Redetermination of the crystal structure of *N'*-(3-ethoxy-2-hydroxybenzylidene)-4-fluorobenzohydrazide monohydrate, $C_{16}H_{17}FN_2O_4$

<https://doi.org/10.1515/ncks-2019-0568>

Received August 6, 2019; accepted August 25, 2019; available online September 9, 2019

Abstract

$C_{16}H_{17}FN_2O_4$, monoclinic, $P2_1/c$ (no. 14), $a = 9.23280(10)$ Å, $b = 12.9330(2)$ Å, $c = 12.3477(2)$ Å, $\beta = 97.383(1)^\circ$, $V = 1462.19(4)$ Å 3 , $Z = 4$, $R_{\text{gt}}(F) = 0.0318$, $wR_{\text{ref}}(F^2) = 0.0861$, $T = 100(2)$ K.

CCDC no.: 1949158

The molecular structures are shown in the figure. Table 1 contains crystallographic data and Table 2 contains the list of the atoms including atomic coordinates and displacement parameters.

Source of material

All chemicals and solvents were used as purchased and used without further purification. The melting point was determined using a Electrothermal digital melting point apparatus and was uncorrected. The IR spectrum was obtained on a Perkin-Elmer RX1 spectrophotometer as a Nujol mull in a KBr cell from 4000 to 400 cm $^{-1}$. The ^1H NMR spectrum

was recorded at room temperature in CDCl_3 solution on a Bruker AVN FT-NMR 400 MHz NMR spectrometer with chemical shifts relative to tetramethylsilane.

3-Ethoxysalicylaldehyde (Sigma Aldrich, 0.17 g, 1 mmol) in methanol (10 mL) was added to a hot stirring methanol solution (20 mL) of 4-fluorobenzoic hydrazide (Sigma Aldrich, 0.15 g, 1 mmol). The mixture was refluxed for 2 h. After filtration, the filtrate was evaporated slowly until colourless crystals were formed. The crystal was washed with methanol and air-dried. Yield: 0.20 g (65.7%) **M.pt:** 379–381 K. **IR** (cm $^{-1}$): 3561 (br) v(O—H), 1648 (s) v(C—O), 1605 (s) v(C—N), 1605 (s) v(C—N), 1078 (s) v(C—O). **^1H NMR** (CDCl_3 , ppm): δ 1.39 (t, $J = 6.9$ Hz, 3H, CH_3), 3.97–4.08 (m, 2H, OCH_2), 6.60–7.11 (m, 4H, Ph-H), 8.05–8.10 (m, 3H, Ph-H), 8.66 (s, 1H, HCN), 10.90 (s, 1H, NH), 12.10 (s, 1H, OH), water-H not observed.

Experimental details

All of the H-atoms were located in a difference Fourier map and were refined without restraint.

Comment

The redetermination of the crystal structure of the title hydrazone compound (I) [5] was conducted in the context of ongoing structural studies of related Schiff base molecules [6, 7] and their organotin compounds [8–10]. With the combined advantages of $\text{Cu } K\alpha$ radiation and low temperature, it was possible to refine all atoms in the molecule with the key result

of improved standard uncertainty values. In addition, a full description of the molecular packing of (I) is now described, an analysis which is complimented by an evaluation of the calculated Hirshfeld surfaces along with the full and delineated fingerprint plots [11, 12].

The crystallographic asymmetric unit of (I) comprises the Schiff base molecule and a water molecule, as shown in the figure (70% displacement ellipsoids). The configuration about the imine-N2—C8 [1.2852(17) Å] bond is *E*. The five non-hydrogen atoms comprising the central chromophore, i.e. C(=O)N(H)N=C, are strictly planar with the r.m.s. deviation

being 0.0033 Å. The dihedral angles formed between the central plane and the least-squares planes through the flanking hydroxy- and fluoro-phenyl rings are 4.35(9) and 23.93(6)°, respectively, indicating almost co-planar and inclined orientations. The dihedral angles formed between the outer rings is 24.26(5)°. The co-planar relationship between the central chromophore and hydroxyphenyl ring allows for the formation of an intramolecular hydroxy-O—H···N(imine) hydrogen bond [O2—H2o···N2: O2—H2o = 0.841(19) Å, H2o···N2 = 2.02(2) Å, O2···N2 = 2.7473(14) Å with angle at H2o = 144.4(19)°].

The crystal of (I) features significant hydrogen bonding involving the water molecule of crystallisation that leads to the formation of a supramolecular double-layer in the *bc*-plane. As shown in the figure, the water molecule accepts a hydrogen bond from the amide-N—H atom [N1—H1n···O1w: N1—Hn = 0.844(19) Å, H1n···O1w = 2.107(19) Å, N1···O1w = 2.9464(15) Å with angle at H1n = 173.0(16)°]. This arrangement is supported by a significant fluorophenyl-C—H···O(water) interaction [C3—H3···O1w: C3—H3 = 0.951(15) Å, H3···O1w = 2.358(15) Å, C3···O1w = 3.1886(15) Å with angle at H3 = 145.7(12)°]. The water molecule also donates hydrogen bonds to the hydroxy-oxygen [O1w—H1w···O2ⁱ: O1w—H1w = 0.849(19) Å, H1w···O2ⁱ = 2.120(19) Å, O1w···O2ⁱ = 2.9030(13) Å with angle at H1w = 153.3(17)° for symmetry operation (i) *x*, $3/2 - y$, $1/2 + z$] and the carbonyl-oxygen atom [O1w—H2w···O1ⁱⁱ: O1w—H2w = 0.90(2) Å, H2w···O1ⁱⁱ = 1.83(2) Å, O1w···O1ⁱⁱ = 2.7115(13) Å with angle at H2w = 169(2)° for (ii) $1 - x$, $-1/2 + y$, $3/2 - z$]. The most prominent interactions between the layers along the *a*-axis are of the type parallel fluoride···π(hydroxyphenyl) [C5—F1···Cg(C9—C14)ⁱⁱⁱ: F1···Cg(C9—C14)ⁱⁱⁱ = 3.8932(9) Å with angle at F1 = 81.52(6)° for (iii) $-1 + x$, $3/2 - y$, $1/2 + z$].

With the aid of Crystal Explorer 17 [11] and literature precedents [12], an analysis of the calculated Hirshfeld surfaces was also conducted as well as the calculation of the full and decomposed two-dimensional fingerprint plots. For the entire asymmetric unit of (I), H···H contacts predominate, accounting for 40.4% of all contacts. Prominent contributions to the surface are also made by O···H/H···O [21.7%] and C···H/H···C [16.2%] contacts. Notable contacts of the type F···H/H···F [8.9%], C···C [5.2%] and N···C/C···N [4.7%] are also apparent but, at separations greater than the sum of the respective an der Waals radii. An analysis was also conducted on the individual components of the asymmetric unit. When the surface contacts for the Schiff base molecule alone were calculated, only very minor changes in percentage contributions were apparent. The major change were noted in a decrease in O···H/H···O [20.3%] contacts. To compensate this, the C···H/H···C [16.7%] and F···H/H···F

[9.4%] surface contacts rose by 0.5%. For the water molecule, only two contacts are noted, namely O···H/H···O and H···H with percentage contributions of 56.8 and 42.8%, respectively.
