Contents

vii	Preface: History and future vision of the International Symposium on Southeast Asian Water Environment H. Furumai
1	Introduction: Water environment in Southeast Asia: Where do we stand today? C. Visvanathan and M. Padmasri
11	Chapter 1: Health
13	Evaluation of detection methods targeting host-specific <i>Bacteroides</i> Spp. as a microbial source tracking marker T. Miura, Y.M. Chan, Y. Masago and T. Omura
21	Groundwater quality problems and issues in the dry-zone of Sri Lanka with special reference to fluoride contamination and Chronic Kidney Disease G. Herath and U. Ratnayake
29	Investigation of nitrate concentration in tap water of Arak City, Iran M.S. Moghadasi, M.R. Alavi Moghaddam, R. Maknoun and A.R. Moghadasi
35	Arsenic contamination in groundwater and Skin manifestations in three VDC of Kailali district in Terai, Nepal M. Maharjan, M.P. Gorkhaly, B. Tuladhar and L. Gorkhaly
41	Comparison of tube-well and dug-well groundwater in the arsenic polluted areas in Cambodia D. Uy, S.C. Hak, C. Huy, M. Srey, T. Chunhieng, S. Phoeurng, H.M. Nasir and D. Fredericks
47	Pathogenic pollution of surface water under dry and wet weather condition in Hanoi downtown P.V. Quan, H. Furumai, F. Kurisu and I. Kasuga
55	DALYs lost due to diarrhoea: Household level drinking water treatment K.A. Mollah, N.A. Molla, R. Ashraf and G. Ali
63	Chapter 2: Industrial Wastewater Treatment
65	Enhanced anaerobic digestion of linoleic acid containing piggery wastewater L. Zhang and D. Jahng
73	Effect of process parameters on adsorptive and bio-removal of cyanide compounds from contaminated water R.R. Dash, C. Balomajumder and A. Kumar
79	Comparison of biohydrogen production process by extreme-thermophilic and mesophilic anaerobic bacteria T. Imai, R. Hasyim and A. Reungsang
85	Effect of salinity in nitrification and denitrification with high ammonia concentration H. Saputra, R. Boopathy and T. Setiadi
93	Study on pre-treatment of dyeing wastewater by Wet Air Catalytic Oxidation and Fenton Oxidation T.H. Cao, T.M. Nguyen, T.H. Vu and N.D. Vu
101	Quantity and quality control to increase the efficiency of water utilization in the condom industry S. Danteravanich, N. Kulsuk, S. Thongsidum and P. Uakritdathikarn
109	Decolourisation of secondary treated tannery effluent by adsorption using activated carbon derived from coconut shell R. Sujatha and P.C. Sabumon
115	Electricity generation from Tapioca wastewater using a Microbial Fuel Cell (MFC) R.M. Rachma, V. Reinaldo, A. Muhyinsyah and T. Setiadi
121	Evaluation of isopropyl alcohol degrading bacteria isolated from a MBR sludge J. Song, L. Zhang, Y. Lee, J. Jeong, J. Lee and D. Jahng
127	Performance evaluation of a pilot-scale Submerged Membrane Bioreactor (SMBR) for potential reuse of department store wastewater C. Ratanatamskul and P. Saenkoch

133	Chapter 3: Physical and Chemical Processes
135	Production of natural coagulant from <i>Moringa oleifera</i> seed for drinking water treatment E.N. Ali, S.A. Muyibi, H.M. Salleh, Md. Z. Alam and M.R.M. Salleh
141	Arsenic removal from ground water by chemical oxidation and adsorption on <i>in-situ</i> formed ferrihydroxide Ngoc Duy Vu and The Ha Cao
147	Preparation and characterization of powdered activated carbon from empty fruit bunch E.S.M. Ameen, S.A. Muyibi, Md. Z. Alam, N.A. Kabashi and M.I. Abdkarim
153	Removal of microbes from highly turbid surface water in Southeast Asia using ceramic membrane filters A. Hata, H. Katayama, S. Wattanachira, S. Sethy, Y. Masago, R. Honda and Y. Matsui
159	Silica fouling of ultra-low-pressure reverse osmosis membrane in fluoride removal P. Rakruam, S. Wattanachira, A. Wongrueng and S. Takizawa
165	Chapter 4: Water Environmental Management
167	Management of effluent from STR20 industry in Southern Thailand S. Danteravanich
173	Components constituting Tropical Water Index: For assessment of water supply and the environment P. Sudjono, Sutenti and N. Jeihan
179	Engaging household sector for improved market-based incentive system in Laguna de Bay, Philippines R.C. Ancog and N.D. Briones
185	Capacity development in Adaptive Water Management: Experiences and lessons learned at Farmers' Water School in Northern Philippines C.M. Pascual, S.M. Contreras, T.S. Sandoval and M.Q. Mangabat
191	Chapter 5: Monitoring
193	Modeling a peri-urban combined sewer system to assess drainage improvements: A case study of Rattanakosin Village, Thailand T. Chaosakul, K.C. Wijekoon, P. Kijjanapanich, T. Udom, C. Siripong, N.H. Dang, K. Sin, N. Samantararat, T. Koottatep, K.N. Irvine, J. Zumfelde and J. Bakert
199	Heavy metal pollution and its long-term trends in Southeast Asian sediments H. Ozaki, S. Segawa, Y. Hasebe, H. Takada, H. Nakata, A. Amano, Y. Inouchi, S. Tanabe, F. Nakajima, K. Fukushi, K. Kuno and I. Watanabe
207	Quality of water in Buriganga river and self-purification capacity from a point source N. Parvin, A.S. As – Sabah, M. Rahman, M. Alam, Md. M. Alam, Md. E. Islam and S.M.A. Islam
213	Application of Yeast Estrogen Screen (YES) assay to monitor endocrine disruptors in surface water in Cantho City, Vietnam N.T. Hoa, L.T.A. Hong and J. Clemens
219	Storm and dry weather water quality characteristics in the Phnom Penh combined sewer system M. Yim, S. Vathna and K. Irvine
225	Index

Preparation and characterization of powdered activated carbon from empty fruit bunch

E.S.M. Ameen, S.A. Muyibi, Md. Z. Alam, N.A. Kabashi and M.I. Abdkarim

Abstract Different powdered activated carbon (PAC) samples were prepared from oil palm industrial residue namely empty fruit bunch (EFB). The prepared EFB samples were carbonized and activated in a horizontal furnace. Physical activation consisted of carbonization for 30 minutes using nitrogen gas followed by activation with CO₂ gas at different flow rates, temperatures and times were used to optimize production conditions. The PAC samples produced were investigated through adsorption study using phenol aqueous solution of 50 mg/L concentration. Characterizations of the best quality PAC sample produced were also determined. The results of this work demonstrated that activation temperature had significant effect on the adsorption properties of the activated carbons. The PAC produced at activation temperature of 800°C, CO₂ gas flow rate of 0.1 L/min and activation time of 15 minutes proved to be the best quality adsorbent as it had given 95.54% of phenol removal at initial 15 minutes contact time. Characterizations of EFB based-PAC showed good quality adsorbent with highly active sites and well-developed pores with BET surface area of 374.73m²/g. The experimental results indicated that the activated carbon prepared from EFB is a promising product in industrial applications as well in water and wastewater treatment.

Keywords adsorption, BET surface area, empty fruit bunch, powdered activated carbon, phenol removal

INTRODUCTION

Activated carbon (AC) has been widely used in the sorption of chemical species from aqueous solutions as a versatile adsorbent with optimal sorption properties (Aksu and Yener, 2001; Alam *et al.*, 2006a; Alam *et al.*, 2007a; Amaya *et al.*, 2007; Muyibi *et al.*, 2008; Alam *et al.*, 2008; Ameen *et al.*, 2008; Achaka *et al.*, 2009). Phenolic compounds are considered to be hazardous wastes, which are released into the aquatic environment by industries such as coke ovens in steel plants, petroleum refineries, petrochemical, phenolic resin, pharmaceutical, chemical and dye industries, etc. (Zumriye and Yener, 2001; Banat *et al.*, 2004). The discharge of phenolic waste into waterways may adversely affect human health as well as that of flora and fauna. Considerable quantities of agricultural by-products result from the annual harvesting and processing of various agricultural crops grown worldwide. These by-products were observed to have potential materials in the manufacture of activated carbons (Kadirvelu *et al.*, 2000; Namasivayan and Kadirvelu, 1999). Malaysia is the largest oil palm producer in the world. Empty fruit bunches are one of the most abundant residues regularly discharged from the palm oil refineries. Small amount is used for steam generation for the processing of the palm oil production while the larger portion is left unused and disposed to sanitary landfills. Hence, converting of empty fruit bunch into activated carbon would provide safe disposal to empty fruit bunch as well as produce useful adsorbent that has wide applications special in water and wastewater treatment. The aim of this study was to evaluate the adsorption properties and characterizations of the activated carbon prepared form empty fruit bunch.

MATERIALS AND METHODS

Empty fruit bunch samples were obtained from a Seri Ulu Langat Oil Palm Mill in Dengkil, Selangor, Malaysia. The samples were washed and dried in the oven at 105°C for 24 hours for dehydration.

Activated carbon production

2-level full factorial design using two central points was selected for the optimization of activated carbon production runs by statistical software Design Expert 6.0.8. The prepared EFB were carbonized and activated in a horizontal furnace of CARBOLITE brand. Physical activation consisted of carbonization using nitrogen gas at flow rate of 2.5 L/min (Phan *et al.*, 2006) for 30 min, followed by activation with CO₂ gas at different temperatures (600, 750, and 900°C), gas flow rates (0.1, 0.175, 0.25 L/min) and times (15, 30, 45 minutes) was adopted to prepare activated carbon samples. The preparation variables levels were selected based on the previous experimental works done by other researchers (Alam *et al.*, 2006a; Phan *et al.*, 2006). The activated carbon samples produced were ground and sieved to size fractions less than 250 µm as shown in Figure 1(a), (b).
