ORAL PRESENTATION

Open Access

An RCT of three programs aimed at reducing risk factors for both eating disorders and obesity: outcomes from the Prevention Across the Spectrum study

Simon Wilksch^{1*}, Susan Paxton², Sue Byrne³, S Bryn Austin^{4,5,6}, Tracey Wade¹

From 2014 ANZAED Conference: Driven Bodies Driven Brains
Fremantle, Australia. 22-23 August 2014

Objective

To conduct an RCT of 3 school-based programs to evaluate if one or more could reduce both eating disorder and obesity risk factors. Method: N = 1,316 Grade 7 and 8 girls and boys (M age = 13.21 years) from three Australian states were randomly allocated to: Media Smart; Life Smart; Helping, Encouraging, Listening and Protecting Peers Initiative (HELP) or control (usual school class). Risk factors were measured at baseline, post-program (5-weeks later), 6-month follow-up, and 12-month follow-up.

Results

Media Smart girls had half the rate of onset of clinically significant concerns about shape and weight as control girls at 12-month follow-up. Media Smart and HELP girls reported significantly lower weight concern and shape concern than Life Smart but not control girls at 12-month follow-up. Media Smart girls experienced additional benefits on eating concerns and perceived pressure to be thin compared to HELP girls and also on levels of physical activity compared to control girls. Media Smart and HELP boys experienced significant benefit on media internalization compared to control boys while Media Smart boys reported additional benefits including significantly lower screen time at 12-month follow-up compared to the other interventions.

Conclusions

Media Smart was the only program to show benefit on both disordered eating and obesity risk factors.

This abstract was presented in the **Prevention & Public Health** stream of the 2014 ANZAED Conference.
