ABSTRACT

There are several Content Management Systems (CMS) that have been used nowadays. For instance, phpBB and SMF to design discussion board or called Forum), Drupal , PHP-Nuke , and Joomla to design CMS Website, CubeCart , Zen Cart and OS Commerce to design E-Commerce. Several web-based content management systems exist both in the Open Source and commercial domains. All of these web systems are designed to simplify the publication of web content to web sites. In particular, they are allowing content creators to submit content without requiring technical knowledge of HTML. Another popular website is Minisite, which is a single-page website where the operator aims to sell one particular product rather than present a company's product portfolio. Unlike usual websites, minisites usually consist of a single page website that utilizes a direct response marketing approach to sell its single product. Traditionally, minisites were developed or designed by web designer using HTML Editor like Dreamweaver, FrontPage, or any website builder software. For users who have limited knowledge on this matter, they need to hire web developer every time they want to update their site. In this proposed project, the system that is going to be developed will reduce the cost and time of the users. By having this kind of system, they can easily update their site online, with no technical skill required.
