Abstract

New corporate developments, such as globalization, diversification and process orientation, are posing a challenge to the degree of integration of business application software. International standard software designed to meet the requirements of all types of business is acquiring greater strategic significance. The increased need for flexibility, localization, and scalable growth makes it necessary for highly integrated businesses applications to be distributable. Possible scenarios reflect managerial and organizational requirements. Additional mechanisms must be incorporated and business processes adapted to compensate for the increased autonomy of sub-applications.

Keywords

Standard software – Distribution – Integration – Corporate management – Business applications – Client/server – Master/satellite
