# 1. INTRODUCTION

## 1.1 Abstract

This research builds on Implicit Leadership Theory, which suggests that a leader's performance is likely to be higher when there is congruence between a follower's prototype of what a leader should be and his or her perception of the leader's behaviour. The essence of effective leadership, according to this theory, is being seen as a leader by others.

Data were collected from 196 leaders and 1,738 followers from 23 countries within Cargill Incorporated, a US food and agricultural multinational. The research was conducted in two phases. During the first phase data were collected on followers' desired leadership values and their perception of their leader's behaviour on the same dimensions. These data were used to compute a congruence score based on a weighted sum of absolute differences. The congruence score data formed the heart of an individualised Leadership Fit Report written for each leader in the study showing the extent of congruence across 21 leadership characteristics (see **Appendix A**).

The second phase of the study focused on a subset of 933 followers from five countries testing the two hypotheses. The two hypotheses in Phase Two were partially supported. The first was that congruence between desired leadership values and perceived behaviour leads to high performance of a leader and incongruence leads to lower performance. The second was that the relationship between congruence and leader performance varied by nationality.

The cross-cultural test of Implicit Leadership Theory captured in Hypothesis 2 was particularly important to Cargill because it revealed unique and important

differences between the five countries included in the second data set. This study found that the nature of the relationship between congruence and leader performance varies significantly between all five countries. More specifically the data suggests that congruence does not always lead to high performance.

This study, albeit exploratory, makes theoretical, methodological and practical contributions in the following ways.

- i. A cross cultural test of Implicit Leadership Theory in a multinational organisation with a significant sample size.
- ii. An existing desired leadership values questionnaire was used and developed further to measure leadership values and leader perception.
- iii. All 196 leaders received a personalised feedback report showing the level of congruence (or degree of fit) for 21 leadership characteristics.
- iv. A methodological contribution was made by using Polynomial Regression Equations and Response Surface Methodology to measure the nature of the relationship between desired leadership values, perceived behaviour and leaders' performance.

Implicit Leadership Theory was shown to be complex yet very relevant to management practice. The research undertaken was exploratory yet it has created the basis for on going discussion.

## 1.2 Acknowledgements

A number of people have contributed to the research undertaken for which I want to express my sincere appreciation; they fit broadly into 4 categories.

1. **Cargill Sponsors:** *Greg Page, Rae Lesmeister, Nancy Siska and Margaret Studer* sponsored this research, created opportunities for discussion and personally believed in the value this research offer to Cargill.

2. **Cranfield Supervisory Panel:** *Professor Anne Huff (Lead), Dr. Christine Communal (Chair) and Dr. Frank Fishwick* have challenged, supported and endeavoured to broaden my thinking and my research. In particular they have been patient whilst I juggle full-time employment and undertaking this research. Earlier members of my panel were *Professor Mary-Jo Hatch (Lead) and Professor Chris Brewster* both of whom encouraged rigorous research and helped start the process with a solid foundation. I would also like to acknowledge three additional members of the supervisory panel who were involved as advisors namely, *Dr. Jim Huff, Lisa Lambert and Dr. Gilles Spony*. All are deep experts in their fields and have contributed significantly to the research undertaken.

3. **Research Administration:** *Tracey Smith and Vicki Kelly* have been the largest contributors to all the administration associated with

questionnaires, electronic mails and telephone calls. Between them they have collected over 7,000 completed questionnaires.

4. **Reviewers:** *Paul McKie* and *Heather Woodfield* were critical reviewers and helped with the document flow and consistency.

### **1.3 Executive Summary**

The primary purpose of this research was to assist Cargill Inc. further its global investments. Improving the effectiveness of global leaders was seen as a necessity for two reasons. Firstly, as a company with over 100,000 employees in 61 countries, there was a need to deepen people's understanding of cross-cultural leadership differences and similarities at a corporate level. Secondly, and more specifically, individual Cargill leaders wanted to be more effective in teams that included participants from backgrounds very different from their own. The tangible indicators of the study's success are that it has generated a corporate level discussion about cross-cultural leadership, whilst the use of the individual feedback report is being expanded. It is hoped that this experience will be of interest to the many other global companies facing similar needs to expand their understanding of cross-cultural leadership.

Implicit Leadership Theory was chosen as a basis for theoretically understanding and addressing the challenges of cross-cultural leadership, whilst the GLOBE leadership questionnaire was identified as an internationally validated instrument to gather data. In the first phase of the study, the leadership values that followers desire were measured against their perceptions of their own leaders' characteristics. Congruence or 'degree of fit' was subsequently calculated. The second phase of the study then examined the nature of the relationship of the congruence between desired leadership values and perceived leader behaviour with a measure of leader performance. The research was exploratory and needs further exploration. It is hoped that the methods and data presented in this study of 196 leaders and 1,738 followers will

be of interest to academic audiences concerned about the congruence between desired values, leader perceptions and leader performance and business audiences concerned with making their international leaders more effective.

### **Phase One:**

Phase One is summarised in Section 2 of this dissertation. It focuses specifically on leader congruence between values and perception, as suggested by Implicit Leadership Theory.

There were two data points used to calculate congruence, both of which came from the follower. Firstly, the GLOBE<sup>1</sup> leadership questionnaire was used to gather data on characteristics that the follower believes 'contribute to' or 'inhibit' outstanding leadership. For the purposes of this research these are referred to as the 'desired leadership values'. For example, the value 'Integrity' is almost universally desired by followers in this study. A second questionnaire administered 6-8 weeks after the first, was used to gather data on the follower's perception of their specific leader's behaviour using the same characteristics. The second questionnaire measured the extent to which the follower perceived that the leader's behaviour exhibited a given characteristic (for example, Integrity). This constitutes a significant extension of the GLOBE leadership project, which has focused on establishing cultural differences in what 'contributes to' and 'inhibits' outstanding leadership.

Section 2 of this dissertation discusses how the questionnaire was chosen and processed, how leaders in Cargill were selected for study, how the followers were

---

<sup>1</sup> GLOBE – The Global Leadership and Organisational Behaviour Effectiveness Research Program

nominated, how the data were analysed and validated, and how the Leadership Fit Report (**Appendix A**) was developed.

Within Cargill, Phase One provided individualised feedback for all 196 leaders from 26 countries participating in the study. The objective of the Leadership Fit Report was to show each leader their level of congruence [or degree of fit] for each of the 21 characteristics established by the GLOBE project. The report became a valuable tool for leaders to understand their teams desired leadership values by identifying areas where their followers agreed and differed. For example, independence, conflict avoider and risk taker had the highest standard deviations for what all 1,738 followers desired from a leader suggesting that there was wide variation in what followers considered a desirable amount. Understanding these differences is important in leadership. Additionally, the Leadership Fit Report became a development tool. As leaders became more self-aware, they identified perceived behaviours that needed change. An increase in self-awareness can lead to an increase in leader effectiveness (Atwater et al. 1998).

Positive reaction within Cargill to this process created demand for a Leader Follow-up Report twelve months after the original reports. Additionally, the analysis of the 1,738 followers gave the Cargill organisation new and relevant macro level information about the leadership values of followers from 23 countries. This proved valuable because it increased awareness of cultural differences in this global company, but it also identified 10 widely appreciated leadership characteristics within Cargill. This is discussed further in Section 2.3.6. The final part of Phase One involved a rigorous review of the Leadership

Fit Report and the supporting processes. Some weaknesses and limitations were identified and subsequently formed the basis for Phase Two.

The outcomes of Phase One were substantial. Firstly, the GLOBE research was extended by incorporating a measure of 'perceived leader behaviour'. Secondly, Phase One identified 10 attributes that are universally required in Cargill of which 6 were identical to the GLOBE study. Thirdly, from a possible 10,626 between group means, 303 desired leadership value means were significantly different ( $p < .05$ ) which supports other research that suggest values differ by nation. Finally, the contribution to Cargill was substantial from the Leadership Fit Report and the macro analysis for senior leaders. Each of these is discussed in more detail in the dissertation.

### **Phase Two:**

Phase Two is reported in section 3 of this dissertation. It focuses on a statistical examination of the nature of the relationship between congruence and leader performance.

It is widely assumed that congruence between followers' values and perceptions of leader behaviour will lead to higher leader performance (Lord et al. 1984; Lord and Maher, 1991; House et al. 1997), but the relationship between congruence and leader performance is rarely tested. Polynomial Regression Equations (Edwards, 1994) and Response Surface Methodology were used to understand the nature of the relationship between desired leadership values, perceived leader behaviour, and leader performance. The independent variables were desired leadership values and perceived behaviour. The dependent variables for leader performance were 8 measures of

characteristics critical for effective leadership in Cargill. The independent and dependent variables are discussed in Section 3.2.3 in this dissertation.

The first hypothesis of the dissertation consists of two parts; the first was that leader performance is high when there is congruence between desired leadership values and perceived behaviour. For example, congruence occurs if a follower desires a high degree of integrity and perceives their leader to have the utmost integrity. Secondly, leader performance is lower when there is incongruence between desired leadership values and perceived behaviour, for example, the follower desires integrity but there is no evidence of any perceived integrity in the leader's behaviour. Conversely, congruence can equally occur with characteristics that are not desired. For example, congruence occurs if autocracy is not desired and not perceived.

The second hypothesis of the study was that the nature of the relationship between congruence and leadership performance varies across cultures. For example, too much autocracy in one country may have a negative impact on leader performance, yet it can have a neutral impact in another country. By using Polynomial Regression Equations these and other questions could be answered regarding the nature of the relationship.

For Hypothesis 1, 26 tests from 160 revealed a relationship that supports the hypothesis that congruence leads to higher levels of performance and incongruence leads to lower levels. Of the remaining 131 tests, 82 revealed significant relationships at the level of culture. These findings suggest that Implicit Leadership Theory may only apply to certain characteristics and certain countries and may not be universal.

For Hypothesis 2, all 160 tests of the relationship between congruence and performance highlighted that culture made a difference most of which were significant to  $p < .01$ . The complexities are discussed in the text with suggestions for further research.

Finally, the analyses conducted revealed interesting relationships that were not tested or predicted, for example, 24 of the 160 tests revealed a relationship that was opposite to Hypothesis 1 in that congruence lead to lower levels of performance. Additionally, significant differences in the relationship were found between countries, especially Japan and Brazil.

Findings from Phase Two lent partial support to Implicit Leadership Theory. The study suggests that the relationship between desired values, leader behaviour and performance are more complex than has been theoretically predicted. Instead, these findings suggest avenues for future research that may offer more realistic advice for managers who are faced with the challenges of managing in increasingly globalised organisations.

## **2. PHASE ONE**

Cargill was established in 1865 in America. The majority of their investments were in North America until 2002 when, for the first time, the majority of its assets were found 'over seas'. After a major investment in Europe, 60% of Cargill's assets are, at the time of writing, present outside North America, compared with almost nothing in the early 1950s. Cargill is aware of the impact of these changes and continually strives to improve the processes that ensure that existing businesses remain competitive whilst new worldwide opportunities are identified. Cargill's experience in the last 10 years indicates that many of its strategic customers operate globally, including Coca Cola, Pepsi Co., McDonalds, Nestlé, and Unilever. Globalisation has affected all of Cargill's operations, including negotiations, research and development, supplier selection, the skills that employees require, the products sold, and the customers targeted. Cargill's aim is to continue to grow, but growth opportunities are limited in North America and Western Europe due to the size of its market share. National mergers and monopoly commissions would prevent further growth in some industries. The major opportunities therefore are outside these regions, particularly in Asia, Eastern Europe and Latin America.

### **2.1 Theory**

The theoretical literature that contributed to this research falls into 3 broad categories; globalisation, leadership and national culture.

### **2.1.1 Globalisation**

Globalisation is changing how the world conducts business. In the past, major companies could focus on their own regions (or even their own countries) and prosper (Goldsmith and Walt, 1999:160). This is either no longer the case or else it is becoming increasingly difficult. Many organisations today pursue a strategy of globalisation to protect their market share and their customer base. “In today’s global market, you do not have to go abroad to experience international competition. Sooner or later the world comes to you.” (Bartlett and Goshal, 2000:139).

As companies are expanding beyond national borders, leaders are increasingly employed internationally, in cultures other than their own, and participation in cross-cultural teams is becoming more commonplace (Brodbeck et al. 2000). In order to succeed, corporations must develop global strategies (Adler, 1997:5) and ensure effective development of global leaders (Pucik and Saba, 1998).

Globalisation is a threat and an opportunity for companies like Cargill; a threat because of new competition entering Cargill’s markets, and an opportunity because trade barriers are falling, consumers are demanding more choice and new ventures are being established. Without effective leaders, globalisation will remain predominantly a threat as new competitors enter Cargill’s markets; however, with effective global leaders, the threats should be minimised and transformed into opportunities.

Globalisation has caused an increase in demand for sophisticated leaders who are capable of handling the managerial complexities that arise when

working with people from other countries (Petrick et al. 1999). As globalisation continues, it increases the necessity for global leaders who can inspire and motivate their workforce regardless of nationality. Cross-cultural management explains the differences in the behaviour of people in organisations around the world, and seeks to investigate how multicultural organisations might improve efficiencies. To implement a strategy of globalisation, corporations have to address the needs of a multi-cultural workforce with all the nuances that that brings. A critical phase of such a strategy is to develop leaders who are competent globally, whilst recognising the fact that leadership skills may have to vary from one country to another (Brodbeck et al. 2000).

### 2.1.2 Leadership

Leadership is one of the world's oldest preoccupations and is a universal phenomenon (Bass, 1990); however, the term leadership is a relatively new addition to the English language (Dorfman, 1996). It appeared approximately 200 years ago in writings about political influence in the British Parliament. The subject has generated more than 7,500 academic studies in the last century yet there is no consensus as to its definition (Bass, 1990). When considering the history of leadership research it has been seen as the focus of group change, activity and process (Cooley, 1902); as a personality attribute (Bowden, 1926); as an exercise of influence (Nash, 1929); as an act or behaviour (Carter, 1953); and as the means to influence (Schenk, 1928). Leadership has also been defined in terms of traits (Mann, 1959), role development or clarification (House, 1971) and social perceptions (Lord and Maher, 1991).

Leadership exists in all societies and is essential to the functioning of organisations within each society (Wren, 1995). However, a major problem with researching 'leadership' is that it means different things to different people (Den Hartog et al. 1997a). Bass (1990:11) states that, "there are almost as many ways of defining leadership, as there are persons who attempted to define the concept."

The word 'leader' can be interpreted differently across cultures. Arguably the most extreme example is the German word 'Führer' which is a literal translation of the English word 'leader'. 'Führer', however, has an understandably strong negative connotation in Germany after the reign of Adolf Hitler, making its

meaning different from the word 'leader', which is interpreted in a far more positive sense in many other countries (Den Hartog et al. 1997a).

Leaders create the vision, the meaning within which others work and live (Adler, 1997). Indeed, when corporations are in pursuit of a strong global presence, the ability of leaders to earn respect is paramount. Global leadership involves the ability to inspire and influence the thinking, attitudes, and behaviour of people from around the world (Adler, 2001).

Although leaders must engage in the behaviour of leading, effective leadership involves a reciprocal process that must account for the perceptions of those who are being lead. James Macgregor Burns (Burns, 1978:425) defined leadership as “the reciprocal process of mobilising by persons with certain motives and values, various economic, political, and other resources in a context of competition and conflict, in order to realise goals independently or mutually held by both leaders and followers.” Lord and Maher (1991:3) focus more on the relationship rather than the tasks performed by a leader. They concentrate on leadership as a “social-perceptual process” and suggest that the “essence of leadership is being seen as a leader by others.” This will be explored further in Section 2.1.3 (Implicit Leadership Theory).

In summary, effective leadership is critical to support Cargill's further growth into new regions of the world. The demands made on future leaders will become more complex due to the difficulties of managing businesses that span countries, continents or the world. Globalisation and the growth of the type that Cargill is currently considering will require leaders with the ability to inspire and influence the thinking, attitudes and behaviour of people from diverse cultures (Adler, 1997). This research aims to provide tools to raise awareness of

cross-cultural differences in leadership and assist the leaders to become more effective when managing teams from different cultures.

### **2.1.3 Implicit Leadership Theory**

The theory that provides the framework for this research project, is known as 'Implicit Leadership Theory'. According to this theory, individuals have beliefs, convictions, and assumptions about the attributes and behaviours that distinguish leaders from others, for example, moral from evil leaders, and effective from ineffective leaders (Eden and Leviatan, 1975). These beliefs, convictions and assumptions are called Implicit Leadership Theories. They influence the value that members of a culture place on a selected leader's behaviour, attributes and motives (House et al. 1997); they also influence how others are perceived (Lord and Maher, 1991). The hypothesis that subjects might judge personality traits of others according to their own implicit personality theories was suggested by Bruner and Tagiuri (1957). Several authors have developed this further and have suggested that followers hold implicit cognitive prototypes of leaders and that leader behaviour is assessed in terms of its fit with these implicit prototypes (Cantor and Mischel, 1979; Cronshaw and Lord, 1987; Eden and Leviatan, 1975; Hall and Lord, 1995; Lord et al. 1984).

An individual's Implicit Leadership Theory refers to beliefs held about how leaders behave in general, and what is expected of them (Eden and Leviatan, 1975). Using an information processing perspective, implicit theories are cognitive frameworks or categorisation systems that people use during

information processing to encode, process and recall specific events and behaviour (Shaw, 1990). Furthermore, the followers' perceptions of leadership behaviour and cognitive prototypes are believed to be developed and influenced by the surrounding *environment*, and can be *situational* (Gerstner and Day, 1994). In short, there is a persistent belief that national culture influences leader prototypes and leader evaluations (Helgstrand and Stuhlmacher, 1999). It is argued that these leader prototypes should be positively related to cross-cultural dimensions (Shaw, 1990). This cultural implication will be explored in Section 2.1.4. Similarly, culturally different followers may perceive different levels of leadership from the same leader, because of the different prototypes guiding their expectations (Chong and Thomas, 1997).

Lord and Maher (1991:11) define leadership as “the process of being perceived by others as a leader.” Research suggests that leadership perceptions may be based on traits (Phillips and Lord, 1986), behaviours and events (Meindl et al. 1985). Rather than attempting to understand a leader's effectiveness in terms of traits and behaviours, recent research (Kenney et al. 1994) is based upon observers' subjective realities of person perception and information processing (Lord, 1985). In other words “leadership factors are in the mind of the respondent.” (Eden and Leviatan, 1975:741). According to Lord and Maher (1991), people use implicit theories as a base both for interpreting behaviour and as a foundation for generating behaviour, and subordinates use implicit leadership theories to evaluate their supervisors (Engle and Lord, 1997). House et al. (1997) suggests that leaders are accepted based on the ‘degree of fit’ or congruence between implicit leadership theories held by the attributors and their leader's behaviours.

Hall and Lord (1995) developed a social information-processing model of leadership in which they assert that leadership perceptions can be explained by two qualitatively different processes: firstly, leadership can be *inferred* from outcomes of salient events. Secondly, leadership can be *recognised* based on the fit between an observed person's characteristics and the perceivers' implicit ideas of what 'leaders' are (Lord, 1985). Lord (1985) proposed a categorisation theory of leadership as an explanation of how recognition-based leadership perceptions are formed. Based on Rosch's (1978) theory of cognitive categorisation, he argues that people are categorised as leaders on the basis of the perceived match between their behaviour or character and the attributes of a pre-existing leader category or prototype. It is the 'recognition based' categorisation that is the focus of this research. According to the leadership categorisation theory of Lord et al. (1984), categorisations are made based upon a match of characteristics of a person to prototypes [or schemas] held in memory, the core of which was often generated in childhood, and parts of which are being regenerated continually (Keller, 2003). Lord et al. (1984) developed this further to suggest that leadership is a cognitive knowledge structure. Perceivers use degree of match to this prototype to form leadership perceptions (Lord and Maher, 1990). Recognising someone as a leader involves a relatively simple categorisation, by the perceiver, as a leader or non-leader. Such a categorical judgement, according to Rosch (1975), is made on the basis of the similarity between the perceiver and the prototype category. It is also suggested that categorisation will change based upon the position of leadership being considered, for example, the perception of a Chief Executive Officer may differ from that of a line manager as categorised by one individual (Den Hartog et al.

1997b). Investigating the type of leadership that people around the world find most or least helpful is the domain of the GLOBE project (House et al. 1997). The GLOBE project relies on Implicit Leadership Theory to examine cultural differences in leadership prototypes.

Lord and Maher (1991) have argued that leadership perceptions are an important consideration because an individual must first be perceived as a leader to be allowed the discretion and influence to perform effectively. Consistent with this argument, Shaw (1990) notes that it is critical for an expatriate manager to be perceived as a leader in a host country to gain the requisite power and respect in order to be effective.

Whilst this research embraced the theory of implicit leadership it did not discount all the previous leadership research conducted over many decades. Mann (1959) and Stogdill (1948) were early contributors to trait theory, which suggested that leaders had certain physical traits and personality characteristics which differentiated them from non-leaders. This work was later criticised (Landy, 1985; Muchinsky, 1983) suggesting that there was no relationship or connection between a leader's personality and their effectiveness. A more recent review (Lord et al. 1986) challenges the assertion that personality does not matter by demonstrating there is a relationship. Calder (1977) identified both behaviours and events associated with leadership perception and being perceived as a leader allows "one to exert greater influence" (Lord et al. 1986:408). What Lord and Maher (1990) have shown is that traits, behaviour and events are crucial distinguishing features of leaders building upon earlier work (Lord et al. 1986). It is these features, as perceived and utilised by others,

and not as they occur in an objective sense, that are crucial in explaining leadership perception.

The purpose of this study is to extend the theory of implicit leadership by first attempting to make explicit what is implicit; in other words, to measure aspects of the implicit theories held by followers regarding follower beliefs of what contributes to an outstanding leader. This is discussed further in Section 2.4.3. This study conceptualises an implicit theory as the follower's desired leadership values, and compares these values to the follower's perception of their leader's behaviour as a test of the principles captured by Implicit Leadership Theory. The ultimate importance of Implicit Leadership Theory lies in the possibility that these perceptions may influence interactions between leaders and followers in the workplace (Hunt et al. 1990). Discrepancies between followers' implicit leadership theories and those of the leader may be associated with dissatisfaction with the leader, and as a result create increased employee turnover (Engle and Lord, 1997), therefore impacting upon the success of an organisation (Hunt et al. 1990). This study will contribute to the work begun by Lord and his colleagues on Implicit Leadership Theory.

#### **2.1.4 National Culture**

Successful growth within Cargill will be dependent on a number of variables, one of which will be having effective leaders to lead the new growth into new countries and developing local leaders. A contributing factor to a leader's effectiveness will be an understanding of how implicit theories of leadership vary from culture to culture. In the previous section the complexities of leadership were discussed; now the discussion is developed further in the context of national culture because most of Cargill's growth will take place in Asia, Latin American and Eastern Europe, where Cargill has less experience.

Despite the central importance of understanding national cultures to international work, a review of the literature reveals that there is no universally recognised definition of 'culture' (Dorfman, 1996:270) nor it is easy to "define" or "measure" (Steers and Sanchez-Runde, 2002:190). The literature offers multiple suggestions for describing culture. For example, culture is something that is learned, not inherited – it comes from the social environment, not from genes and much of this is acquired in early childhood (Hofstede, 1994). Culture has been conceptualised as a complex web of norms, values, assumptions, attitudes and beliefs that are characteristic of a group (Lytle et al. 1995). Culture is also known as the "collective programming of the mind which distinguishes the members of one human group from another" (Hofstede, 1994:5) or, "a set of control mechanisms for the governing of behaviour" (Geertz, 1973:17). In general, we see people as being from "different cultures if their ways of life as a group differ significantly, one from the other" (Adler, 1997:15). "In its most general sense, culture refers to a people's way of life"

(Ronen, 1986:17). The definition of culture that is used in this project is derived from two anthropologists' attempts to make culture operational by specifying both *what it is* and *what it influences*:

*“Culture is a shared set of commonly held general beliefs and values which influences people’s assumptions, perceptions and behaviour”* (Kluckhohn and Strodtbeck, 1961:29). This definition has been chosen because of its association with the research question being undertaken as part of this study in that values and perceptions are central to this study and to understanding cultural differences (Offerman et al. 2001; Gerstner and Day, 1994).

Cultural differences may be examined by differences across geographic region, ethnicity, organisations, professions, religion, gender, generation and social class. The beliefs, values, and practices that are shared by the majority of people belonging to a certain nation are commonly referred to as ‘national’ culture. Every person has patterns of thinking, feeling and behaving which have been learned throughout their lifetime. These patterns are seen in the way people behave at school, in the family and on the job; they are reinforced by national laws and government policies (van Oudenhoven, 2001). National culture is one of a number of categories in which culture can be observed.

Building conceptual bridges between cultures will remain a key competence for cross-cultural leadership (Brodbeck et al. 2000; Hampden-Turner and Trompenaars, 2000). Increasingly, there is an integration of organisations across business and national borders, which demands that the modern manager is able to operate multiculturally (Hofstede 1992). Managers derive their ‘raison d’être’ from the people they manage: culturally, they are the followers of the people they lead and their effectiveness depends on the latter (Hofstede, 1993).

There is sufficient empirical evidence that suggests that people's values, norms and beliefs vary by national culture. There is sufficient empirical research that concludes that there are variations across the globe in how people *communicate*, what they *value*, how they *interact* with people, how they perform their work, how they engage in relationships and demonstrate *trust*, what their concept of *control is*, and how they perceive *time, power, gender* and *status* (Hofstede, 1994; Trompenaars and Hampden-Turner, 1997; Adler, 1997; Brislin, 2000; Hall and Hall, 1990; Adler, 1997). Leadership is inextricably linked to the values and customs of a group of people (Gerstner and Day, 1994). For example, Brodbeck et al. (2000) concluded, after studying 22 European countries, that only a few leadership concepts are culturally endorsed namely, Inspirational, Visionary, Integrity, Performance Orientation and Decisiveness, and that others vary by national culture. That some characteristics are universally endorsed and others are culturally bound has been verified by other researchers (House et al. 1997). Moreover, moving from one culture or country to another, systematic differences can be seen in what is regarded as important for effective leadership (Smith and Peterson, 2002). An important source of differences in leadership among countries is a consequence of these different explicit and implicit theories about the leader-subordinate relationship (Bass, 1990:785).

Cultural similarities and differences are of particular concern for international companies trading in global markets. The idea of creating cross-cultural diversity within the leadership of organisations has been proposed by several prominent researchers (Bass, 1990; Haire et al. 1966; Hofstede, 1980; Sadler and Hofstede, 1976). One important approach to leadership in a cross-

cultural context concerns the role of followers' perceptual processes in identifying leaders (Lord and Maher, 1991), which this research aims to address.

In the previous section, Implicit Leadership Theory was discussed and in particular how subordinates' perceptions of the leader can have a substantial impact on the outcomes of the leadership process. Perceiving someone as a leader is suggested to involve a cognitive categorisation process (Shaw, 1990), in which a target person is matched against an abstract prototype stored in the memory. One of the difficulties with this process, in a cross-cultural context, is that perception is not solely an innate, physiological function of sensory systems. Instead, it is a subjective process reflecting the self and including its cultural background (Markus and Kitayama, 1991).

In cross-cultural situations, leaders and followers may be guided by different leadership prototypes. As a result, the meaning of a leader's behaviour may be ambiguous, since the interpretations made by followers may not match the leader's intention (Chong and Thomas, 1997).

This research seeks to establish the relationship (in terms of congruence or fit) between a follower's desired leadership values and a follower's perception of their leader's behaviour, both of which are impacted by cross-cultural differences.

Much has been written separately about 'leadership' and 'national culture', however, too little is still known about global leadership and the development of intercultural competencies (Harris and Kurma, 2000; Pucik and Saba, 1998). Despite the thousands of empirical leadership studies (Bass, 1990), relatively few have been concerned with the impact of cultural influences on leadership. Much of the writing on cross-cultural differences in leadership is anecdotal or

conceptual (Gerstner and Day, 1994) and relatively few empirical studies have investigated the relationship between culture and leadership (Dorfman, 1996). The lack of research has created problems for businesses in some countries that operate globally because it requires them to be operating in a vacuum without guidance from any management research (Agarwal et al. 1999). Despite this need, there is no cross-cultural theory that is empirically based (Shamir et al. 1993).

Over the past decade, managers and researchers have increasingly recognised the importance of 'organisation culture' as a socialising influence and climate creator within businesses (Adler, 1997:61). Unfortunately, this has tended to limit rather than enhance our knowledge of national cultures (Adler and Jelinek, 1986; Schneider, 1988) which this research is seeking to address. In essence, all of the above will have a major impact on the role of global leaders, and raising awareness of these differences is hoped to increase their effectiveness.

A further debate in cultural studies considers the extent to which the industrialisation of the world in the twentieth-century has impacted upon cultural differences. The concept that economic ideology drives cultural values due to the imperatives of globalisation and industrialisation is deeply rooted in what is known as 'convergence theory'. Convergence implies that as nations become industrialised, there is a significant shift in values towards behaviour that embraces free market capitalism (Ralston et al. 1997). Proponents of the 'divergence approach' argue that national culture, not economic ideology, drives values and even if a country adopts capitalism, the value systems of those in the workforce will remain largely unchanged (Ogbor, 2000).

Cargill, as an organisation, has adopted the view that cultural diversity strengthens the organisation and would generally discourage countries from adopting capitalist values from other cultures. Encouraging managers to abandon their cultural values would receive no support from Cargill. Cargill management acts on the principle that understanding the differences in people's values is critical for building effective cross-cultural relationships.

Despite the various definitions and the complexities involved with understanding national cultures, one objective of this research is to determine the nature of the relationship between desired leadership values and perceived leader behaviour and its impact upon leader performance. This question concerning leadership performance across national boundaries has been particularly salient for Cargill managers. For example, during the course of this study, Cargill managers asked questions regarding the relationship of integrity, and autocracy on leader performance. The questions centred on whether or not performance can ever be hindered by too much integrity or too little autocracy, and how this differs across cultures. These questions have not been addressed in literature.

It is important to stress that understanding cultural differences and values, whilst important, is not the sole factor affecting managerial performance; political, economic, social and enterprise-level variables are equally important (Shenkar et al. 1998). Kuchinke (1999) conducted a study that used leadership values to predict leadership style. Whilst his conclusions demonstrated a clear relationship, other variables exerted stronger effects, suggesting that leadership style and effectiveness are not solely about deep cultural understanding.

In summary, this research seeks to further develop an existing theory in a cross-cultural context. Implicit Leadership Theory provides the theoretical framework, and the test will be conducted with 196 leaders from 26 countries, and 1,738 followers from 23 countries. Effective leadership is critical for Cargill as preparations are made for more major investments in Asia, Latin America and Eastern Europe. Diversity among employees will create multiple views (implicit theories) of effective leadership (Lord and Smith, 1999), as will cultural variability (Gerstner and Day, 1994). Differences can impede leader effectiveness if inappropriately managed (Brodbeck et al. 2000), and leader effectiveness is likely to be attained by those who understand and adjust to such differences (Lord and Smith, 1999). The aim of this research is to present leaders with a measure of their level of congruence (values and behaviour), help increase their self-awareness and cross-cultural awareness, and assist the organisation to develop global leaders.

## **2.2 Methods**

This section discusses how the leaders were selected, where the data came from, the research procedures and the analysis for Phase One.

### **2.2.1 Sample**

#### **2.2.1.1 Selection Process for Leaders and Followers**

Cargill's Board of Directors deemed it important to identify their next generation of leaders. There are currently 35 executive leaders in Cargill – these are the most senior positions. The Board wanted a process to be developed that would identify, prepare and develop leaders to succeed those currently holding one of the 35 positions. Two criteria were used to identify potential individual candidates for these top positions: high performance in their current middle management job grade, and high potential for a more significant job in the future. The assessments were conducted by 84 business unit leaders and 14 functional leaders. Their recommendations were reviewed by those currently holding the 35 executive positions. Over 800 leaders globally met the criteria and were considered potential candidates for the 35 positions within the next 7 years.

The research undertaken as part of this project divided the pool of 800 leaders into the following three categories:-

1. Leaders with a team of varying national cultures.
2. Leaders with a team of the same nationality, but different from that of the leader.

3. Leaders with a team of the same nationality as the leader.

Subsequently, 50 people were chosen from each category. The criteria used for selection were to maximise diversity with regard to age, seniority, job function, nationality and gender.

Cargill's senior managers approved this research but did not mandate any leaders to participate. Without the leaders' willingness to participate there would have been limited access to followers around the world, thus jeopardising the research. The study therefore had to be 'sold and marketed' internally, and the benefits to an individual leader had to be sufficiently quantifiable to encourage participation. The largest single benefit offered to leaders selected as possible candidates was the Leadership Fit Report, which provided individualised feedback to each participating leader.

A total of 150 leaders were invited to participate, and 140 accepted, representing 19 nationalities. Each leader was asked to nominate 8-12 followers and nominations that fell outside of this range were not accepted. The definition of a follower in the communication to the leaders was that:-

1. The leader must have direct or indirect influence over the follower.  
Direct reports were the largest category of followers.
2. The follower must have known the leader for a minimum of 6 months and the degree of interaction must have been significant enough to rate the leader against the characteristics in the questionnaires.
3. The follower must be a full-time employee of Cargill Incorporated, or one of its subsidiaries.

4. The follower must have access to electronic mail for ease of processing<sup>2</sup>.

The leaders had the freedom to choose the followers they desired to be included in the study and therefore it was possible for them to choose those with greater affinity. This potential weakness is discussed in Section 2.4.3.

As more leaders became involved in this research, more Cargill leaders around the world became aware of the research and more specifically of the feedback they would receive. This created an opportunity to widen the research to include more countries and as a result the number of leaders rose from 140 to 196 and increased the leader nationalities from 19 to 26. The 2,122 followers represent 57 countries; however, only 23 countries had 20 or more followers taking the sample size of followers to 1,738.

---

<sup>2</sup> Approximately 30,000 employees worldwide have easy access to electronic mail.

## **2.2.2 Procedure**

This section discusses the procedures that were followed to conduct the research. The following sub-sections are included;

- 2.2.2.1 Questionnaire Selection*
- 2.2.2.2 Demographic Questionnaire*
- 2.2.2.3 Questionnaire 1 – Desired Leadership Values*
- 2.2.2.4 Questionnaire 2 – Perceived Leadership Behaviours*
- 2.2.2.5 Questionnaire Translation and Back Translation*
- 2.2.2.6 Questionnaire Distribution and Processing*
- 2.2.2.7 Handling of Errors/Removing Data*
- 2.2.2.8 Leadership Fit Report*
- 2.2.2.9 Definition of Nationality*
- 2.2.2.10 Confidentiality Procedure*

### **2.2.2.1 Questionnaire Selection**

To fulfil the objectives of this research, a questionnaire was required that would help understand followers' implicit theories of leadership and would be applicable across multiple countries. Whilst acknowledging the fact that it would be difficult to make explicit all of what is held as implicit, a broad questionnaire that would address the cross-cultural needs of this research was still required.

GLOBE's questionnaire was chosen for this research for the following reasons. Firstly, it had been developed with global input, unlike other global questionnaires that are often developed for one country or region, and then used globally. Secondly, over 15,000 people from 53 countries had completed the instrument (Den Hartog et al. 1999). Thirdly, Implicit Leadership Theory was central to their research.

Professor Robert House, from Wharton University, started the GLOBE cross-cultural research project in 1991. The GLOBE research project has become a

network of 170 social scientists and management scholars from 61 countries, working in a co-ordinated long-term effort to examine the interrelationships between society culture, organisational culture and practices and organisational leadership (House et al. 1999).

GLOBE is a long-term, multi-phase project directed toward the development of systematic knowledge concerning how society and organisational cultures and subcultures affect leadership and organisational practices. Phase One of the project focused on the development and validation of scales measuring society culture, organisational culture, and leader attributes. Phase Two uses the scales developed in Phase One to address questions concerning the influence of culture on the desired leadership attributes. In Phase Three, a variety of alternative methodologies were used (for example, ethnographies, unobtrusive measures, media analyses) to develop a comprehensive, non-method bound understanding of desired leadership attributes, organisational culture, and society culture. Phase Four will consist of a series of laboratory studies and will focus upon the questions concerning the interaction of leadership effectiveness and culture.

The research conducted for this dissertation only used their leadership questionnaire. The objective of their questionnaire was to identify and measure the characteristics that 'contribute greatly' to and 'greatly inhibit' outstanding leadership. For the purposes of this research, these are known as the desired leadership values.

GLOBE's leadership questionnaire consisted of 112 items, 99 of which were assigned to 21 leadership factors, which are presented in **Appendix B**. The 21 factors were the result of a confirmatory factor analysis procedure performed by the GLOBE researchers. GLOBE's 21 leadership factors were adopted for Phase

One of this research and were incorporated into the structure of the Leadership Fit Report. Section 2.2.3.3 discussed the principal component analysis performed in this research.

What the GLOBE questionnaire does not measure, however, is perceived leader behaviour. Measuring the degree of fit or congruence was not part of GLOBE's research and subsequently became a major factor in the contribution for Phase One.

### **2.2.2.2 Demographic Questionnaire**

The GLOBE demographic questionnaire was also taken and adapted for this research (See **Appendix C**). A small number of changes were made primarily to facilitate future research, which is discussed further in Section 2.4.4. The changes were made to *name*, *communication method* and *nationality*.

The *name* field was added so that the follower could be contacted if there were questions associated with their responses. The followers were guaranteed confidentiality. What this meant was that under no circumstances were their scores revealed to anybody other than those involved directly with processing the data for this research. Furthermore, this meant that although individual scores were represented within the Leadership Fit Report, there was no possibility of the leader attributing the scores to any individual follower because a minimum of 8 followers was required.

The *communication method* was also added to assist with future research so that congruence could be measured, based on the different responses. This is discussed in Section 2.4.4 as potential future research.

Finally, *Nationality* was extended to increase the richness of the data regarding culture. The purpose of this study was to make comparisons across cultures, and therefore 'nationality' was a critical item. It was decided to collect multiple forms of nationality (for example, country of birth, nationality and passport nationality) to help with analysis. Section 2.2.2.9 discusses this in more detail.

### 2.2.2.3 Questionnaire 1 – Desired Leadership Values

This research used the GLOBE questionnaire in exactly the same way it was used in the GLOBE research project; it is presented as Questionnaire 1 in **Appendix D**. Each of the 112 items focused on one leadership characteristic and were scored on a 7-point Likert scale. The scaling has the following description:

- 1=This behaviour **greatly inhibits** a person from being an outstanding leader.
- 2=This behaviour **somewhat inhibits** a person from being an outstanding leader.
- 3=This behaviour **slightly inhibits** a person from being an outstanding leader.
- 4=This behaviour has **no impact** on whether a person is an outstanding leader.
- 5=This behaviour **contributes slightly** to a person being an outstanding leader.
- 6=This behaviour **contributes somewhat** to a person being an outstanding leader.
- 7=This behaviour **contributes greatly** to a person being an outstanding leader.

For example, for item 1, *‘Diplomatic – Skilled at interpersonal relations, tactful’* a response of ‘7’ implies that the respondent values *diplomacy* as this ‘contributes greatly’ to their definition of an outstanding leader. If however, a score of ‘4’ was given, this implies that diplomacy has neither a positive nor a negative impact on his or her definition of an outstanding leader – a ‘4’ is a neutral score. If a score of ‘1’ was given, this implies that diplomacy has a significant negative impact on their definition of an outstanding leader. Valid responses were any single number between 1 and 7. Checking/ticking more than one box or leaving all 7 blank were invalid responses.

This questionnaire was given to all the leaders and all the followers whom they nominated. The leaders were also requested to complete Questionnaire 1 so that their desired leadership values could be compared with those of their followers. In the Leadership Fit Report a spider diagram, shown on Page 7 (**Appendix A**), contrasts the two sets of values. For the purposes of this study,

this data was not used for any calculations. **Appendix A**/Page 7 contrasts the two sets of data (follower values versus leader values).

#### **2.2.2.4 Questionnaire 2 – Perceived Leader Behaviours**

The GLOBE researchers used Questionnaire 1 to gather empirical evidence to demonstrate that desired leadership characteristics are culturally bound (Brodbeck et al. 2000; Den Hartog et al. 1997a; House et al. 2001). Their leadership questionnaire focused solely on understanding what contributed to outstanding leadership and what inhibited outstanding leadership.

The principal focus of this research was to measure ‘congruence’ or ‘fit’, and therefore a further questionnaire was required. To measure perceived leader behaviour, the questionnaire and characteristics used for Questionnaire 1 were used without making any changes to the items or the sequence. The only change made was that followers would be required to answer the questions with regard to the perception of their leader’s behaviour. Questionnaire 1 thus measured the follower’s desired leadership values, and Questionnaire 2 measured the follower’s perception of their leader’s behaviour. See **Appendix E** for Questionnaire 2.

For Questionnaire 2 the scale was changed to measure frequency of the observed behaviour, as shown below:-

- 1**=I have **never** observed this behaviour or characteristic in <Named Leader>
- 2**=
- 3**=
- 4**=I have observed this behaviour or characteristic only **sometimes** in <Named Leader>.
- 5**=
- 6**=
- 7**= I have observed this behaviour or characteristic **very frequently** in <Named Leader>.

Specific anchors were omitted for the scores 2, 3, 5 and 6 as it was difficult to find appropriate words that could be translated to describe intervals of “never to

sometimes” and “sometimes to very frequently”. The wording chosen instead for each of the translated questionnaires was:-

*Scores 2 and 3 represent a scaling between **never** and **sometimes**.*

*Scores 5 and 6 represent a scaling between **sometimes** and **very frequently**.*

In Questionnaire 2, item 1 reads, '*Diplomatic – Skilled at interpersonal relations, tactful*'. The response can vary from 1 through to 7. If the respondent gives a score of '7' this would imply that they perceive the named leader to demonstrate diplomacy *very frequently*. If however, a score of '4' was given, this implies that the respondent perceives the named leader to demonstrate diplomacy *sometimes*. Finally, if a score of '1' was given, this implies the respondent's perception that the named leader *never* demonstrates diplomacy.

#### **2.2.2.5 Questionnaire Translation and Back Translation**

Language often causes complications during cross-cultural research (Adler, 1984). When conducting cross-cultural research (Brislin, 2000), local language questionnaires should be used to ensure that items present constructs as defined by the researcher (Sekaran and Martin, 1982). However, local language translations may introduce unintended variations in items, which will cause problems with data comparability. The GLOBE questionnaire had been translated into different languages and back translated, but obtaining them proved difficult, so the decision was made to translate these into the required languages for this research. The Research Office at Cranfield University recommended a translation company that had experience of translating questionnaires that had been designed for research purposes. The English version was used as the principal questionnaire, and from that the following translations were made: Chinese, Dutch, French, German, Japanese, Polish, Portuguese, Russian, Spanish, Turkish and Ukrainian. During preliminary discussions, employees in India, Indonesia, Malaysia, Singapore and Thailand expressed a preference for completing the English questionnaires rather than translations.

In this research, each questionnaire was translated from English into the required language and independently back-translated into English. The translation – back translation method is the best known method for instrument translation (Brislin, 1986). The two translators were asked to discuss the differences between the two English translations and agree upon a final version. A pragmatic approach (Brislin, 1986) was taken in evaluating the accuracy of

the back-translation due to the fact that comparisons would be invalid if translations were different. The emphasis was on the concept, rather than the exact words. There was no evidence, from the subsequent administration or analyses, of translation errors.

Meaning equivalence creates further problems for cross-cultural researchers. It is essential that researchers ensure that the values studied have the same meaning in different cultures (Singh, 1995). Even with translation and back-translation a researcher cannot be confident that value expressions have equivalent meanings in different languages and cultures (Smith and Schwartz, 1997). The process described above was designed to minimise variation in conceptual meaning of the items across cultures. In Section 2.2.3.3 principal components analysis offer evidence concerning conceptual comparability across national cultures.

#### **2.2.2.6 Questionnaire Distribution and Processing**

It was essential to develop a questionnaire distribution plan that maintained confidentiality and was easily accessible for all respondents. Cargill's internal web (Intranet) was considered, but reliability issues had caused problems in some countries, therefore a decision was made to process all the research via Cargill's electronic mail system, and not to use the Intranet. A system was then developed that would require minimal re-typing work. Each respondent would enter information and for each item simply cross/check a box (☒). The information entered would automatically be extracted and placed into a larger database for processing. This approach minimised manual work, kept processing costs to a minimum, and minimised errors.

Once Questionnaire 1 had been returned, Questionnaire 2 was prepared but was not sent for 6-8 weeks. The process was designed in this way to ensure that Questionnaire 2 was answered with a 'fresh mind' rather than being influenced by the answers that the followers gave for Questionnaire 1.

Finally, all the data were collected within 10 months. Recommendations for cross-cultural research are to collect data over a minimum period to avoid issues with comparing data (Sekaran and Martin, 1982).

#### **2.2.2.7 Handling of Errors/Removing Data**

Respondents were required to complete all 112 items on each questionnaire. If items were omitted, questionnaires were returned and respondents were requested to complete the missing items. The outcome of this procedure resulted in 96% completed questionnaires for all 196 leaders. If all 112 items were not answered, then the respondent's data would not be used.

In Section 2.2.2.1 the 21 GLOBE leadership factors were explained. The factors, or leadership characteristics were used as part of the validation process. On occasion, respondents would answer two or three questions in the same factor with significantly different scores. For example, leadership factor 12 is Integrity and consists of four items. If the responses to any two items were significantly different, for example, if question 16 (*Trustworthy*) was answered significantly differently from question 88 (*Honesty*), then this would suggest a possible misunderstanding or simple error. A significant difference was defined as two scores with difference of 4 or more within 1 leadership factor. If this was identified, the respondent was asked to check their responses, but without specifying the question number. The wording for the communication is presented in **Appendix F**.

This procedure was followed for 134 questionnaires out of a total of 4,244; for 32 of the questionnaires returned respondents made no changes, but for 102 questionnaires, respondents revised their response. A small number telephoned the researcher to discuss their scores before making the changes.

One individual responded with '4' (no impact) to every item on Questionnaire 1. When consulted, the follower indicated that he believed that "*Leadership is situational*" and therefore they wanted to reply with a 'neutral' score to each item. The problem that arose was that the degree of fit could not be calculated with a score of '4' to each item. In this case the follower agreed that the best solution was to withdraw his response.

### **2.2.2.8 Leadership Fit Report**

The Leadership Fit Report became a critical product in this research. Participation was voluntary and leaders agreed to participate on the understanding that they would receive a personalised report, believing it would have sufficient value.

The Leadership Fit Report intended to accomplish the following:-

1. Highlight the desired leadership characteristics held by the leader's followers, showing where there is agreement and where there are differences within their group.
2. Highlight the desired values of the leader (leaders were asked to complete Questionnaire 1) and contrast this with the followers' leadership values.
3. Highlight the perceptions that the followers hold of their leader, showing where there is agreement and where there are differences within the group across the GLOBE 21 factors.
4. Highlight the congruence between the desired leadership values and perceived behaviour.
5. Highlight the specific items where the largest differences between desired leadership values and perceived behaviour are present.  
[Note: For most leaders, these differences formed their areas for development, for example, Question 16 – Trustworthy. If each of the 10 followers responded with a 7 for *desired leadership values* [contributes greatly to outstanding leadership] and subsequently, each follower responded with a 3 for *perceived behaviour*, then the

average difference for this item would be 4 which is significant when on maximum scale of 6.

6. Provide access to a significant number of followers across multiple countries so that desired leadership values can be analysed by nationality. This was achieved by making summary information available via the intranet.

Each leader attended a one-to-one feedback session with the researcher. The purpose of the session was to provide a detailed explanation of the report and to encourage the leader to consider where development maybe required.

Due to high demand, a *follow-up* Leadership Fit Report was developed (presented in **Appendix G**). The follow-up report was based on the same principles, but measured the change from the previous report. Currently 60 leaders have participated in the follow-up, all of whom received their first report at least 12 months ago.

A core element of the Leadership Fit Report is the degree of fit or congruence calculation. Section 2.2.3.4 discusses this in more technical detail.

#### **2.2.2.9 Definition of Nationality**

In Section 2.2.2.2 the demographic questionnaire was discussed. There were minor changes made to the one used by the GLOBE research project, one of which was nationality. The GLOBE questionnaire had one data field for nationality and it was decided that this was potentially too limiting for the following reasons. Firstly, in a pilot study, leaders and followers were identified who had dual nationality and held two passports. Some followers had been

raised in one country and had moved as a child and subsequently taken on the nationality of the new country. Their new nationality differed from that of their parents.

The conclusions drawn from the pilot study was that the demographic questionnaire must collect a broad range of data that helps understand the followers' cultural backgrounds.

For the purposes of Phase One, the definition of nationality was how the follower defined it. For example, if they were born in Mexico and moved to America as a child and considered themselves to be American, then this represented the definition of nationality. In Phase Two a different definition was used and this is described in Section 3.2.1.1.

#### **2.2.2.10 Confidentiality Procedure**

A confidentiality procedure was developed as part of this research. Its purpose was primarily for those involved in the administration so they understood what information could and could not be shared. The procedure covered the following areas:

1. Individual responses from followers and leaders were not discussed with anybody other than the respondent. Individual scores were never analysed for any other purpose than validation for the Leadership Fit Report. In the event further discussions were required with others, the respondent had to approve this in an electronic mail.
2. Leadership Fit Report: This was produced by the administrative support staff, reviewed by the researcher and subsequently sent to the leader. Contents of the report were not discussed with anybody

outside of the research team. In some cases the Leadership Fit Report was sent to executive coaches for their review but only after the leader approved this.

3. There were multiple opportunities during the research to discuss the contents of a leader's feedback in meetings where talent and talent development was being discussed. The researcher made other leaders aware that the Leadership Fit Report was a development tool not an assessment tool and under no circumstances were contents ever discussed without the approval of the leader.

### **2.2.3 Measures and Analysis**

This section discusses the data standardisation to control for cultural differences and the principal components analysis.

#### **2.2.3.1 Standardisation by Respondent**

Standardisation is a technique often used in cross-cultural research to minimise the potential impact of social desirability and response bias (Vijver and Leung, 1997; Leung and Bond, 1989). Members of collectivist cultures are believed to use the middle range of the scale, while members of individualistic cultures use a wider range of the scale (Kim et al. 1994). Triandis (1995) recommends a standardisation correction procedure to remove cultural bias from the original 'uncorrected' questionnaires. Standardisation transforms raw data into new measurement variables with a mean of 0 and a standard deviation

of 1. The procedure re-represents the values as standard deviations from the mean (Kachigan, 1991) and uses the following equation:-

$$Z \text{ score} = \frac{\text{Observed Value} - \text{Mean Value}}{\text{Standard Deviation of the values}} \quad (1)$$

This procedure was performed on the desired leadership values data (Questionnaire 1) and on the perceived behaviour data (Questionnaire 2) independently. The standardised data also formed the input for the Principal Components Analysis (described later in this section).

#### **2.2.3.2 Standardisation by Country**

From the data collected, it is possible to report on how individuals differed regarding the value they attach to certain leadership characteristics. It is also possible to compare nations by aggregating all the individual scores in one nationality, and therefore report on a different level of analysis. This is a common approach in cross-cultural research; however, it has been criticised because the results at a cultural level may be different from those at an individual level (Hofstede and Bond, 1984; *The Chinese Culture Connection*, 1987).

Before a comparison of nations can be made, a more accurate method to adopt is that of double standardisation as recommended by Hofstede:-

*“Standardisation can be carried out on the scores of individuals or on the mean scores of groups. The results are not necessarily the same: Standardising individual scores before calculating a group mean in general will lead to a somewhat different rank order of*

*goals than calculating a group mean first, before standardising. Ritti (1964) has recommended “double” standardisation of individual scores as a preparation for factor analysis.” (Hofstede, 2001:75).*

In order to allow comparisons across nations and comparisons across individuals, a second standardisation was performed. As discussed, the first standardisation resulted in an individual having a mean score for all 112 items of 0 and a standard deviation of 1. The second standardisation resulted in each nation having an average of 0 for each item and a standard deviation of 1, as suggested by Leung and Bond (1989). This is known as the double standardisation procedure, and was used for the factor analysis described in the next section.

### **2.2.3.3 Principal Component Factor Analysis (PCA)**

The primary purpose of Principal Factor Analysis (PCA) is generally to reduce the data items and make analysis and reporting easier (Kachigan, 1991). The purpose of the PCA in this research was not to reduce the data items; instead, this procedure was followed firstly, to compare the results with the GLOBE project. Secondly, it is a method of confirming that the psychometric properties (or the nature of the items) (Sekaran and Martin, 1982) that are being measured in both questionnaires are actually considered to be the same in the perception of the respondents. A major concern in cross-cultural research, especially in psychological and organisational behaviour, is the applicability of measures developed in one culture to another culture (Sekaran and Martin, 1982; Vijver and Leung, 1997).

When conducting cross-cultural research, social desirability is an additional potential issue not to be overlooked. Social desirability is defined as the tendency of individuals to present themselves in a favourable light (Podsakoff et al. 1982). It is likely that social desirability will vary across cultures (Hofstede, 1984) and therefore, may create a particularly problematic response bias in cross-cultural research. Additionally, respondents from different cultures vary in the way they typically respond to rating scale formats; some using extremes, for example, whilst others use more moderate responses (Smith and Schwartz, 1997; House et al. 1999; Triandis, 1995).

GLOBE's factor analysis resulted in 21 factors with 13 of the 112 items not loading significantly to any one factor, so before the comparison could be made, a process for developing a new factor structure was determined. The difference between the GLOBE research and this research is that GLOBE did not have a second behavioural questionnaire, and therefore had only one set of data to use. For this research, two PCAs were performed using Varimax rotation (one for desired leadership values and one for perceived behaviour), using double standardised data.

Questionnaire 1 (Desired Leadership Values) - The first PCA was conducted on the double standardised desired value data for all 1,738 responses, having first weighted the data by nation to balance the countries with fewer responses.

Questionnaire 2 (Perceived Behaviour) – The second PCA was conducted on the double standardised perceived behaviour data for all 1,738 responses having first weighted the data by nation to balance the countries with fewer responses. The weighting is a feature in SPSS. The results of the PCA and the limitations of this approach are discussed in Section 2.3.2.

#### **2.2.3.4 Degree of Fit Calculation**

This section describes in detail how the fit calculation was defined to determine congruence. The purpose of the fit calculation was to represent congruence numerically in a way that would be easily understood in the Leadership Fit Report. The method chosen to calculate the degree of fit was based entirely on what the follower desired, not assuming that a certain answer was right or wrong. The fit calculation was based upon a weighted sum of absolute differences between desired leadership values and perceived behaviour.

There are two parts to calculating the degree of fit. The first is to determine the maximum possible gap for each of the 21 leadership factors identified by GLOBE. The second is to calculate a fit score for each item within the factor. An overall fit score was determined for each of the 21 GLOBE factors by taking the fit score for all items as a percentage of the maximum potential misfit. A more detailed explanation with examples follows.

When calculating the degree of fit, a maximum possible gap (or misfit) was calculated first for the leadership factor, for example factor 12 - Integrity. Each follower's scores for the items contained within factor 12 were used to calculate a degree of fit for Integrity. All the scores for desired leadership values were used to determine the maximum possible misfit. For Integrity, four items comprised this factor. If a follower answered '7' to all four items for desired leadership values, this meant it was possible that a follower responded with a '1' for all four items for their perceived behaviour leaving a maximum possible absolute mean difference of 6 for all four questions. In this case it equalled a

maximum misfit of 24. The actual fit scores for all the perceived behaviour were represented as a percentage of a maximum misfit of 24. Each of the 99<sup>3</sup> items was used for calculating degree of fit. Questionnaires 1 and 2 had the same items.

Table 1 shows an example of the scores for 10 questions including an overall degree of fit as a percentage. The research undertaken calculated the degree of fit for all 99 items but represented the results as 21 leadership characteristics. In the example in Table 1, ten questions are used. They could all be related to one of the 21 leadership factors e.g. Visionary. In the detailed calculation all questions were used; the fit is represented at the leadership factor level. In the Leadership Fit Report (**Appendix A**/page 10) all the percentage fit scores for all the followers are presented. Table 1 shows how each of those numbers was calculated. All calculations were based on raw scores. The shaded columns (B and H) represent the scores from the follower. All the other columns were calculated.

---

<sup>3</sup> Only 99 items loaded into the GLOBE 21 leadership factors. 13 items were redundant.

**Table 1 - Example of Degree of Fit Calculation**

|     | <b>B</b>                         | <b>C</b> | <b>D</b> | <b>E</b>  | <b>F</b>         | <b>G</b>                | <b>H</b>                   | <b>I</b>               | <b>J</b>         |
|-----|----------------------------------|----------|----------|-----------|------------------|-------------------------|----------------------------|------------------------|------------------|
|     | <b>Desired Leadership Values</b> | ABS(B-4) | 7-B      | ABS (1-B) | Largest D or E   | C*F<br>Max Misfit Score | <b>Perceived Behaviour</b> | ABS Difference H and B | Misfit I*C       |
| Q1  | 1                                | 3        | 6        | 0         | 6                | 18                      | 4                          | 3                      | 9                |
| Q2  | 2                                | 2        | 5        | 1         | 5                | 10                      | 4                          | 2                      | 4                |
| Q3  | 5                                | 1        | 2        | 4         | 4                | 4                       | 2                          | 3                      | 3                |
| Q4  | 6                                | 2        | 1        | 5         | 5                | 10                      | 3                          | 3                      | 6                |
| Q5  | 6                                | 2        | 1        | 5         | 5                | 10                      | 6                          | 0                      | 0                |
| Q6  | 2                                | 2        | 5        | 1         | 5                | 10                      | 7                          | 5                      | 10               |
| Q7  | 1                                | 3        | 6        | 0         | 6                | 18                      | 1                          | 0                      | 0                |
| Q8  | 2                                | 2        | 5        | 1         | 5                | 10                      | 2                          | 0                      | 0                |
| Q9  | 4                                | 0        | 3        | 3         | 3                | 0                       | 3                          | 1                      | 0                |
| Q10 | 7                                | 3        | 0        | 6         | 6                | 18                      | 4                          | 3                      | 9                |
|     |                                  |          |          |           | <u>Total (G)</u> | <u>108</u>              |                            | <u>Total (J)</u>       | <u>41</u>        |
|     |                                  |          |          |           |                  |                         |                            | Misfit 62.0%           | <b>Fit 38.0%</b> |

ABS = Absolute value - a number without its sign

**Columns Input**

**B** represents the follower's score for desired leadership values.

**H** represents the follower's score regarding perceived behaviour.

**Columns Calculated**

**C** represents the size of spread away from the central score of 4. For example -3 or +3 would equate to 3 points away from the score of 4.

**D** represents the result of 7-B resulting in the spread from the maximum score of 7.

**E** represents the result of 1-B resulting in the spread from the minimum score of 1.

**F** represents the result of the largest of column D or E, which equates to the maximum difference.

**G** represents the spread from the central score multiplied by the maximum difference giving a greater weighting factor to the larger spreads.

**I** represents the absolute difference between the perceived behaviour score (H) and the score of desired leadership values (B).

**J** represents the score of misfit by multiplying I and C.

**Totals Calculated**

Degree of *misfit* is the total misfit score (41) as a percentage of the maximum misfit (108). The degree of *fit* is the reverse score (100-x). In the example above, a *misfit* of 62% would equate to a *fit* of 38% (100-62=38)

If the example in Table 1 were the leadership factor Visionary, the leader would have a degree of fit of 38%. This process was repeated for all the items within all

21 GLOBE leadership factors. A percentage fit score was calculated for each of the 21 factors.

A second 'fit' score was calculated and is part of the Leadership Fit Report in **Appendix A** on pages 17-20 and is titled 'Diff'. It is a measure of difference between desired leadership values and perceived behaviour. This column was added to eliminate errors caused by an earlier version which simply presented the mean difference. The fit score referred to here is calculated at the item level not the leadership factor level. An example will help explain the issue. If followers 1 and 3 responded for desired leadership values with '1' for and followers 2 and 4 responded with '7' then the mean score for all followers would be 6. If the scores for perceived leader behaviour for followers 1 and 3 were '7' and for followers 2 and 4 were '1', the perceived leader behaviour scores also had a mean of 6. If the two means were presented as a difference of means, the difference would be 0 implying a high fit, however, in this example the maximum difference actually occurred because follower one responded 1,7; follower two 7,1; follower three 1,7 and follower four 7,1. This possibility meant that the results could be misleading. The difference score is now calculated as the mean of the absolute differences for each follower for each item. In the example above, the difference would be the mean of 6,6,6,6 which equals 6. There is one final comment to make for this calculation and that is if a score of '4' is used for desired leadership values, the item is not used in calculating the difference because 4 implies the item does not contribute to outstanding leadership.

## **2.3 Results**

This section presents the results from Phase One. The objective of Phase One was threefold; firstly, to collect the data associated with the 196 leaders, secondly, to create a Leadership Fit Report for each leader as well as, provide personalised feedback and thirdly, to summarise the findings for Cargill's senior managers.

### **2.3.1 Descriptive Measures**

A total of 196 leaders participated in this research, each of whom nominated between 8 and 12 followers. A response rate of 96% was achieved. A total of 2,217 followers were asked to participate and responses were received from 2,122. The 4% not processed were due to two reasons: some questionnaires were not returned (total 88) and some were incomplete (total 7). A total of 1,738 followers were included in the analysis. The breakdown of nationality is shown in Table 2.

**Table 2 – Sample size of followers per country**

| <b>Nationality</b> | <b>Number Responses</b> |
|--------------------|-------------------------|
| America            | 610                     |
| GB                 | 156                     |
| Brazil             | 118                     |
| Japan              | 94                      |
| Netherlands        | 77                      |
| Singapore          | 72                      |
| France             | 54                      |
| Turkey             | 47                      |
| Germany            | 45                      |
| India              | 44                      |
| Argentina          | 43                      |
| Switzerland        | 42                      |
| Venezuela          | 42                      |
| Poland             | 41                      |
| Philippines        | 39                      |
| Malaysia           | 36                      |
| Mexico             | 34                      |
| Canada             | 33                      |
| Russia             | 30                      |
| China              | 21                      |
| Australia          | 20                      |
| Spain              | 20                      |
| Indonesia          | 20                      |
| <b>TOTAL</b>       | <b>1,738</b>            |

Demographic data indicated that 64% of the followers were male. Respondents had an average of 16 years of work experience and had been employed by Cargill for an average of 10 years. The mean age of respondents was broken down into four categories; 16% were 30 years old or less; 49% were between 31 and 40; 26% were between 41 and 50, and finally 9% were over 50. Table 3 shows the means and standard deviations for each country.

**Table 3 – Means and standard deviations per country.**

| Desired Leadership Values |      |                | Perceived Behaviour |      |                |
|---------------------------|------|----------------|---------------------|------|----------------|
| Nationality               | Mean | Std. Deviation | Nationality         | Mean | Std. Deviation |
| China                     | 4.69 | 0.30           | China               | 4.48 | 0.31           |
| Indonesia                 | 4.60 | 0.25           | Venezuela           | 4.43 | 0.34           |
| India                     | 4.55 | 0.39           | Argentina           | 4.40 | 0.30           |
| Mexico                    | 4.53 | 0.26           | Indonesia           | 4.40 | 0.27           |
| Malaysia                  | 4.52 | 0.21           | Turkey              | 4.37 | 0.32           |
| Philippines               | 4.49 | 0.44           | India               | 4.35 | 0.39           |
| Venezuela                 | 4.46 | 0.34           | Russia              | 4.33 | 0.37           |
| Turkey                    | 4.46 | 0.25           | Brazil              | 4.31 | 0.37           |
| Brazil                    | 4.40 | 0.28           | Netherlands         | 4.28 | 0.31           |
| Argentina                 | 4.40 | 0.26           | Spain               | 4.27 | 0.30           |
| Spain                     | 4.39 | 0.26           | Mexico              | 4.25 | 0.42           |
| Singapore                 | 4.38 | 0.24           | France              | 4.25 | 0.37           |
| France                    | 4.36 | 0.30           | Malaysia            | 4.23 | 0.33           |
| Russia                    | 4.31 | 0.20           | Switzerland         | 4.22 | 0.34           |
| Netherlands               | 4.29 | 0.21           | Philippines         | 4.21 | 0.38           |
| Australia                 | 4.29 | 0.20           | Germany             | 4.21 | 0.22           |
| America                   | 4.27 | 0.24           | Australia           | 4.19 | 0.34           |
| Japan                     | 4.27 | 0.28           | Poland              | 4.19 | 0.34           |
| GB                        | 4.26 | 0.20           | America             | 4.19 | 0.29           |
| Canada                    | 4.25 | 0.18           | Singapore           | 4.18 | 0.41           |
| Switzerland               | 4.24 | 0.22           | GB                  | 4.13 | 0.32           |
| Germany                   | 4.19 | 0.25           | Canada              | 4.11 | 0.31           |
| Poland                    | 4.15 | 0.25           | Japan               | 4.04 | 0.37           |

### **2.3.2 Results of the Principal Component Analysis**

In Sections 2.2.3.3 the Principal Component Analysis (PCA) was described. The procedure was performed with the data collected from Questionnaires 1 and 2. The primary purpose of the PCA was to determine if the two questionnaires measured the same constructs and that the items had the same psychometric properties. This section discusses the outcome of the PCAs, its limitations and how the results were used to form a new set of leadership factors based on the principal components from the PCA. The criteria used for factor selection was influenced by both literature and application. The literature warned of the limitations of selecting factors based solely on Eigen values greater than 1.0 (Gorsuch, 1983) as this often lead to 'overfactoring' yet using a Cattell's scree test could often lead to 'underfactoring'. Methodologists have regarded too few factors in a model as a much more severe error than specifying too many factors (Cattel, 1978; Rummel, 1970; Thurstone, 1947; Fabrigar et al. 1999). The application that influenced the choice was that the factors must have specificity and uniqueness. Each factor would become part of the Leadership Fit Report. A leader therefore must be able to understand the leadership characteristics that support a factor. The initial factor analysis tests conducted (without Varimax rotation) revealed only 9 factors. This proved problematic due to the fact it was difficult to label each of the 9 factors because of the variability within each factor. When 20 or more factors were produced, each was more specific and it was easier for leaders to understand them. The decision was made to use Eigen values greater than 1.0 accepting the limitations but understanding more factors would be produced.

The PCA for Questionnaire 1 revealed 37 principal components with Eigen values greater than 1.0. The correlations between the principal components were low, suggesting that the PCA had identified independent factors. The highest correlation between principal components was 0.331 between principal component number 6 (dictatorial, ruler and autocrat) and number 27 (ruthless and bossy). The highest correlation for each of the 37 factors was determined and the mean of the highest in each was 0.185. This was considered to be sufficiently low enough.

**Appendix H** contains the Eigen values for Questionnaire 1.

**Appendix I** contains all items for each of the 37 principal components.

**Appendix J** shows the correlations of the 37 principal components from the PCA performed on data from Questionnaire 1.

A PCA for Questionnaire 2 revealed 27 principal components with Eigen values greater than 1.0. The correlations between the principal components were higher when compared with the 37 value factors. The highest correlation between principal components was 0.694 between principal components number 6 (self-effacing<sup>4</sup>, modest<sup>5</sup>, egotistical, intra group competitor and egocentric) and 7 (performance oriented, ambitious, excellence orientated and improvement oriented). The highest correlation for each of the 27 principal components was determined and the mean of the highest was 0.38.

---

<sup>4</sup> Reversed score

**Appendix K** contains the Eigen values for Questionnaire 2.

**Appendix L** contains all items for each of the 27 principal components from the PCA performed on the data from Questionnaire 2.

**Appendix M** shows the correlations of the 27 principal components from the PCA performed on the data from Questionnaire 2.

The next objective was to combine the two sets of principal components into one. Each output was reviewed and identical or similar principal components were identified. For example, Table 4 contains the principal component factor 1 from the first PCA.

| 3.03 | 013. Anticipatory - Anticipates, attempts to forecast events, considers what will happen in the future |
| 3.04 | 107. Future-oriented - Makes plans and takes actions based on future goals                             |
| 3.05 | 035. Prepared - Is ready for future events   |
| 3.06 | 102. Visionary – Has a vision and imagination of the future  |
| 3.07 | 071. Intuitive - Has extra insight   |

---

Tables 4 and 5 reveal principal components that are very similar. Item 35 in Table 5 was the only item that did not load onto both PCA factors. The proposed new factor contained all the items in Tables 4 and 5 with the exception of item 35. This principal component was subsequently named ‘Visionary’ following a similar naming convention as that adopted in the GLOBE project. This procedure was repeated for all the similar principal components from PCA1 and PCA2. The new 21 principal components were established following the

same procedure and are presented in **Appendix N**, the summary of which is in Table 6.

**Table 6 – The new 21 principal components**

---

**Appendix O** contrasts the GLOBE factor structure that was established by the GLOBE researchers from their unstandardised data with the new principal components established by this research from double standardised data.

In summary, the two PCAs were performed on two different sets of data (double standardised values and double standardised behaviours) have resulted in 59% of the items (66 of 112) loading onto identical or similar principal components. The following conclusions can be drawn from this:-

1. When comparing the data from Cargill with the GLOBE data, 10 factors were almost identical; the remaining 11 show degrees of difference. The differences were possibly due to the fact that GLOBE only used the leadership values data and it had not been standardised. The proposed new factor structure in this research was a combination of leadership values and perceived leader behaviour data.
2. The two PCAs demonstrated that 66 items show the same or similar psychometric properties. This was deemed sufficient for further analysis in Phase Two of this research.
3. The correlations of the PCAs were not sufficiently high to warrant concern suggesting the principal components were sufficiently independent from one another.

The analysis can be performed at the level of individual and nation although analyses for those nations with fewer than 25-30 followers, in this case 4 of the 23 countries have low power for detecting relationships.

Finally, the 21 principal components were used throughout Phase Two. Phase One focused on GLOBE's 21 factors and became integral to the structure in the Leadership Fit Report. Phase Two focused on the nature of the relationship between congruence and performance which is discussed later.

### **2.3.3 Comparison of Means and ANOVA**

The 1,738 followers represented 23 countries and before any comparisons were made across countries, an understanding of the population means based upon raw data was required. One possibility was *t* tests, but this was discounted

because the number of countries would potentially create a Type I Error (Fleming and Nellis, 2000). Instead a one-way ANOVA test was performed on the raw means for each of the 21 principal components from the two PCAs. The purpose of the ANOVA was to reveal the variances between the country means for each leadership principal component. The ANOVA results are presented **Appendix P** with  $F$  values ranging from 3.73 to 15.6 ( $p < .001$ ) and eta ranges from 0.039 to 0.164. The results show that there were differences across cultures and that they were statistically significant, consistent with other cross-cultural research discussed earlier.

Further analysis was performed to determine where the differences were present. A one-way ANOVA was performed with a *Scheffé* post-hoc test to reveal which country and which principal component have the most differences. The *Scheffé* test was chosen because it is a conservative approach for managing Type I errors and it has the distinction of being one of the safest of post-hoc tests (Graveetter and Wallnau, 2000).

**Appendix Q** presents the first 35 pages of 486 pages from the post-hoc output from SPSS. The first item with a significant difference is on page 23 of Appendix AQ.

**Appendix R** - A summary of these results were produced from Appendix Q and 303 significant differences ( $p < .05$ ) were identified from a possible 10,626. These are presented in Appendix R.

**Appendix S** summarises the countries where the 303 differences are present.

**Appendix T** summarises those leadership factors, which have the most significant differences.

The differences that were found highlight the fact that desired leadership values do vary from nation to nation. In particular, the following items were of significance:

1. The highest 8 scoring differences across means were all associated with the leadership principal component 'independent'.
2. Japan, Poland, Brazil, America and Germany were the nations that recorded the most differences from the other countries.
3. The largest single difference between means (2.78) was between Poland and Argentina with regard to principal component 'independent.'
4. A total of 77% of all the differences were part of 6 principal component factors (Normative, Modesty, Unreliable/Unintelligent, Independent, Friendly/Helpful and Socially Aware).
5. The two countries with the most recorded differences between them were America and Japan. The country with the most recorded number of differences with all other countries was Japan.

### 2.3.4 Principal Component Correlations and Reliabilities

**Appendix U** presents the correlations and Cronbach alphas for all GLOBE's 21 leadership characteristics for desired leadership values and perceived behaviour. The correlations between the independent variables range from – 0.001 (Socially Aware/Indirect) to 0.762 (Team Building/Encourager), indicating that values and perceptions are correlated. The reliabilities (Cronbach alphas) for the desired leadership value scales had a mean of 0.64 and for perceived behaviour a mean of 0.73 which is not high, but many measures used in behavioural sciences are, at best, moderate that is in the range of 0.7-0.8 (Pedhazur, 1997:172) and with a generally accepted level of 0.7 (Nunnally and Bernstein, 1994).

### 2.3.5 Intraclass Correlation Coefficients

Intraclass Correlation Coefficients (ICCs) are used “when one is interested in the relationship among variables of a common class, which means variables that share both their metric and variance” (McGraw and Wong, 1996:30). ICC(1) is calculated as follows:

$$ICC(1) = (ms_b - ms_w) / [ms_b + ((n_g - 1) ms_w)] \quad (1)$$

where  $ms_b$  is the between-group mean square,  $ms_w$  is the within-group mean square, and  $n_g$  is the group size (Bliese, 2000). The strength of ICCs is that they allow determination of how much of the total variability is due to group membership. This technique was used to determine the degree of agreement between those from one country, and also of the followers for a leader. Table 7

highlights the fact that there is some agreement, albeit low, regarding the values that people from one nation place upon desired leadership characteristics. The Intra-class Correlation Coefficients ICC(1) for all these items were statistically significant, and the mean ICC(1) for these items ranged from 0.05 to .22 compared to 0.12 median reported in the organisational sciences (James, 1982). Bliese (2000) suggests a range of 0.05 to 0.20. In contrast, the last column shows a high degree of agreement of followers rating their leader, suggesting that they have a similar perception of their leader.

**Table 7 – ICC(1) Intraclass Correlation Coefficients**

|                             | Nationality    |                | Leader         |                |
|-----------------------------|----------------|----------------|----------------|----------------|
|                             | Values         | Behaviours     | Values         | Behaviours     |
| 01 Visionary                | 0.03***        | 0.05***        | 0.04***        | 0.15***        |

### 2.3.6 Comparison with GLOBE's Results

Comparisons were made with published GLOBE results to determine whether similar findings resulted from the two studies. Firstly, the GLOBE 21 factor structure was compared and correlated to the new factor structure.

**Appendix V1 and V2** presents the correlations between the GLOBE structure and the new PCA structure for desired leadership values and perceived behaviour. There are 10 factors appearing in both sets of results, showing a factor correlation of 0.7 or greater. The 10 factors are shown in Table 8:-

**Table 8 – Ten highest correlations between GLOBE and new PCA for desired leadership values.**

| New PCA                     | GLOBE Factor                  | Correlation |
|-----------------------------|-------------------------------|-------------|
| 17. Socially Aware          | 19. Status Consciousness      | 1.0         |
| 2. Organised                | 1. Administratively Competent | 1.0         |
| 3. Integrity                | 12. Integrity                 | 1.0         |
| 4. Performance Orientation  | 16. Performance Orientation   | 0.955       |
| 5. Autocratic               | 2. Autocratic                 | 0.951       |
| 1. Visionary                | 4. Charismatic I – Visionary  | 0.950       |
| 11. Independent             | 3. Autonomous                 | 0.866       |
| 9. Modesty                  | 14. Modesty                   | 0.861       |
| 16. Elitist/Individualistic | 15. Non Participative         | 0.858       |
| 8. Loner                    | 18. Self Centred              | 0.807       |

From the 112 items, GLOBE identified 21 which met their criteria of universally positively endorsed leader attributes and 8 universally negative (Den Hartog et al. 1999). The criteria used by GLOBE were that 95% of the country scores had to exceed 5 on a 7-point scale and the overall country mean had to

exceed 6. GLOBE assessed the items means of 53 countries, the ICC(1) and  $r_{wg}$  and Table 9 has those items that met the GLOBE criteria.

**Table 9 – GLOBE universally endorsed leadership characteristics**

| Item                | GLOBE Factor         | GLOBE Mean |
|---------------------|----------------------|------------|
| Positive            | Inspirational        | 6.03       |
| Trustworthy         | Integrity            | 6.36       |
| Administratively    | Administratively     | 6.02       |
| Just                | Integrity            | 6.02       |
| Win-win problem     | Diplomatic           | 6.05       |
| Encourager          | Inspirational        | 6.14       |
| Intelligent         | Malevolent           | 6.18       |
| Decisive            | Decisiveness         | 6.20       |
| Informed            | Team Integrator      | 6.13       |
| Effective Bargainer | Diplomatic           | 6.10       |
| Foresight           | Visionary            | 6.02       |
| Plans ahead         | Visionary            | 6.17       |
| Motive Arouser      | Inspirational        | 6.22       |
| Communicative       | Team Integrator      | 6.02       |
| Excellence Oriented | Performance Oriented | 6.16       |
| Confidence Builder  | Inspirational        | 6.13       |
| Honest              | Integrity            | 6.11       |
| Dynamic             | Inspirational        | 6.28       |
| Coordinator         | Team Integrator      | 6.00       |
| Team Builder        | Team Integrator      | 6.15       |
| Dependable          | Malevolent (reverse) | 6.17       |

A similar procedure was followed with the responses from 1,738 followers from 23 countries included in this study. Table 10 shows the 10 attributes found in Cargill that were universally endorsed, 6 of which were the same as those found by GLOBE. These 10 were identified using the same criteria as GLOBE.

**Table 10 – Cargill Universally Endorsed Leadership Characteristics**

| <b>Item</b>     | <b>PCA Factors</b>        | <b>Mean</b> |
|-----------------|---------------------------|-------------|
| Improvement     | Performance Oriented      | 6.42        |
| Inspirational   | <Did not load to new PCA> | 6.62        |
| Anticipatory    | Visionary                 | 6.30        |
| Sincere         | Integrity                 | 6.56        |
| Trustworthy *   | Integrity                 | 6.78        |
| Just *          | Integrity                 | 6.32        |
| Win-win problem | <Did not load to new PCA> | 6.19        |
| Encouraging *   | Encourager                | 6.34        |
| Honest *        | Integrity                 | 6.61        |
| Dynamic *       | <Did not load to new PCA> | 6.37        |
| Team Builder *  | Team Building             | 6.41        |

\* denotes the item was a universally required characteristic for GLOBE and Cargill.

It is possible that the strength of Cargill's organisational culture is evident in these results. One aspect of Cargill's culture that was established in the 1860s and is still emphasised today is ethics and integrity. This may suggest why 4 items in Table 10 are associated with integrity.

### 2.3.7 Feedback to Leaders: Explaining the Leadership Fit Report

This section outlines the process used for providing feedback to the leaders who participated. All 196 leaders received a Leadership Fit Report as Phase One developed. It was essential that the leaders knew how to read and interpret the data presented. The purpose of each page of the Leadership Fit Report can be summarised as follow:

**Page 1 – Title Page:** Leader name and title

**Page 2 – Table of Contents:** Contents of the Leadership Fit Report including appendices.

**Page 3 – Introduction:** This introduces the concept of the Leadership Fit Report. The names represent those who completed both questionnaires and whose responses were valid and discussed in Section 2.2.2.7. The names are sorted alphabetically and are not in the same order as the summary fit on page 10 of the Leadership Fit Report.

**Page 4 – Highest and Lowest:** This page shows the mean of the followers' highest and lowest factors following the GLOBE factor structure. In this example of Mary Smith, the characteristics given the highest rating by her followers were Integrity, Performance Orientation, Inspirational, Visionary and Decisive. For each of these characteristics, the leader's overall fit score was reported and this can be compared with an overall Cargill score. This was also repeated for the characteristics that received the lowest mean score. A high fit for a leadership characteristic that scored low (inhibits outstanding leadership) implies the leader did not demonstrate that behaviour. For example, if a group

of followers rated autocracy as very low and the leader had a 90% fit, this would suggest the leader was not autocratic.

**Page 5 – Leader’s Leadership Values:** Each leader was requested to complete Questionnaire 1. The results of their responses are shown on page 5. This allows the leaders to compare **their** values with the values of their followers.

**Page 6 – Followers’ Desired Leadership Values:** This graph represents the mean scores for the desired leadership values for each of the 21 leadership factors, with the vertical lines to represent +1 and –1 standard deviation. This box/square on the vertical graph line represents the mean scores for each of the 21 leadership factors. The purpose of the standard deviation was to help leaders understand the degree of difference within their team. Groups with a greater degree of difference could potentially create more complexity for a leader.

**Page 7 – Leader Values and Follower Values:** This spider diagram represents the leader’s desired values and the followers’ desired values. It enabled significant differences to be easily identified.

**Page 8 – Perception of the Leader:** This graph represents the mean scores for the perception of each of the 21 leadership factors, with the vertical lines to represent +1 and –1 standard deviation. The purpose of the standard deviation was for the leaders to understand the degree of difference within their team regarding perception.

**Page 9 – Desired Values versus Perceived Behaviour:** This graph represents the two previous graphs (pages 6 and 8) overlaid.

**Page 10 – Summary Fit:** This represents all the followers' overall fit for each leadership factor. Blue numbers are those with  $\geq 85\%$  fit. Red numbers are those with  $< 50\%$  fit. The numbers were decided upon arbitrarily and are not significant. Leaders were encouraged to look for themes. For example, if 3 or 4 followers all scored one leadership factor low, it may suggest that there are issues to be resolved.

**Page 11 – Cargill's Highs and Lows:** This page allowed leaders to compare their scores with those of others. Although 196 leaders were used within this research, the database now holds results from over 250 and it is helpful for some leaders to compare their scores with those of their peers. Leaders must be cautioned on comparing their results with the means for Cargill due to the fact that each leader and each leader's situation was different. This information was meant to be informative rather than evaluative.

**Pages 12-13 – Desired Leadership Values - Follower Differences:** These two pages show the specific items from the questionnaire that had the smallest and largest standard deviation. The scores represented the mean for all the leader's followers. This helped the leader to understand where his/her team agree/differed with each other regarding desired leadership values. Leaders were encouraged to discuss these results with their team to help them understand each other's desired characteristics.

**Page 14 – Perception – Follower Agreement/Differences:** The two sets of items on page 14 refer to the perception that the followers have of their leader. The first list shows the items with the highest degree of agreement; the second is where there is the widest disagreement. Agreement and disagreement

are based on standard deviations. The scores represent the mean for all the leader's followers for that item.

**Page 15 – Major and Minor Differences:** The degree of fit is determined for each of the 21 leadership factors as shown on page 10 of **Appendix A**. The items shown on page 15 represent the mean of the absolute differences for a given item calculated for each follower. This helped leaders identify the major gaps and in many cases allowed the leaders to identify themes, which appeared in the first set of data. For example, the values autocracy and bossy have often appeared together. The size of the absolute difference represents the size of gap between what the follower desires and what is perceived. Large gaps could and have led to larger problems for leaders.

**Page 16 – Where next? Advice:** This final page makes suggestions as to what the next steps may be for a leader. Page 16 stresses a critical limitation of the report, and that is to reaffirm that leadership is not just about leaders leading in the way that their team requires. Many leaders who participated thought that they should always aim for a high degree of fit, which may not be appropriate or may even be counter-productive. For example, if the followers do not desire a leader who creates conflict, it may be inappropriate for a leader to avoid creating conflict, as conflict can sometimes stimulate creativity and increased productivity.

**Page 17-20 Appendix 1 – Questionnaire Items:** Each of the 112 items is listed with their respective scores (min, max and mean) for the followers' desired leadership values and perceived behaviour. The final two columns show the mean and standard deviation of absolute differences.

**Page 21 and 22 – Glossary:** Although the questionnaire was distributed in local languages, the Leadership Fit Report is currently only in English. For some non-native English speakers, some of the words used in the questionnaire were difficult to interpret and therefore a glossary of terms was added as **Appendix 2**.

### **2.3.8 Phase One Findings**

Some basic analyses were conducted to provide findings to senior management in Cargill. Two documents were produced for internal distribution that presented the high level findings (see **Appendix W1 and W2**). **Appendix W1** was translated into six languages. The documents were distributed to raise the awareness of cross-cultural differences and similarities. A project of this nature had never been conducted in Cargill before which increased people's interest in the findings from Phase One. The majority of the content focused on just the desired leadership values – there was no detailed discussion on leader congruence. It was considered to be inappropriate to generalise from the congruence reports for 196 leaders to the organisation. A macro analysis was presented to the executive leaders, highlighting where the lower areas of congruence were.

Regarding the findings for desired leadership values, Table 11 reveals the highest 4 (weighted by country) for Cargill were identical to what GLOBE found as 'Highly Positive Characteristics' and the lowest 2 were also identical to what GLOBE found with the exception of Georgia which was not included in the Cargill study (Brodbeck et al. 2000).

**Table 11 – Weighted Means for Phase One with GLOBE factors**

| GLOBE Means - Values - Weighted. |      |                |
|----------------------------------|------|----------------|
|                                  | Mean | Std. Deviation |
| 12 Integrity                     | 6.52 | 0.54           |
| 16 Performance Orientation       | 6.28 | 0.66           |
| 05 Charis II - Inspirational     | 6.23 | 0.54           |
| 04 Charis I - Visionary          | 6.23 | 0.55           |
| 21 Team II - Integrator          | 6.04 | 0.56           |
| 08 Decisiveness                  | 5.93 | 0.64           |
| 01 Admin Competent               | 5.63 | 0.84           |
| 20 Team I - Collaborative        | 5.61 | 0.63           |
| 09 Diplomatic                    | 5.54 | 0.60           |
| 14 Modesty                       | 5.27 | 0.77           |
| 06 Charis III - Self Sacrifice   | 5.00 | 0.87           |
| 11 Humane                        | 4.98 | 1.00           |
| 03 Autonomous                    | 3.97 | 0.96           |
| 19 Status Consciousness          | 3.93 | 1.33           |
| 17 Procedural                    | 3.87 | 0.85           |
| 07 Conflict Inducer              | 3.73 | 0.96           |
| 10 Face Saver                    | 2.45 | 0.97           |
| 15 Non Participative             | 2.28 | 0.87           |
| 02 Autocratic                    | 2.20 | 0.90           |
| 18 Self Centred                  | 1.92 | 0.75           |
| 13 Malevolent                    | 1.60 | 0.52           |

Additionally, other information was gathered for senior management including; the mean overall fit for 196 leaders was 79.5% with a standard deviation of 0.062. The lowest fit was 33% and the highest was 89%. **Appendix X** shows all the 21 leadership factor scores for all 196 leaders. Their names have been removed and replaced with numbers to protect their identities.

An analysis of fit by item was requested by the Chief Financial Officer in order to determine where Cargill should focus attention for development. In Section 2.2.3.4 a fit calculation was discussed that is used in the Appendix of the Leadership Fit Report. The calculation was performed at the item level. In

**Appendix Y** a ranked list of fit per item is presented. In Table 12 the highest 15 and lowest 15 items are presented.

**Table 12 – Ranked Differences in item fit**

| Rank  | Item | Desired       |                              | Gap |
|-------|------|---------------|------------------------------|-----|
|       |      | Leader Values | Question Description         |     |
| 1     | Q105 | 1.13          | Dishonest                    | 0.3 |
| 2     | Q106 | 1.21          | Hostile                      | 0.5 |
| 3     | Q063 | 1.45          | Non-cooperative              | 0.7 |
| 4     | Q064 | 5.91          | Logical                      | 0.7 |
| 5     | Q059 | 1.83          | Cunning                      | 0.7 |
| 6     | Q060 | 6.20          | Informed                     | 0.7 |
| 7     | Q043 | 1.72          | Intelligent                  | 0.7 |
| 8     | Q050 | 1.32          | Vindictive                   | 0.7 |
| 9     | Q088 | 6.61          | Honest                       | 0.7 |
| 10    | Q029 | 4.41          | Unique                       | 0.7 |
| 11    | Q068 | 4.60          | Normative                    | 0.7 |
| 12    | Q081 | 5.14          | Procedural                   | 0.7 |
| 13    | Q109 | 1.68          | Dependable                   | 0.7 |
| 14    | Q097 | 6.19          | Ambitious                    | 0.7 |
| 15    | Q085 | 1.72          | Non-Participative            | 0.8 |
| ----- |      |               |                              |     |
| 98    | Q099 | 1.99          | Micro-manager                | 1.3 |
| 99    | Q025 | 5.99          | Integrator                   | 1.3 |
| 100   | Q086 | 5.22          | Self-sacrificial             | 1.3 |
| 101   | Q014 | 4.31          | Risk taker                   | 1.3 |
| 102   | Q098 | 5.98          | Motivational                 | 1.3 |
| 103   | Q018 | 3.34          | Intra-group Conflict Avoider | 1.3 |
| 104   | Q007 | 3.78          | Autonomous                   | 1.3 |
| 105   | Q032 | 6.31          | Morale booster               | 1.3 |
| 106   | Q023 | 2.15          | Self-interest                | 1.3 |
| 107   | Q037 | 1.94          | Secretive                    | 1.3 |
| 108   | Q089 | 2.63          | Domineering                  | 1.3 |
| 109   | Q076 | 6.23          | Motive Arouser               | 1.4 |
| 110   | Q002 | 2.87          | Evasive                      | 1.4 |
| 111   | Q049 | 2.50          | Risk averse                  | 1.5 |
| 112   | Q012 | 6.61          | Inspirational                | 1.7 |

The value of Phase One to Cargill was evaluated by conducting a basic survey. **Appendix Z** presents the results of a survey conducted with the leaders who had participated in this research. Overall, the results were good, suggesting that the process had a positive affect on the leaders.

Phase One revealed some unique findings during the analysis. An example is a British leader working in Asia who scored highly on most categories. His team consisted of five different nationalities who varied significantly in what they desired from a leader; many scores ranged from '2' through '6' and some were '1' through '7' on their desired leadership values. What made him unique was that fact that their perceptions varied too. For example, person A desired decisiveness and perceived the leader to be decisive, however, person B did not value decisiveness and did not perceive the leader to be decisive. This may illustrate how different cultures can perceive behaviour differently, or how one leader has the ability to adjust his or her leadership style to meet different needs.

Another example was a Swiss leader who nominated 12 followers, each a different nationality. The Leadership Fit Report revealed the extent of difference within his team. Upon further analysis it revealed that his team had the highest standard deviation on desired leadership values for all 196 leaders.

A final outcome of findings during Phase One was the ability to pre-empt leadership issues for individuals. There were 12 leaders who received feedback that highlighted extremely low fit scores, yet their managers still considered them to be high performing and high potential leaders. For confidentiality reasons discussed in Section 2.2.2.10 it was not possible to discuss these issues

with their managers, however, it was possible to look for opportunities to express concerns to the leaders. In 5 cases leaders saw visible evidence of ineffectiveness and the researcher is currently assisting these leaders with making changes to how they lead.

### 2.3.9 Leadership Fit Follow-up Report

Twelve months after the first Leadership Fit Reports were distributed, leaders enquired about a follow-up report. Leaders who had expressed an interest in a follow-up report had addressed known development issues with regard to how they were perceived, and therefore wanted to undergo the process again in order to measure any movement.

A follow-up report was subsequently developed (see **Appendix G**) but the new data that was collected was not used within this research but will be considered for future research. The procedure required the leaders to nominate a minimum of 50% or 5 followers to participate in the follow-up. Followers were requested to only complete the second questionnaire (perceived leader behaviour). Currently 60 of the 196 leaders have completed the follow-up process. The remaining leaders will complete their follow-up but only after a minimum period of 12 months after their first report was completed.

The Leadership Fit Report is a central tool for an internal development programme within Cargill. Leaders have been invited to attend a development forum, which focuses mainly upon development and deepening their leadership skills. The Leadership Fit Report is part of the program and part of the follow-up. The follow-up has allowed managers to analyse the changes made from one leadership development session to the next. **Appendix AA** presents an introductory speech made by a senior leader. This speech was delivered to a class of 18 leaders, all of which had completed the Leadership Fit Follow-up Report.

## 2.4 Discussion

### 2.4.1 Explanation of the results

The results from Phase One can be discussed in two parts. Firstly, desired leadership values and secondly, congruence or fit. Regarding desired leadership values, the results show a distinct overlap with some of GLOBE's findings (Brodbeck et al. 2000). Section 2.3.8 discussed Phase One findings in more detail. The differences were to be found in the detail; for example, in a GLOBE study of 22 countries, Anglo countries ranked Integrity as the 5<sup>th</sup> factor, Nordic and Germanic ranked it 1<sup>st</sup>, Latin Europe ranked it 4<sup>th</sup>, central Europe ranked it 6<sup>th</sup> and East Europe ranked it 4<sup>h</sup>. Cargill, however, ranked Integrity 1<sup>st</sup> for 19 countries and 2<sup>nd</sup> for 3 countries. It is possible that the results are due to the strong organisational culture of Cargill. The country means for each GLOBE factor are presented in **Appendix AB** which highlight the fact that leadership values do differ cross-culturally and in a number of areas such as Poland, China, Russia and Indonesia represent the highest or lowest means for a factor. These differences proved valuable when discussing national differences with Cargill employees before moving abroad for an expatriate assignment. Furthermore they were presented to a Cargill business that was considering a joint venture with a large India organisation. It is important to stress that the number do not in themselves provide answers, however, they do stimulate questions and raise awareness.

## **2.4.2 Contribution**

### **2.4.2.1 To Theory**

Phase One contributed to theory by expanding the work of the GLOBE project. The GLOBE research project had multiple purposes (see Section 2.2.2.1), one of which was gathering empirical data to determine the characteristics which contribute to or inhibit outstanding leadership.

In Phase One, this research went beyond GLOBE's research project by measuring congruence and generating valuable feedback for Cargill managers.

To measure congruence, the research undertaken modified the GLOBE process to gather empirical data on perceived leader behaviour. This approach facilitated collecting commensurate data on desired leadership values and perceived leader behaviour from 2,122 respondents from 57 countries. A total of 66 of the 112 items were measuring the same psychometric properties and can be used in future research.

This research has found universally endorsed characteristics desired by leaders across 23 countries of which one third were the same as GLOBE's findings.

### **2.4.2.2 To Cargill and Practice**

Although Cargill has businesses in 61 countries, a recent independent study concluded that the organisation has not always 'thought' and 'acted' globally. By creating awareness of cross-cultural leadership issues, this project has generated benefits to Cargill as an organisation and to the individuals within Cargill. Senior leaders are now carefully considering aspects of globalisation

and cross-cultural leadership. As evidence of this change the President and Chief Operating Officer recently launched a web discussion with 60 senior managers from around the world encouraging discussion on the characteristics of a global company. Furthermore, the researcher was asked to summarise and present this to the executive leaders. The summary is presented in **Appendix AC**. In addition, the researcher will lead a group of senior leaders in discussing the implications of globalisation in China in March 2004.

This project has also created value in less quantifiable ways. For example, this project has given a 'voice' to the minority cultures within Cargill. The majority of middle and senior level leaders in Cargill are American, Dutch or British. All of these leaders have an excellent command of the English language. It became evident through this research that leaders from other nations felt that their views and values were not always understood within the organisation and often language was cited as the reason. This project has assisted in communicating their concerns and differences and made some core issues visible. For example, in some cultures people show emotions at work more visibly than do Americans, Dutch and the British. Some leaders from Latin America felt encouraged by this study to communicate their belief that demonstrations of emotion, common in Latin culture, should not be discouraged in Cargill. Other leaders felt free to criticise corporate communication because of its extensive use of the English language, which limits some understanding for non-native English speakers. This project facilitated discussion of issues like the foregoing examples with hundreds of people throughout Cargill. The result has been to reinforce Cargill's position that employees should value and understand cultural differences. Discussion

groups have taken place in 4 continents over the course of the research and have been attended by over 400 people.

The Leadership Fit Report has been valuable to individuals within Cargill. Although 196 leaders participated in the research, a further 50 have gone through the process and the feedback has been very positive. Leaders have used the report to increase their understanding of their teams, to increase their self-awareness, and to improve their leadership effectiveness. Leaders have openly discussed the results of their feedback with their team. Of the 60 leaders who have participated in the follow-up, 78% have made some improvements to their lower fit areas. Those who have made significant changes (defined as changes above 10% fit on areas of improvement) represent 29% of this group.

### **2.4.3 Limitations**

The research undertaken for this project was the first attempt of rigorous research by the researcher and therefore it has a number of limitations. This section discusses the limitations from Phase One.

#### **2.4.3.1 General**

This research was conducted in one organisation, Cargill, and it is possible that the findings attributed to culture are not in fact national culture but are due to the unique organisational culture within Cargill. In 1999 an assessment of the Cargill organisational culture conducted in 14 countries showed that ethics and integrity were the strongest elements and the results are presented in **Appendix AD**. Hofstede received similar criticism (Kuchinke, 1999) for his

work because its focus was solely upon IBM, however, given the sheer size of Cargill's operations, the large number of countries in which it operates, and the diversity of industries in which it is active, it is not likely that all differences observed in this study are solely due to factors unique to Cargill.

A second potential weakness is that the sample size for some countries was small. It may be possible in the future to repeat this exercise with 300-400 people from each of the five countries. It is possible that the results may be more significant.

#### **2.4.3.2 Questionnaire**

A further limitation was the questionnaire from GLOBE. Whilst it was developed globally, the researcher felt that there were possible weaknesses that may have affected the project. The first was the GLOBE questionnaire omitted domains of leadership and values that are important in Cargill and may be important in other contexts as well. What makes research of this nature challenging is the fact that questions have to be designed for a broad audience without being exhaustive. Researchers may wish to include items associated with technical knowledge and ability. For example, if the leader is an accountant then research shows there are differences regarding what followers expect their leaders to know. In Cargill Poland, followers expect that leaders know all the answers and a leader would lose face if asked a question they could not answer. In Cargill America this is not the case and leaders can say, "I do not know." Another example found during this research is a leader's ability to listen. There are no questions associated with listening, yet current research highlights this is a critical characteristics for leader effectiveness (Trompenaars

and Hampden-Turner, 2001) and there are wide cultural differences regarding listening and silence (Smith and Bond, 1999).

A further limitation of the questionnaire is the sequencing of some of the questions. Some very similar questions have been sequenced next to each other and are part of the same leadership factor. For example;

**7. Autonomous** - Acts independently, does not rely on others

**8. Independent** - Does not rely on others; self-governing

**15. Sincere** – Means what he/she says, earnest

**16. Trustworthy** - Deserves trust, can be believed and relied

**31. Encouraging** - Gives courage, confidence or hope through reassuring and advising

**32. Morale booster** – Increases morale of subordinates by offering encouragement, praise, and/or by being confident

**66. Foresight** - Anticipates possible future events

**67. Plans ahead** - Anticipates and prepares in advance

**69. Individually-Oriented** - Concerned with and places high value on preserving individual rather than group needs

**70. Non-egalitarian** - Believes that all individuals are not equal and only some should have equal rights and privileges

**99. Micro-manager** - An extremely close supervisor, one who insists on making all decisions

**100. Non-delegator** - Unwilling or unable to relinquish control of projects or tasks

All the items identified above are appropriate for this research, however, the possible limitation is that the sequencing of the items affected respondents' answers. They were identified too late in the research to consider re-sequencing them.

Another possible limitation is that leaders were allowed to select followers for inclusion in the study. It is possible that some leaders chose the followers with the greatest affinity and others desired to have some more candid feedback and therefore chose those with less affinity. Because the Leadership Fit Report was

not intended for performance evaluation and its exclusive use was to assist leaders with their development, it was decided not to prescribe a structure.

Furthermore, the followers were not given a definition of a 'leader'. Earlier in this research it was decided not to define a 'leader' and allow the followers to set their own definition. It is feasible than some followers considered, for example, the President of the United States as their definition of a leader when completing Questionnaire 1, others considered their church pastor, whilst others considered the position their immediate manager held. Although it is possible that followers selected leaders other than their immediate managers, it is not likely that this is a significant problem in this study given the high degree of congruence shown between values and behaviour for many leaders.

In Section 2.1.3 it was noted that Implicit Leadership Theory suggests that individuals hold mental model or schemas regarding what constitutes a good leader from a ineffective leader. A further limitation of this research is the fact that one cannot expect that 112 questions in Questionnaire 1 will allow all the implicit values a person holds about leadership to be made explicit. Therefore, this study makes no claim to have fully mapped the implicit leadership schemas possessed by respondents. However, it is likely that the broad range of values included in the GLOBE questionnaire capture many important elements of valued characteristics of leaders. Furthermore, the GLOBE project researchers use Implicit Leadership Theory in a different way to how it has conventionally been understood (Smith and Peterson, 2002). Traditionally, Implicit Leadership Theory has dealt with those aspects of leadership-related cognition of which respondents are least aware. The original studies provided respondents with cues about both leader behaviour and group performance with

a view to indicating high or low performance distorted perceptions of behaviour (Lord et al. 1978). The GLOBE project applies Implicit Leadership Theory differently in that leadership theory is defined and ideals and attitudes are explicitly expressed (Smith and Peterson, 2002).

#### **2.4.3.3 Leadership Fit Report**

A concluding part of Phase One was to review the process and method of the research. During data analysis, several issues arose that raised concerns regarding the method chosen for calculating the degree of fit. The difference calculation literature was reviewed in more detail and concerns expressed in that literature are discussed in this section.

The degree of fit is the central part of the Leadership Fit Report, and is based on the general premise that a high degree of fit between a leader and his or her followers leads to positive outcomes and higher performance. The Leadership Fit Report seeks to measure the degree of fit between what a follower desires and how the follower perceives their leader. The closer the match between the two sets of data, the higher the fit will be. As discussed in Section 2.2.3.4, degree of fit is measured as a percentage.

The degree of fit calculation is based upon a weighted sum of absolute differences, which is the most popular method to gain an index of similarity or dissimilarity (Johns, 1981). Researchers have typically used bivariate congruence indices of an algebraic  $(X-Y)$ , absolute  $(|X-Y|)$  or squared difference  $(X-Y)^2$  (Edwards and Parry, 1993).

Despite wide-spread use in the fit literature, difference scores have been criticised repeatedly for a variety of reasons (Nunnally, 1962; Cronbach and

Furby, 1970; Edwards and Parry, 1993; Hesketh and Myors, 1997; Nyambegera et al. 2001; Nunnally, 1962; Hesketh and Myors, 1997; Nyambegera et al. 2001). In reviewing the literature that criticises difference scores, three areas of weakness were identified from the degree of fit calculation, all of which are applicable to this study.

The absolute difference scores are nondirectional (Edwards, 1993; Kristof, 1996). The implication for this research is the inability to differentiate between misfit when perception is just above or just below the value required. For example, if a follower states a value of '5' for integrity for desired leadership values and rates their leader with a '3' for perceived behaviour, the result is a misfit of '2'. Likewise, if the follower's perception is '7', this also is a misfit of '2'. One could argue that a misfit of '5' and '3' is more significant than a misfit of '5' and '7'. In other words, is it better to have too much integrity or too little? Resolving this weakness under this existing methodology (weighted sum of absolute differences) would be difficult due to the fact that it would be inappropriate to rate all 112 items and then determine whether positive or negative misfit is a good thing or a bad thing. For example, too much autocracy (perception higher than desired values) may be inappropriate in some countries; however, too little autocracy (perception lower than desired values) in other countries may also be inappropriate. This shows that misfit in both directions could be negative and highlights a weaknesses of non-directional measures.

A second weakness is associated with measuring leader performance or effectiveness. The current method for calculating fit implies that high fit has a positive outcome, when some degree of 'misfit' may be more beneficial for the

leader, the followers or the organisation. For example, if a leader stimulates a high degree of conflict and the followers do not value conflict, the fit would be low. However, leader performance may be higher when the leader stimulates conflict when the conflict is productively oriented towards solving organisational problems. Thus performance outcomes may be enhanced when the perceived behaviour either falls short of or exceeds the amount valued by the followers. Making this the assumption that high fit is good may make intuitive sense, but cannot be demonstrated from the data, as there was no measure of leader performance in Phase One.

A further limitation of the existing method stems from the structure of the values' questionnaire. The 7-point Likert scale has a mid-point of 4, which has a description of 'no impact'. For example, some people may believe that administrative skills are not critical for outstanding leadership. If so, a response of '4' would be given for this question. Followers who then rate their leader's perceived behaviour may respond with '1' (no evidence of administrative skills) or '7' (significant evidence). Regardless of their response for perception, the current calculation would imply that fit has been achieved. An argument can be made that this approach is valid, however, the issue arises when followers respond with a significant number of 4s because it would increase the chance of a leader gaining a higher overall fit. If a follower answered '4' to each question, 100% fit would always be achieved regardless of the perception they held of their leader. A test was performed to ensure that this was not invalidating the results. The correlation between the number of '4's and overall fit was 0.11, so although this may be a technical limitation, it is not believed to have affected the results negatively. The average number of 4s for the 1,738 responses was 16 per

person, which represents 14% when considering there are 112 items. If the questionnaire was a forced distribution and there had to be an even number of responses for all 7 possible answers, then each answer would have 16 scores. Although methodologically this approach has its weaknesses, the low correlation and the number of 4's used suggests that the weakness has not invalidated the results of the Leadership Fit Report. These weaknesses formed the basis for Phase Two to build a stronger research project.

#### **2.4.4 Future research/Next steps**

Regarding Phase One there are 5 specific areas that were considered to develop the research further:-

1. Change the structure of the Leadership Fit Report to reflect the new principal components identified in Phase One.
2. Change the sequence of the questions and consider replacing some of the redundant ones with some new questions specifically focused on Cargill.
3. Incorporate more of the cross-cultural findings by nations into the Leadership Fit Report so that it may assist leaders understanding their team and also raise their awareness of cross-cultural differences.
4. Develop the internal website further and invite people simply to take Questionnaire 1 and provide them with some summarised data per country. This will give more access to data for desired leadership values.

5. Make the Leadership Fit Report part of the development process for high potential leaders. This has been approved and it could be used for all 800 leaders discussed in Section 2.2.1.1.

## **3. PHASE TWO**

### **3.1 Theory**

The theoretical perspective for this research was discussed in Section 2.1. Phase Two builds on findings from Phase One by employing the framework of Implicit Leadership Theory to test the relationship of congruence between follower's implicit views of a leader and perceptions of a leader's behaviour to the leader's performance. At the core of Implicit Leadership Theory is the belief that congruence between what an employee desires from a leader and the leader's perceived behaviour will lead to a positive outcome. The next section discusses research on congruence hypotheses by considering the weaknesses and strengths of alternative approaches.

#### **3.1.1 Congruence Research**

Researchers have been testing congruence theories for many years to demonstrate the impact it has on people's motivation (Huseman et al. 1987), employee retention (O'Reilly et al. 1991), distress (Adams, 1963), stress (Edwards and Rothbard, 1999), performance (Bretz and Judge, 1994) and customer retention (DeCarlo et al. 1999).

Equity Theory (Adams, 1963), for example, proposes that individuals who perceive themselves as either under-rewarded or over-rewarded will be motivated to restore equity. Equitably treated subjects were more content or less distressed than inequitably treated subjects (Carrell and Dittrich, 1978).

Congruence with regard to Equity Theory is the match between what is 'fair' and what is 'perceived'.

Congruence is also central to Self-Discrepancy Theory, which suggests that self-esteem is defined by the match (or the mismatch) between how we see ourselves and how we want to see ourselves (Higgins, 1987). Research has found that employee performance was considered to be higher when self-esteem was evident (Higgins, 1989).

Person-organisation (P-O) and person-environment (P-E) fit is another theory that has attracted the attention of researchers and practitioners in recent years (Kristof, 1996). The theory suggests that a person will be satisfied with their job if their needs are fulfilled by the environment in which they work. P-O and P-E congruence can lead to employee satisfaction. Researchers suggest that satisfaction can lead to increased employee retention (O'Reilly et al. 1991) and greater employee performance (Bretz and Judge, 1994).

Another form of congruence research focuses upon the match between the values that two people hold (Chong and Thomas, 1997). Burns (1978) considers transformational leadership to be a relationship wherein leaders and followers raise one another to higher levels of motivation. Their purposes become fused, leading to greater leader-follower congruence in value hierarchies. Thus, value system congruence between leader and follower is among the most important characteristics of transformational leadership (Krishnan, 2002). Robert Haas, Levi Strauss & Co. Chairman and CEO, has argued that alignment with organisational values and personal values is the key driver of corporate success (Posner and Schmidt, 1992).

Value system congruence between leader and follower could be defined as the extent of agreement between the leader's value system and the follower's value system. Value congruence between employees and their supervisors has been found to be significantly related to employee satisfaction and commitment (Meglino et al. 1989). Posner (1992) found that perceived value congruence was directly related to positive work attitudes. Weiss (1978) found that people aligned their values with the values of their leader if they perceived their leader to be competent and successful. Value congruence indicates a harmonious relationship between leader and subordinate, and should therefore result in greater satisfaction over time. Value congruence also indicates a strong identification of the subordinate with the leader (Krishnan, 2002).

Drawing from Implicit Leadership Theory, this study tests the hypothesis that congruence between a follower's desired leadership values and his or her perceptions of the leader's behaviour will lead to higher performance assessed from the follower's perspective. Stated differently, the congruence hypothesis predicts that leader performance will be maximised when perceptions of the leader's behaviour match the followers' values; and that performance will decline as behaviour deviates from values in either direction. Inherent in this prediction is the notion that when the level of perceived behaviour is less than the level valued by the follower, performance suffers. Conversely, performance suffers when the level of perceived behaviour exceeds the level valued by the follower. The forgoing idea may be stated more formally as a hypothesis:

H1a: Leader performance will be maximised when perceived behaviour is equal to desired leadership values, performance will decline as behaviour deviates from leadership values in either direction. Moreover, the congruence

hypothesis implies that when the level of perceived behaviour matches the level valued, regardless of the absolute level involved, performance will remain constant. This prediction derives from the notion that it is the congruence of values and behaviour that leads to performance rather than any benefit stemming from the value or the behaviour itself.

H1b: Performance will not vary as behaviour and values vary under the condition that they are equal.

Hypotheses H1a and H1b capture the prediction that congruence between follower values and leader behaviour leads to positive outcomes. However, a central prediction in this project is that the joint relationship of values and behaviour to outcomes varies by national culture. As discussed earlier in sections 2.1.4, national culture is expected to influence not only an individual's preferences for certain leadership characteristics but also their interpretations of leader behaviour. Accordingly, the joint effects of follower values and perceived leader behaviour on performance may be expected to vary by national culture. This reasoning leads to Hypothesis 2 below:

H2: The relationship of behaviour and values to performance will vary by national culture.

It is now important to recognise that it is not logically possible for Hypotheses 1a and b to be fully supported and for Hypothesis 2 to be fully supported. Hypothesis 2, stipulating that the relationship of values and behaviour to performance varies across culture, necessarily invalidates the prediction encapsulated by H1a and b, which predicts that congruence maximises performance.

In summary, congruence research has historically relied on variations of difference score calculations to determine the degree of fit between two or more variables. Section 2.4.3.3 discussed a number of weaknesses with the Leadership Fit Report, one of which was the use of difference score calculations to measure fit. Although weighted absolute differences have been used extensively (Johns, 1981) they have their limitations; the major one being that they collapse two variables into one new variable, losing some of the characteristics that the two variables originally had.

Alternative approaches to congruence have been recommended (Johns, 1981; Edwards and Parry, 1993) which eliminate some of the concerns expressed earlier about difference scores. Edwards (1995) recommends an approach combining the use of Polynomial Regression Equations with Response Surface Methodology, which was followed in Phase Two of the dissertation. Kristof (1996), in her research assessing Person-Organisation Fit, concluded by recommending: “in the future, research should be conducted that uses both traditional methods for assessing fit and the polynomial regression equations recommended by Edwards.”

## 3.2 Methods

### 3.2.1 Sample

#### 3.2.1.1 Selection of Countries to Analyse

Phase One collected data from 1,738 followers associated with 196 leaders representing 23 countries. The five countries with the largest numbers of respondents were selected for more detailed analysis in Phase Two, as shown in Table 13. The sample for Phase Two included America, Great Britain (GB) and the Netherlands representing the dominant cultures in Cargill's leadership, and included at least one country from each continent in which Cargill operates.

**Table 13 – Follower nationalities**

| <b>Countries</b> | <b>Followers</b> |
|------------------|------------------|
| America          | 537              |
| GB               | 136              |
| Brazil           | 108              |
| Japan            | 87               |
| Netherlands      | 65               |
| <b>TOTAL</b>     | <b>933</b>       |

The data from followers from America, Great Britain, Brazil, Japan, and the Netherlands (N=933) represent 53% of the total data and were analysed in Phase Two. The number of followers from each country differ from what was stated in Section 2.3.1/Table 2. For Phase One, each follower defined his or her nationality. For example, if a follower was born in Mexico, raised in Mexico and moved to America and now considers himself or herself an American (due to

their passport), then this research considered them as American. In Phase Two, this definition was revised to be more restrictive to ensure cultural homogeneity within each group. Followers were removed from analysis in Phase Two for any of three reasons. Firstly, if they held dual citizenship, secondly, if they were raised by parents of differing nationality and finally, if they had lived outside of their home country for a significant number of years. These followers were removed, not because their views were less important, but to increase cultural homogeneity. The purpose of this analysis was to look at the core nationalities and it was believed that views held by followers who experience multiple cultures may vary significantly from those whose experiences were within a single culture. The 5 countries had a total of 1,055 followers, however, 122 followers were removed due to the criteria described above leaving 933 followers for Phase Two. It could be argued that the 122 followers that were removed actually represented a group worth further investigation. This is true, however, a sample of this size was too small for 5 countries for further analysis.

### **3.2.2 Procedure**

Phase Two was conducted on a sub-set of the data collected in Phase One. In Phase One a detailed account was given of how the 196 leaders were selected and the conditions for those leaders nominating followers. No additional data was collected for Phase Two. In Phase Two, the 933 followers were associated with 148 leaders.

### **3.2.3 Variables and Measures**

### **3.2.3.1 Selection of Dependent Variables – “Leader Performance”**

The Leadership Fit Report was unable to show the relationship between ‘fit’ and ‘performance’ because a measure of performance was not part of Phase One. Two measures of leader performance were subsequently obtained from Cargill but both were rejected as dependent variables measuring performance because of concerns about scaling, reliability issues and validity issues. The first was a measure of overall performance. It was measured on a 5-point scale, and was a rating agreed once per year between an employee and their manager. Of a total of 196 ratings, 64 were incomplete. Preliminary analyses were conducted and the results showed no significant findings. The second was an aggregated measure of 15 leadership characteristics including both technical, and behavioural characteristics. The characteristics were problematic because multiple characteristics were considered as part of 1 item. For example, *‘Behaviour 3: Creates a high performance operating culture which emphasizes the customer, teamwork, personal accountability and positive reinforcement. Models the desired behaviours personally and reinforces desired behaviours at all levels of the organization.’* It was difficult to determine what this actually measured. Aggregated measures imply that the constituent characteristics share the same functional relationship with the dependent variable; an assumption which is frequently unsupported (Edwards and Bagozzi, 2000). A total of 92 of 196 ratings were obtained, and preliminary analyses were insignificant. The correlation between the two organisational measures of performance was 0.24. Due to the fact that both measures incorporated serious

flaws and produced results of little significance, the organisational measures were discarded. The flaws of these two performance measures were discussed internally with Cargill managers who agreed that there were known problems with both measures.

Polynomial Regression Equations test the nature of the relationship between two or more independent variables and a dependent variable. Therefore a dependent variable for the regression equation was required that currently did reside within the data collected.

Table 14 ranks leadership characteristics by desirability in the shaded areas taken from the responses to Questionnaire 1. The means in Table 14 represented the most and least desired characteristics from 1,738 followers and were weighted by country to prevent the larger countries from dominating the mean scores. Due to the fact there was almost unanimity amongst each country regarding the most and least desired characteristics, the sponsors in Cargill decided that any leader who was perceived to have low levels of the first 4 or to have high levels of the last 4 characteristics was unlikely to be perceived to be an effective leader in Cargill. Therefore, the set of behavioural measures corresponding to the 4 desirable and 4 undesirable characteristics were designated as measures of performance. Each of the 8 behavioural characteristics were used as measures of leader performance in the regression equations as dependent variables.

**Table 14 – Leadership Values (Ranked)**

| <b>Leadership Factor</b>          | <b>Raw Mean</b> |
|-----------------------------------|-----------------|
| <b>03 Integrity</b>               | <b>6.589</b>    |
| <b>07 Encourager</b>              | <b>6.364</b>    |
| <b>04 Perform Orientation</b>     | <b>6.341</b>    |
| <b>19 Team Building</b>           | <b>6.306</b>    |
| 21 Motivational                   | 6.070           |
| 01 Visionary                      | 6.045           |
| 20 Calm                           | 5.891           |
| 02 Organised                      | 5.394           |
| 09 Modesty                        | 4.824           |
| 12 Protective/Sensitive           | 4.796           |
| 14 Friendly/Helpful               | 4.715           |
| 06 Normative                      | 4.663           |
| 11 Independent                    | 3.895           |
| 17 Socially Aware                 | 3.628           |
| 13 Risk Averse                    | 3.082           |
| 10 Unreliable/Unintelligent       | 2.780           |
| 18 Indirect                       | 2.389           |
| <b>16 Elitist/Individualistic</b> | <b>2.210</b>    |
| <b>08 Loner</b>                   | <b>1.981</b>    |
| <b>05 Autocratic</b>              | <b>1.958</b>    |
| <b>15 Micro Manager</b>           | <b>1.715</b>    |

Note: The means are based on a scale of 1-7. A score of 7 implies that it “*greatly contributes*” to outstanding leadership. A score of 1 implies that it “*greatly inhibits*” outstanding leadership. These 21 factors were developed as part of Phase One.

The shaded areas represent the highest valued and least valued leadership characteristics.

### 3.2.3.2 Selection of Independent Variables

Regression equations are useful for explaining variance in a dependent variable with independent variables. If there is little or no variance found in either the independent or dependent variables, regression equations will produce results with no or little significance. Before performing the regression analysis, each of the 21 factors were inspected to determine whether variance was sufficient for analyses.

Table 15 shows the variance for desired leadership values from the raw scores. For characteristics with low variance, there was little likelihood that these factors could explain variance in the dependent variable.

**Table 15 – Variance of values (raw)**

| <b>Leadership Factor</b>    | <b>Variance</b> |
|-----------------------------|-----------------|
| 03 Integrity                | 0.247           |
| 19 Team Building            | 0.315           |
| 10 Unreliable/Unintelligent | 0.322           |
| 01 Visionary                | 0.345           |
| 04 Perform Orientation      | 0.352           |
| 07 Encourager               | 0.381           |
| 20 Calm                     | 0.438           |
| 15 Micro Manager            | 0.595           |
| 08 Loner                    | 0.613           |
| 06 Normative                | 0.625           |
| 21 Motivational             | 0.654           |
| 02 Organised                | 0.658           |
| 05 Autocratic               | 0.663           |
| 14 Friendly/Helpful         | 0.789           |
| 16 Elitist/Individualistic  | 0.845           |
| 18 Indirect                 | 0.859           |
| 13 Risk Averse              | 0.911           |
| 09 Modesty                  | 1.068           |
| 12 Protective/Sensitive     | 1.171           |
| 17 Socially Aware           | 1.768           |
| 11 Independent              | 2.505           |

For example, Cargill sponsors believed that Integrity would have strong relationship to overall leader performance. However, if Cargill leaders vary little in the amount of integrity they possess, this factor will not explain variance in their performance. Not surprisingly, the results for Integrity as an independent variable were inconclusive. Principal components with low variance may constitute core values in the organisational culture of the company. For example, ethics and integrity have been stressed by Cargill management since the organisation's beginnings in 1865. In contrast to the low variance of some desired characteristics, Table 16 however, shows greater variance in the perceived behaviour of leaders.

**Table 16 – Variance of Perceived Behaviours**

| <b>Leadership Factor</b>    | <b>Mean</b> | <b>Variance</b> |
|-----------------------------|-------------|-----------------|
| 10 Unreliable/Unintelligent | 2.909       | 0.638           |
| 04 Perform Orientation      | 5.959       | 0.724           |
| 01 Visionary                | 5.350       | 0.727           |
| 06 Normative                | 5.171       | 0.767           |
| 03 Integrity                | 5.994       | 0.947           |
| 19 Team Building            | 5.527       | 0.956           |
| 02 Organised                | 5.389       | 1.114           |
| 13 Risk Averse              | 3.848       | 1.270           |
| 16 Elitist/Individualistic  | 2.471       | 1.311           |
| 21 Motivational             | 4.954       | 1.318           |
| 20 Calm                     | 5.327       | 1.372           |
| 08 Loner                    | 2.281       | 1.405           |
| 14 Friendly/Helpful         | 4.817       | 1.408           |
| 12 Protective/Sensitive     | 4.479       | 1.412           |
| 07 Encourager               | 5.288       | 1.502           |
| 18 Indirect                 | 2.448       | 1.598           |
| 05 Autocratic               | 2.508       | 1.726           |
| 09 Modesty                  | 4.899       | 1.833           |
| 15 Micro Manager            | 2.546       | 1.878           |
| 17 Socially Aware           | 4.072       | 2.158           |
| 11 Independent              | 4.503       | 2.250           |

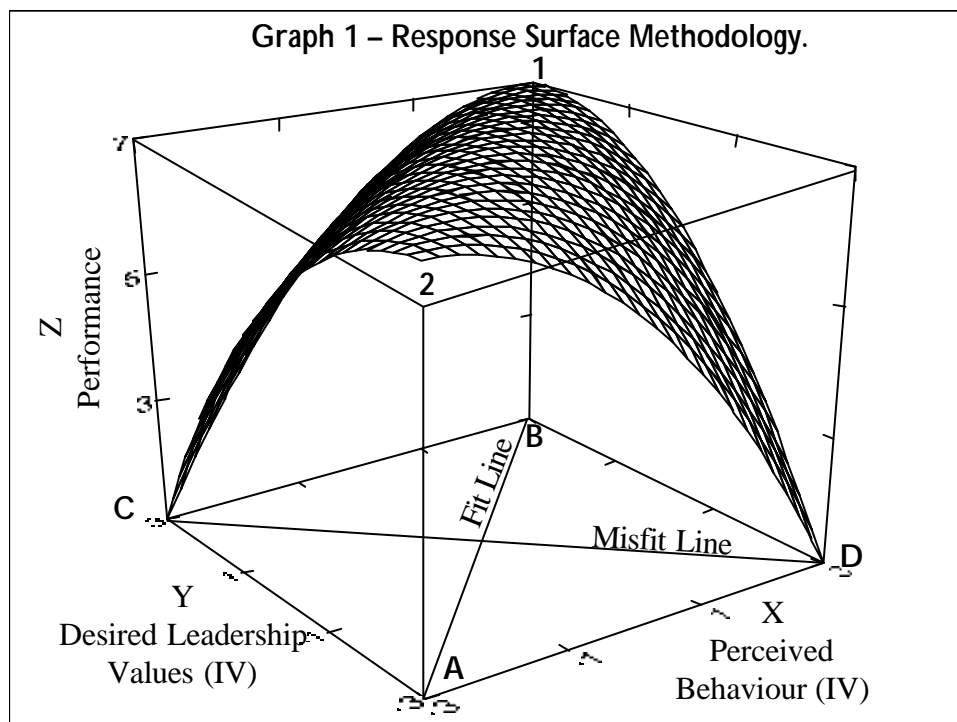

The variances identified in Tables 15 and 16 served as cues for anticipating significant results. Table 17 summarises the preceding discussions regarding variable selection by naming the independent and dependent variables used in analyses for Phase Two.

**Table 17 – Dependent and Independent Variables**

| <b>Organisational Performance</b><br><i>(Dependent variables)</i> | <b>Values and Perception</b><br><i>(Independent variables)</i> |
|---|--|
| 03 Integrity  | 01 Visionary   |

### 3.2.4 Analysis

Polynomial Regression Equations enable the joint relationship between the values and perceptions of behaviour on a dependent variable to be fully modelled and tested. Response Surface Methodology is a graphical technique for representing the polynomial regression equations. Graph 1 shows a response surface of the congruence hypothesis central to this research. The joint relationship of values and perceived behaviour can be understood by focusing attention on two lines, labelled as the lines of *fit* and *misfit*, respectively. The shape of the surface along the fit and misfit lines tests critical hypotheses regarding the relationship of values, perceived behaviour and performance.

The axes are labelled X, Y and Z. X and Y represent the independent variables. For this research they are desired leadership values (Y) and perceived behaviour (X). Z is the measure of leader performance and is the dependent variable. The regression equation predicts Z based on the relationship between X and Y. Each axis X, Y ranges from low to high (e.g. -3 to +3), with low being at the nearest point on the graph. On the base of the graph are two lines with labels A-B and C-D. A-B is referred to as the line of fit and is defined by the equation  $X = Y$ . Any deviation from the A-B line implies that there is a misfit between X and Y. Points 1-2, along the fit line, represent the effect of X and Y on Z under the condition that  $X = Y$ . At point 1, X and Y are both high and Z is also high. At point 2, X and Y are low and Z is high. The congruence hypothesis implies that performance (Z) will not vary as X and Y increase, but rather that it is congruence itself that is associated with high performance. C-D is referred to as the line of misfit and is defined by the equation  $X = -Y$ . Point C and point D, along the line of misfit, exhibit the predicted effects of incongruence. At Point C, where X is high and Y is low, Z is low consistent with the predicted negative effects of incongruence. At Point D where X is low and Y is high, Z is also predicted to be low due to the incongruence between X and Y.

In summary, using Polynomial Regression Equations and Response Surface Methodology allows a more complex and accurate understanding of the nature of the relationship between values, perception and performance. Furthermore, this approach facilitates testing hypotheses of congruence.

The congruence hypotheses, H1a and H1b, may be tested with a polynomial equation testing the joint effects of values and perceptions of behaviour as illustrated below:

$$Z = b_0 + b_1X + b_2Y + b_3X^2 + b_4XY + b_5Y^2 + e \quad (3)$$

where  $X$  represents perceptions of leader behaviour,  $Y$  represents follower's values, and  $Z$  indicates the dependent variable. Equation (3) tests for the direct effects of values and behaviour on outcomes but also accounts for possible curvilinear effects, and the interaction of values and behaviour. The coefficient on  $X$  ( $b_1$ ), is the size of the direct effect of  $X$  holding the effects of the other variables constant. The coefficient of the squared values of  $X$  and  $Y$  capture the curvilinearity in their relationships to  $Z$  and the coefficient on  $XY$  represents the interaction.

Hypotheses H1a and b predict the shape of the response surface along the lines of misfit and fit respectively. Specifically, H1a predicts that the outcomes are maximised when values equal behaviour and that outcomes decline as behaviour deviates from values. This prediction corresponds to an inverted U shape along the line of misfit and is signified by a null slope and negative curvature at the midpoint of the misfit line (i.e.  $X = -Y$ ). The hypothesis of null slope and negative curvature may be tested by using Equation (3). The shape of a surface along the breach line is found by substituting the formula for this line into Equation 3 (Edwards and Parry, 1993), which yields:

$$Z = b_0 + (b_1 - b_2)X + (b_3 - b_4 + b_5)X^2 + e. \quad (4)$$

The term  $(b_3 - b_4 + b_5)$  represents the curvature of the surface along the misfit line, and the term  $(b_1 - b_2)$  represents the slope of the surface along the misfit line at the point where  $X$  and  $Y$  equal the mean of their means. A negative and significant quantity  $(b_3 - b_4 + b_5)$  indicates negative curvature and an insignificant quantity  $(b_1 - b_2)$  indicates null slope in support of H1a.

H1b predicted that outcomes would not vary as values and behaviour increased under the condition that they were equal. This hypothesis corresponds to a flat shape of the response surface along the fit line as indicated by null slope and null curvature and may be tested with Equation (3) as follows. Substituting the formula for the fit line (i.e.  $X = Y$ ) into Equation (3) yields the following equation:

$$Z = b_0 + (b_1 + b_2)X + (b_3 + b_4 + b_5)X^2 + e. \quad (5)$$

The terms  $(b_1 + b_2)$  and  $(b_3 + b_4 + b_5)$  refer to the slope of the surface and the curvature of the surface along the fit line, respectively, at the point where  $X$  and  $Y$  equal the mean of their means. Insignificant quantities for the terms  $(b_1 + b_2)$  and  $(b_3 + b_4 + b_5)$  are evidence in support of H1b.

The quantities representing slope and curvature of the fit and misfit lines can be easily tested in the statistical program SYSTAT, which automatically computes their standard errors and reports significance levels. However, hypotheses involving shapes of the surface along fit and misfit lines may also be tested in SPSS and other standard statistical packages through alternative procedures.

In summary, support for the congruence hypothesis would be evidenced by null slope and negative curvature along the misfit line, and by null slope and null curvature along the fit line. Table 18 represents the expected pattern of results in summary form.

**Table 18 – Expected pattern of results for hypothesis test**

|             | Fit Line      |                     | Misfit Line   |                     |
|-------------|---------------|---------------------|---------------|---------------------|
|             | Slope         | Curvature           | Slope         | Curvature           |
|             | $(b_1 + b_2)$ | $(b_3 + b_4 + b_5)$ | $(b_1 - b_2)$ | $(b_3 - b_4 + b_5)$ |
| (predicted) | Ø             | Ø                   | Ø             | negative            |

Table 18 assumes that the dependent variable for leader performance is a characteristic that is highly desired, for example, Integrity. In Section 3.2.3 the dependent variables were discussed. There were 8 chosen, 4 of which represent characteristics desired by Cargill followers and 4 represent undesirable characteristics. An example of one the undesirable dependent variables is Loner, which was operationalised as ‘somebody who avoids people, works separately and is distant or aloof’. For a highly desired dependent variable curvature along the misfit line should be negative as shown in Table 18, however, this curvature should be positive when the dependent variable is not desired, as is expected for Loner.

The results of tests involving Equation (3) may be plotted as a three dimensional surface to illustrate significant results as was done in Graph 1 illustrating the congruence hypothesis.

Hypothesis 2, predicting that the effects of values and behaviour on performance will vary by national culture, may be tested by treating national culture as a categorical moderator of the independent variables in Equation 3. Given that data from five countries is involved, four dummy codes are sufficient to capture variation across culture; accordingly, America = D1, Brazil = D2, Great Britain = D3, the Netherlands = D4, and Japan was the omitted variable. The moderated equation was generated by multiplying each dummy coded

variable by each variable in Equation (3) yielding an equation with 29 variables and a constant. Although the resulting equation appears unwieldy, hypothesis testing is straightforward when following ordinary procedures for regression analysis with dummy codes (Pedhazur, 1997). The test for Hypothesis 2 was a joint test of the significance explained by the moderating variables in the full equation. A significant F ratio was evidence in support of Hypothesis 2 suggesting that national culture explained variation in performance above and beyond that explained by the quadratic equation involving values, behaviour, their squared and interaction terms.

All combinations of values, behaviour and performance, where support for Hypothesis 2 was indicated by the significant F test, were subjected to further exploratory analysis to test the nature of the variation by national culture. Specifically, the congruence hypothesis described in H1a and H1b was used to test the relationship of values and behaviour to performance within each culture. The congruence hypothesis provided a point of reference for describing differences across cultures by assessing the extent of the deviation from congruence. The approach described in the foregoing paragraphs for testing hypotheses regarding response surfaces was readily adapted to the full polynomial equations involving dummy codes for each country. The full polynomial equation contains terms for each country corresponding to  $X$ ,  $Y$ ,  $X^2$ ,  $XY$ , and  $Y^2$  and was tested as described above.

In summary, 8 dependent variables (DV) were regressed on 13 commensurate pairs of independent variables (IV), referring to Sections 3.2.3.1 and 3.2.3.2 respectively, to test Hypothesis 1 regarding congruence and Hypothesis 2 regarding variation in congruence by national culture. Although

the primary focus was the relationship between the eight DVs and 13 IVs (total 104), the additional analyses included all leadership factors against the 8 DVs totalling 160 regression equations. The 160 regression equations were performed twice, first with all 933 followers for testing Hypothesis 1 and second, controlling for country for testing Hypothesis 2.

Finally, for each of the 160 Polynomial Regression Equations, which supported Hypothesis 2, the equations for slope and curve of the surface along the lines of fit and misfit were tested.

#### **3.2.4.1 Mean Centred Data for Regression Equations**

All the data were standardised in Phase One for the principal component analysis. Each follower answered 112 items and the data were standardised so that each case (follower) had a mean of 0 and a standard deviation of 1. Research suggests a different approach for Polynomial Regression Equations for independent variables. Aiken and West suggest the following:

*Often in social science research  $X$  and  $Z$  are measured on interval scales in which the value zero has no meaning. If some behaviour were predicted from a measure of motivation ( $X$ ) and a 7-point scale ( $Z$ ) ranging from 1-7, the regression coefficient for  $Y$  and  $X$  would be the slope of  $Y$  on  $X$  at the value  $Z=0$ , a value not even defined on the scale! However, when predictors are centred, then the value of 0 is the mean of each predictor. Hence, if  $Z$  is centred, then the  $b_1$  coefficient for  $X$  represents the regression of  $Y$  on  $Z$  at the mean of the  $Z$  variable. Centring produces a value of zero on a continuous scale that is typically meaningful (Aiken and West, 1991:37).*

This subject is also discussed with regard to predictors in Polynomial Regression Equations (Cohen et al. 2003:201), and they “strongly recommend the use of centred polynomial equations” in order to make the results more meaningful.

For dependent variables, Cohen et al. (2003:266) recommend that they are not centred and that raw data should be used for analyses. The predicted score, when left in its original scale, will also be in the units of the original scale, and will have the same arithmetic means as the observed criterion scores. All the regression equations within this study used centred predictors (mean zero and standard deviation unchanged) and raw scores have been used for all predicted scores.

#### **3.2.4.2 Multicollinearity**

Correlations between the independent variables ranged from  $-0.001$  (Socially Aware/Indirect) to  $0.762$  (Team Building/Encourager) as shown in **Appendix U**. Inspection of the correlations indicated that values and perceptions were correlated with each other, and specifically that pairs of values and perceptions referring to the same item were correlated. Multicollinearity among the independent variables may bias estimates of the true relationships among variables because shared variance is partialled away (Pedhazur, 1997; Cohen et al. 2003) and multicollinearity raises the question of whether correlated variables represent different theoretical constructs. However, there is no agreement on what constitutes a high level of collinearity (Pedhazur, 1997). A corrected correlation between pairs of values and perceptions was calculated by incorporating their reliabilities to estimate a true correlation. In

all cases, corrected correlations were less than 1, meeting a minimal standard for suggesting that variables, although correlated, were still measuring distinctly different constructs (Pedhazur, 1997:172).

### 3.3 Results

#### 3.3.1 Descriptive Measures

Section 3.2.3 discussed how the variables were chosen for the independent and dependent variables. The Polynomial Regression Equations helped in understanding the nature of the relationship of 21 leadership characteristics from the principal component analysis (independent variables) with 8 measures of leader's performance (dependent variables). **Appendix AE** presents the mean centred means for the 21 principal components identified in Phase One. They were used as the independent variables for the regression equations of which 13 were key IVs. **Appendix AF** presents the raw means for 8 of the 21 principal components that were used as dependent variables.

**Appendix AG** presents the correlations for the desired leadership values and perceived behaviour for each of the 5 countries being studied in Phase Two. For example, the desired leadership values for 'Visionary' is correlated with the perceived behaviour scores 'Visionary'. Inspection of these correlations revealed a range from a low of 0.090 for 'Micro Manager' to a high of 0.444 for 'Socially Aware'. A country analysis revealed for America, the low was 0.086 for 'Calm' and a high of 0.466 for 'Socially Aware'. For Brazil the low was 0.031 for 'Micro Manager' and a high of 0.421 for 'Normative'. For Great Britain the low was -0.043 for 'Calm' and a high of 0.569 for 'Socially Aware'. For the Netherlands the low was 0.098 for 'Encourager' and a high of 0.500 for 'Protective/Sensitive'. Finally Japan's low was -0.020 for 'Encourager' and their high was 0.528 for 'Normative'. This suggests the correlation between the desired leadership values and perceived behaviour for Socially Aware had the

greatest correlation. These correlations were not deemed to be too high for this type of research – one would expect a certain degree of correlation. Section 3.2.4.2 discussed the issues of multicollinearity, which is an issue with related values for regression equations.

Analyses pertaining to Hypotheses 1 and 2, referring to the outcomes of congruence and to variation in outcomes due to culture respectively, are presented and followed by exploratory results into how the relationship of congruence and leader performance differs between countries. These exploratory analyses were not the primary purpose of this research, but reveal findings relevant to the larger question addressed by this research concerning cross-cultural differences in leadership.

### **3.3.2 Hypothesis 1: Congruence leads to higher performance**

The results presented in Table 19 summarise the analyses pertaining to tests of Hypothesis 1. Hypothesis 1a predicted that leader performance was maximised when values and behaviour were equal, and that performance declined as behaviour fell short of or exceeded the amount valued. Support for this hypothesis is shown by assessing the shape of the response along the line of misfit. Specifically, for the dependent variables of Integrity, Team Building, Performance Orientation and Encourager the shape of the surface along the misfit line should exhibit null slope and negative curvilinearity and the fit line should exhibit null slope and curvilinearity. For the dependent variables of Loner, Elitist, Autocratic and Micro Manager H1a predicts null slope and positive curvilinearity and the fit line should exhibit null slope and

curvilinearity. Table 19 indicates (highlighted in yellow) that 26 of 160 equations conformed to the predicted slope and curvature of the surface along the fit line and misfit line as predicted by Hypothesis 1a. In combination, these analyses suggest a low level of overall support for Hypothesis 1. The p values shown in Table 19 were produced from the overall equation. **Appendix AH** presents the same results in a different format by showing which coefficients were significant and the direction (positive or negative). For example the fit line for Motivational (IV) and Integrity (DV) shows null slope and null curvilinearity and the misfit line shows null slope and negative curvilinearity, which suggests a support of Hypothesis 1. A more detailed explanation of how the results were calculated and analysed is presented in **Appendix AI**.

 Denotes support of the Hypothesis

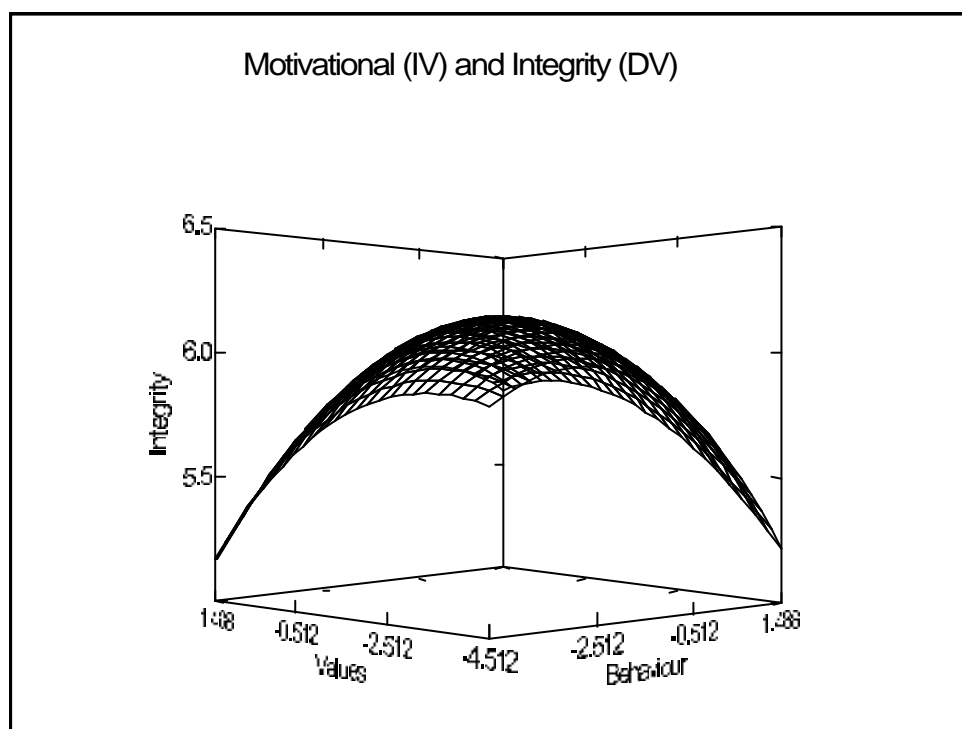

Table 20, which presents the coefficients of regression equation for the same example of Motivational (independent variables) and Integrity (dependent variable), suggests a support of Hypothesis 1.

**Table 20 – Coefficients for Motivational (IV) and Integrity (IV)**

|               | $b_1$ | $b_2$  | $b_3$    | $b_4$ | $b_5$  | $R^2$ | $F_c$ | Fit Slope   | Curve             | Misfit Slope | Curve             |
|---------------|-------|--------|----------|-------|--------|-------|-------|-------------|-------------------|--------------|-------------------|
|               | X     | Y      | $X^2$    | XY    | $Y^2$  |       |       | $b_1 + b_2$ | $b_3 + b_4 + b_5$ | $b_1 - b_2$  | $b_3 - b_4 + b_5$ |
| All Countries | 6.08  | -0.032 | -0.041 * | 0.035 | -0.029 | 0.012 | 2.777 | -0.093      | -0.035            | -0.029       | -0.105 *          |

The surface for this relationship is presented in Graph 2.

**Graph 2 – Surface for Motivational (IV) and Integrity (IV)**

Graph 2 shows the support of Hypothesis 1 by the fact the relationship with the dependent variable (Integrity) is the lowest when there is incongruence between

values and behaviour. Moreover, Graph 2 shows that Integrity does not vary as the fit between values and behaviour increases from low to high.

### **3.3.3 Hypothesis 2: The nature of the relationship varies across cultures.**

Hypothesis 2 predicted that the relationship of values and leader behaviour on leader performance varied across cultures. This hypothesis was tested by the omnibus F test which indicated whether significant differences existed between the countries as a whole. Table 21 presents a summary of the *p* values results for Hypothesis 2. All 160 tests demonstrated support for Hypothesis 2; 153 of 160 were significant at the level of  $p < .001$ , five were significant at the level of  $p < .01$ , and two were significant at the level of  $p < .05$ . These results indicate that the joint relationship of values and behaviour on leader performance varies across the five countries included in this study. These results do not reveal where the differences reside.

**Table 21 – Hypothesis 2: The test of does culture matter – p values**

### 3.3.4 Exploratory tests of differences by country

Exploratory analyses were performed to reveal how the joint relationship of values and behaviour differs across Japan, America, Great Britain, Brazil, and the Netherlands. This involved a further 160 Polynomial Regression Equations using a dummy code for each of the 5 countries yielding 800 sets of country specific coefficients. Each of the 160 tests indicating variation across countries was examined in greater detail to determine in which countries differences existed and to determine how the relationship of values and behaviour to performance differed across countries. To illustrate the approach taken to analyse each set of results, **Appendix AL** presents a detailed example of one of the 160 output reports from the SYSTAT computer application. In this example

involving Independent (IV) and Integrity (DV), the items important for this exploratory analysis are labelled. They are:-  $R^2$ , the coefficients for each variable (X, Y,  $X^2$ , XY and  $Y^2$ ) and the dummy variables, the  $p$  value for the test of Hypothesis 2 referring to whether 'culture matters', and the  $p$  values for tests of the fit slope, fit curve, misfit slope, and misfit curve for Japan, America, Brazil, GB and the Netherlands.

Tests of significance for the features describing the shape of the surface were conducted in SYSTAT, however, Microsoft Excel was used to calculate the quantities for slope and curvature following the procedures described in section 3.2.4. The example of Independent (IV) and Integrity (DV) is presented in **Appendix AM**. Table 22 illustrates how coefficients from SYSTAT output were used to calculate slope and curvature of the fit and misfit lines used to test the congruence relationship. The colour codes are:- Blue – America, Yellow – Brazil, Pink – G.B. and Green – the Netherlands. Japan's results are not colour coded as they did not have a dummy variable so X and Y alone represents Japan.

**Table 22 – Example of Coefficients extracted from SYSTAT output**

|            | Effect             | Coefficient |
|------------|--------------------|-------------|
|            | CONSTANT           | 4.791       |
| X          | F19XCFP            | 0.554       |
| Y          | F19XCFV            | 0.482       |
| X (D1)     | D1                 | 1.23        |
| X (D2)     | D2                 | 1.196       |
| X (D3)     | D3                 | 0.831       |
| X (D4)     | D4                 | 0.874       |
| $X^2$      | F19XCFP*F19XCFP    | 0.003       |
| $X*Y$      | F19XCFP*F19XCFV    | -0.173      |
| $Y^2$      | F19XCFV*F19XCFV    | -0.009      |
| D1*X       | D1*F19XCFP         | -0.516      |
| D1*Y       | D1*F19XCFV         | -0.515      |
| D2*X       | D2*F19XCFP         | -0.751      |
| D2*Y       | D2*F19XCFV         | -0.484      |
| D3*X       | D3*F19XCFP         | -0.631      |
| D3*Y       | D3*F19XCFV         | -0.485      |
| D4*X       | D4*F19XCFP         | -0.401      |
| D4*Y       | D4*F19XCFV         | -0.614      |
| $D1*X^2$   | D1*F19XCFP*F19XCFP | 0.023       |
| $D1*(X*Y)$ | D1*F19XCFP*F19XCFV | 0.234       |
| $D1*Y^2$   | D1*F19XCFV*F19XCFV | -0.009      |
| $D2*X^2$   | D2*F19XCFP*F19XCFP | 0.013       |
| $D2*(X*Y)$ | D2*F19XCFP*F19XCFV | 0.143       |
| $D2*Y^2$   | D2*F19XCFV*F19XCFV | -0.006      |
| $D3*X^2$   | D3*F19XCFP*F19XCFP | 0.036       |
| $D3*(X*Y)$ | D3*F19XCFP*F19XCFV | 0.139       |
| $D3*Y^2$   | D3*F19XCFV*F19XCFV | 0.052       |
| $D4*X^2$   | D4*F19XCFP*F19XCFP | 0.027       |
| $D4*(X*Y)$ | D4*F19XCFP*F19XCFV | 0.198       |
| $D4*Y^2$   | D4*F19XCFV*F19XCFV | 0.117       |

Note: F19XCFP/FV are the mean centred (XC) scores for principal component 19 (F19) for follower perception (FP) and follower values (FV)

**Table 22 is an extract from Appendix AK. In Table 23 there are 3 columns of data presented; ‘p’, ‘Effect Size Direction’ and ‘Formula’. The p values have been taken from SYSTAT output and were presented in Appendix AL. The ‘Effect Size Direction’ has been calculated from the coefficients in Table 22. For example, for Japan the calculation for fit slope uses the coefficients in Table 22 as**

follows:  $X+Y$  or  $0.554+0.482=1.036$ . The 'formula' shows how the 'Effect Size Direction' was calculated. What this exploratory analysis revealed, which will be discussed later, is the fact that in some cases the direction was opposite when comparing countries, for example, in Table 23 fit slopes for Japan, America and Netherlands are positive yet for Brazil and Great Britain they are negative. Table 23 – Extract from the test output in Excel and formulae

|                      | Effect Size |           |  |
|----------------------|-------------|-----------|--|
|                      | P           | Direction | Formula                                |
| <b>Japan</b>         |             |           |  |
| Fit Slope            | 0           | 1.036     | $X+Y$                                  |
| Fit Curve            | 0.035       | -0.179    | $X^2+XY+Y^2$                           |
| Misfit Slope         | 0.644       | 0.072     | $X-Y$                                  |
| Misfit Curve         | 0.283       | 0.167     | $X^2-XY+Y^2$                           |
| <b>America</b>       |             |           |  |
| Fit Slope            | 0           | 0.005     | $X+Y+D1*X+D1*Y$                        |
| Fit Curve            | 0.005       | 0.069     | $X^2+XY+Y^2+D1*X^2+D1*XY+D1*Y^2$       |
| Misfit Slope         | 0.995       | -0.959    | $(X+D1*X)-(Y-D1*Y)$                    |
| Misfit Curve         | 0.173       | -0.053    | $(X^2+D1*X^2)-(XY+D1*XY)+(Y^2+D1*Y^2)$ |
| <b>Brazil</b>        |             |           |  |

| Fit Curve            | 0.13        | -0.029    | $X^2+XY+Y^2+D2*X^2+D2*XY+D2*Y^2$       |
| Misfit Slope         | 0.212       | -0.195    | $(X+D2*X)-(Y-D2*Y)$                    |
| Misfit Curve         | 0.447       | 0.031     | $(X^2+D2*X^2)-(XY+D2*XY)+(Y^2+D2*Y^2)$ |
| <b>Great Britain</b> |             |           |  |
| Fit Slope            | 0           | -0.08     | $X+Y+D3*X+D3*Y$                        |
| Fit Curve            | 0.014       | 0.048     | $X^2+XY+Y^2+D3*X^2+D3*XY+D3*Y^2$       |
| Misfit Slope         | 0.434       | -0.074    | $(X+D3*X)-(Y-D3*Y)$                    |
| Misfit Curve         | 0.767       | 0.116     | $(X^2+D3*X^2)-(XY+D3*XY)+(Y^2+D3*Y^2)$ |
| <b>Netherlands</b>   |             |           |  |
| Fit Slope            | 0           | 0.021     | $X+Y+D4*X+D4*Y$                        |
| Fit Curve            | 0.004       | 0.163     | $X^2+XY+Y^2+D4*X^2+D4*XY+D4*Y^2$       |
| Misfit Slope         | 0.452       | 0.285     | $(X+D4*X)-(Y-D4*Y)$                    |
| Misfit Curve         | 0.822       | 0.113     | $(X^2+D4*X^2)-(XY+D4*XY)+(Y^2+D4*Y^2)$ |

Given the large number of tests, the analyses for the 160 equations were inspected and sorted into 5 categories. The categorisation scheme was intended to eliminate from further consideration equations where results were largely insignificant or inconclusive, and to identify groups of equations where results appeared to be theoretically interpretable and meaningful. Table 24 presents all 160 tests and the descriptions of the 5 categories are:

1. Results not significant at the country level – 49 were in this category and are shown in yellow in Table 24.
2. Some results were significant but inconclusive – 44 were in this category and are shown in grey in Table 24.
3. Congruence leads to high performance – 29 were in this category and are shown with 'Hyp' in Table 24.
4. Congruence leads to low performance – 6 were in this category and are shown with 'Opp' in Table 24.
5. Differences in the relationship at the country level of analysis – 37 were in this category and are shown in red in Table 24.

Further inspection of the joint relationship of values and behaviour to performance focused on the significance of slope and curve along the fit and misfit lines within each country.

**Table 24 - Summary of 160 tests**

| IV\DV                       | 03 Integrity | 19 Team Building | 04 Performance Orientation | 07 Encourager | 08 Loner | 16 Elitist/Individualistic | 05 Autocratic | 15 Micro Manager |

- Not tested
- No coefficients significant (p<.05) - no further analysis required
- Hyp A test which supports the hypothesis
- Opp A test which is the opposite of the hypothesis
- n A test with n coefficients significant (p<.05) - no further analysis required
- N A test with N coefficients significant (p<.05) but some interesting differences between countries

What follows in the remaining part of this section is a more detailed explanation of the 5 categories;

**Category 1 – No significant results:** Despite a significant F test indicating dispersion in means across the five countries, for some analyses the tests of surface along the fit and misfit lines were insignificant. This involved analysing the significant coefficients  $b_1+b_2$  (fit slope),  $b_3+b_4+b_5$  (fit curve),  $b_1-b_2$  (misfit

slope) and  $b_3 - b_4 + b_5$  (misfit curve). If these coefficients were not significant (at least  $p < .05$ ) for any of the five countries, the results were not analysed further. From a total of 160 tests, 49 revealed no results of significance and no further analysis was performed upon these. **Appendix AN** presents an analysis classified as Category 1 for Team Building (IV) and Loner (DV).

**Category 2** – *Some significant results, but inconclusive*: Of the 111 remaining equations, 44 exhibited a small number of significant coefficients for within country analyses but findings were insufficient to draw any conclusions. In **Appendix AO**, the analyses for Encourager (IV) and Team Building (DV) are presented as an example of this category. In the example, for the five countries, only 2 coefficients were significant. No further analysis was performed.

**Category 3** – *Congruence leads to high performance*: Of the 67 remaining, 29 equations demonstrated that congruence leads to higher performance for one or more countries consistent with Hypothesis 1. **Appendix AP** presents the analyses for the 29 tests supporting a congruence effect. Table 25 presents one of the 29 relationships (Friendly/Helpful and Integrity), which demonstrates regressing Integrity onto valued and perceived levels of the Friendly/Helpful factor as moderated by culture. These results are generally supportive of a congruence effect as evidenced by null slope and curvilinearity along the fit line and null slope and significant and negative<sup>6</sup> curvature along the misfit line for America, Brazil, Great Britain, and Japan. The exception is the Netherlands, which is discussed in the next category.

---

<sup>6</sup> This should be positive if the dependent variable represents an undesired characteristic

\* p<.05

\*\*p<.01

\*\*\*p<.001

In the 29 examples in **Appendix AP**, the misfit curve demonstrates that there is a relationship between desired leadership values, perceived leader behaviour and leader performance, such that as congruence increases between values and behaviour (IV), leader performance (DV) increases. As incongruence increases between the values and behaviour, performance decreases. This relationship is illustrated by Graph 3 for Japan.

**Graph 3 – Japan: Friendly/Helpful (IV) and Integrity (DV)**

In Graph 3 the relationship between values and behaviour and its impact on Integrity is evident. Starting at the far left corner of the graph where values are high and behaviour is low, integrity is low. Integrity increases as behaviour increases until Integrity is maximised when values and behaviour are equal at the midpoint of the misfit line. Moving towards the far right corner of the graph, Integrity declines as behaviour exceeds values. Starting at the near corner and proceeding along the fit line, Integrity remains constant where values and behaviour increase under the condition that they are equal.

Table 26 presents a summary of the 29 tests that were consistent with Hypothesis 1. Some of the 29 tests are consistent with the Hypothesis 1 for more than one country and Table 26 shows the 44 occurrences where the test is consistent with Hypothesis 1. Table 27 presents the principal components where

the 44 occurrences were found. Inspection of Table 26 and 27 suggests the following observation:;

1. The relationship that congruence leads to higher performance is more evident in Japan (24 occurrences or 53%) than the other countries. The occurrences for the others were America (11), the Netherlands (3), Brazil (3) and Great Britain (3).
2. The relationships of independent variables to Integrity and Autocratic were more likely to be consistent with the congruence hypothesis with 11 and 10 occurrences respectively. Performance Orientation was the only characteristic to have only one occurrence.
3. The strongest support for the hypothesis came from the test of Friendly/Helpful (IV) and Integrity (DV) with significant results found for Japan, America, Brazil and Great Britain. Protective/Sensitive (IV) and Encourager (DV) was consistent with a congruence hypothesis for Japan, America and Great Britain.

| 16 Elitist/Individualistic  | 2                  |
| 05 Autocratic               |                    |
| 15 Micro Manager            |                    |

**Category 4 – *Opposite support of the Hypothesis 1:*** Some analyses are consistent with an interpretation that is contrary to a congruence effect, meaning that performance is low when values and behaviour are congruent and increases as behaviour falls short of or exceeds values. As noted in the relationship between Friendly/Helpful and Integrity values and behaviour in Category 4, the Netherlands is an example of this type. For the Netherlands the curvature of the misfit line is positive and is paired with a significant negative

slope along the fit line. The findings for the Netherlands show a positive curvature along the misfit line indicating that Integrity is low when Friendly/Helpful values and behaviour are congruent and increases as Friendly/Helpful behaviour deviates from values in either direction. Moreover, Integrity declines as valued and perceived behaviour increase under the condition that they are equal. Within the 160 tests, there were 24 occurrences where the results were contrary to a congruence effect. The results of the 24 contrary relationships are presented in **Appendix AP and AQ**. In **Appendix AP** they are shown with brackets. **Appendix AR** presents the coefficients for Friendly/Helpful (IV) and Integrity (DV) and the Netherlands stands alone as the only relationship that is not consistent with Hypothesis 1 in that it is opposite.

**Graph 4 – Netherlands: Friendly/Helpful (IV) and Integrity (DV)**

Graph 4, shows the relationship of Friendly/Helpful values and behaviour to Integrity for the Netherlands. Integrity is low where values are congruent with behaviour, and integrity increases along the misfit line as perceived behaviour deviates from desired values in either directions. This contradicts what has been found for the other 4 countries.

**Category 5 – Differing relationships between countries:** The final category has revealed some interesting and differing relationships between desired values, perceived behaviour and leader performance. In essence what this category represents, from the 160 tests, are those that reveal some evidence of patterns in the relationships.

Given the exploratory nature of these analyses, their presentation will deviate somewhat from the customary form of Results section. Instead each of the

patterns identified in this category will be described and a possible interpretation offered. Because these results are sample specific, these exploratory interpretations should not be accepted without verification and are presented only for the purposes of stimulating future research. An example of a pattern is that when the results demonstrate a significant ( $p < .05$ ) for one test, for example, fit slope ( $b_1 + b_2$ ) which applies to 1 or 2 countries and is opposite for the other countries. **Appendix AS** presents a series of patterns found in the results.

**Pattern 1:** Two independent variables, Normative and Independent, referring to the extent to which a leader adheres to established rules and conventions, and to the extent to which a leader is self governing and does not rely on others, respectively, showed similar relationships with a cluster of dependent variables for America, Brazil, GB and the Netherlands, however for Japan the opposite relationship was found. For the 4 countries the following relationships Performance Orientation (DV) with Normative (IV), Encourager (DV) with Normative and Independent (IV) and Team Building (DV) with Independent (IV) the slope along the fit line was negative indicating that the DV were higher when values and behaviour matched at low levels compared to a lower level of the DV for match at high levels. Thus leaders were perceived as more Encouraging, more focused on Team Building and Performance Oriented when desired levels and perceived behaviour for Normative and Independent were both low rather than when they were both high. These were the conclusions for 4 countries: America, Brazil, Great Britain and the Netherlands. In contrast, for Japan the relationship was opposite; the dependent variables were higher when

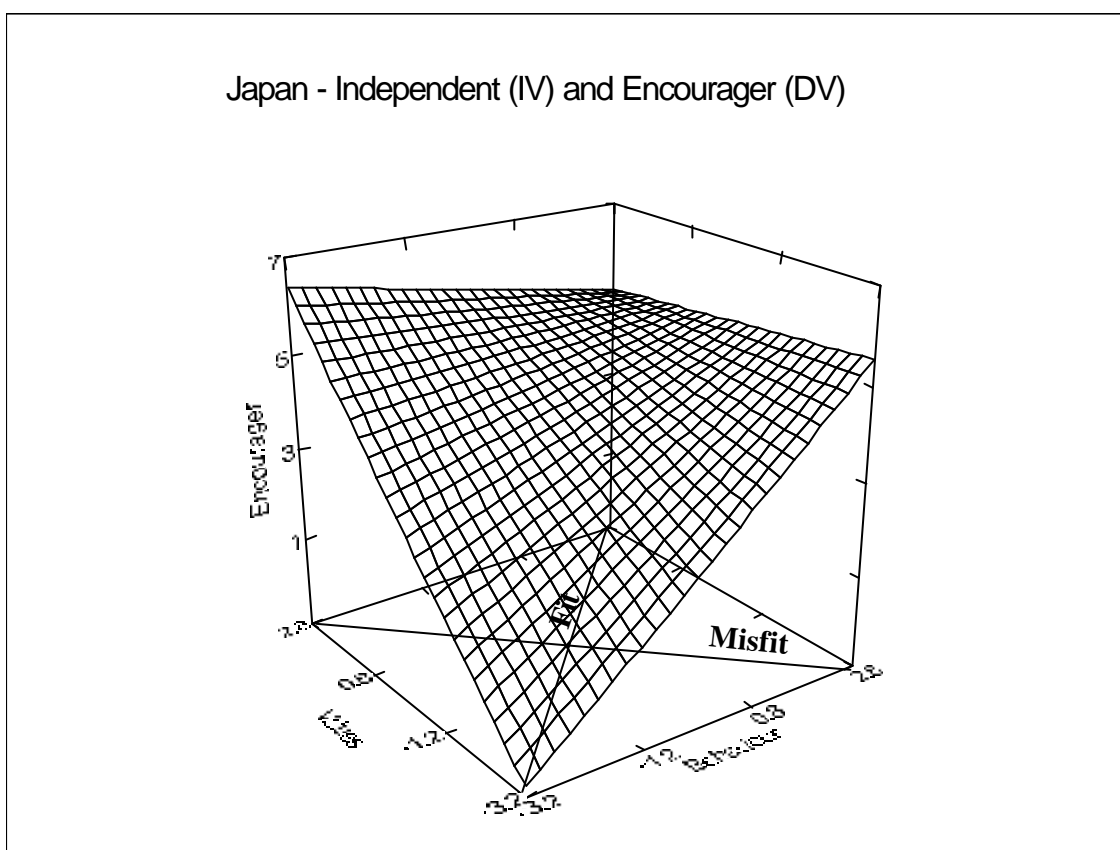

desired values and behaviour matched at high levels. A possible interpretation is that followers for the 4 countries named above perceived that leaders who followed closely rules and relied little on others exhibited little behaviour that could be described as helping to build the team, boosting follower confidence, and were not focused on high performance. However, Japanese followers perceived leaders who exhibited the same behaviour as facilitating team building, morale boosting, and as focused on high performance. Graphs 5 and 6 present two examples from Independent (IV) and Encourager (DV). In Graph 5, the lowest level of the DV is when there is congruence of desired values and perceived behaviour at low level (near bottom corner on Graph 5). The higher level of the DV is achieved when there is congruence of desired values and perceived behaviour at high levels (far top corner on Graph 5). Graph 6 shows the opposite relationship. Focusing on the fit line, there are the highest levels of DV when there is congruence of desired values and perceived behaviour at low levels and low levels of DV when there is congruence of desired values and perceived behaviour at high levels. **Appendix AT**/Page 50 presents the coefficients for Graphs 5 and 6.

**Pattern 2:** A further pattern in **Appendix AS**, which is similar to that described above, may be seen in a cluster of dependent variables that were defined as undesirable by Cargill managers and followers. For the dependent variables of Loner, Elitist, Autocratic, and Micro-Manager, the relationship exhibited for Japan and the Netherlands was in opposition to the relationship seen for the America, Brazil and Great Britain. In this pattern for America, Brazil and Great Britain the dependent variable levels are higher when desired

values and behaviour matched at high levels. In contrast for Japan and the Netherlands, the opposite is the case.

What the patterns also reveal is the fact that Japan has a number of different relationships to the other countries. In **Appendix AS**, there are 15 occurrences where Japan is different from the majority of the other countries in the direction of the relationship.

### **Graph 5 – Japan: Independent (IV) and Encourager (DV)**

**Graph 6 – Brazil: Independent (IV) and Encourager (DV)**

## **3.4 Discussion**

### **3.4.1 Explanation of the results**

Implicit Leadership Theory suggests that a leader's performance is likely to be higher when there is congruence between what a follower desires from a leader and how a follower perceives their leader's behaviour.

The results from this exploratory study suggest that congruence between desired leadership values and perceived leader behaviour leads to high level of performance for some characteristics and in some countries, but the congruence hypothesis was not universally supported. Instead, the relationship between performance and followers' desired values and perceived leader behaviour varies in ways not predicted by Implicit Leadership Theory. These departures from congruence were explored but await further verification in future research.

A series of Polynomial Regression Equations tested the relationship between commensurate independent variables of desired leadership values and perceived behaviour and their joint effects on measures of leader performance. This was an experimental way to assess Implicit Leadership Theory in a cross-cultural context.

Results from a large sample of Cargill managers and their followers across 5 countries (America, Brazil, GB, the Netherlands and Japan) revealed some interesting findings and suggest the following tentative conclusions. Firstly, tests of the congruence hypothesis across a combined sample of followers from five countries were supported for 26 of a total of 160 relationships examined. For these 26 relationships congruence between desired leadership values and perceived behaviour was associated with higher performance. More specifically,

these results suggest that leader behaviour matches desired level for intelligence, ability to motivate others, supportive behaviour, and is able to communicate in subtle ways, the leader's performance is rated more highly. Secondly, tests of all 160 relationships revealed that national culture explained variation in the relationship of congruence to leader's performance, rejecting the notion that congruence invariably leads to higher performance. This finding suggests that the theory of implicit leadership does not manifest itself in the same way across the five cultures included in this study. Thirdly, exploratory analyses conducted to investigate the nature of the differences in the relationship of desired values and perceived behaviour to performance revealed interesting divergences from the congruence hypothesis that may warrant further research. More specifically, Phase One identified that Japan and Poland had the most differences when an ANOVA was performed. Phase Two identified that Japan had the most occurrences of the relationship of IVs and DVs being opposite from the other 4 countries. Numerous authors who have researched the Japanese culture (Smith et al. 1989) and highlighted differences in their values (Peterson et al. 1994) have drawn similar conclusions (Smith et al. 1989; Hofstede, 1994; Hofstede, 2001). Although Japan was different in many cases to the other countries, it had the highest number of results that were consistent with Hypothesis 1. A total of 44 tests at the country level revealed findings consistent with Hypothesis 1 of which 53% were Japanese tests.

A surprising result was the fact that 24 tests revealed a relationship that was opposite to Hypothesis 1. Most of these were Brazil (13) followed by the Netherlands (7), America (7), Great Britain (5) and Japan (1). Although this study was exploratory, it is possible to draw the conclusion that the theory of

implicit leadership is not always supported especially for Brazil. Further research could broaden the range of countries and increase the sample size.

It has not been possible to address some of the questions raised from leaders during the research. For example, having too much Integrity was a question often raised. The low variance for some of the principal components is believed to be a contributing factor.

In summary, Hypothesis 1 and 2 were tested and have shown that in a number of areas congruence leads to higher perceived performance, however, this is not universally supported. Drawing conclusions from this research would suggest that considering Implicit Leadership Theory and more specifically that congruence leads to high performance does not apply universally to the 5 countries in this study. The results revealed a different relationship between values, behaviour and performance and requires further investigation to determine why. The cross-cultural literature highlights where cultural values differ, however, it is difficult to apply the theory to this research as supporting evidence for the findings presented. Further research is required which should explore the 5 countries in more detail and should focus upon some of the relationships tested within this study.

## **3.4.2 Contribution**

### **3.4.2.1 To Theory**

In essence Phase Two has taken proven techniques and applied them in an original way to a known theory. Congruence research, Polynomial Regression Equations, Response Surface Methodology and Cross-cultural research are independently well known but they have never been used collectively to answer a practical research question regarding leadership effectiveness. The contribution therefore of this research is both methodological and theoretical; methodological, because of the way in which the research has used existing methods in a new and unique way and theoretical, because it extends Implicit Leadership Theory by testing it empirically and conducting this in a cross-cultural context.

Implicit Leadership Theory does not claim that leaders will be more successful when there is congruence between desired leadership values and perceived behaviour, but what the theory does state is that congruence is “likely to lead to higher performance” (Lord et al. 1984). This research has made a valuable contribution to this discussion in that it demonstrates congruence and leader performance are in fact linked, however, the relationship cannot claim to be universal nor can it apply to all aspects of leadership based on the findings of this exploratory study. This contribution is important in increasing knowledge of the contributing factors to leadership performance in a global context (House et al. 1997).

### **3.4.2.2 To Practice**

Phase Two assisted in understanding the nature of the relationship between congruence and leader performance. Polynomial Regression Equations (PRE) and Response Surface Methodology were chosen as the methods for analysis. It is possible that the approach taken for Phase Two is too technical for immediate application to Cargill. However, an interpretation of the results will bring additional value to the Leadership Fit Report.

When each leader receives their Leadership Fit Report, a one-to-one session is conducted to ensure that they understand the conclusions of the report. The contribution to Cargill from Phase Two helps this feedback process, and as the database grows, and PREs are applied, more sophisticated feedback can be provided. Leaders asked questions about the degree of fit, for example, “can a leader have too much integrity or too much humane orientation?” “Can a leader have too little autocracy or too little micro management?” PREs help to answer some, but not all, of these questions. The findings from the PRE procedure helps to deepen Cargill’s understanding of how congruence leads to performance, or in the case of a few scenarios, where congruence does not lead to higher performance. These findings therefore provide vital information to be considered in the model, and while they may not be incorporated into the actual Leadership Fit Report, they will be part of the feedback session. It is possible that due to the low variance of some leadership factors, some PRE results were inconclusive. Extending this research and increasing the number of leaders may create more variance.

In conclusion, the Polynomial Regression approach added value to this research; however, it did not replace the Leadership Fit Report. As a result,

both approaches have been adopted for this research. Weighted absolute differences were used to calculate degree of fit and will remain as the congruence calculation for the Leadership Fit Report. Polynomial Regression Equations were used to test the nature of the relationship between follower values, the leader's perceived behaviour, and measures of performance.

### **3.4.3 Limitations**

Although Edwards' approach addresses some of the issues raised with difference scores, it is not without limitations. This approach is highly dependent on sample size (Kristof, 1996) to detect theorised relationships. It is a method that cannot be used for diagnostic purposes at the leader/follower(s) level, or at the small group level, and is therefore not a replacement for the individualised feedback that was offered by the 'degree of fit' calculation, nor is it a congruence calculation. A further limitation is that the interpretation of the results is unfamiliar to some researchers (Engle and Lord, 1997; Friedrich, 1982).

The core theory being tested and expanded is Implicit Leadership Theory. The questionnaire that has been used for this research was taken from the GLOBE project and was developed using 160 psychologists from around the world. Although the measures used in this study were extensively tested through the GLOBE project, these measures did not all meet current standards of reliability. Moreover, these measures were an imperfect instrument for tapping into respondent's 'implicit' theory of a leader. This research cannot make a claim to have addressed everything that is 'implicit'.

#### **3.4.4 Future research/Next steps**

The research undertaken was the first of its kind in that the nature of the relationship of cross-cultural leadership values and behaviour was measured using Polynomial Regression Equations. The research was exploratory in nature and provides a base to build upon in the following ways:-

1. Repeat the principal component factor analysis with mean centred data, not double standardised. The double standardised approach was support by the supervisory panel and by cross-cultural researchers, however, another approach may be required if publication is an objective.
2. Consider developing an organisational measure of leader performance. This may originate from the follower. For example, an additional question on the questionnaire may ask the follower to comment overall on the effectiveness of their leader. This could be used as part of the independent variable in the regression equations.
3. Restructure the Leadership Fit Report to become a truly cross-cultural tool. This could be achieved by additional graphs of mean country scores. For example, if a leader had 3 different nationalities working for him or her, one proposal is to add 1 graph per country so that the leader can contrast the values their followers hold and compare that with others.
4. Develop the internal website further where more information can be readily available contrasting country value scores.

5. Increase the sample size to broaden the variance of some of the leadership values and as a result more relationships may be identified.
6. Work has already commenced on automating the questionnaires via the intranet (internal web). This will not add additional functionality, it will simply make the process of sending questionnaires more automated.
7. A small number of leaders who participated in this study, are leading a team who hold significantly different values than themselves. A further investigation could consider the relationship between leader values and follower values and contrast that to leader effectiveness. It is possible that value congruence may lead to high leader performance.

## 4. RESEARCHER REFLECTIONS

The journey this research has taken me on has been challenging yet enormously rewarding. From the outset the purpose of this research was to make a contribution to theory and practice in the area of cross-cultural leadership research.

This section is in two parts, the first reflecting on what aspects were successful and the second considering the challenges and difficulties of conducting this research.

### **Successful Aspects**

There are a number of factors that I believe made this research successful and rewarding and the account given does not reflect any order of priority.

1. The access to senior managers and their sponsorship within Cargill. The senior management of Cargill, and in particular my manager, gave considerable support to conducting this research whilst in full-time employment. Although Cargill is research oriented, in the past that has only occurred in area of food research or processing and manufacturing. Tackling research in social psychology was a new area for Cargill to consider when this work started in 1999. I am not aware of any other Cargill employee who has conducted research at a doctoral level in the area of Organisation Behaviour.
2. The research was directly linked with my job. Professionally, my role is to head up global leadership development of our top 0.1% of

employees and globalisation is a critical area where Cargill needs development. I believe this gave me the energy and enthusiasm to broaden the research, but my professional role also allowed discussions to take place that contributed to my thinking about this research.

3. The access to people and the 96% return rate exceeded all our expectations. I believe this reflects on the 196 leaders and their willingness to participate. Their eagerness to receive results was the contributing factor to the success of the project.
4. The impact of the Leadership Fit Report has been a major contributing factor to success. It is hard to express in words what impact this has now had on over 250 leaders. A significant surprise to me was the value they placed in increasing their understanding of the desired leadership values their teams have. I did not anticipate the impact of this.
5. The extent of my international travel has helped. During the 4 years of this research I will have visited 20 of the 23 countries that have participated. This gave me opportunities to ask questions about what was found in the data to validate it but more importantly to understand why the results take the form they do.
- 6.** Cranfield School of Management and in particular my supervisory panel has stretched my thinking, challenged me and have been patient. I hope it is a research project that they will feel it reached a high standard. There were numerous occasions where it would have

been possible to limit the scope of this research, but on each occasion they supported broadening it in order to improve the outcomes.

#### 4.1 Challenges and Difficulties

There have been numerous times of challenges and difficulties with this project.

1. **Work Schedule:** I travel in the region of 150,000 to 200,000 air miles per year. My role is global and therefore my travel is global and most months I will visit 2 continents, sometimes 3. Although the travel time allowed study time there were practical limits regarding how many books could be physically carried onto aeroplanes. Balancing the demands from my professional job and the pressures of an Executive Doctorate were extremely challenging.
2. **Home and Family:** When I started the Executive Doctorate my wife, Gill, and I had one son [aged 1] and in 2002 we had our second son. Work and study has undoubtedly put enormous strain on Gill in particular and I know she will be proud to see the completion but I also know deep down she will be pleased when it is over. Our second child was born 10 weeks early and he was in hospital for his first 8 weeks; Gill also had to spend 5 weeks to treat her condition. Having an Executive Doctorate to manage was challenging and I appreciated the patience of my panel because progress was slow during this period and I appreciate the patience and support of Gill.

3. **Scope Creep:** I believe the biggest scope issue was tackling the Polynomial Regression Equations. I knew in 2001 I wanted to consider this but I did not have all the data. Originally my research was planned to be complete at the end of Phase One and Phase Two would simply analyse the data collected and draw conclusions regarding cross-cultural differences. I believe Polynomial Regression Equations became an enormous challenge because there are so few people who understand them and can apply them to this type of research. I contacted the head of Research in a number of British Universities, which proved unsuccessful. Then Professor Jeff Edwards passed my details to one his PhD researchers – Lisa Lambert. She became a valuable member of the wider project team. I entered a phase where there were no guarantees the method would be successful or useful, but I was committed to raising the standard of the research because this was something I wanted to be proud of and continue after the formal part was over. It took 10 months to learn the process, apply it to my data and draw conclusions. I would still argue today that this additional branch in my research was valuable and I believe the decision was correct albeit a large one for the project.

## APPENDICES

## **Appendix A – Leadership Fit Report**

## Appendix B – GLOBE Leadership Attributes

Leadership Attributes measured in the GLOBE study  
SOURCE: GLOBE PROJECT (1998)

| <i>Leadership Characteristics or behaviours</i> | <i>Description</i>   |
|---|--|
| <b>1. Administrative attributes</b>             | <i>Being well organised, methodical and orderly with strong administrative skills in managing complex office work and systems acting independently and autonomously without relying on others, being unique.</i> |
| <b>2. Non Autocratic</b>                        | <i>Not acting autocratically, allowing questioning or disagreement, not being domineering or bossy.</i>  |
| <b>3. Autonomous</b>                            | <i>Individualist, independent and unique.</i>  |
| <b>4. Charismatic I: Visionary</b>              | <i>Having foresight, being able to anticipate and plan ahead, prepared, visionary, and intellectually stimulating.</i>   |
| <b>5. Charismatic II: Inspiration</b>           | <i>Being enthusiastic, positive, encouraging and motivational.</i>   |
| <b>6. Charismatic III: Self-Sacrifice</b>       | <i>Taking risks and making personal sacrifices for the sake of the vision.</i>   |
| <b>7. Conflict Avoider</b>                      | <i>Does not try to exceed the performance of others in team, shares information and has a tendency to behave according to the norms.</i>   |
| <b>8. Decisiveness</b>                          | <i>Being logical minded, determined, wilful and intuitive.</i>   |
| <b>9. Diplomatic</b>                            | <i>Acting as a win-win problem solver, diplomatic, a tactful and effective bargainer.</i>  |
| <b>10. Face saver</b>                           | <i>Interacting in an indirect, evasive manner to avoid conflict and maintain good relationships.</i>   |
| <b>11. Humane Orientation</b>                   | <i>Showing compassion and being generous.</i>  |
| <b>12. Integrity</b>                            | <i>Acting honestly, sincere, and being dependable and trustworthy.</i>   |
| <b>13. Malevolent</b>                           | <i>Wanting to cause harm and showing a desire to cause harm, hostile.</i>  |
| <b>14. Modesty</b>                              | <i>Displaying patience and a calm and modest attitude.</i>   |

| <i>Leadership Characteristics or behaviours</i>   | <i>Description</i>   |
|---|--|
| <b>15. Non Participative</b>                      | <i>Does not micro manage, does not freely delegate, does not share control and does not work on a team basis.</i>            |
| <b>16. Performance Orientation</b>                | <i>Driven for results, excellence and improvement.</i>   |
| <b>17. Procedural</b>                             | <i>Insisting on being formal and a necessity for procedures, rituals, traditions and caution.</i>                            |
| <b>18. Self-Centred</b>                           | <i>Being a 'loner' who acts self-interestedly and asocially.</i>   |
| <b>19. Status conscious</b>                       | <i>Being aware of socially accepted status and acting class consciously.</i>   |
| <b>20. Team I: Collaborative Team Orientation</b> | <i>Being group-oriented, collaborative, loyal and consultative emphasising improvement, high performance and excellence.</i> |
| <b>21. Team II: Team Integrator</b>               | <i>Behaving in a formal, habitual and cautious manner with a preference for regularity and routines.</i>                     |

## Appendix C – Demographic Information from Leaders and Followers

**To:** Follower

**From:** Vikki Kelly, Cobham.

**Date:**

### Leader's Name

is currently going through a leadership development process and part of that process is to gather information on what **you** think about leadership.

Leader's Name would like you to complete the questions at the bottom of this document, which gathers background information about **YOU**. The other attachment, as part of this email, gathers information regarding what **YOUR** views are of **leadership**. Please return both back to me completed. In a few weeks, I will email the third and final part once we have received this feedback.

You are probably aware of people who are exceptionally skilled at motivating, influencing, or enabling you, others, or groups to contribute to the success of Cargill. You would allow those people to “lead” you. We might call such people **“outstanding leaders.”**

In the other attachment, several behaviours and characteristics that can be used to describe leaders are listed. Each behaviour or characteristic is accompanied by a short definition to clarify its meaning.

Using the above description of outstanding leaders as a guide, rate the behaviours and characteristics on the following pages.

We want to understand what **YOUR** view is of an “outstanding leader” and this questionnaire allows us to gather this information. We can also compare Cargill’s answers to 30,000 other responses from other organizations around the world.

To do this, check/tick **ONE** box per question. The box you check/tick should be based on the following scale.

Save both attachments, complete them both and then re-attach them back to another email.

## **THE SCALE**

- 1**=This behaviour or characteristic **greatly inhibits** a person from being an outstanding leader.  
**2**=This behaviour or characteristic **somewhat inhibits** a person from being an outstanding leader.  
**3**=This behaviour or characteristic **slightly inhibits** a person from being an outstanding leader.  
**4**=This behaviour or characteristic has **no impact** on whether a person is an outstanding leader.  
**5**=This behaviour or characteristic **contributes slightly** to a person being an outstanding leader.  
**6**=This behaviour or characteristic **contributes somewhat** to a person being an outstanding leader.  
**7**=This behaviour or characteristic **contributes greatly** to a person being an outstanding leader.

## **AN EXAMPLE**

**As an example, question number one reads:-**

### **1. Diplomatic – Skilled at interpersonal relations, tactful**

If you feel that being “*Diplomatic*” contributes greatly to **YOUR** definition of an outstanding leader, then you should vote:-

|                  |          |          |           |          |          |                     |
|------------------|----------|----------|-----------|----------|----------|---------------------|
| Greatly Inhibits |          |          | No Impact |          |          | Greatly Contributes |
| <b>1</b>         | <b>2</b> | <b>3</b> | <b>4</b>  | <b>5</b> | <b>6</b> | <b>7</b>            |
|                  |          |          |           |          |          | ×                   |

## **Confidentiality Guaranteed**

Individual responses are not shared with anybody. Information is only made available to Leader's Name for the group and individual scores are averaged and names are removed, so your response is not made available to Leader's Name .

## **PERSONAL DETAILS:**

We will analyse the data based upon the different national cultures. Please answer the following questions, even if your answers are the same.

|  |   |                               |                  |
|--|---|-------------------------------|------------------|
| <p><b>1. Name</b><br/>We ask this in case we have questions about your response. We do not share individual results.</p>   | <p><b>Follower's Name</b></p>                               |                               |                  |
| <p><b>2. Country of Birth</b></p>  |   |                               |                  |
| <p><b>3. Nationality</b><br/>This is the country where you have legal citizenship because of where you were born or because of your parents' nationality</p>   |   |                               |                  |
| <p><b>4. Passport Nationality(ies)</b><br/>In most cases your passport nationality will be the same as Q2. In some cases this may be different for a number of reasons. If you have more than one passport, please state them all.</p> | <p>1.<br/>2.<br/>3.</p>                                     |                               |                  |
| <p><b>5. Please list the countries that you have lived in for period of more than one year</b><br/><br/><i>List countries &amp; number of years in each</i></p>  | <p><b>Country</b></p> <p>1.<br/>2.<br/>3.<br/>4.<br/>5.</p> | <p><b>Number of Years</b></p> | <p><b>of</b></p> |
| <p><b>6. How old are you?</b><br/><br/><b>A:</b> &lt;=30<br/><b>B:</b> 31-40</p>   | <p>A, B, C or D</p>   |                               |                  |

|   |                          |
|---|--------------------------|
| <b>C: 41-50</b><br><b>D: &gt;50</b>   |                          |
| <b>7. What is your gender?<br/>Male or Female (M or F)</b>                          | M or F                   |
| <b>8. How long have you lived<br/>in the country where you<br/>currently live</b>   | Years in current country |
| <b>9. What country was your<br/><u>mother</u> born in?</b>                          |                          |
| <b>10. What country was your<br/><u>father</u> born in?</b>                         |                          |
| <b>11. What language(s) were<br/>spoken in your home when<br/>you were a child?</b> | 1.<br>2.<br>3.           |
| <b>12. How many years of full-<br/>time work experience have<br/>you had?</b>       | Years                    |
| <b>13. How many years have you<br/>been a manager?</b>                              | Enter 0 if not a manager |
| <b>14. How long have you<br/>worked for your current<br/>employer?</b>              | Years                    |
| <b>15. How many people report<br/>directly to you in the chain</b>                  |                          |

|  |  |                              |
|--|--|------------------------------|
| <p><b>of command? These are <u>DIRECT</u> reports</b></p>  |  |                              |
| <p><b>16. How many people work in the business unit/department/function of the organization you manage? These are DIRECT and INDIRECT reports.</b></p>   | <p>Approximate number</p>              |                              |
| <p><b>17. How many organizational levels are there between you and the CEO (Warren Staley)?</b></p>  |  |                              |
| <p><b>18. What language(s) do you use at work?</b></p>   | <p>1.<br/>2.<br/>3.</p>                |                              |
| <p><b>19. How frequently do you communicate (written &amp; spoken) directly with Leader's Name ?</b></p> <p>A. Everyday<br/>B. Most days<br/>C. At least once per week.<br/>D. At least once per month.<br/>E. Very infrequently</p> | <p>A, B, C or D</p>                    |                              |
| <p><b>20. Spread 100% across these categories regarding how you generally communicate with Leader's Name regardless frequency.</b></p>   |  | <p><b><u>Percent</u></b></p> |

## Appendix E – Questionnaire 2

### Feedback for <Leader Name>

**To: Follower**

**From: Dave McKie, Cobham.**

**Date: 26 March 2004**

Thank you for already completing and returning the Leadership Questionnaire that has provided us with what YOUR definition and understanding is of an *Outstanding Leader*.

«FirstName» would now like you to complete this questionnaire which has the same questions, but the difference is we want your opinion of «FirstName» «LastName»'s leadership performance. You were identified as somebody who is capable of commenting on «FirstName»'s performance.

#### **CONFIDENTIALITY:**

Under no circumstances will your scores be shared with «FirstName». «FirstName» will receive a summary of all the feedback and we must receive a minimum of eight responses otherwise no feedback will be given to «FirstName». It will be impossible for «FirstName» to link any of your scores directly with you.

For each question we would like to understand what your view is of the current performance of «FirstName» «LastName». To do this, check/tick ONE box per question. The box you check/tick should be based on the following scale.

#### **THE SCALE**

1=I have never observed this behaviour or characteristic in «FirstName» «LastName».

2=

3=

4=I have observed this behaviour or characteristic only sometimes in «FirstName» «LastName».

5=

6=

7= I have observed this behaviour or characteristic very frequently in «FirstName» «LastName».

Scores 2 and 3 represent a scaling between never and sometimes.

Scores 5 and 6 represent a scaling between sometimes and very frequent.

#### **AN EXAMPLE**

As an example, question number one reads:-

*Diplomatic – Skilled at interpersonal relations, tactful*

If you feel that «FirstName» demonstrates this attribute on a *very frequent* basis, then you should vote: -

|                          |                          |                          |                          |                          |                          |                                     |

|  | 1                        | 2                        | 3                        | 4                        | 5                        | 6                        | 7                        |
| <b>101. Avoids negatives</b> - Avoids saying no to another when requested to do something, even when it cannot be done | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>102. Visionary</b> - Has a vision and imagination of the future   | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>103. Willful</b> - Strong-willed, determined, resolute, persistent  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>104. Ruler</b> - Is in charge and does not tolerate disagreement or questioning, gives orders                       | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>105. Dishonest</b> - Fraudulent, insincere  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>106. Hostile</b> - Actively unfriendly, acts negatively toward others   | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>107. Future-oriented</b> - Makes plans and takes actions based on future goals                                      | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>108. Good Administrator</b> - Has ability to manage complex office work and administrative systems                  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>109. Dependable</b> – Reliable  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>110. Dictatorial</b> - Forces her/his values and opinions on others   | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>111. Individualistic</b> – Behaves in a different manner than peers   | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>112. Ritualistic</b> - Uses a prescribed order to carry out procedures  | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> | <input type="checkbox"/> |
| <b>Thank you for completing this questionnaire. Please return to <u>Organisation Effectiveness /cobo</u></b>           |                          |                          |                          |                          |                          |                          |                          |

## **Appendix F – Communication regarding possible mistakes.**

*“Thank you for returning the questionnaire. During processing, it has become evident that some questions may have been misunderstood or a simple mistake has been made. We test to see if similar questions are answered with similar scores, for example trustworthy and honesty. Can you please review your answers and return your questionnaire back. It is **not** necessary that you make any changes; we are only asking you to review your answers. If you feel you did misunderstand some questions or it was a simple error, can you please amend them and return it as soon as possible. Unfortunately we cannot specify the questions because that means we are influencing your scores which is not our intention. We want to minimise errors and ensure your leader receives accurate feedback. Can we remind you that all your answers and communication with us is kept totally confidential. Under no circumstances does your leader see your scores. Thank you once again for your help.”*

## **Appendix G – Leadership Fit Follow-up Report**

## Appendix H – Eigen values for Questionnaire 1

### Total Variance Explained

| Qstn | Initial Eigenvalues |               |              | Extraction Sums of Squared Loadings |               |              | Rotation Sums of Squared Loadings |               |              |
|------|---------------------|---------------|--------------|-------------------------------------|---------------|--------------|-----------------------------------|---------------|--------------|
|      | Total               | % of Variance | Cumulative % | Total                               | % of Variance | Cumulative % | Total                             | % of Variance | Cumulative % |

Extraction Method: Principal Component Analysis.

## Appendix I – 37 Principal Components from PCA for Questionnaire 1

| <b>Factor</b> | <b>Question</b>  |
|---------------|--|
| 1             | 066. Foresight - Anticipates possible future events  |
| 1.01          | 075. Able to Anticipate - Able to successfully anticipate future needs   |
| 1.02          | 067. Plans ahead - Anticipates and prepares in advance   |
| 1.03          | 013. Anticipatory - Anticipates, attempts to forecast events, considers what will happen in the future                         |
| 1.04          | 071. Intuitive - Has extra insight   |
| 1.05          | 102. Visionary - Has a vision and imagination of the future  |
| 1.06          | 107. Future-oriented - Makes plans and takes actions based on future goals   |
| 2             | 034. Orderly - Is organised and methodological in work   |
| 2.01          | 058. Organised - well organised, methodical, orderly   |
| 2.02          | 108. Good Administrator - Has ability to manage complex office work and administrative systems                                 |
| 2.03          | 019. Administratively Skilled - Able to plan, organise, co-ordinate and control work of large numbers (over 75) of individuals |
| 2.04          | 035. Prepared - Is ready for future events   |
| 3             | 015. Sincere - Means what he/she says, earnest   |
| 3.01          | 016. Trustworthy - Deserves trust, can be believed and relied upon to keep his/her word  |
| 3.02          | 088. Honest - Speaks and acts truthfully   |
| 3.03          | 020. Just - Acts according to what is right or fair  |
| 4             | 105. Dishonest - Fraudulent, insincere   |
| 4.01          | 106. Hostile - Actively unfriendly, acts negatively toward others  |
| 4.02          | 050. Vindictive - Vengeful; seeks revenge when wronged   |
| 4.03          | 024. Tyrannical - Acts like a tyrant or despot; imperious, dictatorial, authoritative  |
| 5             | 096. Performance-oriented - Sets high standards of performance   |
| 5.01          | 080. Excellence-Oriented - Strives for excellence in performance of self and subordinates                                      |
| 5.02          | 097. Ambitious - Sets high goals, works hard   |
| 5.03          | 011. Improvement-Oriented - Seeks continuous performance improvement   |
| 6             | 110. Dictatorial - Forces her/his values and opinions on others  |
| 6.01          | 104. Ruler - Is in charge and does not tolerate disagreement or questioning, gives orders                                      |
| 6.02          | 036. Autocratic - Makes decisions in dictatorial way   |

|         |   |
|---------|---|
| 6.03    | 089. Domineering - Inclined to dominate others  |
| 7       | 068. Normative - Behaves according to the norms of his or her group   |
| 7.01    | 081. Procedural - Follows established rules and guidelines  |
| 7.02 *  | 111. Individualistic - Behaves in a different manner than peers   |
| 7.03    | 041. Formal - Acts in accordance with rules, convention and ceremonies  |
| 8       | 031. Encouraging - Gives courage, confidence or hope through reassuring and advising                                    |
| 8.01    | 032. Morale booster - Increases morale of subordinates by offering encouragement, praise, and/or by being confident     |
| 8.02    | 082. Confidence builder - Instils others with confidence by showing confidence in them                                  |
| 9       | 038. Asocial - Avoids people or groups, prefers own company   |
| 9.01    | 047. Loner - Works and acts separately from others  |
| 9.02    | 055. Distant - Aloof, stands off from others, difficult to become friends with  |
| 10      | 074. Self-effacing - Presents themselves in a modest way  |
| 10.01   | 042. Modest - Does not boast, presents self in a humble manner  |
| 10.02   | 051. Compassionate - Has empathy for others, inclined to be helpful or show mercy                                       |
| 11      | 043. Intelligent - Smart, learns and understands easily (REVERSE SCORE)   |
| 11.01   | 109. Dependable - Reliable ( <b>REVERSE SCORE</b> )   |
| 11.02   | 052. Subdued - Suppressed, quiet, tame (REVERSE SCORE)  |
| 11.03 * | 062. Egotistical - Conceited, convinced of own abilities  |
| 12      | 008. Independent - Does not rely on others; self-governing  |
| 12.01   | 007. Autonomous - Acts independently, does not rely on others   |
| 13      | 077. Sensitive - Aware of slight changes in other's moods, restricts discussion to prevent embarrassment                |
| 13.01   | 090. Intra-group face saver - Ensures that other group members are not embarrassed or shamed                            |
| 14      | 049. Risk averse - Avoids taking risks, dislikes risk   |
| 14.01   | 057. Cautious - Proceeds/performs with great care and does not take risks   |
| 14.02 * | 014. Risk taker - Willing to invest major resources in endeavours that do not have high probability of being successful |
| 15      | 028. Loyal - Stays with and supports friends even when they have substantial problems or difficulties                   |
| 15.01   | 039. Fraternal - Tends to be a good friend of subordinates  |
| 15.02   | 040. Generous - Willing to give time, money, resources and help to others   |
| 16      | 100. Non-delegator - Unwilling or unable to relinquish control of projects or tasks                                     |
| 16.01   | 099. Micro-manager - An extremely close supervisor, one who insists on making all decisions                             |
| 17      | 112. Ritualistic - Uses a prescribed order to carry out procedures  |
| 17.01   | 073. Habitual - Given to a constant, regular routine  |
| 17.02 * | 033. Arrogant - Presumptuous or overbearing   |
| 17.03 * | 044. Decisive - Makes decisions firmly and quickly  |

|         |  |
|---------|--|
| 18      | 070. Non-egalitarian - Believes that all individuals are not equal and only some should have equal rights and privileges                 |
| 18.01   | 093. Elitist - Believes that a small number of people with similar backgrounds are superior and should enjoy privileges                  |
| 18.02   | 069. Individually-Oriented - Concerned with and places high value on preserving individual rather than group needs                       |
| 19      | 084. Class Conscious - Is conscious of class and status boundaries and acts accordingly  |
| 19.01   | 065. Status-conscious – Aware of others' socially accepted status  |
| 20      | 072. Indirect - Does not go straight to the point, uses metaphors and examples to communicate  |
| 20.01   | 054. Non-explicit - Subtle, does not communicate explicitly, communicates by metaphor, et allegory, et example                           |
| 21      | 021. Win/win problem -solver - Able to identify solutions which satisfy individuals with diverse and conflicting interests               |
| 21.01   | 022. Clear - Easily understood   |
| 22      | 079. Communicative - Communicates with others frequently   |
| 22.01 * | 085. Non-participative – Does not participate with others  |
| 22.02   | 094. Team builder - Able to induce group members to work together  |
| 22.03   | 056. Intellectually stimulating -Encourages others to think and use their minds; challenges beliefs, stereotypes and attitudes of others |
| 23      | 026. Calm - Not easily distressed  |
| 23.01 * | 046. Irritable - Moody; easily agitated  |
| 23.02   | 087. Patient - Has and shows patience  |
| 24      | 023. Self-interested – Pursues own best interests  |
| 24.01   | 027. Provocateur – Stimulates unrest   |
| 25      | 025. Integrator - Integrates people or things into cohesive, working whole   |
| 25.01   | 076. Motive Arouser - Mobilises and activates followers  |
| 25.02   | 048. Enthusiastic - Demonstrates and imparts strong positive emotions for work   |
| 26      | 003. Mediator - Intervenes to solve conflicts between individuals  |
| 26.01   | 001. Diplomatic - Skilled at interpersonal relations, tactful  |
| 27      | 009. Ruthless - Punitive; Having no pity or compassion   |
| 27.01   | 004. Bossy - Tells subordinates what to do in a commanding way   |
| 28      | 010. Tender - Easily hurt or offended  |
| 28.01   | 101. Avoids negatives – Avoids saying no to another when requested to do something, even when it cannot be done                          |
| 29      | 098. Motivational - Stimulates others to put forth efforts above and beyond the call of duty and make personal sacrifices                |
| 29.01   | 092. Co-ordinator - Integrates and manages work of subordinates  |
| 30      | 078. Convincing - Usually able to persuade others of his/her viewpoint   |
| 31      | 059. Cunning - Sly, deceitful, full of guile   |
| 32      | 029. Unique - An unusual person, has characteristics of behaviours that are different from most others                                   |
| 33      | 095. Cynical - Tends to believe the worst about people and events  |
| 33.01 * | 064. Logical - Applies logic when thinking   |

|         |   |
|---------|---|
| 34      | 061. Effective bargainer - Is able to negotiate effectively, able to make transactions with others on favourable terms          |
| 34.01 * | 083. Group-Oriented - Concerned with the welfare of the group   |
| 35      | 037. Secretive - Tends to conceal information from others   |
| 35.01   | 006. Intra-group competitor - Tries to exceed the performance of others in his or her group                                     |
| 36      | 017. Worldly - Interested in temporal events, has a world outlook   |
| 37      | 045. Consultative - Consults with others before making plans or taking action   |
| 37.01   | 053. Egocentric - Self-absorbed, thoughts focus mostly on one's self  |
| 99      | 012. Inspirational - Inspires emotions, beliefs, values, and behaviours of others, inspires others to be motivated to work hard |
| 99      | 063. Non co-operative - Unwilling to work jointly with others   |
| 99      | 002. Evasive - Refrains from making negative comments to maintain good relationships and save face                              |
| 99      | 018. Intra-group Conflict Avoider - Avoids disputes with members of his or her group  |
| 99      | 060. Informed - Knowledgeable; aware of information   |
| 99      | 091. Dynamic - Highly involved, energetic, enthused, motivated  |
| 99      | 103. Willful - Strong-willed, determined, resolute, persistent  |
| 99      | 086. Self-sacrificial - Foregoes self-interests and makes personal sacrifices in the interest of a goal or vision               |
| 99      | 005. Positive - Generally optimistic and confident  |
| 99      | 030. Collaborative - Works jointly with others  |

\* denotes that the item had a negative correlation and therefore the questions are reversed for that factor.

**Appendix J – Correlations of 37 Principal Components from Questionnaire 1**

## Appendix K – Eigen Values for Questionnaire 2

### Total Variance Explained

| Qstn | Initial Eigenvalues |               |              | Extraction Sums of Squared Loadings |               |              | Rotation Sums of Squared Loadings |               |              |
|------|---------------------|---------------|--------------|-------------------------------------|---------------|--------------|-----------------------------------|---------------|--------------|
|      | Total               | % of Variance | Cumulative % | Total                               | % of Variance | Cumulative % | Total                             | % of Variance | Cumulative % |
| 1    | 18.75               | 16.74         | 16.74        | 18.75                               | 16.74         | 16.74        | 6.73                              | 6.01          | 6.01         |
| 2    | 7.54                | 6.73          | 23.48        | 7.54                                | 6.73          | 23.48        | 5.67                              | 5.06          | 11.07        |
| 3    | 4.35                | 3.89          | 27.37        | 4.35                                | 3.89          | 27.37        | 4.94                              | 4.41          | 15.49        |
| 4    | 3.11                | 2.78          | 30.14        | 3.11                                | 2.78          | 30.14        | 4.19                              | 3.74          | 19.23        |
| 5    | 2.90                | 2.59          | 32.73        | 2.90                                | 2.59          | 32.73        | 3.98                              | 3.55          | 22.78        |
| 6    | 2.44                | 2.18          | 34.92        | 2.44                                | 2.18          | 34.92        | 2.70                              | 2.41          | 25.19        |
| 7    | 2.23                | 2.00          | 36.91        | 2.23                                | 2.00          | 36.91        | 2.68                              | 2.39          | 27.58        |
| 8    | 1.85                | 1.65          | 38.56        | 1.85                                | 1.65          | 38.56        | 2.44                              | 2.18          | 29.76        |
| 9    | 1.84                | 1.64          | 40.20        | 1.84                                | 1.64          | 40.20        | 2.38                              | 2.12          | 31.89        |
| 10   | 1.71                | 1.53          | 41.73        | 1.71                                | 1.53          | 41.73        | 2.37                              | 2.11          | 34.00        |
| 11   | 1.61                | 1.44          | 43.16        | 1.61                                | 1.44          | 43.16        | 2.34                              | 2.09          | 36.09        |
| 12   | 1.55                | 1.38          | 44.54        | 1.55                                | 1.38          | 44.54        | 2.14                              | 1.91          | 38.00        |
| 13   | 1.49                | 1.33          | 45.87        | 1.49                                | 1.33          | 45.87        | 2.13                              | 1.90          | 39.90        |
| 14   | 1.44                | 1.29          | 47.16        | 1.44                                | 1.29          | 47.16        | 2.01                              | 1.79          | 41.70        |
| 15   | 1.41                | 1.26          | 48.42        | 1.41                                | 1.26          | 48.42        | 2.00                              | 1.78          | 43.48        |
| 16   | 1.38                | 1.23          | 49.65        | 1.38                                | 1.23          | 49.65        | 1.95                              | 1.74          | 45.22        |
| 17   | 1.31                | 1.17          | 50.82        | 1.31                                | 1.17          | 50.82        | 1.92                              | 1.72          | 46.94        |
| 18   | 1.30                | 1.16          | 51.98        | 1.30                                | 1.16          | 51.98        | 1.77                              | 1.58          | 48.51        |
| 19   | 1.25                | 1.11          | 53.09        | 1.25                                | 1.11          | 53.09        | 1.74                              | 1.56          | 50.07        |

Extraction Method: Principal Component Analysis.

## Appendix L – 27 Principal Components from PCA for Questionnaire 2

| Factor | Item  |
|--------|---|
| 1.00   | 036. Autocratic - Makes decisions in dictatorial way  |
| 1.01   | 004. Bossy - Tells subordinates what to do in a commanding way  |
| 1.02   | 110. Dictatorial - Forces her/his values and opinions on others   |
| 1.03   | 104. Ruler - Is in charge and does not tolerate disagreement or questioning, gives orders   |
| 1.04   | 024. Tyrannical - Acts like a tyrant or despot; imperious, dictatorial, authoritative   |
| 1.05   | 089. Domineering - Inclined to dominate others  |
| 1.06   | 033. Arrogant - Presumptuous or overbearing   |
| 1.07 * | 001. Diplomatic - Skilled at interpersonal relations, tactful   |
| 1.08 * | 021. Win/win problem-solver - Able to identify solutions which satisfy individuals with diverse and conflicting interests                 |
| 2.00   | 031. Encouraging - Gives courage, confidence or hope through reassuring and advising  |
| 2.01   | 032. Morale booster - Increases morale of subordinates by offering encouragement, praise, and/or by being confident                       |
| 2.02   | 012. Inspirational - Inspires emotions, beliefs, values, and behaviours of others, inspires others to be motivated to work hard           |
| 2.03   | 076. Motive Arouser - Mobilises and activates followers   |
| 2.04   | 082. Confidence builder - Instils others with confidence by showing confidence in them  |
| 2.05   | 094. Team builder - Able to induce group members to work together   |
| 2.06   | 098. Motivational - Stimulates others to put forth efforts above and beyond the call of duty and make personal sacrifices                 |
| 2.07   | 083. Group-Oriented - Concerned with the welfare of the group   |
| 2.08   | 025. Integrator - Integrates people or things into cohesive, working whole  |
| 2.09   | 056. Intellectually stimulating - Encourages others to think and use their minds; challenges beliefs, stereotypes and attitudes of others |
| 3.00   | 066. Foresight - Anticipates possible future events   |
| 3.01   | 067. Plans ahead - Anticipates and prepares in advance  |
| 3.02   | 075. Able to Anticipate - Able to successfully anticipate future needs  |
| 3.03   | 013. Anticipatory - Anticipates, attempts to forecast events, considers what will happen in the future                                    |
| 3.04   | 107. Future-oriented - Makes plans and takes actions based on future goals  |
| 3.05   | 035. Prepared - Is ready for future events  |
| 3.06   | 102. Visionary - Has a vision and imagination of the future   |
| 3.07   | 071. Intuitive - Has extra insight  |
| 4.00   | 015. Sincere - Means what he/she says, earnest  |

|        |   |
|--------|---|
| 4.01   | 016. Trustworthy - Deserves trust, can be believed and relied upon to keep his/her word                                 |
| 4.02   | 088. Honest - Speaks and acts truthfully  |
| 4.03   | 020. Just - Acts according to what is right or fair   |
| 4.04 * | 059. Cunning - Sly, deceitful, full of guile  |
| 4.05   | 028. Loyal - Stays with and supports friends even when they have substantial problems or difficulties                   |
| 4.06 * | 050. Vindictive - Vengeful; seeks revenge when wronged  |
| 5.00   | 038. Asocial - Avoids people or groups, prefers own company   |
| 5.01   | 047. Loner - Works and acts separately from others  |
| 5.02   | 055. Distant - Aloof, stands off from others, difficult to become friends with  |
| 5.03 * | 079. Communicative - Communicates with others frequently  |
| 5.04   | 085. Non-participative - Does not participate with others   |
| 5.05   | 063. Non co-operative - Unwilling to work jointly with others   |
| 5.06 * | 045. Consultative - Consults with others before making plans or taking action   |
| 6.00 * | 074. Self-effacing - Presents themselves in a modest way  |
| 6.01 * | 042. Modest - Does not boast, presents self in a humble manner  |
| 6.02   | 062. Egotistical - Conceited, convinced of own abilities  |
| 6.03   | 006. Intra-group competitor - Tries to exceed the performance of others in his or her group                             |
| 6.04   | 053. Egocentric - Self-absorbed, thoughts focus mostly on one's self  |
| 7.00   | 096. Performance-oriented - Sets high standards of performance  |
| 7.01   | 097. Ambitious - Sets high goals, works hard  |
| 7.02   | 080. Excellence-Oriented - Strives for excellence in performance of self and subordinates                               |
| 7.03   | 011. Improvement-Oriented - Seeks continuous performance improvement  |
| 8.00   | 051. Compassionate - Has empathy for others, inclined to be helpful or show mercy                                       |
| 8.01   | 040. Generous - Willing to give time, money, resources and help to others   |
| 8.02   | 039. Fraternal - Tends to be a good friend of subordinates  |
| 8.03 * | 009. Ruthless - Punitive; Having no pity or compassion  |
| 9.00   | 049. Risk averse - Avoids taking risks, dislikes risk   |
| 9.01   | 057. Cautious - Proceeds/performs with great care and does not take risks   |
| 9.02 * | 014. Risk taker - Willing to invest major resources in endeavours that do not have high probability of being successful |
| 10.00  | 034. Orderly - Is organised and methodological in work  |
| 10.01  | 058. Organised - well organised, methodical, orderly  |
| 11.00  | 112. Ritualistic - Uses a prescribed order to carry out procedures  |
| 11.01  | 041. Formal - Acts in accordance with rules, convention and ceremonies  |
| 11.02  | 081. Procedural - Follows established rules and guidelines  |

|         |  |
|---------|--|
| 11.03   | 073. Habitual - Given to a constant, regular routine   |
| 12.00   | 026. Calm - Not easily distressed  |
| 12.01 * | 046. Irritable - Moody; easily agitated  |
| 12.02   | 087. Patient - Has and shows patience  |
| 13.00   | 043. Intelligent - Smart, learns and understands easily (REVERSE SCORE)  |
| 13.01   | 109. Dependable - Reliable ( <b>REVERSE SCORE</b> )  |
| 13.02   | 105. Dishonest - Fraudulent, insincere   |
| 13.03   | 052. Subdued - Suppressed, quiet, tame (REVERSE SCORE)   |
| 14.00   | 065. Status-conscious - Aware of others' socially accepted status  |
| 14.01   | 084. Class Conscious - Is conscious of class and status boundaries and acts accordingly                                |
| 15.00   | 054. Non-explicit - Subtle, does not communicate explicitly, communicates by metaphor, et allegory, et example         |
| 15.01 * | 022. Clear - Easily understood   |
| 15.02   | 072. Indirect - Does not go straight to the point, uses metaphors and examples to communicate                          |
| 16.00   | 002. Evasive- Refrains from making negative comments to maintain good relationships and save face                      |
| 16.01   | 018. Intra-group Conflict Avoider - Avoids disputes with members of his or her group                                   |
| 16.02 * | 106. Hostile - Actively unfriendly, acts negatively toward others  |
| 16.03   | 101. Avoids negatives - Avoids saying no to another when requested to do something, even when it cannot be done        |
| 16.04 * | 027. Provocateur - Stimulates unrest   |
| 17.00   | 008. Independent - Does not rely on others; self-governing   |
| 17.01   | 007. Autonomous - Acts independently, does not rely on others  |
| 18.00   | 100. Non-delegator - Unwilling or unable to relinquish control of projects or tasks                                    |
| 18.01   | 099. Micro-manager - An extremely close supervisor, one who insists on making all decisions                            |
| 19.00   | 029. Unique - An unusual person, has characteristics of behaviours that are different from most others                 |
| 19.01   | 111. Individualistic - Behaves in a different manner than peers  |
| 19.02 * | 068. Normative - Behaves according to the norms of his or her group  |
| 20.00   | 064. Logical - Applies logic when thinking   |
| 20.01 * | 010. Tender - Easily hurt or offended  |
| 20.02   | 044. Decisive - Makes decisions firmly and quickly   |
| 20.03   | 060. Informed - Knowledgeable; aware of information  |
| 20.04   | 061. Effective bargainer - Is able to negotiate effectively, able to make transactions with others on favourable terms |
| 21.00   | 091. Dynamic - Highly involved, energetic, enthused, motivated   |
| 21.01   | 048. Enthusiastic - Demonstrates and imparts strong positive emotions for work   |
| 21.02   | 103. Willful - Strong-willed, determined, resolute, persistent   |
| 22.00 * | 090. Intra-group face saver - Ensures that other group members are not embarrassed or shamed                           |

|         |  |
|---------|--|
| 22.01   | 070. Non-egalitarian - Believes that all individuals are not equal and only some should have equal rights and privileges       |
| 22.02 * | 077. Sensitive - Aware of slight changes in other's moods, restricts discussion to prevent embarrassment                       |
| 22.03   | 093. Elitist - Believes that a small number of people with similar backgrounds are superior and should enjoy privileges        |
| 22.04   | 069. Individually -Oriented - Concerned with and places high value on preserving individual rather than group needs            |
| 23.00   | 017. Worldly - Interested in temporal events, has a world outlook  |
| 24.00   | 086. Self-sacrificial - Foregoes self-interests and makes personal sacrifices in the interest of a goal or vision              |
| 24.01 * | 023. Self-interested - Pursues own best interests  |

**Appendix Y – Ranked differences scores for all items**

## Appendix Z - Leadership Fit Report – Satisfaction Survey

A recent survey was conducted to measure the value the leaders have placed upon the Leadership Fit Report and to understand if it has helped them determine their developmental areas. Responses were received back from 142 leaders (72%) and their responses were:-

| <b>Question</b>   | <b>Average Response</b>  |
|---|--|
| <i>Q1. How clearly do you understand the principle the Leadership Fit Report was aiming to achieve?</i> | <i>Average 3.92 out of 5.0</i>   |
| <i>Q2. How easily were your leadership development areas highlighted?</i>                               | <i>Average 4.1 out of 5.0</i>  |
| <i>Q3. What was the most helpful part of the report?</i>  | <ul style="list-style-type: none"> <li>- <i>Big Gaps and Small Gaps – 61%</i></li> <li>- <i>Variations in follower scores for desired values – 22%</i></li> <li>- <i>All the data/graphs/detail – 10%</i></li> <li>- <i>Others – 7%</i></li> </ul> |
| <i>Q4. If you have participated in a 360 degree feedback process, which was more</i>                    | <i>82 replied “yes” of which 74 said Leadership Fit was more helpful</i>   |

|   |   |
|---|---|
| <i>informative and helpful?</i>   | .   |
| <i>Q5. Would you like to participate in a leadership fit follow-up report</i> | <i>117 responded "yes"<br/>12 responded "yes, but not now"<br/>13 responded "no" or omitted to answer</i> |

Space was available for additional comments, some of which were:-

*"The volume of data is fantastic and reported similar issues to my 360 degree feedback process"*

*"I am more comfortable with these numbers than descriptive comments which I got in my 360 feedback."*

*"Very easy to understand – very informative – very helpful"*

*"I understand where the questions came from and why we had to use them, but I think the questions should be more geared to us, not Wharton"*

*"I want all my direct reports to complete this process too"*

*"I carry the report everywhere I go to remind myself what I need to work on"*

*"It's too much for me. Just give me the page with my gaps, that's all I want to know"*

*"I had doubts about this report because at the moment we are into measurement overload. I almost pulled out, but I'm glad I didn't – very helpful and a nice job"*

*"It's not just the report I appreciated. I like the fact I can now discuss this with somebody who is independent and totally impartial. I have my challenges ahead, but at least you don't know any of my team – that helps."*

*"I wish there was a factor called "Emotional Intelligence" too."*

## Appendix AA – Speech for Leadership Development.

### Finance Forum – Module II

Note: This text has been used in the previous Mpls sessions, we've personalised certain sections, denoted by blue text for this group (Mpls: 14-17 October)

**Summary leadership messages:** (Delivered by a Senior Finance person)

#### **Leadership, why is it important?**

We are all aware that Leadership is the foundation of Cargill's 3 Pillars, as well as part of our Vision. In some areas Cargill needs to change in order to achieve these goals. The 3 Pillars represent where our focus will be relative to these changes. It will be through effective leadership from you and many others that will help us achieve our goals.

We view you as leaders, otherwise you wouldn't have been invited to attend these forums. As a leader, we expect you to take control of your own development, linking themes and plans to individual – team – function - BU and company objectives and goals. This too is part of successful leadership.

I do not believe one leadership model fits all leaders, especially for all the different teams we have in Cargill. Leadership is situational and it requires you to make decisions regarding how you lead and what emphasis you place on certain factors, e.g. the extent to which you use conflict to create change, or communication skills due to the multi-cultural team you lead.

That said, I believe there are some aspects of leadership that are core, regardless of the function we are employed in. You will find these on your Leadership Fit report and they are fundamental parts of the 3 Pillars plus our Vision, Mission and Values statements.

They are:

*Integrity, being honest, just, sincere and trustworthy*

*High Performance Orientation, through the setting of aggressive, measurable goals and by seeking Collaboration*

For most of you it has been at least 12 months since you went through the Leadership Fit Report. Although positive change in perception do not necessarily occur overnight, whereas as negative change in perception can; **I am informed that from the 11 participants of the 'Follow-up' - 1 of this group has significantly improved overall, 7 have remained almost static, unfortunately, 3 have slipped back.**

We are defining “significance” as +/- 20% change overall or +/-5% change for an individual category.

There are two parts to what I want to cover today. The first is to explore the three core elements, identified above. The second part is to look at what I refer to as **leadership differentiators**. From your report I am referring to categories 4 and 5 – Visionary and Inspirational. So, let's cover the core parts.

### **Integrity.**

More than 2500 Cargill employees globally have participated in the Leadership Fit Questionnaires and provided valuable feedback for our leaders. This feedback was not just from your direct reports, teams, respective BU's, but includes others in businesses as well. The number one characteristic people want from a leader, irrespective of BU or function, is **Integrity**. I believe people are looking to you not only to follow our guiding principles, but also showing by your actions that you “*do what you say you will do*”. Remember it is at the core of our function's Mission, Vision and Values.

Trust is at the foundation of any relationship and is required to engage our teams. I cannot see how any of you will be effective as leaders if this core ingredient is not present. Take a moment to see in which direction your scores have changed.

**Integrity group results:** All 11 remain stable. 1 has a 'fit' below the Cargill average

### **Performance Orientation.**

This isn't just about better results, “High Performance comes when everyone says, ‘I am responsible’” [Greg Page – Cargill News International – Performance]. It was by design that the High Performance pillar is first.

Again, from the 2,500+ people who participated in this survey, they want a leader who is highly performance-oriented (it's the second highest category). This does not just mean manufacturing or processing excellence. The key messages for the High Performance pillar are: -

- Noticeably better people

- ❑ Noticeably better offerings
- ❑ Noticeably better processes and collaboration
- ❑ Noticeably better results

You are all leaders within the finance function. We as a function must make every effort to contribute to making Cargill a high performing company by striving for high performance as leaders. Our competition never sleeps, so we must always strive to improve.

**Performance Orientation group results:** 1 significant move up. 10 remain stable. 3 results are below the Cargill average

### **Collaborative Team Orientation**

Very few, if any, companies could compete with Cargill when we combine our global capabilities to serve our customers. We must collaborate with our function and across our businesses in order for this to happen.

When we analysed the scores question by question, *collaboration* was the fourth highest score regarding what people want from their leaders.

Our profession rests between our functional responsibilities and our business relationships. Being collaborative does not mean we stop doing our jobs in order to work with others, but it does mean we take time to share what we have learned and look for opportunities to strengthen Cargill's global capabilities to serve our customers or make us more efficient. Without collaboration, we cannot perform effectively within the other two areas.

I have been asked to represent the function and we believe these three characteristics are vital for leadership success. Can I encourage you to look at your results and if necessary ask yourself some searching and challenging questions. How has perception changed in the last 12 months!?

**Collaborative group results:** 1 significant move up and 2 significant move down. 8 remain stable. 1 result is below the Cargill average.

Organisation Effectiveness (OE) has already informed me that our highest **fit** scores as a function are in the areas of *integrity* and *performance orientation*. Here are the top 10 questions based on **fit**: -

1. Honesty
2. Trustworthy
3. Logical
4. Ambitious
5. Performance Orientated
6. Informed
7. Excellence Orientated
8. Sincere
9. Improvement Orientated
10. Just

What are your reactions to this list?

I was very encouraged and I believe that other organisations would be envious of it. However, I see that collaboration is not part of our highest scores; it currently lies at position 40 out of a possible 112. This is something we must improve.

Let me remind and challenge you on the average **Fit's** (Cargill overall) for these three factors:-

*Integrity – 85%*

*Performance Orientation – 85%*

*Collaborative Team Orientation – 79%*

Can I strongly encourage you to consider working on these areas if your scores are significantly lower than these averages. Remember, these are at the core of our Leadership. Lower scores will limit your effectiveness and could limit your growth potential in Cargill.

The second part of what I would like to cover are those **leadership differentiators** that I referred to in my opening remarks.

### **Visionary & Inspirational**

OE recently facilitated a leadership event for the Corporate Centre in Minneapolis. This confirmed what we have long believed: whilst all good leaders display integrity, are performance oriented and focus on building collaborative teams, there are other factors which differentiate the very best leaders: **inspiring and visioning**.

A vision is not a snappy tag-line prepared by executives to describe an organisation's future. It portrays the intended direction in an exciting way - it is a compelling story with credible events and people. It adds meaning to people's lives by appealing to their values. It is often challenging and not easy to accomplish. It energises people into action.

***Visionary group results:*** 3 significant move down. 8 remain stable.

Inspiring others relies on more than charismatic oratory skills. Typically, this type of approach will inspire some followers for a short time. Sustained engagement can only come through modesty and unrelenting will, where the leader's compelling modesty is their most noticeable characteristic. “*Looking out of the window*” to attribute success and “*in the mirror*” to apportion responsibility wins respect and engages followers time after time.

***Inspirational group results:*** 11 remain stable.

Today, Martin will be spending time so that you can reflect on your scores, but also consider new techniques to improve your ability to motivate and inspire.

### **In Summary,**

**The minimum we expect from you is that what you learn from this week you incorporate into your own development plan & discuss this with your manager. This is something that they must take full ownership. [NOTE: Bob – could ask how many of the group have a written development plan]**

I accept that leadership is not always easy and changing your style can be painful. If you know change is required, please work at it hard – it won't change by doing nothing or by only completing the minimum. These Forums and your position as a Finance 'Leader' are not a right of passage, but earned through continuous improvement. Well done to those who have already started that improvement.

I hope over the next 12 months you become the leader your team and you want to be.

Thank You.

 Denotes support of the Hypothesis

## Appendix AI – Technical explanation of analysing the results – Hypothesis 1

Appendix AI presents of the statistical output produced by SYSTAT. An additional calculation was required that was performed outside of SYSTAT. The additional calculations were produced in excel. This example illustrates how the estimated regression equation is used to calculate slope and curvature along the fit and misfit lines. Additional calculations are performed in excel with each result to determine hypothesis support. Appendix AK presents the results of all 160 tests without a dummy code for country that were produced from excel. Those that support the hypothesis are identified with a box around the results.

The additional calculations in Appendix AM are to determine the direction of the coefficients for fit slope and curve and misfit slope and curve. They are calculated as follows:-

|              |                  |
|--------------|------------------|
|              | <i>Direction</i> |
| Fit Slope    | X+Y              |
| Fit Curve    | $X^2 +XY+Y^2$    |
| Misfit Slope | X-Y              |
| Misfit Curve | $X^2 -XY+Y^2$    |

The detailed test is to assess the significant of the coefficient and to determine the direction (positive or negative) as described above. In particular the analysis was looking for results that were significant and showing directions that vary from one another, for example Japan and America having significant results, but the nature (direction) being opposite.

**Appendix AJ – Example of SYSTAT output – no dummy variables**

**Appendix AK - 160 PRE tests: no dummy variables**

**Appendix AL – Example of SYSSTAT output for one PRE – dummy variables**

**Appendix AT – Coefficients for tests that did not support Hypothesis 1**

**APPENDICIES**

|  |            |
|--|------------|
| <b>Appendix AA – Speech for Leadership Development. ....</b>   | <b>263</b> |
| <b>Appendix AB – Mean Raw Values based on the GLOBE structure.....</b>   | <b>268</b> |
| <b>Appendix AC – Characteristics of a Global Organisation .....</b>  | <b>271</b> |
| <b>Appendix AD – Cargill’s Organisation Culture.....</b>   | <b>272</b> |
| <b>Appendix AE – Mean Centred Principals Components for Polynomial Regression Equations .....</b>                    | <b>273</b> |
| <b>Appendix AF – Raw Mean Centred Dependent Variables for Polynomial Regression Equations .....</b>                  | <b>274</b> |
| <b>Appendix AG – Correlations for the Mean Centred Dependent Variables for Polynomial Regression Equations .....</b> | <b>275</b> |
| <b>Appendix AH – Test of Hypothesis 1: Direction of significant results .....</b>                                    | <b>276</b> |
| <b>Appendix AI – Technical explanation of analysing the results – Hypothesis 1.....</b>                              | <b>278</b> |
| <b>Appendix AJ – Example of SYSTAT output – no dummy variables.....</b>  | <b>280</b> |
| <b>Appendix AK - 160 PRE tests: no dummy variables .....</b>   | <b>281</b> |
| <b>Appendix AL – Example of SYSSTAT output for one PRE – dummy variables.....</b>                                    | <b>282</b> |
| <b>Appendix AM – Independent (IV) and Integrity (DV) – Excel’s additional calculations.....</b>                      | <b>283</b> |
| <b>Appendix AN – Team Building (IV) and Loner (DV): No significant results.....</b>                                  | <b>285</b> |
| <b>Appendix AO – Encourager (IV) and Team Building (DV): No conclusions .....</b>                                    | <b>287</b> |

|  |            |
|--|------------|
| <b>Appendix AP – Results consistent with Hypothesis 1 .....</b>                              | <b>289</b> |
| <b>Appendix AQ – Results with an opposite support of Hypothesis 1 .....</b>                  | <b>290</b> |
| <b>Appendix AR – Results that demonstrate a different relationship across countries.....</b> | <b>291</b> |
| <b>Appendix AS – Results with patterns of relationships.....</b>                             | <b>293</b> |
| <b>Appendix AT – Coefficients for tests that did not support Hypothesis 1 .....</b>          | <b>294</b> |

Appendix AJ
