ABSTRACT: The present survey based study involves the qualitative diversity of flora and fauna. The diversity assessment was carried out at two campuses of Barrackpore Rastraguru Surendranath College. This extensive study reveals the presence of 256 floral species and 165 faunal species in and around college campuses. The huge faunal diversity is mainly due to high level of floral diversity, which establishes the area as resource-rich habitat with promising reservoir of species. This is the very first effort in exploring the natural wealth of Barrackpore Rastraguru Surendranath College campuses.

Keywords: Flora; Fauna; Diversity; India.

1. INTRODUCTION

Diversity or more specifically species diversity is the variety of living organisms found in natural habitat or surrounding environment [1]. Floral and faunal diversity of an area portrays the health of the habitat and natural wealth of that region. It is also very important for conservation perspectives. Proper conservation initiative can only be taken when proper biodiversity database of an area is available. It is important to have an understanding of the bio-diversity of an area so that the local people and students can be aware of the richness of bio-diversity of the place they are living in and their responsibility to maintain that richness.

Barrackpore Rastraguru Surendranath College is situated in a sub-urban belt and at the bank of river Hooghly. The college consists of two campuses one kilometer apart with coordinates 22°45'47.8"N, 88°20'59.5"E and 22°45'51.8"N, 88°21'20.4"E, respectively (Figure 1). The two campuses are spread over 3.97 acres with lush green natural vegetation and well-maintained gardens. The Barrackpore area, within which the college is located, is very rich in biological diversity. The study area experiences a sub-tropical climate with hot and humid summer (April to June), humid monsoon (July to September) and moderately cool, dry winter (November to February). Annual average temperature of Barrackpore region is 26.4°C and about 1533 mm of precipitation occurs annually [2]. The study was conducted for twelve months of duration starting from July, 2017 to June, 2018. This study allows us to understand the faunal and floral diversity of the surrounding areas of the college premises and their inter-relationship. The present survey is probably the first

effort to prepare the checklists of the floral and faunal species in and around the college campuses of Barrackpore area.

2. MATERIALS AND METHODS

The methodology consists of mainly random sampling techniques [3]. Observing mammals depend critically on the size of the species and its natural history. Bird sampling was done on the basis of direct sighting, call determination and from the nests of some bird species. Reptiles were found mostly by looking in potential shelter sites like the under the surface of rocks, logs, tree hollows and leaf litter.

Active invertebrates like the insects require more active search. For larger winged insects like butterflies, dragonflies and damselflies, random samplings were carried and point sampling was also done. The easiest way to observe many of the invertebrates is simply looking for them in the suitable habitat or microhabitat.

4. DISCUSSION

The list of flora indicates a significant diversity of plants which indicates the overall richness of the place. Overall flora has been classified in 11 groups. The most diverse group is the tree consisting of 70 species, whereas there is only 1 species of bamboo showing the least diversity. A total of 256 floral species have been identified [4-7].

The list of fauna indicates that the college campus is significantly rich in faunal diversity. A total of 165 faunal species have been identified [8-27]. 53 species of birds and a significant number of bird nests at many places have been observed. Mammals' diversity is superior. Avian diversity is wonderful. 68 species of butterflies have been documented, which indicates a healthy ecosystem as a whole. Odonate population indicates that the health of the water bodies and the riverine ecosystem is quite good. The amphibian population also supports this fact. Reptilian population is also quite significant and presence of Bengal monitor lizard indicates that the reptilian population is naturally controlled at the study site.

The findings of the present study reveal the biodiversity of the area, which possesses habitats with rich natural resources. The study confirms the existence of diversity plant species within the campuses and proper maintenance of the garden. The huge faunal diversity is mainly due to ecological dependency of animal species on the plants.

5. CONCLUSION

From the above studies and observations, it can be concluded that two college campuses house a variety of plant species, some of them are important host plants for butterflies to lay eggs. This is the very first effort in exploring the natural wealth of Barrackpore Rastraguru Surendranath College campuses. However, the present study of floral and faunal diversity is not conclusive. Future exploration in this direction will be continued to update this checklist.
