Table of Content

1. Small Active Molecules with Insulin Mimetic Activity	12
<i>Muhammad Taher</i>	
2. Liver and Kidney Protective Effects of the Polyphenols, Tocopherols and Carotenoids	25
<i>Juliana bt Md. Jaffri</i>	
3. Potential Surface Active Properties of <i>Nigella sativa</i>	37
<i>Siti Nurfajariah bt Said and Kausar bt Ahmad</i>	
4. Pufa in Fish: Extraction and Fractionation Methods	51
<i>Sahena Ferdosh and Md. Zaidul Islam Sarker</i>	
5. Polypyrrole-Peg Composite Film for Drug Delivery	64
<i>Khadijah bt Edueng</i>	
6. Co-Encapsulation of Cyclophosphamide and Mesna into Double-Walled Microspheres	77
<i>Farahidah bt Mohamed and Christopher van der Wallle</i>	
7. A Recent Updates of Polysaccharide Based Nanoparticulate Oral Preparation of Insulin with Special Emphasis on <i>In Vivo</i> Application	97
<i>Uttam Kumar Mandal</i>	
8. Development of an Appropriate and Robust Dissolution Method for Solid Dosage Forms	116
<i>Uttam Kumar Mandal</i>	
9. Use of Cyclodextrin in the Production of Biomedical Nano Particles	126
<i>Omar El-Hadad</i>	
10. The Role of Pharmacogenetic Variation in Metoprolol CYP2D6 Genotypes Polymorphism	133
<i>Wan Mohd Azizi Wan Sulaiman, Tariq Abdul Razak, Lay Kek Teh and Rusli Ismail</i>	
11. Polymorphic Crystals and Their Characterisation	163
<i>Mohd Rushdi Abu Bakar, Zoltan Kalman Nagy and Christopher David Rielly</i>	

CHAPTER 4

PUFA IN FISH: EXTRACTION AND FRACTIONATION METHODS

Sahena Ferdosh¹, Md. Zaidul Islam Sarker²

²Department of Pharmaceutical Technology, Kulliyyah of Pharmacy, IIUM, Kuantan, Malaysia

Fish oils are an important dietary source of PUFA which is rich in EPA (eicosapentaenoic acid) and DHA (docosahexaenoic acid). There is a growing interest in rendering and refining fish oil for human consumption due to its high nutritional value. The conventional methods for extraction and purification of fish oil (PUFA) having the disadvantages including high temperature processing and employing toxic or flammable solvents. Therefore, extraction of fish oil using supercritical fluids as solvents, especially carbon dioxide (CO₂), could be a good solution of separation problems which uses low temperature and pressure. The main advantages of using this technology over the traditional fish oil purification steps, are that it decreases the number of steps needed to refine fish oils as well as reduces the use of chemicals during processing. PUFA contents in different marine fishes and general methods for their extraction and fractionation are covered in this article. Emphasis is given to the fractionations of EPA and DHA by means of supercritical fluid extractions (SFE). The advantages of SFE compared to conventional methods are also discussed.

4.1 Introduction

Fish oils are the most important natural source of long-chain PUFA; especially those are omega-3 fatty acids family, EPA and DHA. PUFA are known as essential fatty acids as they cannot be synthesized *de-novo* and must be obtained from the diet (Shahidi, 2001). The importance of fish oil PUFA in human health and disease prevention is well recognized. Many
