Abstract

C₂₄H₂₂Cl₂N₂O₂Sn, monoclinic, P2₁/n (no. 14), $a = 12.6418(1)$ Å, $b = 13.2422(1)$ Å, $c = 13.6364(1)$ Å, $\beta = 104.6370(10)$ °, $V = 2208.72(3)$ Å³, $Z = 4$, $R_{\text{gt}}(F) = 0.0292$, $wR_{\text{ref}}(F^2) = 0.0778$, $T = 100(2)$ K.

CCDC no.: 1949157

The asymmetric unit is shown in the figure. Table 1 contains crystallographic data and Table 2 contains the list of the atoms including atomic coordinates and displacement parameters.

Table 1: Data collection and handling.

Crystal:	Pale-yellow prism
Size:	0.12 × 0.08 × 0.06 mm
Wavelength:	Cu K α radiation (1.54184 Å)
μ :	11.6 mm ⁻¹
Diffractometer, scan mode:	XtaLAB Synergy, ω
θ_{max} , completeness:	67.1°, >99%
$N(hkl)_{\text{measured}}$, $N(hkl)_{\text{unique}}$, R_{int} :	27187, 3936, 0.034
Criterion for I_{obs} , $N(hkl)_{\text{gt}}$:	$I_{\text{obs}} > 2 \sigma(I_{\text{obs}})$, 3775
$N(\text{param})_{\text{refined}}$:	280
Programs:	CrysAlis ^{PRO} [1], SHELX [2, 3], WinGX/ORTEP [4]

Source of material

General: The melting point of the compound was measured on a Electrothermal digital melting point apparatus and was uncorrected. The elemental analysis was performed on a Perkin-Elmer EA2400 CHN analyser. The ¹H NMR spectrum was recorded in DMSO-*d*₆ solution on a Jeol JNM-ECA 400 MHz NMR spectrometer with chemical shifts relative to tetramethylsilane.

Synthesis: Dibenzyltin dichloride was synthesized by the direct reaction of benzyl chloride (Merck) and metallic tin powder (Merck) in toluene according to a literature procedure [5]. Dibenzyltin dichloride (0.37 g, 1 mmol) and 4,4'-bipyridine *N,N'*-dioxide di-hydrate (Sigma Aldrich, 0.11 g, 0.5 mmol) were dissolved in methanol (25 mL) and the mixture was refluxed for 2 h. After filtration, the filtrate was evaporated slowly until pale-yellow crystals were formed. The crystals were filtered, washed with a minimum amount of ethanol and air-dried. Yield: 0.34 g (60.7%). **M.pt:** 469–471 K.

Anal. Calc. for C₂₄H₂₂Cl₂N₂O₂Sn: C 51.33; H 3.92; N 4.99%. Found: C 50.79; H 3.74; N 4.94%. ¹H NMR (DMSO-*d*₆, ppm): δ 2.97 (s, 4H, CH₂), 7.03–7.23 (m, 10H, Ph—H), 7.86 (d, 4H, *J* = 7.00 Hz, py—H), 8.30 (d, 4H, *J* = 7.10 Hz, py—H).

Experimental details

The C-bound H atoms were geometrically placed (C—H = 0.95–0.99 Å) and refined as riding with $U_{\text{iso}}(\text{H}) = 1.2U_{\text{eq}}(\text{C})$.

Comment

Crystal structure determinations of neutral organotin compounds of 4,4'-bipyridine *N,N'*-dioxide (L; systematic name: [4,4'-bipyridine]1,1'-dioxide) are rare, being restricted to the *cis*- and *trans*-isomers of octahedral (4-fluorobenzyl)₂SnCl₂(L) [6]. Each of these is a one-dimensional coordination polymer with the topology being dependent on the specific isomer. Thus, while *trans*-isomer gives rise to a linear chain, the topology of the chain formed by the *cis*-isomer is helical [6]. In continuation of these structural studies, the title compound, also a coordination polymer, [benzyl₂SnCl₂(L)]_n, (I), was investigated by X-ray crystallographic methods.

The molecular structure of the asymmetric unit of (I) is shown in the upper view of the figure (70% displacement ellipsoids). The coordination geometry is based on an octahedron with the donor set defined by two methylene-carbon atoms of the benzyl substituents, two chlorido ligands and two oxido-oxygen atoms derived from two different 4,4'-bipyridine *N,N'*-dioxide molecules, each of which is bidentate bridging. The *cis*-disposed Sn—Cl bond lengths are disparate with Sn—Cl1 of 2.5007(8) Å being shorter than Sn—Cl2 of 2.5101(8) Å. This is despite the oxido-oxygen atoms are each *trans* to a chloride [Cl1—Sn—O1 = 172.02(6)° and Cl2—Sn—O2ⁱ = 172.33(6)° for symmetry operation (i) 1 + x, y, z] form experimentally equivalent Sn—O bonds, i.e. Sn—O1 = 2.306(2) Å and Sn—O2ⁱ = 2.317(2) Å. In the same way, non-systematic variations are noted in the Sn—C bond lengths, with Sn—C1 of 2.157(3) Å being shorter than Sn—C8 of 2.196(3) Å; C1—Sn—C8 = 170.03(14)°. Non-systematic variations in geometric parameters are notorious in organotin chemistry and DFT calculations indicate these arise as a result of the crystalline manifold rather than any chemical reasons [7, 8]. The maximum deviation from a regular octahedral geometry in terms of cis-angles is seen in the O1—Sn—O2ⁱ angle of 80.18(8)°. As seen from the lower part of the figure, the resulting supramolecular chain has a linear topology, being propagated by translational symmetry.

The crystal of (I) features pyridyl-C—H···Cl [C23—H23···Cl2ⁱⁱ: H23···Cl2ⁱⁱ = 2.64 Å, C23···Cl2ⁱⁱ = 3.500(4) Å with angle at H23 = 152° for (ii) -1/2 + x, 3/2 - y, 1/2 + z] and pyridyl-C—H···O(oxido) [C18—H18···O2ⁱⁱⁱ: H18···O2ⁱⁱⁱ = 2.49 Å, C18···O2ⁱⁱⁱ = 3.090(4) Å with angle at H18 = 121° for (iii) 1 - x, 1 - y, 1 - z] interactions which combine with methylene- and pyridyl-C—H···π(phenyl) [C8—H8b···Cg(C9—C14)^{iv}: H8b···Cg(C9—C14)^{iv} = 2.76 Å, C8···Cg(C9—C14)^{iv} = 3.527(4) Å with angle at H8b = 135° and C16—H16···Cg(C2—C7)^v: H16···Cg(C2—C7)^v = 2.94 Å, C16···Cg(C2—C7)^v = 3.709(3) Å with angle at H16 = 138° for (iv) 2 - x, 1 - y, -z and (v) -1/2 + x, 3/2 - y, -1/2 + z] interactions to sustain a three-dimensional architecture.

Employing Crystal Explorer 17 [9] and literature procedures [10], the calculated Hirshfeld surfaces and two-dimensional (full and decomposed) fingerprint plots were obtained. An analysis of this showed that the most significant percentage contributors to the surface are H···H contacts, accounting for 42.9% of all contacts. There are other significant contacts to the surface of the asymmetric unit, namely C···H/H···C [25.3%], Cl···H/H···Cl [16.0%] and O···H/H···H [7.7%]. Of the remaining 8% of surface contacts, the most dominant are N···H/H···N [2.3%].
