

# DISTRIBUTIONAL EQUATION FOR LAGUERRE-HAHN FUNCTIONALS ON THE UNIT CIRCLE

A. BRANQUINHO AND M.N. REBOCHO

ABSTRACT: Let  $u$  be a hermitian linear functional defined in the linear space of Laurent polynomials and  $F$  its corresponding Carathéodory function. We establish the equivalence between a Riccati differential equation with polynomial coefficients for  $F$ ,  $zAF' = BF^2 + CF + D$  and a distributional equation for  $u$ ,  $\mathcal{D}(Au) = B_1u^2 + C_1u + H_1\mathcal{L}$ , where  $\mathcal{L}$  is the Lebesgue functional, and the polynomials  $B_1, C_1, D_1$  are defined in terms of the polynomials  $A, B, C, D$ .

KEYWORDS: Hermitian functionals, measures on the unit circle, Carathéodory function, Laguerre-Hahn affine class on the unit circle, semi-classical functionals.

AMS SUBJECT CLASSIFICATION (2000): Primary 33C47, 42C05.

## 1. Introduction

In this paper we introduce the concept of Laguerre-Hahn class of hermitian functionals on the unit circle. Let  $u$  be a hermitian regular linear functional defined in the linear space of Laurent polynomials and  $F$  the corresponding Carathéodory function. The functional  $u$  (respectively, the corresponding Carathéodory function,  $F$ ) is said to be *Laguerre-Hahn* if  $F$  satisfies a Riccati differential equation with polynomial coefficients,

$$zAF' = BF^2 + CF + D, \quad A \neq 0. \quad (1)$$

We shall call the set of all such functionals (respectively, Carathéodory function,  $F$ ) the *Laguerre-Hahn class on the unit circle*. We remark that the Laguerre-Hahn class on the unit circle can be regarded as an extension of the Laguerre-Hahn class on the real line, studied in [5, 7, 8].

If  $B \equiv 0$  in (1) we obtain the Laguerre-Hahn affine class on the unit circle (see [2, 3]). If  $B \equiv 0$  and  $C, D$  specific polynomials, we obtain the semi-classical class on the unit circle (see [2, 6, 11]). Moreover, the Laguerre-Hahn class on the unit circle includes the class of second degree functionals on

the unit circle (see [4]) and includes, as we will see on section 3, the linear-fractional transformations of Carathéodory functions which are Laguerre-Hahn.

Analogously to what has been done on the real case (cf. [7, 8]), we establish the equivalence between (1) and a distributional equation for the corresponding  $u$ ,

$$\mathcal{D}(Au) = B_1u^2 + C_1u + H_1\mathcal{L}, \quad (2)$$

where  $\mathcal{L}$  is the Lebesgue functional, and  $B_1, C_1, D_1$  polynomials defined in terms of  $A, B, C, D$ .

This paper is organized as follows. In section 2 we give the definitions and introduce some notations which will be used in the forthcoming sections. In section 3 we study the stability in the Laguerre-Hahn class, and give some examples of sequences of polynomial orthogonal with respect to a functional of Laguerre-Hahn type. In section 4 we state some auxiliary results which enable us to establish, in section 5, the equivalence between (1) and (2).

## 2. Preliminaries and notations

Let  $\Lambda = \text{span}\{z^k : k \in \mathbb{Z}\}$  be the space of Laurent polynomials with complex coefficients,  $\Lambda'$  its algebraic dual space,  $\mathbb{P} = \text{span}\{z^k : k \in \mathbb{N}\}$  the space of complex polynomials, and  $\mathbb{T} = \{z \in \mathbb{C} : |z| = 1\}$  (or, using the parametrization  $z = e^{i\theta}$ ,  $\mathbb{T} = \{e^{i\theta} : \theta \in [0, 2\pi[ \}$ ) the unit circle.

Let  $u \in \Lambda'$  be a linear functional. We denote by  $\langle u, f \rangle$  the action of  $u$  over  $f \in \Lambda$ .

Given the sequence of moments  $(c_n)$  of  $u$ ,  $c_n = \langle u, \xi^{-n} \rangle$ ,  $n \in \mathbb{Z}$ ,  $c_0 = 1$ , the minors of the Toeplitz matrix are defined by

$$\Delta_{-1} = 1, \quad \Delta_0 = c_0, \quad \Delta_k = \begin{vmatrix} c_0 & \cdots & c_k \\ \vdots & & \vdots \\ c_{-k} & \cdots & c_0 \end{vmatrix}, \quad k \in \mathbb{N}.$$

**Definition 1** (cf. [10]). The linear functional  $u$  is:

- a) *hermitian* if  $c_{-n} = \overline{c_n}, \forall n \geq 0$ ;
- b) *regular* or *quasi-definite* if  $\Delta_n \neq 0, \forall n \geq 0$ ;
- c) *positive definite* if  $\Delta_n > 0, \forall n \geq 0$ .

As an example of hermitian functional we have the *Lebesgue functional*,  $\mathcal{L}$ , defined in terms of its moments by  $\langle \mathcal{L}, \xi^{-n} \rangle = \delta_{0,n}$ ,  $n \in \mathbb{Z}$ .

If  $u$  is a positive definite hermitian functional, then there exists a non-trivial probability measure  $\mu$  supported on the unit circle such that

$$\langle u, \xi^{-n} \rangle = \int_0^{2\pi} \xi^{-n} d\mu(\theta), \quad \xi = e^{i\theta}, \quad n \in \mathbb{Z}.$$

**Definition 2.** Let  $\{\phi_n\}$  be a sequence of complex polynomials with  $\deg(\phi_n) = n$  and  $u$  a hermitian linear functional. We say that  $\{\phi_n\}$  is a *sequence of orthogonal polynomials* with respect to  $u$  (or  $\{\phi_n\}$  is a sequence of orthogonal polynomials on the unit circle) if

$$\langle u, \phi_n(\xi) \overline{\phi_m(1/\xi)} \rangle = K_n \delta_{n,m}, \quad \xi = e^{i\theta}, \quad K_n \neq 0, \quad n, m \in \mathbb{N}.$$

If for each  $n \in \mathbb{N}$  the leading coefficient  $\phi_n$  is 1, then  $\{\phi_n\}$  is said to be a *sequence of monic orthogonal polynomials* and will be denoted by MOPS.

*Remark .* In the positive definite case, as the hermitian functional  $u$  has an integral representation in terms of a measure  $\mu$ , we will also say that  $\{\phi_n\}$  is orthogonal with respect to  $\mu$ .

For a polynomial  $P$  with degree  $n$ , the reciprocal polynomial  $P^*$  is defined by  $P^*(z) = z^n \overline{P(1/z)}$ . It is well known (see [10]) that a given sequence of complex polynomials  $\{\phi_n\}$  is orthogonal on the unit circle if, and only if,  $\{\phi_n\}$  satisfy a recurrence relation of the following type,

$$\phi_n(z) = z\phi_{n-1}(z) + a_n\phi_{n-1}^*(z), \quad n \geq 1, \quad (3)$$

with  $|a_n| \neq 1$ , and initial conditions  $\phi_0(z) = 1$ ,  $\phi_{-1}(z) = 0$ .

Given a sequence of monic orthogonal polynomials  $\{\phi_n\}$  with respect to  $u$ , the *sequence of associated polynomials of the second kind*  $\{\Omega_n\}$  is defined by

$$\Omega_0(z) = 1, \quad \Omega_n(z) = \langle u_\theta, \frac{e^{i\theta} + z}{e^{i\theta} - z} (\phi_n(e^{i\theta}) - \phi_n(z)) \rangle, \quad n = 1, 2, \dots,$$

and verify  $\phi_n^*(z)\Omega_n(z) + \phi_n(z)\Omega_n^*(z) = 2K_n z^n$ , for all  $n = 1, 2, \dots$  (see for instance [10]).

We consider the formal series associated with the hermitian linear functional  $u$ ,

$$F_u(z) = c_0 + 2 \sum_{k=1}^{+\infty} c_k z^k, \quad |z| < 1, \quad (4)$$

$$F_u(z) = -c_0 - 2 \sum_{k=1}^{+\infty} c_{-k} z^{-k}, \quad |z| > 1. \quad (5)$$

Since, for each  $\theta \in [0, 2\pi[$ , the following expansions take place,

$$\begin{aligned} \frac{e^{i\theta} + z}{e^{i\theta} - z} &= 1 + 2 \sum_{k=1}^{+\infty} (e^{i\theta})^{-k} z^k, \quad |z| < 1, \\ \frac{e^{i\theta} + z}{e^{i\theta} - z} &= -1 - 2 \sum_{k=1}^{+\infty} (e^{i\theta})^k z^{-k}, \quad |z| > 1 \end{aligned}$$

then, taking into account the definition of the moments of  $u$ , formally we can write

$$\left\langle u_\theta, \frac{e^{i\theta} + z}{e^{i\theta} - z} \right\rangle = F_u(z), \quad z \in \mathbb{C} \setminus \mathbb{T} \quad (6)$$

where  $\langle u_\theta, \cdot \rangle$  denotes the action of  $u$  over the variable  $\theta$ ,  $\theta \in [0, 2\pi[$ . Thus, we will also say that the series in (4), (5) formally correspond to the function  $F_u$  defined by (6).

In the positive definite case,  $F_u$  is the *Carathéodory function* corresponding to  $u$ , and is represented by

$$F_u(z) = \int_0^{2\pi} \frac{e^{i\theta} + z}{e^{i\theta} - z} d\mu(\theta), \quad z \in \mathbb{C} \setminus \mathbb{T},$$

where  $\mu$  is the probability measure associated with  $u$ .

Next we see some operations in the linear space  $\Lambda'$ . Given  $u \in \Lambda'$ ,  $f, g \in \Lambda$ , the functionals  $fu$  and  $\mathcal{D}u$ , both elements of  $\Lambda'$ , are defined by

$$\langle fu, p \rangle = \langle u, fp \rangle, \quad \langle \mathcal{D}u, p \rangle = -i \langle u, \xi p' \rangle, \quad p \in \Lambda$$

thus,  $\langle \mathcal{D}(gu), p \rangle = -i \langle u, \xi gp' \rangle$ ,  $p \in \Lambda$ . We remark that if  $u$  is hermitian, then  $\mathcal{D}u$  is also hermitian.

We consider the *generating function of the moments for a hermitian functional*,  $u$ , defined in  $\mathbb{C} \setminus \mathbb{T}$  by

$$\mathcal{F}_u(z) = \sum_{n=0}^{+\infty} c_n z^n, \quad |z| < 1, \quad \mathcal{F}_u(z) = - \sum_{n=1}^{+\infty} c_{-n} z^{-n}, \quad |z| > 1.$$

Then the following relation between the Carathéodory function and the generating function of the moments holds,

$$\mathcal{F}_u(z) = \frac{F_u(z) + 1}{2}, \quad z \in \mathbb{C} \setminus \mathbb{T}. \quad (7)$$

The next definition is the analogue of the definition given in [8] for the real case.

**Definition 3.** Let  $u, v \in \Lambda'$  be hermitian linear functionals and  $\mathcal{F}_u, \mathcal{F}_v$  the corresponding generating functions of the moments. The *product of  $u$  and  $v$* ,  $uv$ , is the functional defined in terms of its moments by

$$(uv)_n = \sum_{\substack{\nu+k=n \\ \text{sgn}(\nu)=\text{sgn}(k)=\text{sgn}(n)}} u_\nu v_k, \quad n \in \mathbb{Z}, \quad (8)$$

that satisfies

$$\mathcal{F}_u(z) \mathcal{F}_v(z) = \mathcal{F}_{uv}(z) \quad (9)$$

*Remark .* The functional  $uv$  defined by (8) is hermitian.

As a consequence, we get the following result.

**Lemma 1.** *Let  $u$  be a hermitian linear functional and  $F_u$  the corresponding formal Carathéodory function. Then,*

$$(F_u)^2 = 2F_{u^2} - 2F_u + 1. \quad (10)$$

*Proof:* Put  $u = v$  in (9) and get, after using (7) that  $F_{u^2} + 1 = ((F_u)^2 + 2F_u + 1)/2$ , and the required follows. ■

### 3. Stability in the Laguerre-Hahn class on the unit circle. Examples.

We begin this section studying the stability of the Laguerre-Hahn Carathéodory functions under a special kind of linear-fractional transformations.

**Theorem 1.** *Let  $F_1$  be a Carathéodory function satisfying a Riccati differential equations with polynomials coefficients,*

$$A_1 F_1' = B_1 F_1^2 + C_1 F_1 + D_1, \quad A_1 \neq 0, \quad (11)$$

*and  $F_2$  a linear-fractional transformation of  $F_1$  of the following type*

$$F_2 = \frac{\alpha_1 - \beta_1 F_1}{-\alpha_2 + \beta_2 F_1}, \quad \alpha_1, \alpha_2, \beta_1, \beta_2 \in \mathbb{P}, \quad \alpha_1 \beta_2 - \alpha_2 \beta_1 \neq 0.$$

*Then,  $F_2$  satisfies*

$$A_2 F_2' = B_2 F_2^2 + C_2 F_2 + D_2, \quad (12)$$

with

$$A_2 = -(\alpha_1\beta_2 - \alpha_2\beta_1)A_1 \neq 0, \quad (13)$$

$$B_2 = (\alpha_2\beta_2' - \alpha_2'\beta_2)A_1 + \alpha_2^2B_1 + \alpha_2\beta_2C_1 + \beta_2^2D_1, \quad (14)$$

$$C_2 = (\alpha_2\beta_1' + \alpha_1\beta_2' - \alpha_2'\beta_1 - \alpha_1'\beta_2)A_1 \\ + 2\alpha_1\alpha_2B_1 + (\alpha_1\beta_2 + \alpha_2\beta_1)C_1 + 2\beta_1\beta_2D_1, \quad (15)$$

$$D_2 = (\alpha_1\beta_1' - \alpha_1'\beta_1)A_1 + \alpha_1^2B_1 + \alpha_1\beta_1C_1 + \beta_1^2D_1. \quad (16)$$

Thus, if  $F_2$  is a Carathéodory function, then  $F_2$  is Laguerre-Hahn.

*Proof:* We have  $F_2 = \frac{\alpha_1 - \beta_1F_1}{-\alpha_2 + \beta_2F_1}$  or equivalently  $F_1 = \frac{\alpha_1 + \alpha_2F_2}{\beta_1 + \beta_2F_2}$ . By substituting  $F_1 = \frac{\alpha_1 + \alpha_2F_2}{\beta_1 + \beta_2F_2}$  in (11) we obtain (12) with coefficients given by (13)-(16). Thus, the assertion follows. ■

Next we see some examples of Laguerre-Hahn sequences.

**Corollary 1.** *Let  $\{\phi_n\}$  be a MOPS on  $\mathbb{T}$ ,  $\{\Omega_n\}$  the sequence of associated polynomials of the second kind and  $F, F_1$  the corresponding Carathéodory functions. If  $F$  is Laguerre-Hahn and satisfies  $zAF' = BF^2 + CF + D$ , with  $A \neq 0$ , then  $F_1$  is Laguerre-Hahn and satisfies  $zAF_1' = -DF_1^2 - CF_1 - B$ .*

*Proof:* It is well known that  $\{\Omega_n\}$  is orthogonal with respect to  $F_1 = 1/F$ , with  $F$  the Carathéodory function associated to  $\{\phi_n\}$  (cf. for example [9]). Thus, the assertion follows from Theorem 1. ■

**Definition 4** (Peherstorfer [9]). Let  $\{\phi_n\}$  be a MOPS on the unit circle,  $(a_n)$  the corresponding sequence of reflection coefficients and  $N \in \mathbb{N}$ . The sequence  $\{\phi_n^N\}$  defined by (3) with  $\phi_n^N(0) = a_{n+N}$ ,  $n = 0, 1, \dots$  is said to be the *sequence of associated polynomials of  $\{\phi_n\}$  of order  $N$* .

Let  $\{\phi_n\}$  be a MOPS with respect to a Carathéodory function  $F$  and  $\{\Omega_n\}$  be the sequence of orthogonal polynomials of the first kind. In [9] it is established that  $\{\phi_n^N\}$  is orthogonal with respect to the Carathéodory function  $F^N$  given by

$$F^N = \frac{(\Omega_N - \Omega_N^*) + (\phi_N + \phi_N^*)F}{(\Omega_N + \Omega_N^*) + (\phi_N - \phi_N^*)F}, \quad (17)$$

and  $(\Omega_N - \Omega_N^*)(\phi_N - \phi_N^*) - (\phi_N + \phi_N^*)(\Omega_N + \Omega_N^*) = -2K_N z^N \neq 0$ .

**Corollary 2.** *Let  $F$  be a Carathéodory function,  $\{\phi_n\}$  the corresponding MOPS,  $\{\Omega_n\}$  the sequence of associated polynomials of the second kind and  $F^N$  the Carathéodory function corresponding to the sequence of associated polynomials of  $\{\phi_n\}$  of order  $N$ ,  $\{\phi_n^N\}$ . If  $F$  is Laguerre-Hahn and satisfies*

$$zAF' = BF^2 + CF + D, A \neq 0,$$

*then  $F^N$  is Laguerre-Hahn and satisfies*

$$A_N (F^N)' = B_N (F^N)^2 + C_N F^N + D_N,$$

*with  $A_N = 4K_N z^{N+1} A \neq 0$  and*

$$\begin{aligned} B_N &= zA \{(\Omega_N + \Omega_N^*)'(\phi_N - \phi_N^*) - (\phi_N - \phi_N^*)'(\Omega_N + \Omega_N^*)\} \\ &\quad + (\Omega_N + \Omega_N^*)^2 B - (\Omega_N + \Omega_N^*)(\phi_N - \phi_N^*)C + (\phi_N - \phi_N^*)^2 D, \\ C_N &= zA \{(\Omega_N - \Omega_N^*)(\phi_N - \phi_N^*)' - (\Omega_N + \Omega_N^*)'(\phi_N + \phi_N^*)\} \\ &\quad - 2(\Omega_N^2 - (\Omega_N^*)^2)B + 2(\phi_N \Omega_N + \phi_N^* \Omega_N^*)C - 2(\phi_N^2 - (\phi_N^*)^2)D, \\ D_N &= (\Omega_N - \Omega_N^*)^2 B - (\Omega_N - \Omega_N^*)(\phi_N + \phi_N^*)C + (\phi_N + \phi_N^*)^2 D. \end{aligned}$$

*Proof:* From (17) it follows that  $F = \frac{(\Omega_N + \Omega_N^*)F^N - (\Omega_N - \Omega_N^*)}{(\phi_N + \phi_N^*) - (\phi_N - \phi_N^*)F^N}$ , and using Theorem 1 the assertion follows.  $\blacksquare$

## 4. Auxiliary results

Next we establish results that will be used in next section. We consider hermitian linear functionals  $u \in \Lambda$  and  $F_u$  the corresponding formal Carathéodory function defined by (6).

**Lemma 2** (cf. [2]). *Let  $u$  be a hermitian linear functional and  $A, B$  polynomials. Then, for all  $z \in \mathbb{C} \setminus \mathbb{T}$ ,*

$$\langle B(\xi)u, \frac{\xi + z}{\xi - z} \rangle = P_{u,B}(z) + B(z)F_u(z), \quad (18)$$

$$A(z)F_u'(z) = -A'(z)F_u(z) + Q_{u,A}(z) + \frac{1}{iz} \langle \mathcal{D}(Au), \frac{\xi + z}{\xi - z} \rangle \quad (19)$$

where  $P_{u,B}$ ,  $Q_{u,A}$  are polynomials with  $\deg(P_{u,B}) = \deg(B)$ ,  $\deg(Q_{u,A}) = \deg(A) - 1$ , defined by

$$P_{u,B}(z) = \langle u, \frac{\xi + z}{\xi - z} (B(\xi) - B(z)) \rangle, \quad (20)$$

$$Q_{u,A}(z) = -A'(z) - \langle u, 2\xi \sum_{k=2}^{\deg(A)} \frac{A^{(k)}(z)}{k!} (\xi - z)^{k-2} \rangle \quad (21)$$

*Remark .* From (20) and (21) follows  $P_{u,B+\tilde{B}} = P_{u,B} + P_{u,\tilde{B}}$ ,  $P_{u,\alpha B} = \alpha P_{u,B}$ , with  $\alpha \in \mathbb{C}$  and  $B, \tilde{B} \in \mathbb{P}$ .

**Lemma 3** (cf. [1]). *Let  $u \in \Lambda'$  be a hermitian linear functional and  $A$  a polynomial. Then,  $(A(z) + \overline{A}(1/z))u$  is hermitian.*

Next lemma is a generalization of Theorem 3.4 of [1].

**Lemma 4.** *Let  $u$  be a hermitian linear functional. If there exist polynomials  $A, B, C, H$  such that  $\mathcal{D}(Au) = Bu^2 + Cu + H\mathcal{L}$ , with  $\mathcal{L}$  the Lebesgue functional, then*

$$\mathcal{D}(A + \overline{A})u = (B + \overline{B})u^2 + (C + \overline{C})u + (H + \overline{H})\mathcal{L} \quad (22)$$

*Conversely, if (22) holds, then  $u$  satisfies the distributional equation with polynomial coefficients*

$$\mathcal{D}(A_1u) = B_1u^2 + (C_1 + isA_1)u + H_1\mathcal{L} \quad (23)$$

where  $s = \max\{\deg(A), \deg(B), \deg(C), \deg(H)\}$ , and the polynomials  $A_1, B_1, C_1, H_1$  are given by  $A_1(z) = z^s(A(z) + \overline{A}(1/z))$ ,  $B_1(z) = z^s(B(z) + \overline{B}(1/z))$ ,  $C_1(z) = z^s(C(z) + \overline{C}(1/z))$ ,  $H_1(z) = z^s(H(z) + \overline{H}(1/z))$ .

*Proof:* If  $\mathcal{D}(Au) = Bu^2 + Cu + H\mathcal{L}$ , then

$$\langle \mathcal{D}(Au), \xi^k \rangle = \langle Bu^2 + Cu + H\mathcal{L}, \xi^k \rangle, \quad \forall k \in \mathbb{Z}.$$

Applying conjugates follows

$$\langle \mathcal{D}(\overline{A}u), \xi^{-k} \rangle = \langle \overline{B}u^2 + \overline{C}u + \overline{H}\mathcal{L}, \xi^{-k} \rangle, \quad \forall k \in \mathbb{Z}.$$

Therefore, we obtain

$$\langle \mathcal{D}((A + \overline{A})u), \xi^n \rangle = \langle (B + \overline{B})u^2 + (C + \overline{C})u + (H + \overline{H})\mathcal{L}, \xi^n \rangle, \quad \forall n \in \mathbb{Z},$$

and (22) follows.

Conversely, if  $u$  satisfies (22), then we successively get for all  $k \in \mathbb{Z}$

$$\begin{aligned} \langle \mathcal{D}((A + \bar{A})u), \xi^k \rangle &= \langle (B + \bar{B})u^2, \xi^k \rangle + \langle (C + \bar{C})u, \xi^k \rangle + \langle (H + \bar{H})\mathcal{L}, \xi^k \rangle, \\ -ik \langle u, (A(\xi) + \bar{A}(1/\xi))\xi^k \rangle &= \langle u^2, (B(\xi) + \bar{B}(1/\xi))\xi^k \rangle \\ &\quad + \langle (C(\xi) + \bar{C}(1/\xi))\xi^k \rangle + \langle \mathcal{L}, (H(\xi) + \bar{H}(1/\xi))\xi^k \rangle. \end{aligned}$$

Let  $s = \max\{\deg(A), \deg(B), \deg(C), \deg(H)\}$ , then the last equation is given by

$$\begin{aligned} -ik \langle u, \xi^s(A(\xi) + \bar{A}(1/\xi))\xi^{k-s} \rangle &= \langle u^2, \xi^s(B(\xi) + \bar{B}(1/\xi))\xi^{k-s} \rangle \\ &\quad + \langle u, \xi^s(C(\xi) + \bar{C}(1/\xi))\xi^{k-s} \rangle + \langle \mathcal{L}, \xi^s(H(\xi) + \bar{H}(1/\xi))\xi^{k-s} \rangle, \quad \forall k \in \mathbb{Z} \end{aligned} \quad (24)$$

If we write  $m = k - s$  and define  $A_1, B_1, C_1, H_1$  as in the statement of the lemma, the equation (24) is given by

$$\begin{aligned} -i(s+m) \langle u, A_1(\xi)\xi^m \rangle \\ = \langle u^2, B_1(\xi)\xi^m \rangle + \langle u, C_1(\xi)\xi^m \rangle + \langle \mathcal{L}, H_1(\xi)\xi^m \rangle, \quad \forall m \in \mathbb{Z}, \end{aligned}$$

and so,

$$\begin{aligned} -im \langle u, A_1(\xi)\xi^m \rangle \\ = \langle u^2, B_1(\xi)\xi^m \rangle + \langle u, (C_1(\xi) + isA_1(\xi))\xi^m \rangle + \langle \mathcal{L}, H_1(\xi)\xi^m \rangle, \quad \forall m \in \mathbb{Z}. \end{aligned}$$

From the definition of  $\mathcal{D}$ , the previous equation is equivalent to

$$\langle \mathcal{D}(A_1u), \xi^m \rangle = \langle B_1u^2, \xi^m \rangle + \langle (C_1 + isA_1)u, \xi^m \rangle + \langle H_1\mathcal{L}, \xi^m \rangle, \quad \forall m \in \mathbb{Z},$$

and we get (23). ■

**Lemma 5.** *Let  $u$  be a hermitian linear functional and  $F_u$  the corresponding formal Carathéodory function. If  $F_u$  satisfies  $zAF'_u = BF_u^2 + CF_u + D$  in  $\mathbb{C} \setminus \mathbb{T}$ , then  $u$  satisfies the distributional equation*

$$\langle \mathcal{D}(Au) + L(\xi)u - 2iB(\xi)u^2, \frac{\xi + z}{\xi - z} \rangle = iH(z) \quad (25)$$

with

$$L = i(-zA' + 2B - C), \quad H = B - 2P_{u^2, B} + P_{u, -zA'+2B-C} - zQ_{u, A} + D. \quad (26)$$

*Proof:* If we use (19) and (10) in  $zAF'_u = BF_u^2 + CF_u + D$  we get

$$(-zA' + 2B - C)F_u - i\langle \mathcal{D}(Au), \frac{\xi + z}{\xi - z} \rangle = 2BF_{u^2} + B + D - zQ_{u,A} \quad (27)$$

On the other hand, from (18) and (19) we know that,

$$\begin{aligned} & (-zA' + 2B - C)F_u \\ &= \langle (-\xi A'(\xi) + 2B(\xi) - C(\xi))u, \frac{\xi + z}{\xi - z} \rangle - P_{u, -zA'+2B-C}(z) \\ BF_{u^2} &= \langle B(\xi)u^2, \frac{\xi + z}{\xi - z} \rangle - P_{u^2, B}, \end{aligned}$$

and substituting these two equations in (27) we get

$$\begin{aligned} & \langle \mathcal{D}(Au) + i(-\xi A' + 2B - C)u - 2iBu^2, \frac{\xi + z}{\xi - z} \rangle \\ &= i(B - 2P_{u^2, B} + P_{u, -zA'+2B-C} - zQ_{u,A} + D). \end{aligned}$$

Thus, we get (25) with  $L, H$  given in (26). ■

**Theorem 2.** *Let  $u$  be a hermitian linear functional and  $F_u$  the corresponding formal Carathéodory function. If  $F_u$  satisfies*

$$zAF'_u = BF_u^2 + CF_u + D, \quad |z| < 1$$

*then  $u$  satisfies the distributional equation with polynomial coefficients*

$$\mathcal{D}(A_1u) = B_1u^2 + (isA_1 - L_1)u + H_1\mathcal{L},$$

*where  $s = \max\{\deg(A), \deg(B), \deg(L), \deg(H)\}$ , and the polynomials  $A_1, B_1, L_1, H_1$  are given by  $A_1(z) = z^s(A(z) + \overline{A}(1/z))$ ,  $B_1(z) = z^s(2iB(z) + \overline{2iB}(1/z))$ ,  $L_1(z) = z^s(L(z) + \overline{L}(1/z))$ ,  $H_1(z) = z^s(iH(z) + \overline{iH}(1/z))$ , and  $L, H$  are defined in (26).*

*Proof:* If  $F_u$  satisfies  $zAF'_u = BF_u^2 + CF_u + D$ ,  $|z| < 1$ , then, from Lemma 5, we obtain (25),  $\langle \mathcal{D}(Au) + L(\xi)u - 2iB(\xi)u^2, \frac{\xi + z}{\xi - z} \rangle = iH(z)$ . Applying conjugates and the transformation  $Z = 1/z$  to previous equation we get  $\langle \mathcal{D}(\overline{A}u) + \overline{L}u - \overline{2iB}u^2, \frac{\overline{\xi} + 1/z}{\overline{\xi} - 1/z} \rangle = -i\overline{H}(1/z)$ . Since  $-\frac{1/\xi + 1/z}{1/\xi - 1/z} = \frac{\xi + z}{\xi - z}$ , we obtain

$$\langle \mathcal{D}(\overline{A}u) + \overline{L}u - \overline{2iB}u^2, \frac{\xi + z}{\xi - z} \rangle = i\overline{H}(1/z). \quad (28)$$

Summing (25) with (28) we get

$$\langle \mathcal{D}((A + \bar{A})u) + (L + \bar{L})u - (2iB + \overline{2iB})u^2, \frac{\xi + z}{\xi - z} \rangle = i(H(z) + \overline{H}(1/z)).$$

Therefore, if we compute the moments of the hermitian functional

$$\mathcal{D}((A + \bar{A})u) + (L + \bar{L})u - (2iB + \overline{2iB})u^2$$

(using the asymptotic expansion of  $\frac{\xi + z}{\xi - z}$  in  $|z| < 1$  and in  $|z| > 1$ ) we get

$$\mathcal{D}((A + \bar{A})u) + (L + \bar{L})u - (2iB + \overline{2iB})u^2 = (iH + \overline{iH})\mathcal{L}.$$

From Lemma 4 we obtain the required functional equation.  $\blacksquare$

If we take  $B = 0$  in previous Theorem we obtain the result for the Laguerre-Hahn affine class.

**Corollary 3.** *Let  $u$  be a hermitian linear functional. If  $F_u$  satisfies*

$$zAF'_u = CF_u + D \quad \text{for } |z| < 1,$$

*then  $u$  satisfies*

$$\mathcal{D}(A_1u) = (isA_1 - L_1)u + H_1\mathcal{L},$$

*where  $s = \max\{\deg(A), \deg(L), \deg(H)\}$ , and  $A_1, B_1, L_1, H_1, L, H$  are given by  $A_1(z) = z^s(A(z) + \overline{A}(1/z))$ ,  $L_1(z) = z^s(L(z) + \overline{L}(1/z))$ ,  $H_1(z) = z^s(iH + \overline{iH}(1/z))$ ,  $L(z) = i(-zA'(z) - C(z))$ ,  $H(z) = P_{u, -zA' - C}(z) - zQ_{u, A}(z) + D(z)$ .*

## 5. The characterization theorem

**Theorem 3.** *Let  $u$  be a hermitian linear functional and  $F_u$  the corresponding formal Carathéodory function. If  $u$  satisfies  $\mathcal{D}(Au) = Bu^2 + Cu + \xi H\mathcal{L}$ , where  $\mathcal{L}$  is the Lebesgue functional, then  $F_u$  satisfies the differential equations, in  $\mathbb{C} \setminus \mathbb{T}$ ,*

$$zAF'_u = -\frac{iB}{2}F_u^2 + (-zA' - iB - iC)F_u + \frac{iB}{2} - iP_{u^2, B} + zQ_{u, A} - iP_{u, C} + E, \quad (29)$$

*with  $E(z) = -2izH(z)\mathbb{I}(z)$ , where  $\mathbb{I}(z) = \begin{cases} 1 & , |z| < 1 \\ 0 & , |z| > 1 \end{cases}$ .*

*Conversely, if  $F_u$  satisfies the differential equations (29), then  $u$  satisfies the distributional equation*

$$\mathcal{D}(Au) = Bu^2 + Cu + \xi H\mathcal{L}, \quad (30)$$

where  $\mathcal{L}$  is the Lebesgue functional.

*Proof:* If we substitute  $\mathcal{D}(Au) = Bu^2 + Cu + \xi H\mathcal{L}$  in (19) we get

$$\begin{aligned} & zA(z)F'_u(z) \\ &= -zA'(z)F_u + zQ_{u,A}(z) - i\langle Bu^2, \frac{\xi+z}{\xi-z} \rangle - i\langle Cu, \frac{\xi+z}{\xi-z} \rangle - i\langle \xi H\mathcal{L}, \frac{\xi+z}{\xi-z} \rangle. \end{aligned}$$

From (18) follows

$$\begin{aligned} zA(z)F'_u &= -zA'(z)F_u + zQ_{u,A}(z) - i(P_{u^2,B} + B(z)F_{u^2}) \\ &\quad - i(P_{u,C} + C(z)F_u) - i\langle \xi H\mathcal{L}, \frac{\xi+z}{\xi-z} \rangle. \end{aligned} \quad (31)$$

Since  $\langle \xi H\mathcal{L}, \frac{\xi+z}{\xi-z} \rangle = 2zH(z)\mathbb{I}(z)$  then, in  $|z| < 1$ , (31) is equivalent to

$$\begin{aligned} zA(z)F'_u &= -iB(z)F_{u^2} + (-zA'(z) - iC(z))F_u \\ &\quad + zQ_{u,A}(z) - iP_{u^2,B}(z) - iP_{u,C}(z) - 2izH(z) \end{aligned}$$

and, in  $|z| > 1$ , (31) is equivalent to

$$\begin{aligned} zA(z)F'_u &= -iB(z)F_{u^2} + (-zA'(z) - iC(z))F_u \\ &\quad + zQ_{u,A}(z) - iP_{u^2,B}(z) - iP_{u,C}(z). \end{aligned}$$

Using (10) we get (29).

We now prove the converse. If  $F$  satisfies

$$\begin{aligned} zAF'_u &= -\frac{iB}{2}F_u^2 + (-zA' - iB - iC)F_u + \frac{iB}{2} - iP_{u^2,B} \\ &\quad + zQ_{u,A}(z) - iP_{u,C}(z) + E(z), \quad |z| < 1, \end{aligned}$$

then, from (25), we get

$$\langle V, \frac{\xi+z}{\xi-z} \rangle = 2zH\mathbb{I}(z) \quad \text{with} \quad V = \mathcal{D}(Au) - Bu^2 - Cu.$$

Using the asymptotic expansion of  $\frac{\xi + z}{\xi - z}$ , in  $|z| < 1$  and in  $|z| > 1$ , the two previous equations are, respectively, equivalent to

$$\langle V, 1 + 2 \sum_{k=1}^{+\infty} \xi^{-k} z^k \rangle = 2zH(z), \quad |z| < 1, \quad (32)$$

$$\langle V, -1 - 2 \sum_{k=1}^{+\infty} \xi^k z^{-k} \rangle = 0, \quad |z| > 1. \quad (33)$$

Writing  $zH(z) = h_1z + \dots + h_lz^l$  then, from (32) we get

$$\langle V, 1 \rangle = 0, \quad \langle V, \xi^{-k} \rangle = h_k, \quad k = 1, \dots, l, \quad \langle V, \xi^{-k} \rangle = 0, \quad k \geq l + 1 \quad (34)$$

and, from (33) we get

$$\langle V, 1 \rangle = 0, \quad \langle V, \xi^k \rangle = 0, \quad k \geq 1. \quad (35)$$

Finally, from (34) and (35), we conclude that  $V = zH\mathcal{L}$  and (30) holds. ■

If we do  $B = 0$  in previous Theorem we get the following result to the Laguerre-Hahn affine class (see [2, 3]).

**Corollary 4.** *Let  $u$  be a hermitian linear functional and  $F_u$  the corresponding formal Carathéodory function. If  $u$  satisfies  $\mathcal{D}(Au) = Cu + \xi H(\xi)\mathcal{L}$ , then  $F_u$  is such that*

$$zA(z)F'_u(z) = (-zA'(z) - iC(z))F_u(z) + zQ_{u,A}(z) - iP_{u,C}(z) + E(z), \quad (36)$$

for  $z \in \mathbb{C} \setminus \mathbb{T}$ , with  $E(z) = -2izH(z)\mathbb{I}(z)$ .

Conversely, if  $F_u$  satisfies (36), then  $u$  satisfies  $\mathcal{D}(Au) = Cu + \xi H(\xi)\mathcal{L}$ .

As a consequence of previous Theorem, we get a characterization for semi-classical functionals (see [2]).

**Corollary 5.** *Let  $u$  be a hermitian linear functional and  $F$  the corresponding formal Carathéodory function, satisfying a differential equation with polynomial coefficients*

$$zA(z)F'(z) = (-zA'(z) - iC(z))F(z) + P(z), \quad z \in \mathbb{C} \setminus \mathbb{T}. \quad (37)$$

A necessary and sufficient condition for  $u$  to be semi-classical and satisfy  $\mathcal{D}(Au) = Cu$  is that the polynomial  $P$  of (37) satisfy  $P = zQ_{u,A} - iP_{u,C}$ , where  $Q_{u,A}$  and  $P_{u,C}$  are given by (20) and (21).
