Переклад у галузі електроенергетики. Методичні рекомендації до практичних занять з дисципліни для студентів спеціальності 7.030507 «Переклад» напряму підготовки 035 «Філологія» / М.В. Орел; М-во освіти і науки України, Нац. техн. ун-т. – Дніпро: НТУ «Дніпровська політехніка», 2019 – 63 с.

Автор:

М.В. Орел, доц.

Затверджено до видання редакційною радою НТУ «ДП» (протокол № 4 від 23.04.2019) за поданням методичної комісії напряму підготовки 035 «Філологія» (протокол № 8 від 18. 02. 2019).

Методичні матеріали призначено для самостійної роботи студентів спеціальності 7.030507 “Переклад” напряму підготовки 035 «Філологія» для організації практичних занять із дисципліни «Переклад у галузі електроенергетики».

Рекомендації орієнтовано на вдосконалення навичок перекладу науково-технічних текстів.

Відповідальна за випуск завідувач кафедри перекладу, канд. філол. наук, проф. Т.Ю. Введенська.

## UNIT 1

## ENERGY EFFICIENCY

### Text: THE ELUSIVE NEGAWATT

*If energy conservation both saves money and is good for the planet, why don't people do more of it?*

line IN WONKISH circles, energy efficiency used to be known as “the fifth fuel”: it can help to satisfy growing demand for energy just as surely as coal, gas, oil or uranium can. But in these environmentally conscious times it has been climbing the rankings. Whereas the burning of fossil fuels releases greenhouse gases, which contribute to global warming, and nuclear plants generate life-threatening waste, the only by-product of energy efficiency is wealth, in the form of lower fuel bills and less spending on power stations, pipelines and so forth. No wonder that wonks now tend to prefer “negawatts” to megawatts as the best method of slaking the world’s growing thirst for energy.

Almost all blueprints for tackling global warming assume that energy efficiency will have a huge role to play. In the greenest of futures mapped out by the International Energy Agency, a think-tank financed by rich countries, greater efficiency accounts for two-thirds of emissions averted. The McKinsey Global Institute (MGI), the research arm of the consultancy, thinks that energy efficiency could get the world halfway towards the goal, espoused by many scientists, of keeping the concentration of greenhouse gases in the atmosphere below 550 parts per million.

MGI believes that unlike most other schemes to reduce emissions, a global energy-efficiency drive would

be profitable. The measures it has in mind, all of which rely on existing technology, would earn an average return of 17% and a minimum of 10%. The Intergovernmental Panel on Climate Change makes a similar point. It believes that profitable energy-efficiency investments would allow Pakistan to cut its emissions by almost a third, Greece by a quarter and Britain by more than a fifth.

In other words, big investments in energy efficiency would more than pay for themselves, and fairly fast. Although a lot of money would have to be spent—\$170 billion a year until 2020—by MGI’s reckoning that is only 1.6% of today’s global annual investment in fixed capital.

Moreover, with ample profits to be made, financing should be easy to attract.

Yet if there are so many lucrative opportunities to improve efficiency, why are investors not already taking advantage of them? To a degree, they are: in America, for example, “energy intensity”—the amount of energy required to generate each dollar of output—is falling by about 2% a year. This is only partly because America’s factories, houses, cars and appliances are becoming more efficient: it is also because energy-guzzling factories have moved to cheaper spots such as China. But globally, too, energy intensity is falling by around 1.5 % a year.

But as McKinsey points out, there are still hundreds of billions of

dollars' worth of unfulfilled but potentially profitable opportunities in energy efficiency available to households and companies. What is holding investors back? One answer is price. In the eyes of many consumers, electricity and fuel are often too cheap to be worth saving, especially in countries where their prices are subsidised.

By and large, energy intensity is, not surprisingly, lower in countries where electricity prices are higher. It is no coincidence that Denmark has both high power prices and an energy-efficient economy. Among American states, for every cent per kilowatt-hour by which prices exceed the national average, energy consumption drops by about 7% of the average. George David, the boss of United Technologies, a conglomerate that makes air-conditioners, lifts and aircraft engines, among other items, argues that higher fuel and power prices are the only motor needed to drive energy efficiency.

But there are still plenty of profitable investment opportunities in energy efficiency, even in the places with the most expensive power. David Goldstein, author of a recent book on energy efficiency, points out that until recently businesses in New York lit their premises more brightly than did those in Seattle, despite New York's much higher power prices. And Hawaii, the American state with the dearest power, is not the most efficient.

The problem, analysts explain, is a series of distortions and market failures that discourage investment in efficiency. Often, consumers are

poorly informed about the savings on offer. Even when they can do the sums, the transaction costs are high. Despite recent price increases, spending on energy still accounts for a smaller share of the global economy than it did a few decades ago.

For all these reasons, homeowners, as Lord Stern pointed out, tend to demand exorbitant rates of return on investments in energy efficiency—of around 30%. They generally want new boilers or extra insulation to pay for themselves within two or three years. Businesses are not quite so demanding, he says, but they still tend to put greater emphasis on increasing revenues than on cutting costs.

Similar stories crop up in the markets for new homes and offices, appliances and vehicles. Builders are not the ones who end up paying the utility bills, so have little reason to add to the construction costs—and hence the price of a home or office—by incorporating energy-saving features. The makers of appliances and cars also know that not all consumers and drivers will think as carefully about running costs as about the purchase price. By the same token, landlords have scant incentive to invest in energy efficiency on their tenants' behalf. And power companies are usually keen to encourage their customers to consume as much power as possible.

Financing energy-efficiency investments can also be difficult. In the developing world, capital can be scarce. In rich countries, the savings from making individual homes more efficient are too small and the overheads involved too high to be of much interest to most banks.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 What do you understand by the term 'energy efficiency'?
- 2 What important advantage has energy efficiency over fossil fuels?
- 3 In what way can energy efficiency help the environment?
- 4 What does the term 'energy intensity' mean?
- 5 What are the reasons of insufficient investment in energy efficiency?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Globally, energy intensity is falling.
- 2 Investments in energy efficiency would pay for themselves.
- 3 Power companies encourage their customers to consume less power.
- 4 The makers of appliances and cars know that not all consumers and drivers will think as carefully about the purchase price as about running costs.
- 5 Denmark has both high power prices and an energy-efficient economy.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The sum of money to be invested in energy efficiency annually. ....
- 2 The percentage of an average return a global energy-efficiency drive would earn. ....
- 3 The percentage of rates of return on investments in energy efficiency homeowners demand. ....
- 4 The supposed number of parts of greenhouse gases in the atmosphere per million. ....
- 5 The minimum percentage of a return a global energy-efficiency campaign would earn. ....

## LANGUAGE FOCUS

### A Definitions

Match the words from the text with their corresponding definitions:

- |                             |  |
|-----------------------------|--|
| 1 power (line 120)          | a) a company's profit for a year expressed as a percentage of the capital employed during the year;                              |
| 2 fossil (line 9)           | b) a photographic copy of a plan for making a machine or building a house or other structure;                                    |
| 3 rate of return (line 135) | c) buildings or machines which a business owns and which can be used for a long period of time in the production of other goods; |
| 4 think-tank (line 26)      | d) something transacted; a piece of business;  |

- |    |                          |    |   |
|----|--------------------------|----|---|
| 5  | running costs (line 155) | e) | made of substances that were living things many millions of years ago;  |
| 6  | overheads (line 169)     | f) | difficult to catch, find or remember;   |
| 7  | fixed capital (line 59)  | g) | force that can be used for doing work, driving a machine, or producing electricity (= electricity);   |
| 8  | transaction (line 128)   | h) | (especially of a business, trade, or job) bringing in plenty of money; profitable;  |
| 9  | blueprint (line 21)      | i) | (of costs, amounts, demands etc) much greater than is reasonable, usual, or expected;   |
| 10 | lucrative (line 63)      | j) | the amount of money needed for operating a business or other activity;  |
| 11 | elusive (title)          | k) | money spent regularly (e.g. on insurance or heating) to keep a business running;  |
| 12 | exorbitant (line 135)    | l) | a committee of people experienced in a particular subject, established by an organization, government etc to develop ideas and advise on matters related to that subject. |

## B Understanding expressions

Choose the best explanation for each word or phrase from the text.

- |    |  |    |   |
|----|--|----|---|
| 1  | Fuel (line 3):   | 2  | Conservation (subtitle):  |
| a) | a solid substance that is burnt to produce heat or power;  | a) | the act of keeping something from being wasted or lost;   |
| b) | a material used mainly for producing power in the engines of cars, aircraft etc;                                     | b) | the careful preservation and protection of animals and plants to prevent them being lost for ever;                          |
| c) | a material that is used for producing heat or power by burning or by atomic means.                                   | c) | the act of protecting forests and rivers from being wasted.   |
| 3  | Global warming (line 10):  | 4  | Greenhouse gas (line 9):  |
| a) | the gradual slight warming of the air surrounding the Earth because of the sun's light and heat;                     | a) | a gas, especially natural gas which is burnt in the home for heating and cooking;   |
| b) | a general increase in world temperatures, caused by carbon dioxide collecting in space immediately around the Earth; | b) | a gas, especially carbon dioxide or methane, which is thought to trap heat above the Earth and cause the greenhouse effect; |
| c) | the weather conditions under which the temperature of the air is rising.   | c) | a gas which is used to poison or cause extreme discomfort.  |
| 5  | Energy (line 4):   | 6  | Investment (line 110):  |
| a) | the quality of being full of life and action;  | a) | money claimed for harm done;  |
| b) | the power which one can use in working;  | b) | money given to support unprofitable enterprises;  |
| c) | the power which can do work.   | c) | money used for income or profit.  |

- |   |  |
|---|--|
| <p>7 Energy intensity (line 67):</p> <ul style="list-style-type: none"> <li>a) the amount of energy required to generate each dollar of output;</li> <li>b) the increase in amount of energy;</li> <li>c) the amount of energy produced.</li> </ul> | <p>8 Incentive (line 157):</p> <ul style="list-style-type: none"> <li>a) a situation that is favourable for a particular purpose;</li> <li>b) something which encourages one to greater activity;</li> <li>c) the ability to take action without asking for the help or advice of others.</li> </ul> |
|---|--|

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 Their office is in central London, so their ..... are very high.
- 2 The job makes ..... demands upon my time.
- 3 The bank charges a fixed rate for each ..... transaction.
- 4 We are trying to reduce our .....
- 5 The engine was specially adapted to increase its .....
- 6 Coal is a ..... fossil fuel.
- 7 The authority of the plant is trying to attract more investment in the .....
- 8 The report is a ..... for the reform of the nation's tax system.
- 9 Despite all their efforts , success remained .....
- 10 She looked for an investment with a better .....

### D Collocations

Match these verbs and nouns as they occur in the text.

- |  |  |
|--|--|
| <ol style="list-style-type: none"> <li>1 energy</li> <li>2 power</li> <li>3 greenhouse</li> <li>4 utility</li> <li>5 aircraft</li> <li>6 climate</li> <li>7 investment</li> <li>8 price</li> <li>9 electricity</li> <li>10 construction</li> </ol> | <ol style="list-style-type: none"> <li>a) opportunities</li> <li>b) efficiency</li> <li>c) increases</li> <li>d) costs</li> <li>e) prices</li> <li>f) bills</li> <li>g) gases</li> <li>h) engines</li> <li>i) stations</li> <li>j) change</li> </ol> |
|--|--|

### E Words with similar or related meanings

- 1 The phrase 'to satisfy growing demand for energy' is used in paragraph 1. What other phrase is used in the same paragraph with a similar meaning?
- 2 The adjective 'profitable' is used several times in the text. What other word is used in the text with a similar meaning (para 5)?
- 3 Three words are used in the text with the meaning of 'income' (para 3, para 4, para 10). What are they?
- 4 The word 'engine' is used in paragraph 7. What other word is used in the same paragraph with a similar but figurative meaning?

- 5 What word could replace 'reduce' (para 3)?
- 6 The phrase 'by about 7%' is used in line 101. What other word is used in the text with a similar meaning to 'about' (para 5)?
- 7 The text uses the noun 'drive' (line 40) to express a planned effort of a group for a particular purpose. Can you think of at least one word to replace it?
- 8 Does the word 'greenest' (para 2) suggest colour or the environment?

## F Words that seem similar

- 1 The words 1) 'efficient' (line 121) and 2) 'effective' are similar, but they have slightly different meanings. Match these definitions to the two words:
  - a) producing the desired result;
  - b) working well, quickly, and without waste.
- 2 The terms 1) 'power' (line 120) and 2) 'energy' (line 4) are frequently confused. Which of the following definitions fits the two words?
  - a) the capacity of a physical system to perform work (is measured in joules);
  - b) the rate at which work is performed or energy is transmitted (is measured in watts and horsepower).

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions.

- |   |         |        |
|---|---------|--------|
| a) To happen or appear unexpectedly (para 11).                        | c ..... | u..... |
| b) To plan in detail in advance (para 2).                             | m ..... | o..... |
| c) To be in the end (para 11).  | e ..... | u..... |
| d) To make (something) to stay in place (para 6).                     | h ..... | b..... |
| e) To give or be a satisfactory explanation (para 9).                 | a ..... | f..... |
| f) To trust; to have confidence in (para 3).                          | r ..... | o..... |
| g) To draw attention to the fact (para 6).                            | p ..... | o..... |
| h) To give money in exchange for goods that one has bought (para 10). | P ..... | f..... |

## H Opposites

Find a word in the text that has an opposite meaning.

- |                         |                          |
|-------------------------|--------------------------|
| a) encourage (para 9)   | f) less (para 12)        |
| b) exorbitant (para 12) | g) lower (para 8)        |
| c) cheap (para 8)       | h) save (money) (para 1) |
| d) big (para 9)         | i) partly (para 5)       |
| e) easy (para 12)       | j) increase (para 10)    |

## I Measures

Do you know what these measures mean? If not, check the key.

- |             |             |           |                  |
|-------------|-------------|-----------|------------------|
| a) watt     | c) megawatt | e) gallon | g) kilowatt-hour |
| b) kilowatt | d) negawatt | f) litre  | h) terawatt-hour |

## UNIT 2

## COAL AS AN ENERGY SOURCE

### Text A: OLD CLEAN COAL

*Using photosynthesis to capture exhaust gases from power plants could reduce the emissions produced by coal-fired stations*

line FOR its supporters, the idea of  
growing single-celled algae on  
exhaust gas piped from power  
stations is the ultimate in recycling.  
5 For its detractors, it is a mere pipe  
dream. Whoever turns out to be  
right, though, it is an intriguing idea:  
instead of releasing the carbon  
dioxide produced by burning fossil  
10 fuels into the atmosphere, why not  
recapture it by photosynthesis? The  
result could then be turned into  
biodiesel (since many species of  
algae store their food reserves as  
15 oil), or even simply dried and fed  
back into the power station. Of  
course, if it were really that easy,  
someone would have done it  
already. But although no one has yet  
20 commercialised the technology,  
several groups are trying.

One of them is GS CleanTech,  
which has developed a bioreactor  
based on a patent held by a group of  
25 scientists at the Ohio Coal Research  
Centre. The GS CleanTech  
bioreactor uses a parabolic mirror to  
funnel sunlight into fibre-optic  
cables that carry the light to acrylic  
30 “glow plates” inside the reactor.  
These diffuse the light over vertical  
sheets of polyester that form the  
platform on which the algae grow.  
Eventually the polyester is unable to  
35 support the weight of the algae, and  
they fall off into a collection duct  
positioned underneath.

GreenFuel Technologies, based in  
Cambridge, Massachusetts, has a

40 different approach. Its reactor is  
composed of a series of clear tubes,  
each with a second, opaque tube  
nested inside. This arrangement  
makes it possible to bubble the  
45 exhaust gas down through the outer  
compartment and then bubble it back  
up through the opaque middle. The  
bubbling gas causes turbulence and  
circulates the algae around the reactor.  
50 The constant shift between light and  
darkness as the algal cells circulate  
increases the amount of carbon that  
they fix, probably by promoting  
chemical reactions that occur naturally  
55 only at night.

A preliminary test of GreenFuel’s  
reactor design suggested that it can  
remove 75% of the carbon dioxide  
from a power station’s exhaust.  
60 GreenFuel claims that over the course  
of a year, a hectare of its reactors  
should be able to produce 30,000 litres  
of oil, which could be used as  
biodiesel, and enough carbohydrates  
65 to be fermented into 9,000 litres of  
ethanol, which can be used as a  
substitute for petrol.

There is, of course, no free lunch.  
As Rob Carlson of the University of  
Washington points out, if money is to  
be made selling products made from  
exhaust gas, then that gas goes from  
being waste matter to being a valuable  
resource.

75 Far from giving it away, power  
companies might even start charging  
for it. That would, indeed, be a  
reversal of fortune.

## Text B: DIG DEEP

*Carbon storage will be expensive at best. At worst, it may not work*

- line EVEN in the most alternative-friendly future imaginable, coal is unlikely to go away. It is cheap, abundant and often local. So what  
5 can be done to make coal's use more acceptable?
- One much-discussed possibility is carbon capture and storage, or CCS, which involves burying CO<sub>2</sub> deep  
10 underground. The generating companies have high hopes of it. There are just two problems. No one knows if it will work. And everyone knows that, whether it works or not,  
15 it will be expensive—so much so that the alternative start to look attractive. The one serious attempt to investigate its use in an actual power station, the FutureGen  
20 project, based in Illinois, was cancelled in January because the expected cost had risen from \$830m to \$1.8 billion.
- The “capture” part is not that hard.  
25 Carbon dioxide reacts with a group of chemicals called amines. At low temperatures CO<sub>2</sub> and amines combine. At higher temperatures they separate. Power-station exhaust  
30 can thus be purged of its CO<sub>2</sub>, by running it through an amine bath before it is vented, and the amine can be warmed to release the gas where it will do no harm. Better still, the coal  
35 can be reacted with water to produce a mixture of CO<sub>2</sub> and hydrogen in which the carbon dioxide is much more concentrated than in normal flue gas, so it is easier to scrub out. What  
40 is then burned is pure hydrogen.
- It is what comes next that is the problem. The disposal of carbon dioxide needs to be permanent, so a lot of conditions have to be met. To be a successful burial site, a body of rock  
45 needs to be more than 1km underground. That depth provides enough pressure to turn CO<sub>2</sub> into what is known as a supercritical fluid, a form in which the stuff is more likely to stay put. The rock in question also has to have enough pores and cracks in it to  
50 accommodate the CO<sub>2</sub>. Lastly, it needs to be covered with a layer of non-porous, non-cracked rock to provide a leakproof cap. So far, only three successful CCS projects are under way. None of them is actually linked to generating electricity.
- The scale of the problem is awesome. The three showcase projects each dump about a million tonnes of CO<sub>2</sub> a year. But American electricity industry alone produces  
60 1.5m tonnes, which would mean finding 1,500 appropriate sites. Even transporting that amount of gas would be a huge task. As to the cost, a report published by MIT reckons  
70 on \$25 a tonne to capture CO<sub>2</sub> and pressurise it into a superfluid, and \$5 a tonne to transport it to its burial site. It therefore suggests that power stations which dump CO<sub>2</sub> into the atmosphere should be charged \$30 a tonne.
- Such a charge, whether a tax or a system of tradable permits to pollute, would change energy economics radically but even the most optimistic proponents of carbon capture and storage doubt it  
80 will be a serious alternative much before 2020.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 Is coal currently used as a major fuel for electricity generation?
- 2 What's the connection between coal and electricity?
- 3 Does the coal industry continue to expand in many parts of the world?
- 4 Does coal cause enormous damage to human health and local ecosystems?
- 5 Why do you think countries continue to employ coal-fired power plants even when they pollute the environment?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Coal is classified as a nonrenewable energy source because it takes millions of years to form.
- 2 Coal contains energy that the plants absorbed from the sun – burning coal releases this energy which can be used to generate electricity.
- 3 Generating electricity using coal is currently relatively inexpensive, but the cost is affected by world coal prices, which can be volatile.
- 4 Burning coal doesn't produce greenhouse gas emissions.
- 5 "Clean coal" usually means capturing carbon emissions from burning coal and storing them under the earth.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The amount of oil which a hectare of reactors can produce per year. ....
- 2 The supposed amount of ethanol GreenFuel's reactors can obtain. ....
- 3 The annual amount of CO<sub>2</sub> dumped by each CCS project. ....
- 4 The amount of CO<sub>2</sub> American electricity industry produces. ....
- 5 The number of sites needed for burying 1.5m tonnes of CO<sub>2</sub>. ....
- 6 The amount of money needed for capturing a tonne of CO<sub>2</sub>. ....
- 7 The cost of transporting a tonne of CO<sub>2</sub> to its burial site. ....

## LANGUAGE FOCUS

### A Definitions

Match the words from the text with their corresponding definitions:

- |                         |   |
|-------------------------|---|
| 1 recycling (A, line 4) | a) very simple, usually very small plants that live in or near water; |
| 2 detractor (A, line 5) | b) an area where used, damaged, or unwanted matter is buried;         |
| 3 ultimate (A, line 4)  | c) a person who supports or argues in favour of smth;                 |
| 4 algae (A, line 14)    | d) the activity of reusing things that have already been used;        |

- |    |                                     |    |   |
|----|-------------------------------------|----|---|
| 5  | photosynthesis<br>(A, line 11)      | e) | a person who says bad things about smb or smth in order to make him/her/it seem less good or valuable;    |
| 6  | pipe dream (A, line 5)              | f) | a defeat or piece of bad luck;  |
| 7  | duct (A, line 36)                   | g) | a thing used in place of another;   |
| 8  | exhaust gas(A, line 45)             | h) | unwanted gas;   |
| 9  | substitute (A, line 67)             | i) | a pipe or tube for carrying liquids, air etc;   |
| 10 | reversal of fortune<br>(A, line 78) | j) | the production of special sugar-like substances that keep plants alive, caused by the action of sunlight; |
| 11 | burial site (B, line 44)            | k) | irregular and violent movement of the air;  |
| 12 | turbulence (A, line 48)             | l) | an impossible hope, plan, idea etc;   |
| 13 | proponent (B, line 80)              | m) | the highest point.  |

## B Understanding expressions

Choose the best explanation for each word or phrase from the text.

- |    |   |    |   |
|----|---|----|---|
| 1  | Carbon (A, line 52):  | 2  | Carbon dioxide (A, line 8):   |
| a) | a poisonous yellowish simple substance (element) that shines faintly in the dark and starts to burn when brought out into the air;      | a) | the gas produced when animals breathe out, when carbon is burned in air, or when animal or vegetable matter decays; |
| b) | a simple substance found in a pure form as diamonds, graphite etc or in impure form as coal, petrol etc;                                | b) | a gas that is lighter than air; will not burn and is used in some kinds of lights;                                  |
| c) | a simple substance (element) that is used especially in the production of atomic power.   | c) | a non-metallic substance (element), usually in the form of a greenish-yellow gas.                                   |
| 3  | Ethanol (A, line 66):   | 4  | Petrol (A, line 67):  |
| a) | ordinary alcohol found in alcoholic drinks, it is also used for removing fat and oil;   | a) | a thin oil made from the wood or certain trees, used for removing unwanted paint from clothes, brushes etc;         |
| b) | a heavy silver-white metal that is a simple substance. Is liquid at ordinary temperatures, and is used in thermometers, barometers etc; | b) | a liquid obtained especially from petroleum, used mainly for producing power in the engines of cars, aircraft etc;  |
| c) | poisonous alcohol found in some natural substances, such as wood.   | c) | an oil made from petroleum, coal etc, burnt for heat and in lamps for light.  |
| 5  | Oil (A, line 63):   | 6  | Coal (B, line 34):  |
| a) | any of several types of thick fatty liquid used for cooking;  | a) | rock, earth etc from which metal can be obtained;   |
| b) | petroleum; a mineral oil obtained from below the surface of the earth, and used to produce petrol;                                      | b) | a sort of white limestone that is hard, cold to touch, and used for buildings, statues, gravestones etc;            |
| c) | a pale greenish-yellow oil obtained   | c) | a black or brownish-black mineral   |

from olives, used in cooking and for making salad dressings.

**7 Carbohydrate (A, line 65):**

- a) a common silver-white substance (element), burns with a bright white light, and is used in making fireworks and mixtures of metals;
- b) a soft heavy easily melted greyish-blue metal, used for waterpipes, to cover roofs etc;
- c) any of several substances, such as sugar, which consist of oxygen, hydrogen, and carbon, and which provide the body with heat and power (energy).

which is dug from the earth, which can be burnt to give heat.

**8 Hydrogen (B, line 36):**

- a) a gas that is a simple substance (element), without colour or smell, that forms most of the Earth's air;
- b) a gas, without colour or smell, that is lighter than air, and burns very easily;
- c) a greenish-yellow strong-smelling gas that is a simple substance (element) and is found in many chemical compounds. It is usually added to the water in public swimming pools to help to keep it clean.

**C Complete the sentence**

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 We experienced a ..... in the second half of the game.
- 2 She is one of the strongest ..... of the tax reform.
- 3 Grasses, trees and ..... are raw materials for biofuels.
- 4 The children are very enthusiastic about .....
- 5 The recipe calls for butter, but you can use margarin as a .....
- 6 The concentration of the ..... in the atmosphere is very high.
- 7 Her ..... say she does not really understand ordinary people.
- 8 The flight was very uncomfortable because of .....
- 9 His scheme for building a perpetual-motion machine is just a .....
- 10 To look for the gas leak with a lighted match really was the ..... in stupidity.
- 11 The Weyburn-Midale CO<sub>2</sub> project transports carbon dioxide from a coal gasification plant to its ..... in a depleted oil field in Saskatchewan.

**D Collocations**

Match these verbs and nouns as they occur in the text.

- |           |                       |
|-----------|-----------------------|
| 1 capture | a) oil                |
| 2 reduce  | b) products           |
| 3 grow    | c) hydrogen           |
| 4 diffuse | d) algae              |
| 5 produce | e) exhaust gases      |
| 6 bury    | f) chemical reactions |
| 7 burn    | g) light              |
| 8 warm    | h) emissions          |
| 9 make    | i) carbon dioxide     |

## E Words with similar or related meanings

- 1 The phrase 'power station' (A, para 1) is used to describe a building in which electricity is made. What other phrase is used in the same text with a similar meaning?
- 2 What other word is used in the text (B, para 6) with the same meaning as 'supporter'?
- 3 The word 'constant' is used in the text with the meaning of 'continually happening or repeated'. What other word is used in the text (B, para 4) with a similar meaning to 'constant'?
- 4 The phrase 'carbon dioxide' is used several times in the texts. Find the chemical formula for 'carbon dioxide' (B, para 3).
- 5 Two words are used in the texts (A, para 4; B, para 3) with the meaning of 'to get rid of'. What are they?
- 6 The word 'to dump' is used in paragraph 5 (B). What similar word is used earlier (para 3) in the text?
- 7 The writer uses two different words (A, para 5; B, para 4) in the meaning of 'material'. What are they?

## F Opposites

Find a word in the text that has an opposite meaning.

- |                             |                          |
|-----------------------------|--------------------------|
| a) supporter (A, para 1)    | e) at best (A, subtitle) |
| b) increase (A, subtitle)   | f) combine (B, para 3)   |
| c) light (A, para 3)        | g) low (B, para 3)       |
| d) waste matter (A, para 5) | h) likely (B, para 1)    |

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions.

- |   |              |
|---|--------------|
| a) His statement ..... to be false.                                   | t .... o.... |
| b) An acid can ..... a base to form a salt.                           | r .... w.... |
| c) Water is ..... hydrogen and oxygen.                                | c .... o.... |
| d) The information is ..... to the appropriate government department. | f .... b.... |
| e) The film is ..... a novel by D.H. Lawrence.                        | b .... o.... |
| f) The noise was so loud that she ..... her ears ..... her hands.     | c .... w.... |
| g) I'd like to ..... that if don't leave now we shall miss the bus.   | p .... o.... |
| h) She ..... all her money to the poor.                               | g .... a.... |

## H Questions

Below you will find answers to four different questions. Read the Text B and try to supply the missing questions.

- 1 But although no one has yet commercialised the technology, several groups are trying.
- 2 GreenFuel Technologies, based in Massachusetts, has a different approach.
- 3 The bubbling gas causes turbulence and circulates the algae around the reactor.
- 4 Carbon dioxide reacts with a group of chemicals called amines.
- 5 They doubt it will be a serious alternative much before 2020.

## UNIT 3

## NUCLEAR POWER

### Text: THE SHAPE OF THINGS TO COME

#### *How tomorrow's nuclear power stations will differ from today's*

line	THE agency in charge of promoting nuclear power in America describes a new generation of reactors that will be "highly economical" with		and their neighbours. These new power stations belong to what has been called the third generation of reactors, designs that have been
5	"enhanced safety", that "minimise wastes" and will prove "proliferation resistant". No doubt they will bake a mean apple pie, too.	45	informed by experience and that are considered by their creators to be advanced. But will these new stations really be safer than their predecessors?
10	Unfortunately, in the world of nuclear energy, fine words are not enough. America got away lightly with its nuclear accident. When the Three Mile Island plant in Pennsylvania overheated in 1979	50	Clearly, modern designs need to be less accident prone. The most important feature of a safe design is that it "fails safe". For a reactor, this means that if its control systems stop
15	very little radiation leaked, and there were no injuries. Europe was not so lucky. The accident at Chernobyl in Ukraine in 1986 killed dozens immediately and has affected	55	working it shuts down automatically, safely dissipates the heat produced by the reactions in its core, and stops both the fuel and the radioactive waste produced by
20	(sometimes fatally) the health of tens of thousands at the least. Even discounting the association of nuclear power with nuclear	60	nuclear reactions from escaping by keeping them within some sort of containment vessel. Reactors that follow such rules are called
25	weaponry, people have good reason to be suspicious of claims that reactors are safe.	65	"passive". Most modern designs are passive to some extent and some newer ones are truly so. However, some of the genuinely passive reactors are also likely to be more expensive to run.
30	Yet political interest in nuclear power is reviving across the world, thanks in part to concerns about global warming and energy security. Already, some 441 commercial reactors operate in 31 countries and provide 17% of the planet's electricity, according to America's	70	<b>Safety chain?</b> Nuclear energy is produced by atomic fission. A large atom (usually uranium or plutonium)
35	Department of Energy. Until recently, the talk was of how to retire these reactors gracefully. Now it is of how to extend their lives. In addition, another 32 reactors are	75	breaks into two smaller ones, releasing energy and neutrons. The neutrons then trigger further break-ups. If this "chain reaction" can be controlled, the energy released can be used to boil water, produce steam and drive a turbine that generates
40	being built, mostly in India, China	80	

electricity. If it runs away, the result is a meltdown and an accident (or in extreme circumstances, a nuclear explosion—though circumstances are never that extreme in a reactor because the fuel is less fissile than the material in a bomb).

In many new designs the neutrons, and thus the chain reaction, are kept under control by passing them through water to slow them down. (Slow neutrons trigger more break ups than fast ones.) This water is exposed to a pressure of about 150 atmospheres—a pressure that means it remains liquid even at high temperatures. When nuclear reactions warm the water, its density drops, and the neutrons passing through it are no longer slowed enough to trigger further reactions. That negative feedback stabilises the reaction rate.

Most American nuclear reactors are pressurised-water reactors of this type. So is the reactor being built in Olkiluoto in Finland—the largest planned to date. This reactor will produce 1,600 megawatts when it starts generating electricity, enough by itself to supply the needs of 1.8m households. The Olkiluoto reactor has several protective measures against accidents in addition to its innate design. These include four independent emergency-cooling systems, each capable of taking heat out of the reactor after a shutdown, and a concrete wall designed to withstand the impact, accidental or otherwise, of an aeroplane.

Canada, a country that has spent its entire history trying to distinguish itself from its southern neighbour, has its own nuclear

design, too. Its pressurised heavy-water reactors, known as CANDU, are similar to ordinary pressurised-water reactors (or light-water reactors, as they are sometimes known) but they contain water in which the hydrogen atoms have been replaced by deuterium. Heavy water is expensive. However, the fuel used by CANDU is cheap.

A South African design, called the "pebble-bed", is, however, truly passive. Instead of water, it uses graphite to regulate the flow of neutrons, and instead of making steam, the reactor's output heats an inert or semi-inert gas such as helium, nitrogen or carbon dioxide, which is then used to drive the turbines. The name of the design comes from the fact that the graphite is used to coat pebblelike spheres of nuclear fuel. Like the CANDU design, pebble-bed reactors can be refuelled while running.

Further into the future, engineers are developing designs for so-called fourth-generation plants that could be built between 2030 and 2040. Work on these designs is the job of a ten-nation research programme whose members include America, Britain, China, France, Japan, South Africa and South Korea.

Three of these designs are for fast reactors (which work without any need for the neutrons to be slowed down). But fast reactors have complicated designs that could prove expensive to build.

Whether such reactors would be apple-pie safe is a different question. But 2030 is still a long way away. Plenty of time for the sloganeers to sharpen their pencils.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 How is nuclear energy created? How does it work?
- 2 What are the advantages of nuclear energy?
- 3 How is the safety of nuclear power stations ensured?
- 4 How dangerous is nuclear power compared with other forms of energy?
- 5 What kind of resources does nuclear energy require?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Uranium is the fuel most widely used by nuclear plants for nuclear fission.
- 2 Nuclear energy is cleaner and more environmentally friendly than coal-, oil- or gas-fired power stations.
- 3 Nuclear power is a source of energy that emits greenhouse gases.
- 4 Nuclear power plants provide an energy source that is not sustainable.
- 5 Fourth-generation nuclear plants are offering significant advances in safety.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The number of commercial reactors operating in the world. ....
- 2 The percentage of electricity generated by commercial reactors. ....
- 3 The number of reactors being built in India, China and their neighbours. ....
- 4 A figure showing the pressure of water in new nuclear designs. ....
- 5 The amount of electrical power to be produced by the reactor in Olkiluoto in Finland. ....

## LANGUAGE FOCUS

### A Definitions

Match these terms with their definitions:

- |                               |   |
|-------------------------------|---|
| 1 nuclear energy (line 10)    | <b>a)</b> a process in which the parts of the nucleus (=centre) of an atom are rearranged to form new substances; |
| 2 nuclear power (line 23)     | <b>b)</b> an accident in a nuclear reactor;   |
| 3 nuclear reactor (line 104)  | <b>c)</b> a number of related chemical changes, each of which causes the next;                                    |
| 4 nuclear weaponry (line 23)  | <b>d)</b> the splitting of the nucleus (=centre) of an atom, which results in much power being released;          |
| 5 radioactive waste (line 59) | <b>e)</b> a bomb which explodes because of the atomic reactions inside it and which causes terrible destruction;  |

- |                                      |   |
|--------------------------------------|---|
| <b>6</b> atomic fission (line 72)    | <b>f)</b> very powerful weapon which uses atomic power to cause mass destruction and death;   |
| <b>7</b> nuclear reaction (line 60)  | <b>g)</b> the powerful force that is produced when the nucleus (=central part) of an atom is either splitter or joined to another atom; |
| <b>8</b> nuclear explosion (line 83) | <b>h)</b> (a) material (usually uranium or plutonium) that is used for producing heat or power in a nuclear reactor;                    |
| <b>9</b> nuclear accident (line 12)  | <b>i)</b> power, usually electricity, from nuclear energy;  |
| <b>10</b> chain reaction (line 77)   | <b>j)</b> a large machine that produces nuclear energy, especially as a means of producing electricity;                                 |
| <b>11</b> (nuclear) bomb (line 87)   | <b>k)</b> the radioactive by-products from a nuclear reactor, which are difficult to get rid of safely and are usually buried;          |
| <b>12</b> nuclear fuel (line 148)    | <b>l)</b> the extremely fast release of a large quantity of energy as a result of a nuclear chain reaction.                             |

## **B Understanding expressions**

Choose the best explanation for each word or phrase from the text.

- |  |   |
|--|---|
| <b>1</b> Radiation (line 11):  | <b>2</b> Atmosphere (line 95):  |
| <b>a)</b> something which is radiated;   | <b>a)</b> the mixture of gases that surrounds the Earth;  |
| <b>b)</b> the radiating of heat, light etc;  | <b>b)</b> the standard unit of pressure;  |
| <b>c)</b> radioactivity.   | <b>c)</b> the air, especially in a room.  |
| <b>3</b> Neutron (line 75):  | <b>4</b> Rate (line 103):   |
| <b>a)</b> a very small piece of matter that moves round the nucleus of an atom and that by its movement causes an electric current in metal; | <b>a)</b> a quantity such as value, cost, or speed, measured by its relation to some other amount;                              |
| <b>b)</b> a very small piece of matter that carries no electricity and that together with the proton forms the nucleus of an atom;           | <b>b)</b> a figure showing the number of times one quantity contains another used to show the relationship between two amounts; |
| <b>c)</b> a very small piece of matter that carries positive electricity and that together with the neutron forms the nucleus of an atom.    | <b>c)</b> a charge or payment fixed according to a standard scale.  |
| <b>5</b> Protective measure (line 113):  | <b>6</b> Density (line 98):   |
| <b>a)</b> an action taken to bring about a certain result;   | <b>a)</b> the amount of information that can be stored per unit of space on a magnetic tape or disk;                            |
| <b>b)</b> an instrument used for calculating the stated amount, length, weight etc;  | <b>b)</b> the relation of the amount of matter (the mass) to the space in which the matter is packed (its volume);              |
| <b>c)</b> an action taken to prevent   | <b>c)</b> the quality of being dense.   |

something dangerous from happening.

7 Generation (line 3):

- a) all people of about the same age;
- b) the act or process of generating;
- c) the members of a developing class of things at certain stage.

8 Pressure (line 94):

- a) force or weight onto something;
- b) forceful influence; strong persuasion;
- c) conditions in one's work, one's style of living etc that cause anxiety and difficulty.

### C Word search

Complete the text with the words given below.

A 1 \_\_\_\_\_ was designed by George Westinghouse and adapted from the reactors used in 2 \_\_\_\_\_. Inside a 3 \_\_\_\_\_, water which is kept under high 4 \_\_\_\_\_ to prevent it from boiling has a double function. In a closed 5 \_\_\_\_\_, it serves as a coolant for the 6 \_\_\_\_\_ and as a 7 \_\_\_\_\_ to slow down the fast 8 \_\_\_\_\_ created during 9 \_\_\_\_\_. As the water in the primary loop circulates, it becomes very hot. This 10 \_\_\_\_\_ is then transferred to a 11 \_\_\_\_\_ of water. The resulting 12 \_\_\_\_\_ is used to 13 \_\_\_\_\_ that 14 \_\_\_\_\_.

- |                              |                              |
|------------------------------|------------------------------|
| a) pressure                  | h) generate electricity      |
| b) moderator                 | i) reactor core              |
| c) drive turbines            | j) steam                     |
| d) primary loop              | k) neutrons                  |
| e) heat energy               | l) nuclear submarines        |
| f) pressurised water reactor | m) fission                   |
| g) secondary loop            | n) pressurised water reactor |

### D Words with similar or related meanings

- 1 The adjective 'nuclear' is combined with a number of nouns, such as 'energy', 'accident', 'weapon' etc. What other word from the text can substitute 'nuclear'?
- 2 The word-combination 'nuclear power' is used several times. What other word is used in paragraph 2 with a similar meaning to 'power'?
- 3 The article deals with the question about how tomorrow's nuclear power stations will differ from today's. One more word is used in the text (para 2) with the same meaning as 'station'. What is it?
- 4 What word is used in the text (para 5) with the same meaning as the phrase 'keep under control' (line 89)?
- 5 The verb 'contain' is used in line 136. What other word is used (para 7) that has a similar meaning?
- 6 Two words are used in line 155 that are synonymous. What are they?
- 7 What word from the text could replace the word 'security' (subtitle)?
- 8 "Commercial reactors operate in 31 countries" (para 3). What other word is used in the text (para 4) with a similar meaning to 'operate'?

## E Words that seem similar

- 1 The verbs **1)** 'stabilise' (line 102) and **2)** 'regulate' (line 144) have different meanings. Which of the following definitions fits the word 'stabilise' and which fits the word 'regulate'?
- a) to make work at a certain speed;
  - b) to become firm, stable or unchanging.
- 2 The verbs **1)** 'leak' which is met in the text with the noun 'radiation' (line 15) and the verb **2)** 'escape' which is used in the text with the noun 'waste' (line 60) have slightly different meanings. Match these definitions to the two words:
- a) to get away from an enclosed space;
  - b) to let (a liquid, gas etc) in or out of a hole or crack.
- 3 The phrase **1)** 'nuclear fission' (line 72) shouldn't be confused with the phrase **2)** 'nuclear fusion'. Match these definitions to the two phrases:
- a) a nuclear reaction in which a heavy nucleus splits spontaneously or on impact with another particle, with the release of energy;
  - b) a nuclear reaction in which atomic nuclei of low atomic number fuse to form a heavier nucleus with the release of energy.

## F Opposites

Find a word or phrase in the text that has an opposite meaning.

- |                              |                      |
|------------------------------|----------------------|
| a) cheap (para 4)            | e) similar (para 12) |
| b) slow (para 6)             | f) stop (para 7)     |
| c) retire a reactor (para 3) | g) more (para 5)     |
| d) accident prone (para 4)   | h) light (para 8)    |

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions:

- |  |          |          |          |
|--|----------|----------|----------|
| a) to escape punishment for something wrong that you have done (para 2); | g) ..... | a) ..... | w) ..... |
| b) to (cause to) stop operating (para 4);                                | s) ..... | d) ..... |          |
| c) to split into smaller units (para 5);                                 | b) ..... | i) ..... |          |
| d) to escape (para 5);   | r) ..... | a) ..... |          |
| e) to make or become slower (para 6);                                    | s) ..... | d) ..... |          |
| f) to behave or perform noticeably well (para 8);                        | d) ..... | o) ..... | f) ..... |
| g) to go through (para 6);   | p) ..... | t) ..... |          |
| h) to have as a place or point of origin (para 9).                       | c) ..... | f) ..... |          |

## H References

What do these words refer to in the text?

- |                    |                    |
|--------------------|--------------------|
| a) these (line 31) | f) its (line 130)  |
| b) these (line 4)  | g) its (line 9)    |
| c) ones (line 74)  | h) its (line 98)   |
| d) ones (line 66)  | i) their (line 41) |
| e) it (line 81)    | j) them (line 90)  |

## UNIT 4

## ALTERNATIVE ENERGY

### Text: THE POWER AND THE GLORY

*The next technology boom may well be based on alternative energy. But which sort to back*

line EVERYONE loves a booming  
market, and most booms happen on  
the back of technological change.  
The world's venture capitalists,  
5 having fed on the computing boom  
of the 1980s, the internet boom of  
the 1990s and the biotech and  
nanotech boomlets of the early  
2000s, are now looking around for  
10 the next one. They think they have  
found it: energy.

Many past booms have been  
energy-fed: coal-fired steam power,  
oil-fired internal-combustion  
15 engines, the rise of electricity, even  
the mass tourism of the jet era. But  
the past few decades have been quiet  
on that front. Coal has been cheap.  
Natural gas has been cheap. The  
20 1970s aside, oil has been cheap. The  
one real novelty, nuclear power,  
went spectacularly off the rails. The  
pressure to innovate has been  
minimal.

25 In the space of a couple of years,  
all that has changed. Oil is no longer  
cheap; indeed, it has never been  
more expensive. Moreover, there is  
growing concern that the supply of  
30 oil may soon peak as consumption  
continues to grow, known supplies  
run out and new reserves become  
harder to find.

The price of natural gas, too, has  
35 risen in sympathy with oil. That is  
putting up the cost of electricity.  
Wind- and solar-powered  
alternatives no longer look so costly  
by comparison. It is true that coal  
40 remains cheap, and is the favoured

fuel for power stations in  
industrialising Asia. But the rich  
world sees things differently.

45 In theory, there is a long queue of  
coal-fired power stations waiting to  
be built in America. But few have  
been completed in the past 15 years  
and many in that queue have been  
put on hold or withdrawn, for two  
50 reasons. First, Americans have  
become intolerant of large, polluting  
industrial plants on their doorsteps.  
Second, American power companies  
are fearful that they will soon have  
to pay for one particular pollutant,  
55 carbon dioxide, as is starting to  
happen in other parts of the rich  
world. Having invested heavily in  
gas-fired stations, only to find  
themselves locked into an  
increasingly expensive fuel, they do  
not want to make another mistake.

That has opened up a capacity gap  
and an opportunity for wind and  
sunlight. The future price of these  
resources—zero—is known. That  
certainty has economic value as a  
hedge, even if the capital cost of  
wind and solar power stations is, at  
the moment, higher than that of coal-  
fired ones.

#### **A prize beyond the dreams of avarice**

The market for energy is huge. At  
present, the world's population  
consumes about 15 terawatts of  
power. And by 2050, power  
consumption is likely to have risen  
to 30 terawatts.

Scale is one of the important

differences between the coming energy boom, if it materialises, and its recent predecessors—particularly those that relied on information technology, a market measured in mere hundreds of billions. Another difference is that new information technologies tend to be disruptive, forcing the replacement of existing equipment, whereas, say, building wind farms does not force the closure of coal-fired power stations.

For both of these reasons, any transition from an economy based on fossil fuels to one based on renewable, alternative, green energy—call it like you will—is likely to be slow, as similar changes have been in the past. On the other hand, the scale of the market provides opportunities for alternatives to prove themselves as the margin and then move into the mainstream, as is happening with wind power at the moment. And some energy technologies do have the potential to be disruptive. Plug-in cars, for example, could be fuelled with electricity at a price equivalent to 25 cents a litre of petrol. That could shake up the oil, carmaking and electricity industries all in one go.

This renewed interest in energy is bringing forth a raft of ideas, some bright, some batty, that is indeed reminiscent of the dotcom boom. As happened in that boom, most of these ideas will come to naught. But there could just be PayPal or a Google or a Sun among them.

More traditional companies are also taking an interest. General Electric (GE), a large American engineering firm, already has a thriving wind-turbine business and

is gearing up its solar-energy business. Meanwhile, BR and Shell, two of the world's biggest oil companies, are sponsoring both academic researchers and new, small firms with bright ideas, as is DuPont, one of the biggest chemical companies.

### **The poor world turns greener too**

That, at least, is the view from the rich world. But poorer, rapidly developing countries are also taking more of an interest in renewable energy sources, despite assertions to the contrary by some Western businessmen. It is true that China is building coal-fired power stations at a blazing rate. But it also has a large wind-generation capacity, which is expected to grow by two-thirds this year, and is the world's second-largest manufacturer of solar panels—not to mention having the largest number of solar-heated rooftop hot-water systems in its buildings.

Brazil, meanwhile, has the world's second-largest and most economically honest biofuel industry, which already provides 40% of the fuel consumed by its cars and should soon supply 15% of its electricity, too. South Africa is leading the effort to develop a new class of safe and simple nuclear reactor—not renewable energy in the strict sense, but carbon-free and thus increasingly welcome. These countries, and others like them, are prepared to look beyond fossil fuels. They will get their energy where they can. So if renewables and other alternatives can compete on cost, the poor and the rich world alike will adopt them.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 What are the alternative energy sources?
- 2 Why is solar sometimes termed the primary renewable energy?
- 3 What are the disadvantages of geothermal energy?
- 4 Why is renewable energy preferable?
- 5 What are the benefits of using renewable energy?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Wood still remains the most common source to produce biomass energy.
- 2 Solar energy is one the alternative energy source that is used most widely across the globe.
- 3 Hydrogen energy is completely renewable and can be produced over and over again on demand.
- 4 Many of the wind turbines can capture much power all at once before feeding it to the power grid.
- 5 Alternative sources of energy produce significant amounts of pollution.

### C Information search

Scan the text quickly and find the figures, percentage or sums of money that correspond to the following pieces of information.

- 1 The amount of power which is presently consumed by the world's population. ....
- 2 The amount of power which the world's population is likely to have consumed by 2050. ....
- 3 The cost in cents of a litre of petrol at which plug-in cars could be fuelled with electricity. ....
- 4 The number of the world's biggest oil companies. ....
- 5 The percentage of total fuel consumed by Brazil's cars which is provided by its biofuel industry. ....
- 6 The percentage of total electricity Brazil's biofuel industry supplies. ....
- 7 The percentage of total China's wind-generation capacity by which it is expected to grow. ....

## LANGUAGE FOCUS

### A Definitions

Match the words from the text with their corresponding definitions:

- |                   |  |
|-------------------|--|
| 1 glory (title)   | a) a (period of) rapid growth or increase;                       |
| 2 hedge (line 68) | b) the capacity of the largest sort of coal-fired power station; |

- |   |   |
|---|---|
| <p>3 renewable (line 139)</p> <p>4 nanotech boomlet (line 8)</p> <p>5 boom (line 2)</p> <p>6 biotech boomlet (line 5)</p> <p>7 internal-combustion engine (line 14)</p> <p>8 capacity (line 63)</p> <p>9 fossil fuel (line 165)</p> <p>10 terawatt (line 76)</p> <p>11 gigawatt (line 76)</p> <p>12 alternative energy (subtitle)</p> | <p>c) a matter made of substances that were living things many millions of years ago;</p> <p>d) the use in science and industry of living things such as cells and bacteria to make drugs and chemicals, destroy waste matter etc;</p> <p>e) great fame and admiration;</p> <p>f) machinery methods etc which can perform processes extremely quickly or make or measure objects which are extremely small;</p> <p>g) energy from nonconventional [alternative] sources of energy;</p> <p>h) 1,000 gigawatts;</p> <p>i) that can be renewed, especially by natural processes or good management;</p> <p>j) the amount that something can produce;</p> <p>k) something that gives protection, especially against possible loss;</p> <p>l) an engine which produces power by the burning of a substance, such as petrol, inside itself.</p> |
|---|---|

## B Understanding expressions

Choose the best explanation for each word or phrase from the text.

- |  |  |
|--|--|
| <p>1 Green energy (line 96):</p> <p>a) energy which is produced by a generator;</p> <p>b) energy which does not cause harm to the environment;</p> <p>c) energy which is produced by a wind turbine.</p> <p>3 Information technology (line 84):</p> <p>a) the mathematical principles that deal with information and the sending of information between humans and machines;</p> <p>b) the science of collecting, arranging, storing, retrieving, and sending out information;</p> <p>c) the science or practice of collecting, storing, using, and sending out information by means of computer systems and telecommunications.</p> <p>5 Margin (line 102):</p> <p>a) a process in which the parts of the nucleus (=centre) of an atom are rearranged to form new substances;</p> | <p>2 Novelty (line 21):</p> <p>a) a writer of novels;</p> <p>b) a short, not very serious novel, usually about love;</p> <p>c) the quality of being novel; interesting newness.</p> <p>4 Nuclear reactor (line 160):</p> <p>a) a process in which the parts of the nucleus (=centre) of an atom are rearranged to form new substances;</p> <p>b) a large machine that produces nuclear energy, especially as a means of producing electricity;</p> <p>c) a factory or other place where nuclear weapons might be made.</p> <p>6 Academic researcher (line 130):</p> <p>a) a person with great knowledge of the subjects that are taught to develop the mind rather than to provide practical skills;</p> |
|--|--|

- |   |   |
|---|---|
| <p>b) a large machine that produces nuclear energy, especially as a means of producing electricity;</p> <p>c) a factory or other place where nuclear weapons might be made.</p>   | <p>b) a person who works in a science, especially physics, chemistry, or biology;</p> <p>c) a person who thinks only about the real world and real problems.</p>  |
| <p>7 Scale (line 80):</p> <p>a) size or level in relation to other things or to what is usual;</p> <p>b) a rule or set of numbers comparing measurements on a map or model with actual measurements;</p> <p>c) a set of musical notes in order, upward or downward, and at fixed separations.</p> | <p>8 Avarice (line 73):</p> <p>a) extreme eagerness and desire to get or keep wealth;</p> <p>b) the quality of always thinking about oneself and about what will be best for oneself;</p> <p>c) one's opinion of oneself; selfesteem.</p> |

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 Computer circuitry now includes advanced processes made possible by .....
- 2 The big tax cuts fuelled a consumer .....
- 3 BMW engineers are examining how to make a saloon car that can run with a hydrogen .....
- 4 New Zealand and Sweden import a lot of .....
- 5 Those who died bravely in battle earned everlasting .....
- 6 Buing a house will be a ..... against inflation.
- 7 This factory has a productive ..... of 200 cars a week.
- 8 ..... refers to energy sources that have no undesired consequences such as, for example, fossil fuels or nuclear energy.
- 9 By buying more efficient bridges, over the years, Americans save more than 200 .....-hours annually.
- 10 Sun, wind, and waves are ..... sources of energy.

### D Collocations

Match these verbs and nouns as they occur in the text.

- |                |               |
|----------------|---------------|
| 1 venture      | a) company    |
| 2 mass         | b) boom       |
| 3 industrial   | c) researcher |
| 4 economic     | d) business   |
| 5 energy       | e) power      |
| 6 dotcom       | f) tourism    |
| 7 solar-energy | g) value      |
| 8 academic     | h) plant      |
| 9 chemical     | i) capitalist |
| 10 nuclear     | j) technology |

## E Words with similar or related meanings

- 1 What word is used in the text with the same meaning as 'boom' (para 1)?
- 2 What other adjective is used in the text (para 11) with the same meaning as 'booming' (para 1)?
- 3 The leading energy sources are coal, oil and natural gas (para 2). What is a general term for all of them (para 13)?
- 4 What word from the text could replace the verb 'grow' (para 4)?
- 5 The word 'price' is used in paragraph 4. What word with a similar meaning is used in the same paragraph?
- 6 The adjective 'renewable' is combined with the noun 'energy' (para 9). What other adjectives from the text (subtitle, para 9) can substitute 'renewable'?
- 7 In paragraph 12 there is a phrase 'renewable energy source'. Find two words in the text (para 13) that has a similar meaning.

## F Words that seem similar

- 1 The verbs 1) 'invest' (line 58) and 2) 'sponsor' (line 129) have different meanings. Match these definitions to the two words:
  - a) to support and pay for (part of) an activity;
  - b) to put (money) to a particular use, in order to have a profit.
- 2 The adjective 1) 'favoured' (line 40) and the adjective 2) 'welcome' (line 163) have slightly different meanings. Match these definitions to the two words:
  - a) gladly accepted; received with pleasure;
  - b) having special advantages or desirable qualities.

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions:

- |  |         |                |
|--|---------|----------------|
| a) to search (para 1);                                     | l ..... | a .....        |
| b) to start to behave in a strange, confused way (para 2); | g ..... | o .....        |
| c) to come to an end, so that there is no more (para 3);   | r ..... | o .....        |
| d) to increase in amount (para 4);                         | p ..... | u .....        |
| e) delay (para 5);   | p ..... | o ..... h .... |
| f) to make possible the development of (para 6);           | o ..... | u .....        |
| g) to look for outside the range or limits of (para 13);   | l ..... | b .....        |
| h) to set free (from control, prison, duty etc) (para 9);  | s ..... | u .....        |
| i) to form or make (something) (para 9);                   | b ..... | o .....        |
| j) to produce, especially give birth to (para 10).         | b ..... | f .....        |

## H Prepositions

Complete these sentences with a suitable preposition.

- 1 "The television doesn't work." "Have you plugged it ..... ?"
- 2 They opened the country to trade ..... to trade.
- 3 Don't rely ..... the bank lending you the money.
- 4 The new chairman will shake ..... the company.
- 5 We were looking ..... for a nice place for a new job.
- 6 They've put the price ..... .

## UNIT 5

## SOLAR ENERGY

### Text: BRIGHT PROSPECTS

***Energy: Solar power is in the ascendant. But despite its rapid growth it will not provide a significant share of the world's electricity for decades***

line LAST year Microsoft outfitted its  
campus in Silicon Valley with a  
solar system from Sun-Power, a  
local company that makes high-  
5 efficiency (and, some say, the  
world's best-looking) solar panels.  
A few months later Microsoft's  
arch-rival, Google, began building  
something on an even grander scale-  
10 one of the largest corporate solar  
installations to date. But all of this  
may yet be topped by Wal-Mart. In  
December the retail giant solicited  
bids for placing solar systems on the  
15 roofs of many of its supermarkets.  
Besides producing favourable  
publicity, the appeal of using solar  
power is obvious. Unlike fossil  
fuels, which produce significant  
20 amounts of pollution and enormous  
amounts of greenhouse gases, the  
sun's energy is clean and its supply  
virtually limitless. In just one hour  
the Earth receives more energy from  
25 the sun than human beings consume  
during an entire year. According to  
America's Department of Energy,  
solar panels could, if placed on  
about 0.5% of the country's  
30 mainland landmass, provide for all  
of its current electricity needs.  
Yet since they were first invented  
more than five decades ago,  
photovoltaic solar cells—devices  
35 made of semiconductor materials  
that convert sunlight into electricity—  
have generated much publicity but  
little energy. In 2010 photovoltaic  
systems produced 0.04% of the  
40 world's electricity, according to the  
International Energy Agency. The  
thing that has held back the  
widespread deployment of solar  
panels is their price. Sunshine is  
45 free, but converting it into electricity  
is not. At present, solar power is at  
least two to three times as expensive  
as the typical electricity generated in  
America for retail customers.  
50 Even so, many people believe the  
prospects for solar energy have  
never looked brighter. Decades of  
research have improved the  
efficiency of silicon-based solar  
55 cells from 6% to an average of 15%  
today, whereas improvements in  
manufacturing have reduced the  
price of modules from about \$200  
per watt in the 1950s to \$2.70 in  
60 2010. Within three to eight years,  
many in the industry expect the  
price of solar power to be cost-  
competitive with electricity from the  
grid.  
65 In the meantime, some European  
countries and parts of America have  
instituted subsidies to support the  
adoption of solar power. California's  
"Million Solar Roofs" initiative, for  
70 example, will hand out about \$3  
billion in rebates and other  
incentives over a decade to  
encourage the installation of solar  
panels. In Europe Germany offers  
75 producers of solar power generous  
feed-in tariffs. As a result of such  
incentives, the market for solar  
power has grown by about 40% a

80 year for the past five years. In a  
matter of a few years, solar power  
has become a big business. This  
development has not gone unnoticed  
by America's venture capitalists,  
who have embarked on a spending  
85 spree. Solar power has become one  
of the fastest-growing areas:  
investments have risen from \$59m  
in 2008 to \$308m in 2010.

The main beneficiaries of this  
90 windfall are start-ups, such as  
Nanosolar and Miasole, which are  
based in Silicon Valley and focus on  
new technologies. Both firms are  
betting on "thin film" solar cells,  
95 which can be made with vastly less  
semiconductor material than  
traditional silicon-based devices.  
They also intend to employ new,  
continuous manufacturing processes  
100 that promise to reduce the cost of  
solar panels very quickly in future.

#### **Dawn of a new technology**

Humans have always depended on  
energy from the sun, though it was  
105 exploited mostly indirectly for  
thousands of years. The  
photoelectric effect was not  
discovered until 1839, when  
Alexandre Becquerel, a French  
110 physicist, observed that light could  
generate an electric current between  
two metal electrodes immersed in a  
conductive liquid. About 40 years  
later Charles Fritts, an American  
115 inventor, devised the first solar cell.  
Made with selenium and a thin layer  
of gold, the device was less than 1%  
efficient.

The first terrestrial solar cells were  
120 used for off-grid applications in  
remote locations where placing  
conventional power lines was not  
possible or economical. Among the

earliest buyers of solar panels were  
125 gas and oil companies, which began  
to use solar power in the mid-1970s  
to protect wellheads and  
underground pipelines from  
corrosion and to power navigational  
130 aids on offshore oil rigs. In the  
1980s America's Coast Guard began  
using solar panels to America's  
Coast Guard to buoys. By the early  
1990s solar cells powered hundreds  
135 of diverse off-grid applications  
including telecoms equipment,  
emergency roadside phone boxes,  
and consumer devices such as  
calculators and watches.

#### **Slow sunrise**

The solar industry has in the past  
profited from the manufacturing  
improvements of chipmakers, and is  
now finding ways to benefit from  
145 innovations in other high-tech fields.  
"I think of the silicon solar-cell  
industry as a marriage between the  
semiconductor industry, where it  
gets its base technology, and the CD  
150 industry, which is very high  
volume," says Richard Swan-son,  
SunPower's president.

But despite the growing infusion  
of capital, innovation and talent,  
155 solar power will provide only a tiny  
fraction of the world's electricity  
needs for the foreseeable future.  
Even if the industry continues to  
grow at the same torrid pace, it will  
160 not be able to supply more than 1%  
or so of the world's electricity needs  
for at least another decade. That may  
sound like a gloomy forecast, but  
some regard it as a huge  
opportunity. It means there is a lot  
of room for growth, says Mr  
Roscheisen, Nanosolar's irreverent  
boss.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 Three big companies are mentioned in the article. Rank them in terms of their contribution to the success of solar industry, starting with the one most effective.
- 2 What is the main reason for insufficient deployment of solar panels?
- 3 What measures are taken by developed countries to encourage the adoption of solar power?
- 4 What are the pros and cons of solar energy?
- 5 What is the future of solar energy?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 The company Sun-Power produces highly efficient solar panels.
- 2 By using new technologies, start-ups plan to increase the cost of solar panels.
- 3 The first solar cell was made of silicon and a thin layer of gold.
- 4 Solar power provides only a tiny fraction of the world's electricity needs.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The percentage of the world's electricity produced by photovoltaic systems in 2010. ....
- 2 The percentage by which the market for solar power has grown for the past five years. ....
- 3 The sum of money invested into solar power in America in 2010. ....
- 4 The percentage of the efficiency the first solar cell had. ....
- 5 The sum of money for which modules were bought in 2010. ....

## LANGUAGE FOCUS

### A Definitions

Match these terms with their definitions:

- |  |   |
|--|---|
| 1 photoelectric effect (line 107)          | a) a very small piece of silicon containing a set of electronic parts and their connections, which is used in computers and other machines;     |
| 2 solar cell (line 34)                     | b) a substance, such as silicon, which allows the passing of an electric current more easily than an insulator, but not as well as a conductor; |
| 3 solar panel (line 6)                     | c) an offer to do some work at a certain price;   |
| 4 semiconductor (line 35)                  | d) an apparatus for producing electric power from sunlight;   |
| 5 chip <i>also</i> silicon chip (line 143) | e) the receiver of a benefit or advantage, especially of money or property;   |

- |                                 |   |
|---------------------------------|---|
| <b>6</b> power line (line 122)  | <b>f)</b> the process connected with the generation of electricity between two metal electrodes immersed in a conductive liquid under the influence of light; |
| <b>7</b> grid (line 64)         | <b>g)</b> an unexpected lucky gift or gain, especially money;   |
| <b>8</b> module (line 58)       | <b>h)</b> a very great rival;   |
| <b>9</b> windfall (line 90)     | <b>i)</b> a network of electricity supply wires connecting power stations;  |
| <b>10</b> bid (line 14)         | <b>j)</b> a number of solar cells working together;   |
| <b>11</b> arch-rival (line 8)   | <b>k)</b> an independent part or unit which can be combined with others to form a structure or arrangement;   |
| <b>12</b> beneficiary (line 89) | <b>l)</b> a large wire carrying electricity over land or underground from where the electricity is produced to where it is used.                              |

## **B Understanding expressions**

Choose the best explanation for each word or phrase from the text.

- |  |   |
|--|---|
| <b>1</b> Electricity (line 36):  | <b>2</b> Technology (line 93):  |
| <b>a)</b> the power which is carried usually by wires;   | <b>a)</b> a method of doing something that need skill;  |
| <b>b)</b> the powerful force that is produced when the nucleus of an atom is either split or joined to another atom; | <b>b)</b> knowledge dealing with scientific and industrial methods and their practical use in industry; |
| <b>c)</b> the power which is produced or caused by heat.   | <b>c)</b> a planned way of doing something.   |
| <b>3</b> Installation (line 11):   | <b>4</b> Conductive liquid (line 113):  |
| <b>a)</b> a piece of equipment intended for particular purpose;  | <b>a)</b> (a) liquid containing a solid or gas mixed into it, usually without chemical change;          |
| <b>b)</b> an apparatus in a fixed state ready for use;   | <b>b)</b> (a) liquid able to conduct electricity;   |
| <b>c)</b> something necessary or useful for doing one's job.   | <b>c)</b> a substance which flows, is wet, and has no fixed shape.                                      |
| <b>5</b> Solar system (line 3):  | <b>6</b> Prospect (line 51):  |
| <b>a)</b> the sun together with the planets going round;   | <b>a)</b> the expectation that something will happen as one wishes;                                     |
| <b>b)</b> such a system round another star;  | <b>b)</b> (a) possibility;  |
| <b>c)</b> the system which uses the power of the sun's light.  | <b>c)</b> something which is productive soon.   |
| <b>7</b> Innovation (line 145):  | <b>8</b> Dawn (of) (line 102):  |
| <b>a)</b> a suggested (business) offer, arrangement, or settlement;  | <b>a)</b> the time of day when light first appears;   |
| <b>b)</b> practical ability or skill in a particular area of activity;   | <b>b)</b> the beginning or first appearance of a new period, idea, feeling etc;                         |
| <b>c)</b> a new idea, method, or invention.  | <b>c)</b> at the first light of day.  |

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 These two companies are ..... in the computer industry.
- 2 Over the years the solar industry has been able continuously to reduce the cost of silicon-based .....
- 3 Samsung and LG, a South Korean conglomerate, more often link their appliances with cables and ..... than with wireless technology.
- 4 ..... are used in making transistors.
- 5 As the billions of transistors on the ..... get smaller, there is more room to add extra functions.
- 6 In Japan, where electricity is expensive, solar power is now fully cost competitive with power from the .....
- 7 "Thin film" solar cells use little or no .....
- 8 ..... for building the bridge were invited from British and American firms.
- 9 As prices for silicon have gone up, so have prices of solar .....
- 10 People on high incomes will be the main ..... of these changes in the tax laws.

### D Collocations

Match these verbs and nouns as they occur in the text.

- |             |                        |
|-------------|------------------------|
| 1 convert   | a) efficiency          |
| 2 institute | b) a bid               |
| 3 reduce    | c) solar power         |
| 4 generate  | d) a process           |
| 5 use       | e) cost                |
| 6 improve   | f) light               |
| 7 employ    | g) an electric current |
| 8 protect   | h) a subsidy           |
| 9 place     | i) a power line        |
| 10 solicit  | j) wellheads           |

### E Words with similar or related meanings

- 1 Two words are used many times with the meaning of 'force that can be used for doing work, driving a machine, or producing electricity'. What are these?
- 2 What other word is used in the text (para 2) with the same meaning as 'sunlight' ?
- 3 The collocation 'manufacturing improvements' is used in paragraph 8. What word is used in the same paragraph with a similar meaning?
- 4 What phrase is used in paragraph 5 with a similar meaning to 'innovations' (line 154)?
- 5 What phrase (para 5) could replace the phrase 'at the torrid pace' (line 159)?
- 6 The phrase 'infusion of capital' is used in line 153. What word with a similar meaning is used earlier in the text (para 4)?
- 7 The phrase 'produce electricity' is used in line 39. What other phrase is used in paragraph 5 with the same meaning?
- 8 The verb 'invent' is used in line 32. What word with a similar meaning is used in paragraph 6?

## F Words that seem similar

- 1 The words **1)** 'economical' (line 123) and **2)** 'efficient' (line 118) have slightly different meanings. Match these words with their definitions:
- a) using money, time, goods etc, carefully and without waste;
  - b) working well, quickly, and without waste.
- 2 The adjectives **1)** 'significant' (line 19) and **2)** 'enormous' (line 20) which describe the noun 'amounts' have completely different meanings. Match these definitions to the two words:
- a) of noticeable importance, effect, or influence;
  - b) extremely large.
- 3 The verb **1)** 'devise' (line 117) and the noun **2)** 'device' (line 117) are confusingly related words. Match these words with their meanings:
- a) an invention or plan;
  - b) invent, create, contrive.
- 4 The adjectives **1)** 'conventional' (line 122), **2)** 'typical' (line 48) and **3)** 'traditional' (line 97) have slightly different meanings. Match these definitions to the three words:
- a) produced, done, or used in accordance with tradition;
  - b) following accepted customs and standards, sometimes too closely and without originality;
  - c) exhibiting the qualities, traits, or characteristics that identify a kind, class, group, or category.
- 5 The phrasal verbs **1)** 'profit from' and **2)** 'benefit from' (para 8) have different meanings. Match them with their meanings:
- a) to make a profit from something;
  - b) to get help or an advantage from something.

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions:

- |  |         |         |
|--|---------|---------|
| a) to supply (para 1);                                       | p ..... | f ..... |
| b) to refrain from (para 2);                                 | h ..... | b ..... |
| c) to distribute (para 4);                                   | h ..... | o ..... |
| d) to direct one's attention to something (para 5);          | f ..... | o ..... |
| e) to risk (money) on the result of a future event (para 5); | b ..... | o ..... |
| f) to rely on (para 6);                                      | d ..... | o ..... |
| g) to gain advantage (as a result of something) (para 8).    | b ..... | f ..... |
| h) to begin doing something.                                 | e ..... | o ..... |

## H Understanding meanings

Choose the right definition of the word 'room' in the phrase 'there is a lot of room for growth' as it is given in the text (line 165):

- a) space available for something;
- b) opportunity for doing something;
- c) the people present in a room;
- d) a part or division of a building enclosed by walls, floor, and ceiling.

## UNIT 6

## WIND POWER

### Text A: WHERE THE WIND BLOWS

*A grandiose plan to link Europe's electricity grids may recast wind power from its current role as a walk-on extra to being the star of the show*

line	WIND power has two problems. You don't always get it where you want it and you don't always get it when you want it. According to Dr	40	Put like this, a Europe-wide grid seems an obvious idea. That it has not yet been built is because AC
5	Schmid, the head of ISET, an alternative-energy institute at the University of Kassel, in Germany, continent-wide power distribution systems in a place like Europe	45	power lines would lose too much power over such large distances. Hence the renewed interest in DC.
10	would deal with both of these points. The question of where the wind is blowing, would no longer matter because it is almost always blowing somewhere. If it were windy in	50	Dr Schmid calculates that a DC grid of the sort he envisages would allow wind to supply at least 30% of the power needed in Europe. Moreover, it could do so reliably—and that means wind power could be used for base-load power supply.
15	Spain but not in Ireland, current would flow in one direction. On a blustery day in the Emerald Isle it would flow in the other.	55	A group of Norwegian companies have already started building high-voltage DC lines between Germany, Scandinavia and the Netherlands though these are intended as much to sell the country's power as to accumulate other people's. And
20	Dealing with when the wind blows is a subtler issue. In this context, an important part of Dr Schmid's continental grid is the branch of Norway. It is not that Norway is a huge consumer. Rather,	60	Airtricity—an Irish wind-power company—plans even more of them. It proposes what it calls a Supergrid. This would link offshore wind farms in the Atlantic ocean and the Irish,
25	the country is well supplied with hydroelectric plants. These are one of the few ways that energy from transient sources like the wind can be stored in grid-filling quantities.	65	North and Baltic seas with customers throughout northern Europe.
30	The power is used to pump water up into the reservoirs that feed the hydroelectric turbines. That way it is on tap when needed. The capacity of Norway reservoirs is so large, that	70	Airtricity reckons that the first stage of this project, a 2,000 turbine-strong farm in the North Sea, would cost about \$2.7 billion. That farm would generate 10 gigawatts. An equivalent amount of coal-fired capacity would cost around \$2.3 billion. Such offshore farms certainly work. Airtricity
35	should the wind drop all over Europe—which does happen on rare occasions—the hydro plants could spring into action and fill in the gap for up to four weeks.	75	already operates one in the Atlantic, and though it currently has a capacity of only 25 megawatts, increasing that merely means adding more turbines.

## Text B: TRAPPED WIND

### *Compressed air might help to make wind power more reliable*

line Wind-power turbines have played an  
important step in renewable energy  
but now the future of wind power  
may be underground. By using  
5 compressed-air energy storage  
plants, air is pumped into large  
underground formations where it  
can be used later to deliver a large  
amount of energy that it received.

10 Pumping water into the reservoir  
of a hydroelectric power plant may  
be a good way of storing energy  
captured by wind farms—but what if  
15 there are no such plants to hand and  
no high-tension lines to reach them?  
One answer is to use the energy to  
compress air, which can be  
squirrelled away in hermetically  
20 sealed underground caverns. Then,  
when electricity is needed, the air  
can be released and used to turn a  
generator. Compressed air energy  
storage involves converting  
25 electrical energy into high-pressure  
compressed air that can be released  
at a later time to drive a turbine  
generator to produce electricity.

At the moment, however, there  
30 are only two compressed-air-energy-  
storage plants in the world (one in  
America and one in Germany), and  
neither was built to make use of  
wind power. Instead, they are  
designed to take advantage of  
35 variations in the price of electricity.  
When power is cheap, it is used to  
run their compressors. When it is  
expensive, the valves are opened  
and the generators turn.

40 Compressed-air plants are  
inefficient, and so they are  
commercially viable only in places

where the price of power varies  
dramatically. But the intermittent  
45 nature of wind power can cause just  
that sort of variability. By 2011, a  
wind-powered compressed-air plant  
had been built in Iowa.

50 Meanwhile, General Compression,  
a small firm based in Attleboro,  
Massachusetts, is taking another  
approach. Its windmill compresses air  
directly. This has the advantage of  
eliminating two wasteful steps: the  
55 conversion of the mechanical power of  
a windmill into electricity and its  
subsequent reconversion into  
mechanical power in a compressor.  
But an air-compressing windmill,  
60 while fine for storing energy, cannot  
transmit electricity directly to the grid.  
The firm will not produce its first  
prototype until 2020, but sceptics  
already worry that what it gains on the  
65 swings, it will lose on the roundabouts  
—or, in this case, on the turbines.

Most other compressed air energy  
storage plants operate under the  
same principle, although to increase  
70 efficiency they are more focused on  
retaining the heat associated with  
compression. One of the major  
issues with compressed air energy  
storage is that when you compress  
75 air it heats up. When the electricity  
is required it needs to be expanded,  
which requires heat. In addition, the  
cooler the air, the more you can  
store. Companies are therefore trying  
80 to find ways to store the heat  
generated during compression, so it  
can then be used to heat the air for  
the expansion helping drive more  
efficiency in the overall process.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 What is wind energy?
- 2 What are the advantages of wind-generated energy?
- 3 What are the economic obstacles to greater wind power usage?
- 4 Are there environmental problems facing wind power?
- 5 Why do we need energy storage?
- 6 What countries produce the most wind energy in the world?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Compressed air energy storage is a way to store energy generated at one time for use at another time using compressed air.
- 2 Wind power consists of converting the energy produced by the movement of wind turbine blades driven by the wind into mechanical energy.
- 3 Wind energy is a source on non-renewable energy.
- 4 Wind energy has the potential to become the backbone of a future secure global energy supply.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The cost of the first stage of the Supergrid. ....
- 2 The sum of money equivalent to €2 billion. ....
- 3 The capacity of the farm to be built in the North Sea. ....
- 4 The cost of an amount of coal-fired capacity equivalent to that of the capacity of the farm. ....
- 5 The capacity of the offshore farm which operates in the Atlantic. ....
- 6 The number of turbines to be built in the North Sea. ....

### D How the text is organized

These phrases summarise the main idea of each paragraph. Match each phrase with the correct paragraph:

- | Text A  | Text B  |
|---|---|
| 1 advantages of a dc grid;                    | 1 attempts of companies to store heat;                    |
| 2 perspectives of the airtricity's project;   | 2 the way of storing energy;                              |
| 3 designation of dc lines in northern europe; | 3 how a compressed-air energy storage plant operates;     |
| 4 problems of wind power;                     | 4 the approach of general compression;                    |
| 5 how hydroelectric plants work in norway;    | 5 building a compressed-air plant in the american midwes; |
| 6 where the wind is blowing.                  | 6 the future of wind power.                               |

## LANGUAGE FOCUS

### A Definitions

Match the words from the text with their corresponding definitions:

- |                                      |   |
|--------------------------------------|---|
| 1 wind power (A, line 1)             | a) a place where liquid is stored;  |
| 2 voltage (A, line 55)               | b) a part of a machine, for compressing gas or air;   |
| 3 hydroelectric turbine (A, line 32) | c) a structure with large sails or similar parts which are turned round by the wind, used to produce power for electricity;                     |
| 4 reversion (B, line 57)             | d) a large wire carrying a powerful electrical power;   |
| 5 reservoir (A, line 31)             | e) power produced by wind;  |
| 6 current (A, line 15)               | f) a doorlike part of a pipe or tube which opens and shuts so as to control the flow of liquid, air, gas etc through it;                        |
| 7 capacity (A, line 33)              | g) the amount that something can hold or contain;   |
| 8 valve (B, line 38)                 | h) a continuously moving mass of liquid or gas, especially one flowing through slower-moving liquid or gas;                                     |
| 9 prototype (B, line 63)             | i) the first form of something, especially of a machine or industrial product, from which all later forms develop, sometimes with improvements; |
| 10 compressor (B, line 37)           | j) electric force measured in volts;  |
| 11 windmill (B, line 52)             | k) an engine or motor in which the pressure of water, usually at very high temperatures, drives a special wheel, producing a circular movement; |
| 12 high-tension line (B, line 15)    | l) conversion back to a previous state.   |

### B Understanding expressions

Choose the best explanation for each word or phrase from the text.

- |  |   |
|--|---|
| 1 Generator (B, line 22):  | 2 Power supply (A, line 52):  |
| a) a piece of machinery with moving parts which changes power from steam, oil etc; | a) a steep downward movement of an aircraft with the engines working;       |
| b) a machine that generates something, especially electricity;                     | b) the flow of electricity to a building, machine etc;                      |
| c) a small machine for crushing or grinding the stated solid material.             | c) (a system for) the supplying for something needed.                       |
| 3 Alternative energy (A, line 6):  | 4 Grid (A, line 22):  |
| a) the energy that is different from usual or traditional one;                     | a) the power which is produced by various means, which is carried by wires; |
| b) the energy produced by conventional power stations;                             | b) the wires and other equipment that work an electrical apparatus;         |
| c) the energy produced by underground sources of steam.                            | c) a network of electricity supply wires connecting power stations.         |

- |   |   |
|---|---|
| <p><b>5</b> Alternating current (AC) (A, line 42):</p> <ul style="list-style-type: none"> <li><b>a)</b> a flow of electricity that regularly changes direction at a very fast rate</li> <li><b>b)</b> the flow of electrons in one direction around a circuit</li> <li><b>c)</b> the direction of a current of water</li> </ul>   | <p><b>6</b> Current (A, line 45):</p> <ul style="list-style-type: none"> <li><b>a)</b> something flowing or moving forward continuously;</li> <li><b>b)</b> a natural flow of water moving across country between banks of a river;</li> <li><b>c)</b> the flow of electricity past a fixed point.</li> </ul> |
| <p><b>7</b> Power line (A, line 43):</p> <ul style="list-style-type: none"> <li><b>a)</b> a long mark used as a limit or order;</li> <li><b>b)</b> a large wire, carrying electricity over land or underground from where electricity is produced to where it is used;</li> <li><b>c)</b> (a piece of) string or cord.</li> </ul> | <p><b>8</b> Direct current (DC) (A, line 45):</p> <ul style="list-style-type: none"> <li><b>a)</b> the flow of electrons back and forth;</li> <li><b>b)</b> a flow of electricity that moves in one direction only;</li> <li><b>c)</b> the flow of neutrons in a wire.</li> </ul>                             |

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1** The fuel tank has a ..... of 12 gallons.
- 2** High ..... is the best way to transmit power.
- 3** Power is transmitted along .....
- 4** The ..... is strongest in the middle of the river.
- 5** When ..... of water into ice occurs, it freezes.
- 6** In a ..... a wheel of special blades is driven round at high speed by water.
- 7** The ..... of the heart and blood vessels allow the blood to pass in one direction only.
- 8** A ..... forces substances into less space.
- 9** The first ..... were used for crushing grain.
- 10** The volume of this ..... is 100,000 cubic meters.

### D Collocations

Match these verbs and nouns as they occur in the text.

- |   |   |
|---|---|
| <ol style="list-style-type: none"> <li><b>1</b> store</li> <li><b>2</b> pump</li> <li><b>3</b> supply</li> <li><b>4</b> link</li> <li><b>5</b> convert</li> <li><b>6</b> turn</li> <li><b>7</b> open</li> <li><b>8</b> take</li> <li><b>9</b> compress</li> <li><b>10</b> transmit</li> </ol> | <ol style="list-style-type: none"> <li><b>a)</b> a valve</li> <li><b>b)</b> air</li> <li><b>c)</b> an approach</li> <li><b>d)</b> mechanical power</li> <li><b>e)</b> electricity</li> <li><b>f)</b> a generator</li> <li><b>g)</b> energy</li> <li><b>h)</b> power</li> <li><b>i)</b> water</li> <li><b>j)</b> wind farms</li> </ol> |
|---|---|

## E Words search

Find a word in the text that has a similar meaning:

- |                                 |                                    |
|---------------------------------|------------------------------------|
| a) power (B, para 2);           | f) quantity (A, para 6);           |
| b) mean (A, para 2);            | g) huge (A, para 3);               |
| c) operate (A, para 6);         | h) high-tension (A, para 5);       |
| d) wind farm (A, para 5);       | i) underground cavern (B, para 2); |
| e) problem (A, para 2, para 3); | j) capture (B, title).             |

## F Words that seem similar

- 1 The words 'variation' (B, line 35) and 'variability' (B, line 46) have slightly different meanings. Which of the following definitions fits the word 1) 'variation' and which fits the word 2) 'variability'?
- a) having the tendency to vary, not to stay the same or steady;
  - b) (an example or degree of) varying.

## G Prepositions

Complete these sentences with a suitable preposition.

- 1 When a windmill compresses air, it converts a mechanical power .....electricity.
- 2 In direct current electrons flow ..... one direction.
- 3 At present, power is mostly supplied ..... traditional power stations.
- 4 Wind power can be used ..... the production of electric power.
- 5 The Global Network Institute, based in California, reckons that wind and geothermal power could be gathered ..... places like South America and Siberia.
- 6 Edison was right to argue that DC is the best way to transmit electricity ..... any given voltage.
- 7 Wind power gives power which is very consistent from year ..... year.

## H Questions

Below you will find answers to five different questions. Read the Text B and try to supply the missing questions.

- 1 .....?  
They are designed to take advantage of variations in the price of electricity.
- 2 .....?  
They decided to build a wind-powered compressed-air plant in Iowa.
- 3 .....?  
Two wasteful steps.
- 4 .....?  
\$2.3 billion.
- 5 .....?  
By 2011.

## I Culture note

- 1. Emerald Isle, the name for Ireland, used in literature, often humorously.
- 2. Iowa, a state in the Midwestern United States.
- 3. Massachusetts, a state in the northeast of the US which has Boston as its capital city.

## UNIT 7

## GEOHERMAL ENERGY

### Text A: BLOWING HOT AND COLD

#### *Geologists are getting more juice out of the ground*

line GOLDILOCKS, the fussy, blonde,  
larcenous heroine of an English  
children's story, liked her porridge  
neither too hot, nor too cold, but just  
5 right. Most engineers looking for 45  
underground sources of steam to  
generate geothermal power have  
similar tastes. If the steam is much  
colder than 150°C, it will start to  
10 condense into water before it can be 50  
used to turn a turbine. On the other  
hand, steam hotter than 400°C,  
although richer in energy, is harder  
to find and to handle. Two new  
15 projects, however, aim to push back 55  
both these limits.

Geothermal power stations tap  
aquifers heated by contact with hot  
rocks in volcanic regions—or, in hot  
20 but dry spots, they pump water past 60  
such rocks to heat it up. The  
temperature of the steam produced  
varies, depending on how hot the  
source is and how much heat it loses  
25 on its way to the surface. 65

Not all geothermal activity is hot  
enough to bring water to the boil.  
The Chena hot springs, in Alaska,  
for example, are just right for  
30 bathers, at a porridge-like 43°C, but 70  
not much use for traditional  
geothermal power generation. Even  
within the spa's wells, the water is  
only 74°C. Nonetheless, its owners,  
35 in conjunction with United 75  
Technologies, an engineering  
conglomerate, have worked out how  
to generate power from the tepid  
flow—the coldest ever used in a  
40 geothermal plant. 80

The power station at Chena uses  
the spring water to heat up R134a, a  
fluid hitherto employed mainly as a  
refrigerant. Since R134a has a  
relatively low boiling point, the  
water is hot enough to convert it into  
a gas. This gas is used to drive the  
turbine just as steam would be. Icy  
water from a nearby river then cools  
the gas back to liquid form, to start  
the cycle again. The idea of using a  
liquid with a lower boiling point  
than water to drive a turbine is  
nothing new—it has simply not  
proved worthwhile in the past.

In Iceland, meanwhile, consortium  
of utilities is teaming up to do just  
the opposite: harness steam that is  
much hotter than the norm. The  
wells of most geothermal plants are  
about 2km deep. But the Icelandic  
outfit hopes to drill to depths of 4km  
or more, to get closer to the magma  
that rises towards the surface along  
local faultlines. In such areas the  
steam might be as hot as 600°C.

Tapping this steam would be  
expensive, since it would require not  
only extra building materials, but  
also more durable ones, to cope with  
the higher pressures and  
temperatures. But Olafur Flovenz, of  
Iceland Geosurvey, believes that  
although the costs might increase,  
the amount of electricity generated  
could rise by as much as ten times. If  
the project succeeds, it would bring  
the costs down even further. Better  
yet, it could be replicated in any  
country with a volcano.

## Text B: BENEATH YOUR FEET

### *Geothermal could be hot*

line THE Phillipines are not generally  
associated with the cutting edge of  
technological change. In one  
respect, though, the country is ahead  
5 of its time: around a quarter of its  
electricity is generated from  
underground heat. Such heat is free,  
inexhaustible and available day and  
night.

10 It is also a part of geology that  
sees parts of the country devastated  
by volcanic eruptions from time to  
time. The geysers that turn the  
generators are merely the gentlest  
15 manifestations of this volcanism.  
The question that exercises Jefferson  
Tester, a researcher at MIT, is  
whether it is possible to have the one  
without the other. The Earth's  
20 depths are, above all, hot  
everywhere. So if there is no natural  
volcanism around to bring this heat  
to the surface, his answer is to create  
controlled, artificial volcanism—what  
25 is known as an engineered  
geothermal system (EGS). Instead of  
relying on natural hot springs, you  
make your own.

30 In principle, this is easy. Drill  
two parallel holes in the ground, a  
few hundred metres apart, and carry  
on drilling until the rock is hot  
enough (say 200°). Then pump cold  
water down one hole and wait for it  
35 to come back the other at a suitably  
elevated temperature. The  
superheated water turns to steam  
which you use to power a generator.  
In Dr Tester's view, the reason this  
40 source of power is neglected is that  
it is invisible. Everybody feels the  
wind and the sun, but only miners

notice that the Earth's interior is hot,  
so no one thinks of drilling for that  
heat.

45 Dr Tester reckons that spending  
about \$1 billion on demonstration  
projects over the next 15 years  
would allow 100 gigawatts-worth of  
EGSS to be created in America by  
50 2050, at a commercially acceptable  
price.

#### **Rock-hard**

55 Extracting this subterranean energy  
is not as easy as it sounds. Until the  
term EGS was coined, the field was  
known as hot-dry-rock geothermal  
energy. A century of data collected  
by oil companies suggest it is  
impermeable rocks such as granite  
that are the most effective reservoirs  
of heat. Their very dryness increases  
their heat capacity. But to get the  
heat out you have to make them  
60 permeable. Hence the “engineered”  
is the new name.

The Cooper Basin in South  
Australia has the hottest non-  
volcanic rocks of any known place  
70 in the world, and Australia leads the  
field in exploiting subterranean heat,  
with seven firms snooping around  
the area. One of them, Geodynamics,  
recently completed what it claims is  
a commercial-scale well. And the  
turbines will also turn soon at an  
experimental non-commercial  
project at Soultz, in France.

80 If it can be made to work, EGS has  
got the lot. No unsightly turbines.  
No need to cover square kilometres  
of land with vast mirrors. And it is  
always on. Anybody got a billion  
dollars handy?

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 What is geothermal energy?
- 2 Why is geothermal energy “environmentally friendly”?
- 3 Why is geothermal energy considered a renewable resource?
- 4 How does geothermal energy work?
- 5 What is the future of geothermal energy?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Geothermal energy is thermal energy generated and stored in the Earth.
- 2 Geothermal energy is renewable because the Earth has retained a huge amount of the heat energy that was generated during formation of the planet.
- 3 The source of geothermal power is the sand contained inside the Earth.
- 4 Geothermal energy refers to the production of energy using the internal heat of the Earth's crust.
- 5 There are many advantages of geothermal energy.

### C Information search

Scan the text quickly and find the figures, percentage or sums of money that correspond to the following pieces of information.

- 1 The degree of heat of steam at which it starts to condense into water. ....
- 2 The temperature of steam at which it is richer in energy. ....
- 3 The temperature of water within the spa's wells at Chena. ....
- 4 The supposed temperature of steam according to “IDDP”. ....
- 5 The depth of wells of most geothermal plants. ....
- 6 The sum of money to be spent on demonstration projects. ....
- 7 The amount of electricity the EGSS will generate in America by 2050. ....

### A Definitions

Match the words from the text with their corresponding definitions:

- |                                     |   |
|-------------------------------------|---|
| 1 geothermal energy<br>(B, line 57) | a) the most advanced position, where important action is taken;                         |
| 2 geothermal plant<br>(A, line 40)  | b) something that produces power, such as electricity, gas, or petrol;                  |
| 3 cutting edge (B, line 2)          | c) the energy produced from the heat found deep inside the earth;                       |
| 4 boiling point (A, line 52)        | d) a place where water can be taken from underground;                                   |
| 5 well (A, line 60)                 | e) the temperature at which a liquid boils;   |
| 6 juice (A, subtitle)               | f) a hydroelectric power station which transforms the Earth's interior heat into power; |

- |                             |  |
|-----------------------------|--|
| 7 refrigerator (A, line 44) | <b>g)</b> a set of things needed for a particular purpose a set of things needed for a particular purpose; |
| 8 spa (A, line 33)          | <b>h)</b> the line of crack in the Earth's surface along which one band of rock has slid against another;  |
| 9 source (A, line 6)        | <b>i)</b> (of a volcano) outpouring of fire, lava etc;   |
| 10 faultline (A, line 65)   | <b>k)</b> a place with a spring of mineral water where people come for cures of various diseases;          |
| 11 eruption (B, line 12)    | <b>l)</b> a place from which something comes;  |
| 12 subterranean (B, 54)     | <b>m)</b> being, lying, or operating under the surface of the earth;                                       |
| 13 outfit (A, line 62)      | <b>n)</b> a substance that is used to refrigerate.   |

## **B Understanding expressions**

Choose the best explanation for each word or phrase from the text.

- |  |  |
|--|--|
| 1 Steam (A, line 6):   | 2 Spring (A, line 28):   |
| a) water in the state of a gas produced by boiling;  | a) the place where a river enters a lake, larger river, or the ocean;                          |
| b) substance like air, which is not solid or liquid and usually cannot be seen;                      | b) a place where water naturally flows out from the ground;                                    |
| c) a very small drop of liquid.  | c) a stream or river that flows into a larger one.   |
| 3 Rock (A, line 19):   | 4 Magma (A, line 63):  |
| a) a very high hill, usually a bare or snow-covered one;   | a) a set of substances mixed together so as to give a combined effect;                         |
| b) solid mineral material used in the building industry;   | b) hot melted rock found below the solid surface of the earth;                                 |
| c) the solid mineral material forming part of the surface of the earth and other similar planets.    | c) (a) liquid containing a solid or gas mixed into it, usually without chemical change.        |
| 5 Flow (A, line 39):   | 6 Granite (B, line 60):  |
| a) a large amount of ice, snow, dirt, or rock falling suddenly down the side of a mountain;          | a) a hard solid substance found in the ground and often used for building houses;              |
| b) movement of something in one direction;   | b) a type of rock containing calcium and other substances;                                     |
| c) an overflow of a large amount of water beyond its normal limits.                                  | c) a very hard usually grey rock, used for building and making roads.                          |
| 7 Geyser (B, line 13):   | 8 Volcano (A, line 80):  |
| a) a large area of water, surrounded by land;  | a) (a loud noise caused by) an act of exploding;   |
| b) a natural spring of hot water which from time to time rises suddenly into the air from the earth; | b) a sudden shaking of the earth's surface, which may be violent enough to cause great damage; |

- c) water of a stream, river, etc, falling straight down over rocks, sometimes from a great height.
- c) a hot spring in which water intermittently boils, sending a tall column of water and steam into the air.

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 Oil has a low .....
- 2 Our car uses a lot of .....
- 3 We'll have to find a new ..... of income.
- 4 There have been several volcanic ..... this year.
- 5 ..... became very fashionable places in the UK and Europe in the 18th and 19th centuries.
- 6 Before drilling they tested all their .....
- 7 Electricity generated by ..... is much cheaper than that generated by hydroelectric power stations.
- 8 The old ..... in the village had a wall round it and a bucket that could be lowered for water.
- 9 This new model is at the ..... of computer technology.
- 10 Magma rises towards the earth surface along local .....

### D Collocations

Match these verbs and nouns as they occur in the text.

- |             |                         |
|-------------|-------------------------|
| 1 drive     | a) steam                |
| 2 generate  | b) subterranean energy  |
| 3 pump      | c) information          |
| 4 require   | d) artificial volcanism |
| 5 replicate | e) a generator          |
| 6 harness   | f) a turbine            |
| 7 turn      | g) a project            |
| 8 create    | h) building material    |
| 9 provide   | i) water                |
| 10 extract  | j) geothermal energy    |

### E Words with similar or related meanings

- 1 The phrase 'is available day and night' is used in paragraph 1 (B). What other phrase is used in the last paragraph of the text with a similar meaning?
- 2 What word (A, para 1) could replace the word 'subterranean' (B, para 5)?
- 3 The noun 'well' is used several times in the text. What other word has a similar meaning in the text (B, para 3)?
- 4 The verb 'harness' is used in the text (A, line 58). What other words are used there (A, para 4) with a similar meaning to 'harness'?
- 5 The slang 'juice' (A, subtitle) has its equivalent in the text B (para 1). What is it?
- 6 The word 'reservoir' is used in line 62 (B). What word with a similar meaning is used earlier in the text?

## F Words that seem similar

The words **1)** 'source' (A, line 6) and **2)** 'spring' (A, line 28) have different meanings.

Match these definitions to the two words:

- a) a place where water comes up naturally from the ground;
- b) a place from which something comes.

## G Phrasal verbs

Find phrasal verbs in the text that match these definitions:

- |  |         |         |
|--|---------|---------|
| a) to change into another form, substance, or state (A, para 4). | c ..... | i ..... |
| b) to make or become warm or hot (A, para 2).                    | h ..... | u ..... |
| c) to work together for a shared purpose (A, para 5).            | t ..... | u ..... |
| d) to try to find (A, para 1).                                   | l ..... | f ..... |
| e) to deal successfully with a difficult situation (A, para 6).  | c ..... | w ..... |
| f) to cause to fall or come down (A, para 6).                    | b ..... | d ..... |
| g) to continue, especially in spite of difficulties (B, para 3). | c ..... | o ..... |
| h) to use as a base for future action (B, para 6).               | g ..... | o ..... |
| i) to find by reasoning or calculating (A, para 3).              | w ..... | o ..... |
| j) to depend on (B, para 2).                                     | r ..... | o ..... |

## H Word search

Find a word in the text that has a similar meaning:

- |                               |                        |
|-------------------------------|------------------------|
| a) hard (A, para 1)           | h) price (A, para 6)   |
| b) heat (up) (A, para 3)      | i) coin (B, para 2)    |
| c) region (A, para 5)         | j) company (A, para 3) |
| d) convert (into) (A, para 4) | k) energy (A, para 1)  |
| e) elevate (B, para 3)        | l) let (A, para 4)     |
| f) plant (A, para 2)          | m) force (B, para 6)   |
| g) create (B, para 2)         | n) land (B, para 3)    |

## I Opposites

Find a word in the text that has an opposite meaning.

- |                          |                         |
|--------------------------|-------------------------|
| a) lose (A, para 1)      | e) natural (B, para 2)  |
| b) high (A, para 4)      | f) increase (A, para 6) |
| c) permeable (B, para 5) | g) hot (A, para 1)      |
| d) hard (B, line 3)      | h) without (A, para 2)  |

## F Culture note

- 1 Alaska, the largest state in the US, which is northwest of Canada.
- 2 Goldilocks, the main character in the children's story *Goldilocks and the Three Bears*.
- 3 Iceland, an island country in the Atlantic Ocean south of the Arctic Circle.
- 4 MIT, *abbrev.* for Massachusetts Institute of Technology: an important and respected US university in Cambridge, Massachusetts.
- 5 Phillipines, a country made up of over 700 islands off the southeast coast of Asia. Capital: Manila.

**Text: WOODSTOCK REVISITED**

***Energy: Could new techniques for producing ethanol make old-fashioned trees the biofuel of the future?***

line MANKIND has used trees as a  
source of fuel for thousands of  
years. But now the notion of  
exploiting trees for fuel is being  
5 updated with a high-tech twist. The  
idea is to make ethanol, a biofuel  
that usually comes from maize  
(corn) or sugar cane, from trees  
instead. Politicians and  
10 environmentalists are embracing  
ethanol for a number of reasons.  
Unlike oil, ethanol is renewable: to  
make more of it, you grow more  
crops. And blending ethanol into  
15 ordinary petrol, or burning it directly  
in special "flex-fuel" engines,  
reduces greenhouse-gas emissions.

Why use trees, rather than maize  
or sugar cane, as a feedstock for  
20 ethanol? Because "treethanol" has  
the potential to be much more  
energy efficient. The ratio of the  
energy yielded by a given amount of  
ethanol to the energy needed to  
25 produce it is called the "energy  
balance". The energy balance for  
ethanol made from maize is the  
subject of much controversy, but  
America's energy department puts it  
30 at 1.3; in other words, the ethanol  
yields 30% more energy than was  
needed to produce it. For ethanol  
made from sugar cane in Brazil, the  
energy balance is 8.3, according to  
35 the International Energy Agency.

But for ethanol made from trees,  
grasses and other types of biomass  
the energy balance can be as high as  
16. Producing such "cellulosic"

40 ethanol is much more difficult and  
expensive than producing it from  
other crops. But the science,  
technology and economics of  
treethanol are changing fast.

45 Researchers are racing to develop  
ways to chip, ferment, distil and  
refine wood quickly and cheaply.

Trees are a particularly promising  
feedstock because they grow all year  
50 round, require vastly less fertiliser  
and water and contain far more  
carbohydrates (the chemical  
precursors of ethanol) than food  
crops do. Ethanol is the result of the  
55 fermentation of sugars, which is  
why it can be so simply and  
efficiently made from sugar cane.

Making ethanol from maize is a bit  
more complicated: the kernels are  
60 ground into flour and mixed with  
water, and enzymes are added to  
break the carbohydrates from the  
maize down into sugars, which can  
then be fermented into ethanol.

65 Making ethanol from cellulosic  
feedstocks is harder still, however,  
since it involves breaking down the  
tough, winding chains of cellulose  
and hemicellulose from the walls of  
70 plant cells to liberate the sugars.

This can be done using a cocktail of  
five or six enzymes. The problem is  
that although such enzymes exist,  
they are expensive.

### 75 **The lure of bioprospecting**

So if cellulosic ethanol is to live up  
to its promise, researchers will have  
to find cheaper and more efficient

enzymes. Grass, trees and other biomass feedstocks consist of a mixture of cellulose, hemicellulose and lignin, a tough material that helps plants keep their shape. Two large producers of industrial enzymes are Genencor, an American firm, and Novozymes, from Denmark.

Treethanol has particular appeal in countries that have a lot of trees and import a lot of fossil fuel. Top of the list is New Zealand, which is planning to produce ethanol from a type of willow, and Sweden, which is relying heavily upon wood-based solid as part of its plan to wean itself off oil by 2020.

Even if the right cocktails of enzymes can be found, sceptics say treethanol will still have several problems to overcome. In particular, trees take much longer to grow than grass or food crops—so it might make more sense to make cellulosic ethanol from fast-growing grasses, or the leftover biomass from food crops. Some environmentalists worry that having struggled for years to protect forests from overexploitation, demand for biofuels could undermine their effort.

And now for Frankentreethanol. The idea is to create new, fast-growing trees to address this problem, either through careful breeding or genetic modification. A team led by Vincent Chiang, a biologist at North Carolina State University, is investigating the production of ethanol from genetically modified trees. Their preliminary results clearly point out that transgenic wood can drastically improve ethanol-production economics.

A tree's rate of growth is limited by its lignin structure, which is what determines the tree's strength and form. Trees containing less lignin and more cellulose would both grow faster and also produce more ethanol. Some transgenic trees of this kind are being tested in America. Scientists are looking at ways to modulate the genes that determine the structure of a tree's sugar-containing hemicelluloses in order to make the breakdown and fermentation processes more efficient.

But Steven Strauss, a forest biologist at Oregon State University, says that because of the great genetic variation in willows and poplars, genetic modification may not be necessary. By screening existing varieties it ought to be possible to identify those well suited to ethanol production. Conventional breeding and cloning are very efficient when there is such a variety of species and hybrids to choose from and the tight regulation of genetically modified organisms makes using the technology expensive and time consuming.

Hundreds of thousands of years ago, when man first gained mastery over fire, wood was his primary fuel. In the past few centuries fossil fuels have risen to prominence, with calamitous consequences for the world's climate. A diversity of new fuels and energy sources seems the most likely future. It would be fitting if humanity's portfolio of new energy technologies had a place for wood, the oldest of them all.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 Why has interest in biomass energy resources from forests been rapidly increasing in recent years?
- 2 Is ethanol energy-efficient?
- 3 What is the ethanol fuel energy balance?
- 4 How does the production of biomass and ethanol affect the environment?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Biofuel is a type of energy source derived from renewable plant and animal materials.
- 2 The common method for converting biomass into ethanol is called gasification.
- 3 Enzymes can be used to break down biomass into liquid sugars.
- 4 Trees containing more lignin and less cellulose would both grow faster and also produce more ethanol.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 The energy balance for ethanol made from trees, grasses and other types of biomass containing a lot of cellulose. ....
- 2 The energy balance for ethanol made from sugar cane. ....
- 3 The energy balance for ethanol made from maize. ....
- 4 The cost of a gallon of ethanol produced from trees. ....
- 5 The percentage by which the ethanol yields more energy than was needed to produce it. ....

## LANGUAGE FOCUS

### A Definitions

Match these terms with their definitions:

- |                          |   |
|--------------------------|---|
| 1 ethanol (line 6)       | a) the material from which the cell walls of plants are made, used in making paper, plastic etc;  |
| 2 cellulose (line 68)    | b) ordinary alcohol found in alcoholic drinks. It is also used for removing fat and oil;  |
| 3 enzyme (line 61)       | c) any of several substances, such as sugar, which consist of oxygen, hydrogen, and carbon, and which provide the body with heat and power;       |
| 4 carbohydrate (line 62) | d) catalyst produced by certain living cells, which can cause chemical change in plants or animals or can make these changes happen more quickly; |
| 5 biomass (line 37)      | e) matter from dead or living plants or animals;  |

- |           |                                 |           |  |
|-----------|---------------------------------|-----------|--|
| <b>6</b>  | kernel (line 59)                | <b>f)</b> | a living thing produced from parents of different breeds;  |
| <b>7</b>  | species (line 152)              | <b>g)</b> | the business of keeping animals or plants for the purpose of obtaining new and better kinds;               |
| <b>8</b>  | hybrid (line 152)               | <b>h)</b> | the part of a nut, large grain, or seed, inside its hard covering;   |
| <b>9</b>  | breeding (line 116)             | <b>i)</b> | a division of animals or plants below a genus, which can breed together to produce young of the same kind; |
| <b>10</b> | cell (line 70)                  | <b>j)</b> | that can be renewed, especially by natural processes or good management;                                   |
| <b>11</b> | genetically modified (line 154) | <b>k)</b> | crops, seeds developed by changing the plant's genetic structure to produce larger crops;                  |
| <b>12</b> | renewable (line 12)             | <b>l)</b> | a very small division of living matter, with one centre of activity (nucleus).                             |

## **B Understanding expressions**

Choose the best explanation for each word or phrase from the text.

- |           |  |           |  |
|-----------|--|-----------|--|
| <b>1</b>  | Biofuel (line 6):  | <b>2</b>  | Cane (line 19):  |
| <b>a)</b> | a substance that is burnt to produce heat or power that is solid;  | <b>a)</b> | the hard smooth thin, often hollow, stem of certain plants;  |
| <b>b)</b> | a type of heavy oil used instead of petrol etc in diesel engines;  | <b>b)</b> | a plant with pink flowers and fine hairs on its stem and leaves;   |
| <b>c)</b> | the fuel made from maize (corn), sugar cane, or trees.   | <b>c)</b> | a plant with red, white, or blue flowers.  |
| <b>3</b>  | Engine (line 16):  | <b>4</b>  | Energy balance (line 25):  |
| <b>a)</b> | a machine which generates something, especially electricity;   | <b>a)</b> | a number that measures some quality or process;  |
| <b>b)</b> | an apparatus used for discovering the presence of a particular effect, such as light, heat, sound etc;   | <b>b)</b> | the ratio of the energy yielded by a given amount of ethanol to the energy needed to produce it;                       |
| <b>c)</b> | a piece of machinery with moving parts which changes power from steam, electricity, oil etc, into movement.  | <b>c)</b> | a figure showing the number of times one quantity contains another, used to show the relationship between two amounts. |
| <b>5</b>  | Gene (line 135):   | <b>6</b>  | Cloning (line 150):  |
| <b>a)</b> | a very small division of a living matter, with one centre of activity (nucleus);   | <b>a)</b> | cutting a piece from one plant and tying it to place inside a cut of another, so that it could grow there;             |
| <b>b)</b> | any of the structures shaped like rods that are found in living cells and contain the chemical patterns which control what an animal or plant is like; | <b>b)</b> | producing a single plant or animal in a nonsexual way from any one cell, and exactly the same form as the parent;      |

- c) any of several small parts of the material at the nucleus of a cell, that control the development of all qualities in a living thing.

7 Environmentalist (line 10):

- a) someone who scientifically studies weather conditions and says what the weather is likely to be in the future;
- b) a person who tries to prevent the environment from being spoilt;
- c) a person who studies plants or animals.

- c) the process of producing genetically identical individuals of an organism either naturally or artificially.

8 Petrol (line 15):

- a) a liquid obtained especially from petroleum, used mainly for producing power in the engines of cars, aircrafts etc;
- b) a substance in a state between solid and liquid;
- c) (a) liquid able to turn a solid Substance into liquids.

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 There is a lot of disagreement among scientists and ordinary people about the advantages and disadvantages of ..... food.
- 2 The ..... from a donkey and a horse is called a mule.
- 3 Most energy experts reckon that using maize-based ..... as a substitute for petrol can reduce America's demand for petrol by 10-15% at best.
- 4 This rare bird has become an endangered .....
- 5 Sun, wind, and waves are ..... sources of energy.
- 6 We must encourage research on ..... feedstocks, tomorrow's energy crops.
- 7 Fifty-three years after their invention, silicon-based solar ..... still make Up more than 90% of the market.
- 8 ..... are linked together in cell nuclei on structures called chromosomes.
- 9 Diversa, a biotech firm based in San Diego, is developing ..... capable of breaking down hemicellulose.
- 10 Trees use the carbon thus sequestered to make molecules like ....., and thus more tree.

### D Collocation

Match these verbs and nouns as they occur in the text.

- |              |                             |
|--------------|-----------------------------|
| 1 exploit    | a) crops                    |
| 2 produce    | b) enzyme                   |
| 3 reduce     | c) problems                 |
| 4 protect    | d) transgenic trees         |
| 5 ferment    | e) genes                    |
| 6 test       | f) forests                  |
| 7 find       | g) ethanol s                |
| 8 grow       | h) trees                    |
| 9 overcome   | i) greenhouse-gas emissions |
| 10 modulate  | j) wood                     |
| 11 undermine | k) efforts                  |

### **E Words with similar or related meanings**

- 1 The phrase 'use trees' is met in paragraph 1. What other phrase is used in the same paragraph with a similar meaning?
- 2 What other adjective is used in the text with the same meaning as 'difficult' (para 4)?
- 3 The collocation 'produce ethanol' is used in paragraph 3. What other phrase is used in paragraph 4 with a similar meaning?
- 4 Ethanol is made from maize, sugar cane, trees, and grass. What is a general word for all of them (para 4)?
- 5 What word from the text (para 2) could replace the word 'yielded' (line 23)?
- 6 The word 'cocktail' is used twice (paras 4 and 7) to describe the process of making ethanol. What other word is used in the article (para 5) with a similar meaning?
- 7 The word 'diversity' is used in line 163. What word with a similar meaning is used earlier in the text (para 10)?

### **F Words that seem similar**

- 1 The words **1)** 'tree' (line 1) and **2)** 'wood' (line 47) have slightly different meanings. Match these words with their meanings:
  - a) a tall plant with a wooden trunk and branches, that live for many years;
  - b) the substance of which the trunks and branches of trees are made, which is cut and used for various purposes.
- 2 The adjective **1)** 'tough' (line 68) and the adjective **2)** 'tight' (line 153) have quite different meanings. Match these definitions to the two words:
  - a) well ordered or firmly controlled;
  - b) strong.
- 3 The nouns **1)** 'mankind' (line 1) and **2)** 'humanity' (line 166) have slightly different meanings. Match these words with their meanings:
  - a) the human race, both men and women;
  - b) human beings generally.

### **G Phrasal verbs**

Find phrasal verbs in the text that match these definitions:

- |   |         |         |
|---|---------|---------|
| a) to have confidence in (para 6);  | r ..... | u ..... |
| b) to (cause to) separate into different kinds or divide into types (para 4);                         | b ..... | d ..... |
| c) to crush into small pieces by pressing between hard surfaces (para 4);                             | g ..... | i ..... |
| d) to cause to gradually leave (an interest, habit, companion etc, that one disapproves of) (para 6); | w ..... | o ..... |
| e) to keep to the high standards of (para 5)  | l ..... | u ..... |
| f) to become combined, especially so as to produce a pleasing effect (para 1);                        | b ..... | i ..... |
| g) to direct someone's attention to (para 8);   | p ..... | o ..... |
| h) to have as a place or point of origin (para 1).  | c ..... | f ..... |

## UNIT 9

## ALTERNATIVES TO PETROL

### Text: THE END OF THE PETROLHEAD

#### *Tomorrow's cars may just plug in*

line Nothing ages faster than the future.  
A few years ago there was general  
agreement that if the internal- 45  
combustion engine ever was  
5 replaced by something clean, that  
something would be the fuel cell. A  
fuel cell is a way of reacting  
hydrogen and oxygen together in a 50  
controlled way and extracting  
10 electricity from the process. It was to  
be the precursor of what was known  
as the hydrogen economy, in which  
that gas would replace fossil fuels 55  
and power almost everything.

15 Leaving aside the problems of  
transporting and storing a light and  
leaky gas, what no one was very  
clear about was where the hydrogen 60  
itself would come from. You would  
20 have to make it from something else.  
That something would either be a  
mixture of fossil fuel and water  
(fuels can be reacted with steam to 65  
make hydrogen and carbon dioxide,  
25 but you still have to get rid of the  
carbon dioxide), or just water itself,  
via electrolysis.

But why bother? Why not cut out 70  
the middlemen and plug your car  
30 directly into the electricity mains  
instead? And that, it seems, is what  
may happen. You don't hear much  
about the hydrogen economy these 75  
days. Nor fuel cells. The buzz-  
35 phrase now is "plug-in hybrid".  
Plug-ins should not be confused with  
existing hybrid vehicles, such as  
Toyota's Prius, which contains an 80  
internal-combustion engine as well  
40 as two electric ones. Either sort may

Drive the wheels. The electric  
motors kick in when they can do a  
more efficient job than the petrol  
engine, but even then the electricity  
comes ultimately, via batteries, from  
burning petrol.

In a plug-in, the electricity comes  
from the mains, via an ordinary  
electrical socket. Some intermediate  
designs retain the idea of two sorts of  
engine, but the goal is that the car  
should be powered by electric  
motors alone. If the batteries run  
down, a petrol-powered generator  
will take over. But most cars, most  
of the time, are used for short  
journeys. Gerbrand Ceder, a battery  
scientist at MIT, reckons that if the  
first 50km of an average car's daily  
range were provided by batteries  
rather than petrol, annual petrol  
consumption would be halved. Given  
that the electrical equivalent of a litre  
of petrol costs about 25 cents, that is  
an attractive reduction.

The widespread adoption of plug-  
ins might also reduce carbon-dioxide  
emissions, depending on what sort of  
power station made the electricity in  
the first place. Even energy from a  
coal-fired station is less polluting  
than the serial explosions that drive  
an internal-combustion engine. If the  
energy comes from a source such as  
wind or nuclear, the gain is  
enormous.

Beyond that, the rise of plug-ins  
has implications for the electricity  
industry itself. If they succeed, they  
will put an unanticipated load on the

system. In fact, they may remake electricity as well as transport.

85     **Don't all recharge at once**

That is certainly the view of Peter Corsell of Gridpoint, a company based in Arlington, Virginia. His firm hopes to make its living selling the load-management technology required for "smart grids". Mr Corsell reckons it will become essential if plug-ins arrive in force. At the moment, the grid would be unable to cope if a large number of commuters arriving home plugged in their cars more or less simultaneously to recharge them. Yet if those same cars were recharged at three o'clock in the morning, when demand is low, it would benefit both consumer (who would get cheap power) and producer (who would be able to sell otherwise wasted electricity). Such cars might even act as micropeakers –reservoirs of electrical energy that a power company could draw on if a car were not on the road. Managing plug-ins, Mr Corsell thinks, will be the smart grid's killer application.

In sunny climes, plug-ins might also provide another use for solar cells. Google is already experimenting with photovoltaic car parks. These have awnings covered in solar cells which will shade its employees' cars and simultaneously recharge them. That is an idea which could be spread. Supermarkets, for example, might find that car parks with plugs would attract customers who wanted to top up their cars. And the more opportunities there are for stationary cars to be recharged, the more likely they are to be bought.

Plug-ins are moving from idea to

reality with amazing speed. General production of the Tesla, Elon Musk's new sports car, began in March. The Tesla is not even a hybrid. It draws all of its power from lithium-ion batteries (the sort that power laptop computers), and it has a range of 350km. It can manage that because its price of \$109,000 buys a lot of batteries; Tesla owners are not the sort who count their pennies.

Mass-production plug-ins are not far away either, and the rising price of petrol makes them look more attractive by the day. General Motors intends to launch a plug-in hybrid called the Volt, and Toyota plans a plug-in version of the Prius. Only Honda and Mercedes seem to be sticking to fuel cells. It is all very encouraging. But what would really make a difference would be a breakthrough in battery technology.

At the moment, lithium-ion batteries are the favoured variety. This kind of battery uses lithium in its ionic form. When the battery is fully charged, these ions hang around one of its electrodes, the anode, which is usually made of graphite. During operation, the ions migrate within the battery from this electrode to the other one, the cathode, and electrons pass between the electrodes through an external circuit. It is that current of electrons which drives the motor. The cathode may be made of a variety of materials. Cobalt oxide is traditional but expensive. Manganese oxide is becoming popular. But the future probably lies with iron phosphate, which has less of a tendency to overheat, a problem that has resulted in battery recalls in the past.

## READING

### A Understanding main points

Read the text on page and answer these questions.

- 1 What are the effective alternatives for petrol?
- 2 Why do we need alternative fuels in cars?
- 3 Hydrogen has virtually no greenhouse gas emissions, hasn't it?
- 4 Are propane vehicles are typically more expensive than those running on petrol?
- 5 What are the advantages of electric motors over petrol engines?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 Electricity can be used to power plug-in electric vehicles, which are increasingly available.
- 2 Propane is a readily available gaseous fuel that has been widely used in vehicles throughout the world.
- 3 The major fossil fuel alternatives to petrol are: ethanol and hydrogen.
- 4 The major non-fossil alternative fuels are: liquid petroleum gas and compressed natural gas.
- 5 Petrol is a derivative of petroleum.

### C Information search

Scan the text quickly and find the figures, percentages or sums of money that correspond to the following pieces of information.

- 1 An average car's daily range taken for the calculation of annual petrol consumption. ....
- 2 The cost in cents of the electrical equivalent of a litre of petrol. ....
- 3 The price of Tesla. ....
- 4 The number of electric engines Toyota's Prius contains. ....
- 5 The number of internal-combustion engines Toyota's Prius contains. ....
- 6 The range of the Tesla. ....
- 7 The time of the day when demand for recharging of cars' batteries seems to be low. ....

## LANGUAGE FOCUS

### A Definitions

Match the words from the text with their corresponding definitions:

- |                                       |  |
|---------------------------------------|--|
| 1 internal-combustion engine (line 3) | a) machine that changes electrical power into movement, and is used for working other machines;                        |
| 2 mains (line 30)                     | b) an apparatus for producing electricity consisting of a group of connected electric cells;                           |
| 3 buzz-phrase (line 34)               | c) a liquid obtained especially from petroleum, used mainly for producing power in the engines of cars, aircrafts etc; |

- |    |                             |           |  |
|----|-----------------------------|-----------|--|
| 4  | hybrid vehicle (line 37)    | <b>d)</b> | a piece of machinery with moving parts which changes power from petrol into movement;  |
| 5  | electric motor (line 41)    | <b>e)</b> | an engine, such as a car engine, which produces power by the burning of a substance, such as petrol, inside itself;  |
| 6  | petrol engine (line 45)     | <b>f)</b> | a vehicle using two different forms of power, such as an electric motor and an internal combustion engine, or an electric motor with a battery and fuel cells for energy storage;            |
| 7  | battery (line 47)           | <b>g)</b> | especially <i>BrE</i> a supply of electricity produced centrally and brought to houses etc by wires;   |
| 8  | electrical socket (line 51) | <b>h)</b> | a piece of plastic or other material with holes in it, which is fixed into a wall or on to the end of a wire, and to which electrical equipment can be connected for the electricity supply; |
| 9  | petrol (line 48)            | <b>i)</b> | a phrase related to a specialized subject, which is thought to express something important but is often hard to understand;  |
| 10 | solar cell (line 113)       | <b>j)</b> | restore electrical energy in (a battery or a battery-operated device) by connecting it to a power supply;  |
| 11 | plug (line 122)             | <b>k)</b> | a conductor used to establish electrical contact with a nonmetallic part of a circuit;   |
| 12 | stationary car (line 125)   | <b>l)</b> | the car which is standing still, not moving;   |
| 13 | recharge (line 85)          | <b>m)</b> | a small plastic object with two or three metal pins that are pushed into an electric socket to connect with the electricity supply;  |
| 14 | electrode (line 156)        | <b>n)</b> | an apparatus for producing electric power from sunlight.   |

## B Understanding expressions

Choose the best explanation for each word or phrase from the text.

- |   |   |   |   |
|---|---|---|---|
| 1 | Anode (line 156):   | 2 | Cathode (line 160):   |
|   | <b>a)</b> either of the points at the ends of a magnet where its power of pulling iron towards itself is strongest;                           |   | <b>a)</b> a very small piece of matter that is like an electron but is positively charged;  |
|   | <b>b)</b> the part of an electrical instrument (such as a battery) which collects electrons, often a rod of wire represented by the sign (+); |   | <b>b)</b> the part of an electrical instrument (such as a battery) from which electrons leave, often a rod of wire represented by the sign (-); |
|   | <b>c)</b> the end of a magnet which turns naturally away from the Earth.  |   | <b>c)</b> the end of a magnet which turns naturally towards the Earth.  |
| 3 | Ion (line 155):   | 4 | Electrolysis (line 27):   |
|   | <b>a)</b> an atom or molecule with a net electric charge due to the loss or gain of one or more electrons;                                    |   | <b>a)</b> the decomposition of an electrolyte by the action of an electric current passing through it;  |

- b) a very small piece of matter that carries positive electricity and that together with the neutron forms the nucleus;
  - c) a very small piece of matter that moves round the nucleus of an atom and that by its movement causes an electric current in metal.
- 5 Generator (line 39):**
- a) a machine which generates something, especially electricity;
  - b) a part of a machine that turns round on a fixed point;
  - c) a machine for storing electricity, especially in a car engine.
- 7 Car park (line 79):**
- a) an open space where cars and other vehicles may be parked, sometimes for a small payment;
  - b) a shelter for a car; with only a roof and one or two sides, often built against a side of a house;
  - c) a place where motor vehicles are repaired and petrol and oil may also be sold.
- b) the combining of separate substances into a complete whole;
  - c) the force, caused by the movement and exchange of positively and negatively charged bits of matter in atoms.
- 6 Grid (line 64):**
- a) the flow of electricity to a building, machine etc;
  - b) a network of electricity supply wires connecting power stations;
  - c) the wires and other equipment that work an electrical apparatus.
- 8 Load (line 57):**
- a) something that is being or is to be carried, especially something heavy that is carried by the vehicle, ship, person etc;
  - b) the amount of work that must be done by a member of a group, a machine etc;
  - c) the power of an electricity supply.

### C Complete the sentence

Use an appropriate word or phrase from Exercise A to complete each sentence.

- 1 The car won't start because the ..... has gone flat (=has lost all its power).
- 2 We filled the car with ..... before the long journey.
- 3 "Does your radio work off the ..... or from a battery?"
- 4 Plug the iron into that ....., will you?
- 5 Chemists have discovered about 30,000 inorganic chemical compounds, almost any of which might theoretically be suitable material for an .....
- 6 "How did you manage to drive into a .....?"
- 7 In the UK, a ..... can be also called a 'gas station'.
- 8 Traditional ..... are made of silicon, like computer chips.
- 9 Petrol-electric ..... attain their fuel economy by using ..... in stop-start city traffic and ..... when cruising on the highway.
- 10 Around 50% of cars sold in Europe today rely solely on conventional .....

### D Collocations

Match these verbs and nouns as they occur in the text.

- 1 extract (para 1)
- a) cheap power

- |                     |                             |
|---------------------|-----------------------------|
| 2 recharge (para 7) | b) a load                   |
| 3 attract (para 8)  | c) a motor                  |
| 4 launch (para 10)  | d) a battery                |
| 5 reduce (para 5)   | e) carbon-dioxide emissions |
| 6 charge (para 11)  | f) a plug-in hybrid         |
| 7 drive (para 11)   | g) customers                |
| 8 put (para 6)      | h) cars                     |
| 9 get (para 7)      | i) electricity              |

## E Phrasal verbs

Find phrasal verbs in the text that match these definitions.

- |  |                 |
|--|-----------------|
| a) (of a machine) to stop suddenly (para 3);   | c ..... o ..... |
| b) to gain the use of (a system) by making an electrical connection worth it (para 3); | p ..... i ..... |
| c) contribute; to (begin) to have an influence (para 3);                               | k ..... i ..... |
| d) to lose power and stop working (para 4);  | r ..... d ..... |
| e) to gain control over and responsibility for (smth) (para 4);                        | t ..... o ..... |
| f) to rely; place trust on <i>or</i> upon (para 5);                                    | d ..... o ..... |
| g) to connect to a supply or electricity with a plug (subtitle);                       | p ..... i ..... |
| h) to make use of a supply of something (para 7);                                      | d ..... o ..... |
| i) to fill (a partly empty container) with liquid (para 8);                            | t ..... u ..... |
| j) to delay or move slowly (para 11).  | h ..... a ..... |

## F Prepositions

Complete these sentences with a suitable preposition from Exercise F.

- You can plug ..... the national computer network.
- The engine keeps cutting ..... when I go up hills.
- The coal industry is running .....
- "The television doesn't work." "Have you plugged it ....."?
- I took a painkiller an hour ago, I wish it would kick .....
- Who do you think will take ..... now that the governor has been dismissed?
- I'll have to draw ..... my savings to pay for the repairs.
- "Your petrol tank is nearly empty; let me top it ....."

## F Words that seem similar

- The words **1** 'variety' (line 152) and **2** 'range' (line 62) have slightly different meanings. Match these words with their meanings:
  - the area of variation between upper and lower limits on a particular scale;
  - the quality or state of being different or diverse; the absence of uniformity or monotony.
- The nouns **1** 'mains' (line 30) and **2** grid (line 91) have slightly different meanings. Match these words with their meanings:
  - a system of wires through which electricity is connected to different power stations across a region;
  - the source of electricity supply through cables.

**Text: FLIGHT OF FANCY***The world of energy must change if things are to continue as before*

line	AS SAMUEL GOLDWYN wisely observed, you should never make predictions, especially about the future. As far as predicting the technological future is concerned, people almost always either overshoot or undershoot. Holidays on the moon by 2000, as forecast in the 1960s? Not exactly. A quick hop out of atmosphere, courtesy of Virgin Galactic, is the limit of that vision for the moment. On the other hand, a seemingly boring way of linking computer files full of data on subatomic physics can turn into a world wide web of information in half a decade.		always has been and probably always will be. Giant satellites collecting sunlight and beaming the energy to Earth as microwaves are an idea of heroic proportions, but enough sunlight gets through the atmosphere to make them irrelevant. Other technologies may make a contribution, but only on a small scale. The idea of floating platforms that capture wave energy is technically feasible, but it seems more trouble than building wind turbines. Tidal power works, but even more than hydro, it depends on geography. And the idea of liberating hydro from geography with small, free-standing turbines may have local application, but maintaining such turbines is far more trouble than taking a spanner to a windmill.
5		45	
10		50	
15		55	
	In retrospect, this special report will no doubt be proved to have been guilty of both over- and undershooting. It has begun from the premise that big changes are afoot in the energy field, and has tried to pick the technologies most likely to be important. Some outcomes are mutually exclusive. A truly electric car would eliminate the need for biofuels, except, perhaps, in aircraft. Truly cheap biofuels might price electric cars out of the market. A breakthrough in the capture and storage of carbon dioxide would bring coal back into play with a vengeance. Geothermal may be better than solar. Solar may be better than wind.	60	
20		65	
25		70	
30		75	
35		80	
40	The report has ignored some technologies because they will not get anywhere. Fusion, that favourite of fantasists, is 30 years away, as it		All sorts of wacky but intriguing ideas are being looked into, such as flying turbines that would exploit the high winds of the jetstream. And so are perfectly sensible ones, such as ultracapacitors for storing electricity, that are now niche products but might suddenly blossom, to the embarrassment of prophets. Maybe, too, the hydrogen economy will rear its head again—but only if a way can be found of storing the gas easily and at high density. That would require a material that can absorb large volumes of it. One for Dr Gerber's materials genome project, perhaps. This report has also ignored the

question of efficiency, except in the special context of small grids. The idea of “negawatts”, as improvements in efficiency are sometimes known, has always been a favourite of greens. But there is too often a gleeful hairshirtedness to their pronouncements, which helps to explain why high-profile changes such as the introduction of energy-efficient light bulbs are viewed cynically by so many people.

In any case, a lot of efficiency improvements just happen in the background, as part of most businesses’ continuous search for cost savings. Car engines, for example, are much more efficient than they used to be, and are likely to become still more so. The reason that American cars are such gas-guzzlers is not that their engines have got worse but that the cars themselves have got heavier.

Besides, as Robert Metcalfe, the networking guru, said at a recent conference: “You are not going to conserve your way out of the problem”. The need to keep doing the same thing—consuming energy in ever larger quantities—is a force for change. How quickly that change will happen is hard to tell.

### **Sunlit uplands**

In some fields, such as information technology, change happens suddenly or not at all. In others, such as energy, it can happen gradually to start with, but as the curve accelerates upward there comes a point where things move very fast. Ten years ago wind turbines were marginal. Now they are taken seriously, and in another decade they may contribute as much

as a fifth of the world’s electricity.

The same could happen to solar energy, which is ten years behind wind, and geothermal, with a 20-year lag. Whether it would happen faster if carbon emissions were charged for at an honest price is a moot point. Certainly, that is the only way to bring about the widespread adoption of carbon-dioxide capture and storage. But for the rest, the best way might, paradoxically, be what exists now: a threat that is real enough for electricity generators to price it into their future calculations without affecting their existing plants.

The lack of new coal-fired capacity creates a real opportunity for alternatives, among them renewables. But the lack of an actual carbon price still keeps the cost of existing electricity down, and thus the necessary incentives in place to make Google’s cheaper-than-coal equation a reality.

If and when such cheaper alternatives arrive, the markets of Asia will open and Mr Khosla, an Indian-born American, will see the fruits of this adopted homeland roll out into his native country. It will be a long time before King Coal and Queen Oil are dethroned completely, but their reigns as absolute monarchs of all they survey are coming slowly to an end.

A large variety of new energy technologies are at various stages of development. Obviously, it is impossible to predict which of the options will win in the marketplace – this will be determined by future specific technological and economic developments.

## READING

### A Understanding main points

Read the text and answer these questions.

- 1 What do you think is the future of energy?
- 2 Why is solar energy called the energy of future.?
- 3 What is the future of nuclear energy?
- 4 Biomass has great potential to provide renewable energy, hasn't it?

### B Understanding details

Mark these statements T (true) or F (false) according to the information in the text.

- 1 The energy system of the future won't look like today's: the scale of change over the next 10 to 20 years will be considerable.
