Benign lung tumors: Presentation, Diagnosis, and Outcome

C. Pacheco¹, H. Dabo², G. Fernandes², P. Bastos³, A. Magalhães²

Introduction

Results

Benign tumors of the lung are uncommon and can be diagnostically challenging.

Objectives and Methods

Retrospective analysis of the clinicopathologic data and outcome of patients with benign lung tumors diagnosed in the last 10 years.

Number of patients 72 Male 68%

Sintomatic patients

Male	68%
Mean age	55 ± 15,2 years

20.00/	
39,9%	

Dyspnea	31,1%
Cough	13,8%
Weezing	10,3%
Pulmonary infections	34,4%

Radiologic features

Solitary lung nodule	73,6%
Tumor	23,6%
Other	2,8%

Diagnostic procedures	
Bronchoscopy (BC)	61
Transtoracic needle biopsy (TNB)	26

Surgery (S)

Results

Bronchoscopy

Total patients

Endobronchial lesion	16
Biopsies Total lesion removal	16 7
Histologic analysis	
Hamartoma	7
Papiloma	4
Granular cell myoblastoma	3
Leyomioma	1
Inflammatory pseudotumor	1
Location	
Trachea	29%
Right bronchial tree	35%
Left bronchial tree	36%

Patients without surgical treatment Total patients

Refuse surgical treatment	11
Lost "follow-up"	3
Death by other causes	4

Transtoracic needle biopsy

Total patients	26
Diagnostic	14
Histologic analysis Hamartoma Myxoma	13 1

Surgery

Total patients	47
Surgical procedure	
	4 C O /
Lobectomy	45%
Sleeve lobectomy	6%
Segmentectomy	49%
Histologic analysis	
Hamartoma	32
Solitary fibrous tumor	5
Lymphangioma	2
Adenoma	2
Chondroma	1
Myofibroblastic tumor	1
Papilloma	1
Inflammatory pseudotumor	1
Granular cell myoblastoma	1
Desmoid tumor	1

Conclusions

Benign lung tumors are usually assymptomatic and do not pose a significant health problem. The purpose of surgical intervention for benign lung tumors is to avoid missing potentially malignant lesions. In some situations, these tumors can be diagnosed and treated endoscopically.
