## RELIABILITY AND VALIDITY OF NOVEL METHODS IN THE ASSESSMENT OF COLD-INDUCED SHIVERING.

## Arnold J.T., Hemsley Z., Hodder S.G, Lloyd A.B.

Environmental Ergonomics Research Centre - Loughborough University - United Kingdom

### INTRODUCTION

**CONTEXT:** Shivering defined as the 'simultaneous asynchronous contraction of the muscle fibres in both flexor and extensor muscles' <sup>(1)</sup>.

Both the onset and magnitude of shivering are influenced by corresponding reductions in skin or deep-body temperature, but also a range of non-thermal factors <sup>(2-3)</sup>.

Despite various forms shivering quantification in research and practice, a direct comparison between metrics has yet to be performed, specifically in quantifying shivering onset.

**AIM:** The purpose of this methodological study was twofold:

- To compare the test-retest reliability of four independent metrics for the assessment of shivering onset; whole-body oxygen uptake (VO<sub>2</sub>), electromyography (EMG), mechanomyography (MMG) and bedside shivering assessment scale (BSAS).
- 2. To compare the validity across metrics as appropriate methodological tools for

**COOLING STIMULUS:** Passive cooling via lower body cold-water immersion at  $10 \pm 0.4$ °C, with an industrial fan placed 1.5 m away to encourage convective cooling of the upper body (T<sub>a</sub>, 21.2 ± 1.2°C; air velocity, 3.5 ± 0.18 m·s)(**Fig 2**) whilst avoiding immersion of equipment.

Participants remained in the bath until 10 mins after they were deemed to be maximally wholebody shivering.

#### ASSESSMENT OF SHIVERING:

Figure 2: Methodological set-up to induce deep-body cooling.

#### shivering research.

## METHODOLOGY

PARTICIPANTS: Ten healthy volunteers (age,  $23 \pm 3$  yrs; stature,  $1.75 \pm 0.07$  m; mass,  $71.1 \pm 11.5$  kg).

**DESIGN:** Repeated measures design, visiting the laboratory on three occasions, undertaking identical sessions (*Fig 1*). Prior to cold exposure, participants remained seated in a thermoneutral environment (21°C) for 20 mins allowing skin temperature to stabilise.

 $\dot{VO}_2$  – continuous breath-by-breath via metabolic cart.

*EMG* – wireless surface EMG (right pectoralis major, posterior deltoid, trapezius). Sampled at 1000 Hz and the signal rectified.

*MMG* – tri-axial accelerometer, 30 x 20 x 10 mm; 13 g (right pectoralis major). Movement axes was sampled at 1000 Hz and collated by square rooting the sum of squares.

*BSAS* – subjective stages; *1.* minor localised shivering-related muscular twitches, *2.* noticeable intermittent burst shivering of the extremities, *3.* generalised sustained whole-body shivering.

**DATA ANALYSIS:** All data sub-sampled into 10 s average time blocks and graphed as a function time to synchronise sampling rates.

Intermittent shivering onset was defined via visual identification of the inflection point, by a secondary inflection point for constant shivering.

Inflection points independently established by three researchers and the median was used. The corresponding time elapsed (relative to entry into the bath), and T<sub>rec</sub> was noted.

#### RESULTS

NOTE: Intermittent, onset of intermittent shivering. Constant, onset of constant shivering. Trial 1,2 & 3, data are mean  $\pm$  SD; n = 10. Mean Diff, mean  $\pm$  SD of the within subjects difference across trials, with a root sum of squares applied to ensure positive values. Mean CV, mean  $\pm$  SD of the within subjects co-efficient of variation across trials. ICC, Intra-class correlation co-efficient across trials with 95% confidence intervals, based on a mean-rating (k = 3), absolute-agreement, 2-way mixed-effects model. **Figure 3:** Onset of intermittent and constant shivering assessed via various metrics during lower body cold water immersion. NOTE: Data are mean ± SD with individual data points. Intermittent, onset of intermittent shivering. Constant, onset of constant shivering. n = 10.

Figure 4: Representation of signal to noise ratio across three independent metrics in the assessment of shivering onset. NOTE: Data are means of three repeated trials across subjects; n = 10. Intermittent shivering onset defined via visual inspection of inflection

#### DISCUSSION

**RELIABILITY**: In view of the ICC values observed, all metrics provide a good-excellent degree of test-retest reliability in the assessment shivering onset (*Table 1*). Interestingly, time elapsed relative to cold exposure provided a more consistent predictor of shivering onset than core temperature; thus evidence is presented for the addition of a temporal element in the regulation of thermal homeostasis.

VALIDITY: Chronologically, MMG and EMG were similar in the identification of shivering onset, while a lag was seen in VO<sub>2</sub> derived identification (*Fig 3*). As such MMG and EMG present a suitable choice for research requiring real time objective identification of shivering onset. BSAS 1 preceded any activity registered via other metrics, yet comparing objective metrics with BSAS equivalent stages (i.e. BSAS stage 2 vs. objective intermittent shivering, and BSAS 3 vs. objective constant shivering), a lag was seen in identification via BSAS. Note, considerable variability exists in the magnitude of the delay.

Assessment of signal to noise ratio favoured EMG (SNR, 1.43 ± 2.11) as an analytical tool, followed by MMG (SNR, 0.67 ± 0.84) and finally VO<sub>2</sub> (SNR, 0.37 ± 0.66) (Fig 4).

INTEGRATION OF METRICS: Each metric in isolation presents a series of key limitations, thus development of an integrated measure of shivering onset, based on the current data is proposed:

$$\operatorname{hivering}^{(\operatorname{GlobalSNR}^{Live})} = \left( \frac{\left( \frac{\left( EMG_{\overline{\chi}}((t-750)-(t-150))^{-}EMG_{\overline{\chi}}(t-150) \right)}{2\sigma_{EMG}((t-750)-(t-150))} \right)}{2\sigma_{EMG}((t-750)-(t-150))} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}((t-630)-(t-30))^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}((t-630)-(t-30))^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right)}{2\sigma_{VO_{2}}((t-630)-(t-30))} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}((t-630)-(t-30)} \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right) \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right) \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right) \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)}}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-630)-(t-30)} \right)} \right) + \left( \frac{\left( VO_{2\overline{\chi}}(t-630)-(t-30)^{-}VO_{2\overline{\chi}}(t-150) \right)}{2\sigma_{VO_{2}}(t-150)} \right)} \right) + \left( \frac{\left( VO_{2\overline{\chi}}(t-60)-(t-30)^$$

Where:

- **GlobalSNR<sup>Live</sup>** is a real time metric based on the mean SNR of VO<sub>2</sub>, EMG and MMG.
- $\overline{x}$  is a rolling average of given time block
- *t* is current time in seconds
- $2\sigma$  is two standard deviations

Intermittent shivering onset: **GSNR**<sup>Live</sup> > 0.51.
