### Abstract

View references (21)

A configurable, triple wavelength fiber laser based on broadband mirrors (BBMs) and an arrayed waveguide grating (AWG) is demonstrated. The laser uses a semiconductor optical amplifier (SOA) as the primary gain medium due to its inhomogeneous broadening property that allows for the generation high intensity lasing wavelengths. The combination of the AWG and BBMs allows for triple lasing wavelength outputs with channel spacing from 0.8 to 4.0 nm to be obtained. The generated output is adjustable between 1540.6 and 1548.6 nm. The proposed SOA-based system is stable and can be used as a reserve laser source for wavelength division multiplexing systems. © 2019 Wiley Periodicals, Inc.

### SciVal Topic Prominence ⓘ

Topic: Fiber lasers | Erbium | Wavelength spacing

Prominence percentile: 91.898 ⓘ

### Author keywords

AWG broadband mirror multi-wavelength SOA WDM

### Indexed keywords

Engineering controlled terms:

Arrayed waveguide gratings Broadband amplifiers Fiber amplifiers Fiber lasers Multiplexing equipment Optical switches Semiconductor optical amplifiers Waveguides Wavelength division multiplexing

Engineering uncontrolled terms

Broadband mirrors Channel spacings Inhomogeneous broadening Lasing wavelength Multi-wavelengths SOA-based systems Triple wavelengths Wavelength-division multiplexing system

Engineering main heading:

Laser mirrors
