 100% and 97%, when done between 29-32 weeks and criterion set as ≤2.7cm.
- The relation of age with respect to labor outcome describes the chisquare =0.787 and P=0.675 which is not significant. Thus age did not have any impact on labor outcome.
- The relation of BMI with respect to labor outcome describes the chisquare= 3.027 and P = 0.387 which is not significant.. Thus BMI did not have any impact on labor outcome.
- The relation of socioeconomic status with respect to preterm labor describes the chi square = 2.051 and P = 0.562 which is not significant. Thus socioeconomic status did not have any impact on the prediction for preterm labor.
- The relation of socioeconomic status with respect to neonatal complications describes the chi square = 13.108 and P = 0.594 which is not significant. Thus socioeconomic status did not have any impact on neonatal complications.

- The relation of women in working group for risk of preterm labor describes the chi square = 0.875 and P =0.350 which is not significant. Thus women who belonged to the working group did not have a predilection for preterm labor.
- The relation of women in working group for risk of neonatal complications describes chi square = 4.754 and P = 0.447 which is not significant. Thus women who belonged to the working group did not have a predilection for neonatal complications.
- The relation of different inclusion criteria with respect to preterm labor describes the chi square=5.366 and P = 0.068 which is not significant. Thus percentage of recurrence of preterm labor does not vary among the group with different inclusion criteria.
- The relation of different inclusion criteria with respect to neonatal complications describes the chi square =19.176 and P = 0.038 which is significant. Thus the neonatal complications did have a significant relationship with history of abortion and preterm group i.e 38.3% with preterm labor and abortion group and 23.5% with PPROM group.
- The relation of passive smoking with preterm labor describes the chi square = 4.348 and P = 0.037 which is significant. There is an increased

incidence of preterm labor in group with history of passive smoking i.e 66.7% in preterm group and 34.8% in term group.

- The relation of passive smoking with neonatal complications describes the chi square = 7.315 and P = 0.198 which is not significant. There is no increased incidence of neonatal complications in group with history of passive smoking.
- The relation of NICU admission with respect to pregnancy outcome, term/preterm describes the chi square = 45.960 and P = 0.000 which is significant. Thus neonates belonging to preterm birth group had higher incidence of NICU admissions i.e 13.6% in preterm labor group vs 6.2% in term labor group.
- The relation of NICU admission with respect to neonatal complications describes the chi square = 74.787 and P = 0.000 which is significant.
 99% Respiratory distress syndrome, 4.9% Jaundice, 1.2% Low birth weight, 1.2% skin infections, 1.2% sepsis.
- The relation of neonatal mortality with respect to preterm labor describes the chi square = 5.822 and P = 0.016 which is significant. Incidence of neonatal mortality is1.2% in the preterm group.
- The relation of neonatal mortality with respect to neonatal complications describes the chi square = 9.239 and P = 0.100 which is not significant.

- The t-test showed a good correlation between salivary progesterone and transvaginal cervical length with respect to pregnancy outcome and neonatal complications as they describe P = 0.000 which is significant.
 i.e., lower the progesterone, higher the incidence of preterm labor and neonatal complications.
- The correlation between BMI with salivary progesterone and cervix length between 24 to 28 weeks and 29-32 weeks. (Progesterone 24-28 weeks- P = 0.361; Progesterone 29-32 weeks- P = 0.785; cervix 24-28 weeks- P = 0.530; cervix 29-32 weeks- P = 0.875) is not significant. Thus pre pregnancy BMI had no impact on pregnancy outcome in this study.
- The t-test done for correlating height, weight and BMI with pregnancy outcome describes P value (height- P = 0.520; weight- P = 0.305 and BMI- P = 0.396) which is not significant. Height, weight and BMI did not have significant impact on pregnancy outcome i.e term or preterm.
- The t-test done for correlating height, weight and BMI with neonatal complications describes P value (height P = 0.569; Weight -P = 0.113; BMI- P = 0.159) which is not significant. Thus height, weight and BMI did not have significant impact on neonatal complications.

- The logistic regression curve relating salivary progesterone level to gestational age at delivery shows a statistically significant linear relationship. i.e., lower the salivary progesterone level, lesser is the gestational age of delivery.
- The regression equation thus derived i.e., multiplying the estimated salivary progesterone level by a constant value and adding another constant value for that gestational age, at which salivary progesterone level is estimated, gives the gestational age of delivery.

Y = 26.1645 + 0.002658 x Salivary progesterone level at 24 to 28 weeks.

Y = 26.9582 + 0.002923 x Salivary progesterone level at 29 to 32 weeks.

Where, Y is the gestational age at delivery.

Summary

SUMMARY

- 1. The age, pre- pregnancy height, weight and Body mass index was not useful in predicting the preterm labor and neonatal complications.
- 2. The risk of preterm labour were not increased in working women.
- Socio economic status did not have a significant impact on labor outcome and neonatal complications.
- 4. The incidence of recurrence of preterm labor did not vary among patients with previous history of spontaneous abortion between 20-28 weeks, preterm labor and PPROM.
- 5. The risk of neonatal complications in women with preterm labor were more in those with previous history of spontaneous abortion between 20-28 weeks and previous history of preterm labor. A similar association was not seen in those with previous history of PPROM.
- 6. Women with passive smoking (i.e history of smoking among family members) were at a greater risk for preterm labor.
- Neonates of women with passive smoking were not more prone for neonatal complications.
- 8. Risk of NICU admissions were more in preterm deliveries.
- Most common cause for admission in NICU, in preterm deliveries being respiratory distress syndrome followed by jaundice.

94

- 10. Neonatal mortality is more in preterm deliveries, the prime cause being respiratory distress.
- 11. Salivary progesterone estimation at 24-28 weeks and then at 29-32 weeks in asymptomatic high risk AN mothers was a valuable predictor of preterm labor when the cut off was fixed at ≤ 3903pg/ml at 24-28 weeks and ≤ 2975 pg/ml at 29-30 weeks.
- 12. Transvaginal cervical length measured at 24-28 weeks and then at 29-32 weeks, at the time of salivary progesterone estimation also, had similar sensitivity and specificity in predicting preterm labor when the cut off was fixed at ≤3.1cm at 24-28 weeks and ≤2.9cm at 29-32 weeks.

Conclusion

CONCLUSION

Salivary progesterone is a better predictor of preterm labor when compared to transvaginal cervical length, as it has better sensitivity and specificity, is a non-invasive method and sample collection is easier. Though transvaginal scan is available in every antenatal unit, it needs technical expertise and further, it shows inter-observer variability.

An ideal biochemical marker must be able to predict the problem at an earlier GA for appropriate interventions to be done. Hence it is justified in doing the salivary progesterone estimation at 24-28 weeks though it has comparatively lesser sensitivity and specificity than at 29-32 weeks.

In utero transfer can be advised for antenatal women whose salivary progesterone level are \leq 3903pg/ml at 24-28 weeks and \leq 2975pg/ml at 29-32 weeks for better obstetric outcome and better neonatal salvageability.

INSTITUTIONAL ETHICS COMMITTEE MADRAS MEDICAL COLLEGE, CHENNAI-3

EC Reg No.ECR/270/Inst./TN/2013 Telephone No. 044 25305301 Fax: 044 25363970

CERTIFICATE OF APPROVAL

То

Dr. M.Mahalakshmi Postgraduate M.S.(Obstetrics & Gynaecology) Madras Medical College Chennai – 600 003.

Dear Dr.M. Mahalakshmi,

The Institutional Ethics Committee has considered your request and approved your study titled "Salivary progesterone as a blochemical marker to predict preterm birth in asymptomatic high risk women" No.24122014.

The following members of Ethics Committee were present in the meeting held on 02.12.2014 conducted at Madras Medical College, Chennai-3.

| 1. | Dr.C.Rajendran, M.D., | : | Chairperson | |
|----|---|---|--------------------|--|
| 2. | Dr.R.Vimala, M.D., Dean, MMC, Ch-3 | | Deputy Chairperson | |
| 3. | Prof.B.Kalaiselvi, M.D., Vice-Principal, MMC, Ch-3 | | Member Secretary | |
| 1. | Prof.R.Nandini, M.D., Inst.of Pharmacology, MMC | | Member | |
| 5. | Prof. P. Ragumani, M.S., Professor, Inst. of Surgery, MMC | : | Member | |
| 6. | Prof.Md.Ali, M.D., D.M., Prof. & HOD of Medl.G.E., MMC | : | Member | |
| | Prof.K.Ramadevi, Director, Inst. of Biochemistry, MMC | : | Member | |
| 8. | Prof.Saraswathy, M.D., Director, Pathology, MMC, Ch-3 | : | Member | |
| 9. | Prof.S.G.Sivachidambaram, M.D., Director i/c, | : | Member | |
| | Inst.of Internal Medicine, MMC | | | |
| 10 | Thiru S.Rameshkumar, Administrative Officer | : | Lay Person | |
| | Thiru S.Govindasamy, B.A., B.L., | : | Lawyer | |
| 12 | .Tmt.Λrnold Saulina, M.Λ., MSW., | : | Social Scientist | |

We approve the proposal to be conducted in its presented form.

The Institutional Ethics Committee expects to be informed about the progress of the study and SAE occurring in the course of the study, any changes in the protocol and patients information/informed consent and asks to be provided a copy of the final report.

1 Julio

Member Secretary, Ethics Committee

INFORMATION TO PARTICIPANTS

- We are conducting a study on the level of salivary level of progesterone, a hormone and length of cervix by transvaginal ultrasonogram and its effect on preterm labour i.e. delivery before 37 weeks of pregnancy.
- We are selecting antenatal women according to the need for the study. We wish that you participate in this study.
- In this study, we shall collect your saliva twice(1) between 24 to 28 weeks, 2) 3 to 4 weeks later) and do special test to measure the progesterone hormone level. Simultaneously, we shall measure the length of the cervix by transvaginal ultrasonogram. The tests you are subjected to, shall not affect you or your baby in uterus.
- Your participation in this study will not affect your AN care or any treatment if needed .
- The privacy of the patients in the research will be maintained throughout the study.
- In the event of any publication or presentation resulting from the research, no personally identifiable information will be shared.
- Taking part in this study is voluntary. You are free to decide whether to participate in this study or withdraw at any time; your decision will not result in any loss of benefits to which you are otherwise entitled.
- The results of the special study may be intimated to ypu at the end of the study period or during the study if anything is found abnormal which may aid in the management or treatment.

I ______ have read the information in this form (or it has been read to me). I was free to ask any questions and they have been answered. I am over 18 years of age and, exercising my free power of choice, hereby give my consent to be included as a participant in this study.

1. I have read and understood this consent form and the information provided to me.

: Dr.M. Mahalakshmi

- 2. I have had the consent document explained to me.
- 3. I have been explained about the nature of the study.
- 4. I have been explained about my rights and responsibilities by the investigator.
- 5. I have informed the investigator of all the treatments I am taking or have taken in the past months/years including any native (alternative) treatments.
- 6. I have been advised about the risks associated with my participation in the study.*
- 7. I agree to cooperate with the investigator and I will inform him /her immediately if I suffer unusual symptoms. *
- 8. I have not participated in any research study within the past. *
- 9. I am aware of the fact that I can opt out of the study at any time without having to give any reasoned this will not affect my future treatment in this hospital. *
- 10. I am also aware that the investigators may terminate my participation in the study at any time, for any reason, without my consent. *
- 11. I hereby give permission to the investigators to release the information obtained from me as result of participation in this study to the sponsors, regulatory authorities, Govt. agencies, and IEC if required.
- 12. I understand that my identity will be kept confidential if my data are publicly presented.
- 13. I have had my questions answered to my satisfaction.
- 14. I consent voluntarily to participate in the research/study.

I am aware that if I have any question during this study, I should contact the investigator. By signing this consent form, I attest that the information given in this document has been clearly explained to me and understood by me. I will be given a copy of this consent document.

ூராய்ச்சி தகவல் தாள்

சென்னை எழும்பூரில் உள்ள அரசு தாய் சேய் நல மருத்துவமனைக்கு வரும் முந்தைய காப்பத்தில் குறைமாதத்தில் பிரசுவித்து தற்போது காப்பமுற்றிருக்கும் தாய்மார்களுக்கு இந்த காப்பத்திலும் குறை மாதத்தில் பிரசுவிக்க வாய்ப்பு உள்ளதா என்பது பற்றி ஆராய்ச்சி நடைபெற்று வருகின்றது.

நமது உமிழ்நீரில் பல உட்சுரப்பி இயக்குநீர் வகைகள் (ஹார்மோன்) உள்ளன. அவற்றில் புரஜெஸ்டிரோன் என்ற உட்சுரப்பி இயக்குநீர் அளவினைக் கொண்டும், மற்றும் கர்ப்பப்பை வாயின் நீளத்தை யோனி வழியாக செய்யும் ஸ்கேன் மூலம் அளப்பதன் மூலமும், குறைமாதத்தில் பிரசவமாகக்கூடிய வாய்ப்பை எளிதில் கண்டறிய முடியும் என்பதே இந்த ஆராய்ச்சியின் நோக்கமாகும்.

நீங்களும் இந்த ஆராய்ச்சியில் பங்கேற்க நாங்கள் விரும்புகீறோம். இந்த ஆராய்ச்சியில் உங்களுடைய உமிழ்நீரை இருமுறை (I–24–28 வாரங்களில் II– 3–4 வாரங்கள் கழித்து) சேகரித்து சில சிறப்பு பரிசோதனைக்கு உட்படுத்தீ அதன் தகவல்களை ஆராய்வோம். அதே சமயத்தில் உங்கள் கர்ப்பப்பை வாயின் நீளத்தை யோனி வழியாக ஸ்கேன் செய்து அளப்போம். இதில் பங்கேற்பதால் தங்களுக்கு கிடைக்க வேண்டிய கவனிப்பிற்கோ, சிகிச்சைக்கோ எந்தவித பாதிப்பும் ஏற்படாது என்பதை தெரிவித்துக் கொள்கிறோம். மேலும் இந்த பரிசோதனைகளால் வயிற்றில் உள்ள குழந்தைக்கோ அல்லது உங்களுக்கோ எந்தவித பாதிப்பும் ஏற்படாது என்பதை தெரிவித்துக் கொள்கிறோம்.

முடிவுகளை அல்லது கருத்துக்களை வெளியிடும்போதோ தங்களது பெயரையோ அல்லது அடையாளங்களையோ வெளியிடமாட்டோம் என்பதையும் தெரிவித்துக் கொள்கீறோம்.

இந்த ஆராய்ச்சியில் பங்கேற்பது தங்களுடைய விருப்பத்தீன் பேரில் தான் இருக்கிறது. மேலும் நீங்கள் எந்நேரமும் இந்த ஆராய்ச்சியிலிருந்து பின்வாங்கலாம் என்பதையும் தெரிவித்துக் கொள்கிறோம்.

இந்த சிறப்புப பரிசோதனைகளின் முடிவுகளை ஆராய்ச்சியின்போது அல்லது ஆராய்ச்சியின் முடிவின்போது தங்களுக்கு அறிவிப்போம் என்பதையும் தெரிவித்துக் கொள்கீறோம்.

1. INTRODUCTION

Preterm birth is defined as birth between the age of viability and 37 completed weeks of gestation. It includes deliveries between 24 to 36 weeks and 6 days gestation and also includes all births with birth weight above 500gms. The incidence varies from 5% to 8% among most developed and developing countries. Infants between 34 and 36 weeks account for approximately 75 percent of all preterm births.

Pretern birth cause an increased perinatal mortality, long term morbidity and affects health economics. India has the highest number of preterm births and deaths in the world.

The four main reasons for preterm birth are:

- Induction of labor for fetal or maternal causes or the infant is delivered by caesarean delivery before onset of labor – 30 to 35%
- 2. Idiopathic preterm labour with intact membranes 40 to 45%
- 3. Idiopathic preterm premature rupture of membranes $30\ to\ 35\%$
- 4. Higher order pregnancy. (ovulation induction)
