**Figure 3.** Localization of fatty acyl substitutent in phosphatidylcholines; PC 16:0/18:1 (9Z) fragmentation was conducted by selecting the ion at *m*/*z* 760.5 in the quadrupole region Q1 followed by collision-induced fragmentation in the trap region. (**A**) Shows the *m*/*z* 430–580 region of collision-induced dissociation mass spectra for drift time regions 2 and 3 for rhesus (*upper panel*), mouse (*mid panel*), and human plasma (*lower panel*) samples by LC-IMS/TOF. (**B**) Depicts the fragmentation pattern for synthetic standards PC 18:1 (9Z) / 16:0 (*upper panel*), PC 16:0 / 18:1 (9Z) (*mid panel*), and PC 16:0/18:1 (9Z) ( $^{13}C_1$  in  $\omega$  methyl position) (*lower panel*) in drift time regions 2 and 3 by flow injection analysis. dt=drift time for fragment ions generated in the trap region
