3. Instituto Botánico, Sección de Sistemática, Etnobiología y Educación. Jardín Botánico de Castilla-La Mancha. Avenida de La Mancha s/n. 02006 Albacete.

The Cavanillesian names *Galium fruticosens* and *Scorzonera pumila*, basionym of *Launaea pumila*, are lectotypified from original specimens preserved in the Cavanilles herbarium in the Royal Botanic Garden of Madrid (MA).

*Keywords:* Cavanilles, Compositae, Rubiaceae, lectotype, nomenclature.

## Tipificació de dos noms Cavanillesians, *Galium Fruticosens* (Rubiaceae) i *Scorzonera pumila* (Compositae)

Els noms cavanillesians *Galium fruticosens* i *Scorzonera pumila*, basiònim de *Launaea pumila*, són lectotipificats a partir d'espècimens que pertanyen al material original de l'autor conservat a l'herbari del Reial Jardí Botànic de Madrid (MA).

*Paraules clau:* Cavanilles, Compositae, Rubiaceae, lectotip, nomenclatura.

Antonio José (Joseph) Cavanilles (1745-1804) was the most outstanding botanist of the Spanish Enlightenment. His contributions to the taxonomic knowledge of the world flora (more than 80 genera and 1000 taxa) are good proof of his significance (see e.g., Stafleu & Cowan, 1976; López Piñero & López Terrada, 1995). Garilleti (1993) studied the Cavanilles's herbarium, however he explicitly stated in the introduction to his work, that his aim was to study the Herbarium, and in any case a lectotypification of his taxa was achieved. In this sense, the author indicates that "Nuestro objetivo ha sido estudiar el herbario de A. J. Cavanilles, en ningún caso se ha concretado una lectotipificación de sus táxones" [Our aim was to study the herbarium of A. J. Cavanilles, in no case has materialized a lectotypification of their taxa] (Garilleti, 1993: 5; Garilleti, pers. comm.). Therefore, the type indication in this work only indicates the Cavanilles's original material preserved in several herbaria, but does not constitute an effective typification according to Art. 7.11 of the ICN (Turland et al., 2018) because "designation of a type is achieved only if the type is definitely accepted as such by the typifying autor [...]."

The purpose of this paper is to lectotypify of the names *Galium fruticosens* Cavanilles (1795: 3) and *Launaea pumila* Cavanilles (1793: 19). The designation of the lectotypes is based on the consultation of Cavanilles's original elements and the literature cited in the protogues.

## Lectotypification of the names

### *Galium fruticosens* Cav.

*Galium fruticosens* Cavanilles (1795: 3) is closely related to *G. lucidum* All. (Ehrendorfer, 1976) a common species in South and Southern Europe, so that in some cases has been treated as a subspecies (Bolòs & Vigo, 1983; Ortega Olivencia & Devesa, 2007). *Galium fruticosens* is a plant without stolons, leaf margin is revolute and strongly scabrid, with pedicels relatively long and may be as longs as the diameter of the flowers, which may be up to 5 mm. The species is characterized by their leaves of the main stems usually 2,5-8(18) mm, those of the non-floriferous branches mostly heavily incurred at least towards the apex and less than 5(6) mm, with very thickened margins or

revolute, and these characteristic are not found in *G. lucidum*. This plant inhabits altered scrubs, rocky and stony, very sunny slopes, subnitrophilous grasslands of road and highway margins, etc., on limestone, marl, limestone marl, gypsiferous loam and coastal sand in the East, Central and South-Central parts of the Iberian Peninsula (Ortega Olivencia & Devesa, 2007).

Cavanilles's protologue (1795: 3) consists of a diagnosis “*GALIUM* caule frutescente : foliis linearibus, senis : pedunculis bifloris.”, followed by a complete description of the plant, a geographical locality “Habitat copiose in montibus Valdignae, Enguerae, et prope Monasterium de la Murta”, and an illustration (Cavanilles, 1795: icon 206, f. 2). A note is also provided in the protologue “A Thunbergio exemplar accepi in promontorio Bonae-Spei lectum, quod a Valentina planta nullatenus differt”. The Cavanilles's icon is an excellent illustration that represents a complete plant, and it is suitable for the lectotype of the name.

In the Cavanilles's collection at MA (Herbarium of the Royal Botanic Garden of Madrid, Spain), there is a sheet that contains original material (MA barcode MA 150798) (image available at <http://161.111.171.57/herbarioV/visorVCat.php?img=MA-01-00150798>) (Fig. 1). The sheet bears a plant well developed and complete, and three fragments also with fruits, and is labelled “*Galium fruticosum* sp. / in Valdigna Enguera montibus” handwriting by Cavanilles (see also Garilletti, 1993: 206). We have not been able to locate any further original material in any consulted herbarium [e.g., at BM, C, G, LD, LINN, MA, MO, P (incl. P-LA and P-JU), UPS, acronyms according to Thiers (2019)].

Ferrer-Gallego & Guara (2011: 85) indicated the sheet MA 150798 as “Typus”. Nevertheless, according to the Art. 7.11 of the ICN, they failed in not reporting the statement “designated here” (*hic designatus*) or an equivalent phrase, therefore the “typification” is ineffective. Among the Cavanilles's original elements, the illustration included in the protologue and the specimen at MA, we designate the specimen MA number 150798-1-1, as the lectotype of the name *Galium fruticosens*. This specimen matches the traditional and current concept of the name (see e.g., Willkomm & Lange, 1865; Ehrendorfer, 1976; Bolòs & Vigo, 1996; Ortega Olivencia & Devesa, 2007).

***Galium fruticosens*** Cav., Icon. Descr. Pl. 3: 3 (1795)  
≡ *Galium lucidum* subsp. *fruticosens* (Cav.) O. Bolòs & Vigo, Collect. Bot. (Barcelona) 14: 100 (1983).

Ind. loc.: “Habitat copiose in montibus Valdignae, Enguerae et prope Monasterium de la Murta”.

**LECTOTYPUS (hic designatus): SPAIN.** Valdigna, Enguera [Valencia], Cavanilles s.n., MA, barcode MA 150798 (image available at <http://161.111.171.57/herbarioV/visorVCat.php?img=MA-01-00150798>).

### ***Scorzonera pumila* Cav.**

The genus *Launaea* (Cichorieae, Compositae) comprises about 40 taxa (Tomb, 1977). Cavanilles (1793: 19) describes *Scorzonera pumila*, name currently accepted in the genus *Launaea* [as *Launaea pumila* (Cav.) Kuntze]. This species is distributed in North Africa (Morocco and Algeria) and Iberian Peninsula (Central, South and East parts, rarely in the Northeast part), and grows in dry gypsaceous, saline, loamy, limestone or clay soils. It is a perennial herbaceous plant with leaves usually confined to lower half of stem, pinnatisect, and capitula 20-24 × 12-16 mm (Boulos, 1976; Mejías, 2017).

Cavanilles's protologue (1793: 19) consists of a diagnosis “*SCORZONERA* acaulis, foliis pinnatis, pin-nulis linearibus glabris, apicibus albis” followed by a complete description, a geographical locality “Habitat prope Sucronis oppidum ad montis radices contra mare, et in incultis Noveldae ditionis”, and an excellent illustration (Cavanilles, 1793: icon 221, f. 3) that represents a complete plant, and it is suitable for the lectotype of the name.

In the Cavanilles's collection at MA, there is a sheet that contains original material, MA barcode 476254 (image available at [http://herbario.rjb.csic.es/zoom3.php?filename=Scorzonera\\_pumilla\\_476254](http://herbario.rjb.csic.es/zoom3.php?filename=Scorzonera_pumilla_476254)). The sheet bears eight plants well developed (five of these with flowers), and two fragments also with flowers, and is labelled “*Scorzonera pinnata: humilis pumila* / Icon. Tab. 121 / In maritimis Cullera, et in / collibus Novelda. / Maio 1791” handwriting by Cavanilles (see Garilletti, 1993: 228-229). We have not been able to locate any further original material in any consulted herbarium (e.g., at BM, C, G, LD, LINN, MA, MO, P [incl. P-LA and P-JU], UPS).

In conclusion, among the Cavanilles's original elements, the illustration included in the protologue and the specimen at MA, we designate the specimen MA with barcode 4762541 as the lectotype of the name *Scorzonera pumila*. This specimen matches the traditional concept and current use of the name (see e.g., Willkomm & Lange, 1865; Kuntze, 1891; Boulos, 1976;

- Bolòs & Vigo, 1996; Mateo et al., 2013; Mejías, 2017).
- Scorzonera pumila*** Cav., Icon. 2: 19, tab. 121, fig. 2 (inter IV et XI-1793).
- ≡ *Launaea pumila* (Cav.) Kuntze, Revis. Gen. Pl. 1: 351 (1891).

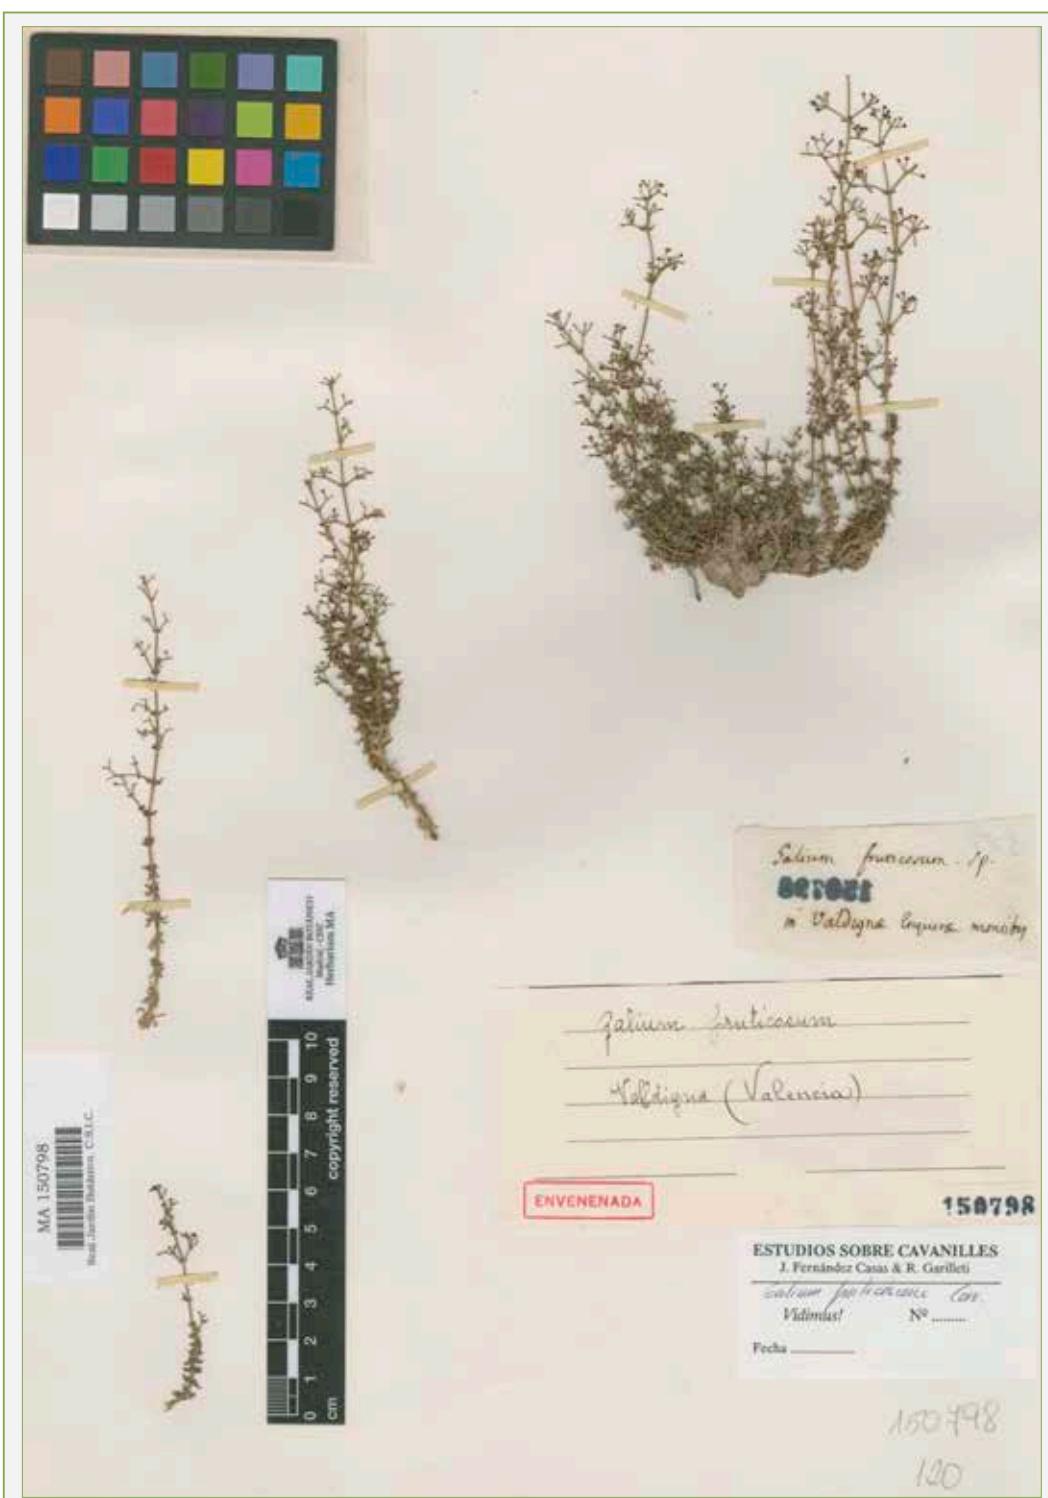

Ind. loc.: “Habitat prope Sucronis oppidum ad montis radices contra mare, et in incultis Noveldae ditionis”.

**LECTOTYPUS (hic designatus): SPAIN.** Cullera [Valencia], Novelda [Alicante], V-1791, Cavanilles s.n., MA, barcode 476254 (Fig. 2) (image available at [http://herbario.rjb.csic.es/zoom3.php?filename=Scorzonera\\_pumilla\\_476254](http://herbario.rjb.csic.es/zoom3.php?filename=Scorzonera_pumilla_476254)).
