Abstract

[v View references \(31\)](#)

Modification of starch blend properties by contact with supercritical carbon dioxide (scCO₂) was studied. Potato starch (PS), sweet potato starch (SPS), and cassava starch (CS) were blended with wheat starch (WS) at 15, 25, 50, 75 and 85% (w/w) ratios. For WS, the maximum decrease in gelatinization temperature (T_p) was 13 °C. The WS-PS and WS-CS blends exhibited a decrease in T_p of 13 to 17 °C. Reduction in T_p by treatment was 10 to 18 °C for all blend ratios. Conditions for lowering the starch blend T_p were determined to be a minimum contact time of 1 h with scCO₂ at 60 °C and 20 MPa. Swelling of starch granules that leads to the lowering of T_p involves both kinetic and physicochemical factors. Gelatinization of wheat starch blends with scCO₂ pressure treatment provides a versatile and non-thermal method for modifying the properties of ingredients used in food processing applications. © 2014 Elsevier B.V.
