The field of social movement studies as it exists in the North America remains generally unable to provide good explanations for some of the more significant social movement activity of the past decade. Mass mobilizations such as the Wisconsin Uprising, Occupy Wall Street, Black Lives Matter, and for that matter, the waves of resistance to the Trump administration, are usually described as "spontaneous" reactions to precipitating events. Beyond this, studies of these manifestations generally deal with questions of framing, mobilization, escalation, etc., as if each could be accounted for independently and discretely. Meanwhile, less visible social movement activities ranging from the daily activism of meetings, fundraising, and training to the development of new strategies and politics are at best treated as cases of abeyant or submerged movements, and at worst (and more commonly) ignored. I argue in this paper that such failures to explain both spectacular uprisings as well as the daily works of activists are rooted in the same positivist logic that conflates epistemology with ontology, imperializes the empirical, and in doing, eliminates the makers of history from the history they make. While mid-level theoretical tools commonly used in social movement studies today retain utility, on their own they are insufficient for explaining the role of activists in interpreting long-term structural change and in constructing and implementing social movement strategies. In example, I bring together my findings from 26 interviews, archival research, and participant observation of two related cases: The Wisconsin Uprising of 2011, and the emergence of a new democratic constitutionalism in the United States. Through these cases, I introduce a theoretical framework for explaining the trajectories and outcomes of movements in struggle. Movement building activities are not always readily available to empirical analysis, yet they occur nonetheless, producing forces that enter play in times of heightened conflict.

Professional Dynasties and the State: Changes in the Relations

Profession-state relations vary across time and place. Project *Professional Dynasties as a Social Mechanism of the Reproduction of Professional Groups* is directed towards the studies of reasons and circumstances of the rise and fall of professional dynasties. It also centers on the role of professional dynasty traditions in the multiple social field taking into consideration the influence of the state and the market. The phenomenon of 'professional dynasty' was brought to life by the Soviet state in the 1920-s. By the dynasty we understand a social group localised in the industrial and socio-economic sphere, characterised by blood-kinship relationships, where several generations do their professional work in the same sphere. We study dynasties from the point of view of the resources of family professional strategies and as informal methods and practices in the context of changing economic, science-technical, social and cultural realities. Dynasties also provide conditions for the effective professional adaptation and career realisation of young generations. Dynasty members have a different understanding of the trends of the development and perspectives of the transforming society. They differently adapt to the conditions of the accelerated science-technical progress.

The scientific novelty is based on the fact that there has been almost no research in the following spheres: (1) dynasties as state social constructs that reveal the social demand for producing elite professions; (2) how professional dynasties are formed in the various spheres of the professional landscape (parents' expectations, passing down of educational trajectories, passing down of professional skills, etc.); (3) what professional and social standing of dynasties are; (4) how professional mobility is accomplished, what enhances professionalisation and what hinders it. The object of the research is the dynasties in engineering, teaching and medical profession. We are conducting qualitative interview research with the members of dynasties in Moscow and other Russian regions.

Relational Ontology of the Social World: Charles H. Cooley's Paradigm

Cooley's thought is characterized by theoretical timelessness. Its first important feature is the idea of a system, which calls for joint consideration of a whole and its parts, along with their relations in time and under specified circumstances. The second key point is the idea of changeability, which requires tracking not only ordinary emergence, but also (and, perhaps, most importantly) the changes affecting the structures and processes of human life. The third feature of Cooley's thought is relationality, which excludes any atomistic views of social life and calls for the identification of social ties, their strength and meaning, their moral overtones and individual concretization, as well as their reference to broader systems and networks. The fourth one is the idea of complexity, which means that individual configurations or weaves of relations, phenomena and things or objects should be treated as irreducible to their components. The fifth one is interpenetration, continuous permeation or overlapping of various orders of reality: material and spiritual or ideal, instincts and norms, biological and situational constraints, and conscience. Together, these five basic presuppositions form a relatively coherent relational paradigm of the social world. Its analytical reconstruction serves to provoke reflection whether, and to what extent, Cooley's theoretical ideas find their continuation within contemporary sociology, e.g. in the works of Goffman, Moscovici or Scheff. This could significantly contribute to a better articulation of those variants of contemporary relational sociology that recognize the transactional nature of human experience as a basic heuristics in the analysis of constitution and reconstitution of the social order.

Cooking Filipino Identity through 'Delicious' Activism: Examining the Practices of Second-Generation Filipino Youth in the Filipino Food Movement

Scholarship on youth cultural activism has neglected to showcase the potential of culinary arts as a type of socially-engaged cultural production. To address this gap in the literature, this paper will focus on the Filipino Food Movement, a growing identity-oriented social movement that harnesses Filipino culinary arts as a means to disseminate knowledge about Filipino culture and cuisine. The Filipino Food Movement was originally founded in 2011 by second-generation Filipino-Americans who sought to make Filipino cuisine as ubiquitous as Chinese cuisine in the United States, which speaks to a larger issue of the politics of representation among transnational Filipinos. This study uses interviews with second-generation Filipino-Canadian youth, notably chefs and culinary entrepreneurs who are involved in the Filipino Food Movement, to showcase how their involvement in the Filipino Food Movement is informed by their unique identifications as second-generation Filipino-Canadian youth. I argue that the Filipino Food Movement is implicit in a politics of representation, wherein second-generation Filipino-Canadians use food as a means to challenge their "invisibility" and "hypervisibility" in Canadian society. To this end, I discuss the movement's methods such as digital strategies (i.e., social media, blogging) and community engagement (i.e., events, workshoping), as ways of transforming knowledge about Filipinos in the context

of contemporary multicultural societies. Food is one of the most accessible ways for people to relate to and learn about different cultures, having the potential to reach a wide and diverse audience. Indeed, the Filipino Food Movement is a "third space" (Bhabha 1994), a transformative site through which second-generation Filipinos make use of unconventional methods, like the culinary arts, as a form of cultural activism and as an affirmation of cultural citizenship. Through food, second-generation Filipino youth can express their hybrid Filipino identifications on their own terms—challenging what it means to be Filipino in the twenty-first century.

Leaving the 'Crab in the Bucket': Exploring Structural Explanations to the 'Invisibility' of Filipino Cuisine in Canada

Filipinos are the fourth largest visible minority group in Canada, yet compared to other Asian cuisines such as Chinese, Vietnamese, and Japanese cuisine, Filipino cuisine has remained underrepresented in Canada's culinary landscape. Existing works seem to suggest that Filipino cuisine is "invisible" due to intercultural conflict within Filipino communities, spurred by *utak-talangka* or "crab mentality" (Andrei 2010; Barker 2014), negative character traits that are said to manifest as over-competition, jealousy, and an inferiority complex. Similarly, interviews with Filipino cuisine entrepreneurs and chefs in Winnipeg and Ottawa also pinpoint crab mentality and the "lack of an entrepreneurial drive" among Filipinos as reasons for the absence of Filipino restaurants in Canada. This paper challenges and expands on the crab mentality explanation by suggesting an alternative approach that considers structural factors such as colonialism and structural racism to explain Filipino cuisine's "invisibility". To this end, I connect the Philippines' history of colonization and colonialism's psychological violence on the subaltern's psyche (Fanon 2008; Okazaki, David and Abelman 2008) and analyse Filipino "crab mentality" as "colonial mentality" (David 2013). Structural racism is discussed with relation to (1) the racist legacy of the Philippine exhibit at the 1904 St. Louis World Fair which portrayed an indigenous tribe, the Igorot, as "savages" due to their consumption of dog meat; and (2) the Orientalist depictions of Filipino cuisine in televised programming, notably in culinary tourism programs, which are informed by the logics of neoliberal multiculturalism. Operating under the guise of entertainment and education, these programs frame Filipino cuisine as "exotic" and "risky" foods, subsequently problematizing it. By exploring the cultural production of Filipino cuisine in Canada, we can better understand how the overarching systems of colonialism and racism are implicated in practices of cultural production among racialized groups.

E Governance, Decentralization and Development: An Experience of Gyandoot

Abstract

In India rural people look up to urban areas for its economic opportunities. Most rural population decides to move to urban areas in search for employment, better opportunities and higher living standards. As rural areas tend to lack in basic facilities and infrastructure so development and mobility in every aspect whether social, economic or political is hindered. To reach the vast rural population Indian government has relied on the use of ICTs for development. Many E-government efforts in India strive to improve efficiency, transparency, accountability and effectiveness of the government (Bhatnagar 2004). There has been a continuous effort to improve government processes, provisioning right ambience through deployment of ICT infrastructure at all levels of administrative structure. National e-Governance Plan (NeGP) provides a holistic approach with lay out of a road map at national level. Moreover, it is widely accepted that decentralization is a development panacea across the political spectrum (Bardhan 1996, Manor 1999). So, it becomes imperative to understand how ICT-enabled e-governance can contribute to decentralization of power or rather facilitate a more decentralized form of governance. This paper presents the success factors for rural ICT projects in India. Gyandoot project, one of the successful projects of the government, is taken as an example to understand decentralization of power and development through ICT-enabled e-governance in the rural areas. The study tries to raise some issues which act as roadblocks in the ICT projects taken up in rural India.

Supported Home Ownership and Adult Independence in Milan: The Gilded Cage of Family Housing Gifts and Transfers

This paper analyses practices of intergenerational support for homeownership among different generations of families in Milan, Italy, highlighting the role of housing in family welfare relations and life-course transitions. It makes use of an original dataset of qualitative interviews investigating homeownership pathways and the negotiations of support that they pre-suppose. The paper explores the meanings and moral reasonings behind the decision to accept (or not) support in context of contemporary discourses surrounding the liquidity and availability of housing and finance. It highlights the moral compromises and emotional negotiations inherent in the giving and receiving of support for housing, contributing to a body of literature concerned with the reproduction of home and family. Furthermore, it stresses the importance of homes and housing assets in mediating dependence and re-affirming family bonds within a family oriented welfare context, despite conflict, resistance, and frustrated aspirations.

Family Structure and Chinese Elderly's Mental Health and Life Satisfaction: Does Social Support Matter?

Using data from five waves of the Chinese Longitudinal Healthy Longevity Survey (N = 5,000), we examined the association between family structure and the psychological well-being and life satisfaction of elderly Chinese citizens, paying attention to the mediating role of social support. We also explored whether this association differs by types and sources of social support. Structural equation modeling (SEM) results indicate that living alone was negatively associated with rural elders' life satisfaction, whereas urban elders living in institutions were more likely to be satisfied with their life. Social support not only played an important mediating role, but also mattered to elders' psychological well-being and life satisfaction. The mediating role played by social support differed by types and sources of social support. Implications for the well-being of the Chinese elderly population are discussed.

RC49-822.7

MAO, XUPENG* (*New York University*)

Relationship between Social Support and Subjective Well-Being Among Chinese Older Adults

Using data from two waves of the China Health and Retirement Longitudinal Study (CHARLS) (N = 5,500), I examined the relationship between types and sources of social support and subjective well-being (i.e., depressive symptoms and life satisfaction) among the Chinese older adults aged 60 and above. I also paid attention to the moderating role of three contextual factors (i.e., living arrangement concordance, education, occupation) in these relationships. OLS and logistic regression analyses results indicate that formal financial support and social support from children are important in ensuring the subjective well-being among the Chinese older adults. In addition, older adults with lower education, with agricultural work or no work experience, or with living arrangement discordance had better subjective well-being from having children's instrumental support than their corresponding counterparts. Implications for the well-being of the Chinese elderly population are discussed.

Corporatisation, Authoritarianism and the Threat to Academic Freedom in SA Universities – the Case for Robust Independent Trade Unionism

While scholarly research and attendant debates on higher education in South Africa precede the democratic period, they however grew in intensity in the years following the official collapse of the apartheid system as marked by the first ever general elections in 1994, ushering in a democratically elected government. Central themes to these research and debates were a complex set of questions of transformation of the racially and ethnically fragmented system of higher education as part of redress of apartheid legacy, and the growing corporatisation of universities with potentially adverse effects on access and equity for the

historically marginalised black community, as well as on institutional autonomy and academic freedom. These were also seen as posing threat to job security through subcontracting of so-called non-core activities (cleaning, security and grounds) to private service providers. The looming unrealistic expectations on academics to contribute to generation of third stream income through large quantities of publications and other means such as offering of part-time courses also received attention. Today these fears have turned into a reality. This explains the protests that were led by students demanding free education and an end to outsourcing of work. This paper, based on my observations as an academic in South Africa for the past two decades, a member of trade union, and review of research by fellow academics, examines the manifestation of this authoritarian, neo-liberal managerialist corporatisation trend and its impact on academic freedom in universities. In so doing, I would provide an analysis of the role and significance of robust independent trade unionism in challenging this trend and restoring academic freedom as well as the challenges and obstacles to such unionisation. This I would do with reference to examples in some of the universities in SA.

Youth Theory - a South African Perspective

Theory, and in particular sociological theory, Wallace and Wolf (1980:3) asserted, is about real life situations and experiences, and that "...our whole way of looking at the world depends on our theoretical perspective; and to read sociological theory is to understand a great deal more about what we and our world are like and how unordinary, complex, and ambiguous the most taken-for-granted and everyday aspects of our life may be". This suggests that sociological theory not only informs our understanding of social reality, but that it is itself derived from that reality. This paper concerns itself with the latter. It examines a collection of empirical studies on youth in the contemporary South African society which are part of the book on youth in the BRICS countries, with the view to deriving theoretical insights on youth. These will be examined against the existing conceptual frameworks on youth, and especially the indigenous African concepts of youth.

Continuing Vocational Education and Training (CVET) for a Changing World: The Case of Catalonia (Spain)

According to Luengo (2016), in Spain, the percentage of people in their working-age that have low or no qualification is over 22% higher than the EU-27 (including Norway and Switzerland) average. In what concerns people with intermediate qualifications, in Spain their percentage is less than a half compared to that in the EU-27 (including Norway and Switzerland), while the percentage of people with higher education is superior in Spain by 3%. Luengo (2016) argues that this is a serious problem because the projections are that half of the jobs that will be created in Europe in the next 10 years will require intermediate qualifications, therefore, if we do not change this situation, the future looks very negative for the Spanish society. We will present the results of our study carried out between 2015-2016, in this context of the Catalan system of continuing vocational education and training. The goal of our communication is to present the CVET system in Catalonia, with particular attention given to a government-run programme addressed to unemployed. This programme achieves a high rate employment for the people who participate and it offers high quality and innovative training, adapted to the necessities of individuals and of the markets.

Balance or Unbalance of Professional, Family and Private Life in Contemporary Greece?

Reconciliation of work and private life is an important determinant positively related to the female participation rate, increasing employability, reducing unemployment, enhancing gender equality, promoting the sharing of caring responsibilities and addressing current demographic challenges. Reconciliation policies can be defined as policies that directly support the combination of professional, family and private life. In addition to leave facilities, flexible working-time arrangements, financial allowances and child-care services, family members involvement seem to play important role to combine more effectively these two spheres. The paper investigates how the situations for the reconciliation of professional and personal life of working women in Greece are being shaped in the time of the crisis. Is there more or less unbalance and how it is experienced by working women? Indeed the limited state provisions and lack of childcare facilities in combination with increased costs for private care shapes new conditions for the reconciliation of work and private life in our country. In the context of this paper, we will refer to practices of reconciling family and professional obligations, to the factors that influence them, and to the role of the family and the spouse / partner in achieving better harmonization. In addition, we will attempt to record the difficulties and the problems faced by women as a result of the economic crisis. The data comes from a survey with sample of 1,000 working women living in different areas (metropolitan, urban and rural) of Greece.

RC32-582.1

MARATOU-ALIPRANTI, LAURA* (*Athens University*)

Female Migration in Greece: Integration Process and Citizenship

While immigration in Greece started in the early 1980s, it was only in the early 1990s that significant numbers of economic migrants started arriving and Greece became a new destination country. An additional important feature of the immigration process in Greece is the large proportion of women who migrate alone in search of employment and better conditions of life. With regard to the integration process of migrant women many studies indicate that issues related to citizenship are crucial. In particular the exclusion of women from social goods and their non-active participation in social and political life in the countries of residence are of paramount importance. These issues are key indicators used internationally to measure the degree of social integration of economic migrants. In the contrary, active political participation highlights the level of their integration. In the context of the problematic for the social integration of migrants in new immigration countries a survey on a sample of 600 economic women migrants who had residence and work permit was conducted by EKE (National Centre for Social Research) in 2010 financed by the European Integration Fund. This paper presents some outcomes of the above survey related to the integration process of women migrants living legally in our country. We will present issues regarding the interest of immigrant women in political life, and their participation in collective political activities and organizational schemes.

Staging the Trip on the Screen : Analysing the Representations of the Drug Taking in Films.

History of drugs in contemporary society can be readdressed from the side of the senses, using popular culture and subcultures as materials. Among them, some films tried to deal with the experience of drug taking through a sensorial experience, especially in the second half of the XXth Century.

This paper will analyse a selection of movies depicting drug addiction : *The Trip* (Roger Corman, 1967), *Easy Rider* (1969), *La Montana Sagrada* (Alejandro Jodorowsky, 1973), *The Shoot* (Jerzy Skolimowski, 1978), *Drugstore Cowboy* (Gus van Sant, 1989), *Naked Lunch* (David Cronenberg, 1991), *Trainspotting* (Danny Boyle, 1996), *Las Vegas Parano* (Terry Gilliam, 1998), *Requiem for a dream* (Daren Aronofsky, 2000), *Blueberry* (Jan Kounen, 2004)...

The talk will focus on extracts staging sensorial experience of ecstasy or of the bad trip, but also overdoses caused by drug ingestion. The key-questions will be : how cinema can describe what is unspeakable ? What are the roles of the senses (vision and sound) in the depiction on screens of the altered or parallel universes created by the drug ingestion ? How are suggested the role of the senses movies can't show directly like smell or taste ? For what purpose, being known directors always wanted to express some feelings, values or judgements in the staging of extreme scenes ?

A particular attention will be held to visual grammar used to describe the drug trip: visual and auditory hallucinations, inserts and accelerated montage, slow motion, soft focus, filters of vivid colours... The way soundtrack is also worked to account the disruption of senses will also be highlighted.

Finally, as a lot of these movies were also termed "classics" by critics, these representations had also an impact on social imaginary. Thus their effects on our own perception of the world, passed through popular culture, will also be questioned.

RC02-JS-8.6MARCHETTI, SABRINA* (*Ca' Foscari University of Venice*)GAROFALO GEYMONAT, GIULIA (*Ca' Foscari University of Venice, Italy*)*A Global View on Domestic Workers' Power between Politics, Movements and Unions.*

Domestic workers have been seen as the quintessential example of precarious, informal, hidden and therefore typically unorganized laborers. Notably, their position in the labor markets tends to be negatively affected by contextual factors contributing to the social construction of care and domestic tasks at the intersection of gender, race and class-based differences. Nevertheless, recent decades have seen an increasing visibility of this category of workers, due to the strengthening of their organizations and/or the improvement of normative frameworks that impact on their conditions. These transformations invite us to interrogate the processes through which such informal and precarious workers have acquired new (structural, symbolic or associational) power, and the ways in which this power has been used, for what purposes, and by which actors, depending on the context.

This presentation explores these questions by taking a comparative look at key moments in the history for domestic workers' rights and conditions in the nine countries involved in the DomeQUAL research project (India, Philippines, Taiwan, Italy, Germany, Spain, Ecuador, Colombia, Brazil) starting from the 1950s till today. We focus in particular on how the question of domestic workers rights has come to be, in some specific moments and places, a terrain of intervention for trade unions, political parties, no-profit organizations, etc. We try to assess the interactions among these actors as well as the type of agency that domestic workers themselves have deployed in these different instances, also in relation to the contextual factors simultaneously affecting their conditions in each context.

RC37-665.8MARCIANTE, LUCIA* (*University of Bologna, Department Sociology and business law*)MORALLI, MELISSA (*University of Bologna*)*Culture Innovation and Public Participation Practices: Museomix Case from the Knowledgeability to the Social Capital As Growth Factor*

The innovating practices of digital museology are the answer to the economic contraction in the post-modern society. This is the case-study of Museomix, a creative maketon of French matrix, born in Paris in 2011. The aim of Museomix is to put people on the mainstream in the creation of value for museums. Indeed, this project intend to activate creative practices, considering them as growth tool for the museums audiences' participation. These practices of collaborative consumption change the way to consider culture as development motive and offer a choice in the challenge against the dialogue dearth between capacity to aspire and traditions, at the same time. museomix favors a way of living the cultural spaces of the city, with positive impacts on the community of reference. Through projects of cultural regeneration. The hypothesis is that little museums could become a cultural place where consumers can be engaged and active audiences-citizens. By the *ethos* "Do-It-Yourself" and the idea that co-create is more entertaining that only consume, the main question is if these practices could fill the gap between museums and web cultures participative. The Museomix global project (museomix.org) aims to a museum: that is inclusive; where each participant in the process of creation finds its own place; that is a laboratory which grows together with one's audiences; where the communities are into the network.

Key concepts coming out, such as: consumer's agency, audience development, *empowerment* either of the single and of the community, knowledgeability, innovation, participation. The social capital is the value added in the sense that the quality of the generated relationships can foster integration, inclusion and solidarity for the growth of local communities.

RC51-845.1MARCUELLO-SERVOS, CHAIME* (*Universidad de Zaragoza*)*Sociocybernetics and Lobbying in Digital Times: Siren Servers, Big Data and Future Control*

Jaron Lanier (2013) coined the notion 'siren servers' to describe the relationship between information, technology and business. The interaction of these elements creates a model of perverse economy and political order. Big data is the new fashion and the key to control many aspects of social systems and future social decisions. Siren servers are powerful computers with non-transparent software that suck from the cloud, from the Internet and social networks all type of information of the users. Computers increase the capacity of calculus; this increases the capacity of anticipation and prognosis. Big data is not only massive

amounts of data; it is also money, power and control. Free services, free accounts, free access is the song of the mermaid, from the sea of the data. Facebook, Amazon, Google Instagram, Twitter, ... as many others use our data to make a profit. At the same time, digital sphere allows a non-traditional and complex way of lobbying. It is a circular system, a non-trivial machine where cognitive capture and social pressure have own systemic processes. In this paper, first, we propose a sociocybernetical framework to analyze and discuss these new social conditions and technological constraints. Second, we deep into digital sphere and model lobbying social interactions. Third, we propose the "traceability" of public policies looking at revolving doors phenomena and power relations inside this digital media.

RC14-261.3MARENT, JOHANNES* (*University Trier*)*Symbolic Ordering: Representations of Flight and Arrival in the "European Refugee Crisis"*

Images, used by media outlets, convey specific worldviews that have an influential impact on public opinion about forced migration. This analysis focuses on the role images played in media representations of the "European refugees crisis". It offers empirical evidence for how images offer specific interpretations of the nature of group relationships. This article focuses on the front pages of six daily German and Austrian newspapers during a 3-day period, September 5 - 7, 2015, when forced migrants in Hungary began walking towards Austria and Germany, and culminates with their arrival there. The analysis reconstructs iconic constellations and iconological references, the interplay between text and image, and the political context of production. I argue that there was a transformation in the symbolism of German newspapers, one which is not evident in the Austrian newspapers, whereby images of forced migration shifted from presenting a seemingly uncontrollable danger to constituting a political trump card. This shift, observable in the visibility of previously invisible German locals and personalized depictions of refugee women and children, is more than a demonstration of solidarity – it is a move to gain symbolic power. The German media constructs a narrative of second flight to the "West", reactivating a historic symbolic boundary between Eastern and Western Europe. Images of "the refugee" construct a narrative of a strong Germany (opposed to a disorganized EU) that uses its power for humanity (opposed to Hungary). At the same time, the Austrian media published distancing images which depicted no active part for Austrians, focusing on amorphous masses instead. Although forced migrants are at the center of these images, neither their experiences nor the circumstances for their flight are addressed in them. The marking of difference in these media representations of "the other" primarily serves the collective identity of the nation.

RC03-78.3MARIN LOPEZ, RENATO* (*University of Barcelona - CRIT*)*From Ephemeral Garden to Green Facility, Community Embedding of Empty Spaces*

Within a context of ecological crisis, involvement in community gardens enables daily life to make sense. Community gardens allow the emergence of new narratives of the city, changes in the conception of time and urban rhythm and relations among citizens and heterogeneous social actors. Community gardens in Barcelona are transitioning from pioneering to maintenance phase in part thanks to a program of ceding spaces for non-profit entities. The criteria are: ephemeral and temporary nature, social involvement and self-management capacity and high social impact. Pla BUIITS has proved to be a socially innovative formula for regenerating vacant spaces and produce news social relations. It has a low cost for the municipality and it offers a resource with high social value for organizations that in another way would not be able to afford it. Pla BUIITS owes its success to a particular mix of top-down policy instrument with bottom-up initiative. We conduct a case study of the program to answer why most of the projects were born as community gardens and how they get embedded into neighbourhood social life and local institutions (formal and informal). Following a qualitative approach, we go deeper in three spaces which have strong neighbouring component and they have become intergenerational spaces. The results show how a temporary cession might become a permanent green facility due to the creation of bridging relations. In some cases, erase it could generate a conflict. Despite the projects are, a priori, open to external players, some of them do not necessarily become open spaces with public outcomes. A statement of openness can accompany endogamous dynamics. The discussion around "community" essence, collective efforts or on an individual level is complex. They are different non-hierarchical spheres.

RC08-170.2MARINHO LOPES, ALINE* (*Universidade Federal Fluminense*)*Transatlantic Dialogues: The Reception of French Sociology in Brazil*

The aim of this work is to analyze the reception of French sociology in the Brazilian sociological production of the 1940s and 1960s, trying to understand how authors, themes and concepts from that tradition of thought were read, appropriated and reworked. Taking as a case study the works of Brazilian sociologists Maria Isaura Pereira de Queiroz and Fernando de Azevedo, the paper intends to examine how the circulation and remaking of French sociological ideas contributed for the new syntheses that enriched the discipline. Pereira de Queiroz carried out her university education during the period of the French Mission at the University of São Paulo, and later completed her training in Paris, where she also taught. Fernando de Azevedo played a decisive role in the coming of French teachers to Brazil, having also participated in countless international associations, including in the direction of ISA. The analysis of the trajectories and works of the two authors demonstrates that the Brazilian sociological tradition is part of the global history of sociological thought, which allow us to go beyond the nation-state as an analytical frame of reference.

Migrant and Refugee Children in Polish Schools – (non) Discriminatory School Practices

School is a place and space where the past meets the present and inclusion meets exclusion; where, on the one hand, cultural and social meanings are shared and negotiated and the platforms for dialogue are searched for. On the other hand, school generates resistance and a closed attitude towards that which is different, distinct, towards other values-varying from those that are dominant, towards other meanings and beliefs. This results from a fixed repertoire of content, subjects, issues, ceremonies and rituals that accompany them. Polish school is a place where migrant or refugee children are still relatively rare. School praxis still seems to be oriented towards the needs of a homogeneous environment, with an average, undistinguished child, and most importantly, one who does not stand out against the majority of school class. Field research (observation, interviews, visual ethnography) conducted in school environment allows to discern children's diversity with a clear division into those who are better and worse. Available research indicates that migrant children, in particular refugee children experience multiple, complex discriminatory practices and their cultural context at school as a diverse place and space is ignored or treated in the category of folklore. The aim of the presentation is to outline the situation of migrant and refugee children in Polish schools and illustrate dominant (non) discriminatory school praxis. We will refer to research results from 2015-17 when interviews were conducted among 80 teachers from primary and lower secondary schools as well as parents of foreign children and employees of NGOs who realise interational projects in cooperation with schools. Results of research conducted with the use of visual ethnography-photographs of rituals, places and spaces which (do not) discriminate-will also be presented. The presentation is an attempt at a critical look at the place and space-Polish school-where migrant and refugee children function.

How to Invest, in Whom and for What Ends? the Politics of Social Investment Reforms in Israel 1990-2017

Social Investment (SI) emphasizes the future economic benefits of early and ongoing investment in human capital, and active inclusion via labor market integration. However, even if embraced wholeheartedly, the context of austerity coerce policymakers to decide how to invest scarce resources: what groups to target and which policy instruments to use. Recent studies explore the role of coalitions in the production of distinct SI strategies focusing on, first, the translation of international SI ideas to domestic policy agendas, and second, the politics of SI policies, where actors struggle to define and advance SI policies with different distributional outcomes. This paper focuses on the Israeli case, where SI ideas were introduced and used to advance and shape social policy reforms since the late 1990s. Although Israel is lacking a coherent and persistent SI agenda, it is possible to identify two different SI policy agendas that were advanced by competing coalitions. The first, headed by fiscal bureaucrats from the Ministry of Finance, prioritized short-term budget constraining goals and frequently truncated SI initiatives, particularly those with universal aims. At the MoF, SI was not perceived as instrumental for economic growth. A second coalition was headed by monetary bureaucrats from the Central Bank since the early 2000s, actively calling to breach fiscal constraints and increase social investment in early education, skill formation, and the integration of disadvantaged populations into the labor market. The paper analyzes the role of both coalitions in the politics and outcomes of SI policy reform (1999-2017). In Israel, political cleavages and policy legacies are politicizing social investment in specific un- and underemployed

disadvantaged populations. In the context of austere social spending control, I focus on successful SI reforms and ask what political conditions and strategies made these reforms successful, which populations benefited from them, and how SI policies were designed?

Pathways to Environmental Activism: A CROSS-National Study

What are the key factors that lead individuals to engage in environmentally significant behaviors like activism, and are these the same in different places? To answer these questions, this paper tests a model of pathways to environmental activism across thirty-seven countries spanning three regions of the globe (high income/former socialist/developing) using 2010 data from the International Social Survey Program. Given extant work, we investigate how a core set of predictors including individual contexts, environmental risk perception, pro-environmental attitudes, willingness to contribute, self-efficacy and environmental knowledge affect environmental activism across nations. Results from structural equation modeling with latent variables (SEMLV) reveal that the model is robust across regions and nations, with education, knowledge, attitudes, and willingness to contribute having consistent effects on environmental activism. We discuss the performance of the model across multiple comparisons—the full sample of countries, regions, and individual countries—to provide a comprehensive empirical investigation of pathways to activism. Our study also highlights cross-national variations in the factors shaping activism related to efficacy and institutional structures, yielding insights for future comparative work.

Testing Measurement Equivalence across Nations: An Empirical Investigation of Environmental Concerns

In seeking to describe trends in public opinion about environmental concerns cross-nationally, social scientists use a variety of measures and analytical techniques. Although an understudied topic, the question of measurement comparability across contexts is important for this line of inquiry. Only a handful of studies assess the extent to which measures of environmental concern are comparable in cross-cultural surveys using an appropriate analytical technique. This research examines public opinion on the environment in cross-national context using data from thirty-seven countries in the 2010 International Social Survey Program (ISSP) Environment dataset. We use structural equation modeling with latent variables (SEMLV) to construct a latent variable of environmental risk perception. We examine the composition, level, and distribution of the latent construct environmental risk perception cross-nationally, with comparisons across theoretically-informed regional groups as well as individual countries. Particular attention is given to how structural equation modeling can be used as a tool for testing measurement equivalence in cross-national research.

We conduct confirmatory factor analyses (CFAs) across many axes of comparison (pooled, by region, and for individual countries) given their salience in setting the stage for multigroup comparisons using CFAs (MGCFAs) (Bollen 1989). Establishing equivalence, defined in this study as configural and metric invariance for hierarchy of invariance tests, is vital for this study as MGCFAs enable the testing of to what extent environmental risk perception is invariant across the regions and the 37 countries in the 2010 ISSP data. After establishing measurement equivalence of the latent construct, we investigate how a core set of predictors including individual education, socio-demographics, environmental beliefs and attitudes, willingness to make environmental sacrifices, and personal efficacy shape environmental risk perception across nations. Results from structural equation modeling with latent variables (SEMLV) reveal that the model is robust across nations, yielding insights for future comparative work.

The Bald and the Beautiful: Uchronian Thought in Two Tardian Writings

Uchronian thought can be built on the basis of counterfactuals supported by a temporal bifurcation leading to alternate paths or by imagined futures sustained by factual anticipation or projected desires. Since Renouvier introduced the conceptual underpinnings of uchronie, the uses of counterfactuality as a way of discussing causality in social sciences have been common. Meyer or Weber can be presented as good examples of this tendency. Less usual, but no less important have been the contributions of sociologists who use uchronian devices as a prototypical instrument for dissecting and criticizing contemporary societies

and anticipating possible futures. Among these, it is worth mentioning Gabriel Tarde. Apparently condemned to oblivion, the author is currently enjoying what some have already described as "Tardomania", becoming the putative founder or anticipator of theoretical approaches ranging from the sociology of innovation to actor network theory. Among his vast number of publications, two deserve a special place in the conceptualization of future studies: "Fragments d'Histoire Future" and "Les Géants Chauves". If the first has been analyzed and discussed, the second remains almost completely unknown, even among Tarde scholars. Both documents reveal an aesthetic approach to social and a deep concern with the possibilities of improving the human race by technological means. A tragic but ironic tone is pervasive among these texts that offer a paradoxical reflection on societies and natural environments. Far from the design of utopias, Tarde comes close to the build-up of a sociological science-fiction filled with cautionary remarks, imaginative tales and a systematic use of the language of "possibility", one of the key but seldom referred concepts of the man from Sarlat. In this paper we'll discuss the theoretical and methodological repercussions of Tardian analysis and their possible impact for Future studies.

National Educational Systems and Social Indicators in Latin-America

During last decades, social mobility literature have tried to link educational inequalities to the institutional aspects. Scholars have tried to connect micro with macro dimensions. Thus, some author have proposed to classify educational systems according three dimensions: *stratification*, *decommodification* and *standardization* (Almendinger, 1989; Van der Werfhorst and Mijs, 2010). *Stratification* serve us to know how students are placed in different strata as a consequence of selectivity and tracking process (Bukodi *et al.*, 2017). *Decommodification* refers to the extent to which state provides resources to education (Brunello and Chechi, 2007). *Standardization* is associated to the degree to which nations follow a common policy in relation to budget, examination and curriculum. It is been thought that each of this dimensions has impact on educational inequalities. In this paper we review those indicators according to these dimensions and add others in order to classified educational systems of countries that participate in INCASI Project (5 countries of Latin America and 5 countries of Europe).

Género, Verdad y Memoria En Colombia: Elementos Para El Análisis

A lo largo del reciente proceso de paz en Colombia, el enfoque de género se convirtió en uno de los temas clave de la negociación, llegando incluso a ser uno de los detonantes del triunfo del "no" en el plebiscito de referendación del acuerdo de paz. Como parte de las discusiones que se generaron alrededor de las cuestiones de género estuvieron temas como los derechos a la participación política y a la tenencia paritaria de la tierra, pero también, de manera central, la situación de las mujeres frente a las particulares afectaciones que ellas sufrieron durante el conflicto por parte de diferentes actores armados y, muy especialmente, por agentes del estado, mayores responsables en número de estas violaciones. Mujeres de diferentes procedencias sociales se han referido a la manera como sus cuerpos han sido tratados como botín de guerra, como medio para asegurar el control de un territorio o como mecanismo para asegurar un castigo eficaz al enemigo. Teniendo en cuenta estos antecedentes, este trabajo propone contribuir a la construcción de un marco de comprensión de la dimensión de género en un momento en que se camina hacia la construcción de memoria, verdad y reconciliación.

MARSHALL, BARBARA* (Trent University)

Healthism@Home: Digital Self-Tracking and Embodied Aging

In this paper, I consider the ways that embodied aging may be produced through digital self-tracking technologies, interrogating the underlying rationalities and alignment with neoliberal demands for self-care. While research in the biomedical and exercise sciences focuses on how self-tracking devices can enhance interventions aimed at behavior modification with older adults, I draw on interviews with older users to argue that we need to attend more carefully to how the data produced by self-tracking circulates through the networks of technologies, relationships and regimes of expertise that are embedded in everyday social worlds.

The Use of 'discursive Affects' As Uncertainty Management Strategy in the Context of Neurodevelopmental Disorder Genetics

In the genetic diagnostics of neurodevelopmental disorders (NDDs), uncertainties can be considered common. When answers to diagnostic questions are not forthcoming, 'diagnostic odysseys' describe a prolonged search for causal explanations for a child's NDD. The lack of closure, due to uncertainty, is considered a significant source of anxiety for families and clinicians alike. However, these same diagnostic odysseys can be portrayed as uncertainty adventures with researchers, clinicians, and even patients and their families heroically searching for solutions to diagnostic problems.

This presentation will discuss the 'discursive affects' that experts in NDD genetics used to manage uncertainty in a context in which uncertainty is considered common. The data for this presentation are taken from 16 interviews with experts working in NDD genetics research and/or practice. These experts work in a field that is constantly changing, with regards to new genomic technologies (NGTs), patient populations, and disorders studied and diagnosed. These changes give rise to uncertainties around categories, criteria, and practices.

The discursive affects referred to in this presentation represent my interviewees' affective responses to questions about uncertainty. Two specific, contradictory affects, 'bravado' and 'hesitation,' will be highlighted. Bravado reflected my interviewees' approach to uncertainty as an adventure that was, according to my interviewees, faced fearlessly. They also spoke about their patients as partners in this uncertainty adventure. My interviewees' hesitations around their work, specifically with regards to their lack of comprehensive understanding of NDDs and the goals of genomic testing, illustrated their doubts and reservations, which contrasted with their bravado. These discursive affects highlight ways in which my interviewees shaped and dealt with uncertainty and certainty in the above-mentioned clinical and research contexts.

Social Policy for a Low Carbon Future: The Possibilities of Design, Discourse and Deliberation in a Comparative Context

The necessity of moving towards a low-carbon society is recognised at the international level by organisations ranging from the EU and the OECD to the UN; yet national policy makers in Australia have struggled to develop integrated policy solutions. As such, a crucial research question is how do we institutionalise a *coordinated* transition to a low-carbon society? In this paper the goal is to explore the ways in which social policy, economic and environmental policy solutions to the low-carbon issue might be better integrated in the Australian context, drawing on comparisons with other countries. The paper has three components. First, it problematizes the issue of social and environmental integration. Second, it sets out the research design and theoretical orientations of an interdisciplinary project, sponsored by the Australian Research Council, which is examining the possibilities of social and environmental integration through a number of different lenses. Third, it drills down into one of aspect of the project's design – the analysis of policy discourse at the national policy level – in order to present findings about the integrative (and disintegrative) possibilities of policy framing and political communication in relation to Australia's National Electricity Market and its Renewable Energy Targets. Implications for policy theory and policy synergy are discussed in the final section of the paper.

JOHN, RENÉ (Institut für Sozialinnovation)

Mapping out Practices of Innovation Outside of Metropolitan Areas

Within the field of (social) innovation research, metropolitan areas are often seen as the only spatial arrangement where innovative ideas can be developed and implemented. In order to deconstruct this spatial deterministic assumption, the research project "Broadening Horizons – Changing Perspectives" focuses on areas outside of metropolitan areas. The first goal within the project has already been carried out. It has been the creation of a catalogue of criteria for identifying successful agglomeration distant (instead of so-called rural) regions. We define agglomeration distant region by using a three dimensional continuum. The three assessment dimensions were built upon the three theoretical perspectives: space, innovation and governance. The first dimension refers to the spatial perspective and gives information about the distance to the ideal agglomeration. The second dimension is based upon the innovation perspective and gives information about how resilient in terms of preserving the potential course of actions a region is. The third dimension is based upon the governance perspective and describes the functionality of the regional governance regime. The second goal of the project

will be the description of success stories through tales of overcoming failures as "small losses" (Sitkin 1992) of two agglomeration distant regions in Germany which will be identified using the catalogue of criteria. Qualitative data collection based on fieldtrips including semi structured interviews and ethnographic data collection will be conducted in the next two years. The focus will be on the identification of endogenous regional potential along the three perspectives. The outcome of the research project will contribute to a better understanding of practices of innovations outside of metropolitan areas as well as identifying methods to support endogenous innovative potentials in agglomeration distant areas. This will be presented as an outline of an ongoing project.

Promoting and Measuring Adolescents' and Youth Well-Being: State of the Art and Controversies

La signature en 1989 de la Convention Internationale des Droits de l'Enfant (CIDE) a représenté une étape majeure pour la reconnaissance des enfants en tant qu'adulte en devenir. La CIDE a suscité de nombreuses initiatives dans les décennies qui ont suivi et notamment avec l'objectif de promouvoir leur bien-être. Cette notion de bien-être est complexe à définir et encore plus à mesurer. Les études sur le bien-être des populations et son évaluation se sont développés et ont mobilisé un nombre croissant d'experts et de disciplines à l'échelle internationale. Appliquée à l'enfance et à la jeunesse, cette notion de bien-être implique de tenir compte des spécificités de ces groupes d'âge et du rôle des premiers agents de socialisation que sont les parents, sans parler des questionnements nouveaux et de l'utilisation d'indicateurs et de méthodes de mesures différents par rapport à l'étude du bien-être en population générale.

Lors de cette communication, et dans le cadre des travaux de la chaire « enfance, bien-être, parentalité » (CNAF-EHESP-Arènes), nous proposons tout d'abord de nous interroger sur l'évolution des indicateurs pris en compte pour la mesure du bien-être des adolescents et des jeunes, en synthétisant les apports et orientations de différentes disciplines scientifiques (psychologie du développement, psychologie cognitive, neurosciences, sciences humaines, économie, sociologie) et les savoirs professionnels (Protection Maternelle et Infantile, justice des mineurs, dispositifs de protection de l'enfance, soutien à la parentalité). Cette approche transdisciplinaire permettra de dresser un état des lieux des savoirs autour du bien-être de l'enfant et de repérer les débats et controverses qu'il suscite. Dans un deuxième temps, nous proposons à l'appui des données disponibles de l'enquête HBSC (Health behavior of school-aged children) de formuler des hypothèses pour expliquer la situation de la France en termes de communication entre les parents et les adolescents.

MARTIN, ELOISA* (Univ Federal Rio de Janeiro)

Textures of the Sacred, or How Popular Religion Could Renew Religious Studies

Hundreds of ethnographies, over at least 30 years, have already established that everyday practices deal with the sacred beyond the borders that divide spheres of activity, and that the sacred is lived and recognized in spaces that combine and go beyond religion, including also politics, popular culture, ethnicity, etc. Departing from these previous efforts, this paper will present the idea of the sacred as a differential texture in the lived-in world, but not as something distant or "radically other", as in Durkheimian definitions: the sacred will be analysed as a category which goes beyond the frontiers of the religious sphere to establish markers in the secular world, without necessarily implying a transcendent message or a moral sanction. These textures are created and recognized by practitioners, while combining elements that are not strictly religious to live and 'make sacred'. In this sense, the sacred is not conceived as prior to reasoning or logic since it cannot exist without human agency. By crossing the profane/religious frontier and opening "religion" as the main object of research, this paper propose that the concept of textures of the sacred may open new paths for analysis and a theoretical contribution to renew the sociology of (popular) religion.

MARTIN, SUSAN MARIE* (Independent Scholar)

Pro-Poor Market or 'push-Cart Evil'? the Struggles of Poor Women Trading in 'world-Class' Cities

Michel Foucault observed that even well intentioned policies have the potential to oppress. Historically and globally, this phenomenon is readily observed in cities when seemingly innocuous and potentially beneficial programmes of governance are positioned by civic leaders as meeting social needs by creating 'jobs' and 'cleaning up' inner cities. The result: urban public space is shaped for private gain, and the voices of the urban poor are silenced, their needs ignored, and they

are pushed deeper into the social and economic margins. Across the twentieth century a significant casualty in the rush to create 'world class' cities was the market access rights of women seeking subsistence earnings. For centuries they have entered urban public space as street traders when the macroeconomy failed to produce employment opportunities, and governments failed to produce social supports to meet fundamental needs. However, their presence on the streets means they are visual reminders of the failures of the state and the economy as providers, and so they are, typically, constructed as counter-modern and deviant.

In the affluent 'West' open street markets have been hampered rather than protected by governments; this trend has spread to debtor nations modernising by criteria established in the affluent 'West'. This trend persists despite common knowledge that street markets are vital for the poor as workers and consumers. This paper demonstrates how using a comparative study to create what Foucault calls 'a history of the present' informs the past, and deepens an understanding of contemporary struggles over public space. Qualitative and quantitative data gathered on women street traders in 1920s Ireland, when triangulated with contemporary data on their sisters in Latin America, Africa, and Asia, 'emancipates' the stories of the undocumented, develops an understanding of how governance structures deepen marginalisation, and suggests policy alternatives to hyper-regulation that privileges mainstream business interests.

Visualising Public and Private Space in Everyday Life

This paper draws on data from the empirical research study *Photographing Everyday Life: Ageing, Lived Experiences, Time and Space* funded by the ESRC, UK. The focus of the project was to explore the significance of the ordinary and day-to-day and focus on the everyday meanings, lived experiences, practical activities, and social contexts in which people in mid to later life live their daily lives. The research involved a diverse sample of 62 women and men aged 50 years and over who took photographs of their different daily routines to create a weekly visual diary. The visual portrayal of public and private space was shown to be significant and included distinctions between private space (e.g. the home) and public space (e.g. work, social spaces, parks, shops). The portrayal of space was moreover nuanced, interconnected and complex, e.g. more photographs were present of 'public' areas in a home (e.g. lounge, kitchen) than private areas (e.g. bedroom); some spaces reflected dimensions that are normatively constructed as both public and private (e.g. gardens, some work spaces); as well as the ways participants moved between public and private spaces (e.g. use of transport). Some participants were also noticeably more uncomfortable and reluctant when photographing certain areas, such as work spaces and colleagues, or taking photographs in some public places. The paper concludes by highlighting a complex engagement with space, in which participants drew and re-drew boundaries surrounding meanings of space, sometimes within the same interview or even within a discussion of the same photograph. This suggests that when 'doing' age and ageing, spaces and places themselves, together with images of these contexts, have no 'fixed' meaning (Massey, 1994), but rather that meanings are made and re-made in the moments that spaces are both visually depicted and reflected upon.

KRABEL, JENS (Coordination office "Men in Early Childhood and Care" c/o Catholic University of Applied Sciences)

Cuidados, Cuerpos y Emociones: Los Hombres En Educación Infantil Reconfiguran Las Relaciones De Género

Las reflexiones aquí presentadas parten del análisis de la experiencia de transformación del perfil profesional en las escuelas infantiles de los educadores-cuidadores en Alemania con el programa *Männer in Kitas* (hombres en educación infantil). Dicho proyecto, impulsado y financiado por el Bundesministerium für Familie, Senioren, Frauen und Jugend (Ministerio de Familia, Tercera Edad, Mujeres y Juventud) se pone en marcha hace una década, para fomentar que los hombres participen en una profesión muy feminizada en casi todos los países. Una década más tarde se replica el estudio, una aproximación cualitativa y cuantitativa, para conocer cómo se ha transformado la profesión de los y las educadores infantiles. En esta ocasión también se aplicará el estudio a mujeres, lo que permitirá tener una perspectiva de cómo se han reconfigurado las relaciones de género a partir de la puesta en marcha de dicho programa. Con los datos de dicho estudio, pretendemos presentar una reflexión sobre cómo la incorporación de los hombres a este ámbito ha cambiado tanto la forma en la que se entiende el cuidado y la forma de educar en las escuelas infantiles. La relación cotidiana de los hombres con las criaturas en este ámbito permite vislumbrar cómo se conforman nuevas masculinidades, su relación con los cuidados, las emociones y con los cuerpos. En el universo de la educación infantil los hombres han contribuido a reconfigurar el contenido de la profesión del cuidador/educador, incorporando nuevas visiones y posibilitando la génesis de nuevos valores y estilos de trabajo (Cremers y Krabel, 2012; 2014). El análisis,

realizado desde una perspectiva de género e interseccional, se centra en el estudio de dos de las dimensiones que operan en el trabajo analizadas en otro lugar bajo la propuesta de "domesticación": la dimensión corporal y la emocional (Martín Palomo, 2008).

Las Políticas De Cuidado De Personas Mayores: Un Análisis Comparado En Argentina, Uruguay y España

El bienestar de las personas se alcanza a partir de un complejo ensamblaje de recursos. Hay formas diversas de dar cobertura a las necesidades de los más mayores: sea fomentando la vida activa y el autocuidado; sea a través de la familia, de las instituciones públicas, del mercado, o de la sociedad civil. El proceso de construcción de políticas de cuidado para mayores en Iberoamérica es de reciente historia. En términos generales, pueden delinearse dos vertientes: una que pone en el centro la necesidad de ciertos grupos de población de ser cuidadas, por tanto, es un enfoque de políticas focalizadas sobre determinados colectivos (generalmente, los más vulnerables; como ocurre con programas puntuales en algunas ciudades de Argentina); la otra que coloca el foco en la organización social de los cuidados como asunto de intervención pública, por tanto, es un enfoque de políticas universales, para toda la ciudadanía (al modo que se planteó en la ley vigente desde hace una década en España, o la ley de 2015 que crea el Sistema Nacional Integrado de Cuidados en Uruguay). Realizar un mapeo de las políticas de cuidados para las personas mayores en Iberoamérica implica trazar dos cartografías: por un lado, una que dé cuenta de las formas en las que los estados emprenden políticas en este sentido; por el otro, describir comparativamente el marco normativo e institucional que las consagra en diferentes países, Argentina, Uruguay y España, como representantes de tres diferentes modelos. En dicha cartografía se buscará establecer una breve historia de la génesis de dichas políticas: sea desde las políticas sociales, sea desde las políticas de salud, de vejez, de exclusión. Sea desde las políticas de género y conciliación, de familia, de empleo o de uso tiempo.

Adequate or over-Education: The Demand of Work Force at Company in Spain and Italy.

Fortunato, Vincenzo; Martín-Artiles, Antonio; Lope, Andreu; Barrientos; Daniel; Moles, Benajmi (University of Cosenza; Autonomous University of Barcelona). ISA CONGRESS: GROUP 55. INCASI PROJECT

The purpose of this exploration is to study the adequacy of training to employment based on the opinion of the employees themselves. The relationship between training and employment is a singularly important debate that emerges with each educational reform, or with the technological transformations linked to the new paradigms in the organization of work and to the new organizational models of companies. This debate has led to the development of theories of correspondence, "connective" theories, linked to certain aspects of the theory of human capital and functionalists. The debate is not new, but it is endless. The origin of the debate between training and employment dates back to the end of the 19th century. The thrust of the connection between training and employment seems to be related on two sides: that of educational institutions because of their interest in controlling curricula linked to modernization and industrialization: educational institutions were trying to avoid being marginalized from technological progress. On the side of companies, whose demand for new professional profiles with greater technical preparation was an unavoidable necessity.

Family Ties & Aging in Changing and Challenging Times: When Care Comes Home

Today's aging families are historically unprecedented: they are smaller, fewer people are marrying, more are childless, first-time parents are older than ever before. Not only are more people living to old age, more are living longer in old age. This combination of individual longevity and co-longevity of generations represents new terrain for families. This paper examines how older people and their families are impacted by structural forces that shape the everyday dynamics

of family care, beyond the impact of proximate contextual experiences. Social forces, reflected in changing family structures, national immigration policies, labour laws and housing affordability, add to challenges for families when care 'comes home' in later life. The concept of *relational properties* is used as a heuristic device to examine how institutional imperatives and social and cultural factors shape experiences of care at home. A decade of Canadian research on home care at the 'nexus' of the public and the private spheres emphasizes how care for and to older people is a dynamic negotiated process involving workers, family members and older people themselves. Analyses of 'nexus' data identified three relational properties of family care in later life: collectivity (understanding home care beyond the dyad of older client and paid care worker); contingency (the regulatory authority of agencies; materiality and characteristics of home space; variability in skills and characteristics of paid care workers); and cultural diversity (emphasizing ethno-cultural diversity between workers, elderly clients and family members). These relational properties enable examination of how social forces impact family care, along a continuum from highly collaborative where paid and unpaid carers "share the care," to contested, reflecting cultural differences in race, culture, and social class.

Age, Gender and Cast for Ethnographic Research in India: The Intersectional Challenges of Language and Meaning across Cultural Frontiers

This report is from a study of the consequence of advanced management training for Indian, industrial sector engineers. Technical acquisitions aside, the Western model training was taken principally as a new International Managerial Language (IML), effecting changes in perspective and action both at work and at home. In this very large, multi-lingual country, language and meaning are volatile commodities with use varied by context; resulting in serious challenges to assure constant comparative treatment during the four-phase iterative-ethnographic phases of the work. The larger study included 102 interviews; 50 with managers, in their offices, reported here.

The intricacy of power /gender / and caste relations imposes not only for Indians at work and home, but for researchers. There is deep-rooted tradition of respect for mature and experienced individuals, along with devout admiration towards professors –typically of the highest cast level; but, a post-colonial ambivalence for the out of cast *white-face*, can moderate behavior and communication.

The respondent-managers were mostly elite, highly educated, male engineers; including a few women, treated equally at work. This did not mirror the broader societal-place granted to Indian women, with professional life entwined with family position and Western-individuality unfathomable. Particularly evasive is the caste-issue: kept invisible to Westerners, referred with researchers only 'on the oblique', since caste-status treatment is legally prohibited—yet fostered from the bottom-up by affirmative action laws; and all the time constituting the Social-DNA of Indian relations.

To appropriate these dilemmas, a culturalist reading of the identity and relationship issues of India is developed. Calling upon the concepts of fundamental values (Kluckhohn & Strodtbeck 1961), communalism (Schwartz 1997), power distance and future orientation (Hofstede 1987), and communication style (Hall 1961). With reference along the way to Suddaby (2006) for methodological inspiration and Bourdieu (2000) who stimulated interpretative treatment of the data.

La Participación De Los Jóvenes Universitarios En La Asistencia a Los Damnificados Después De Los Recientes Sismos En México

Durante el mes de septiembre se suscitaron diferentes sismos en la república mexicana, los cuales tuvieron efectos devastadores en la zona sur y centro del país. Desde la fecha se han contabilizado más de 350 personas fallecidas y cerca de 3 000 inmuebles seriamente dañados. Ante la emergencia muchos estudiantes universitarios en la Ciudad de México desde sus respectivas escuelas organizaron sus propios centros de acopio, brigadas para la remoción de escombros, y diferentes actividades de apoyo en las poblaciones afectadas. En tiempos recientes diferentes encuestas habían planteado que la sociedad mexicana era una sociedad poco participativa, más aún que los jóvenes se encontraban entre los sectores más apáticos, entonces se hace imperante saber ¿Por qué los jóvenes universitarios participan de cara a los recientes sismos ocurridos en México? ¿Qué condiciones causales los llevan a participar de cara a estos eventos naturales? Mediante la elaboración de entrevistas a 30 estudiantes (con participación y sin participación) provenientes de dos campos disciplinares diferentes (humanidades y ciencias sociales) se busca conocer cuáles son las configuraciones de condiciones que permitan explicar la participación y la apatía de los universitarios. Esta investigación utiliza el análisis comparativo cualitativo (QCA) escasamente utilizado para explicar las motivaciones de la participación ciudadana en casos con N pequeña. Esta es una investigación en proceso que planea tener resultados preliminares para el mes de febrero de 2018.

The Dispute for Equal Marriage in Mexico. a Longitudinal Field View

In Mexico we have an unfinished process on the recognition of the rights of same-sex couples. Nowadays equal marriage is legal in one-third of the states of the country. Given this gradual progress, last year the presidential initiative that would validate civil unions throughout the country was rejected by Congress of the Union under pressure of conservative groups.

The current state of affairs in equal marriage has had the intervention of different social, political and institutional actors in a trajectory of three lustrums. These actors have developed different processes of interaction and dispute in the public sphere and in the field of political decision making for the configuration of different institutional arrangements.

This paper is based on strategic action field theory (Fligstein and McAdam 2012) which is useful to understand processes of interaction and dispute among actors with different interests for the establishment of institutional social arrangements. Through the longitudinal analysis of speeches and performances (2001-2016) of organizations involved in the dispute processes, information is provided to analyze how the field operates and defines the rights of equal marriage.

This research identifies three episodes of opening and closing: (1) introduction of the rights agenda by the LGBT movement and the involvement of the ruling party in the country capital (2001-2009); (2) Supreme Court intervention, movements, and leftist parties in the entities making changes to expand rights (2010-2015); the most recent dispute, (3) where conservative groups succeed in blocking the presidential proposal of equal marriage (2016). Together these episodes of dispute and agreement allow us to explain the unfinished rights of same sex couples in Mexico and to glimpse the potential stagnation of the agenda in the coming years.

International Organiztion and Bad Social Analysis: Early School Leaving and Youth Which Are Neither in Employment Nor in Education or Training

Los organismos internacionales producen estadísticas de gran impacto mediático y político, pero de escasa claridad analítica. El abandono educativo temprano y los jóvenes que ni trabajan ni estudian ("nini") son dos ejemplos de este problema. Ambos conceptos guían los debates públicos sobre la juventud y el mercado de trabajo, pero generan mucha confusión, llevando a la toma de medidas políticas poco adecuadas. En el caso del abandono educativo temprano se confunde obtener o no una titulación académica con estar cursando estudios, lo que supone objetivos claramente diferentes de política educativa. Por tanto, una subida o bajada de este indicador no nos informa claramente sobre la evolución del sistema educativo. Por otro lado, los "ninis" confunden la inactividad laboral con el paro, que también son dos fenómenos claramente diferentes, cuya evolución como indicador no nos permite separar los jóvenes que no quieren

realizar una de esas dos actividades de los que no encuentran trabajo. La crítica de estos indicadores nos lleva a la necesidad de emplear otros que solo reflejen una dimensión social de cada problema tratado, para que su evolución en el tiempo nos informe adecuadamente de cómo evoluciona la sociedad. La sociología debe ser más crítica con los indicadores elaborados por este tipo de organismos, y no usarlos como categorías centrales en sus propios análisis. El debate se ilustra con datos del contexto de la Unión Europea, especialmente de España.

Discursive Technologies in the Psychological Government of Subjectivities: Happiness and Resilience in Times of Neoliberalism

During the last decades there has been a significant proliferation of psychological discourses linked to the notions of 'happiness' and 'resilience', related to the so-called 'positive psychology' in vogue today. These notions have become important references in different areas of social life, being continuously deployed in professional practices, media, institutional management and public policies. In particular, such notions have become central to a growing therapeutic culture articulating numerous devices of social and subjective regulation (i.e. self-help literature, coaching, popular culture). This paper seeks to analyse how these discourses on 'happiness' and 'resilience' take part in psychological technologies governing subjectivity, understanding them as particular regimes of truth defining the relationship of the subjects with themselves and with others. It explores how such discourses construct a certain model of psychological subject and promote specific social relations inscribed in a matrix of power. In particular, the paper discusses the relationship between these discourses and a neoliberal rationality for the government of behaviour and subjectivity in contemporary capitalism. Through discursive analysis of some psychological materials typical of the therapeutic culture in the Mexican context, we examine the way in which the use of such languages and symbolic repertoires is consonant with the neoliberal logic that promotes a subject as 'entrepreneur of himself'. Such an approach allows us to understand recent discourses about 'happiness' and 'resilience' as social practices with a significant impact on the psychological management and regulation of individuals in the contemporary social world.

Gender and Social Action in a Mexican Province: A Photovoice Project with Activist Women

In this paper we present a research project aiming to explore activist women participation in social and political action in the Mexican province of Colima. This province is characterized by a recent and significant increase in violence against women including a high rate in feminicides. In this context, the research project seeks to explore the ways in which women, as a particular vulnerable group, engage in community development and social transformation processes. The photovoice methodology is used as a participatory action-research technique that elicits participants' expression of experiences, perspectives and knowledge through photographic production. This methodological approximation allows to explore social factors relevant to women's experience in activism, accounting for fields or areas in which this participation is developed, political strategies, social capital, cultural and institutional obstacles and the role played by gender in the configuration of particular forms of engagement in social action. Moreover, this methodological device also allows to approach these relations from the situated perspective of the participants' lived experiences, acknowledging embodied subjectivities as a fundamental condition to understand social and political engagement. Analysis of the relation between gender and social action is undertaken from a feminist theoretical perspective, seeking to understand gender-based power relations shaping the problem. A particular contribution of the project is the discussion about the potentiality of photovoice as a participatory research instrument consistent with with feminist theories and epistemologies.

Factores De Riesgo Psicosocial En Trabajadores De Aseo Público: Caso Celaya, Guanajuato

Si bien es cierto que en las últimas dos décadas se ha puesto énfasis en la discusión acerca de los factores de riesgo psicosocial en las organizaciones y las consecuencias que éstos tienen para los trabajadores, también lo es que no se trata de un tema nuevo, aunque sí con diversos agregados a lo largo del tiempo (Moreno-Jiménez, 2011).

Cuando se habla de los factores de riesgo psicosocial, se hace referencia tanto a aspectos de la persona como del lugar y puesto de trabajo, de ahí que se definan como aquellos elementos del trabajo que al interactuar con las características individuales pueden generar daño en la salud del trabajador (Osorio-Escobar, 2011; Neffa, 2002).

El objetivo de esta investigación fue identificar factores de riesgo psicosocial en trabajadores del área de aseo público (recogida de basuras domésticas y limpieza viaria) de la ciudad de Celaya, Guanajuato (México), a través de observación in situ con el fin de diseñar lineamientos básicos de seguridad e higiene para este grupo de trabajadores.

Los principales factores de riesgo identificados mediante la observación de las actividades realizadas por el personal de aseo público fueron: revisión al salario; relaciones interpersonales entre los trabajadores; apoyo a los trabajadores respecto a toma de decisiones, mejora en las condiciones y equipos de trabajo; condiciones laborales (lugar de trabajo, horario, equipos de protección, material de trabajo); ampliación de la plantilla; promoción del desarrollo personal; seguridad laboral; enriquecimiento del trabajo.

A partir de dichos factores se elaboró una propuesta de lineamientos básicos de Seguridad e Higiene para los trabajadores de aseo público que contempla atender veintidós aspectos relacionados con factores higiénicos y nueve con factores motivadores (Herzberg, 1959).

Regulation from within? the Role of Minority Representatives in the Local Governance of Religious Diversity

The regulation of religious diversity in the public sphere of Western European countries has increasingly become an issue of political and scientific interest. State actors and institutions are no longer the only active agents in these processes. As some authors have shown, governance networks composed of a variety of state and non-state actors are increasingly gaining prominence in the regulation of religion (Martikainen, 2013). Particular attention has been paid to the role of individual religious actors as well as that of interfaith groups and platforms at the local level (Dick & Nagel, 2017; Griera, 2012). Drawing on qualitative fieldwork conducted in three French cities between 2015 and 2017, in this presentation I enquire to what extent and how do representatives of minority religious groups contribute to the "formatting" (Roy, 2013) of religious minority practices in the context of the local governance of religious diversity? How do these representatives intervene in the shaping of particular religious subjectivities deemed "acceptable" and "legitimate" in the public sphere in contrast to those considered "problematic"? And how do they navigate, and contest or accept the regulatory role imposed on them by local public authorities?

The Process of Transnational Higher Education System Creation

The work to be presented has as theoretical reference the reciprocal relationship between the process of globalization and higher education. It aims to emphasize the contemporary higher education at the international level. It is immersed in a swirl of profound social, political, economic and cultural changes that affect most countries. In this perspective, the paper emphasizes that an adequate sociological analysis of the transformations that are taking place in contemporary higher education at the international level needs to consider both the global context, in which it is situated, and the national systems. The paper seeks to highlight that in the context of globalization, economic, political, cultural and academic activities are not confined within the limits of national societies, but tend to overflow beyond their borders. This same dynamic of the process of globalization is also present in contemporary higher education, in which the global level and national systems have a reciprocal relationship. It aims to analyze certain trends of transformation that are occurring in the international context of higher education in contemporary societies. Supported by appropriate literature and also observations by the author (France, England, Hong Kong and Singapore), the information collected to date tends to indicate that in the context of globalization, higher education is not confined more within the limits of national societies, but has transpired beyond the borders of their countries. The exhibition will focus on certain dimensions that, in establishing mutual relations, gradually come to form a transnational space for international higher education, such as: (i) the process of deterritorialization of higher education; (ii) increasing academic mobility; (iii) the impact of international rankings in the field of higher education; (iv) race in certain countries and / or institutions of higher education to build world class universities, in a context of fierce international competition for academic prestige.

MARTINS, PAULO HENRIQUE* (Federal University of Pernambuco)

Internal Colonialism and Oligarchic Domination from Inter-Ethnic Conflicts

The theory of internal colonialism systematized by authors such as Pablo Gonzalez Casanova and Immanuel Wallerstein even in the 1960s is important for postcolonial and decolonial studies. Such theory contributes to broadening the social class marker, including others such as ethnicity and nationality that help explain the complex dynamics of conflicts and social pacts. Internal colonialism makes a great contribution to the understanding of ethnic disputes between indigenous peoples and colonizing elites, as is evident, for example, in the cases of Mexico, Ecuador, and Bolivia. However, it seems to us that this theory is equally important to explain the system of oligarchic domination. This suggestion makes sense when we understand that oligarchies in postcolonial societies are ethnic groups that organize power and control patrimonial assets from blood, family, and color identifications. It seems to us that the crisis of countries like Brazil and others in Latin America can be clarified when we understand that behind the economic and political question there is an important ethnic dimension in the structuring of power and conflicts. The racism generated by ethnic practices explains the impossibility of the invention of a republican pact necessary to promote social rights to inclusion and egalitarian citizenship.

About Some Tensions in the Building Process of Climate Justice Movements

About some tensions in the building process of climate justice movements

My intervention will focus on key tensions in the building process of climate justice movements in Europe and in Maghreb. My fieldwork on different branches of this burgeoning network on this side of the Atlantic Ocean underlined a structural issue: the discrepancies between the global climate justice framework and the way most local struggles against high carbon-emitting projects think and organize themselves.

Indeed, the collectives for climate justice based in Paris that I followed and participated in during two years – in their majority composed of urban, white, middle-class activists – seek to articulate their involvement in solidarity with "frontline communities", whether they are in Europe or not. By contrast, the latter make little to no reference to the concepts of "climate justice", "environmental inequalities", "political ecology" etc.

My presentation will in particular draw from a blockupy movement against an airport project in Brittany, as well as a toxic tour collective that aims at bringing attention to territorial pollution in Paris suburbs. It will also summon the perspectives of activists, notably from Maghreb, that denounce the neo-colonial potential of the climate justice movement.

Life Events, Living Arrangement and Satisfaction Among Rural Elderly

This paper discusses about the life events of the elderly, their current living arrangement and their satisfactions. A study was carried out among 173 elderly in Maruthamputhur village of Tirunelveli district. The findings reveal that 43% of the elderly are living with their spouse, 23% are living with their son, 45% are living alone, and only 8 % are living with their daughters. Nearly half of the respondents (41.6%) are very much satisfied with their current living arrangement, 19.6% of them are satisfied to some extent and the remaining one third (38.7%) of them are not satisfied. Satisfaction with the current living arrangement varies across different forms: the highest proportion of dissatisfaction is among those who are living alone (61%), followed by living with daughter (31%) and living with sons (22%); the least dissatisfaction is when they live independently with their spouses (14%).

The life events such as the marriage of son/daughter and the death of the spouse have brought them difficulties. Most of the elderly experienced neglect by the son after getting married. The sons do not provide care or support to their parents. In majority of the cases where the elderly are living with sons, property plays a key role. Once the property is transferred to them, the conditions become worse due to the problems made by sons/daughters-in-law. In Indian society which is marked by the patriarchal system, the elderly are expected to live with the son. But compared with sons, daughters are found providing better care. Daughters too are comfortable in living with their parents consequent on the death of spouse, separation or disability. Most of the elderly people experience loneliness, particularly loss of companionship, in their later life after the death of the spouse

RC21-402.1MARX, VANESSA* (*Universidade Federal do Rio Grande do Sul (UFRGS)*)*New Urban Agenda between Internationalization and the Right to the City*

The dialectic between Global and Local in the globalized world establishes itself with force in the management of the cities. Cities, social movements and organizations, and transnational corporations have become agents in the international system, influencing not only territories but also global governance. Globalization and the influence of new actors in transnational governance have impacted the guidelines by explaining the contradictions of the New Urban Agenda and Habitat III.

The disputes in the city through the democratization of uses and the public space are increasingly fierce. The housing occupations in the central zones become a means of invoking and alerting on the urban deficit and the inequalities produced by the gentrification of certain districts of the city. Urban activism, as a way of claiming social movements fighting for housing, highlights the exclusion promoted by the capitalist system as in the case of the 4th district in the city of Porto Alegre (Brazil).

On the other hand, the international action of cities and their recognition in this context make them political actors that promote their territory and manage to raise resources with the support of the State, at times creating exceptional regimes to attract foreign investments, as in the case of mega-events which were held in Brazil such as the World Cup and the Olympic Games.

This article demonstrates the complex and contradictory relations that are established in the territory with the impact of globalization and the financialization of cities. The social movements agenda in the fight for housing and public spaces claim the right to the city, in search of a collective view on urban problems in the face of the prioritization of capital and individual dynamics that has occurred not only in Brazilian cities, but in cities of other parts of the world as well.

RC56-JS-32.3MARYAM, HAFSA* (*American International University*)*Assessing the Existence of Empathetic Attitude of Bangladeshi Urban Men Towards Working Women*

The number of women getting employed in formal jobs is increasing rapidly in Bangladesh. With this, the traditional concept of gender roles is also shifting. This paper aims to understand the degree of empathy married men feel towards the participation of females in workforce in Bangladesh. Being a conservative society, the traditional belief has always been towards men as the earners and providers while women are supposed to be the caretakers. The primary purposes of this paper are to assess and compare the perception of married men, whose wives are either working or non-working, towards women who are working in formal jobs. In addition to the marital status, the other parameters of this study will be the age, income, the societal and the religious background of the participants.

A sample of 288 male participants was used, out of which 138 had working wives and the rest 150 men had stay at home wives. The instruments used in the survey were the newly developed multidimensional aversion to women who work scale (MAWWWS) and another questionnaire developed by the researchers.

Changing family structures and access to education were reported to be the dominant determinants towards empathetic attitudes towards working women. Moreover, young men were found to be more understanding about working females. It was found out that those working women were more favored who could prioritize their family responsibilities over their professional roles.

This study is about the societal prejudices as well the acceptances that women who are engaged in income generating activities receive from their spouses and from other men, especially in their respective workplaces. There isn't much availability of literature about the overall attitude of men towards working women in the context of Bangladesh. It should be replicated in other countries to investigate the resulting differences, if any.

RC07-150.3MARZOCHI, SAMIRA* (*Federal University of São Carlos - UFSCar - SP*)*Cyberspace, Subjectivity and Decentering: The Political Emancipation As Problem of Time and Space*

There are many authors of contemporary social theory, - philosophy, psychoanalysis, anthropology, history, economics, sociology, - that underpin the preponderance of the space category over time category. In economic, cultural and political spheres, we can observe the increasing primacy of "space" in the constitution of subjective experience in relationship with the advent and spread of digital technologies, and their reflections in the field of political culture. Especially from the second half of the 20th century, new relations between time and space are impregnating the production, consumption, labor ethic, world-views, artistic productions, new behaviors, political practices and sensibilities. The new political practices based on immediate subjectivity, which live in an eternal present, that prevents the imagination of the future and their ruptures, can dismiss the

idea of political project, totality and universality. A short-term political economy dissolves the representation of the arrow of time and blocks the perception of any dimension beyond the present surface. The "online" metaphor puts us exactly on the line of history. The time flows on this line, but between its banks, we feel only the exigencies of an absolute present time. It no longer offers the prospect of a vanishing point, but the inertial speed. In fact, "we don't have time"; a new kind of space made by instantaneity - the cyberspace - involves us, showing off like all the possible space of action.

RC29-531.7MARZULO, EBER* (*Universidade Federal do Rio Grande do Sul*)*El Espacio De Los Pobres Como Locus De La Narrativa De La Criminalidad Violenta*

En el presente trabajo se problematiza las relaciones, locus y agentes de la criminalidad violenta, a partir de obras de la literatura y audiovisual. Las obras de producción audiovisual tanto como la literatura contemporánea han establecido una narrativa que expone los aspectos intrínsecos a la violencia en los grandes centros urbanos de las Américas y, muchas veces, incluso sin comprometimiento con la verosimilitud, elementos ineludibles para el problema. Están en el libro Ciudad de Dios y su repercusión mundial y polémica en Brasil, desde su adaptación al cine (2000), o en el libro El año en que Zumbi tomó a Rio, ficción distópica de una ciudad de Rio atacada por el narcotráfico con poderío bélico militar. También en serie global, en la cual un afroamericano con poderes extrahumanos actúa en la disputa por el poder en el barrio de Harlem en Nueva York. Allí están el narcotráfico asociado a política, expresando los intereses de las agrupaciones criminales; la policía, como presencia sólo penal y violenta; y la comunidad con el superhéroe defendiendo su identidad. Hay el tema de la compra de armas letales de compañía bélica de traficante por el Ayuntamiento a la policía, a través de la mediación del personaje que hace la concejal distrital del barrio, para enfrentarse a los superpoderes del superhéroe que es el defensor de los débiles y oprimidos miembros de la comunidad afroamericana. Se explicita en la producción audiovisual y literaria las relaciones complementarias entre industria bélica, narcotráfico y Estado penal-policial tal como descrito y analizado por la literatura académico-científica y el locus de esta relación: los barrios periféricos de los pobres de las grandes ciudades occidentales. Son los atributos espaciales de los territorios de los pobres que interesa analizar como parte de la narrativa sobre la criminalidad violenta en la sociedad contemporánea.

RC38-JS-3.6MASCHMANN, TINA* (*Methodenzentrum Sozialwissenschaften, Georg-August-Universität, Göttingen*)*Perspectives on Intersectional Interrelations in Biographies of First-Generation Students.*

The core business of social-constructivist biographical research is to reconstruct biographical trajectories, which are interrelated with historical societal processes and individual processes of action. By combining different approaches to the research object, and by the search for diversity of perspectives and the reconstruction of self-attributions and attributions by others, this approach is predestined to uncover processes of positioning and intersectional interactions in life-histories. As current developments in biographical research show, an explicit consideration of balances of power in individual and collective historical processes is a worthwhile addition (Rosenthal 2016). But the extent to which discrimination, exclusion processes and inequality dimensions are considered and weighted still depends largely on the sensitivity and education of the researcher.

This is why I argue for a systematic and explicit integration of the concept of intersectionality into the process of hypothesis formation and abductive inference.

I have implemented this approach in my research, which is based on biographical-narrative interviews with first-generation students and their parents and gained an insight into how the interrelationships between gender and class, or social positioning, can have effects within family systems. On the basis of a case study, I will discuss how the educational advancement of a child may shift the balance of power in the family system, and why parents sometimes find it harder to deal with the educational advancement of their child if it is a girl.

RC38-676.3MASSARI, MONICA* (*University of Naples Federico II*)*The Body of the Others and the Politics of Refusal in Europe*

The body in its insuppressible materiality and, at the same time, profound symbolic value represents the *place* where the wounds of History's violence inflicted by present time may be mostly visible. The dead body carried out by the waves during the umpteenth Mediterranean shipwreck. The besieged, kept at distance and rejected body across the European frontiers. The exotic body sold and bought within the sex market in the streets of our cities. The body

dreaded and, therefore, denigrated, vilified, because perceived as a symbol of an otherness which is considered incompatible with the West. And, still, the subjugated, subaltern, racialized body. The silent, voiceless body of those who have been confronted with the horror and the unspeakable and that appears stripped, besides of its rights, of any human value. Bodies apparently relegated in the most hidden interstices of our modernity which actually ask for and induce at looking at the historical, political and social matrixes of the suffering that they are emblem of. But, at the same time, bodies which bring carved in the flesh uncomfortable memories which scatter moral and cultural horizons which we considered acquired. On the basis of the outcomes of various pieces of research in the field of migration carried out by the Author through the adoption of a biographical approach, this paper aims at reflecting on the role played by bodily images and widespread bodily social representations in shaping the perception and public reactions on refugees in contemporary Europe, by focusing in particular on the debate aroused since the emergence of the so-called *refugee's crisis*. The aim is to provide a reflection on the processes of social construction of otherness in contemporary society through an approach which combines analysis of case-studies with theoretical social reflection.

MASSIDDA, LUCA* (*Tuscia University*)

Morphology of an Election Campaign. Deconstructing the Plots of Political Storytelling in 2018 Italian Vote.

Morphology of an Election Campaign. Deconstructing the Plots of Political Storytelling in 2018 Italian Vote.

The fundamental features of contemporary political culture - the weakness of ideologies, the personalization of political action, the crisis of intermediary bodies and the fragmentation of the audience - continue to stimulate the process of "mediatization" of politics. In this context, it is not surprising that the political world looks with increasing interest to the media logic of television seriality, the narrative genre that more than any other is now showing itself capable of capturing the attention of the fickle "postmodern" viewer. In particular, election campaigns are increasingly becoming complex narrative architectures focused on the performance of political leaders and organized in multi-strand plot-lines.

So why not use some categories of narratology to read the patterns of political competition? Why not adapt content analysis tools, normally used to decompose and classify storytelling, to deconstruct the plot of political communication?

The paper will present the first results of a research conducted on the self-representations built by the main Italian political leaders engaged in the 2018 election campaign. Among the variables analyzed: narrative target; setting elements; cast's composition; narrative roles; forms of representation; modes of enunciation; themes; plots and master plots; morals; ideologies; moods. The goal is to identify and classify the basic narrative structures of contemporary political communication, with particular attention to the behavioral patterns followed by political leaders during an electoral competition.

Solidarity-Building with Anti-Extractivist Struggles in the World March of Women in the Macro-Norte Region, Peru

This paper seeks to address the theme of the session by presenting and discussing research results on recent evolutions and challenges facing mobilizations in the World March of Women. We document how, since 2011, the World March of Women has been forging solidarities with the struggles of non-feminist others in the Macro-Norte region of Peru as part of its process of movement building. We also show how, in this process, the struggles against extractivism in which peasant and indigenous women are involved have been actively redefined as "women's struggles" and as congruent with the popular feminism of the March. These developments are important for feminism as they are contributing to expand the political platform and priorities of the March beyond the more classical feminist issues (women's poverty and violence against women) it had initially embraced at both the local and transnational scales. Taking on struggles against extractivism as a new priority is also posing challenges for feminist mobilizations, among which is the ability of popular feminism and of the March to integrate more intersectional perspectives. In particular, we highlight how, in our case study, the March has engaged in solidarity building with the anti-extractivist struggles of the indigenous community of Canaris while both naming and eliding indigenous difference to the benefit of an analysis centering neoliberal capitalism. The paper draws on data collected in 2015 as part of Anabel Paulos' doctoral research on convergence spaces in Peru and of Dominique Masson's broader research project on solidarity-building around food sovereignty in the World March of Women.

A Comparison of Russians and the Leader Countries in Economic Development By Modernization Indicators, Based on Wvs Data

This report is devoted to comparing the values of Russians and inhabitants of the most successful countries in economic development. The study is based on the World Value Survey data (wave 6, 2010-2014). The purpose of the study was to compare the data for Russia and the data of the leading countries on modernization indicators to determine whether changes are taking place in favor of economic development or are a brake on it. To identify the values that contribute to the modernization of society, we use the typology proposed in L. Harrison's "The Central Liberal Truth." Harrison explicates the theory developed by the Argentine sociologist M. Grondona. In this theory were distinguish a group of cultural factors that influencing on progress. They form a typology consisting of 25 points, according to which it is proposed to analyze the degree of progressivity of cultures. Cultures favorable for economic development are opposed to cultures that resist such development. We selected analogues of these 25 points in WVS and compare them between Russians and the inhabitants of the four most competitive countries in Europe. To determine the group of European leading countries in terms of various indicators of modernization, 10 indicators of economic growth, outlined by Harrison, were applied. These indicators were used to assess the progressiveness of countries (117 countries were ranked). Indicators of progress, reflect the level of welfare, the level of confidence in institutions, the level of corruption and the nature of income distribution.

Effectiveness of CCTV Systems in Crime Reduction: A Quasi Experimental Study in Eight Polish Cities

Video monitoring systems (video surveillance, CCTV) has developed in many countries around the world in last 20 years. It is a technical tool instrumental in the execution of social norms relating to public order. However, studies show that effectiveness of CCTV systems crime prevention is ambiguous (Lim et al. 2016; Welsh and Farrington 2002; Gill and Spriggs 2005; Piza et al. 2014). Assessment of crime prevention function of CCTV systems appears methodologically difficult, due to data limitations, and complexity of the topic. In our paper we present results of the investigation on CCTV effectiveness in crime prevention in eight Polish cities. Cities chosen for the analysis have at least 100 cameras and are relatively big (more than half a million inhabitants on average). The period of 2005-2015 was taken for analysis. Data on crime (six categories: car theft, car damage, burglary, robbery, fight and assault) were obtained from the Police. The study follows the experimental scheme, with installation of cameras treated as the experimental intervention. The experimental areas (where cameras were installed) and control areas (without cameras) areas were determined via spatial, GIS based analysis taking into account socio-economic criteria, such as: size of the area, number of inhabitants, dwellings type.

The analysis is based on the relative change of the crime rates in experimental areas in the years prior and after CCTV implementation. To our knowledge it is the first study applying quasi experimental method to several locations in parallel, and measuring long time series (10 years).

MATEOS MORA, CRISTINA* (*University Pablo Olavide, Sevilla*)

The Effect of Cultural Aspects on Electoral Behaviour: The Protest Vote.

The last municipal elections have shown a growth in the vote to new electoral office as a blank vote.

For us, this electoral behaviour is an 'exit' electoral strategy, in terms of Hirschman, of the traditional political party arena (1977) which we have called a 'protest vote' (Herrera, Mateos, Navarro, 2017). The objective would be to explore the contextual factors that would facilitate this electoral behaviour.

These contextual aspects will include: a) the influence of the effects of crisis in Spain today, and b) the cultural or symbolic aspects that we will try to measure through the application of a 'cultural scenes' approach. Other demographic aspects (such as age, gender, social position, political attitude) will be controlled in order to understand the importance of the contextual aspect in the emergence of these new and ascending political proposals.

The cultural dimension has been extensively studied and related to analysis of social mobilisations, political participation or innovative processes, among others. However, we will try to emphasise within the cultural aspect its most symbolic dimension which in turn is more related to the political behaviour of citizens.

Thus, the analysis tries to focus on how some of these contextual aspects will condition, or even act as facilitators for, the possible 'protest vote'. In this sense we rely on the works of Miller and Silver (2015), Silver and Miller, (2014), Rooduijn and Burgoon (2017).

Therefore, our research questions will be the following:

- Do you explain the electoral context through the cultural context? In such a case, is there a cultural scene that promotes a protest vote?

This will be done with secondary data provided by the Ministry of the Interior in the municipal elections of 2015, and data from the Census as well as surveys.

MATEOS MORA, CRISTINA* (*University Pablo Olavide, Sevilla*)

Urban Regeneration Policies: Effects on the Cultural Dynamics of Cities

Urban regeneration projects are instruments based on integral interventions in territories that present some type of urban vulnerability.

In Spain, since the 90s, urban regeneration projects have been carried out in different cities, where the work of these initiatives try to influence the opportunities that the environment offers to the inhabitants of the neighborhoods intervened.

The characteristics of the projects themselves may have effects on different aspects of local well-being, for example in terms of their cultural dimension, among others.

In this case, we analyze the effect that these projects present when it comes to forming cultural dynamics through the specialization of their cultural facilities. That is, how intervention through urban regeneration projects affects the formation of different structures of opportunities for the development of different lifestyles and practices of cultural consumption. Namely, these processes influence the formation of different 'cultural scenes' or the evolution over time of these 'scenes'.

In order to do this, we will analyze the impact of urban regeneration projects through a quasi-experimental design, namely, we compared urban areas with integral intervention (experimental areas) and similar urban areas without interventions (control areas).

This paper uses information gathered under the URBANIMPACTS project financed by the Ministry of Economy and Competitiveness and FEDER (CSO-CSO2015-70048-R)

Sexual Violence and Emotional Well-Being of Widows in South East Nigeria

Most studies have examined the inhuman practices meted out on widows in the South East Nigeria. But this study is focused on sexual violence and emotional well being of widows in South East Nigeria with the aim of ascertaining the factor that necessitate sexual harassment and emotional torture on widows in this region. The main purpose for the institution marriage is companionship. To the traditional Igbo society, marriage is not only a union between a man and a woman; it is a union between communities and clans. Thus a woman who is married into a family is regarded as a wife to the entire kindred. She is often referred to as *Nwuye anyi* (our wife), She is cherished by every member of the family both male and female, young and old. Despite all these, losing one's husband to death leaves the woman in a state of dilemma. She is exposed to all manners of dehumanizing challenges, prominent among which are sexual harassment and psychological torture. Qualitative data was gathered from 100 participants from Abia and Imo states of Nigeria. The participants are widows whose age range is from 17 to 68 living in the rural and urban communities. Key Informant Interview (KII) was also conducted with four elder, two from each state. Analysis was made using descriptive method. The study observed that widows are deprived sexually and thus, vulnerable to sexual abuse by the extended members of their husbands' family. The younger widows are more disposed to sexual abuse than the older ones. The study therefore suggests the establishment of widows' foundation at federal and state levels where widow's welfare will be properly addressed.

Parental Leave and Intra-Regime Differences in a Liberal Country: The Case of Four Canadian Provinces

This paper compares access to parental leave benefits in the four largest Canadian provinces –Québec, Ontario, Alberta and British Columbia between 2000 and 2014, using quantitative data from the Employment Insurance Coverage Survey. We show patterns of inequality in the nature and the extent to which parents are supported by leave benefits following the birth of a child. Our analysis reveals that, like labour market participation patterns, social class (using family income and educational level as markers of class), gender and province of residence correspond with the level of support parents receive. We argue that Alberta and Québec represent two regimes of parental benefits. In Alberta the take-up of maternity leave is low, and is closely related to income and educational level. In addition, very few fathers use parental leave. Conversely, the vast majority of mothers and fathers have access to parental benefits in Québec. We argue that Alberta is closer to a liberal regime of parental benefits, while Québec is closer to a social-democratic model. In the discussion we address how leave benefits replicate class, gender, and geographic inequality, and structure family care options.

A Story of Racial Capitalism: Dialectics of Place and Imaginaries

In this paper, I present a dialectics of the city and imaginaries of black masculinity to examine the operation of hegemony in racial capitalism. First, I trace labor narratives in the African city from colonialism to crisis, narratives through which racial signifiers took on cultural overtones. I focus on Abidjan, Côte d'Ivoire, where in the French "civilizing mission," as a privileged class of *évolué* [evolved] citizens, African – and male – interlocutors of the colonial state were the first wage laborers incorporated into the capitalist economy. The wage persists as a register of civilized manhood in the postcolony despite the proliferating informal economy. Next, I examine imaginaries of blackness in transatlantic dialogue. In what I call *imaginaries of negation*, modern urban subjectivity demanded approximating whiteness through work and its overlapping cultural identity. During anticolonial and antiracist struggles, *imaginaries of affirmation*, in response, asserted "black power" and "black is beautiful." Anchored in Marxist traditions, these affirmations were positioned against racial capitalism: the double hegemony of the politics of representation (race), and political economy (capitalism). Finally, as *imaginaries commodified*, coincidental to the global contraction of wage labor for black men, iconic black men in mass media representations become celebrated capitalist tropes. They fracture the once-singular opposition to the double hegemony of the politics of representation and political economy. Blackness, hyper-commodified, becomes a vehicle of consent. I suggest that the double commodification of blackness, as productive potential and cultural artifact, together define the project of racial capitalism.

Non-Standard Work Schedules and Long Work Hours: The Dual Influence on Workers' Work-Family Conflict in Japan

Economies that operate 24 hours per day and seven days per week have emerged in many developed countries in response to globalization, a shift toward services, and information technologies. These changes have increased the number of non-standard work schedules, such as evening, night, and weekend shifts outside the historical nine-to-five workday. Japan is unique because non-standard work schedules have been penetrating its culture of long work hours. This context might be difficult for workers and their spouses to balance work and family, and it might be a barrier to women's social advancement in Japan, where there is a strong gendered division of labor. This study investigated the effects of long work hours (weekly and overtime) and non-standard schedules (shift and Sunday work) on workers' and spouses' work-family conflict and related outcomes (sleep quality, feeling of being rushed, life satisfaction). Secondary data on a nationally representative sample of 1,654 couples (with children) in 2015 were tested using multiple regression analysis. The results found that long work hours and non-standard schedules had a dual influence that worsened workers' work-family conflict and the related outcomes. The impact was stronger for males than for females. Male workers' overtime days and Sunday work worsened their work-family conflict and shift work lowered their sleep quality. Interactions between long work hours and non-standard work negatively affected work-family conflict for the males. Husbands' long work and non-standard work did not influence their wives' outcomes, but wives' work conditions influenced their husbands' outcomes. Increasing non-standard work in Japan seriously degrades health and work-family conflict resolution for male and female workers. Women's employment opportunities might be limited because they seem to be avoiding these work styles as much as possible.

Constituting Shared Workspaces and the Moral Order: Analysis of Workers' Practice in a Japanese Animation Studio

This presentation presents a research on moral order in office by empirically analyzing the case of a Japanese animation studio. In the Japanese animation industry, many animators work as freelancers on a piece-rate wage system; however, approximately 90% of them work for animation studios. This causes tensions because animators need to spend their time with different members in the same studio, despite freelance work having the advantage of allowing discretion. For example, they need to communicate with the managerial staff to arrange production schedules. In this session, I reveal how studio members treat and solve this tension in the course of their actions. For this purpose, I conducted fieldwork in an animation studio (Studio X) in Tokyo for three months, which involved participant observations, interviews, and video recordings. As an analytical concept, I used Lucy Suchman's "constitution of shared workspaces (CSW)," which indicates that spatial order in a workplace is constituted through the various activities of workers using verbal/nonverbal actions, tools, and physical environments. From this perspective, it was discovered that members in Studio X engage in some practices in order to preserve their autonomy. For example, animators' drawing desks are designed as personal spaces with partitions and shelves, members avoid talking to others around the animators' desks, and when they need to talk to someone sitting at their desk, they try to minimize the duration of interaction by leaving their desk as soon as they finish talking. In sum, these practices make a space a personal workspace and maintain the moral order in Studio X, indicating office ethics in the sense of respecting individual workers' autonomy. In this way, spatial order and workers' practices are significant analytical topics for studying the moral order of various workshops, workplaces, and offices.

Peer Workers As the Health Workforce in Japan: Broadening the Concept of "Health Workforce" and Current Challenges

In recent health workforce policies, the employment of peer workers—lay persons engaged in health and social care services—has increasingly become common internationally. Evidence has shown that peer worker-based interventions increase service user empowerment. These situations resulted in broadening the concept of "health workforce," which used to refer to skilled professional workers in general.

In Japan, patients, family members, and community residents have increasingly been involved in the provision of health and social care, and some are paid workers employed by local governments and healthcare organizations. The present study analyzes various cases of the implementation of peer workers in health and social care in Japan and clarifies challenges behind it.

Different levels of challenges have been found through analyzing these cases. First, there is a challenge in the lack of understanding of the usefulness and role of peer workers. As there is a large perception gap about peer roles among health service workers, recruitment methods, collaboration with health professionals, and working conditions have been uneven.

Second, related closely to the first point, there is a problem in human resource development. Several studies have shown that peer workers have rich experiences of illness as patients, which are useful in health and social care services if their way of sharing those experiences with service users can be properly developed. However, in many cases, peer workers are regarded as "quasi-professional," and their training is based on knowledge transmission and technical acquisition as common features of professional education, although, as pointed out in previous works, approaches to supporting service users are not the same between health professionals and peer workers.

What Makes Values of Coworking Spaces?: A Comparative Case Study in Tokyo, Bali and Berlin

This research explores the value of coworking spaces and nomad work based on ethnographic fieldwork in Shibuya (Tokyo, Japan), Ubud (Bali, Indonesia) and Berlin (Germany). Business has underscored the principles of connection, collaboration, and innovation in recent years. Furthermore, efforts have been made to design workplaces that foster these values. This has been made possible by an offline world that holds new beliefs due to the overlap between online and offline. The development of mobile and social media has no doubt promoted the trend of working in any location. These three cities have gained attention in recent

years as a city that is exploring and implementing the movement of location independence in life and business.

This trend represents a new world: 'second offline'. 'Second offline' indicates a context in which virtual information is superimposed onto real space. It means having information from the Internet in one's daily life and regularly referencing it (Tomita ed, 2016). We can consider PCs and the (early) Web to be 'linking media' that transcend physical zones and connect workplaces, as is the case with telework. In contrast, we can consider mobile and social media to be 'superimposing media', which indicates a restructuring and upgrade of workplaces from a new perspective, as with coworking spaces and nomad work.

This paper analyzes how workers and directors in coworking spaces make co-organize their "community" by fieldworks conducted in three city which are in different social context. We also discuss how do work "space" becomes work "place" from theoretical viewpoint of Tuan's terms; "space" and "place".

Expatriates and Changing Employment Practices of Transnational Companies

Expatriates have been categorized as a privileged group because of their economic and institutional advantages in the process of migration. They may have been, but rapid social change led by globalization and neoliberalism is changing their social status and employment situation. This paper aims to show a new diversity of expatriates so as to cast doubt on the general image of expatriates as global elites, using the case of Japanese transnational companies in China.

Transnational flow of Japanese expatriates to emerging countries in Asia was expanded since late 1980s. Intra-company relocation of managers and engineers for the purpose of knowledge and technology transfer was widespread at this early stage. Japanese transnational companies introduced a new transnational employment system in 1990s, in which workers moved individually to the destination and were hired directly by overseas branches, usually through staffing agencies. Now two different types of expatriates work in the same workplace in Japanese transnational companies. The latter migrant workers are positioned relatively lower in the hierarchy as well as in terms of remuneration and benefits than company-specific expatriates and are called "locally employed workers."

How and why did Japanese transnational companies introduce the new expatriate system? How does this new employment practice affect the social status and the employment environment of expatriates? Based on empirical research in Shanghai and Hong Kong since 2009, this paper examines the new phase of globalized employment practices in Japanese transnational companies.

The Varied Conceptualisations of Subjectivity, Agency and Social Structure in Current Sociological Research on Educational Strategies – Implications for Our Understandings

This paper examines how sociological research on family educational strategies in specific contexts handles one of the classic oppositions found within the social sciences – that between a focus on subjectivity and agency, on the one hand, and social structure, on the other. While research addressing subjectivity and agency tends to be ethnographic in approach, focussing on practices, cultural discourses and socialisation processes in particular settings, studies concerned with social structure often draw on quantitative data. In both cases, however, subjectivity, agency as well as social structure are sometimes explicitly and at other times implicitly addressed through the research design, the empirical data referred to and, not least of all, the theoretical lenses guiding the analysis. In more quantitatively-focused work, conceptualisations of subjectivity and agency are sometimes absent, though they tacitly assume there are actors behind observed patterns. Other times, research in the field may draw on Durkheimian-styled collective representations of group practices, more psychology-oriented notions of behaviour, or a variety of constructivist conceptions of agency. As for social structure, scholars variously engage with Weber-inspired stratification theory, space or field-oriented concepts (introduced by Bourdieusian scholars), less clearly defined systems of social organisation inspired by the cultural turn in social class analysis, and, more recently, often employ the less theorized notion of 'the market'. In this paper we review a group of studies representative of the different approaches taken within research on family educational strategies, highlighting the variety of concepts and research designs employed and the rationales for this. We specifically focus on the assumptions made in the studies' interrogations of family educational strategies, and consider how the theoretical and empirical approach taken shape, and support, what is claimed about the observed relations between education, social groups, and individual practices.

RC10-207.3MAXWELL, JESSICA* (*The James Hutton Institute*)*Reflections on the Use of a Participatory Action Research Methodology to Investigate the Development of a Global Knowledge Product*

This paper reflects upon the use of a participatory action research approach to investigate a global knowledge production process. The process was convened by the International Union for Conservation of Nature (IUCN) to inform the development of the Key Biodiversity Area Standard (KBA Standard). This research explores the role of participatory action research in studying the complex interplay that exists between research, policy, and practice in the field of biodiversity conservation. The primary aim of this research was to work with the IUCN to understand and evaluate the purpose, process, outputs, and outcomes of the knowledge production process towards improved reflection, learning, and ultimately practice. This involved working closely with practitioner partners from the IUCN by collaboratively defining the research problems, designing and implementing the research methods, and evaluating the process. This paper reflects upon the benefits and challenges of using of a participatory action research methodology in this context and provides recommendations for how this could be adapted and used in future global knowledge production processes.

RC17-326.3MAY, TRISTAN* (*EMLYON Business School*)*Rebel, Rebel: Insurgent Users and the Identity Rollover in the Field of Electric Guitars*

With this study I aim to shed light on how and under which conditions organizations reflect and recreate dominant discourses and cultural-institutional arrangements against the backdrop of social-cultural upheaval. To do so I venture into the electric guitar industry and inquire with a historical case study how the field's identity shifted from one of a fairly neat character enrooted in country music and white Swing traditions to a rebellious one with the non-conformist values of rock-stardom. In particular I focus on how the insurgent users rising to fame in the gaze of the countermovement of the mid and late 1960s reinvented the understanding of the electric guitar. In stark contrast to the manufacturers' ambitions to create sonic perfection, these rebellious guitarists found new affordances in the artefacts. They drove their amplifiers to the maximum in volume and cut their speakers just to get a dirty, distorted tone. Only years later, when rock music was fully established in its own right and after the countermovement lost its political momentum, the manufacturers caught up on the cultural phenomenon, commemorated it in a nostalgic fashion, and heavily built their identity claims around the "sex, drugs, and rock'n'roll" myths.

While previous research silently assumes that organizations basically ignore their insurgent users, my case study highlights the unintended consequences and their avalanche effects on the organizational, field, and institutional level. As such I inquiry how agency is distributed between organizations and their audiences. This is relevant as the boundaries between organizations and audiences are getting in our digital age increasingly blurred. User-generated content is getting preponderant in marketing efforts and also the discursive interactions between organization and audience become more and more means for strategic appropriation. My findings suggest a mutual cat and mouse game in the quest for recurring legitimacy.

RC09-188.1MAYVILLE, AVIDEH* (*George Mason University*)*The Transformation of "Capacity" in the Field of International Development: USAID in Afghanistan and Pakistan, 1977-2017*

This study exposes the transformation of "capacity" within the development discourse through a discursive analysis of USAID projects in Afghanistan and Pakistan between 1977 - 2017. Capacity development has emerged as a pervasive component and objective of aid in the discourse, in spite of being ill-defined by donors. The question of what capacity is, how to build it, and to what end begs deeper theoretical questions on Western notions of global progress and order, state and market, and the applicability of these models to post-colonial states. USAID is a significant actor in the industry of aid with an unrivaled role in the production of projects, providing a unique institutional vantage point from which to realize relationships and networks of aid production. USAID explicitly states that "AfPak" is vital to US national security, citing security and governance challenges in both countries as reasons for sustained efforts in development. This raises important questions about the nature of projects to build 'capacity' and how they are linked to foreign policy interests.

The fates of Afghanistan and Pakistan are intertwined. The colonial demarcation of their shared border exacerbated ethnic and tribal tensions adapting to a state system. Each state's internal dynamics are complex. The porous nature of the border enables insurgencies, some of which intermingle with state actors and

carry out covert state agendas locally, regionally, and globally. The questions of governance and legitimacy have remained in dispute since the inception of both states, underscoring the importance of how capacity and legitimacy are related in governance. This study demonstrates that Western notions of progress are masked by the concept of capacity in the development discourse and translated into projects constructed by institutions, government officials, academics, and private sector actors, perpetuating historical relationships of global inequality that corrupt and compete with indigenous models of governance.

RC25-477.3MAZANIELLO-CHEZOL, MAUD* (*Centre de recherche de l'Institut universitaire en santé mentale de Montréal*)*Les Modeles De Conflits Dans Le Discours De Patients : Une Etude Des Recits De Maladie (Conflict Patterns in Patient Stories: A Study of Illness Narratives)*

Avec la recrudescence des maladies chroniques et de la gestion sur le long terme que ces conditions de santé nécessitent, les politiques de santé publique basées sur les recherches scientifiques favorisent les approches centrées sur le patient, la personne ou l'utilisateur partenaire. Toutefois, la relation soignant-soigné et tout ce qu'elle implique durant la maladie de la personne malade, depuis la suspicion d'un état anormal biologiquement jusqu'à l'état de rémission, est sujette à de nombreuses dynamiques conflictuelles au vu des décalages entre les connaissances médicales et 'profanes'. Cette analyse vise à identifier l'émergence des conflits et de leur résolution dans 35 entrevues de patientes canadiennes ayant reçu un diagnostic de cancer du sein. Étudiant la diversité des voix présente dans les entrevues (en termes d'âge, de diagnostic, de stade de maladie, d'origines ethniques, de niveaux d'éducation), nous avons dégagé les typologies de conflits. Dans ce travail, nous avons mis en avant les potentiels conflits pouvant surgir dans le parcours de soin des patientes atteintes d'un cancer du sein. Dans les récits, trois systèmes de confrontations émergent et s'inscrivent dans une perspective écologique des conflits dans la relation de soin. L'étude des conflits dans les récits de maladie souligne une organisation souvent normative des acteurs impliqués dans la ligne de soin des patientes. Ces résultats ouvrent la voie à des recherches futures sur l'intégration de ces modèles de conflits dans la formation médicale afin de les anticiper pour améliorer le parcours de soin des personnes malades. Pour ce faire, une approche personnalisée centrée sur les systèmes interdépendants de conflits est recommandée pour une pratique médicale sensibilisée à l'écologie des individus.

RC04-86.1MAZIDI, MOHAMMAD* (*Shiraz University*)NAZARI, FATEMEH (*Shiraz university graduate student*)*Educational Inequalities in Iran Based on the View Points of Some of the Educational Experts and Qualified Teachers*

Inequality is an important issue in this modern world that cannot be easily passed along. In fact inequality across all its meanings is the humanity's ignorance of human beings. The human that has been emphasized on their equality and equity since the beginning of human creation. If we have a detailed analysis of inequality, we will see the power on the one hand and the lack of awareness on the other hand. The power of the oppressors and the lack of awareness of the oppressed. So inequality has appeared not only in one dimension, but also in all aspects of human life. One of the important dimensions of inequality in the world is educational inequality. Study of roots and core components of inequalities in each educational system can be very important step towards reducing it. In this study, the researchers intend to examine the components of educational inequalities in Iran's educational system. Therefore, the present study is conducted within the qualitative paradigm using Grounded Theory (GT) method. Data were collected through an in-depth interview in which the participants of the study (the educational experts and qualified teachers) were selected in a purposeful manner considering the maximum variation sampling and saturation point regulations. Results of the study revealed that different aspects of educational inequality were realized in Iranian educational system.

RC06-130.2MAZUY, MAGALI* (*Ined*)*Childlessness in France : Recent Trends*

In the low European fertility context, French fertility is one of the highest in Europe. The level is quiet lower since two years, after more than two decades of stability.

This 'sustained fertility' is also driven by strong procreative norms: few women remain childless, and even very fewer by choice, and childlessness varies according to educational level. Most of the births occur while women are between 25 and 35 years old. Fertility at youngest or "oldest" ages is not so well accepted.

Most of births occur outside marriage and conjugal situations at birth are more diverse.

Fertility pathways are polarized: young mothers are more often belonging to low social status, and there are strong discrepancies in private life pathways of women. Higher educated women used to remain more often childless.

But some of these norms are a little bit changing.

The aim of this paper is to analyze the recent evolutions of social differences in childlessness in the French context of "high" fertility. We assume that fertility indicators can show that social differences are vanishing, even if private life pathways of women are, in France, diverse, despite a low level of childlessness.

MCALLEESE, SAMANTHA* (*Carleton University*)

Political Activist Ethnography: Considerations for Public Criminology and Sociology

The literature on public criminology (and public sociology) brings about discussion around what does or does not count as public academia. Some authors see the role of the public criminologist as newsmaker (Barak 2007) while others envision having more of a direct influence on public policy (Currie 2007). In reading these discussions and debates, I notice a preoccupation with using public criminology as a way to maintain the relevance of the discipline rather than with creating criminological (and sociological) knowledge with and for communities that can be used to mobilize and support activism and advocacy work.

This paper will consolidate literature on political activist ethnography (see Smith 2006) with literature on anti-oppressive research practices to resolve some of the debates in the public criminology literature and to consider a way of *doing* criminology that is not only public, but that is also more engaged, active, and innovative. Incorporating this methodological literature into discussions of public criminology is important for those of us who are involved in social movements, who work frontline in the community, or who are involved in other forms of activism or advocacy.

Ultimately, this paper endeavours to answer the following questions:

- How can political activist ethnography and other anti-oppressive research practices serve to strengthen the practice of public criminology?
- Can these methodological considerations help strengthen the relationship between academia and the community? Research and practice? Knowledge and social justice/social movements?
- How do criminologists and sociologists produce meaningful/rigorous academic research while also being involved in social justice movements, frontline work, advocacy and/or activism?

Do Politics Belong in Football? the Case of Celtic F.C.

In recent years, debates surrounding the question of whether politics can be legitimately expressed in the context of football have been reinvigorated in Scottish society. In 2016, the Scottish national side, along with the English national side, were fined by FIFA for displaying the remembrance poppy symbol on their strips in a World Cup qualifier, in breach of a rule which prohibits 'political, religious or commercial messages at football matches'. Football supporters are subject to similar restrictions, particularly in Scotland, where the contentious Offensive Behaviour at Football and Threatening Communications (2012) Act criminalises, among other behaviours, forms of political expression.

This paper draws on my recently-completed doctoral research: a qualitative exploration of the meanings and experiences of football supporters in the West of Scotland. Through semi-structured interviewing and ethnographic observations, the research uncovered binary representations of football supporters as 'roughs' and 'respectables', as supporters for whom football is a site for alternative political expression are routinely marked out and treated differently from 'respectable' supporters by the authorities. This paper focuses on participants' narratives regarding how they internalise and in some cases resist these stereotypes, reclaiming football as a space for class solidarities and alternative political expression. The paper focuses specifically on a sub-section of supporters of Celtic Football Club who engage in expressions of support for Irish Republicanism. It explores how their football affiliation is bound up in their understandings of their national, ethnic, social class, and political identities. Given the current political context, as Scotland's place in the United Kingdom is increasingly insecure, participants' narratives offer an important insight into how complex identities are made sense of in a time of significant political, socio-economic and cultural change.

Fake News in Real Paradise: Turning a Blind Eye to Untold Truths in Tourism.

ABSTRACT: In recent months and years, debates have been raised about the use of various media to promulgate misinformation about people, events and places for political and/or financial purposes, leading some commentators to hail the 'post-truth' era. Partially, this concerns the epistemology of journalism, the idea that truth is relative, and the spread of 'fake news'. Yet the shift from traditional to digital media has opened up critical questions concerning the professional practices of the media industry and also the power of ordinary people to influence many others through social media. In tourism this is not a novel issue, destination information is always mediated. However, in today's democratised media world, which enables information about human rights abuses, exploitation, modern slavery and so on to be disseminated broadly, there seems to be little appetite amongst potential tourists to destinations to understand or undertake action in the face of these alternative facts, or truths about destinations. This paper will examine discourses of truth in tourism by focusing on the specific localities which have continued to operate as successful tourism destinations despite conflicting media coverage concerning human rights and exploitation. It will apply the lens of consumer ethics to tourism to discuss how and why truths and lies are woven and/or filtered. The paper will explore how tourism can be mobilised to promote ethical practices.

Categories of Race in Australian Indigenous Peoples

This paper seeks to detail the ways in which, in Australia, rulers sought to shape conduct among racialized parts of the population by seeking to governmentalize the category of race, producing and managing 'mixed race' groups with specific effects for their communities, their children and their descendants. Liberal forms of government, including authoritarian forms of governing, were mixed with forms of bio-politics in ways that produced devastating effects on cultural and family ties into the present. The paper examines these sociological and historical events in the context of current escalating rates of incarceration of Indigenous people in Australia.

Platform Capitalism, Millennials, and an Online Labor Movement? Flexibilization from a Labor Perspective

Labor leader Ed Ott (2014) remarks in his conclusion to *New Labor in New York*, "The old labor movement missed a lot, especially as the world changed around it." (291). What does it mean, then, that the ways various types of workers are responding to challenges they face regarding the organization of their work looks quite similar to tried-and-true union methods? In this paper, we argue that the gig economy is the paradigmatic example of what happens when opportunistic employers find themselves awash in an economy of un- or under-employed youth. We remain suspicious at the continued (re)production of the gig economy as a system of work and its resultant negative consequences. Yet resistance and pushback forged mainly by organizations of young workers have sought to thwart the growing trends of the gig economy, so as to prevent those trends from spreading too pervasively and altering the terrain of more "traditional" labor and employment relations.

The paper explores how we see this phenomenon play out through three general trends: workers vying for more control over their schedules and their hours through Fair Workweek Initiatives and other legislative policy changes, workers developing their own online platforms and organizing them in cooperative manners, and workers not traditionally seen as being easily organizable utilizing collective bargaining strategies and also uniting to form new, flexible unions that redefine the very concept at its core. We understand this flexibility as a call for the labor movement's renewed energy in thinking through new forms and strategies, and we argue that millennial workers' efforts at resistance demonstrate those new, flexible tactics needed to build a better labor movement, both online and in the streets.

MCCANN, GILLIAN* (*Nipissing University*)

A Plea for the Cosmopolitan in the Age of "Common Sense"

In an interview, the academic and writer Azar Nifisi lamented the lack of attention paid to cosmopolitan traditions within Islam by the western media. In this paper I will build on Nifisi's observation and examine more generally trends in culture that erase mixed and mongrel heritage. We appear to live in an age where both religious and national groups increasingly use the language of purity as way to create and police both political and personal boundaries. Using the theories of Mary Douglas and Malek Khouiri, among others, I will argue that resistance needs to be mounted against histories and theories that erase the messy and hybrid realities of religious and cultural traditions such as those in India, where

colonization has imposed strict boundaries about ideas of religion. This has contributed to Sikhs, Hindus and Muslims re-writing and "purifying" their histories to fit this model. The erasure by revision of mongrel cosmopolitan realities must stop so that untidy lived religiosities may be properly theorized.

Understanding the Resource Curse with the Crisis Opportunity Model

Numerous communication theories, such as uncertainty reduction, crisis communication, and media effects theories, provide an opportunity to understand how a crisis can be leveraged for change. The crisis opportunity model demonstrates how an event that produces uncertainty and spurs corresponding information seeking behaviors (to alleviate stress associated with the unknown) can bring about change. Uncertainty produces a vulnerability that shortcuts people's cognitive filters that allows one's reality to be defined for them. The crisis opportunity model explains the phenomenon of opportunities during uncertainty based on vulnerabilities of people's information seeking tendencies that are necessary to meet cognitive and emotional demands.

Uncertainty provides an opportunity to define and frame the reality people engage with. A story that frames reality must merely provide a perception of coherence that alleviates the stress of uncertainty for a person or group of people. A story alleviates cognitive and emotional demands by framing reality consistent with previous memory cues and information sources. The propositions of this model are straightforward. An event causes uncertainty which leads people to reduce uncertainty through information seeking behaviors. If a social structure or person is looked to for information during this time, then an opportunity to frame reality exists.

Numerous Sub-Saharan African countries have abundant natural resources, but succumb to the resource curse which can be explained by the crisis opportunity model. Prior grievances spur conflict when revenue disbursements fluctuate with the market. These fluctuations are then highlighted by out of power groups to display past tensions as though the in-power group is withholding distributions and perpetuating historical conflicts. This phenomenon in Nigeria resulted in additional costs during oil revenue decreases to increase security of oil pipelines, further limiting available wealth for distribution, thus providing another event to emphasize the out of power group's narrative.

'Lone Wolf' Terrorism, Security and Violence Against Women

In the wake of 'lone wolf' terrorist attacks in western countries, including, the US, UK, Australia and France, there is increasing political and scholarly attention devoted to the phenomena of radicalization and home-grown terrorism as a major threat to national security. Political and policy debate has focused on the connection between lone wolf attacks, foreign policy and domestic counter terrorism policies, particularly the potential of these to exacerbate the risks of such attacks. The scholarship on lone wolves, in criminology and related disciplines, typically based on case studies, has focused on definitions, typologies, and models of radicalization. None of the studies consider the phenomena or risk of lone wolf terrorism through the lens of violence against women. A number of media reports and commentaries, on the other hand, reveal or highlight violence against women in the biographies of such attackers and speculate on what this means for contemporary understandings of terrorism generally and lone wolf terrorism in particular. This paper explores the possible connections between lone wolf terrorism and violence against women. It contributes to the extant scholarship on lone wolf terrorism by asking what might be learnt by looking at events so defined through a gendered lens. Using case studies as the empirical base this lens affords a wider appreciation of the context and/or pathways for the violence of lone wolf terrorism. The paper argues that the failure to focus on the connections between violence against women and lone wolf terrorism is part of an ongoing failure to take women's security seriously; a failure which may also limit efforts to understand and respond effectively to the risks of lone wolf terrorism.

MCDANIEL, SUSAN* (*Prentice Institute for Global Population and Economy, University of Lethbridge*)

Families By Default: Frazzled and Fraught

The prevailing contemporary ideal, at least in most neo-liberal policy regimes, is individualization of risk *writ large*, as risk insurance and supports by states shrink. Left with few options, people turn to families either biological or chosen. Families of origin are not always places that take you in when there is nowhere else to

go, as poet Robert Frost opined. They can be fractious and violent, perhaps even more so when individuals are tossed together out of duress or need. Building on previous research by the author on families of choice in managing low income (Gazso & McDaniel, 2015), on meanings of family with ageing and social change (McDaniel & Gazso, 2014), on networks as family (Gazso, McDaniel & Waldron, 2015) as well as on relative prospects of children as they age (McDaniel, Duncan & Gazso, 2016), the research in this paper analyses interviews with those in mid-life in two SES groups in two countries, the US and Canada. The methodological innovation is that the interviews not originally done with an intergenerational focus, are re-coded into generational groupings. This avoids the solidarity bias in many intergenerational surveys, and offers new insight into intergenerational conflicts and contestations. The overarching context for the interviews is the economic crisis, the Great Recession of 2008 +. We find that re-familisation is fraught, even when chosen. Intergenerational relationships can be strengthened but as often are fraught.

Powerful Practices: The Impact of Family Relationships on Queer Youth Mental Health and Wellbeing

Global research consistently shows that compared to heterosexual youth, those who identify as non-heterosexual have a much greater risk of poor mental health. A key risk factor associated with poor mental health in youth populations is conflict with the family about sexual orientation. Parental violence, abuse and rejection are strongly correlated with queer youth mental distress; conversely, a supportive, caring and accepting parent-child relationship is correlated to mental wellness in queer youth.

However, the majority of existing research on queer youth mental health and family relationships uses survey data to examine compromised parent-adolescent relationships. Evidence-based knowledge of the gendered and heteronormative power relations of parenthood and wider family relations is absent. Moreover, this research is overwhelmingly conducted within a biomedical psychiatric paradigm that tends to pathologize young people's emotions and conceptualize the family as a monolithic, biological institution. We present findings from a small scale UK study that utilizes sociological theorizations of 'emotion' and 'family' to explore family relationships and the mental health of queer youth.

Drawing from qualitative interviews with queer youth aged 16-25 (n=20), interviews with their families (n=10) and digital/paper emotion maps, we focus on the emotional and relational work done by queer youth and their families to negotiate disempowerment, violence and injustice – from both within and outside the family. We reframe emotion as meaningful human sensations that guide interactions; families are conceived as social and affective units that are created through everyday practices and processes of relationality. The findings are read through theoretical understandings of intergenerational and heteronormative regimes of power that inform the production of developmental norms of identity/sexuality, and neoliberal norms of successful adulthood. We present analysis on how power, emotions and relationships are implicated in the management of young people's non-normative sexualities within families, and their impact on mental health and wellbeing.

MCDONALD, KEVIN* (*Middlesex University London*)

Exploring the 'Experiential Grammar' of Jihadist Actors: Embodied Subjectivities and Imaginaries in Social Media Communications

One of the most significant dimensions of Jihadist movements involves their 'experiential grammar', evident in the primacy of personal experience over organizational structure, a development linked to the importance of social media to these movements. This paper uses such communications to explore the *experiential* dimensions of contemporary jihadist movements, evident in particular in immersive experiences that both amplify and limit what can be felt.

The focus of this paper is experiences of distant, mediated suffering, where good and evil mutate into purity and impurity, and where jihadism manifests many of the characteristics of racism and hate crime. Here visceral and embodied experience plays a critical role, from the place of humour as an embodied practice of integration, to disgust and the grotesque.

This paper considers *theoretical* challenges emerging from such practices, in particular the importance of new approaches to embodiment and affect for a sociology of mediated experience. *Methodologically*, these movements underline the need to move beyond sociology's traditional reliance on textual and numerical data, and highlight the need to construct research strategies that engage with social media as a sensory medium of embodied actors.

RC47-786.1MCDONALD, KEVIN* (*Middlesex University London*)*Improvisation: Embodiment, Affect and Imagination*

Despite the importance of creativity and rupture within collective action, social movement studies has emerged as one of the areas of sociology most shaped by analytical sociology and its commitment to analyse social life in terms of 'social mechanisms', dynamics and processes, and a research strategy that considers social movements fundamentally 'familiar process' to be disaggregated into their 'component mechanisms', in order to understand 'what makes them work'. Here the study of social movements becomes reduced to disaggregating the mechanics of protest.

In this paper I argue that rather than focus on disaggregating the familiar, the task of social movement studies today is to reconstruct our capacity to capture the unfamiliar, in particular rupture and creativity. To do this we need a radical break with the social mechanisms paradigm, and new types of method and intervention, capable of engaging with embodiment, affect and imagination, and with practices of human vulnerability and a corresponding ethics. This involves a break with the 'protest paradigm' that has come to dominate social movement studies, and calls for a new engagement with relational practices, increasingly involving making and doing, though which need is made visible. This involves a new focus on practices of care and on actors' struggle to make need and vulnerability take on social and political forms. This demands a new attention to the increasing importance of creative processes in emergent forms of self-organizing, increasingly experienced as spaces of resonance, where actors seek to thread aesthetic practices into action, and in the process produce different capabilities to feel. Such practices are central to attempts to construct new relationships between ethics and politics. This paper puts this theoretical framework to work through exploring the increasing importance of improvisation in contemporary action, and the ethic of attention to the particular that such practices involve.

TG04-983.2MCDONALD, RUTH* (*The University of Manchester*)*Hope, Risk and Uncertainty: The Management of Madness in English Forensic Psychiatry Hospitals*

Forensic psychiatrists are responsible for managing mentally disordered offenders who are deemed to be a risk to themselves and others. At the same time, these doctors are charged with helping their patients to recover, enabling them to leave hospital. The context of perceived risk of reoffending and uncertainties surrounding patients' potential for recovery create challenges for doctors in these settings. This paper draws on interviews (with 30 psychiatrists and 40 patients), focus groups and hospital site visits to explore these issues. It describes how doctors and patients construct uncertainty and linked to this, emphasise maintaining hope for recovery, as a means of coping with challenges. At the same time, the maintenance of hope has adverse consequences for patients, which creates unease for doctors treating them. The result is that doctors simultaneously espouse the need to maintain hope and pursue actions which suggest that hope for recovery (discharge) has been abandoned. Occasionally they acknowledge that this is the case. These accounts and actions appear to be contradictory and irrational, though they enable doctors to make changes to services to improve patients' quality of life. In contrast, the accounts of older doctors are more coherent. These doctors appear less inclined to use uncertainty to maintain hope for recovery, but they do emphasise hope. The object of hope is, however, redefined by them in a way which does not include discharge. The paper suggests that the difference between the groups of doctors reflects, in part, socialisation and education processes which differed across generations, particularly with regard to notions of recovery and patient empowerment. The fact that older doctors are much closer to retirement may also explain why these doctors are less engaged in hoping for recovery in the distant future.

RC17-332.3MCDONALD, RUTH* (*The University of Manchester*)*Leadership and Threat Management in Meta Organizations: Case Studies from English Primary Medical Care*

Meta Organizations (MOs) comprise individual organizations which retain their identity and a high degree of autonomy. MOs are reliant for their survival on maintaining commitment from their member organizations. A key aspect of the offer from MOs to individual organizations is strength in numbers, far beyond that enjoyed by individual organizations. Membership is more likely to be attractive when organizations are feeling threatened and where organizations perceive themselves to be better able to defend against threats by joining forces with other organizations. Whilst in some sense, threats are objective, there is also a strong element of perception involved. This paper reports findings from a study of 4 MOs in England each comprising primary medical care organizations. The data collected comprises 132 interviews and observational data of 55 meetings over a period of 14 months. The study examined the ways in which respective

MO leaders attempted to maintain commitment of member organisations in the early stages of development of these MOs. We found that although all 4 MOs shared a common strategic aim, there were variations between MOs with regard to the ways in which they engaged members around this aim. Whilst the construction of threats by MO leaders was important, the ways in which this was enacted was an emergent and tacit rather than explicitly planned approach. MOs which constructed threats and linked them to solutions in a way which resonated with members' immediate and self-interested concerns were more successful than those which focused on high level strategic aims and attempted to appeal to pro-social motivations. We suggest that this is not because the doctors in member organizations were inherently self-interested. Instead where MOs provided assistance in concrete terms and linked this to threat diminution, this enabled doctors and other staff in member organizations to engage in pro-social behaviours.

RC39-684.5MCDONALD-HARKER, CAROLINE* (*Mount Royal University*)BOGDAN, EVA (*University of Alberta*)*Family Functioning and Well-Being in the Aftermath of Disaster: One Year after the 2013 High River, Alberta Flood*

On June 20, 2013 catastrophic and unprecedented flooding took place in Alberta, resulting in damages estimated as exceeding \$5 billion dollars, the second costliest environmental disaster in Canadian history. The town of High River, Alberta a small rural community just South of Calgary, Alberta was the hardest hit by the floods. All 13,000 residents of High River were evacuated, and not allowed to return to their homes for several weeks. In the aftermath of the flood, many families faced severe damages to their home, places of employment, their children's school, and local recreational facilities. Many families also faced social, emotional, and psychological difficulties. In a Canadian context, little is known about how family life is altered by disasters, particularly in relation to family functioning. Specifically, little is known about how families manage, function, and cope following disasters. Using qualitative data collected through face-to-face interviews conducted with 105 parents residing in High River, Alberta, this study examines the impact of the flood on intimate partner relationships, work roles and responsibilities both inside and outside the home, parent-child relationships, family-school involvement, and overall family recovery needs. We discuss the significance and implications of the findings, which help bridge the gap between family needs and the services provided post-disaster and contribute to furthering knowledge about pragmatic and representative changes to resources and policies surrounding disaster response, recovery, mitigation, and preparedness.

RC27-490.4MCGEE, DARRAGH* (*University of Bath*)PELHAM, JULIETTE (*University of Bath*)*Biopolitics at Play: Locating Human Rights, Refugees and Grassroots Humanitarianism in the Calais Jungle*

This paper examines the biopolitical footprint of a new wave of grassroots humanitarian organisations in the informal refugee camp, popularly dubbed 'The Jungle', in Calais, northern France. Set against the formal humanitarian void created by the French state barring of international aid agencies, and the abject conditions of camp life, we trace the shifting socio-spatial remit and progressive politicisation of these 'apolitical', volunteer-based organisations as they encounter a crisis of human rights in the Jungle, prior to its violent demolition by state decree in October 2016. In foregrounding the quotidian perspective of two organisations, Play4Calais and the Refugee Youth Service, and their unorthodox deployment of physical cultural forms such as play, sport, cinema and art, we reveal a grassroots humanitarian praxis which not only stands in tension with the violent border sovereignties of neoliberal states, but which opens up the inchoate possibility for political struggle and refugee-centred claims-making over the right to inhabit the 'exceptional' space of the camp.

RC13-257.3MCGRATH, RICHARD* (*University of South Australia*)STEVENS, KRISTEN (*University of South Australia*)*Forecasting the Social Return on Investment Associated with Children's Participation in Circus-Arts Training on Their Mental Health and Well-Being.*

The early and middle years of childhood are recognised as being pivotal in ensuring good cognitive development throughout life, resulting in healthier societies. Healthier societies can mean a reduction in lifestyle related illness and therefore potentially reduce reliance on healthcare resources. Furthermore, healthier societies have been shown to be more economically productive. The purpose of this study was to forecast the Social Return on Investment (SROI)

associated with children's participation in a circus-arts program on their mental health and well-being.

A mixed method approach was adopted for this study. Key stakeholders were children aged between 8-14 years. Children were surveyed (n=23) and participated in focus group (n=55) interviews, prior to and after, six months of circus-arts training.

The questionnaire used was the internationally validated Kidscreen-27. The focus group interviews asked children their beliefs about how circus made them feel and benefits of participating in circus-arts training.

The SROI analysis found that for every one dollar invested, \$7 of social return may be generated due to participation in a circus-arts program. Improvement occurred across four key areas concerning children's mental health & well-being; stress relief, self-esteem, confidence and socialisation.

Findings from this study indicate the value of investment in the performing arts, highlighting the importance the circus-arts on children's mental health. Associated impacts to improving children's self-esteem, confidence along with relieving stress are identified as decreasing the potential costs of treating associated illnesses: such as depression and anxiety. Improvements in socialisation have been linked to costs associated to social dysfunction: such as crime victimisation and incarceration.

A Critical Overview of the Significance of Power and Power Relations in the Lives of Children in Care: Evidence from an Irish Study.

This paper draws upon findings from an Irish study of permanence and stability outcomes for children in long-term care, completed by the UNESCO Child and Family Research Centre NUI Galway, on behalf of Tusla, the Child and Family Agency from 2014 to 2017. The research is based on qualitative materials from 27 biographical narrative interpretive method (BNIM) interviews with children, young people, parents and foster carers. The research found that three factors markedly affect permanence and stability for children and youth in care in this context. These are communication, relationships, and services supports. Through a narrative methodology, different forms of power relations across these three domains became very evident. Using a Foucault-informed theorisation of power, the paper uses illustrative quotes from children and young people to demonstrate how power and power relations markedly affected how they conceptualise permanence and stability, their relationships with social workers, and how they interpreted the societal functions of child welfare systems. Some commentaries from parents and foster parents will illuminate the importance of greater attention to attending to children's views and experiences in care specifically through a power and power relations lens. In the discussion, practice guidance developed from the study is outlined and considered. The need for more explicit studies of power and power relations in relation to children and families involved with child welfare systems is argued for in order to bring about an increased voice for children and young people in the development and improvement of public child welfare services.

Valuation and Collaboration Among Craft Brewers: Early Insights from an Analysis of Consumer Ratings

In pursuing the problem of (e)valuation in sociology, this paper is concerned with the collaborative dynamics that create value. Based on a unique dataset of 225 collaborations among craft brewers, we analyze which combinations of organizations increase consumer ratings of the beers produced. Craft brewing provides a fascinating laboratory for the study of how consumers rate the products of collaborative formations. Collaborations between craft brewers result in one-off products, beers that exist for a limited period of time, rarely to be produced again. Such collaborations occur frequently and exist over the course of several weeks or months, until the product is brewed, packaged, and distributed. At that point, collaborators return to their daily brewing operations. With the help of several research assistants, we created a dataset of craft brewer all collaborations in which at least one brewer was located in Illinois. The data are compiled from websites on which consumers rate beers: RateBeer and Untappd.

Initial analyses shows that brewers that follow certain strategies are likely to collaborate with others pursuing certain strategies. For example, we find that brewers that engage in serial hook-ups are likely to do so with brewers that are outside of their core networks while monogamists are likely to seek out those who engage in serial hook-ups. These strategies have consequences for the valuation of their efforts. The products of craft brewers who collaborate with those outside of their core networks consistently receive higher consumer ratings than other forms of collaboration. We suspect that certain collaborative arrangements

facilitate authenticity or novelty in the marketplace, which consumers reward with higher ratings. We plan to test hypotheses related to whether authenticity or novelty are driving changes in consumer valuations of products.

HAAG, JULIUS (University of Toronto)

The Canadian Code of the Street and the Structural and Symbolic Repercussions for Youth from Priority Neighbourhoods

Using data from 300 interviews with youth under 25 in Toronto's priority neighbourhoods—areas marked by high poverty and crime rates—this paper discusses how youth negotiate a high potential for physical violence from peers within and between neighbourhoods as well as structural and symbolic violence from authority figures like police, educators, and potential employers. In line with Anderson's Code of the Street we find that youth express a strategy of self-preservation through maintaining respect and honor. Youth report that respect is earned and maintained through courage and willingness to engage in physical violence if one's honour has been violated. Honour is maintained through strict adherence to community norms, most prominently by abiding by a code of privacy marked by not communicating knowledge to authority figures like police or educators. The codes of respect and honour that allows youth to navigate and survive the potential for physical violence in their neighbourhoods, however, exposes youth to high levels of confrontation with figures of authority. Youth report physical and symbolic violence from police whose primary objectives of crime prevention and investigation run in direct opposition to the code of honour and privacy these neighbourhoods maintain. Youth also report being exposed to structural violence from employers who discriminate based on address and a supposed complicity with the violence and crime their address is associated with. Finally, youth also report structural and symbolic violence from educators at both the high school and post-secondary levels due to the code of honour and reputation that come from living in a priority neighbourhood. In sum, the authors describe how the codes developed in neighbourhoods to survive the threat of physical violence creates and maintains symbolic and structural violence from authority figures that youth experience and actively attempt to resist in an effort to gain prosperity.

MCKEEN, PATARA* (International Institute for the Sociology of Law)

Rights Recognition, Integration, and Pakistani Migration in the Basque Country

My research investigates rights recognition, integration, and Pakistani migration in the Basque Country (Euskadi). What must be understood is that the Basque Country is a truly unique locale; livened by its passionate communities, linked together through a rich and vibrant history, that, in turn, encapsulates an extraordinary way of life. Yet, decades of political strife, violence, and ensuing period of globalization have altered its social makeup. Herein, I seek to understand how Pakistani migrant conceptualize integration by analyzing specific conditions which foster inclusion (language, labour and family). Therefore, I investigate the meaning behind 'rights recognition' in the Basque Country which creates both 'encompassing' and 'exclusionary' forms of citizenship. Starting in Oñati, I analyze how a small town with a strong connection to Basque national identity articulates its own integration policy. Using in-depth interviews, questionnaires, and surveys, I target community members, local organizations, and other relevant actors to understand Pakistani migrants in their new locale. What I find is that the divide that separates identity and citizenship is often associated with rights. However, the extent of understanding identity and the political implications of citizenship are differentiated by what rights mean to either Pakistani migrants or the Basque people.

Exit, Voice, Loyalty & the Political Response of Irish Youth to Socio-Economic Crisis

This paper discusses the political response of Irish youth to the most recent financial crisis, using Albert Hirschman's theory of Exit, Voice and Loyalty to examine the use of emigration and protest as responses to economic decline. It investigates the manifestation of both of these responses and the factors, which influenced young Irish citizens in their choice. It seeks to present the scope of the crisis amongst Irish youth in terms of unemployment, emigration and their experience of austerity and to establish an account of the impact of that experience

upon the relationship between Irish citizens and state. This study explores various obstacles and issues affecting that relationship particularly in times of crisis, as well as analyzing the potential repercussions that these obstacles pose for the relationship between citizens and state. Finally it examines the notion of "loyalty" in the way that contemporary Irish society responds to socio-economic decline, particularly in regard to youth, it interrogates current systems of engaging young people in politics and explores the potential of post primary schooling as a means of improving this situation. This work is the product of participatory research with the youth activist group "We're Not Leaving", amongst various other elements of research.

MCKEEVER, GRAINNE* (UCD)

From Student to Citizen: The Role of Post-Primary Schooling in Political Socialisation

This paper discusses the role of post primary schooling in the political socialization of young citizens. It explores the potential of this formative experience for young people as they begin to develop their understanding of what it means to be a "good" citizen and how they visualize themselves fulfilling that role in the future. In a country such as Ireland where the education system has historically been dominated by religious orders, and no national policy on civic development exists; this paper questions the role of the post primary school as a place for civic education, seeking to understand the experiences which contribute to effective preparation for active engagement in civil society post schooling. The study is based on introduction of a new course for senior cycle in Irish post-primary schools called *Politics & Society*. It profiles eight case study schools, four pairs of twin schools with only one of the "twins" receiving the treatment of the new civics course. By interviewing all eight principals and surveying all final year students (over 1000) it assess how the school experience has impacted these students intentions for political participation and civic engagement. By examining the relationship between variables such as political knowledge, political efficacy, social capital, gender, socio economic background, ethnicity and religion, this study reveals the educational inputs which inform active citizenship outputs and presents an account of the tools required by young citizens for political participation and civic engagement post schooling.

MCKENZIE, JORDAN* (University of Wollongong)

Utopia and Dystopia in Cultural Narratives of Happiness and the Good Life

Karl Mannheim once described utopian thought as any state of mind that is "incongruous with the state of reality within which it occurs" (1936: 173), but what portion of the contemporary interest in happiness and the good life can be understood in this way? Interest in utopian thought has waned in recent decades (consider thinkers like Marcuse, Ricouer, Castoriadis, Bauman), while dystopian narratives come to the fore through concerns about yet another global market collapse, pending nuclear disasters and an increasingly dysfunctional political public sphere. Yet against this backdrop is a heightened interest in finding happiness, albeit in largely individualised terms. Research in positive psychology has promoted terms like mindfulness, flow, resilience, and gratitude as personal responses to living within a period of anxiety, stress and moral ambiguity. But where are the utopian theories of the good society during this period of heightened interest in chasing the good life? This paper aims to demonstrate how the contemporary surge of interest in happiness research, within both public and academic discourses, can be reframed as a project in utopian social analysis, and to some degree, critical theory. Large scale statistical analyses (such as the World Happiness Report) consistently highlight the need for a fairer distribution of economic resources, greater recognition of personal and cultural differences, a renewed engagement with politics in the public sphere and civil society, and a critique of individualised, rationalised and generally neoliberal ideological positions. By incorporating utopian thought into popular discourse on the good life, the potential for reimagining debates around progress, technology, rationalisation and inequality can be renewed in an era where traditional utopian literature may seem unhelpful or wilfully idealistic.

MCLAUGHLIN, PAUL* (SUNY Geneseo)

Marxian Essentialism Versus Darwinian Population Thinking: Alternative Foundations for a Post-Exemptionalist Environmental Sociology

Foster's masterful reconstruction of Marx's analysis of metabolic rift created a new core concept for environmental sociology which affords fresh insights into both historical and contemporary environmental problems. However, Foster's assertion that Marx provides a possible foundation for a post-exemptionalist

environmental sociology is less defensible. Marx's commitment to essentialism precludes a full theoretical account of the relationships between structural diversity, environmental adaptation and human agency. I substantiate this claim and propose a more nuanced assessment of Marx's legacy by employing recent revisions to the standard account of the Darwinian revolution as a metatheoretical lens to illuminate the strengths and limitations of Marx's incipient environmental sociology. These comparisons support Catton and Dunlap's contention that Marxian theory is unecological. However, they also establish the metatheoretical basis for and precise limitations of Foster's claims to the contrary. Marx partially integrated the environment into social theory by relying, not on property essentialism emphasized in the standard account, but on functional-developmental essentialism. Marx used the latter to emphasize the centrality of environmental relationships and the universal necessity of adaptation in his definitions of human nature and modes of production. However, functional-developmental essentialism's reliance on context-independent dynamic laws is incompatible with contemporary ecological thinking. These deficiencies preclude Marxian theory from serving as a foundation for environmental sociology. Thus, while we should retain Marx's substantive concerns, we should abandon further attempts to mine his works and, instead, pursue more innovative lines of theoretical research. To fully incorporate the environment, we must follow Darwin's lead by rejecting essentialism and nominalism in favor of population thinking. The concept of a socially constructed adaptive landscape represents one such alternative evolutionary model. This framework integrates organizational sociologists' insights into structure-environment interaction; constructionists' attention to agency, language, culture, and values; and political ecologists' concerns with power, inequality, and processes of marginalization.

Political (dis)Engagement during the Transition to Adulthood Among Ethnic Minorities in Five Western Countries

Social boundaries and perceived discrimination are particularly salient for the political socialization of ethnic minority adolescents and young adults. Research on the political incorporation of ethnic and racial minorities is dominated by two competing perspectives. On the one hand, the racialization of immigrant groups can result in a reactive ethnic identity and disengagement from the political sphere. On the other hand, theories of ethnic resilience and pan-ethnic organizations point to co-ethnic social capital as a resource for collective action and political mobilization, especially for oppressed minority groups. We investigate the relationship between perceived discrimination and political engagement among ethnic minority adolescents and young adults in five countries: England, Germany, the Netherlands, Sweden and the US combining data from the Children of Immigrants Longitudinal Study in four European Countries (CILS-4EU) and the Panel Study of Income Dynamics Transition to Adulthood (PSID-TA) in the US. We expect a stronger political apathy in contexts where youth are disconnected from co-ethnic/pan-ethnic organizations, including churches and mosques, that can mobilize political engagement.

Irregular Migration Journeys: Women Asylum Seekers in Athens, Greece

The growth of the securitization framework in Europe has emerged out of the political and social dynamics that portray migrants as a threat to public order, cultural identity, and domestic and labour market stability. Refugees are no longer portrayed as simply a humanitarian or political matter, but they have become part of emergency politics, meaning that extreme measures can be taken in trying to create security, extending as far as removing the rights of those that are portrayed as the potential threat.

My research aims to understand the lived experiences of the contemporary and ongoing migration journeys of women arriving "irregularly" in Greece, from the point of view of the women themselves. I examine the lived experiences of arrival, asylum claiming, transiting or settling of women in Athens with a focus

on the obstacles they experienced and how they responded. I seek to assess the effects of the multiple and diverse "raising" of European borders on asylum seekers and, in particular, the effects this has had on women who have fled their home countries, arrived in Greece and become involved with a grassroots women's NGO in Athens. My data derives from participant observation and in-depth interviews at the above-mentioned NGO in Athens during the summer of 2017.

Bringing Innovation Home: Indigenous Development in Kunshan, China

Access to technology and expertise remains a fundamental issue in global economic integration. China has been an exception among developing economies, pursuing successful strategies for indigenous innovation in tandem with massive foreign investment in production. Among development zones, Kunshan has emerged as China's richest county, succeeding Guangdong's Shunde two years ago with a per capital GDP of thirty thousand U.S. dollars. Supported with extensive Taiwanese capital and technology, the county has prospered as an electronics manufacturing platform and exporter. How have they integrated into foreign knowledge circles while cultivating local expertise? This paper focuses on the local state role in mediating global capital and knowledge flows in the Development Zone of Kunshan County. Building on theories of the developmental and the entrepreneurial state, we track strategy and performance. A survey of 180 foreign-invested firms provides a profile and highlights problems for foreign investors, while the Five Year Plan of Jiangsu Province outlines Party-State technology policy. The local Party Committee oversees both foreign and local inputs, as well as planning and implementation of urban industrial development strategies. Interviews with the local Party Committee provide critical detail on industry-state relations in a development zone. Working between firm and state, we couple strategy and current R&D status, with a focus on effective patterns for indigenizing knowledge networks from abroad. We conclude with a refinement of the developmental state thesis, highlighting how a strong state can also play an entrepreneurial role in global capitalism.

MCNAMARA, DENNIS* (*Georgetown University*)

China's Competitive Complementarity: Cross-Border Innovation in Asian ICT

A socialist market economy with Chinese characteristics stands alone among post-socialist economies in both profile and performance. A "coordinated market economy", the Party-state remains deeply involved. The state plays a major role in designing credible protections for intellectual property, insuring a position in global knowledge flows critical for innovation. I examine the interplay of corporatist industry associations and China's *entrepreneurial state* supporting an open innovation that can sustain growth in regional cross-border ICT production networks with Japan.

Open innovation appears critical for tapping innovation opportunities in global value chains (GVCs). A complementarity in technology between home firm and suppliers abroad helps insure effective collaboration in a production chain, despite different levels of technological sophistication. At the same time comparable institutions for property protection are necessary to insure against leakage of proprietary process and production technologies.

I argue that a coordinated business-state strategy in China has fostered a competitive complementarity of production and protection networks between the two nations. A coordinated advance in value-added production, supported by investment in local R&D facilities, tracks congruence in upgrading technology. A similar chronology of institutional efforts by the State Intellectual Property Office (SIPO), and the Japan Intellectual Property Office to coordinate property protections highlights institutional complementarity.

Evolving or "competitive" complementarity in IPR policy and practice parallels product complementarity. The study sheds light on the institutional underpinnings of complementarities in regional innovation systems between an advanced liberal and a socialist market economy. This strategy helps refine emerging theories of the entrepreneurial state for the Asian context, particularly of business-state relations in cross-border knowledge exchange with developing economies. It likewise extends understanding of development patterns within GVCs. Finally, it extends the Comparative Capitalism literature with a sector-specific case study of knowledge protections between coordinated market economies.

Deepening Inequalities or Opportunities for Renegotiation? : The Impact of Climate Shocks on the Gendered Distribution of Household Labor

Many countries in sub-Saharan Africa are highly vulnerable to climate change, and climate shocks profoundly affect household welfare, labor, and economic activity. However, much of the existing literature has not examined these effects with an awareness of gendered systems or gender-differentiated outcomes.

Our study aims to adjudicate between three competing hypotheses about the impact of environmental shocks on the gendered distribution of labor within households. When power relations between men and women are unequal, we might expect the work burden associated with shock response to fall more heavily on women. Much of the existing literature assumes that women will shoulder this burden, but empirical verification has been minimal. An alternative possibility is that the disruption caused by climate shocks provides an opportunity for the renegotiation of gender contracts within the household in favor of women. Finally, we might simply expect a continuation of pre-existing distributions of labor and responsibility rather than an intensification or reduction of women's responsibility, given the relative rigidity of gender value systems and social norms.

Using recent panel data from the World Bank's Living Standards Measurement Study, as well as geo-referenced meteorological data, we examine the impact of climate shocks (defined as significant deviations in temperature from the seasonal average) on the relative workloads of male and female household members in three types of work: agricultural work, paid work, and water/fuel collection. We began by examining data from Malawi, with plans to expand the analysis to comparable datasets from Tanzania, Uganda, and Ethiopia. Preliminary results using household and time fixed effects suggest that climate shocks provide an opportunity for renegotiation of gendered household labor allocations in favor of women, rather than an increase in the work burden they bear.

Income-Sharing As Relational Work: Understanding Informal Financial Transactions in Côte D'Ivoire

While embeddedness has been the foundational principle of modern economic sociology, recent scholarship using a relational approach rejects the analytical separation of economic and social spheres, highlighting their profound co-constitutiveness. A relational approach to analyzing economic behavior reveals the dynamic process of relationship management that occurs both *through* and *in service* of economic transactions. To date, this approach has most commonly been applied to special cases of intimate domains in which market logic seems an uncomfortable fit.

Our work extends relational economic sociology theory to everyday financial transactions. We analyze the practice of income-sharing, or the social expectation that better-resourced individuals should give informal loans and gifts to others upon request, among formal sector workers in Côte d'Ivoire, West Africa. In-depth qualitative research reveals that financial considerations interact with relational concerns to shape the case-by-case calculus that workers perform when deciding whether to give money in response to particular requests.

Acknowledging the social relational work performed in informal financial transactions is crucial for understanding these economic behaviors. First, we find that far from being pre-determined either by self-interest or by social norms, individuals have leeway to determine whether to give. Second, givers' calculations about whether money is available to give is not an objective accounting practice; it requires evaluating the personal and social implications of diverting money that had been "earmarked" for another purpose. Third, the asker is deemed deserving of the loan/gift not by virtue of the type or strength of social network tie with the giver, but by the relational work the asker performs demonstrating adherence to social conventions. Finally, when refusing a request, givers use a variety of strategies to prevent or mitigate damage to their relationships. Relational work is accomplished not just through the performance of economic transactions, but also through the justification of these (in)actions.

Capital-Labour Relations and Indigeneity in the Popular Economy

In Latin America and across the world Bolivia is heralded as a country with an indigenous president and a progressive constitution that recognises the plurinational nature of the country. Whilst the government's agenda of 'indigenous autonomy' has rightly attracted the interest and excitement of scholars and activists alike, it affects only a handful of indigenous people in a

country which is mostly urban. The city of El Alto in particular – the larger albeit younger twin of La Paz – is seen as the 'Aymara capital' of the Andes and is home to large numbers of indigenous people, the majority of whom are forced into the labour market. Some have celebrated the colourful markets that characterise the city as a popular economy, marvelling at the ingenuity of Aymara *comerciantes* [traders] and the integration of indigenous practices and beliefs into their enterprises. The expression of indigeneity within a capitalist urban environment, they argue, has formed not-quite capitalist forms of production and distribution. However, I suggest the informal, precarious forms of this work reveals the ways in which capitalist relations have been embedded within pre-existing social relations as part of a dialectical struggle between the forces of the market and subaltern subjects eking out a living in an uncertain environment. Through analysis on labour markets statistics I demonstrate how these Aymara forms of commerce and production fit nicely into the precarious, unregulated world created by neoliberal reforms some three decades ago. Far from being non-quite capitalist, labour relations in El Alto have assumed a hidden form and are still very much constrained by the same logic as capital-labour relations in the rest of the capitalist world.

The Globalization of 'Bicycles for Development': Examining a Sport for Development 'Movement'

Sport for development (SFD), which refers to the use of sport and physical activity to improve livelihoods and respond to broader social development issues (Kidd, 2008), has rapidly proliferated in recent years in research and practice (Schulenkorf, Sherry, & Rowe, 2016). Despite this increase in attention to the challenges and opportunities related to SFD, limited consideration has been paid to the globalization of the 'bicycles for development' (BFD) 'movement', which features a variety of corporations, non-governmental organizations, international institutions, and local communities. Although there is research that has explored the intended and unintended consequences of the globalization of sport (Giulianotti, 2004; Thibault, 2009), there remains a gap of in-depth research on BFD – and how it relates to SFD – as a form of globalization. Specifically, there is a notable lacuna in the research that explores the impact and role of bicycles and how they move from the Global North to – and within – the Global South. Therefore, in this paper, we outline the contemporary globalization of the BFD 'movement' based on an analysis of a global 'BFD' map, encompassing over 60 BFD organizations operating in more than 40 countries. We discuss and reflect on: 1) the work of BFD organizations and their associated 'development' goals; 2) the locations and areas of the world that the BFD movement operates across and within; and 3) the social issues identified by each organization, attending to how these issues may or may not vary by region. In doing so, we attend to how this BFD 'movement' occurs within complex sets of socio-cultural-political relations infused with power dynamics, and offer preliminary insights into how the BFD 'movement' has been influenced by, and influences, globalization. Finally, we address the potential of the BFD 'movement' and what is needed for future research and understanding.

The Community in Social Programs for Poor Youth: Between Inclusion and Risk

This article is framed within the debates about the social, institutional and state processes of regulation of youth in conflict with criminal law, especially in contexts of inequality, where social and security policies are merged to govern the new generations. Since the 2000s, in Argentina, there have been community-based programs aimed at "at-risk" youths. These programs offer recreational activities, educational and labour support, and conditional cash transfers to youth, who must engage themselves in a "life project" out of crime. In these types of programs, the idea of "the community" has a double face: on the one hand, it is the necessary vehicle for social inclusion, but on the other hand, it is the source of the problems that endanger young people. This paper focuses on the category of community and explores programs' representations of it, as well as the ways in which the community itself – widely understood – manifests itself with a multiplicity of "govern projects" for young people. Among those projects, those linked to illegalities or sociability forms that contradict the ones promoted by the programs, are included. The argument is based on empirical data collected on qualitative research on social inclusion programs and youth crime prevention programs implemented in Buenos Aires, Argentina, between 2007 and 2017.

MEDEIROS, ANA JUDITE* (*Rio Grande do Norte Federal University*)
 ALVES, MARIA LUCIA* (*Universidade Federal do Rio Grande do Norte*)
Sociology of Arts

The medieval romances are songs of Provençal poetry (12th century), sung by minstrels in the Iberian Peninsula, who arrived in Brazil (16th century), the voice of the Portuguese colonizer. These novels were found in Rio Grande do Norte (18th century), northeast of Brazil, in the village of Alcaçus and kept in the voice and memory of lacemakers during their songs of work. In the 90's, the folklorist Deifilo Gurgel collected the songs from the lacemakers at the Alcaçus Romanceiro (1992). This material was used to compose the *Missa de Alcaçus* (1996). The novels found consist of texts taken from literature and popular poetry, with improvisations of medieval liturgical music, recognized through the scale of mixolidio mode. These novels were subjected to empirical analysis under the concept of collective memory (HALBWACHS: 2008), in which two aspects are observed, first the distinction between the concept of collective memory for historical memory, which according to Halbwachs, historical memory leads to memories and expand in the social consciousness, different from the collective memory; and the second aspect, that these medieval romances, although they remain in the historical memory, were invisible in the music of Rio Grande do Norte, until the composition of the work *Missa de Alcaçus*, when they appear their melodic themes resigned in the work, becoming visible. In order to understand their insertion of the novels in the work of Mass, the methodological resource of symbolic cartography (SANTOS: 2000) was used to identify the melodic affinity between the novels and the songs of the Mass, according to a scale, projection and symbolization of each piece of the work. Under this procedure were found affinities and possibilities of amplification of the present (SANTOS: 2001), in which it aroused the interest in taking advantage of different musical experiences capable of contributing to contemporary music.

Dissident Domestication of Public Spaces. Micro-Occupations in Urban Redevelopment Areas: Tokyo and Hong Kong

Shibuya, a dynamic, commercial and complex ward in Tokyo, allocates the construction of one of the biggest projects of urban redevelopment in this city. This under-construction site is central and acts as a core hub, containing a centrifugal force that attracts activities and people to its centre. Hong Kong on the other hand, known as the shopping paradise, is small in area but one of the most complex urban sites, and contains in its surface a permanent state of under construction projects.

In these two different modes of urban redevelopment, in recent years there have been spatial occupations as actions of protests. Nevertheless, after their eviction, these places became hubs of spatial and social control, in a sense to avoid possible future occupations implemented by local authorities. It is in this situation that local groups, acting with a dissident character, challenge this state of control, appropriate leftover urban spaces produced by the sites of construction, and transform them into radical domestic public spaces. While in Shibuya, the leftover spaces, result of the construction site, is a net of points spread around it, and in Hong Kong, they are a net that covers the surface of the city.

Through multiple micro-occupations, dissident citizens expose a state of movement of objects, creating a mode of inhabiting two cities in one: XL and L infrastructure (highways, overpasses, skyscrapers, and so on) and S objects and actions (umbrellas, light bulbs, masks, blue plastic fabrics, etc.). In both areas, these micro-occupations are placed in different layers and levels, and the result is a complex system of actions that generates a micro-aesthetic image, one that is dynamic and intermittent, and emerges as a radical assemblage of ad-hoc architectures.

Religion and the Peace and Environmental Movement in Southern Philippines

The paper examines the role of religious organizations such as the Peace Advocates Zamboanga, a Catholic organization and the Interreligious Movement for Peace composed of persons with varied religious affiliations in the peace and environmental movement in Southern Philippines. These organizations have emerged to address the increasing violence gripping Zamboanga City and Western Mindanao since the 1990's. The most recent conflict last September 9, 2013 was an armed confrontation between government forces and the Moro National Liberation Front-Misuari Faction which lasted for 23 days and paralyzed the city and displaced thousands. In a multi-cultural city composed of Christians, Muslims and indigenous communities, these organizations and religious leaders have helped heal the wounds of conflict among communities and have promoted

the care for mother earth issuing statements to the media, visiting and assisting evacuees and marginalized communities, and by actively promoting peace education in schools and organizing the city's annual week of peace celebrations among others.

Conducting Online Focus Groups with Parents of Children with Sensory Processing Disorder

I conducted three online focus groups using Facebook's secret groups. I recruited parents and caregivers (N=27) of children with sensory processing disorder (SPD) or "sensory issues." At least four methodological problems emerged. First, all participants were mothers of the children despite using gender-neutral recruitment materials. In hindsight, my recruitment methods were not gender-neutral as I recruited among people who write about their child's experiences with sensory processing disorder online and promoted my research among SPD Facebook groups (used predominantly by women). Second, mothers some mothers indicated that their older children reviewed everything they posted on the internet about them (including while in the focus group). They also alluded to challenges for children with SPD related to puberty and toilet training but would not elaborate for fear of embarrassing their child despite the privacy of the secret group. Third, the quality of participants' responses varied. Most participants responded to every question in the first two focus groups and were willing to comment on each other's responses. In the third group, I had to follow-up via email multiple times to receive participation from respondents. The data from the third group is less interactive and in-depth. Fourth, there are special challenges with compiling the data after the study. Decisions must be made as to whether to preserve and analyze deleted comments, "likes," and other "reactions" to posts, for example. Special care must be made to ensure that data is complete because comments get truncated and must be expanded within Facebook to be viewed. Data also must be reorganized chronologically as Facebook organizes the group's feed based on the recentness of activity on a post. Overall, special considerations must be addressed when utilizing online focus groups using Facebook.

Of Home and History: Life Stories, Race and Place-Making in Observatory, Cape Town

The recent upsurge of interest in urban migration, place-making and identity has focused largely on issues of international and regional refugees and immigrants, and integration. There is however less focus on how people move through spaces in individual cities, and how 'small movements' (Arnaut, 2012) shape both life stories and understandings of a place.

In Cape Town, Observatory is often seen as an inclusive neighbourhood in the segregated city, accepting of race and class mixing, and described historically as a 'grey area' – neither black nor white, or both during apartheid (Unneberg 2005; Peck & Banda 2014).

The life stories of 20 feminine residents of Observatory, elicited through in-depth interviews, reveal that individuals' movements in and out of Observatory have frequently had a profound impact on their life courses. Observatory's status as a diverse space allowed residents to reshape their biographies: white residents have shed their racist or conservative homes and histories to create new post-apartheid identities in Observatory; black residents have achieved class-mobility, and access to the (white) urban centre, to construct lives tenuously outside of the oppressive effects of segregation. Frequently however, the experiences of black residents, whose biographies include dispossession or discrimination within Observatory, remain 'unreal'; while those of white residents that affirm Observatory as diverse or inclusive, are seen as 'real' (Skeggs et al. 2004).

I argue that, in the example of Observatory, biographical research demonstrates the significance of small movements in and out of the neighbourhood in shaping both individual lives and collective understandings of place, and also challenges the pervasive perspective of Observatory as unwaveringly inclusive and diverse. Thus, participant biographies can help unpack or trouble dominant understandings of place and history, and can contribute to a more robust account.

Revisiting the Green Consumer – Attitudes, Identity and the Conditions of Environmental Consumption

Empirical studies reveal that even respondents with pro-environmental concerns frequently do not show pro-environmental behavior. Given the mixed

empirical results regarding the impact of attitudinal measures on environmental behavior, scholars have introduced environmental identity measures as a competing explanatory approach for environmental behavior. They assume that the moral components of acting responsible with regards to the collective good (ecological sustainability) may be better reflected by variables that map the self-identity of conscious and ethical consumers instead of attitudinal measures that reflect mere mental evaluations of objects. Recent evidence on the determinants of consumer behavior suggests that identity measures indeed outperform attitudinal measures in explaining variation in environmental decision making. Our study will operationalize two competing theoretical approaches to measure environmental identity along with traditional measures of environmental attitudes. Environmental decision making will be scrutinized with regards to consumer behavior at farmers markets. Shopping groceries at weekly farmers markets can be considered as an action that provokes effort and is rather disadvantageous compared to shopping at ordinary supermarkets (limited opening hours, restricted product range, no parking, no shopping carts). We will assess whether consumers consider the conditions of shopping at farmers market as rather high-cost and test whether consumer behavior can better be predicted by attitudinal or identity measures. We use data from four waves of the GESIS panel, a probabilistic mixed-mode access panel in Germany. Given the reported explanatory power of the identity measures in multivariate analyses and the lack of applications in the German context, this broadening of the scope will shed a new light on the ongoing theoretical discussion between proponents and opponents of the rational choice framework. Furthermore we can provide empirical evidence whether the concept of identity also works within the German context.

MEICHSNER, SYLVIA* (*University of Sheffield*)

Institutional Care Settings for Children and Young People As Strategic Resource

This paper seeks to examine the use of institutional childcare as a strategic resource and coping strategy for children and young people living in adverse circumstances. It will draw on empirical material from different studies, including a qualitative longitudinal study on residential settings for children and young people in a large Mexican-American border town. It will provide an overview over the specific features of this urban agglomeration and their relevance for families, children and young people. Spaces for agency in the face of social exclusion and poverty will be identified in a second step before case studies on individual children exemplify the at times utilitarian use of care facilities through service consumers.

In so doing the paper contributes to two debates. On the one hand it will add to the controversial discussion around institutional childcare, its potential usefulness as a tool for child saving and its possibly damaging effects on child development. On the other hand it will raise and discuss questions regarding the conceptualization of child agency.

Rescuing the Rescuers – Female Care Worker in the Grip of Caring Power

This paper seeks to explore the situation of un- or low-skilled local women working in residential care institutions for children and young people that have been established and are maintained by affluent religious groups from abroad. Drawing on empirical research in a large Mexican-American border town the trajectories of these women in the social space including the cumulative disadvantages inherent to their current position will be tracked. The way how these women are conceptualised by members of the religious groups who are trying to rescue them from a life at the margins of society will be examined and the overarching narrative framing this approach as well as the norms and values underpinning it will be traced. In so doing the power imbalances permeating and enabling the relationship between these women and their religious host institutions will become evident. Analysing them from the perspective of the Foucault-inspired concept of caring power the paper argues that inclusion and exclusion can be closely intertwined.

PEETZ, THORSTEN (*University of Bremen*)

WAIBEL, DÉSIÉE (*University of Bremen*)

Valuation Constellations

In our presentation, we want to put forth a new analytical perspective for the emergent research field of valuation studies. Loyal to their theoretical foundations in pragmatist social theory (Boltanski & Thévenot, 2006; Dewey,

1916, 1939), current valuation studies focus mainly on valuation practices in situations (Berthoin Antal, Hutter, & Stark, 2015). While this perspective offers rich descriptions of practices of valuation in diverse fields such as the arts (Merriman, 2015; Wohl, 2015), finance (Beunza & Stark, 2004), science (Dussauge, Helgesson, & Lee, 2015; Hirschauer, 2015), or education (Kalthoff, 2013), it ignores important trans-situational aspects of valuation processes. In reference to current valuation research, we argue that while the topic of trans-situationality has recently caught researchers' attention on a substantive level, conceptual and theoretical work is widely missing.

In order to fill this gap, we then introduce the concept of *valuation constellations*. The concept highlights the potential of trans-situational forces in valuation processes in three different respects: *Positions* – valuee, valuator, and audience – whose *relations* span across situational contexts, trans-situationally valid *rules*, and technological *infrastructures* (Meier et al., 2016). The analytical potential of the concept is then illustrated in the context of three ongoing research projects out of rather different social spheres: (1) The process of canonization within the Roman Catholic Church; (2) processes of intimate valuation via real time dating applications; and (3) amateur literary criticism on Amazon.com. By presenting a variety of ways how trans-situational forces shape valuation processes, we aim at a discussion of trans-situationality in valuation studies on the conceptual level.

How Are Acts of Collective Violence during War Remembered in Times of Peace? - Doing Memory By German Soldiers Returned from Combat Missions

This paper is about returning soldiers, their re-integration processes, discourses in the civilian population, and the interaction between discourses and biographical self-presentations.

From the beginning of the first military operations of the Bundeswehr (the German army) in the early 1990s (e.g. in Bosnia, Kosovo or Afghanistan), these operations were referred by the German media as "peace missions" or "stabilization missions". Government officials classified them as "military assistance", "commitment" and "international responsibility".

According to our empirical findings, which are based on a combination of discourse and biographical analysis, this dominant public and political discourse diverges from the reality presented by the soldiers. In our paper we will discuss the question of how everyday life and political discourses constitute the biographical self-presentations and how the discourses are perceived, modified or rejected by the biographers.

We will discuss two case studies of ex-soldiers who faced the challenge of integrating their experiences of combat missions into everyday life. It will be seen that they established different biographical repair strategies which (initially) enabled them to exclude their (traumatizing) experiences of combat missions from their own biography in order to adapt themselves to "normal" civilian life. They learned that it is necessary to keep silent about their experience of violence, to deny or trivialize it. These strategies fit the dominant discourse and present the military operations as largely harmless.

At the same time, the biographers complain of a lack of recognition and define themselves as returnees "without a voice". This self-perception fits with a relatively new counter discourse, established since 2010 by several thousand (former) soldiers, who have joined together in veterans' associations. They call themselves "New German Veterans" and fight "against forgetting" and for acknowledgement as returnees from the war. They understand themselves as "mouthpieces" of their grouping and want to "break the silence".

Financialization Process of Housing on the Periphery of Capitalism: The Case of Brazil after the Global Crisis of 2008 and the Protagonism of the "My House My Life"

The Brazilian government has spent the last 30 years without directing a massive investment in housing, sanitation and transportation, which, in turn, has created serious problems in Brazilian cities. However, after 2005 Brazil resumed investment in areas such as Housing, thus transforming cities as an excellent space for generating profits, interest and real estate income, thus arousing the interests of large contractors in both real estate production and heavy construction. In addition, the expressive globalization of housing and real estate markets and economic adjustment policies, cities have become too costly for the low-income segments of the population - and, increasingly, also for the middle-income population. In Brazil, the market started to regulate prices, establishing parameters for prices, location and availability of housing and land. This contributed to the strengthening of the perception of housing as a mere

commodity and financial asset, thus counteracting the right to adequate housing. In this sense, this work seeks to construct through a qualitative and case study method for an analysis of the financialization of housing in the Especially in post-crisis Brazil in 2008 and to seek as results elements that may reaffirm the hypothesis that the "Minha Casa Minha Vida" Program is part of a financialisation process and has systematically and significantly contributed to generating profits and Interest and income to various capitals, especially from other sectors that are not part of the construction industry, thus strengthening the idea that home ownership with globalization becomes a global financial asset, thus dehydrating the idea of housing as a right Social and human rights to ensure access to various other fundamental rights and reproductive rights. Of human beings.

MELGACO, LUCAS* (*Vrije Universiteit Brussel*)

From the Electronic Eye to Live Streaming Surveillance: Two Decades of the Optical Metaphor

Almost 25 years ago David Lyon published *The Electronic Eye: The Rise of the Surveillance Society*, one of the milestones in the history of surveillance studies. Already on the cover of the book the visual, or more precisely the optical, metaphor was paramount, as it pictured a Magritte style surrealist eye filled with clouds. The reference to the eye, to vision, has accompanied developments in surveillance studies and can be found in Foucauldian references to the panopticon as well as in more recent works like Gilliom and Monahan's *SuperVision* or Marx's *Windows into the Soul* (whose cover is incidentally also illustrated by colorful eyes). Surveillance studies authors have, however, argued that in the latest years not only images but other forms of non-imagery data have become equally important. Among the latter there are data from passenger name records (PNR), credit card information (already mentioned by Lyon himself in the *Electronic Eye*), and all sorts of metadata. However, in this presentation I will argue the still central importance of the image for surveillance studies today by discussing its importance, among others, for social media and most recently live streaming activities.

Transnationality and the Filipina Domestic Worker: Some Evidences from Brazil

It has become increasingly noticeable that upper-class Brazilian families are seeking foreign domestic labour and one of these is the Filipina. Despite a recent formalization of the employment status of domestic workers in the country and the subsequent rise in wages, there are reasons to suppose that mere economics are insufficient to explain their preference. Since the early 20th century, the Philippines have been a major global source of migrant labour, both skilled and less skilled (Country Migration Report – The Philippines 2013). Most recently (between 2004 and 2007), Filipinos have been the fastest growing group of immigrants among foreigners in Brazil issued with residence and work permits (Focus Migration, 2008). This presentation explores the social fabric of Filipina society in Brazil, who is part of a new international migratory wave. The sociological scope includes the inescapable element of the question of family, language, culture, and even religion. Global domestic labour is growing in Brazil, although the country has traditionally had provisions of domestic female labour. Focusing on the city of São Paulo, it is possible to note through preliminary observation, the occurrence of privileged spaces of the meeting points of these workers. Using a qualitative method, information was collected primarily from Filipina domestic workers about their social, personal and occupational lives. Of fundamental importance was also the dense observation of participants in as many aspects of their lives as possible – mostly in the community. As is already identifiable in São Paulo, the Filipinos may be distinguished as one of those communities that behave in a more or less segregated way. The data shows how the Filipino community, while maintaining its distinct identity, has integrated in various ways with local Brazilian society. There are arguments to believe that transnationality is associated with various inequalities, therefore leading to vulnerability.

Exploiting Migration: Tourist Gaze, Art Industry and Cultural Policies

The Mediterranean refugee crisis entails an interesting cultural process showing the complex and controversial relationships between cultural heritage, tourism and art industry, as well as between political narratives, urban policies and cultural marketing.

Main cultural and political institutions, well-known artists and mass media tend to exploit this crisis with effective cultural products, which intertwine emotions, voyeurism and socio-cultural awareness.

Political narratives, based on the importance of enhancing awareness of the crisis, offer an effective cover to these operations. Migrants and refugees tend to become objects of tourist and media gaze, though their real stories and memories are hardly taken into account.

Among the many examples, Ai Weiwei's sophisticated installations with migrants' lifejackets and rubber lifeboats, in Berlin, Vienna and Florence, as well as his documentary presented to Venice film festival, show the deep interrelation between media, marketing and cultural policies.

In Lanzarote tourists can visit an ultimate attraction, an underwater museum displaying also a huge sculpture showing migrants and dead bodies on a rubber boat. This sculpture is named after Lampedusa, a tiny island between North Africa and Italy, which in recent years has received thousands and thousands of migrants, becoming a global symbol of the Mediterranean refugee crisis.

Lampedusa itself is at the centre of an interesting process of metabolization and exploitation of migration. This island has become a popular setting for movies, TV serials and documentaries (one of which was even awarded the Golden Bear at Berlin Film Festival). It has also hosted exhibitions displaying objects of migrants missed during their journey.

These cases are "good to think" the difficult relationships between tragedies, tourism and art industry, as well as between spectacularization of suffering, tourist gaze and cultural policies.

MELOTTI, MARXIANO* (Niccolò Cusano University, Rome)

MARRA, EZIO (Università degli Studi di Milano Bicocca)

When Migration Becomes a Tourist Brand... Lampedusa and the Refugee Crisis

Lampedusa has become a global icon of the Mediterranean refugee crisis, and a good place to think the relationships between tourism, cultural change and social inequalities.

Until some years ago, the island was a major gateway for migrants and refugees trying to reach Europe from Northern Africa. The arrival of thousands of migrants and the presence of a migrant Reception Center have deeply affected local economy based on tourism.

Owing to media representation and political narratives, Lampedusa had acquired a special image as a liminal place where tourists could experience some extreme aspects of the refugee crisis, from shipwrecks to corpses on the beaches.

Recently the situation has changed: arrivals are now under control and tourism appears to be increasingly successful. Local community and tourism industry have metabolized migration, which seems to have become a new "tourist brand". This gives international visibility, no longer frightens tourists and even attracts a new kind of niche tourism. Lampedusa is an interesting social laboratory. Owing to its tourist success, the island is deeply changing: it is acquiring global patterns and risks losing its traditional identity.

Lampedusa has often been presented as the "island of peace": its community was nominated for the Nobel Peace Prize and its Mayor received the Unesco Peace Prize. Is it possible to think Lampedusa as a space able to overcome social and cultural conflicts and to contribute to building "active peace"? Could migration help the island rediscover its longstanding cross-cultural Mediterranean identity? Could migration be used as an innovative tool to build a new tourist and "sustainable" identity based on intercultural dialogue?

The paper presents the first results of a field research carried out by Marxiano Melotti (UniCusano), Elisabetta Ruspini and Ezio Marra (University of Milano-Bicocca).

Poverty, Power and Ethics: Slum Tourism in the Philippines

Slums in the Philippines are dispersed across the country. These slum areas often have limited access to basic services, no legal land tenure and insecure shelter, usually on the least appealing plots of land. Many Filipino slum dwellers live in areas where they are vulnerable to natural and man-made disasters. The increase of slums has long been treated as a common problem of urban areas all over the world. Its increase is considered as a challenge primarily to urban governance. Though global initiatives have been raised to solve the problems associated with slums, particularly to urban planning, the increase of slums also has presented opportunities and threats to the tourism industry.

During the 1980s, the 'Smokey Mountains' in the Philippines had become a symbol for urban poverty. In the early 1990s, a tour operator started offering tours to this huge garbage dump, where thousands of people lived and worked. These tours temporarily stopped in 1993 when the dump was closed. Most inhabitants had to move to Payatas, another dump, which collapsed in 2000 in a landslide that buried hundreds of people. Today, there is "Smokey Tours," which is a project of World Experience Philippines, Corp, a duly registered non-government organization in the Philippines founded by Juliette Kwee. According to the founder, this special tour seeks to raise awareness about social issues, inspire

individuals to bring about societal change, and bridge the gap between people from different backgrounds.

Literature suggests that slum tourism has been subjected to various ethical discourses in the international scene. Using secondary data analysis and qualitative research methodology, this paper aims to explore how slum tourism developed in the Philippines and identify the issues related to poverty, power and ethics that emerged due to the promotion of these slum tours.

Reclaiming 'Free Markets' from the Neo-Liberals? Thinking through Capitalist Coalitions in Anti-Globalization Movements

As the information revolution unfolds, concerns over access to information technologies are increasingly embroiled in wider concerns over the (anti) democratic implications of global capitalism. In the United States, these concerns are manifested in a social movement seeking to implement Network Neutrality regulations that prevent telecommunications service providers from exploiting their position as network gatekeepers, ostensibly to safeguard the freedom and openness of the Internet to democratic participation and endogenous, user-driven development. This movement draws on themes and tactics common to the broader anti-globalization movement, including opposition to the concentration of power among multi-national corporations, resistance to deregulatory pressures, promotion of economic self-determination, and the mass mobilization of supporters through the Internet. Unlike other such movements, however, Network Neutrality movement organizers have sought change on explicitly pro-capitalist terms, by casting demands as the legitimate expression of free market principles – based on meaningful competition – in opposition to the (neo-liberal) position of free markets as *laissez-faire* deregulation.

Drawing on a wide corpus of movement materials, including legislative committee testimony, SMO documents, and interviews, I argue this case raises questions about the utility of conceptualizing resistance to global capitalism as struggles against particular *expressions* of capitalism – and perhaps as struggles to enact particular visions of alternative capitalist possibilities – rather than as struggles against globalization or capitalism *per se*. This conceptualization poses a dilemma: on one hand, coalition-building with entrepreneurial capitalists aligned with the movement's vision of Internet openness has been key to the movement's success; on the other hand, there may be far-reaching consequences to further entrenching market mechanisms as the primary organizing principle of access to information technologies.

The Dynamics of Medical Authority

Despite our interest in determining our health decisions, physicians have great control over our bodies, minds, and lives. Their pronouncements are more widely-accepted than those of stakeholders that range from nurses to pharmaceutical companies, and they are able to set high prices for their care, sometimes leading patients to shoulder massive debt to pay off medical expenses.

How do doctors manage this privileged authority? This paper uses over six years' worth of ethnographic data to answer this question, incorporating factors internal and external to medicine. I argue that doctors manage their authority in the context of competing for status among doctors who share with them an interest in developing new knowledge. Specifically, the terms for status among doctors will be closely tied to the expectations of these peers regarding how knowledge is produced, and public expectations for the practice of medicine. Physicians compete with peers for status by making a case for the quality of the knowledge they have developed and would like to have orient practices profession-wide. Those seeking to have their knowledge widely adopted are observed by peers in a range of venues, and judged in terms of qualities that they would like to have represent the profession's authority with outside stakeholders. Those doctors who put medicine's authority at risk though engaging in behavior deemed culturally inappropriate are denied the opportunity for visibility that comes from being given access to medicine's key venues. Consequently, these doctors' knowledge is unlikely to become dominant, ensuring that these physicians potentially able to place the group at risk are denied positions that would enable them to represent the collective in a negative light.

This dynamic and contingent model, I argue, better explains how authority is gained and lost in medicine than the static, institution-centered, and hierarchical model that presently dominates.

Brand Feminism: Promotional Culture and Contemporary Feminist Activism

Ever since the late 1960s when Virginia Slims cigarettes released their logo 'You've come a long way, baby', tapping into women's liberationist tropes, scholars have been aware of the ways corporations have adopted feminist slogans and rhetoric to sell their products. While there is growing scholarly interest in the ways corporations promote 'brand-led' or 'commodity activism' (see Mukherjee and Banet-Weiser 2012), there is a surprising dearth of research on the other side of the coin - the ways activists are increasingly adopting slick PR and marketing strategies into their campaigns including, branding, commercialising, franchising, merchandising, and the increased use of celebrity icons.

Given the contemporary 'hot-ness' of feminism around the globe (Gill 2016), and the plethora of recent initiatives such as the global SlutWalk movement and the Women's Marches in January 2017, this is a timely and fruitful space in which to apply theories from promotional and critical consumer studies. In this talk, I will outline a new theoretical account of what I term 'brand feminism', which attends to the ways feminist activists are increasingly drawing on corporate strategies to 'brand' their activism, including commercialisation, franchising, merchandising, professionalisation, and increased use of celebrity icons. While 'framing' (Entman 1993) or 'networks' (Diani & McAdam 2003) may have been key concepts in the past to understand social change movements, I propose that as neoliberalism continues to gain global dominance, we need a new theoretical framework in which to understand the relationship between activism, promotional culture, and social change.

Legítimo Victimario: Juventud, Violencia y Vida Cotidiana En Unidades Habitacionales Populares De La Ciudad De México

La violencia interpersonal se ha convertido en uno de los mecanismos prácticos para la resolución de conflictos cotidianos en la Ciudad de México. Sobre todo, en espacios donde la ausencia de autoridad es evidente y la responsabilidad de los habitantes de protegerse recae sobre sí mismos, tal como en las unidades habitacionales populares ocurre. Es en este marco que se ha configurado a los jóvenes varones como los encargados de protegerse a sí mismos, a sus familias y a su patrimonio, bajo el respaldo de sus comunidades de pertenencia, lo que me lleva a proponer la categoría de *legítimo victimario* como una posibilidad de análisis en la dupla juventud y violencia.

MENESES REYES, MARCELA* (*Instituto de Investigaciones Sociales- Universidad Nacional Autónoma de México*)

Legítimo Victimario: La Violencia Como Mecanismo De Resolución De Conflictos Cotidianos En Entornos Urbano Populares De La Ciudad De México

En ciertos entornos urbano-populares de la Ciudad de México los conflictos cotidianos por mantener el orden y la seguridad en los barrios se dirimen de distintas formas entre los vecinos ante la ausencia de autoridad o ante la falta de reglas hegemónicas. En algunas ocasiones el diálogo y la negociación imperan, en otras las acciones individuales y abusivas se imponen, y en muchos otros casos se recurre a la violencia como un mecanismo práctico y efectivo para solucionar los conflictos.

En esta forma de enfrentar los problemas de la vida cotidiana que se multiplican en los barrios, edificios y unidades habitacionales populares, son los jóvenes varones los que actúan violentamente como los defensores de sí mismos, de sus familias y de su patrimonio ante la ausencia de autoridad. Todo esto bajo el velo y visto bueno de sus familias y comunidad de pertenencia, lo cual me lleva a plantear la categoría de *legítimo victimario* como una posibilidad de análisis en la relación juventud y violencia.

MENEZES, PAULO* (*University of Sao Paulo, Brazil*)

Revisiting the Horror: Joshua Oppenheimer's Act of Killing (2012) and S-21 the Khmer Rouge Killing Machine (Rithy Panh, 2003)

This paper aims to analyze the films *Act of Killing*, by Joshua Oppenheimer (2012) and *S-21 The Khmer Rouge Killing Machine* (Rithy Panh, 2003). The first film was made from interviews with members of death squads seeking to understand how thousands of people were exterminated by supposedly being "communists" in one of the greatest genocides of the second half of the twentieth century. In some instances, comparisons will be made with S21 - The Khmer Rouge Killing Machine, another horror moment of the late twentieth century in the contrary sense as here the supposedly "anti-communists" were the exterminated.

The proposal is to discuss the relations between cinema and the production of knowledge in the Social Sciences, in order to highlight the problems of episte-

mological background and methodological issues concerning the use of film as a privileged research material.

The aim is to investigate the articulations proposed by the films, its formative aspects, evidencing the ways in which the relations between cinema and society are established, through detailed analysis of its narrative, its options, its silences. Certainly every researcher in Social Sciences gives the world a sense from the value options he makes. However, in doing so, he must be aware that there is not, as Weber pointed out, something valuable and worthy "in itself" to be investigated, an inherent or unique sense of things. In view of this, the researcher, looking to the film, exposes himself to the risk of sustaining the connections that he establishes, connections that are significant from the valorative options he makes. The perspective is that at the end of the analysis the significant blocks, reconstituted and highlighted in their various moments, point not only the common points with other possible interpretations, but above all, distances, dissent and disagreements between them.

Governing through Value: Public Service and the Asset Rationale

The financial and managerial transformations that fall under the rubric of New Public Management do recurrently include the transition from standards of public 'expenditure' to principles of public 'investment', that is, to an emphasis on the 'return' of public money and on the assessment of its capacity to 'create value'. The crucial part played by quantitative metrics and performance measures in the construction of these transformations has been highlighted and analysed. Yet, the 'investment' rationale that these transformations entail deserves further scrutiny. The fact that considering something in the terms of an 'asset', i.e. in its capacity to 'create value' from the perspective of an 'investor', involves not only a transformation of the thing/service under consideration. It redefines also the roles - the very 'making up' - of public service users and providers. This study provides an exploratory contribution to the examination of this hypothesis. We focus on three areas of public service that are highly exposed to these modernization policies: hospitals, universities and prisons. We concentrate on the cases of France and England, where particular styles of New Public Management have translated into particularly problematic processes of quantification and valuation. We study the extent and manner in which the resources these public services consist of (personnel, facilities, knowledge, management) are considered as 'assets', that is, as elements whose 'value' stems from being considered from an investor's viewpoint. We also examine how the 'user' proper (the patient, the student, the inmate) is featured as an 'asset' in this 'value creation' machinery. We suggest that what we call the 'asset rationale' operates on a cultural level and carries profound political significance. It involves the development of a particular culture in the conduct of public administration and its assessment or, put differently, a new form of considering what the state consists of.

Public Demonstrations

In a context of mounting political and material insecurity and stalled growth, precipitated in large part by the ascendance of the Hindu right, what is the fate of the category of 'the public'? How are contemporary mobilisations redefining the public in India? In this paper we examine a range of protests and movements that have punctuated the past year - from campus conflagrations, to labour struggles and farmers' struggles, to caste-based mobilisations, to the championing of the right to privacy - and consider the definitions of 'the public' that they demonstrate. We will investigate the site and subject of the public specified in these demonstrations, as we analyse them in terms of what they reveal about who is considered to be a legitimate member of the public, the fate of those who are considered to be encroachers on political and physical spaces of the public, and the role of private property in regulating access to 'the public.' Our focus will be to understand the challenges of organising for social justice in the contemporary era, where 'the public' is increasingly privatized and de-secularised, and the rights of citizens are suspended in the name of public interest and national security.

Eastern European Service Contract Workers in the German Meat Industry - Institutions, Networks and Conventions

This contribution will be based on an ethnographic case study of the transnational labour market that allocates Eastern European workers to jobs in the German meat industry, including interviews, informal talks, observations, and

document analysis. The empirical reconstruction of this specific transnational labour market and of the complex configuration of market (making) actors aims at revealing its underlying logic and at developing a theoretical understanding of (this type of) transnational labour markets more generally. Specific attention will be paid to institutions, networks and conventions that enable cross-border recruitment, placement, and matching in this case and thereby enact this transnational labour market. A special focus will be put on the complex interplay of EU legislation and national labour laws of the home and host countries, on the gaps between these levels and the ways that (collective) market actors fill them, and on the role of national and EU-level industrial relations for regulating this transnational labour market.

Rich Country, Poor Chances? How Institutions and Resources Shape School-to-Work Transitions of Disadvantaged Students in Germany

Germany is a rich country with a pronounced educational expansion over the past decades. Yet, educational inequality in Germany remains among the highest in industrialized countries. About 8% of a student cohort leaves general schooling without any educational degree. This group is particularly vulnerable at the transition to vocational training and the labor market. Students without any degree come from the lowest track of the stratified regular school system and from special-needs schools. The assignment to these school types differs by student ability, but assignments also vary by region, proximity to schools, and administrative practices. As a result, students with very similar (low) basic competencies are found in both school types. Depending on these institutional contexts, students experience differential support in school and especially in their transitions into the vocational training system and the labor market. In our paper, we analyze the pathways of students with similar cognitive ability: Do comparable school leavers face the same disadvantages at labor market entry, or do students from special-needs schools suffer from additional stigmatization? How effective is the support program for special need students to overcome their low chances of a successful labor market entry? What is the role of social, cognitive and motivational resources ("agency") besides institutional constraints and support for labor market integration?

We use data from the German National Educational Panel Study (NEPS). Due to an oversampling of low-achieving students, the data sets offer the unique possibility to compare students from special-needs schools with similar students from regular schools. In our analyses, we first employ sequence analysis to illustrate pathways to labor market integration for all low-achieving students. In a second step, we match students from different school types and model their employment status at the end of the observation frame, controlling for the differential support they received.

Teachers' Identities and Pedagogic Practices in Barcelona and Buenos Aires. Global Pressures, Local Responses and Common Challenges

In Western developed and non-developed contemporary societies, comprehensive secondary schooling faces numerous and complex challenges triggered by the emergence and consolidation of the globalised knowledge society, the expansion of social inequalities, and the proliferation of youth cultures. In this scenario, this paper maps out some of these challenges in secondary schools in Barcelona (Spain) and in the City of Buenos Aires (Argentina). Based on different qualitative research projects carried out in each city, the paper focuses on teachers' identities and pedagogic practices in secondary schools for pupils from socially and economically disadvantaged families, and located in deprived urban areas. The following questions organise our analysis: How do teachers define their work in these schools? How do they address the distance between the school cultural capital and working class cultural capital? How do teachers see their own responsibility with regard to pupils' school "success" or "failure"? What are the tensions between teachers' identities, policy pressures and young people's experiences, knowledge and identities? In order to address these questions, this paper is organised into three sections. The first examines our theoretical tools - pedagogical devices, identities and the social construction of educational trajectories - drawing from English and French literature. The second describes the educational policy scenario in Barcelona and Buenos Aires, and, in turn, examines how different groups of teachers deal with everyday challenges and how they delineate diverse teachers' identities. Finally, we compare and contrast the cases under examination and we identify common and specific challenges for comprehensive education, as well as lessons to be learned beyond the researched scenarios. In sum, the paper allows mapping some of the 'old'

and 'new' challenges facing secondary education in order to achieve educational success for all students and contextualise them in light of the contemporary social, economical and cultural transformations.

MERGENER, ALEXANDRA* (Federal Institute for Vocational Education and Training)

Balancing Work and Family Life with Home-Based Telework? Perspectives of German Employees in Different Occupations

Home-based telework is usually associated with flexible working hours and often considered as a strategy to enhance employees' work-family balance. Thus, having the opportunity to work from home is perceived as a feasible way to combine family life and paid employment – particularly for those (mostly women) who are responsible for childcare and by this often restricted to participate in conventional on-site work. However, working from home could also mean that professional and domestic spheres are closely interrelated and results in blurred borders between work and family life. This could be especially the case for persons in leading or management positions as these are mostly in demanding, competitive and pressured contexts. The question is therefore: Concerning work-family-balance, is home-based telework a blessing or a curse?

Using data from a representative telephone-based survey of 20,000 persons in active employment in Germany (BIBB/BAuA Employment Survey 2018), this study analyses the effects of teleworking options on the subjective work-family-balance of German employees. Aspects of particular interest include differences by professions, occupational positions, intensive work contexts, tasks, working hours and gender.

This question is especially interesting due to the increasing digitalisation of (western) labour markets, which may result in growing teleworking opportunities. In this context, the research project broadens the discussion about pros and cons of home-based working by findings that can directly applicable to German employees (because of the specific national database). Furthermore, these results are also transferable to working populations of other nations with similar structures.

From 'the Gang' to Educational Sociology: A Reappraisal of Frederic M. Thrasher's Legacy

Like other colleagues from the Department of Sociology at the University of Chicago, Frederic M. Thrasher owes his reputation to the research carried out during his PhD and published in 1927 as 'The Gang': a 'classic of sociology' that has become over time a reference for those studying youth gangs and youth subcultures. Although representing for him an opportunity to get sudden recognition and a constant reference throughout his career, the experience in Chicago is only the first step of his academic and intellectual biography. In 1927, after the release of 'The Gang', Thrasher joined the Department of Educational Sociology at the New York University. At NYU, he had the opportunity to redefine its intellectual path. Thrasher placed the novelty of the Chicago approach at the service of the challenge launched by Educational Sociology: recognizing the role and contribution of sociology in analyzing and solving educational problems. Thrasher worked in New York from 1927 to 1959, focusing his analysis on the social contexts that influence educational processes, the relationship between school, informal groups and communities, the contents and roles of informal education, the effects of 'motion pictures' on young people and the relationship between education and prevention of juvenile delinquency. This phase of his intellectual biography remains largely unknown. However, while considering its limits and contradictions, it seems still able to offer interesting insights to contemporary research.

In this direction, the paper aims at presenting and critically analysing the main features of the empirical researches and of the theoretical and methodological thoughts developed by Thrasher throughout his path from Chicago to New York, also in the hope that it can offer new insights for – as in the aims of the session – reversing the approach in the studies of youth gangs.

Política Social y Pobreza Alimentaria En México. Una Visión Desde La Gerencia Social.

El propósito del presente trabajo es analizar una de las estrategias de política social, clave del gobierno mexicano, orientada a atender el problema de la pobreza extrema en México, agudizada en las tres últimas décadas, producto de la política económica neoliberal. Se pretende realizar un acercamiento a la política social denominada “nueva generación”, desde el enfoque de la Nueva Gerencia Pública en su especificidad de Gerencia Social. En específico se analiza la estrategia denominada *Cruzada contra el Hambre*, su estructura, funcionamiento y desempeño con el fin de señalar algunos de sus efectos en materia de combate a la pobreza alimentaria así como los efectos que tiene en la disminución de la brecha de desigualdad que la política neoliberal ha provocado. Esta estrategia se define de inclusión y bienestar social, aunque su enfoque es atender las carencias por lo que la crítica se dirige a señalar sus limitaciones en términos de la sobrevivencia de los sujetos; fue diseñada originalmente para atender a una población de 7.01 millones de personas consideradas en *pobreza extrema con carencia alimentaria*. Anunciada en su momento, como uno de los ejes fundamentales de la política de desarrollo social bajo un enfoque de derechos humanos del actual gobierno mexicano.

La revisión crítica de la estrategia permitirá establecer el alcance de la misma, si se trata de una estrategia de una política social de nueva generación, si amortigua o erradica el problema de la pobreza pero sobre todo se busca identificar o proponer desde la perspectiva de la gerencia social, reactivar la participación social y comunitaria en la atención de la pobreza alimentaria en México. La gerencia social como una herramienta para el ejercicio comunitario, para la participación ciudadana en el contexto de reorientar los supuestos con los que opera la política alimentaria.

MERLA, LAURA* (Université Catholique de Louvain)

Understanding the Articulation between Digital and Physical Mobilities, Spatial Embeddedness and Social Relations through the Lens of Children Growing up with Two ‘Homes’

I will present the main theoretical foundations of the ongoing ERC Starting Grant project « MobileKids: children in multi-local, post-separation families », which seeks to understand the lives of children aged between 10 and 15 in the context of shared custody arrangements.

The project investigates in particular the diversity of children's experience of multi-local family life in Brussels, Torino and Lyon, and seeks to identify their specific needs, through children's own accounts of their experiences. This means determining how, and under what circumstances, children appropriate their multi-local lives and develop new forms of habitus that incorporate mobility, virtual connectedness and the capacity to appropriate them and act upon them, which is in turn particularly valuable in societies where mobility (social, geographical, professional, etc.) is increasingly becoming a new stratifying factor (Glick Schiller and Salazar, 2013).

I will argue that children growing up between – and across – two households represent a key entry for developing empirical and theoretical knowledge on the inter-relations between mobility (including virtual), spatial embeddedness, and social relations. The micro-level everyday practices of those children indeed opens up a window for a better understanding of the characteristics, and articulation of:

1. the spatialisation of ‘family’, which questions the relations between « life spaces » (multilocal residentiality) and « lived space » (or the intimate network of someone's real and imaginary places and territories) (di Méo, 2012), and brings forward the importance of space/time articulations, in a context where “choreographies of existence” (Duchêne-Lacroix, 2010) are produced through the management and coordination of intermittent absence and co-presence within, and across households;
2. virtual mobility and virtual connectedness, which allow for the development of new repertoires of connectedness and co-presence that transcend space and time, and interrogate the role that ICT play in the management and structuring of daily social relations.

Gender Belongings: The Effects of Historical Visibility over the Life Course

In this presentation we focus on gender belongings throughout the life course and their relation to the increased recognition and historical visibility of gender diversity in Portuguese and British contexts. Taking gender belonging as a linking concept between self and society that allows us to analyse social change (May, 2011), we deepen the relation between temporal (biographical and historical) dimensions and the process of discovering and identifying with a non-binary gender.

Through a historical, comparative and transnational approach we present preliminary results of a PhD research on non-binary genders framed by the ERC funded project TRANSRIGHTS (<http://transrightseurope.com>). Our starting point of analysis are 20 biographic interviews with individuals born between 1943 and 1997 who identify beyond the gender binary – i.e. don't belong exclusively to a masculine or a feminine gender. Based on an analysis of biographic and socio-historical data from Portugal and the United Kingdom, we tackle how gender diversity recognition and historical visibility impacts on self-discover processes and enables different gender belongings.

Concretely, we applied the *biographical-interpretative-method* as a privileged tool to explore the ways in which socio-historical circumstances relate to individual and particular lives (Cohler and Hostettler, 2003; Wengraf, 2000). With regard to gender belongings our data shows how access to information and transgender networks, as well as the possibilities for legal gender recognition open the way for earlier processes of discovery and identification. Through the analysis of troubled and nonlinear trajectories in view of the mainstream “transgender path” (discovery-> treatment-> gender transition/migration), we verified that individual gender belonging is specially marked by the time in which one lives. Historical context has profound implications upon the course of an individual's life. By focusing on the relations between gender belonging and time, our results allow us to better understand the complex interrelations of change in personal and social life.

Sounds from Istanbul's Old Beer Factory: The Case of Bomontiada

This paper will be focusing on the transformation of the historic beer factory in the Bomonti neighbourhood of Istanbul into an entertainment and culture hub, *Bomontiada*. Bomonti the brewery label established by the Swiss Bomonti Brothers in Istanbul in the late 19th century, inspired the name of this neighbourhood. One of the main contributors of the transformation of such a hub has been the company behind Istanbul's music venue Babylon, called Pozitif. Starting off in 1999, Babylon has been re-located within this renovated, creative cultural hub in 2015. In the recent years, this venue has been hosting the emerging local artists alongside those recognized global names within certain (sub)genres, providing an opportunity for creating an amalgamation of translocal networks between artists and creative actors. In this respect, I will be critically analysing Bomontiada, especially focusing mainly on the hub's music venue Babylon, together with its other “hip”, “artsy” and flamboyant dining and wining spaces, workshop events and its art space, etc. as an example of how capitalism engages with creativity and creative labour thus bringing forth gentrification processes. Hence, I will be contemplating on how the Bomonti neighbourhood is changing through this hub and its live music venue. On the other hand, taking into consideration the cultural policies and the governmental support to such arts and culture spaces are extremely low and have worsened in the recent years in Turkey, the initiation, organisation and sustainability of them have been maintained by private investors. Although neoliberalism engages with, and absorbs “creativity” within itself, in the context of Istanbul, how has the historic building of Bomontiada and its music venue Babylon –of course with the contribution of other spaces in this hub- articulates the city through its neighbourhood into the global networks of entainment and culture?

Pilgrimage, Heritage and Politics in a Divided Society

This paper will explore how religion, politics and heritage intersect in the deeply divided Cypriot society by examining one of its most important pilgrimage centres: the Christian-Orthodox monastery of Apostle Andreas. The monastery is a significant container of cultural heritage and is visited mainly by Greek-Cypriots (G/C) but also, although to a lesser degree, by Turkish-Cypriots (T/C). After the island's division in 1974, the monastery was rendered largely inaccessible to the G/C only to be reinstated as a popular pilgrimage destination in 2003 when the opening of the checkpoints made it possible for the G/C and the T/C, respectively residing in the island's southern and northern parts, to cross the dividing line.

The revival of the pilgrimages, as well as the restoration works that began in 2014 with the involvement of both the G/C and the T/C communities, indicate and help to mold the shrine's continued salience. The paper makes use of ethnographic data deriving from in-depth interviews with pilgrims and participant observation of their journeys, in order to examine the revival of the pilgrimage in conditions of ongoing division. Focusing upon G/C pilgrims, it explores the impact of violent and ideological conflict upon different groups of pilgrims (i.e. refugees, people born before and after 1974); their motives, their constructions of and the meanings ascribed to the journey and the site. The paper will therefore look at the ways in which pilgrimages are affected by conflict, as well as their role in reshaping worlds dislocated (Jansen 2012: 10-11) owing to refugeeedom and displacement.

Jansen, W. 2012. 'Old Routes, New Journeys: Reshaping Gender, Nation and Religion in European Pilgrimage,' in *Gender, Nation and Religion in European Pilgrimage*, ed. by W. Jansen and C. Notermans. Surrey: Ashgate (pp. 1-19)

MESJASZ, CZESLAW* (*Cracow University of Economics*)

Complexity of Social Systems As Awareness of Ignorance

The first attempts to define complex entities go back to the works of Weaver (disorganized complexity and organized complexity), Simon - the Architecture of Complexity, and Ashby - the Law of Requisite Variety. In his search for the meaning of complexity, Lloyd identified 45 methods of describing complexity. A convincing picture of intricacy of the research field of complexity studies is reflected in the scheme proposed by Castelani. In other writings numerous definitions of complexity are formulated. The ideas associated with complexity drawn from mathematics, physics and natural sciences can be called 'hard' complexity research as an analogy with the 'hard' systems thinking including the 'first order cybernetics'. The 'soft' complexity research, coined per analogy with 'soft' systems thinking and 'second order cybernetics', includes the qualitative ideas of complexity elaborated in other areas - cybernetics/systems thinking, social sciences and in psychology. At present, the extant interpretations of complexity of social systems seem to be inadequate to the needs of theory and practice. It especially concerns the society dominated by information overabundance which leads not only to the problems with the number of impulses produced and received but to difficulties of assigning the meaning to information. Bearing in mind the above assumptions, an attempt is made to develop a new interpretation of social systems complexity which is based upon reflexivity, intersubjectivity, interdisciplinarity and multilevel individual and interactive knowledge. Awareness and self-awareness of ignorance of the participants of an intersubjective process of negotiating the meaning of complexity constitute the point of departure of a new interpretation, and even perhaps, of a new definition of social systems complexity. The hypothesis will be proved that the new interpretation of complexity is applicable in studying the phenomena in modern society at the macro-scale - environment, macroeconomic processes and, particularly, at the micro-scale - corporate management.

"to be or Not to be" Vs. "from Being to Becoming": Inequality As a Property of Complex Social Systems

The challenges of social and economic inequality have been known since the onset of civilizations. Already in the 20th Century several major works on that topic were published by Amartya Sen but a new significant impulse has been given to the discussion on that topic after the publication of research by Thomas Piketty and co-authors. Those publications were followed by other works of Joseph Stiglitz and Branko Milanovic. They were accompanied by more or less "shocking" reports and results of empirical research papers illustrating dramatic discrepancies in distribution of income and wealth in the world society (OECD, UNDP, UNU/WIDER, World Bank). The discussion on inequality includes two major approaches. The first one embodies narrow empirical approaches, often without a deeper explanation of causes. In the second approach, inequality is analyzed within a framework of broad ideological and political considerations. There exists a research gap, in which the middle-range theoretical discourse based on systems thinking, and complex systems studies, in particular, can be placed. Analogies, metaphors and mathematical models deriving from complex systems studies can be helpful in a better understanding of causes as effects of socio-economic inequality. Narrowing the discussion to some preliminary issues, the paper aims at showing how modern systems thinking, and especially the ideas dealing with complexity of social systems, can be helpful in a better understanding of the phenomenon of sociopolitical inequality. Applications of the following ideas can be considered: consequences of Pareto distribution, Lorenz distribution, Zipf's Law, scale-free networks, thermodynamic models and analogies, hierarchical structure of systems, holarchy, heterarchy, functional differentiation of systems and other formal models. Parallely, qualitative ideas of complexity such as the Luhmann's concept and others can be applied. The collection of proposed ideas is obviously not limited.

Does Same-Sex Marriage Change the Relationships with Families of Origin?

Several studies have highlighted the specificities of kin relationships among gays and lesbians, especially their greater distance from biological families and their preference for "families of choice" [1], defined by elective links including partners, ex-lovers, friends, and some selected kin... (Donovan, Heaphy & Weeks, 2001 ; Weston, 1997). But at the same time, even if the responses are not always positive, events like births or marriage can also bring the couple and their parents closer together, since these steps can redefine roles in the family and generate a desire for inclusion and "reconciliation" (Smart, 2007). For example, the birth of a child often strengthens the ties between a same-sex couple and their parents as these latter are much likely to accept their role as grandparents even if they have difficulty accepting their child's homosexuality (Cadoret, 2002). In this context, the opening of marriage to same-sex couples in France in 2013 enables same-sex partners to be legally recognized as spouses and thus obtain a status similar to others. But how does this legal recognition of their relationship affect their kin network? Do families of origin readily accept a same-sex couple's decision to marry? Does the marriage lead to conflict or, on the contrary, to closer relationships? In different-sex weddings, most of the extended family is invited and parents sometimes take part in the organization (Maillochon, 2016), but for now we know little about the ceremonies of same-sex couples. Through a qualitative study of 35 men and women married to someone of the same sex in France, I will study the influence of legal unions and the changes in relationships with kin after the partners announce that they are going to marry.

[1] Coming-out tends to be difficult because parents sometimes deprecate homosexuality (Weston, 1997), which might explain their children's distance.

Agency Work. How Policemen Develop Connective Repertoires Whilst Working.

In contemporary professional practice, dealing with heterogeneity is part of the job. The 'pure' and enclosed conception of professionalism seems no longer sufficient. Therefore professionalism is being reconfigured into forms, such as 'hybrid professionalism' (Noordegraaf, 2007; 2011) and 'connective professionalism' (Noordegraaf et al., 2014). Hybrid professionalism cuts across the traditional dichotomy of the managerial versus the professional logic and seeks to develop new identities on the edge of different, often conflicting institutional logics. Connective professionalism does not regard professionalism as either 'enforced' or 'fragmented', but seeks professional repertoires that acknowledge the heterogeneity of occupational domains and the collective nature of professional practices. These reconfigured perspectives are arising, but what about professional action, in-between identities and institutions? Since professional knowledge and identity are no longer treated as fixed, the question is how they are being developed *in practice*.

Existing studies on the development of hybrid identities and connective repertoires focus on managerial subtypes (such as 'strategists') or hybridization within traditional professions (such as 'healthcare'). This article examines hybrid and connective professionalism within the field of policing, as an exemplary street-level profession. Empirically, we use an intervention approach that includes a responsive evaluation method to dig into the way hybrid policemen find their way. We use the notion of 'identity work' (McGivern et al., 2015) to examine how hybrids deal with conflicting institutional logics and work to create a position for themselves. However, this concept falls short in describing how professionals build new repertoires that are aimed at tackling problems. In addition, we coin the term 'agency work' to describe the way in which present-day professionals can only work to create connective repertoires whilst working. We study how policemen work on new connections, and we study interventions for facilitating agency work. We draw conclusions for police practices, but also for research agendas.

The Cajun Navy: Understanding Integration of Emergent Volunteer Groups into Disaster Response

This research explored the formation of an all-volunteer emergent group, the Cajun Navy, from Greater Baton Rouge Flood of 2016 and its transition to an extending, emergency response organization that provided life-saving capabilities to overburdened emergency responders following Hurricane Harvey in 2017. The Cajun Navy is the acquired name of outdoorsmen (and potentially women) mostly from southern Louisiana who use their personal flat bottom boats to conduct

volunteer rescues during flood events. With increasing frequency of disasters, effective use of the whole community for volunteer response is a growing need for emergency management to ensure the safety and welfare of the public. The unprecedented transition within one year of formation to high functioning life-saving capability that deployed to another state is a new phenomenon in the disaster response community. This presentation will discuss: 1) How the Cajun Navy originally formed and transformed to respond to Hurricane Harvey; 2) How they used technology and social media in operations and dispatching individual boats to citizens in need; and 3) How the informal and unstructured Cajun Navy integrated with the very formal and structured search and rescue operations conducted by federal, state and local response teams. Data were drawn from in-person, in-depth interviews with both Cajun Navy volunteers who responded to Hurricane Harvey and emergency management officials in areas that coordinated with the Cajun Navy. The work contributes to theories on social organization, especially in disaster settings, volunteer behavior and motivations, social capital, and technology and social media adoption for emergency response.

Conceptualizing Childhood As Located within Subaltern, Modern and Postmodern Theory

In this paper I conceptualize childhood as seen from the perspectives of subaltern, modern and postmodern theory. I argue that the concept of childhood is a social and cultural construction. Childhood was a short period in medieval times. Childhood as we know it today was invented within the modern discourse following The Enlightenment and the Age of Reason. I argue that in the wake of the Enlightenment and the *Industrial Revolution*, two contrasting trends emerged regarding children, viz. the notion of child centeredness (among the emerging middle classes), and increasing proletarianization of children (among the lower classes). Modernity brought about change in how childhood was understood where the notion of the original sin gives way to the idea that children were innocent, close to nature, uncorrupted and pure, and the importance of shaping young minds early. There was a sharp contradiction between a romantic idealized view of childhood rooted in eighteenth-century Enlightenment and the brutal reality of most children's lives. The subaltern status of the proletarianized children continues into the 20th and 21st centuries even as the Welfare state and the "Century of the child" triggered off the Convention on the Rights of the Child in 1989 and the new Sociology of Childhood creating spaces for constructing notions of children and childhoods that understands the child as a unique complex, individual subject, rich in potential, strong, powerful and competent. Finally the postmodern discourses of children go beyond the notion of integrated agency of children and locate childhood in a variety of domains and are located in a number of communities because they engage with different sets of people in different social settings, are seen to find multiple expressions of self – multiplicity of voices. Difference, change and fluidity become the starting points in analysis of childhood.

Understanding Climate Change Scenarios. a Second Order Observation of Climate Change Databases

Understanding climate change scenarios. A second order observation of climate change databases

Climate change is a contested scientific debate. Despite a broad consensus about climate change taking place, we do not have a clear forecast of the expected scale of that change over the following decades. However, scenarios such as 6DS and RCP8.5 suggest that the current trajectory could lead to a plausible temperature increase of 4- 5 °C. The implications of such change are uncertain.

Governments and public and private organizations have begun to set tasks and goals to minimize climate change effects. These actions are related to how they perceive the causes and effects of the problem, but it is unclear upon what information they base their decisions.

Climate change databases are a set of information that allow society to develop environmental knowledge to improve the decision-making process, but the databases are in themselves frameworks to interpret reality. Databases are a reflect of what is considered relevant to make decisions about climate change.

A Sociocybernetics perspective offers a way to observe the databases as a knowledge system with specific delimitations, elements and interrelations. This perspective will enable us to set a second order observer who explains how this knowledge could improve or limit the making of better decisions by exploring:

1. How available databases are focusing on the problem
2. What agents are intervening in constructing those databases

3. Who has access to those databases i.e. understanding that the access is restricted for economic, infrastructural and knowledge factors

We want to understand how the information in the databases could impact the decisions about how to face climate change, and who is going to benefit from those decisions.

Neighborhood and Mental Health Among Hong Kong Elderly

This study investigates the association between various aspects of neighborhood and depression among Hong Kong elderly with a focus on neighborhood elderly services, a modifiable factor with policy implications. Using two waves of data from the Hong Kong Panel Study of Social Dynamics (HKPSSD), it reveals that elderly facilities aiming to encourage social participation and personal interaction are significantly related to reduced depressive symptoms. The positive impact of such elderly facilities is stronger among the disadvantaged older population living in low-SES neighborhoods. The result suggests that the concept of the neighborhood can be applied to Hong Kong, an ultra-dense Chinese metropolis.

The Pedagogy of Installation: Engaging a Public with Distasteful Learning

With my use of photographs and collages my research work overlaps with the work of artists; and with my use of exhibition strategies it overlaps with that of curators. Underpinning all of my research work is a desire to offer people something to learn – through the beauty/visual appeal of that work, especially where the 'something' is difficult and distasteful. Projects created within this research are made *pedagogically*, *aesthetically* and with a learning public in mind. Such an approach seems to speak easily to institutional discourses of impact and public engagement but I suspect that beauty and distasteful truths are too tricky to measure to ever hold intrinsic value for these discourses.

Room for Ridiculous Things is a project-in-progress that began with an artist's studio installed in a faculty meeting room. In the 'studio' I created drawings and collages, covering the walls and floor with my efforts and inviting the faculty to wander in, ask questions or leave comments. The ongoing project aims to teach something of a personal distasteful learning of dementia: to reframe the learning of a degenerative neurological disease and the long-term care of those affected. The emotional aesthetic (the 'why') of the project is inextricable from the construction of its pedagogy.

In this presentation I explore primarily what exactly *Room for Ridiculous Things* is teaching and how. In particular I share the artistic, curatorial and pedagogic techniques I use to produce an affective response and facilitate public engagement with distasteful truths in (my) learning of dementia. My intention is to explore connections between project, pedagogy and public when art is co-opted sociologically: what is the art/visual teaching and how is it doing that; what is being marginalised or rejected and what are the effects?

Trends in the Effects of Parents' Education on Leisure Activities of Children Aged 6-17

A possible explanation for the association between the education of parents and their children is the way children spend their leisure time. Highly educated parents would let their children undertake activities in their free time that enhance their school success. According to Bourdieu (1984), children's leisure time is primarily a reflection of the social status group of their parents; according

Lareau (2011), especially highly educated parents stimulate their children to do activities in an institutionalized context. While both explanations are not mutually exclusive, it is possible that there has been a shift in parents' investments in particular among higher status groups, from investment in exclusive high status activities to a broader range of activities.

In the presentation we will show how the leisure activities of at home living children, aged 6 to 17 years, depends on their parents' education and whether there are over time changes in the effects of parents' education. We use representative survey data from the Netherlands (AVO 1979-2007) of the Dutch Social and Cultural Planning Office.

New Knowledge Contemporary Aesthetics of Sciences and the Dirge of the Withering Scholar

True scholarship and the institutionalization of science was never a veritable symbiosis. Scientific socialization always exposed itself to suspicion of mutual arrangement with the ruling order, whilst being continuously transmitted via the consolidation of the dominating spirit and its organizational manifestations. Avoiding the trap of romanticizing scholarship, the question of scholarly autonomy and intellectual work concerning the progression of thought is at the core of interest. Thus, it is crucial to get an understanding how contemporary scientific and/or intellectual work appears today. By exemplifying "new knowledge", that is, the contextualization of the mechanisms of the work of science in the age of its new technological reproducibility and the identification of its societal position the aim of the paper is to identify the constellations of the alienated mind and its condition of development. Academic world-wide competition, scientific mass-production, the economization of the University as well as the prioritization of the production process are indicators of the withering of unauthorized thought. The aesthetic constellation of digitized science and the academic as entrepreneur (re-)producing "new knowledge" can be understood as allegory to the modern alienated mind: creative, flexible, adaptable and arbitrary. The trained academic has replaced the scholar. Notwithstanding, the academic as entrepreneur is both exposed to the rules of the "free-market" and socio-historical legitimized by the "aura" of the scholar.

Art, Territory, Market, and Politics in Contemporary São Paulo: The Minhocão Case Study

The central area of São Paulo city, in Brazil, is currently undergoing a process of "regeneration" or "revitalization" in which culture and art have a crucial and ambivalent role. After decades of decay, the region is now receiving public and private investments, especially after the release, in 2014, of a new urban development plan. The study focus on a key area of this process, a major elevated motorway known as Minhocão (big worm), which future has been subject of disputes among several agents. There are at least three different organized groups of citizens disputing the destiny of the area. One of them wants the motorway to become a park, much alike the Highline Park in New York City. The other two wish the demolition of the structure. The groups have distinct amount of economic, cultural and political capital and also different political perspectives on the quarrel, in which the government and private real state companies are also influential. This area is now a thriving cultural scene, with graffiti, skateboarding, music, gastronomy and other expressions of urban culture. Many artists are currently living and working/creating there. Their presence increases the symbolic value of the region, but they are at the same time adversely affected by the conversion of the symbolic valorization they bring into the economic valorization that expels them. The research, based on field research, interviews, media and data analysis about the region tracks the disputes regarding the future of the territory and how art and culture have an ambivalent role in the symbolic and economic valorization of the city. The paper presents how struggles about the uses of the city nurture the creation of subversive forms of artistic expression, especially – but not exclusively – in graffiti. Territory, politics, market and art are complexly intertwined in the metropolis

Implementing the Human Capital Agenda: The Agency of Corporate Foundations in the Reforms of Public Education in Contemporary Brazil

There is a consensus regarding the need for reforms in the Brazilian public educational system. Virtually nobody is satisfied with the quality of public

education in the country. Nevertheless, the consensus stops there. Several players with unequal amount of economic, social, cultural and political capital take part in an ongoing dispute about the terms and goals of the reforms. One major debated issue is the creation of a national common curriculum. Some private foundations linked to corporate power are the main agent forming a coalition to advance the agenda of a national curriculum inspired in the US Common Core and in other international experiences, such as the Australian and Chilean cases. Even though facing criticism, some powerful corporate foundations together with the public sector are advancing the project meant to improve the "human capital" and hence the competitiveness and the economic development of the country. One of the main goals is to make the school system more accountable, especially through rankings defined by national and international standardized tests. In spite of the blatant political element of this issue, the foundations try to enunciate it as a technical or post-political matter, as it is often the case in the neoliberal discourse. Since the most powerful foundation acting in public education in Brazil extensively funds research centers in important US universities (Columbia, Illinois, Harvard, and Stanford), the research is based on a field research at events funded by the private foundations both in the US and in Brazil in the last three years. We also attended public hearings about the common curriculum, in which we could trace the dispute regarding the future of public education in Brazil. The paper will present the agents of this controversy and their ways of influencing government, facing resistance and converting economic capital into political power.

MIEG, HARALD* (*Humboldt-Universität zu Berlin*)

Professional Responsibility: How Can We Develop Weber's Ethics of Responsibility As a Framework for Professional Ethics, and Why Should We Do so?

This paper examines Weber's ethics of responsibility as an analytical framework for the study of professional ethics. Traditionally, professional ethics is studied with regard to ethics codes, that is sets of rules established by professions to govern professional behavior. More recently, discussion has again arisen concerning the responsibilities of professions, emphasizing the central values which professions serve. This paper takes a third stance, based on an understanding of professional responsibility as a "social fact" (Durkheim) and a result of the social division of labor. We do not start by asking: "What should a profession / a professional do due to their professional responsibility?" but by asking: "How is responsibility organized, delivered, and performed in the case of professions?" The paper starts with a review of Abbott's (1983) seminal paper on professional ethics, i.e., codes of ethics (driven by status claims); and a review of Weber's concept of an ethics of responsibility (vs. an ethics of conviction) in the light of his understanding of rationality. This analysis reveals the main aspects of Weber's ethics of responsibility as being: (i) relational (a process of "responses" to relevant stakeholders), (ii) agency-focused (respect, autonomy), and (iii) based on the insight of an irresolvable value conflict (not bound to any substantive rationality). If we consider professions as the product of social closure, then codes of professional ethics serve as formal rationalities for securing trust in a form of personal service, regulated by a closed epistemic community (the profession) and delivered by individual members of that community. A Weberian understanding of professional responsibility shifts the focus from values and ideology to delivery and performance.

Science, Medicine and Industry: Translational Research As a Framework for Innovation

Initiée dans les années 1990, la recherche translationnelle est un concept dont le but est de renforcer et fluidifier les relations entre chercheurs, médecins et industriels afin d'accélérer les processus d'innovation en santé. Souvent résumé par l'expression « from bench to bedside », le concept semble s'imposer progressivement en France depuis les années 2000, aussi bien dans les politiques publiques de la recherche que dans le milieu scientifique et médical. La multiplicité des acteurs qu'il est supposé réunir, les logiques diverses qu'il mobilise et les différentes structures qui l'incarnent ne manquent pas d'interroger le sociologue sur l'opérationnalité du concept, sa réalité sur le terrain et son impact sur l'innovation. En nous appuyant sur l'étude du cas de la radiologie interventionnelle, nous proposons une réflexion sur ce concept et étudierons ses impacts sur les trajectoires d'innovations – que nous nommerons « *processus translationnels* ».

En s'appuyant sur les résultats qualitatifs (entretiens & observations) et quantitatifs (scientométrie) d'une étude portant sur la radiologie interventionnelle (RI), nous proposons ici d'étudier les mécanismes jouant sur les processus translationnels et d'identifier les freins à la diffusion de l'innovation médicale. Trois dimensions seront plus particulièrement étudiées : 1/ Les facteurs scientifiques.

Il conviendra de s'interroger sur la visibilité et l'identification des publications scientifiques et, surtout, de souligner l'importance de l'évaluation épidémiologique, rendue délicate en RI par la profusion des techniques. 2 / Les facteurs économiques. Il s'agira de souligner l'enjeu de la collaboration science-industrie dans le développement des innovations thérapeutiques, mais aussi celui de la cotation des actes afin d'assurer la diffusion des techniques. 3 / Les facteurs socio-cognitifs. La reconnaissance de la RI a pu être freinée par des jeux de pouvoir entre spécialités, ainsi que par un déficit d'identification par les acteurs institutionnels et un manque de visibilité auprès du grand public.

MIJIC, ANA* (*University of Vienna*)

Lost in Migration? Narratives of (non-)Belonging of Diasporic Identities

At the very beginning of Olja Alvirs debut-novel "Kein Meer", her protagonist Lara Voljić, a young Viennese of Bosnian descent remarks: "I am too young to be entitled to be traumatized by the war. However, I am too old to know nothing about it – too old not to be concerned." (Olja Alvir 2016, Kein Meer, 8). Broadly speaking Lara is inquiring the boundaries of her lifeworld which is substantially characterised by war and migration. She is trying to understand what lies within and what lies beyond these boundaries; and what she is allowed or able to disconnect from her individual biography.

Within an ongoing sociological research project at the University of Vienna I am focusing on the identity-formation and transformation of the Bosnian diaspora(s)—i.e. Bosniaks, Bosnian Croats, and Bosnian Serbs—living in Vienna. According to the initial presupposition of this project, wartime, post-war, and migration constitute a very particular and tense context within which people from Bosnia-Herzegovina have to (re-)construct their self-images—their individual identities as well as their collective belonging(s). These diasporic post-war identities will be analyzed by the means of a hermeneutical analysis of narrative interviews.

In my contribution I would like to focus on a hermeneutical reconstruction of the life stories of Bosnian Viennese, who came to Austria as child refugees during the war in the 1990ies. I am aiming to decipher the dynamics of identity-construction and re-construction in the light of the experienced war as well as their socialization in different "objective realities" (Peter L. Berger & Thomas Luckmann) and to work out their sense of belonging and identification.

RC14-280.4

MIJIC, ANA* (*University of Vienna*)

Together but Separate. Symbolic and Social Boundaries in an Ex-Yugoslavian Viennese Neighborhood

People of ex-Yugoslavian origin are an integral part of Vienna. According to estimates over 250.000 people with roots in former Yugoslavia are living in the Austrian capital. A great many of them came as refugees during the war in the 1990ies.

The violent dissolution of Yugoslavia has had an enduring impact on the diasporic community also in another respect: the war drove a wedge between the ex-Yugoslavian Viennese of different ethnic allegiances. Yugoslavian diasporic organizations, soccer clubs, or cultural facilities disintegrated along ethnic lines. Yugoslavia as well as Yugoslavians disappeared from the scene and with them the hitherto effective informal pan-ethnic network of neighborhood support—the so called *komsiluk*.

Within an ongoing sociological research project I am focusing on the identity-formation of the Bosnian diaspora(s)—i.e. Bosniaks, Bosnian Croats and Serbs—living in Vienna. The analysis of narrative interviews conducted with Viennese of Bosnian origin reveals, that there are quite ambivalent interpretation patterns regarding the neighborhoodly relations between the Viennese Bosnians of different ethnic affiliations: Frequently, interviewees claim that even in Vienna Bosnians are not able to interact peacefully, that they have to avoid each other, and argue simultaneously—i.e. within the same interview—that ethnicity is immaterial in everyday life, that they don't even know which ethnic group their neighbors belong to.

In my contribution I would like to illuminate this ambivalence. More precisely, I will focus on the analysis of the symbolic and social boundaries between Bosnians of different ethnic backgrounds in one specific Viennese neighborhood: the so called Balkan-Mile. The Balkan-Mile is the informal expression for the *Ottakringer Straße*, a street which is highly frequented by former Yugoslavian migrants. By combining a hermeneutical analysis of narrative interviews with ethnographic observations in this neighborhood I seek to examine the everyday practices and processes of boundary making and the differentiation between "us" and "them".

SILVERMAN, DAVID (*Goldsmith, London*)

Speaking for the Client: Talk and Silence in Homeless Casework

Current welfare organizations prioritize the involvement of citizens as co-producers in their encounters with professionals. Using 24 video recorded meetings between municipality caseworkers, shelter staff and homeless people at three homeless shelters, we investigate how such co-production initiatives affect the encounter between homeless people and staff. In these encounters, we demonstrate that the homeless are not always able to give voice to their situations and their preferred choices. Indeed, one hour of interaction may include only five minutes of talk by the homeless individual. Nonetheless staff often assume that their clients were at the centre of the encounter, even when there is little indication that they understand the Danish language spoken. In order to analyze and explain dilemmas like these, we draw on symbolic interactionism and conversation analysis, placing linguistic and bodily actions, as well as their contexts, at the very centre of the analysis of human interaction.

The Consequences of Globally Traded Primary Commodity Products Liberalization: The Case of Subsistence Farmers in Uganda

The aim of this research is to find out the mechanisms through which global trade of primary commodity products and local government's agricultural policies interact with the coping strategies of subsistence farmers. For that purpose, I focus on the Ugandan typical cash crop, coffee and cotton, both of which are produced almost entirely for export, not for domestic consumption.

During 1990s, the government of Uganda, like many other aid-recipients, had no choice but to take the structural adjustment measures recommended by World Bank if she is to continue pursuing national development with the help of western donors. Coffee and cotton were two of the typical industries needed to be liberalized: State monopoly on export was dismantled and the money these products can fetch was directly linked to the fluctuating world market prices.

Subsistence farmers, if they are to survive in the society where both the market availability of food and the paid employment opportunities are limited, need to optimize the allocation of their resources to cash crops and food crops. Given the loss of guaranteed fixed returns from the investment in cash crops after liberalization, farmers are now expected to produce cash crops if and only if other possibilities of cash income are not available or less efficient. These individual strategic

behaviors may or may not contradict with the national development plan of the government, which seeks to boost the production volumes of coffee and cotton because they have been accounting for significant part of national revenue from export.

Using the statistical records as well as interviews to local subsistence farmers, this study tries to examine whether or not actual farmers behaviors are strategic, and to what extent the macro-level consequences of these micro-level behaviors are consistent with the government sector goals as the bases for entire national development.

MIKATS, JANA* (*University Graz*)

"When Home Becomes a Workplace: Family Practices in the Context of Home-Based Work"

The paper examines everyday practices of family life in context of home-based work in the creative industries. It sheds light on the overlap resp. the blurring of boundaries between private life and work and the interrelated space-time arrangements, when the family home becomes the location of both family life and workplace.

For a long time, space has been a marginalized topic in family research and childhood studies and has only recently received intensified attention in the context of multi-locality e.g. migration. So, it can be stated that the mono-local home generally gets little attention and if so it remains a private and "work-free" space. Thus, the paper aims to broaden the perspectives on the home by a practice-theoretical approach and examines the temporal, spatial and material aspects of everyday family practices.

The results are based on empirical data of a multi-perspective (parents and children) and qualitative multimethod (interviews, photo elicitations, socio-spatial network games, and observations) fieldwork with Austrian families.

This broad perspective shows how family practices are carried out in the place of single location home/workplace as well as how the spatial arrangements are created in the practices and how they enable and constrain them. The results indicate that home-based work might blur well-established boundaries between work and private life, and makes thus interdependencies more visible. By bringing work "back" into the home, the dualistic construction of work and home as well as career and parenthood, is blurred.

The paper discusses both the empirical approaches and the results.

Social Network Approach to the Marginal Social Movements` Discourse Reproduction: The Case of Russian Lesbian Feminist Discourse

This paper develops social network approach to the marginal social movements` discourse reproduction. Russian lesbian feminism was taken as an instance of marginal social movement.

Lesbian feminist community and its ideology appeared in the USA during the Second-wave feminism (Reger, 2017). Lesbian feminism gained its followers from Radical feminism and Gay Liberation movement (Reger, 2017). Initially, lesbian feminist community consisted of young, middle-class, white women who studied in universities (McCammon and Einwohner, 2017). Now lesbian feminism in USA is not as popular as it was in 20th century, nevertheless, some of the lesbian feminist ideological elements are still present in American society, for example Michigan Womyn's music festival (Browne, 2009). In contemporary Russia, lesbian feminism exists not only offline but also has several communities in social network V Kontakte such as "LF" and "Lesbiyanki-feministki". Study of Moscow lesbian subculture has shown that Russian lesbians have similar to American lesbians lexicon (Saraeva, 2014). Probably, Russian lesbian feminist discourse also has properties of cognitive and social subsystems, which make it similar to American lesbian feminist movement. If Russian lesbian feminist movement has the same social base as American one, the discourse of the lesbian feminists could influence Russian social life on the different levels of social structure.

It is planned to combine social network analysis with in-depth interviews to recreate social mechanisms, which spread lesbian feminist discourse in Russian society. We are working on techniques for the structuration of discourse in social networks, detection, operationalization and validation of manipulative behavioral models. These models could maintain integrity of the Russian lesbian feminist community.

Privatizing Collaboration: Rhetorical Strategies of Legitimacy in the Transformation of a Hospitality Exchange Platform

There is a growing recognition that digital platforms increasingly structure everyday lives, yet their business models often remain nebulous (Scholz, 2013; Srnicek, 2016). Van Dijk (2013: 15) recognized that "balancing user participation against for-profit business strategies posed a real challenge to the digital media industry". Companies managing platforms navigate between a few publics, including users, funding institutions, and regulatory bodies, in their effort to secure legitimacy. This paper describes the legitimacy crisis in Couchsurfing (CS), a collaborative hospitality platform which was transformed into a for-profit in 2011.

Launched in 2004, the platform drew on rhetoric and practice of open collaboration: it attracted many volunteers offering various contributions to its development and operated as a non-profit. The growth of the user base led to a governance crisis and to the emergence of a more crystallized organizational structure and culture, emphasising that one of the key values of CS is that it will always remain non-profit. Yet, CS's application to become a charity was ultimately denied. The organisation managing the platform was dissolved and replaced by a for-profit corporation which received venture capital funding (about \$22.6m). The transformation was announced to the community *ex post* and resulted in a severe backlash.

The paper draws on over 70 interviews with CS volunteers, (former) employees, founders, and "regular" users; as well as documents, press articles and other relevant texts collected through web scraping. I reconstruct the legitimating accounts (Creed et al., 2002) meant to persuade CS members to accept the change and the latter's counterarguments. The leaders framed the situation both in a negative ("we had no choice") and in a positive way, emphasizing that the new organizational form will serve the organization's mission better. The dispute is a case of a struggle over the meaning of a collaborative technology and voluntary labour.

Protective Effect of Marriage on Health: Instant or Cumulative, Short- or Long-Term?

Although research on the protective effect of marriage for health has yielded vast empirical evidence, the dynamics of this effect is not always clearly conceptualized. Moreover, the previous literature is dominated by U.S. studies, which creates the need to analyze different social contexts.

This paper contributes to the field by explicitly distinguishing between an instant vs. cumulative effect of marriage on health, as well as between a short- vs. long-term effect of the transition into first marriage. We analyze mental and physical health, functional limitations, self-rated health, and health satisfaction. Our contribution extends the existing empirical evidence to German panel data, which allow observing long-term health trajectories.

We use German SOEP data covering the period 1984-2015 and fixed effects regression for panel data to model the dynamics of the effects of marriage on health, separately for men and women.

Our results show a cumulative protective effect of first marriage on self-rated health among men, which, however, seems to disappear after controlling for selection into marriage. Among women, self-rated health decreases after marriage and remains on a low level in the long run. Marriage effects on the other health measures are rather inconsistent and weak. The only consistent effect is the positive short-term effect of the transition into first marriage on various health outcomes.

In contrast to most previous studies, our analysis explicitly models various types of dynamics in the protective effect of marriage on health. Our results suggest that the protective effects of marriage for health are generally overstated. This shows how important it is to use FE models to control for time-invariant covariates, to model simultaneously the various types of dynamics, and to attempt to control for selection on factors correlated with health trajectories.

Older People Living Alone in Lithuania: Challenges of Social Inclusion

The paper examines the social inclusion / exclusion of older adults living in one-person households. Although the family unit remains to be significantly important living arrangement for individuals, one of the key changes in Lithuania is increasing proportion of single-person households. They comprised 28 % in 2005, while in 2016 – even 39 % (Eurostat-SILC, 2017). Among older people (65+) nearly half (46 %) are living in single-person households, and that is the highest indicator among the EU member states (Eurostat-SILC, 2017). Due to low fertility the kin networks will become narrower in the future. Thus, demographic trends presuppose increasing share of single-person households. On the other hand, in the last decade the Governmental policy on residential care is changing: more

older people are expected to choose to reside for longer within their own home and local community. Therefore the challenges to ensure community based services and community aged-care packages still remain in Lithuania. That could increase possibility to be socially excluded in old age, and single persons could be especially vulnerable group in this sense.

This study uses original nationally representative data from the survey "Older people living alone: trends, profiles and challenges to intergenerational integration - OPLA" carried out in Lithuania in 2017-2018. The OPLA is financed by Lithuanian Research Council (No. GER-001/2017).

Main challenges associated with increasing number of single older adults in Lithuania are discussed and research-based recommendations on social integration methods for this older age group are provided. The paper concludes by discussing conceptual, methodological and policy issues revealed by the research, particularly in relation to the issue of preventing single older adults from social exclusion.

Public Shaming in Theory and Practice: Digital Culture Meets Classical Sociology

The mobile phone, endowed with the capacity to record and circulate images (and videos) to diverse and dispersed people through online means, is one of the most significant components of digital culture today. New and heterogeneous forms of so-called public shaming have emerged in the wake of this now ubiquitous technology. Often, they involve the intractable distribution of material that depicts—or appears to depict—identifiable persons engaging in transgressive acts of varying kinds. In recent years, these forms have stimulated different kinds of studies, and generated significant public commentary (and debate) in popular media and beyond. A recent example can be found in the online 'naming and shaming' of white supremacists pictured as participants during public rallies in some US cities. Taking this case as my point of entry, this presentation aims to make sociological sense of contemporary 'public shaming' related phenomena in relation to some of the enduring concerns from classical sociological theory, especially regarding the nature of the social bond and relationship between individual and (modern) society. I draw upon Durkheimian and Weberian theoretical writings and traditions to think through the social complexities of digital 'shaming', developing a conception of the publicly 'accountable' contemporary subject. This paper brings classical sociological theory into conversation with the study of contemporary mediated society in its digital cultural and visual forms.

MILES, ANGELA* (*OISE, University of Toronto*)

Feminist and Indigenous Contributions: What Does It Mean to be Human?

Feminisms vary as do Indigenous activist approaches. This paper focuses on very broadly defined 'integrative feminist' and 'matriarchal Indigenous' tendencies in these movements in North America.

Elsewhere, I have identified an 'integrative feminist' tendency made up of very varied feminisms and womanisms that: a) insist on women's equality and common humanity (with men) while affirming female-associated life centred values (community, sharing, nurture, and cooperation) as defining social priorities; b) integrate resistance to all dominations (patriarchal, colonial and capitalist) as essential aspects of feminist politics; c) see commonality and diversity (among women) not as static opposites, but as enriching tensions in a dialectic of change and possibility; d) are holistic in refusing the fragmentations of industrial patriarchal society.

What I refer to here as 'matriarchal Indigenous politics' is Indigenous activism (whether self-defined as feminist or not) grounded in defining egalitarian, holistic, relational, matriarchal values, worldview and vision, which draws also on critical analysis to understand and take on the struggles Indigenous communities face today in brutal ways, in the wider world and within Indigenous communities.

This paper:

- explores these two profoundly compatible struggles for change, both of which resist not only exploitation and oppression but alienation itself and put the meaning of what it is to be human at the core of movement theory and practice;
- briefly sketches the intensification of capitalist class power and violent neo-liberal expansion and enforcement of enclosure and commodification that have made our humanity a burning question for ever wider groups and put Indigenous struggles at the forefront of resistance today;
- reflects on the ways learning from historical and actually existing Indigenous gift culture/ economy and matriarchal social structures can deepen and re-affirm integrative feminist analysis and vision;
- considers the potential for building more pro-active solidarity between these two movement tendencies.

Data Farm: On Precision Agriculture and the Political Ecology of Disruption

To read the headlines, American farming is on the edge of a profound and unprecedented revolution: a "big data revolution on the farm" (Wihbey 2015), the "third green revolution" (CEMA 2016), or, simply, "the next great agricultural revolution" (Powell 2017). This revolution, known as "precision agriculture" (PA), is an emerging approach to food production in which farmers leverage the power of digital sensing and big data analytics to manage their crops, livestock, and operations at formerly impossible levels of detail. Proponents assert this more granular information translates to greater control over inputs and costs, in turn shrinking agricultural pollution while increasing productivity.

A closer look at the complicated mix of forces driving PA reveals that its benefits appear more ambiguous, and likely to be less evenly distributed, than current accounts suggest. PA unfolds within an economic and political context likely to reward increases in farm consolidation, automation, and managerial control, conditions that benefit larger farms and landholders, influential agricultural companies, and financiers over smallholder farms, farm laborers, or other species.

Through historical contextualization and comparative study of PA adoption in the Northeast vs. the Great Plains, I show how the development and implementation of PA systems are less a revolutionary, technology-driven break with the past, than an intensification and extension of an already existing socio-economic logic of capitalist accumulation. I argue that while PA may contribute to significant changes in farming, these will neither necessarily nor automatically accrue in the form of greater independence for more farmers, greater food security for more people, or large-scale reductions in pollution and ecological disruption caused by conventional farming. Only by understanding the real social and historical dimensions of precision agriculture can we appreciate how best to avoid its pitfalls, and ensure its potential benefits are as evenly and effectively shared as possible.

Emergency Response and Beyond Lessons Learned: Puerto Rico in the Aftermath of Hurricane Maria

In the aftermath of Hurricanes Katrina (2005), Sandy (2012), Harvey (2017) and Irma (2017), the roles of public policy, emergency response, and elected officials with disaster response responsibilities have often been the source of sometimes praise and sometimes condemnation; but always, the emergency response to a natural disaster remains the subject of social scientific research. This manuscript employs a comparative case study approach to highlight the emergency response to the humanitarian crisis in Puerto Rico following Hurricane Maria (2017). At the center of this analysis are the lessons learned from previous disasters and their application (or non-application) by local and federal emergency managers and first responders and the role of the ongoing economic hardships in Puerto Rico.

Black Social Media Use and Discrimination: Sites of Oppression and Expression

This study investigates the association between self-reported experiences of discrimination and social media usage among African American adults. Experiences of discrimination were assessed using a 10-question scale of self-reported discrimination encounters. Data analysis was based on a sample of 220 African American adult respondents residing in Texas. Results indicate that African Americans reporting higher levels of discrimination utilize social media sites more frequently than those who report lower levels of discrimination. In addition, African Americans who experience higher levels of discrimination are more likely to have a Twitter or Facebook account than those who experience lower levels of discrimination. Together, these findings suggest that social media sites such as Twitter and Facebook serve as sites of expression for people of color to air their grievances, find community, and cope with offline forms of racism and discrimination.

RC06-129.5MILLER, TINA* (*Oxford Brookes University*)DERMOTT, ESTHER (*University of Bristol*)*Is Anything New in Contemporary Fatherhood?: A View from Europe on Policy, Practice and Discourse.*

The 'involved' father, who is emotionally and economically engaged, has become a recognisable ideal in many Western societies. Policy changes have to varying degrees endorsed practices of involvement especially around the time of birth and during the early weeks and months of a child's life. Discursive changes are discernible too as men engage a language of caring, bonding and emotional, intimate connection through 'being there' as a father. And research on the everyday practices of fathers also indicates some degree of change. But how far are these shifts indicative of a new type of fatherhood? In this presentation we explore whether there is anything new about fatherhood through three interlinked areas. These are; what counts as change? Where should we look for change? What are the levers of change? Through this focus and a consideration of European fatherhood research, we document key findings, assess their significance and most importantly assess the cumulative effect of these changes. We conclude that while contemporary practices of fathering must be understood and explained within broader cultural and economic milieu, the multiplicity of shifts does indeed infer a new durability.

RC39-682.3MILLER-BELAND, DANIELLE* (*Concordia University*)*Disaster Management through the Sociological Study of Methylmercury Contamination*

The research which I am conducting looks at the social implications and impact of large scale methylmercury contamination, notably focusing on the well-known case in Grassy Narrows, Ontario, caused by the Reed Paper Company in the 1960s, and the long struggle in which the contaminated First Nations communities had to go through in order to receive the help and reconciliation that was due to them and to begin a proactive environmental cleanup, a decision taken by the government only just recently.

My research focuses on the historical and social aspects of methylmercury contamination, the impact it has on those affected by it, and how certain social actions influenced, or swayed, the recovery process of these communities. My studies do not only look at Canadian cases, but globally, comparing and contrasting different countries worldwide in order to understand the impacts caused by certain social actions and perceptions and their effects on the long term recovery process from the contamination. This has allowed me to undertake a more global understanding of contamination and which social actions have what kind of long term effects in the recovery process, not only for the environment, but those affected by the disaster.

Through my experiences travelling and studying the impact of methylmercury in different societies, such as Japan and Slovenia, my research now highlights the value of social action in Canada in regards to environmental disaster and the importance of social reaction on the long term consequences in order to construct better policies and responses when faced with disasters. The ultimate goal is to ensure more positive and proactive responses to reduce the harmful consequences in environmental disasters and their impacts on Canadians.

RC39-688.5MILLER-BELAND, DANIELLE* (*Concordia University*)*Reducing Long-Term Disaster Risk through a Global Comparative Analysis of Methylmercury Contamination*

In order to understand the full impact of disaster risk reduction research can have on the long term consequences caused by man-made disasters, this presentation will utilise a historical comparative analysis to demonstrate the usefulness in organizing and creating reconciliation when it comes to man-made environmental disasters causing human harm.

Methylmercury has been, and still is, one of the most harmful by-products in factory and mining production, and has been the leading cause of severe environmental contaminations worldwide with many cases causing harm to the people living in the nearby areas. The most well-known case if that of Minamata, Japan, demonstrating the worst-case scenario seen in regards to methylmercury contamination, and unfortunately, it is not the only one. But not all communities impacted by this contamination have such a negative impact, such as seen in Idrija, Slovenia, a small town built on the second biggest mercury mine in the world. While the community is saturated with mercury, there has not been an official case of poisoning since the early 70s. These differences in biological harm caused by the contamination can help us understand and realise the different impacts social reactions can have on the long-term consequences caused by methylmercury.

By comparing different cases of large-scale methylmercury contamination world-wide, this presentation seeks to demonstrate the value of cross-compari-

son research in understanding the long term impact of large scale contamination and how certain social effects have an effect on the recovery process of the contaminated community.

RC56-911.3MILLER-TREMBLAY, JEAN-PHILIPPE* (*Ecole des hautes études en sciences sociales (EHES)*)*Facing an Empty Battlefield: (Re)Creating Physical Proximity through Close Order Drill in the French Infantry (1870-1918)*

This paper explores the notion of physical proximity in the French infantry from the franco-prussian war to the first world war through the study of one military technique: close order drill. Until the last quarter of the nineteenth century, its practice was the keystone of combat preparation, until the breech-loading magazine rifle, the machine-gun as well as quick firing artillery brought major changes on the battlefield. Fighting in close order became progressively unfeasible as well as unthinkable, as it became clear that such compact formations would mechanically dissolve when facing modern firepower. However, the instruction of close order drill endured. Indeed, it was regularly practiced when at great distance from the enemy, that is from the first steps of infantry training on the barrack square all the way to marching when out of reach of an enemy's weapons. Its persistent presence, even through the first world war, can be partially explained by looking at its ability to (re)create physical proximity between troops fighting on a more and more empty battlefield.

The current historiography focusses on its obsolescence as a military technique. Consequently, its diverse ceremonial, training as well as combat purposes remain unstudied. By confronting instruction manuals, essays on tactics and war diaries of soldiers, the modernity of close order drill in the French infantry will thus be uncovered. This work contributes to the cultural and military history of tactics in the 19th and 20th century.

RC27-500.2MILLINGTON, BRAD* (*University of Bath*)MANLEY, ANDREW (*University of Bath*)WILLIAMS, SHAUN (*University of Bath*)*The Data Analyst: Elite Sport Performance and Precarious Work*

In January 2017, the online publication *Paste Magazine*, in its regular 'Secret Soccer Analyst' column, featured a frank and forewarning confessional on the work and life of a sports data analyst. Writing under the clever heading, 'Mo Moneyball Mo Problems', the anonymous author lamented everything from the isolating nature of the data analyst role, to the immense time commitment data analytics require, to the low standards of pay that characterize the industry – the last of these deemed a function of the large pool of labourers from which employers can draw. "I've been depressed for a few years now and I've just started to get professional help," the secret author revealed. "Every day I wonder if my job is a glimmer of hope in my life, or my worst enemy" (<https://www.pastemagazine.com/articles/2017/01/the-secret-soccer-analyst-mo-moneyball-mo-problems.html>). As knowledge labourers situated in an economy increasingly characterized by precarious (i.e., flexible, insecure, low pay) work, and, more specifically, as skilled but increasingly abundant workers in an elite sporting context dependent on time-sensitive insights into ever larger pools of performance data, the sports data analyst role indeed seems ripe for the types of problems outlined in the secret analyst's confessional. This presentation seeks to interrogate the twin premises that, in an age of Big Data, data analysts are growing more important to elite sport performance while at the same time experiencing work and life conditions that are marked by precarity. The presentation contextualizes the role of the data analyst in relation to the wider Big Data moment before discussing the presenters' empirical work on Big Data in sport, which includes preliminary insight into the challenging and in some ways precarious nature of data analysis work.

RC15-293.3MILLS, CHINA* (*University of Sheffield*)HILBERG, EVA (*University of Sheffield*)*The Psycho-Social Lives of Diagnostic Algorithms*

Increasingly, digital technology is used to collect mental health data, to diagnose mental health problems, and as a route of mental health intervention and clinical management. This paper explores the relationship between the quantification and digitization of mental health in India, conceiving of both as 'human technologies' that fold into each other to construct mental health as amenable to technological intervention, and act as key drivers in global advocacy to make mental health count. This paper draws upon preliminary findings from fieldwork on the psychosocial life of diagnostic algorithms in India, highlighting the different dimensions of the conception, dissemination, use, and appropriations of diagnostic tools. By emphasizing the psychological impact of these medical tools, this approach does not only trace the 'social lives' of medical

knowledge and conceptions, but also directs attention to effects on individual and collective notions of health and well-being, and imaginaries of 'medicine'. The paper reflects on the different imaginaries of mental health and medicine enacted in the conception of these algorithms and in their use - the psycho-social lives of diagnostic algorithms. Here, a technological calculability and rationality of mental health encounters the vagaries of locally specific implementation efforts, and different notions of the medical encounter. This includes exploring potential preferences of pharmaceutical treatment over other treatment alternatives, and different notions of medical advice and public education around mental health. The paper seeks to overall address the question of how the supposed algorithmic rationalization of mental health diagnosis gets mediated in different practices and cultural contexts.

Ethics and Aesthetics of Art- and Science-Making at the End of the World

The Ensayos project is a collaboration between artists, scientists, and local agents based in the Tierra del Fuego region of Chile and Argentina. The group has evolved in the liminal space between art, science, and politics, taking an exploratory, creative, and sometimes activist approach to the environmental and geo-political challenges faced by inhabitants of the region. In one example, the collective has addressed the threat of invasive beaver populations to the survival of the subpolar forests in the region. Ensayos artist, Christy Gast, designed human size beaver costumes with which participants could embody members of the invader species and participate in community meetings and performances, bringing the voice of the beavers into the conversation. This intervention built on collaboration with local biologists devoted to understanding the behavior of beavers, and led to further joint scientific and artistic efforts to conserve subpolar forests and to re-imagine and test forms of continued co-habitation with beavers. This paper builds on a three-year participant observation of Ensayos, and examines the process of trial and error whereby participants have developed a space and strategies for collaboration. The survival of the project relies on a utopian outlook based on an anti-capitalist ethic of uselessness, discursive strategies that recognize and include the voices of non-human agents, and the transgression of traditional disciplinary and communicative boundaries. As a community of artists, scientists, and local agents, Ensayos enacts a utopian effort to address challenges to multi-species survival and to embrace opportunities for adaptation in the anthropocene.

Comparative Analyses of Exclusionism in (Post-)Post-Socialist Countries: With Special Attention to Mongolia

Although exclusionist and anti-immigrant movements can now be observed wildly in (post-)post-socialist societies, it remains yet to be solved whether or not the public in those societies shares views and actions characterized by those movements. In order to address this question on an empirical basis, this study explores the attitude toward people with different background harbored by people in these societies. To be specific, the second wave and the third wave data of the Life in Transition Survey conducted in most of former socialist societies are analyzed in this study. In those waves of the survey, conducted in 2010 and 2014 respectively, the survey asked respondents' willingness to accept people with different cultural background as their neighbor. The two waves of the survey also includes a question whether the respondents evaluate immigrants' contribution to the economy, or find immigrants a burden. Using such data enables both time-series and cross-national comparative analyses of the attitude.

In the analyses, this study gives particular attention to Mongolia, where the rise and rampancy of ultranationalists and xenophobic movements was repeatedly reported even before immigrant issue became central in Central and East European countries. Previous study found Mongolians' weaker tolerance to different culture compared to people in other (post-)post-socialist societies, as well as Mongolian tendency to regard people with different culture as a threat to social security or unemployment. The study, however, had little success in revealing factors relating to tolerance or intolerance to the people of different cultures (Minato, K., 2014, "Mongolian Tolerance and Intolerance Toward Different Cultures: An Exploration Based on Analyses of Cross-National Survey Data." *Acta Mongolica*, 15: 41-46). Hence, this study reexamines the findings of the previous study, and to clarify the factors behind the Mongolian attitude toward different cultures.

The Double Movement and the Perspectives of Contemporary Capitalism

Enzo Mingione

University of Milano Bicocca

The double movement and the perspectives of contemporary Capitalism Abstract

The interpretation of contemporary social change by mainstream paradigms of the social sciences is not convincing mainly for two reasons. First, these interpretations are centred on a different hypothesis of equilibrium and stability while our societies can only be understood in terms of dynamism and tensions. Second, they underestimate the importance of interdependence between different phenomena and processes in different parts of the world and, nearly always, end up in ethnocentric explanations referring only to the reality of the global north and use biased methodologies privileging the economic to the social. In order to take into proper account the dynamism and the complex interdependence of our societies, this contribution is divided in three parts. In the first part, I shall put the contemporary tensions of social change into an interpretative frame freely inspired by the Polanyi concept of double movement (Polanyi 1944). In the second part, I shall locate the interpretative frame in a more precise historical and socio-cultural context where the double movement happens within the present globalised and individualised processes of change in the industrially advanced countries. In particular, I will consider the European context, while not ignoring the impact of global interdependence. Finally, in the third part, I shall elaborate the analysis in order to take into account the effects of the long lasting economic and financial crisis.

CORICA, AGUSTINA (Facultad Latinoamericana de Ciencias Sociales)

Grammar of Youth: Approaches to the Study of Change and Social Reproduction from Longitudinal Strategies

The advantages of longitudinal studies in the analysis of social change processes are significant as they allow to reconcile macrosocial trends with transformations in life course individual patterns. The *Grammar of Youth* Longitudinal Studies Program (Programa de Estudios Longitudinales *Gramáticas de la Juventud*) of FLACSO Argentina began to develop in 1998. Throughout two decades of work and with the objective of contributing to the theoretical and methodological debate on inequality, social justice, and providing inputs for the elaboration of programs and policies for education, employment and youth, it has been consolidated as a program of great originality in the South American region.

The information compiled by the Program has allowed to analyze the main transformations in the education-to-work transition of young people in Argentina since the beginning of the 21st century. The panels present the evolution of two generations that reached the coming of age (18 years old) in two very different social economic conjunctures. On the one hand, G 99 classifies young people who reached 18 in a period of time marked by unemployment and economic recession (1999). On the other hand, G 11 classifies young people who reached 18 in a context characterized by greater employment opportunities and social protection (2011).

This presentation shows, from the processing of recent field results, the main trends of the passage from education to employment of young people who have participated in two different economic and political conjunctures. The central idea is to provide evidence on trends towards change and social reproduction observed through the life course of young people in the south region of Latin America, with the purpose of contributing to the theoretical and methodological debate in the field of youth studies.

MIRANDA, ANA CAROLINA* (Universidade Federal do Rio de Janeiro - UFRJ)

Dailylife As Utopia: Collective Authorship in Rio De Janeiro Contemporary Art Exhibitions

This paper seeks to analyse collective authorship in the production of contemporary art in Brazil after June 2013 demonstrations. It starts off with the intersection between art, politics and urban issues, a peculiar phenomenon in Rio de Janeiro for the past years. It also investigates how utopia is a recurring term in the contemporary art world. Therefore will be considered the following artistic practices as collective authorship work: creations signed by a group of individuals adopting a single name, the so-called "collective". As case studies, the investigation observes art exhibitions at Rio Art Museum (MAR) and Helio Oiticica Art Centre (CMAHO) from 2013 through 2017. The purpose is to examine the openness to this art collaboration tendency in Rio de Janeiro, reflecting on works that have been eliminating individual authorship in favour of a collective one. Also noticing that this kind of work deals mainly with performances on the streets and in the art circuit. This article observes artistic practices carried out through partnerships in the city's visual arts circuit, in addition to also reflecting on the significant occurrence of collective authorship in contemporary art internationally

- which also supports strong ties with political and urban subjects. This approach aims to understand how art institutions deal with collective authorship that produces social engaged works while testing if the concept of collectivity is becoming a strategy for artistic legitimization. It analyses if these works trigger the institutionalization of a new conception on what comes to be recognized as art. In sum, the paper main objective focuses on clarifying the contradictory rise of artistic collective authorship despite the prevalence of individualistic ideas on contemporary society.

MIRANDA, DANIEL* (*Pontificia Universidad Católica de Chile*)

Inequality and Youth Citizenship Participation: An Intergenerational Approach

Empirical evidence has shown consistently that resources are related with participation. For instance, people with higher levels of education, income and/or knowledge have more chances to participate. This inequalities it can be observed from the early years, demonstrating the relevance of intergenerational transmission of political inequalities and the political socialization processes. The general aim of this paper is to assess the direct and indirect influence of the socioeconomic background on students citizenship participation using different participation ways that are defined here under the umbrella of citizenship: It involves a *community dimension*, which refers to the relationships with the community and informal or civil associations; as well as a *civic dimension*, that refers to the relationships with formal institutions and the political system, such as voting and activist participation. The specific objectives are two. First, to evaluate the direct relation among socioeconomic characteristics of families with different types of citizenship participation, arguing that these socioeconomic measures (i.e. parental education, socioeconomic status or books at home) could produce differentiated socialization's processes for different types of participation. Second, to evaluate the indirect socialization mechanism proposed by Brady, et. al. (2015), these are: family politicization and status reproduction. The analyzed data was obtained from the International Civic and Citizenship Study (ICCS). This study was applied on 2009 to a eight-grade student's sample (n=140000) from 38 countries. Given the nested design characteristics of the study, multilevel structural equation model were estimated. General results indicate that socialization processes considering socioeconomic characteristics present differentiated patterns for different types of participation, particularly in the indirect processes.

The Political Socialization of Attitudes Towards the Equality of Rights from a Comparative Perspective

The lack of tolerance towards traditionally disadvantaged groups, such as immigrants, ethnic minorities and women, represents a growing challenge to current democracies. Assuming that attitudes towards such social groups are at least partly learned during the political socialization of school-age children, this paper explores individual differences in equality of rights attitudes according to socioeconomic and demographic characteristics (gender and immigration background) in eighth grade students from 38 countries. The data come from the last International Civic and Citizenship Education Study (ICCS), 2009. Using structural equations and multilevel models, the analysis estimates regression models with a set of measures, with family status being the main independent variable. The results show that there are large differences across countries regarding the level of inclusive attitudes and that parental education and the number of books at home are relevant predictors of more inclusive attitudes of children in most of the countries analyzed, but the patterns differ by gender and immigrant groups. The positive association between resources and egalitarian attitudes shows significant differences for immigrant students and female students. The association is stronger in the case of girls and weaker in the case of immigrant students. Moreover, results show that those students who belong to disadvantaged groups (girls and immigrants) would show higher levels of egalitarian attitudes. On the one hand, girls demand higher levels of equality for the three evaluated target groups, while on the other, students with an immigrant background demand higher levels of equality particularly focused on immigrants and ethnic groups. It is relevant to remark that the support for tolerance by girls goes beyond a mere self-interest demand, as this is not only related to gender equality. The findings are discussed taking into account current and future political issues associated with migration and demands for equal rights.

MIRANDA, NATALIA* (*CriDIS / UC Louvain*)

Beyond Pure Trade Unionism. Activism Synergies in the Movement Against the Pension System in Chile.

This proposal aims to show how trade unions can transform their political culture due to the articulation with a more citizen-driven activism within a social movement.

Based in the "No más Afp" movement which is opposing the private pension funding system in Chile, we claim that trade union organizations are still a main device for developing the foundations of a social movement. Nonetheless, this is not enough for massively extending the movement and its demands to the whole Chilean society.

While trade unions are key actors for producing the struggle agenda, planning public rallies, and the politicization of the movement, a citizen-driven activism has emerged in it, placing digital technologies at the core of their practices, the "everydayness" of the struggle, and reaching the average Chilean person beyond the worker.

We argue that these two political cultures meet each other within the movement, with tensions and learnings, settling a cross-fertilization process from the articulation of their different practices of activism.

We would like to show this encounter process, exposing their risks, challenges, and the potential to strengthen the movement. Then, to examine the role of trade unions in current and future social movements, especially from a post 2011 era, which has contributed to reinforce the use of the internet and technologies in the coordination of collective action and protest around the world. Finally, to discuss how this encounter can enrich the classic debate between old and new social movements, proposing some ideas for future approaches.

The Ageless Art of Sharing, a Few Historical Aspects.

Sharing, understood as a collective action, challenges the idea of private ownership. It aims at being a paradigm shift that touches all the ways we relate to the most important pillars of society: identity, goods production and distribution, food, health, education, culture, art, personal care, institutional decisions, politics and democracy, among others.

Rachel Botsman and Roo Rodgers in the Book *What's Mine Is Yours* (2009) highlighted the importance of the term collaborative consumption that describes "the rapid explosion in traditional sharing, bartering, lending, trading, renting, gifting, and swapping reinvented through network technologies on a scale and in ways never possible before".

The sharing trend is becoming increasing more important in contemporary society. However, the action of sharing -that channels actions and visions about how to collaborate and pervades all human spheres from the personal to the collective-, is not new: it is transversal to human history.

What we call sharing society and economy could be understood as a redesign of previous social practices adapted to the needs of the complexity of our contemporary situation. In fact, sharing practices can be understood as an essential human feature. It is present in practices such as *potlatch*; reciprocal altruism (Trivers, 1971); cooperative acquisition and byproduct mutualism; tolerated theft and scrounging and costly signalling (Gintis; Bowles; Boyd; Fehr, 2005).

This paper will explore how not competition or appropriation but rather collaboration and generosity, the social action of sharing, is a transversal fundamental principle present in the social imaginary, yet to be fully manifested.

Varied Informality in Transnational Firms.

In India's major cities, large, glass-faced corporate offices occupy special economic zones and stand in marked contrast to the surrounding public infrastructure. Middle class workers find the prospect of working in transnational firms in India attractive in part because of the environment of work. Air conditioned, spic and span offices, transportation to and from work, and a high security environment are promoted as perks of employment with foreign firms. In this paper, we explore the employment arrangements and training of those who provide transport, security, and housekeeping services for India's transnational firms. Drawing on over one hundred interviews with workers, subcontractors, facilities managers and policy makers conducted between 2010 and 2014, we explore the work experiences and training of these low-wage workers (specifically, drivers, security guards and housekeepers) who support and provide the physical infrastructure for transnational organizations in India.

State initiatives designed to promote the influx of foreign capital have over-ridden (through poor enforcement) many of India's labour laws in the past two decades. This has given rise to a situation where despite unprecedented growth in the GDP since the 1990s, there has also been an increasing informalization of labour in India (Jhabvala and Standing, 2010). Ironically, corporations which are unambiguously part of India's formal sector and are infused with foreign capital which allow them to create lavish organizational campuses, are the very ones in

which labour informality pervades (Nigam, 1997). We explore the ways in which informalization is prevalent in low-wage service sectors and the impact of this employment arrangement on the lives of workers. We also explore the diverse manifestations of informality and varied employment relationships present amongst the three groups of workers we studied – drivers, housekeepers and security guards. We trace the training requirements which workers face as a result of the informality they face.

Higher Education in Iran from 1985 to 2015; Social Justice and Social Responsibility

The higher education in Iran has undergone many changes during the last three decades. Over the academic year 1985-86, the number of Iranian students was 167,457 and in 1995-1996, the number of students was 1,046,254. Meanwhile, in 2005-2006, this amount reached to the number of 2,389,860 and in 2015-2016, the number of Students have been 4,348,383. In a nutshell, over the course of three decades, the number of students has grown 26 times.

Like in many countries of the world, quantitative growth in Higher education in Iran has occurred mainly in the private sector up to the degree that almost 15% of the higher education is at the state sector and 85% is related to the private sector..

Access to higher education, social and economical mobility, increased social awareness and the achievement of suitable job, especially in the first decade, have been one of the most important benefits of the high growth and development of higher education in Iran. However, this growth has also been a huge challenge including graduates's Employment which has been the most important problem of the last decade.

Along with the quantitative growth of higher education in Iran, higher education institutions have brought many of their facilities to small towns. Although these movements have been the cause of the growth of small towns to some extent and also the university was both symbolically and socio-economically important for those towns, the current situation have brought some problems amongst the decline in the demand for higher education and the need for integration of higher education institutions.

This article aims to pay more attention to the social responsibility of the universities as one of the ways out of the challenges of higher education in Iran. The purpose of this paper is to extend this concern and its dimensions.

School and Mental Health of Students

In this study, we tried to understand how students in high school, are experiencing the school environment. Specifically curriculum, power relations and school's overall atmosphere are the topics that have been studied. Our main question was how these experiences affect their socialization. The hidden curriculum is an important part of school culture that shows how a group of people live, think and feel, and a system of values and meanings is shared. These curriculums can be created on purpose but not written in schools. Some are even unintentional and unknowing.

Many studies have explored these programs and have an impact on educational and learning processes, but a small part of the studies have addressed the social impacts of these programs. In this study, using psychological and sociological theories, from a sociological point-of-view, we studied these obvious and hidden curricula from students' perspective. The purpose of this study is to understand the impact these curricula have on socialization and mental health of students

In this study, using participatory observation, structured interviews, and a variety of visual studies methods, we analyzed one of Tehran's all-female schools over the course of two years. First we studied how the students describe their world and tried to find out the meaning of school and its programs from their standpoint.

We also tried to identify dimensions of the hidden curriculum in schools and the students' experience of it. We examined its impact on the students' positive and negative mental health. In fact, in this study, school was studied as a social system and the social role of "being a student", with its rights and duties, was a key element of shaping identity and socialization for these students.

Moral, Ethical and Post-Modern Guilt

A long and authoritative tradition in the social sciences regarded guilt as the most important moral feeling that provided the basis for a higher order of morality than shame. Towards the end of last century, however, certain

sociologists raised concerns that guilt was withering away in mature modernity due to increasing moral permissiveness and the breaking of previous moral restraints. This would contradict Freud's conception that civilization both emerged and develops by virtue of an increasing sense of guilt. But Freud did not take into account the process through which the self was liberated from the sway of an over-weening super ego and transformed into a reflexive project and an object of self-governance. Giddens consequently argued that there is now a tendency to move away from guilt, and that the dynamics of guilt will be replaced on psychological center-stage by the dynamics of shame. In contrast, I argue that a transition from guilt to shame is impossible from a socio-psychological point of view. I base this position upon a sociological socio-psychological analysis of guilt as related to the Meadean I-me self, particularly given the differences between guilt and shame in respect to phenomenology, behavioral tendencies, and the structure of the self. This illustrates the difference between two different forms of guilt: *primary guilt*, which is a *moral emotion* socialized in primary socialization and often fused with shame, and *secondary guilt*, which is an *ethical emotion* socialized in secondary socialization. Accordingly, I contend that there is instead a tendency today to move from ethical guilt and the principle of equity that characterized modernity, which is unconcerned with morality and social justice, towards a higher form of *post-modern guilt*, which is based upon a post-modern ethics. The latter accommodates both ethical and moral allocation rules within a single principle of justice.

MISHRA, NIHARRANJAN* (*National Institute of Technology, Rourkela*)

Locating Tribal Identity and Cultural Existence in the Light of Industrialization in Post-Colonial India

The tribal communities in India have developed their identity in close proximity to the natural resources around which they had developed their cultural traditions, economy, social control mechanisms, religious myths and techniques of production. They have developed a symbiotic relation with their local environment. For them land was not merely a source of livelihood rather a representation of their cultural identity and existence.

In the name of development, tribal communities in post-colonial India have been alienated not only from the development processes, but even from their own dwellings. As mainstream development processes tended to create social spaces of inequality, tribal communities face marginalisation virtually in every sphere of social life. More than half of them are malnourished, two thirds continue to be illiterate and live below the poverty line. With the introduction of globalisation more land is being acquired to encourage investment by the Indian and foreign private sector in the tribal region of Middle India. Due to this marginalization their long-standing social position, which is 'self-representation' has become question mark. The loss of land has brought a question on their indigenous identity.

With the above back ground taking some secondary cases and also from personal experiences the present paper has tried to explore the impact of industrialization on tribal identity and cultural existence in central India.

Emergence of Single Mother Families: A Case from Urban India

The basic unit of society is family. There is a change in the structure and function of the family along with many other institutions of society. The factors like improvement in education, modern occupations, income disparities and spatial distance are affecting the solidarity of the family and its relationships. The social and economic changes have brought about a significant transformation in the traditional pattern of two-parent families in the past few decades. The single parent families are gradually increasing in urban India. Most often these families are headed by women with dependent children, forming single mother families. About thirty-three percent of household, worldwide, is estimated to be headed by women. These women are either divorced or separated, widow, unmarried or do not have a partner. The industrial development, urbanization, and socioeconomic changes are few important reasons for the making the single parent family as a viable unit in Indian context too. The increasing ability of women to earn income is one among few important factors in the increasing number of single mother families in the cities of India. The sociological research explored the changing lifestyles of families headed by women in India. The present paper will dwell into the changes in the family system in India with reference to the rise in single mother families.

Movements Generate Movements: Intertwines of Issues, Organizations and Ideologies

The present paper examines the intertwines among three movements led by an environmental movement and the impact of interweaves on the nature and

aspects of democratization in a northern province of India in the last three decades of the last century. Firstly, the paper explores the broader sociopolitical context of protest waves giving rise to the environmental movement and thereafter a chain of movements in the region. Secondly, the emphasis of the paper is on the articulation of other interrelated issues in other movements leading eventually to a demand for political autonomy and the right to self-development of a regional community, which broadens the scope people's intervention in public policy. Thirdly, the paper focuses on the pathways of the growth of specialized (in people's mobilization) organizations, which ultimately evolve into the pressure groups and help the interconnections among the assortment of people's struggles at a local level over a short period of time. Lastly, the paper explains the course of the eruption and dissemination of partial and total ideologies and debates which provoke the conditions of mass awakening and thereby enlarging the public sphere and motivating people to react, agitate and participate in democratic processes. It is argued that the construction and reconstruction of history (democracy) are marked by people, enlarging the public sphere, on the one hand, and on the other, by the state limiting people's collectivization and protests through the process of institutionalized sequestration. The argument of the paper is that people's struggles as collective-agencies have their distinct accounts, nonetheless, they are interlinked in an order of coexistence as well as in an order of succession.

Barricading 'Hindutva Capital': Student Movements and Ideas of Dissent and Resistance in Contemporary India

Contentious nature of Indian student movements have roots in their colonial history. But unlike past(pre-independent anti colonial movement and post independent movement for strengthening democracy), contemporary student movements in India face different challenges. Rise of right wing Hindutva politics; whose political ideology seeks legitimacy from exclusionary hierarchical Hindu theology of 'Varna and Caste'; in collaboration with neo-liberal ruling elites, pose challenge the very fundamental of Indian democratic system. Neo-liberal policies, which advocates privatization of education and delegitimize students as 'political entity' help to further consolidate Hindu hierarchy; as in a privatized education system students from lower class and lower caste are denied entry because of their economic inability. The very 'Indian dichotomy', ruling elite sense of India as 'Technological Powerhouse' and growing Student unrests in leading Universities increasingly confront each other and questions to the current political establishment and their policies.

This paper conceptualizes the idea of dissent and how dissent transforms into the process of resistance, in context of Student movements in Indian Higher educational Institutions and while doing so, also focuses the historical transition of student movements in India and how that transition affected present day motives of movements. To understand these, paper explores relations among religion, society and capital and how capital's effort to normalize non-democratic, exclusionary practices to maximize its profit is facing resistance in Indian campuses in terms of method and practices of movements. Finally, the paper also finds the impact that student movements' create in national politics in respect to policy formulation and how it integrates itself with larger society. The paper will particularly focuses on anti-privatization movements in education and students activism on 'enacting Rohit Act' (Rohit Vemula, an 'untouchable' student committed suicide in campus) to protect the students of marginalized and weaker communities.

Mobilizing Social Movement: Land Grab, Peasant Resistance and Role of State in India

Notion of resistance is an inseparable part of any Social Movement. Social Movement with its collective characteristic, not only represents contemporary 'time and space', but also demands a historical understanding of politics and society. 'Land Grab' as a phenomenon deeply rooted in the 'political economy' of a state and transcends its visible temporality by connecting past with present social structure and influence future, essentially by using ideas like control, power and domination as its elements. India, as a British colony and historically being an 'agrarian state', uniquely experienced these. As a part of colonial idea of 'The White Man's Burden', colonial 'modernity' successfully ended the peoples' sovereign rights on their land and grabbed them in pretext of colonial laws like Chota Nagpur Tenures Act, 1869 or The Land Acquisition Act, 1894. In post-colonial period, there is hardly any change in the outlook of new rulers. Idea of colonial modernity continues to drive successive governments and development of 'democracy' was attached to Big Dams, large industrial projects, large scale mining or urbanizing the nation. As a result, just like their colonial predecessor land grab is legitimized by usage of term like 'public interest'. But also like colonial period, contemporary India too saw many anti land grab movement.

The proposed study intends to conceptualize a framework to explore how anti-land grab resistance through mobilization transform into social movement and

in that context how peasant identity interact with notions like control, domination or power in Post-colonial Indian democracy. It also critically examines the corporate and state relationships in discourse of land and development. The study specially focuses on anti-land grab social movements (of different period of times) of eastern Indian state; West Bengal and how these movements negotiate with Indian state and bring changes in state's policy outlook in question of 'land-peasant' relationship.

MISUMI, KAZUTO* (Kyushu University)

Tolerant Solidarity from the Viewpoint of Normative Conflict

In this paper we formally discuss compositions of tolerant solidarity from the viewpoint of normative conflict. Defining solidarity as <we-relation> via net-base symbols (Schutz, 1962), we formalize beliefs that represent what symbols are significant for <we-relation> in terms of Boolean equations. Tolerant solidarity is confronted with contradiction between universalism and relativism. Then, "less conflictual solutions" (LCS: Murakami, 1994) will be an excellent guide for tolerance when we define it as restriction of normative conflict. In addition LCS works as the standard of tolerance in the acceptance process of meta-beliefs that specify desirable beliefs based on certain ideal goals. We consider 6 type meta-beliefs as indicated in the following Boolean equations. (Ragin, 1987. We call each term in equations presentation pattern.)

- (1) Liberal universalism: $W=S(A+B)=SAb+SaB+SAB$
- (2) Universalism: $W=Sab$
- (3) Homogeneous universalism: $W=SAb, W=SaB$
- (4) Particularism: $W=sAb, W=saB$
- (5) Relativism: $W=s(A+B)=sAb+saB+sAB$
- (6) Privatized particularism: $W=sab$

Suppose that there is a group where members commonly accept concrete net-base symbols, A and B, for solidarity W; however, they are divided into two subgroups on acceptance of an abstracted net-base symbol, S. In this case, each sub-group may have 18 different types of belief in general. If a meta-belief is perfectly included in a belief, namely all the presentation patterns in the former also appear in the latter, a person who has the belief will not experience any conflict when accepting the meta-belief in question. Thus we examine tolerance of each meta-belief from the viewpoint of LCS, and will conclude that LCS does not guarantee that liberal universalism is the most tolerant meta-belief; however, it might best fit with tolerant solidarity because it holds moderate tolerance and a consistent ideal goal at the same time.

The above-mentioned analysis may suggest a general mechanism that explains acceptance and rejection of normative discourses.

On the Ethics of Ownership in Participatory Visual Research

A critical ethical issue in participatory visual research relates to ownership of the visual productions – photos, cellphilm and videos, drawings and digital stories. As Akeson et al (2014) highlight in their study of ethical issues linked to arts-based research with war affected children, we may, as researchers, enthusiastically engage with the idea of participant voice when it comes to media making, but forget that with authorship and visual production comes the idea of ownership. Nowhere is the potential for abuse more evident than in participatory visual work with children and young people. Drawing on Burowoy's (2003) idea of revisiting and reflexive ethnography, in this paper, I revisit several arts-based projects related to research with children and young people in Rwanda, Kenya and South Africa. To what extent do the goals of public engagement take over the goals of personal agency? Are there any justifications for by-passing the consultative process with children and young people? Through narrating and studying a series of vignettes drawn from these arts-based projects, I seek to deepen an understanding of the issue of ownership and in particular interrogate the ways in which the initial meaning making process is often separated from the equally important area of identity and autonomy. While this is not a completely new area to participatory visual research, it is an area that complements well the idea of dissemination and public engagement.

Gender Equality and Decent Work for Female Sex Workers in Jamaica

Women in developing countries face more complex challenges as they are more likely to be unemployed than men, be a part of informal and part time work. Work is an essential component of human existence and women should be able to pursue decent work which is free from discrimination and stigma with satisfactory conditions. The situation becomes even more complex for female

sex workers, who are at a greater disadvantage because of the gender inequality that exists in the society. The fact that there are no entrenched laws that protect female sex workers from the numerous vulnerabilities and the exploitation that they are susceptible to, means that they face further marginalisation from the labour force and other areas that are basic to human existence such as; access to health care.

This paper examines the important role that the Sustainable Development Goals (SDGs) can play on highlighting women equality and their ability to derive the benefit of decent work. Additionally, it argues for the inclusion of female sex workers in any discussion on women equality and decent work. Decent work principles should be applied to this group with the view to reduce the multiple forms of exploitation that plague them. The issue is of importance on various levels including; better access to health care, expansion of human and labour rights and towards a more entrenched social policy, that will offer further social protection to female sex workers and that may also have positive implications for the larger society.

The global goals in particular numbers five and eight present an opportunity to highlight the unique circumstances of female sex workers. This paper provides some recommendations to improve the situation of all women and in particular sex workers for the attainment of a more inclusive development.

MITCHELL, RASHALEE* (*The University of the West Indies Mona campus, Jamaica*)

Social Protection for Sex Workers in Jamaica: The Way Forward for Policy Development

Commercial sex work presents an important area for social policy and development. In Jamaica, the activity is considered illegal, unethical and immoral but nonetheless, continues among the younger females in the country. Female sex workers have been identified as a vulnerable group because of the risk of: sex trafficking, HIV and the illegal drug trade and may forms of abuse. These multiple forms of vulnerability, pose challenges for development and have implications for social policy, which need to be clearly defined. The absence of a social policy framework for sex workers presents challenges for national development goals and human rights' commitments. An expanded social policy framework linked to gender equality, human rights and the International Labour Organisation (ILO's) Decent Work Agenda, is likely to enable sex workers to have access to enhanced social protection, labour rights, health rights and reduce the risk of abuse and exploitation that sex workers encounter.

The aim of this presentation is to highlight some of the major findings from the study of female sex workers in Jamaica. It will also denote a blueprint for a more entrenched social policy that offers widespread social protection for sex workers in Jamaica.

Fear of Victimization or Feeling Secure: An Exploration of Police-Elderly Interface in Cities of Eastern India

Fear of victimization results in immobility of the vulnerable - children, women and elderly, shutting them off from the society. Free movement, independence, security and self-respect can help the vulnerable come out of the cocoon and lead an active life. At an age, when they have sacrificed their most precious days of life in building the society, the elderly suffer more from the fear of victimization than physical constraints, forcing them to days of dependency. Confinement within the four walls of domesticity acts as an impediment to expression of likes and dislikes making their lives dull and monotonous. The recent instances of rising crime against the elderly adds on to their fear and insecurity. To help them come out of this crisis, the law enforcement agencies can play a very crucial role in making their presence felt and thereby arouse a feeling of security among the elderly. In an humble effort to fill a dearth of literature on police-elderly relationship in India, the present study attempts to explore the police - elderly interface in some cities of eastern India through a small sample survey to understand the relationship that they share and whether the police has been successful in making the elderly feel unafraid. The study analyses the community policing initiatives of the police meant specifically for the elderly in cities of eastern India and the awareness of the target group in this regard. It also attempts to unveil the comfort level of the elderly to communicate with the police and whether they suffer from any apprehension towards law enforcement agencies. It is only when the vulnerable feel assured of the rule of law can we boast of a secure and safe society.

To Migrate or Not to Migrate: Punjabi Women's Thoughts on Migration

In this paper, I explore how women negotiate their roles within immigrant families in individual and relational terms, and its subsequent impact on the families' patterns of settlement. Sikhs, an understudied immigrant group, is the focus of this paper. I look particularly at how the distribution of advantages and disadvantages for Sikh women impact the ways in which they see themselves and others concerning decisions surrounding migration. The methodology is a combination of ethnography and semi-structured interviews conducted with Sikh immigrant women in the New York tri-state area as well as families with migration aspirations and return migrants who live in the Punjab, a state in India that is the point of origin for many of the Sikh women. The findings advance knowledge in the following areas: a) expand research on this understudied immigrant group from South Asia, b) show the importance of analyzing intra-group differences in order to illuminate the multiple axis of settlement of any one immigrant group, and c) pushes for theoretical frames that will capture this complex immigrant experience that considers the intersection of various categories and social locations that shape the lives of women in immigrant families.

Social Category and Autonomy: Lifescore of Japanese Expatriate Spouses

How does social category as "expatriate spouses" affect the autonomy of Japanese expatriate women who accompany their husbands? The everyday life of Japanese expatriate spouses who lived in Duesseldorf, Germany, is explored by lifecourse interviews and discussed to answer this question. By analyzing their lifecourses, it was found out that the social category as "expatriate spouses" has a dominant power in their daily lives. They were expected to be a good wife and good mother as a member of the group. Moreover, narrative analysis indicates that two social structures are closely related to this situation.

(1) Japanese rigid business-oriented society in Duesseldorf

(2) the position of being "sengyou-shufu" (non-working and full-time housewife)

In a host country, some Japanese expatriate spouses pursue their autonomy by resisting being a member of the group and try to establish their own identity regardless of this category. However, the finding shows that at the time of resettlement, they face difficulty finding jobs because of their disrupted life course with very short-term working experiences. Their own autonomy which was nurtured and formed in Germany needs to be reexamined to create a new self-image. This research brings a new view to the Japanese expatriate women in showing their conflict and desire for autonomy.

Involvement in Chorus: Collective Feeling and Alfred Schutz's Theory

This presentation will analyse singing in chorus and community consciousness in terms of Alfred Schutz's argument in "Making Music Together". Chorus is one of the typical activities involved in making music together in leisure time. Here, I focus on chorus as not an artistic activity, but singing experience in daily life. As an example of a chorus, I will treat the Japanese popular folksong, 'Furusato' ('My Old Country Home'), which was frequently performed by choruses directly after the Great East Japan Earthquake in 2011; it was sung by performers and audiences as the encore at concerts or in theatres as well as at various charity events to overcome the disaster and realise a national bond. This song is generally regarded as important because of its lyrics, which depict an old Japanese landscape, but it is also significant that the song was sung in unison; people sang together the same melody simultaneously. As such, they shared a communal memory and feeling which the song invoked through the collective act of singing without verbal communication. While Schutz emphasised a 'tuning-in' relationship and 'we-feeling' in general as non-language communication when making music, the type of community may vary according to singing form and context. When 'Furusato' was spontaneously sung in unison chorus at various events after the Earthquake, its community-feeling might have been different from that which would be inspired by chorus at a concert hall based on regular practices in advance. I will discuss what type of singing in chorus may arise, what type of 'we-feeling' there is and ultimately rethink Schutz's theory.

MIZEN, PHILLIP* (*Aston University*)

Agency, Contingency and Relative Good Fortune in Street Children's Access to Paid Work in Accra's Informal Street Economy

The sociology of street children is now defined by its rejection of the narratives of child welfare organisations that identify the street as the root cause of children's immiseration and improper socialisation (Glauser 1997). In its place, sociological analysis has questioned the value of conceptualising street

children as a coherent group on the street and in a parallel move has looked to conceptually re-position street children away from assumptions of passivity and neglect, towards a foundational insistence that street children are active and strategic social agents (Offit 2008; Kovats-Bernat 2006; Panter-Brick 2002). It is the adequacy of this latter concern that is the focus of this paper. By reintroducing the location of children within the informal street economy and by considering their efforts to seek paid employment, this paper draws upon extensive and long-term qualitative research examining the lives of street children in Accra, Ghana (Mizen and Ofosu-Kusi 2010a, 2010b). The argument here is that sociological notions of strategic action and efficacious agency seem ill-suited to accounting for the dilemmas and difficulties that the quest for paid work inevitably involves. Rather, it is relative good fortune within the radical uncertainty of the informal street economy that seems much more appropriate to accounting for how these children are integrated into work.

Construction of the Human Trafficking Problem in Mexico: Bias of the Concept and Unmet Law and Policy Goals

As in many other countries, human trafficking is a sub-product of neoliberalism and globalization, where more flexible labour legislation and the decline of the welfare state, set a wide sector of society into vulnerable conditions. In the case of Mexico, it represents as a source, transit, and destination country for human trafficking, where most of the victims fall into sexual exploitation and some of them are exploited in forced labour in agriculture, domestic service, food processing factories, construction, the informal economy and begging among other "dirty jobs". The Mexican government signed in 2005 of the UN international human trafficking treaty, and the first national anti-trafficking law was formulated in 2007 to fulfil the international commitment, additionally in 2010 the first national antitrafficking program was released. In 2012 the federal government presented a new anti-trafficking law, later reformed in 2014 with its respective anti-trafficking policy. Thus, trafficking has been defined and redefined by Mexican legislation, leading to a misrepresentation of the concept in different spheres such as in mass media, political legislation and policy implementation as well as in academia.

In most of the cases, human trafficking has been interpreted as a synonymous of sexual exploitation and prostitution, creating complexity on law enforcement process, where the necessities for victims' assistance, the prevention of the phenomena and, the prosecution of the crime are not met.

Therefore, the purpose of this paper is to explore and analyse the consequences of the trafficking misrepresentations, as well as the unaccomplished duties and goals regarding the antitrafficking law and policy, showing the government lack of responsibility to provide justice access and proper care for the victims.

The Impact of Social Media Communication on Armed Forces' Legitimacy

The Swiss Armed Forces (SAF) as part of a democratic political system depend on societal legitimacy of the organization and its mandates, it is their license to act. Legitimacy is generated by [complying with binding](#) principles like the [federal](#) and by [societal acceptance](#). It is about political transparency and participation (von Bredow 2008). Democracy, legitimacy and [the public](#) are [closely connected](#). In the public the SAF and their mandates become visible. In this sphere, they can be controlled and legitimated by the citizens, as part of a deliberative [discussion](#). Political decisions are communicatively negotiated, arguments and information get compared, and verified by reasonableness. Thereby political [comprehension](#) can be [increased](#) (Habermas 1998). A public discourse enables the citizens to perceive themselves as part of a society. This creates loyalty and thereby political decisions can be supported by all citizens, not only by the majority (Imhof 1996). Considering this, the meaning of political communication including the SAF's communication becomes obvious as it forms the most important basis for political legitimization processes.

For long public political communication was mediated by traditional mass media with journalists as gatekeepers. Nowadays, social media provide a new way to communicate and interact directly with the citizens. The official SAF social media communication potentially brings the organization closer to the people and starts a dialogue with them. At its best the SAF will become more transparent and social media communication may [increase](#) reputation, confidence, legitimacy and societal support.

To measure the effect of social media communication on legitimacy, the Military Academy at the ETH Zurich has conducted a survey amongst the represen-

tative Swiss internet population. Based on this data, the paper will show what impact the official social media communication of the SAF has on their legitimacy.

After the Storm

Storms reign the Caribbean. Recent storm Irma caused damage to 90% of all homes in St Maarten that is a country within the Kingdom of the Netherlands. First to provide aid were the military and the military will make large part of the reconstruction effort. Ships will bring in materials, provisions, and first necessities whilst the reconstruction team is headed by former Lieutenant-general Hans Leijtens ... a former Military Police general. Civil and military authorities will have to work together to reconstruct almost everything, but foremost to piece together a governance structure that enables the collaboration between civil and military partners. The collaboration activates a constabulary force structure that demands more than fighting the forces of nature and that requires a military contribution to re-establishing and reconstructing governance after the storm. The Janowizian concept of the modern constabulary use of the military organization will be put to test within the context of disaster relieve and crisismanagement.

Municipal Borderwork, Jurisdictional Games, and Racial Profiling: Barcelona's Fight Against Unauthorized Street Vending

The governance of street vending is part of broader projects of urban governance which, in big cities, is often informed by dynamics that unfold at national, regional and global scales. For this reason, it is a particularly interesting object to inquire into the overlapping jurisdictions and scales, the displacement of borderwork, and the everyday practices of a multiplicity of actors involved in urban and immigration governance. In the summer of 2015, Barcelona's municipal government came under fire from the opposition for what was seen as a lax response to street vending. Reacting to criticism, it started to promote a tough-on-street vending discourse, backed by a high-profile crackdown on immigrant street vendors. While selling products without the proper licensing is managed as a municipal bylaw violation, the issue is multilayered. Most vendors are recent immigrants from Senegal living in Spain in violation of the Alien Act, and many of them sell knock-off copies of luxury brand products, which is a criminal offence. In an attempt to rid the city of its street vendors, authorities used—among other actors—municipal police officers to repress bylaw violations, Autonomous Community police officers to criminally prosecute the selling of counterfeit goods, and National police officers to apply the Alien Act. Street vendors thus find themselves at a juncture where various legislative frameworks (municipal, immigration, and criminal laws) intersect to govern their presence in the city and in the country. The paper uses this case to analyze how various actors can engage in jurisdictional games and racial profiling to perform what amount to forms of municipal borderwork.

Children with Disabilities in Child Well-Being Research – an Inclusive Methodology

In this paper, we discuss the inclusion of children with disabilities in child well-being research with reference to the Australian segment of the CUWB research project. Children with disabilities are rarely included in research on children's perspectives on well-being, and are in general excluded from child population research. Reasons for the lack of inclusion of children with disabilities in research may include perceptions that they are different from children generally, and/or incapable of contributing their views on issues important to them. Additionally, involving children with cognitive and communication difficulties can present time and methodological challenges for researchers, because multiple methods may be needed to enable their participation and engagement.

There is however, a need for more in-depth research to understand what well-being means for these children in the context of their experiences of living with disability. Recent research has indicated that the quality of life of children with disabilities is significantly lower than for children more generally. It is particularly important that knowledge is obtained on the immediate and longer-term limitations, for children whose lives are lived with disability or illness, in terms of 'usual' child activities and experiences of childhood associated with child well-being.

In this paper we outline our application of a methodological approach that combines childhood sociology with critical disability studies theories. We describe

how in applying the agreed qualitative research protocol for the multi-national project, we adjusted activities, processes and communication strategies to suit the abilities and preferences of individual children. We discuss enablers for engagement and how we managed the challenges confronted in implementing this research approach with participants aged 12- 15 years of age at an Australian school for children with disabilities. The paper concludes with a summary of lessons learned and next steps for this research.

The Significance of Space and Place for Well-Being in Childhood

The particular framework used for analysing data is an important element in understanding and defining child well-being through qualitative research. In this paper we discuss the use of space/place as the analytic frame for deriving a construction of children's lives and well-being from themes dominant in the narratives of children in the Australian contribution to the broader multi-national child well-being research project.

Our use of spatiality as a frame reflects the situating of the Australian project in the context of the broader CUWB study, whereby the emphasis on the global and local, highlights the significance of place for child well-being. We discuss ways in which the narratives of children in the Australian research challenge the conceptualisation of space as 'stasis', by informing us of the way in which the 'time of childhood' contextualises space. Further, our analysis of children's narratives indicates the significance of emotions in giving meaning to the spaces and places in children's lives. It shows how the dynamics of adult-child relations, in carers' attempts to border spaces of childhood, are at times accepted and other times contested by children, referring to both home and school. Attempts to establish spatial borders for children and children's ongoing contestation of these borders is particularly evident in children's use of media in their social relations. We discuss findings from the research on how children use technology, sometimes alongside more conventional child media, such as painting, to construct their individual and group life spaces, while also constructing themselves. We draw out some implications of the linking of place with well-being for understanding childhoods in a global world.

School: A Healthy Workplace? Health Promotion and Prevention in the Teaching Profession

The teaching profession is a challenging one for many reasons: Teachers have to deal with current societal changes due to migration processes, social problems and behavior changes in children. Teachers' working hours, work tasks and their field of responsibility are not clearly defined and their profession is broadly discussed in public – often negatively biased (Rothland, 2013). Teachers are exposed to a high level of physical and psychological stress as well as to an ongoing change of the educational system. This research project deals with the question which measures of health promotion and prevention could be taken to reduce stress factors for teachers. Therefore 20 guided interviews with experts in health promotion at schools, principals and teachers of different school types in Austria have been conducted and analyzed using a summarizing content analysis. The results show different organizational and individual measures of health promotion for teachers. These include training and supervision programs for supporting them in reflecting their professional life, increased team teaching, allocating social workers and psychologists at schools and relieving teachers of administrative tasks. Health promotion for teachers is also seen as one of the management's tasks and is not perceived as being the teacher's personal responsibility exclusively. These required management tasks include enhanced social support of teachers and fostering their collegial cohesion, providing training and support programs for personal and professional matters for developing skills to manage the professional life in a health promoting way as well as to enable teachers to change their profession if necessary.

Supervision for Teachers As a Measure of Health Promotion – an Evaluation Study Using a Mixed Methods Approach

In this evaluation study the impact of a one-term individual supervision of primary school teachers in Vienna was evaluated using a mixed methods approach

of quantitative and qualitative research methods. In a quasi-experimental design the experimental group (n=25) was exposed to supervision and the control group (n=35) was not. A longitudinal questionnaire survey was conducted, one before and one after the supervision for depicting differences between the condition of the supervised teachers and the control group. The questionnaire contains measurement tools for assessing physical and psychological health condition, quality of life, workload and workability, burnout risk, self-efficacy and emotional distancing from work. After the intervention a focus group discussion with five supervisors was conducted in order to assess the benefit of supervision for teachers from the experts' perspective, to summarize their recommendations for the implementation of supervision and to find the main focus and ideal organizational structure. The results of the statistical data analysis show that work load and workability, physical and psychological health condition, health satisfaction, self-efficacy, emotional distancing from work and emotional exhaustion in the supervised group have developed more positively compared to the control group. Most effects have a relevant magnitude, but are not statistically significant ($p < 0,05$), due to the small sample size. In the focus group discussion the supervisors reported that teachers benefit from individual supervision. Provided that all content discussed during supervision is treated with absolute anonymity and confidentiality, the supervisors could not find any disadvantages that might result from supervision. The empirical results suggest that individual supervision should be implemented broadly as a measure of health promotion for teachers.

Institutional Changes and the Gender Regime in Tunisia: Is a Transition Patriarchal to Modern Gender Relations Underway?

Theorization of gender at the meso-institutional and macro-systemic levels has thus far focused on advanced capitalist societies of Western Europe and North America (Walby 2004; 2009), Connell 1987); Pascall and Lewis 2004; but see Bose 2015). The proposed paper builds on that research but seeks to extend it through application to a non-Western case study, Tunisia.

The paper would elucidate (a) changes in key institutional domains in Tunisia – women's involvement in the professions, sustained feminist activism, family law reform, VAW legislation, and the increase in women's political representation, especially since the 2011 democratization process – which may represent a shift from the longstanding patriarchal to a "modern" (rights-based) gender regime; (b) the ongoing challenges to the transformation of the gender regime emanating from Tunisia's peripheral status within the capitalist world-system and exacerbated by the 2008 Great Recession and post-Arab Spring regional conflicts: high unemployment, growing income inequality, low investment and growth, and political instability; and (c) the specific challenges within Tunisia's labour market – notably, shortage of decent work and absence of enforcement of work-family reconciliation policies – that preclude wider female labour force participation and that contribute to gender, regional, and income inequalities. Sources of data and information include government documents and data, publications of feminist organization and women's policy agencies, the author's fieldwork in Tunisia since 1990, and the relevant secondary sources.

The paper will contribute to historical comparative analyses of varieties of gender regimes while also confirming the salience of economic and financial factors and forces in the (un)sustainability of gender transformations. Finally, the paper will propose a research agenda to extend gender regimes varieties beyond the contemporary and Western-based categories of "social democratic" and "neoliberal", and to encompass "democratic socialist", "dependent capitalist", and "state capitalist" gender regimes.

Social Change and the Evolution of Gender Differences in Depression: An Age-Cohort Consideration

The tendency for females to display more depressed affect in the United States is a highly complex social problem that has personal and society-wide impacts. This study investigates whether social change in education, employment and household work during the 20th century has been associated with improvements in the mental health status of younger cohorts of Americans (and in particular American women). Using Mirowsky's (2013) age-vector modelling strategy, we distinguish between changes in the depression implications of employment and household work due to cohort versus age effects. Controlling for race, education, and marital status, we find gender differences in depression decrease significantly for incoming cohorts. Employment is also highly and increasingly beneficial for younger cohorts of women, while lower levels of employment are especially detrimental for incoming cohorts of men. In accounting for housework involvement, higher levels are associated with a stronger drop in depression for men, but not for women. Accounting for the interaction between work at home and in the workplace, we find that gender differences in depression are smallest among those who do not work at home— this holds across levels of

employment and cohorts. In addition, women's depression curve remains similar within employment categories across levels of involvement in housework, while depression decreases with higher levels of housework for younger cohorts of men who had a strong workplace involvement for the duration of the study.

Remembering Cynthia Joseph: Reflecting on the Intersection of Gender and Ethnicity in Malaysia

The life and works of the late Cynthia Joseph inform the subject of this paper. Joseph's study of young females within the schooling system strikes at the heart of the many critiques of Malaysia's affirmative action policy, or the New Economic Policy (NEP). The later was originally conceived and implemented in 1972 to narrow socio-economic inequality in a new nation previously governed and segregated by race under colonialism. Although the NEP was intended to diminish racial differences, 40 years or so after its implementation, ethnic relations have evidently become more strained than ever. While old inequalities have disappeared (such as urban-rural divide on the basis of ethnicity), new ones have taken shape (along the lines of religion and ethnicized political power). Why have this been so? Joseph's many studies unpack this question by delving into the micro and everyday experiences among those furthest from the reins of power. The narratives of young female students she studied disprove the success of the NEP. Joseph's portrayal of the life of Malaysian schoolgirls of different ethnicities tells this story. Charting their life-course as they embrace, accommodate, negotiate or circumvent the NEP, Joseph's study mirrors her own bittersweet trajectory, of her migration from Malaysia to Australia. It reminds policy makers that nation-making should only be built upon the notion of inclusivity rather than exclusivity. By reviewing many of Joseph's seminal works on this question the paper revisits the notion of gender and ethnicity as they intersect at the crossroads of nation-making, democratic transition and political reformation in current day Malaysia. What are the new agendas and articulations for reforms? Can a subjectivity based on race, gender and class be re-invented and lead to meaningful political and social transformations in the country?

Processes of Social Exclusion within the Professions: "You're Not Really Supposed to be Here."

In Canada, formal commitments to improving 'diversity' within the professions begins with affirmative action admissions to professional education programs, and employment equity hiring. Despite these measures, it is important to examine the everyday work experiences of those who have been traditionally under-represented in the professions. In this paper we examine the social processes through which exclusion and marginalization occur in three professions: law, social work and academia. We draw on qualitative interviews with almost 100 professionals who identify with groups traditionally marginalized by race, ethnicity, Indigeneity, sexual or gender identity, social class background, and/or disability. Semi-structured interviews were conducted by phone or in person, transcribed verbatim, and iteratively coded through regular team discussions using software AtlasTi.

For some groups, a major concern was normalization and self-surveillance, navigating disclosures of stigmatizing social identities, and constant concern with proving themselves 'good enough' professionals. Members of some groups entered the social field of the professions lacking valued social and cultural capitals, as well as *habitus*, which left them fighting a pervasive sense of dis-ease with institutionally encoded rules. Isolation was the norm across groups and across professions. For those who were most visibly 'Other' overt hostility was startlingly common, in addition to everyday 'microaggressions' that reinforced marginality. Vicarious experiences were often extremely painful. Many participants took on extra work – often invisible and uncounted – to promote equity for others. People struggled with essentialism and tokenism, reducing them to their social identities, yet also with dismissal of their knowledge, experience, authority and critiques. Examining experiences across social groups, within the relatively elite context of three different professions, highlights similarities and distinctions in contemporary mechanisms of social exclusion within the professions.

Rethinking Problem of Sexual Violence: A Shift from Gender-Conflict to Gender- Reconciliation

My central argument is that the interlinked issues of power, violence and justice, apart from being contextualized with the 'lived experience' of victims of sexual violence of any kind, must be approached with an eye on gender-reconciliation. Patriarchy, its ideology and vision of social and state structures has shaped perceptions of the people especially of the higher castes regarding the dangerous nature of female sexuality and the urgency of controlling it by any means for the health and stability of the system. One of the most effective strategies for replacing the patriarchal culture by humanistic values is to change the content and direction of socialization of boys and girls. In order to reinforce the process, school text-books and children's literature require a new orientation. The second strategy is to recast those cultural symbols which project female body as merely an instrument for ensuring the purity of race and thus the line of succession in almost all hierarchical societies, more so in the Indian case. I shall also argue for initiating a dialogue between the spokesmen of patriarchy and advocates of human rights for women. In which ways will it create a healthy and equitable gender- relations ? Last but not the least is the agency of enlightened young women in not only redefining womanhood but also in creating a gender-sensitive society, thus marginalizing the violent masculinities . Recent protests by a large number of girls against persistent sexual harassment and short-sighted policies of administration in the Banaras Hindu University showed that patriarchal values can no longer arrest the emergence of a new generation of self-reliant women who want to create a new vocabulary of power governing social relationships. I shall conclude my presentation by showing clippings from a film NH 10 [released in 2014]

MOLDENHAWER, BOLETTE* (*University of Copenhagen*)

Pedagogical Work with Asylum-Seeking and Refugee Children in Denmark - a Prism to the Study of Emotional Work in Education

Interpersonal and emotional aspects of pedagogical work have during the last few decades been of great interest among educational researchers. This paper offers an analysis of social and moral dimensions of education by using professional interactions with asylum-seeking and refugee children as a privileged prism through which to study the relational and emotional aspects of pedagogical work. The paper argues that the link between education and emotion is well addressed by considering the positioning of asylum-seeking and refugee children as a particularly vulnerable group characterized by anxiety and insecurity (Vitus & Nielsen 2011).

Drawing on empirical material based on participatory observations and interviews with staff from the administration, asylum centre and schools in selected municipalities, the analytical attention is directed towards professional practices and ideas, norms and sentiments expressed within and between the institutional settings. The investigation is informed by a micro-sociological approach based on Erving Goffman's theory of the interaction order (1983) and Arlie Hochschild's conceptualization of emotions and emotional work (1979). As such, strategic emotional work is informing the analysis of the how to maintain a professional distance to the pedagogical work without being to personal engaged in the asylum-seeking and refugee children's fate and destiny. By understanding emotional dynamics in this specific sociocultural and learning context, the paper opens up for a more general understanding of interpersonal and emotional aspects of education (Turner 2009).

Analysis on the Refugees Representation in the Spanish Digital Press

Spanish stereotypes towards refugees are based, among other things, on the information that media dissemination offers. In order to approach the research problem, a discourse analysis will be carried out to verify how the representation of refugees in the Spanish media is and what are the stereotypes to which

both representations refer. The corpus analyzed will consist of all related news published in the digital edition of two of the most widely read newspapers in Spain: "El País" and "ABC", from April 2015 to September 2017. On the one hand, critical discourse analysis (CDA) will be used to study the linguistic representation of refugees in both media and, on the other hand, the analysis of contingency tables to detect anomalies in the representation of the same in newspapers. The objective of the study will be to evaluate the representation of the refugees in both media, after analyzing a series of previously established discursive categories that will be evaluated by external judges. In accordance with the criteria of external judges and subsequent analysis of the opinions, the expected results should show that the representation of refugees varies significantly in both media, while in one category there will be categories related to immigration control and migration policies, in another, categories related to Human Rights and International Cooperation will predominate.

Perceived Threat As a Risk Factor for Social Rejection of Muslims in Southern Spain: The Case of the Municipality of El Ejido.

Southern Spain has emerged as a crucial enclave for the study of attitudes towards immigration. Due to its geographical location, it is the gateway to Europe for immigrants from the African continent. Specifically, the municipality of El Ejido is one of the most significant socio-cultural laboratories in Europe with 88,752 inhabitants, of which 30,105 are of foreign origin, and with a world-pioneering production model of intensive agriculture, which depends on a work force mainly made up of immigrants from different ethnic backgrounds. Currently, 60% of the total number of foreigners residing in the municipality are of Moroccan nationality, which makes them the focus of the collective imagination of the economic immigrant. The purpose of this paper is to evaluate, using Threat Theory, how Moroccan immigrants are perceived, identifying the variables that can be considered predictors of social rejection, as well as the quantification of their strength as risk factors. For this purpose, a cross-sectional study was carried out with a sample of 450 individuals living in the city of El Ejido, divided into cohorts by district, age, and sex. The sociodemographic and perceived realistic threat variables which could influence the level of perceived symbolic threat were evaluated by the adjustment of ordinal logit models. The ratios (odds) for classification in a higher level of anxiety were interpreted in the variables that proved to be significant and could be considered risk factors for rejection of Muslims.

Income Inequalities in Health: A Latent Class Growth Mixture Model Approach

Some of the difficulties in studying income inequalities in health have arisen from the scarcity of longitudinal data, objective measures of health, and not having the entire distribution of income available to explore the full spectrum of the relationship. Our paper contributes to the income-health gradient literature by exploring the association of long-term income trajectories and health in a different, and potentially more robust, manner to the traditional variation around the mean approach. Using data from the British Household Panel Study and the UK Household Longitudinal Study (UKHLS), we explore the full distribution of income, and model unobserved heterogeneity in income trajectories over the course of eighteen years (BHPS waves 1-18), using latent class growth mixture models (LCGMM). We adjust trajectories for age, household type, employment status, and education at baseline, year nine, and year eighteen, respectively. We find evidence of five types of income trajectories: high-increasing-plateau, high-decreasing, medium-stable, medium-increasing, and low-stable. We then investigate associations with these trajectories and: i) a range of nurse assessment measures, and ii) blood-based biomarkers collected at Wave 3 of UKHLS. We examine different pathways between long-term income and biomarkers capturing different physiological systems. Finally, we also conduct a sensitivity analysis relating mean income over 18 years to the objective health measures to assess whether a different picture of the relationship between long-term income and health emerges. Advantages and disadvantages of both approaches will be discussed. Policy implications will also be touched upon.

The Ethics of Participatory Dissemination: Reflections from Participatory Research on Sexual Violence with Girls and Young Women in Rural South Africa

The Ethics of Participatory Dissemination: Reflections from Participatory Research on Sexual Violence with Girls and Young Women in Rural South Africa

Participatory research involves co-creating knowledge with the research participants. Ideally, the analysis of findings as well as their dissemination must also be participatory and be led by the participants themselves, and at a minimum, involve them as active and equal partners. This, participatory researchers argue, not only produces knowledge that is authentic and relevant, but is likely to generate "work that can directly impact policy, service interventions or community practice" (Liebenberg, Ikeda, and Jamal, n.d. p.1). Yet, involving participants, specifically women and girls, equally and consistently from conceptualisation of the research to the dissemination process, often proves challenging. Reasons for this range from the researchers' commitment to privileging their voices throughout the research process, to the fact that due to unequal gender norms and the gender-based violence linked to them, they are "at the lowest end of them all" (Amnesty International, 2007.p.1) in their families and communities. While participatory dissemination is a logical step in participatory research, some ethical question emerge: What can we ethically expect women and girls who participate in our research to contribute to dissemination, particularly about violence in their communities? Does their involvement in communicating such findings put them in further danger of marginalisation or even violence? How might participatory researchers balance the need to 'do least harm and most good' and to "avoid any possible harmful consequences resulting from [participants'] identification" (Amnesty International, 2008, p.5), with the principles of participatory research and therefore, participatory dissemination of findings? This presentation will reflect ongoing research on sexual violence with girls and young women in rural South Africa and ethical dilemmas linked to participatory dissemination of the emerging findings and engaging the community in the implications thereof.

Impacto Del Origen Social En La Inserción Laboral De Los Graduados Universitarios: Un Análisis Comparativo Entre Argentina y España.

Desde el punto de vista de las desigualdades de oportunidades, puede afirmarse que la educación formal y sus logros aspiran a limitar los efectos del origen social de los individuos, los cuáles pueden ser tanto económicos como culturales. Esto es especialmente relevante para la educación superior y sus logros en términos de ingresos ocupacionales.

La presente ponencia se propone analizar en qué medida las condiciones de origen económico y cultural pesan en los la inserción laboral de los graduados universitarios comparando las dinámicas de Argentina y España. Para llevar a cabo este análisis utilizamos la técnica regresión logística siendo la variable dependiente los ingresos obtenidos en el mercado laboral como indicador de inserción. Argumentamos que en ambos países las condiciones económicas de origen tienen a no ser significativas en el logro económico, mientras que las condiciones culturales tienen más influencia, así como los logros educativos de los entrevistados y entrevistadas y su inserción ocupacional. Los países difieren, sin embargo, en la capacidad explicativa de los modelos.

En base a estos resultados se reflexiona sobre la capacidad comparativa así como las limitaciones de los indicadores que se utilizan para observar la dinámica de inserción laboral de los /as graduados/s universitarios/as en ambos países.

Identity and Normativity in a Conflict: Heteronormative Discourse in School Lgbtqi+ Support Projects

How do heteronormative discourses frame the community participation and school activism of young LGBTTIQ-supporters in Germany? How do young LGBTTIQ - supporters frame their belonging, being trapped between the human rights discourse of the LGBTTIQ -supporters and the heteronormative discourse of their peer group? How do activists cope with this tension between the both discourses, while being part of the school as community and building alliances?

The paper elaborates on the results of the analysis of group discussions with school children (aged of 14 to 18), who participated in LGBTTIQ -support projects in different schools in the Federal State of North-Rhine Westphalia in Germany.

The group discussions were recorded and analyzed with help of socio-linguistic method of objective hermeneutics. The participants of the group discussions met in order to discuss their experiences and practices as well as success and challenges with other LGBTTIQ -support activists from other high schools. In their group discussions within mixed groups of activists, who firstly met during the session, the students articulate their conceptions of LGBTTIQ -identities and homophobia. They articulate their ideas of norms within the society and share, how they look for supporters within schools as organizations and use democratic school structures in order to support fellow LGBTTIQ -students in high schools.

While engaging actively within their school communities in order to make life of the LGBTTIQ -students better, the school activists demonstrate simultaneously a strong tie to the heteronormative discourse, despite knowing about its exclusion potential.

With help of reconstruction of what the school activists consider as norm and normality in their unmoderated group talks, the paper seeks to demonstrate, how heteronormative discourse intervenes with the sense of community belonging and influences life reality of gendered school community.

Young Australian's (re)Interpretations of Social Media Campaigns for the Prevention of Violence Against Women.

While much is known about the use of social media and technology as mechanisms of control and towards the detriment of healthy relationships, what we know about how these tools can be used to promote violence prevention and healthy relationships is limited. The aim of this research is to measure how young people actively interpret Australia's nationally funded long term, evidence based primary prevention program to combat violent supportive attitudes: 'The Line'. Currently, 33% Australian women have experienced physical violence, and 20% have experienced sexual violence – most commonly from someone that they know, often their partner. 'The Line' is targeted towards young people aged between 12 and 20 and their caregivers to navigate influencers for discussions of gender and relationships to promote violence prevention. This research uses digital content analysis and online conversation analysis with 3 years of data flow between young people publicly interacting with 'The Line' via social media. It addresses how digital violence prevention resources can address peer influences and social norm intervention strategies as transformative culture that reflects and empowers young people's agency through their use of technology. Through social media, young people negotiate their lives, opinions, relationships and selves through language and content creation as they discuss everyday risks and pleasures. They embed themselves through the hybridisation of social media to document and reshape the world around them as technological counterpublics. This project underscores young people's attitudes as they present and reinterpret the discourses surrounding gendered and interpersonal violence in their lives; and describe what impact prevention resources have within these spaces. The findings of this research highlight the need for ongoing research into the use of social media in primary prevention of violence against women to empower the engagement of young people.

"Neighborliness Revival" through "Social Facilitation" in Tehran: Case Study of Farangian Town Neighborhood

"Neighborliness revival" through "Social Facilitation" in Tehran: Case Study of Farangian Town Neighborhood

Neighbors' ties and relations in today's world are weakening and decaying with the ever-growing expansion of modernity. Tehran city -the capital of Iran- is also no exception; in this city, weakening of neighborly relations is by far more severe in district of upper-middle economic, social and cultural class.

It seems that one way to revive neighborly relations is through the use of social facilitations based on the new urban relationships.

Tehran is divided into 22 districts and 374 neighborhoods, and neighborhood is the pivot the urban management revolves around. The following article spells out the experience of neighborly relations revival in Farhangian Town neighborhood - one of the northern neighborhoods, located in the 2nd district of Tehran, with middle- high-class residents - over the past three years with the help of the residents of the neighborhood and with the guidance of social facilitators (the authors of the article).

In the present research, the following questions have been answered:

- How was the concern over the weakening of neighborliness and the necessity of its revival brought up by the residents?
- Why has social facilitation been chosen as the best solution for neighborly relations revival?
- How did the local community encounter the social facilitator?

- What measures have been taken by residents during the past three years after that the facilitators left the neighborhood in regards with the revival of the neighborly relations?
- What are the neighborly relations like now?

It should be noted that the present research method is collaborative observation and interview. At the end of the article, it is concluded that the neighborliness revival experience of Farhangian Town through social facilitations can be applied as a model in other neighborhoods of Tehran.

MONDAL, LIPON* (Virginia Tech)

Understanding "Neoliberal Spatial Violence" As a New Mode of Production

This paper aims to examine how violence, both subjective and objective, produces and sustains a particular mode of production in a neoliberal urban space. The article thus uses two sets of data (came from fieldwork in Dhaka, Bangladesh, during the summer 2017): (1) 65 life histories collected from the poor who have been living since the 1980s in inner-city slums located in the 500-meter buffer zone on each side of a one-mile long street (i.e. Panthapath), and (2) a slum survey conducted in this particular area (which finds 147 slums built on privately owned lands, of which 72 slums are on grabbed/disputed lands).

The empirical evidence purports the "neoliberal spatial violence" as a peculiar type of mode of production due to its embeddedness in the violent processes of capital accumulation. This accumulation process has at least four dimensions. First, this process evicts urban poor from their lands or homes. Second, the very process brings back those evicted poor to live in the commercially built tin-shed slum-houses and forces them to pay a high rent for a 216-252 cubic feet room without any window/ventilation (where 4-7 people usually live) and compels them to share one kitchen, one bathroom, and one toilet with 50-80 people. Third, it forces the poor to live under constant threat to their health and lives and punishes those who appear to be a threat to illegal housing (and drug) business. Fourth, it violently dispossesses the poor from all forms of capital and keeps them in extreme poverty across generations, confining them to a "lifetime prison cell" as tenants.

By reflecting on Marxist spatial theories, Galtung's idea of structural violence, and Žižek's conception of systemic violence, this presentation argues that violence qualifies to become a "new mode of production" in the era of neoliberal globalization.

MONGIA, RADHIKA* (York University)

The Modern State As a Colonial Formation: Citizens, Migrants, and Legal Regimes

Whether alarmist or optimistic, pronouncements in the 1990s regarding the decline, if not the impending demise, of the nation-state were premised on a willful blindness to crucial aspects of domains such as migration. In this domain, the continuing salience of the nation-state was patently evident in a state monopoly over the regulation of mobility, writ large in, for instance, the technology of the passport (Mongia, 1999). Pursuing the invitation of this panel to discuss the contemporary state in relation to migration, this paper has two aims: First, it seeks to historicize the nation-state in relation to migration control. This historicization reveals how the emergence of the nation-state, as an entity encasing a fixed territory and a fixed population understood in specifically *national* terms, is itself enmeshed in a complex history of a racialized regime of global migration. In this regime, nationality functions as an alibi for race. Second, the paper addresses the vexed issue of the distinction between the colonial state and the modern state. Though they are coeval formations, the former is characterized by differentiated legal regimes, most notably for the colonizer and the colonized. The hallmark of the latter is the production of formally equal and equivalent subjects (i.e., liberal citizens). The paper argues that the differentiated legal regimes that subvert the citizen/migrant distinction, now normalized across the world, constitute the generalization, or globalization, of the colonial state. In other words, the very form of the modern state is now indistinguishable from the colonial state. To make these arguments, the paper draws on archival materials and debates concerning state regulation of Indian migration in the nineteenth and early twentieth centuries, a rich array of theoretical literatures, and the incontrovertible evidence from varied contemporary state formations.

RC31-557.1MONICO, CARMEN* (*Elon University*)ERAUSQUIN, JENNIFER TOLLER (*University of North Carolina at Greensboro*)*A Critical Sociological Analysis of "Push-Pull" Factors Influencing Human Trafficking: Towards an Integrated, Multidimensional Conceptual Model to Inform Interventions*

Trafficking in persons (TIP), a form of modern day slavery, is both a global and local phenomenon. In this paper, the authors have applied a critical sociological lens to examine the human trafficking literature to develop a preliminary conceptual model for understanding the multiple, micro- and macro-level factors influencing human trafficking. The authors use examples and data from around the globe. This critical sociological analysis of TIP situates the experiences of victims and survivors within their macrosocial contexts, specifically societal norms about gender, regional migration streams, and legal issues intersecting to create "push" and "pull" factors producing and sustaining human trafficking. Among immigrants, the intersecting factors diffuse the smuggling and trafficking dynamics, making it difficult for law enforcement and service providers, for example, to assess the needs of victims and to ensure critical services to survivors, while assisting them to move from rescue to restoration. Drawing from this secondary research, the authors develop an integrated, multidimensional conceptual model of practice. The model builds on systems and feminist theories, as well as human rights and strength-based approaches, and proposes to involve a wide range of stakeholders, such as social scientists, law enforcement, survivors and advocates, to work together in the creation of evidence-based policies and programs to combat human trafficking. The session will include a paper presentation by the authors and a discussion of the model and its potential applicability in various international, national and local contexts.

TG03-958.3MONICO, CARMEN* (*Elon University*)*A "Constructed" Definition of Child Abduction to Promote Child Rights and Welfare: A Study of Best Practice in the Search of Stolen Children in Guatemala*

Child abduction has become a global concern for governments, communities and families in countries of origin and reception of children adopted internationally. National and international standards and regulations on intercountry adoption have been strengthened to address the trafficking, sale, and abduction of children across nations. Within and among various disciplines, child advocates and human services practitioners alike have offered different perspectives on child abduction. This article offers a "constructed" definition of child abduction drawing from an extensive review of the literature on intercountry adoption, and study results from the author's dissertation on the experience of Guatemalan women whose children were stolen and trafficked to be adopted internationally. The paper identifies implications of child abduction for human rights and child welfare systems, and offers a practical model for searching for stolen children.

RC22-409.20MONTAÑES JIMENEZ, ANTONIO* (*Autonomous University of Barcelona*)MACIA, RAMON (*autonomous university of barcelona*)*Public Expressions of Evangelical Religiosity in European Modern-Day Cities. the Case of Barcelona.*

Theories of secularization predicted an unpromising future for religion. However, contemporary urban spaces are filled with a growing array of religious expressions and symbols that are indicative of the global revitalization of religious identities, and the religious pluralization of modern-day cities. Following this trend, Catalonia (Spain) has recently borne witness to an exponential growth of religious plurality and non-catholic religious minorities across the region, particularly within its capital city, Barcelona. Evangelical churches are arguably the predominant driving force behind Barcelona's new religious vitality, outnumbering any other non-catholic confession and denomination in terms of visibility, religious centers and presence in the street. The present research explores and analyzes the most visible dimension of contemporary evangelical religious communities: the organization of activities, concerts, events, street campaigns and celebrations in public space. The main aim is to identify and explain the strategies of gaining visibility and the repertoires of mobilization that evangelical religious communities employ in urban public space, as well as how these strategies and repertoires have changed in recent years. This project is markedly innovative in the field of religious studies and will contribute to the creation of scientific knowledge regarding contemporary religious transformations and their impact on public space. Research methodology includes discourse analysis of interviews, faith-based pamphlets and web pages official statements. This paper is part of a

Spanish government-funded project entitled "The place of Religion in open urban spaces: A comparative case study of public Religious Acts and Celebrations in Madrid and Barcelona".

RC07-159.2MONTAZAMI, ALI* (*Tamkang University*)*Creating a Better World: To Transform Futures Knowledge into Action*

Among the required skills to be infused into the Futures Research curriculum, facilitating the final aim which is "creating" a better world is concentrated in this paper. In fact, all knowledge, skills, methodologies and theories about better futures, need to be converted into the actions to be able to make the better futures. Therefore, the skill of how to use futures-oriented knowledge and theories to create the futures is too essential and needs to be more developed. So far, in many training sessions and curriculum of Futures Research we teach and learn theoretical values which are in fact very useful and the result of great job by researchers and scientists, but the learners who supposed to take action using such knowledge, are not usually aware about how to put it in practice to make preferable futures.

This paper, by providing several examples, proposes a way to include practical parts in theoretical courses to transform the knowledge and information into action and teach the learners the art of applying learnt knowledge and information in creation of preferable futures. In these examples each session of a training course includes three parts. The first part is Theoretical Knowledge, second part is Learning Workshop and the third part is Output and Action Design Workshop. Theoretical part, as usual, provides the information and knowledge about the topic, the part of Learning Workshop helps the learners to practice the Key Message of the session to be well understood and the part of Output and Action Design Workshop helps the learners to understand the relation between learnt knowledge and the process chain of creating the futures as well as making actions towards creating preferable futures with applying such knowledge. This session program design could be applied for university courses as well as public futures training programs.

RC15-282.11MONTEIRO, PAULO* (*Lisbon University Institute*)*Functional Foods: The Proto-Medicalisation of Everyday Life and the Biopolitics of Prevention*

In spite of the apparent paradox, in modern societies, between a sophisticated food science, for one side, and the expansion of diseases related with the food regimen, for the other, food has progressively played a dual role: instrumental as provider of nutrients to sustain the biological cycle as well as therapeutic resource managed in an isolated or in a combined approach. Functional foods (FF), developed in Japan in the early 80's, are the result of the convergence of food science and the food industry's methods, with the express purpose of improving health and well-being as well as preventing future disease, fuelling consuming dispositions leveraged by a mix of believes, reflexivity, knowledge and activism from health consumers. In Portugal, the market of the different segments of FF is already quite significant and the current investigation combines the results of a national survey about nutritional habits, with 1200 respondents, which included a specific section about FF with the analysis, innovative for sociological purposes, of more than 500.000 transactions, integrating at least one FF, performed with a retail chain's customer card with the purpose of establishing consuming profiles of this category of products. Favouring a mix-methods methodology, the analysis of content of 4 focus groups, comprising 24 participants, enabled the revelation of the logics and modes of adhesion to this 'natural' tool and exploit the big hypothesis namely the use of FF, mainly as a therapeutic instrument, as being a new contemporary expression of the medicalisation of social life, and particularly of the food act, in the context of a widespread biopolitics of prevention. Conclusions of the present investigation reveal the different gradients of acceptance of FF as a sign of the triple social dynamics such as normalisation, commodification and proto-medicalisation that characterise the food modernity in Portugal.

RC31-560.3MONTES, VERONICA* (*Bryn Mawr College*)DOMENICK, LILIAN (*Haverford College*)*Cultivating Home: How Migrants Achieve Belonging and Social Agency through Community Building Practices*

In a moment where exclusionary nationalist sentiment in Europe has increased and xenophobic and nativist discourses intensify in the United States, a scholarly exercise reflecting on belonging and its relationship to place, migration and home becomes imperative. "The sense of belonging is constituted through shared meanings and sense of social alliance between people and places where they reside" (Shutika 2011: 15). In this regard, the development of the sense of

belonging is the result of the activities that people employ to emplace themselves in new and everyday situations. Drawing on a qualitative methodology consisting of open-ended interviews, participant observation and the case-study approach, we examine projects developed by the Coalición Fortaleza Latina, a grassroots group of Latino migrants in the area of Philadelphia, which, as we will demonstrate in this paper, have allowed these migrants to craft a sense to belonging in the community. In this paper, we focus our analysis on two projects: a) a 12-week workshop on economic self-sufficiency, and b) a community garden. Specifically, this article presents and discusses the spatial and organizational dimensions of these projects, their specific structures and meanings, and their role as a vehicle of social recognition and visibility of the presence of Latino migrants in the community. The argument of this paper is that these projects serve important social mechanisms, first, to create a sense of community among the members of the coalition, and secondly to affirm these individuals' right to claim space and belong in the new society. Particularly, through these social practices, these migrants not only recreate a sense of home but most importantly allow them to exercise a social agency which helps them to shield their community from the escalating aggressive xenophobic and nativist environment in which they live.

MONTES DE OCA BARRERA, LAURA* (*Institute of Social Research, National Autonomous University of Mexico*)

Scope and Limitations of Institutional Innovations in Mexico. Reproduction of Political Inequality?

The goal of this paper is to show the scope and limitations of institutional innovations formally designed to foster greater political inclusion through complementing traditional forms of political representation by means of direct participation and shared governance. To do so, I present empirical evidence from the work of consultative bodies related to decision-making processes in four regulatory domains: the use of transgenic seeds; the regulation of the telecommunications; the restriction of junk food in schools; and the control of carbon emissions from automobiles. Impacting the economic, social, and political interests of a wide variety of stakeholders (from consumers to big business and government), these processes constitute a "living laboratory" in which we may assess the effectiveness of institutional innovations. Ultimately, this paper contributes to discuss, with empirical evidence, the reproduction of political inequality, despite putatively democratic innovations.

MONTOYA, NATHALIE* (*Université Paris Diderot*)

Comparing Art Education in France and US: A Methodological Issue

I will talk about a current research started in 2014: As a researcher in art education seeing how it has been structured as a field in France, I wanted to compare its parallels as advocated in the US in the last thirty years.

This pretty broad ambition raised a methodological issue: while France has a long tradition of a centered politics in the arts, US is said to have barely a national cultural policy, in that every state, every region has its own agenda, its own political frame, and arts education projects would happen mostly because of local and individual initiative.

In this spirit, I conducted a sociological research by interviewing art educators in museums of New York City, along with reading documents produced by non-profit organisations advocating the cause of art education.

My research made me realize that contrary to what most people believe about cultural policy in the US, there exist public scenes for advocating the cause of arts and arts education. But these are mostly privately funded organizations, such as foundations, non-profit organisations, professional unions etc.

When studying closely their reports, I found a surprising convergence around a few themes that appear across the world of art education in US, in a way reflecting the centralization that the US federalist approach aimed to critique. In fact there are a few of these organizations who produce pivotal materials that everyone refers to, raising a close enough comparison to the French centralized cultural scene.

The long detour to find this centralized scene emerging out of decentralization enable us to adopt a wider comparative perspective on cultural policy: it's the entire structure of public action, public debate, and the place arts has been given in the construction of democracy that can be compared in the two countries.

Interaction Effects between Government Partisanship and Labour Market Policies on Health Among 20 OECD Countries

The aim of the study is to identify whether interaction between flexicurity labour market policies and the government partisanship impact infant mortality rate and suicide rate among young adults in 20 OECD countries.

The major theoretical thrust of the study is that health is unevenly distributed as a result of power relations. We hypothesized that with the larger leftist share of seats in parliament, the negative consequences for population health of the flexibility labour market policies will be buffered and the beneficial consequences of the security policies will be strengthened.

Using panel data of 20 OECD countries for the period of 1998-2010, we conduct OLS regressions with panel-corrected standard error. Two models are built to examine the relationship. In model 1, security labour market policy score, flexibility labour market policy score, and leftist share of seats are regressed on health outcomes. In model 2, interaction terms, security with leftist share of seats and flexibility with leftist share of seats, are added to model 1.

Hypotheses are partially confirmed. First, the security labour market policy score is positively correlated with population health, but the effect disappeared when the interaction terms are added. Second, the flexibility labour market policy score is negatively correlated with worse population health. Third, interaction between flexibility and leftist partisanship predicts lower infant mortality rate. But it results in higher suicide rate among young adult while the size of the effect reduces.

Through this research, we provide empirical evidences that the leftist partisanship buffers the negative consequences for population health of the flexibility labour market policies. This study is the first to empirically understand the interaction effects between flexicurity labour market policies and the government partisanship on population health. Politics still matter for population health. More egalitarian governments and their equitable policies will save infant and young adult.

Study of Young Cooks' Labor Experiences: How Is the Combination of Apprenticeship and Creative Labor Associated with Exploitation?

This study investigates the labor of apprentice of young cooks, focusing on the labor process and perception of work by young cooks in Seoul, Korea. With in-depth interview of 20 young cooks working at restaurants aged from 19 to 34, this study identifies the nature of cooking labor showing both the nature of manual labor and creative labor. This study reports that most interviewees experience an absence of labor rights under the time and space pressure, such as long working hours, high level of labor intensity, lack of break and low wages. To develop new cooking skills, they endure a poor employment practice in between 'labor' and 'learning. Otherwise, they have to change their workplaces frequently. The poor working conditions cause their physical damage and mental burnout, generating exit from the labor market or moving to self-employment. An understanding for young cooks reveals how exploitation takes place and it is justified by the combination of an apprenticeship and cooking as creative work.

MOORE, AMI* (*University of North Texas*)

Caring for a Loved One with Stroke in Lomé, Togo: Challenges, Resources, and Outcomes.

Background: Stroke, the second leading cause of death globally, disables its victims who often live at the mercy of informal caregivers. While some societies may be relatively well equipped for informal caregiving, others, such as the Togolese society, do not have the appropriate resources to help both people with stroke and their caregivers.

Objectives: The primary objective of this study was to examine informal caregiving experiences of people with loved ones with stroke in Lomé, Togo.

Methods: This was a qualitative study of twenty informal caregivers. We used a grounded theory methodology to examine the caregiving experiences.

Findings: The findings show that caregiving experiences of people providing care to loved ones have an intersectional characteristic, whereby structure (available schemes and resources to caregivers) and agency (individual's ability to think, act, and critically evaluate and choose course of action) increase caregiving bur-

den and ultimately creating multiple stressors to caregivers and the loved ones with stroke. For instance, poor governance of national resources in Togo creates a situation where hospitals are inadequate, social assistance is unavailable, and loved ones have to fend for themselves to provide foods, medication, and care to people with strokes. Even caregivers who have very few resources are forced to provide care despite their own needs. This creates a situation of great stressors, human sufferings, and poor quality of life for both caregivers and loved ones with stroke.

Conclusion: While Togolese are willing to provide care to loved ones with strokes even putting their own needs aside, policy makers should be aware of how this informal caregiving job becomes stressful to both caregivers and people with stroke because of mostly structural limitations.

Just an Environmental Movement? the Radical Subjectivities of the Anti-Fracking Movement in Australia

This paper begins by problematising the label of "an environmental movement" in relation to the the anti-fracking campaign in Australia. It suggests that such a label limits the potential of the movement and misses the complexity of the subjectivities active and produced through the campaign. What began as a movement against climate change targeting coal fired power stations, has evolved into a radical alliance cutting across indigenous groups, eco-activists, local communities and farmers. What seems to be at issue for the Lock the Gate campaign is much more than fracking, and includes water, land rights, community control and to some extent who has the right to survive under neoliberal capitalist relations. Issues such as fracking are by their very nature intersectional, they provide platforms for alliance building and also show how many societal problems or injustices are intertwined with one another (whether that be the environment, health, energy and food security, racism, and so on). The campaign in Australia is ongoing, and has had significant victories in the banning on unconventional gas in the state of Victoria. This paper draws on extensive field research with the movement's participants as well as historical analysis of previous environmental movements in Australia. I employ social reproduction theory to draw out these relations, aiming to highlight the processes of subject formation and show how many movements that would traditionally be considered environmental, have become much more than that.

ENGELHARDT, ANNE (Kassel University)

Moving Beyond the Toolbox: Providing a Materialist Dialectical Lens to Social Movement Studies

There have been numerous studies within critical political economy that try to make sense of the (post) crisis period by focusing on top-down analyses of capitalist hegemony. However, these studies appear to ignore the importance and proliferation of social movements that the period has given birth to. In contrast, Social Movement Studies, which focuses on such movements, tends to lack a theory of capital and thus missing class struggle, and has thus inadequately addressing questions of the state, power relations and what such movements mean for our current capitalist conjuncture. To provide an analysis that can benefit from both traditions, we propose that the study of social movements must be re-contextualised in a critical social theory centred on *class struggle* and that the non-dogmatic use of materialist dialectics may be beneficial. Yet, this does not mean we reject the methods employed by critical social movement scholars such as Charles Tilly, Doug McAdam and Sidney Tarrow, but rather re-formulate them through a materialist dialectical lens. Consequently, cognitive, relational, and environmental *mechanisms* are repurposed as cognitive, organizational, environmental, and institutional *dynamics*. This reformulation focuses on the processes and relations of the movement that is both embedded in and co-constituted by its social context, instead of the narrow and static focus on inputs, outputs (failure/success) or static and general categories that dominates much social movement studies.

Dislocation and Disconnection in Post-1970s Crime Fiction

Post-1970s crime fiction offers an insight into the various strains on social belonging in the twenty-first century. This group of novels show, in piercing detail, the consequences of not fitting in, the role of institutions in binding and separating us, the situations that force people to retreat from social life (and the precariousness therein), and the ambivalent work of social integration. What makes these social situations appear especially dangerous is the pervasive sense that there is no reliable, benevolent source of safety. There is, in the twenty-

first century crime novel, a startling absence of opportunity to change or move, and an abnegation of responsibility on the part of social authorities to care and protect. Such things are etched into the world of the contemporary crime novel. It's there in the desolate small town of a Karin Fossum novel, as well as the sprawling, decentered Glasgow of Malcolm McKay's books, the eerily evacuated housing estates of Tana French's later stories, and the split-city of Belfast in Adrian McKinty's novels, full of no-go zones and ungovernable spaces. This fiction captures the effects of late capitalism, most strikingly the desolation of shared, civic space and the related proliferation of unjuridified spaces, both physical and virtual. The inefficiency of the state and its administrative agencies in protecting its citizens serves as an important backdrop to this. In sketching-out this — our — social world, twenty-first century crime fiction poses a pressing question: what happens to the individual when there is no where to run, no one to run to, and the thing one is running from is amorphous and inscrutable? This paper takes up this question and considers what contemporary crime fiction can tell us about the pathological effects of late capitalism in producing a sense of dislocation and disconnection.

MOORE, SARAH* (University of Bath)

Displacing Uncertainty: Pregnancy and Life-Crisis Risk Rituals

This paper draws upon and develops my previous work with Adam Burgess on 'risk rituals' (Moore and Burgess 2011). 'Risk rituals' are behavioural adaptations that have the appearance of simple avoidance strategies. In certain circumstances these acts take on a ritualistic, even totemistic character. The concept has been used to discuss self-checking-for-illness routines, drink-spiking avoidance measures (Moore and Burgess 2011), and surgical face mask-wearing for flu-avoidance (Horii 2013; Burgess and Horii 2012). This paper sets out to develop the concept of 'risk rituals', and it does so by returning to the anthropological literature that originally shaped our understanding of this type of behaviour. It is a mainstay within Anthropology that certain culturally-defined periods of transition — being born, coming-of-age, getting married, becoming a parent, and dying — are marked with rituals. Turner (2008:168) describes these as 'life-crisis' rituals. The social function of the 'life-crisis' ritual is, amongst other things, to inaugurate the neophyte to her new obligations and help recalibrate the social group: in other words, they answer to problems of social uncertainty concerning shifting roles and group membership. This paper focuses on the health-related rituals surrounding pregnancy in contemporary society, and argues that these might be seen to constitute life-crisis 'risk rituals'. What is the nature of this particular set of 'risk rituals' and what do they tell us about the meaning of new parenthood? Can 'risk rituals' function as 'life-crisis' rituals, and how do the latter answer to a problem of uncertainty? This paper attempts to answer such questions.

Planning, Platforms and Participation: Fields of Public Participation in Urban Transformation

Public participation is one of the more well-worn contentious issues for the professionalized fields of urban planning and regeneration. Recent years have seen keen interest in how near-future digital technologies – for example, immersive interfaces, crowd sourcing, big data analytics, or environmental sensors – might improve planners' understanding of and engagement with their publics. Arguably less well understood, however, are the ways in which generic, commercial social media platforms such as Facebook, are already producing an unprecedented archive of commentaries, debates and anxieties around urban transformation. Other forms of mediated public engagement around urban change, such as local journalism, have existed in the past. But social media platforms appear to create a distinct form of networked, always-on, asynchronous participation that is largely autonomous from the consultative exercises designed by professional planners. The obvious contemporary significance of such platforms, at least for some communities, raises interesting questions about the encounter, and possibly competition, between the 'participation' fostered by the professional field of urban planning and the spaces of such commercial platforms. In this paper, we explore these questions via a case study of an ambitious yet divisive cycling infrastructure scheme led by the London Borough of Waltham Forest, dubbed 'Mini Holland'. We consider the differences and relationships of three prominent digital platforms through which the publics convened around the scheme: Twitter, notable for the way cycling campaigners and local politicians coalesced in support of the scheme; Facebook in which some of the most divisive contributions occurred, often exhibiting recursive and memetic forms of humour, personification, vilification, trolling and, occasionally, earnest and considered dialogues; and finally Commonplace, a platform produced by London-based developers, specifically designed for urban regeneration consultations, and used by the Council to collect geotagged commentary and emotional metrics related to the scheme.

Mexico-USA Immigrant Women's Rights, Public Policies and Vulnerabilities

Mexico-USA Immigrant Women's rights, public policies and vulnerabilities

The globalization trend has been contributing to the emergence of increasingly diverse migration realities. The adaptation process between immigrants and their destinations has become a major challenge for governments as well as communities around the world, and governments are increasingly searching for new dynamic patterns of interaction among immigrants. Mexico's migration process encompasses several phases and dimensions since it is a country of origin, transit and destination, however Mexican emigration to USA predominates. Female migration is a determining factor with major impact on hundreds of Mexican families, currently Mexican female migration has been linked to gender violence in the country and to a decisive change in migration motive. This fact has created a major vulnerability both in Mexico and United States. The violation of their rights is alarming, therefore it is necessary to develop public policies in Mexico that will guarantee justice and protection to migrant women. Immigrant women in the United States struggle against discriminatory practices and a wave of Mexican-phobia. The issue has surpassed the authorities, public institutions and the insecurity has increasingly made women more insecure. Public policies should be more inclusive and protective of migrant women, it is necessary to implement a binational program in order to support this sector of the population.

Understanding the Experience of Urban Leisure Spaces: Using Geographically-Explicit Ecological Momentary Assessment to Understand Space-Use Patterns, Perceptions, and Preferences of Locals Versus Tourists

Understanding individuals' experiences within leisure activities and environments using experience sampling techniques has been a longstanding interest of leisure scholars. However, the reported location of participants has often been vague and only allowed for rather gross aggregation; for instance, "home" versus "away from home." Technological advance in the fields of geographical information systems as well as information technology, however, has afforded far greater specificity and has allowed for individualized assessment of a variety of features of specific environments. The purpose of this presentation is to illustrate how new approaches to in-situ experience assessment may allow for an understanding of urban leisure spaces, differentiated by user characteristics as well as a variety of environmental variables.

First, an overview of geographically-explicit ecological momentary assessment (GEMA) will be provided and will address strengths of GEMA approaches relative to more commonly used techniques to sample experiences. Second, using the case of tourists' versus locals' experience of the urban environment and leisure provisions, the presentation will seek to demonstrate how motivation and habituation may lead to distinct patterns of participation and experience in given locations. As well, the possibility of combining knowledge of salient personal characteristics (e.g., personality and temperament) with geographically-explicit state-based data (e.g., arousal and affect) will be explored. It is to be argued that understanding how tourists and locals may respond to their engagement with different aspects of the built environment will allow for better conceived and marketed experiences for tourists and well as improved livability and enjoyment for local residents. Lastly, to be discussed are methodological considerations related to sampling, data security, and analysis, as well as possibilities for certain types of data validation through comparison to objective reports.

Global Care Chains in the Mediterranean: The Aging Process of Migrant Care Workers for the Elderly in Marseille and Madrid

This paper presents the first results of an ongoing postdoctoral research focusing on the links between the care jobs for the elderly and the aging processes of the professional caregivers and their families. Through an international comparison and a qualitative methodology, this paper mobilizes the concept of "global care chains" to explore the care work for the elderly (professional and family) and its links with migration processes in the context of the aging Mediterranean region. Findings are based on a cross-national qualitative fieldwork conducted in 2017-2018 in the cities of Marseille and Madrid. A combination of qualitative methods has been applied to explore the discourses of women from two populations of immigrant origin that occupy a large part of the care jobs for the elderly in each

of the two cities: women of origin Algerian in Marseille and women of Ecuadorian origin in Madrid.

The objectives of this communication are: on the one hand, to explore the material possibilities that jobs in the elderly care sector offer to Algerian and Ecuadorian women workers to deal with the care needs of the elderly parents as well as their own aging (salaries, days-off, pensions, etc.); on the other hand, to analyze the reconfiguration of the family dynamics and the gender roles through the migration processes, the experiences of employment and the "gendered responsibilities" to care for older relatives. To conclude, through these two issues (material possibilities and family dynamics) the aim is to problematize the idea of what a "good care" is, which far from being a "natural instinct", is a social concept that reconfigures its meaning in particular contexts.

MOREAU, NICOLAS* (*University of Ottawa*)

Understand the "Black Box" of a Sports-Based Intervention Program: The Strength of Social Ties

Although there exists many sports-based intervention programs for youth, little is known about the underlying processes of these types of programs, i.e. what we call the "Black Box" of a sport program. Furthermore, the perspectives of youth are seldom taken into account even if the intervention program is designed "for them". The data presented in this conference is the result of a long-term action research with a Montreal organization using sport in a psychosocial perspective. More specifically, our objective was to understand, from the youth perspective, the processes and key dimensions of sports-based interventions that contribute to the development of youth social bonds. In our perspective, such bonds are essential to reduce stigmatisation, discrimination and inequities. Methodologically, we conducted 27 interviews with youths, a focus group with five coaches and "observant participation" of trainings and challenges. We found that six elements are essential for this sports-based intervention program : (1) Implementation of a supportive climate; (2) Implementation of collaborative strategies that promote group cooperation; (3) Equilibrium between outside rules and self-initiated actions; (4) Collectivisation of individual performances; (5) Interconnectedness of effort and pleasure; and (6) Exploring beyond the participants' comfort zones. We conclude that these six conditions can positively transform social bonds between youth as well as between youth and coaches. Indeed, sport can be a tool for social transformation (reduction of social inequalities, empowerment, strengthening social bonds, etc.) but this has to be done through reflexive practices.

Social Street Phenomenon: An Innovative Answer to Sociality Need and Urban Regeneration

This abstract is based on the result of a 3 year research carried out by the Observatory on Social Street research group and on my ongoing doctoral research project in order to observe, analyze and check the evolution of the Social Street phenomenon. The aim of this contribution is to give a descriptive portrait of such emerging phenomenon, drawing on qualitative data gathered by empirical research. At the moment, there are more than 455 Social Street worldwide. Social Streets are defined as "streets where neighbors aim to create or re-create proximity sociality, using Facebook as communication tool"(C. Pasqualini, 2016).

Thus far, the Social Street phenomenon has not been a widely researched topic, with the tiny exception of social street in the context of technology and social networks. The study of this phenomenon, both locally and internationally, has elucidated the diffusion of Social Street in urban metropolis as well in smaller contexts. Social Street are inclusive and potentially accessible to everyone, and they are also able to create social and technological innovation. Social Streets take care of social control, and about information, they participate to events that occurs in the neighborhood, promote sociality, take care of common goods of the city, especially in the neighborhood context.

In the presentation, I would like to focus on three case studies: Milan (71 Social Streets), Bologna (56 Social Streets) and Rome (33 Social Streets), showing common features and differences in activities and spread of this phenomenon.

The research, based on the Mixed Methods Research Theory (Burke Johnson, J. Onwuegbuzie, A. Turner, April 2007), has investigated the Social Street phenomenon with on-line surveys, qualitative interviews to Social Street founders and ethnographic (and web ethnography) observations in the Social Street activities.

Young People and Inequalities: The Case of Italian University and the Right to Attain the Highest Level of Education

"Schools are open to everyone. Primary education, which is imparted for at least eight years, is compulsory and free. Capable and deserving pupils, including

those without adequate finances, have the right to attain the highest levels of education. The Republic renders this right effective through scholarships, allowances to families and other benefits, which shall be assigned through competitive examinations." (Costituzione Italiana, art. 34)

In this proposal, we will compare the data with the goals agreed in the strategic European plan Europe 2020 for the Italian Country, according to which at least 30% of the population below 35 yo in each European country should graduate from university. These data will be followed by a discussion on the role of the economic crisis in the European countries, with particular attention given to the strategies adopted by the Italian Government to face the challenges of investing on State Education in a under resourced scenario.

The Data from the Regional Observatory on the right to education seem to confirm that there is a gap between the principle expressed in the Italian Constitution and the actual situation. For academic year 2010/11, students eligible for scholarship were 181.312, (15,8% of the total student population), while in academic year 2015/16 the figure had already dropped to 146.958, i.e. 9,2% of the total student population.

Finally we will see how the Italian university population is continually decreasing. Since academic year 2007/08, the percentage of enrolment at university has diminished by 8,1%.

The percentage varies according to the different Italian regions, with the most significant decrease seen in the southern regions, which show a higher level of economic and social inequality compared to the Northern areas of the country, and where universities rarely have access to scholarship funds.

Attitudinal Parental Childcare Options in South Europe. the Case of Spain.

The present study analyses the most desirable parental childcare options when having children under six years old at home in Spain using the ISSP 2012 Data base. The analysis carried out offers a variety of preferences towards the different family models and interesting contradictory attitudes that seem to be resolved through preferences towards a 'hybrid' or 'adaptive' family model. This model could be understood as an indicator of the strategies that Spanish families are developing as a result of the transitional process under which they are living. It is confirmed that the traditional culture exerts greater influence at the ideal level than the modern one. The analysis allows to identify the determinants of family model preferences for both, men and women and for the age groups considered.

Inter-Group Resentments and Populist Mobilization in the 2016 U.S. Presidential Election

The past two decades have witnessed a powerful surge of populist politics around the world, which has drawn increasing scholarly attention in recent years. The prevailing narrative in these accounts is one of populist political actors cashing in on a reservoir of overlooked grievances and demands that spring from large-scale social, economic, and cultural changes. These works provide useful insights into the emergence and growth of populist politics. However, they also have several shortcomings. First, they tend to homogenize populist constituencies by focusing on a particular demographic group (e.g., the white working class or white rural voters) as the social base of populism, thereby neglecting how distinct social groups may find populist projects appealing for distinct reasons. Second, scholars often invoke emotional mechanisms such as fear, anger, and resentment to explain how macro-level social changes lead to populist political attitudes and behaviors at the micro-level. To date, however, little systematic research has been undertaken to empirically examine the role of emotions in populist mobilization. Given the centrality of emotions to populist mobilization, this is an important limitation. Finally, although it is commonly acknowledged that the populist mantle can be claimed by political actors of all stripes, nearly all accounts of the recent rise of populism focus on either left- or right-wing populism but not on both, and therefore, cannot explain how the same socioeconomic and cultural processes may simultaneously bolster different and contending forms of populism. In this paper, I aim to overcome these limitations by exploring the intergroup emotions that were mobilized by Donald Trump and Bernie Sanders in the 2016 U.S. presidential election. Drawing data from the 2016 American National Election Studies and using an intersectional analysis, I intend to shed light on the different types of social resentments that underlie left- and right-wing populist mobilization.

Migration and Pre-2020 Olympic Urban Renewal in Tokyo

This paper investigates the nature and impacts of pre-2020 Olympics urban renewal projects and public policies in the city-center of Tokyo, by focusing on its "migration oriented dimensions". Discussing Tokyo's "migration led gentrification" or "foreigners friendly policies" may sound unexpected at first glance, or even inappropriate, as the Japanese capital hasn't been known for its demographic diversity; the rate of foreign born population is far lower than in other global cities (4 % compared to 36% in New York or 37% in London in 2017), while the discourses of "homogenous Japan" in public debate and "no-immigration principle" in policy making seem to be still dominant. This paper, however, demonstrates how the situation has changed since the beginning of the new century. As we will demonstrate in this paper, *Tokyo Metropolitan Government* has become very interested in attracting foreign populations who can be classified into two different categories: better-off populations and low-wage workers. In the context of intense worldwide competition among cities, enhancing Tokyo's attractiveness and global city status comes to be at the top of its political agenda. 2020 Olympic games represent a great opportunity for the TMG to achieve a series of urban renewal projects to attract foreign tourists (their number has sharply increased from 4.1 millions in 2011 to 13.1 millions in 2016) as well as wealthy expatriates (a new urban renewal plan has been announced in 2017 for turning Tokyo into a "global financial hub"). Such a change has also brought an important need for migrant workers in several industries and their increasing presence contributes to transform the city as well. Based on a qualitative research, this paper analyzes the consequences of these shifts on the city and its community, examining in what ways and to what extent they have made the city more uneven.

From Social Movement Studies to Socio-Material Movement Studies: New Materialism-Based Methodology of Social Movement Case Studies

The case study methodology of SMs has developed in order to address the concrete local situation and to clarify the locally embedded causal mechanisms of SMs. Since the emotional turn of the Social Movement theory emerged through criticizing the 'macro-structural bias' of SM Theory, there is alternative theory being able to investigate situated cultural perspectives of SMs. It is, however, not enough to investigate only the human behavior that comprise the organization of the social movement and its process. Because the local and individual materiality as well as the material things (or non-humans) plays also the crucial role of SM identity-creating and continuity. This point of view is strongly influenced by the emerging currents of New Materialism-based sociological investigation (Fox and Alldred, 2017) and thus a turn from Social Movement to Socio-Material Movement investigation (Rieger and Wagonner (eds.), 2016).

Therefore in this presentation, I will show the theoretical as well as methodological application of investigating both the cultural and the natural object of SM as a specific assemblage of the human-nonhuman relations. First, I will show what the New Materialism and New Materialism-based sociological investigation signifies. Second, I will demonstrate how it is methodologically applicable in SM studies that opens up the Socio-Material Movement Studies.

The Local Community's Participation and the Benefit Sharing of Community Based Tourism Lao PDR: Case Study of Khao Kouay Nbca-

The tourism in Lao PDR is paid attention to the ecotourism site because of the rich natural resources and the various culture. In 2009, the international conference of ecotourism was held in Vientiane that is the capital city in Laos. Community Based Tourism (CBT) has been developed in Laos in order to improve the welfare of local communities, as well for the conservation. 'Community based' means the local community is engaged with management and the decision-making, and the benefit is allocated directly into local community (Khanal and Babar, 2007). Khao Kouay NBCA is one of the most famous CBT sites in Lao PDR. Douanphosy, Han and Ping (2015) have tackled the environmental assessment for the CBET in Phou Khao Kouay NBCA, and analyzed the participatory of local community. Their results show that the CBET in this area has the potential site as ecotourism and that local community is willing to participate in the CBET. Sirivongs and Tsuchiya (2012) demonstrates that villages that participate in the CBET have the better evaluation for the resource management than other villages. Sirivongs and Tsuchiya (2012) analyzed their village understands that the conservation for natural environment leads to the opportunity to get the benefit in the future.

However, the previous studies don't focus enough on the level of the participatory by local community and the benefit sharing in the local community. This paper discusses two points about the Community Based Eco-Tourism (CBET) project in PKK NBCA in Lao PDR based on the collected questionnaire data; (1) The level of the local community's participation, (2) The structure of the benefit sharing.

Condescending Integration: How Organizations Hinder the Potential of Skilled Migrants

Migrant integration policies are geared towards the attraction of qualified workforce to compensate for labor market shortages (Cerna, 2014). At the same time, the skilled migrant workforce is less likely to be employed compared to skilled natives (OECD, 2014). This raises the question why the integration of skilled workers does not work. Most of the literature on migrant integration in organizations focuses on labor market access (mostly quantitative) and discrimination in the workplace (mostly qualitative). While the first emphasizes measurability, the second is thematically biased towards the plight of low-skilled workers. Relatively little is known of the structural barriers for skilled migrants inside organizations. In this context, Sweden boasts one of the most generous migrant integration policies across industrialized countries (Koopmans, 2010; MIPEX, 2017). Both at the level of political discourses and organizational practices, there is an active commitment to the labor integration of skilled migrant workers. Yet, labor integration outcomes of skilled migrants remains modest, unemployment among skilled workers born outside of Scandinavia being ten times higher than that of natives (Saco, 2017). This hints at a significant failure of integration leading to continued skill mismatch.

I explore the existing reproductive mechanisms inside organizations, that effectively prevent the full integration of skilled migrants. I am inspired by Bourdieu's theory of practice (1977) to analyze an organization actively engaged in the integration of skilled migrants. I carry out in-depth qualitative interviews to analyze two types of practices: recruitment practices targeting skilled migrants, and the everyday interaction between skilled migrants and managers. Practices in and by organizations reveal that skilled migrants are often portrayed as passive and incomplete, shaping the conditions for possibilities of full labor integration.

This work uncovers a condescending regime of integration that reproduces inequalities, and contributes to explain the lack of integration of skilled migrants in organizations.

Showroom of Fancy Technology or Homie Environment of Daily Living? a Sociological Study of Interaction between Welfare Technology and Older Residents in the "Nursing Home of the Future"

Policy makers and practitioners have promoted community-based care and living based on the idea of ageing in place. While the importance of ageing at "home" and in a familiar community has been emphasised where older residents feel attached and comfortable to age, their "home" environment has been changing due to the new trend of using welfare technology aiming to support active, independent and healthy living. As living with advanced technology is a relatively new experience for most elderly people, daily interaction with technology may add new meanings and transform their perceptions of everyday environment. However, little is known about how older persons reconstruct their perceptions and understandings of "home" when advanced technological supports come in daily living environment. Therefore, this paper explores the transforming process of individual understanding the concept of "home", based on the reflective life-world approach which is often used to investigate lived experiences and perceptions of individuals in the studies of healthcare and nursing care. Empirically, we use the Nursing Home of the Future (located in Denmark) as case, where a number of welfare technologies have been implemented. We conduct in-depth interviews with residents of the nursing home, their families and care workers, aiming to gain a holistic understanding of the residents life world, living with fancy, new technologies. The data collection will be completed by spring 2018. Analysing data, the paper reveals 1) the changing process of taken-for-grantedness in everyday life with welfare technology and 2) mechanism of experiencing and coping with fluctuations of individual ideas for home and ageing in place among residents, families and care workers, resulted from a new interaction with welfare technology. The findings of this study contribute to the emerging literature on how ageing in nursing home is being shaped – and shape – the use of new welfare technologies.

Urban Poverty and Social Cohesion in Contemporary Capitalism: What We Can Learn from the Neapolitan Case

My contribution to the round tables focuses on the Neapolitan case (in Southern Italy): an example of spread urban marginality but also as a place where it is possible to promote new negotiation practices among different actors in the consideration of the resources embedded on a small scale. I aim to describe the peculiar socio-economic structure of the city which is characterized by a specific intertwining of pre-Fordist and post-Fordist features of economic organisation. This can be seen in the widespread presence of informal activities that characterises the city on the long-term. Albeit a general decrease in their influence, these activities still play an important role in the reproduction of the urban social structure. At the same time immigrants are involved in a number of commercial activities which probably constitute the main trait of the new urban informal sector. This can be seen, for example, in the area around the railway station, characterized by the presence of immigrants from Maghreb, China, Sub-Saharan Africa and East-European countries. The peculiar socio-spatial structure of the city allows the most disadvantaged subjects to develop survival strategies and to cooperate also in absence of those shared cultural models that the politics of recognition find so relevant. Without resorting to the abusing metaphor of the "porous" city, there is indeed in Naples a long tradition of practice of "togetherness" among strangers, places where people can meet out of scheduled arrangements. These forms of encounters are based on friendships and kinship networks but also on the simple sharing of daily life and work spaces. Some final comments will be made on the contribution of Enzo Mingione to the understanding of these issues and to their link to the contemporary debate on the dialectic between global forces and local challenges in Western cities.

Civil Disobedience and Civic Responsibility: Vietnam War Draft Resisters in Their Statements

This paper investigates the relationship between the state and the individual in draft resisters in Vietnam War and to explore the nature of their civil disobedience. Draft resistance as a form of civil disobedience reveals rare intense tension between the individual action and the state imperative. How could a citizen stand up and act against a democratic government? While the decision and action of draft resisters seem individualistic, this paper argues that there is a strong *civic* component to them—a firm sense of civic responsibility concerning universal ideals of human rights and well-being of human community everywhere.

The major source of this study is the statements by draft resisters to their local Draft Board, both published and unpublished, collected at the Swarthmore College Peace Collection. Reviewing the primary source, this study examines the subjective meaning of draft resisters with these questions: How did draft resisters understand the ideas of noncooperation, nonviolence, and civil disobedience? How did they see the relationship between the state and the individual, a democratic state and a democratic citizenry?

This paper finds that the sense of civic responsibility permeates their statements of refusal and resistance; highly personal choice and action of draft resistance is connected to the social. The paper argues that there is a close tie between civil disobedience and civic responsibility among the draft resisters, and that the tie was formed in the social and historical context of the time—the Civil Rights movement and the previous generations of draft and war resisters.

Women's Empowerment in the Workplace: Changing Perceptions over Time with Makeup

In the early 1900s, Helena Rubinstein and Elizabeth Arden created careers for themselves that redefined how makeup and women were perceived in society during a time when the women's movement made strides in earning more rights for women. Before Arden and Rubenstein's work, makeup was seen as inappropriate because it was commonly worn by sex workers. However, Arden and Rubinstein believed that makeup was for all women. This study analyzes the history and society of the 1900s regarding women and makeup, as well as the efforts of Rubinstein and Arden and why they are still effective to this day. This study also uses the theory of social comparison to examine how the increasing visibility and marketing of makeup by makeup gurus and makeup tutorials on YouTube and Instagram have influenced young women's self-perception as they pursue careers and how it empowers them in the workplace today. The results will be drawn from two focus groups in which makeup as a tool of empowerment

will be discussed. Preliminary results suggest that makeup is more accepted by the younger generation because of access and diversity in its marketing from peers through social media. Theoretical implications for future research are discussed, such as applications to racial and ethnic, social class differences and occupational variations.

MORRIS, ALAN* (*Institute for Public Policy and Governance, University of Technology Sydney*)

The Financialisation of Housing and the Housing Affordability Crisis in Sydney

Over the last decade, house prices in Sydney have soared and it is now one of the most expensive housing markets globally. In mid-2017, the median price for a detached home reached \$AU1.18 million (about \$US900,000). This paper, drawing on documents and existing research, first outlines the features of the current crisis and then examines the key contributors. Key features of the crisis include substantial household debt, dropping homeownership rates, housing stress, an increasing proportion of households consigned long-term or forever to the insecure and expensive private rental market, increasing homelessness and an acute shortage of social housing. What is argued is that the underlying cause of the crisis has been the reconceptualisation of housing in Australia so that it is viewed "as an instrument for profit-making" (Madden and Marcuse 2016: 4). The financialisation of housing has been actively encouraged by government policy. The extremely generous tax-breaks for investors in a context of record low interest rates has resulted in a massive increase in the number of small investors. In 2016 there were 2.03 million landlords in Australia representing 15.7 percent of all tax-payers. The tax breaks offered make purchasing a residential property as an investment an eminently sensible investment strategy and investors are prepared to pay a higher price than a conventional home purchaser. Besides the local dynamics, Sydney's status as a global city that is perceived as a safe haven, has resulted in a substantial inflow of foreign capital into its residential property market. In many new apartment developments, the majority of purchasers are foreign investors. At the end of 2014, it was reported that Australia, the US and Britain are the first choices for Chinese property investors and that within Australia, Sydney is the favourite destination.

Religion in and Against National Identity

While religion often poses a threat to the nation, it is also regularly, and in recent times increasingly, expressed as a fundamental characteristic of national identity. This presentation will investigate how, within nationalist discourses, religion increasingly appears as a set of historical ideas responsible for the production particular civilizations, rather than as a mode of being or a social realm concerned with doctrines, practices, institutions and statuses linked to revealed truth. It will be argued that by portraying religion as an object of cultural heritage, nationalisms are able to: a) claim to overcome disputes between thick and thin notions of national identity, and b) deny the sectarian nature of discriminatory practices and nationalist claims to supremacy.

MORSELLO, BARBARA* (*University of Roma Tre*)

"It's like a Full Stop" Women's Healing Stories in Surgical Reconstruction after Breast Cancer.

The interest in medical science by sociology, especially in the United States, has begun since the Thirties and Forties, by authors such as Parsons, Mead, Merton, and especially Strauss and Glaser. This interest arises from the awareness that, with the growing complexity of the social environment and the gradual specialization of medical practice, considering the patient's social context and its story of illness it becomes more than ever indispensable. From an institutional perspective, however, today is discussed about Narrative Medicine to refer to a new centrality of illness stories, not merely as a limited practice of 'social' and human sciences, but as a central aspect that the medical investigation should identify. Moving into the paradigm of Narrative Medicine, it will be useful to reflect on the power of narrative as remarkable data for research work and clinical practice, but above all to reveal unexpected features at various stages: from pathology to diagnosis, to therapy, and to daily life with the disease. The purpose of the contribution is to discuss the results of an empirical research conducted at the Department of Plastic and Reconstructive Surgery of the National Cancer Institute 'Regina Elena' of Rome (IRE) through the adoption of a narrative approach to breast cancer. The focus was to define different features of the 'reconstruction' of the body and the biographical re-composition after the disease. Specific attention will be given to how healing processes are activated and perceived by patients, often in contrast

with medical perception, creating a 'middle-earth', a type of 'liminal path' full of desires, fears and expectations.

Unsettled Ground: An Institutional Ethnography of a Residential School

The physical spaces of deteriorating Indigenous residential schools in Canada carry enormous discursive and cultural weight. Decades after their closure, residential schools are physical reminders of the colonial violence committed against Indigenous children and families. The intergenerational trauma experienced by contemporary Indigenous families and communities is immense and has major sociological implications. The remaining structures and spaces continue to shape how Indigenous identity is understood and constructed by the dominant majority in the contemporary setting- particularly how the state responds to and frames the victimization of Indigenous peoples. Even though these schools were closed and sometimes repurposed, the remaining structures and physical spaces endure as highly visible confirmations of the colonial violence committed against Indigenous people in Canada. This research examines the meaning making role that the locations and physical spaces of residential schools play in contemporary Indigenous identity construction and Indigenous-state negotiations. Building on postcolonial theory, this paper argues that the closing of Indigenous schools did little to extinguish the sites as locations for prejudicial construction of Indigenous identity according to lingering colonial attitudes and assumptions. The ruins of residential schools across Canada are evocative of the power of strategies of colonial geography. By positioning this research within the ruins as a starting point, this work identifies how race and space collide in the ruins of colonial geographies and what this means for identity construction in Canada as a contemporary settler state. This research incorporates the institutional ethnography approach in order to access the meaning-making potential of the deteriorating structures of residential schools. By completing an institutional ethnography of the Alberni residential school, this research seeks to understand how even in the contemporary setting, the materiality of the school retains a meaning-making role and to understand how these sites impact on the lived experiences of the local Indigenous band.

MORTON, MAVIS* (*University of Guelph*)

News You Can Use: A Critical Examination of Mainstream News Framing of Ontario Femicides 2015-2016

A critical feminist media analysis of Ontario femicides (2015-2016) found negative reporting frames appeared at twice the rate as positive ones. A community engaged research (CEnR) project between the Ontario Association of Interval and Transition Houses (OAIH) and a graduate sociology course analyzed mainstream news accounts of 29 Ontario femicide cases between 2015-2016 based on a framing analysis we developed via a literature review of previous studies on media's representation of femicide and/or violence against women. We found that across 73 Ontario and Canadian news items (from mainstream national newspapers, local newspapers, and TV news), an average of two negative frames were used, compared to an average of less than one positive frame. Prevalent negative frames included the lack of information about the woman's experience of a history of violence by the perpetrator and the portrayal of violence against women as an individualized problem rather than a gendered societal problem. The most common positive frames humanized the victim by including her picture and by including information acknowledging how the woman impacted the lives of others. Leaving out the social context of women's experiences of a history of violence by the perpetrator fails to educate people about important risk factors and femicide prevention. For example, according to the Ontario Domestic Violence Death Review Committee (2009-2016), an average of 70% of women who were killed via an intimate partner had a history of domestic violence (Office of the Chief Coroner for Ontario 2016). However, this is not reflected in the media coverage, as 96% of the cases we analyzed failed to acknowledge a history of violence. We concur with Fairbairn and Dawson (2013) who argue that media coverage has the potential to shape and reinforce societal understandings of violence against women and help set future political and policy agendas.

Management between Semi-Profession and Superprofession

Institute of professions today is undergoing a dramatic transformation, losing former social status, confidence of clients and protection by the state. Professions become increasingly subject to fluctuations in the labor market and in product markets than a subject of professional self-regulation. The instability

of the professions is compounded by a high rate of changeability in skills demand and partly devalues the previously accumulated knowledge, and sometimes whole profession. The frequency of mismatch between the available skills and skills demand puts professional education in the ambiguous position. All these challenges to fully relate to the formation of the managerial profession, but the former adds some specifics. Being a cross-cutting profession management present in different types of activities, so it should reflect also the global changes in the object and the conditions of governing. Some shifts may strengthen management as a profession, and others on the contrary, to weaken or to radically transform. Given such a perspective the paper aims to study the trends that can shape the future of management in the coming decades and the likely scenarios of its development against other professions. It explores significant global trends in work, knowledge accumulation, new role of ICTs and managerial functions all of which are seen as drivers of the potential future of professional management that may contribute to its transformation from semi-profession to super-profession, super-authority or enterprising management.

MOSTOLIZADEH, S. ALI* (*University of Waterloo*)

"My Piano Is My Homeland": Music, Activism, and Syrian Civil War

Music is an 'abstract machine' that can construct new forms of reality (Deleuze & Guattari, 1988). Music either as a collective space to negotiate identity (Byrd, 2014), or a platform to resist the dominant regimes (Saada-Ophir, 2006), or a liminal space to fill gaps between ideals and realities (Stokes, 1998), is a "memory bank" for decoding people's stories (Chatwin, 1987, p. 120). This study unfolds narratives of war, displacement, and migration induced by Syrian Civil War through analyzing the songs of Ayham Ahmad, a Palestinian-Syrian musician, composer, and activist who fled the war in Syria. Focusing on Ayham's songs and musical life from Syria to Germany and applying narrative inquiry for representing the second-hand data from social media, the purpose of this study is to unpack the ways Syrian civil war has formed Ayham's music and how he has used his songs as a means of activism. This research contextualizes the songs and connects them to Ayham's experience of life in war and as a refugee in Germany. The findings suggest the significance of music for being politically active and creating productive spaces for refugees or those who are living under precarious situation caused by war or conflicts.

Simmel and the Formation of the Modern Individual

Among the many accomplishments of the sociology of Georg Simmel, his studies on the relationship between individual and society are among the most valuable for contemporary studies. After a long tradition of ignoring the individual in favor of a more structural look, many sociologists today are concerned with the way in which individuals are portrayed, and the real way in which they live their lives and face the many challenges posed by modern societies. In addition to that, social structures themselves are being looked now as producing particular types of individuals, in different times and places, as shown in the *Sociology of the Individual* of Danilo Martuccelli and his *individuation theory*. Concerned with how societal changes such as the money economy and the metropolis have enlarged individual's social circles and shaped the modern individual, Simmel is among the forefathers of this kind of analysis. The modern free subject has looked at society as something strange, as a reality *sui generis*, which gave birth to the modern social sciences and sociology in particular. How does this process of individuation is analyzed in Simmel's work? Which new lights can the German sociologist give to our contemporary look on the individual? Those are among the questions I wish to address in this presentation.

How Can Adults Realize Children's Agency in Liquid Modernity?: Challenges of Adventure Playgrounds in Urban Tokyo

Giving children agency, voices, and rights is easy to state yet difficult to realize. Protesting against the hierarchical relationship between adults and children had a certain impact in the late twentieth century.

However, in modern societies, the "tutelary complex," a web of supervision of children, cannot and should not be completely removed. Consequently, instead of stressing the dichotomy between adults' control and children's agency, we should explore how adults can realize children's agency, sometimes locally and temporarily, in specific contexts. Additionally, diversities and changes in historical and geographical contexts should be examined.

This paper aims to analyze Japanese adventure playgrounds in two different contexts: the first successful case that has become a standard since the 1970s and a recent struggling case.

The aim of the playgrounds is for children to play freely. Adults have set the slogan that this is where children can be responsible for taking risks and realize free play without interference. Importantly, the key to actualizing this philosophy is not only the existence of skilled playworkers who organize the playgrounds by removing actual dangers, but also the principle of voluntary participation of parents and local adults. This principle allows both adults and children to keep away from closed pairs and existing values. Some become empowered, and through this sense of empowerment, present and future community leaders are created. Therefore, the model have the potential to realize a utopian generational relationship and social ordering.

However, the recent case indicates that the principle faced difficulties when people and authorities began accepting children's rights, with the biggest issue being the gap between demand and supply. Preserving the original principle under the increasing demand may undermine its voluntary nature. By showing the detail of this case, this paper will discuss the importance of flexible frames in analyzing generational relationships.

How Does Personal Experience of a Social Change Entail a Theoretical Shift in the Social Sciences? Polish Sociology in Times of Solidarity Social Movement

Significant social changes (wars, revolutions, important social movements) are *total social facts* – they remodel social world in many aspects, including the social sciences. In times of turmoil personal experience of researchers is greatly enriched. I am interested in how this enrichment results in the adjustment of the social theory or sometimes even in a fundamental paradigmatic change. My *research strategic site* is Stefan Nowak's circle. Nowak was a key figure of Polish sociology of the 1960s and 70s., once called by Lazarsfeld "the best surveyman in Europe", practitioner and theoretician of positivist sociology. He contributed significantly to the understanding of the Polish post war society under communist regime. The research his students conducted on the Solidarity social movement at the beginning of the 80s as well as their personal experience of this historical time resulted in the immediate reversal of the previous theoretical vector while maintaining the importance of the results. It turned out that antipositivist sociology particularly well accounted for events happening in Poland. Nowak's circle – the core of the positivist sociology in the 70s – was transformed into a laboratory of theoretical experiments in the 80s. In my paper I'm going to elaborate on a mechanism of the theoretical shift in sociology in the context of a big social change.

The Daisies' March: Labour Movements, Feminism and Identity Politics across the Urban-Rural Divide

The Marcha das Margaridas (Daisies' March) started in the year 2000 and has had five editions since then, mobilizing in 2015 100,000 women to Brasília. The organization of the March is driven by the trade union movement of rural workers in partnership with more than ten others movements and organizations, especially women movements. The March is organized at the local, regional and national level through a participatory process. In his last edition, the dialogue between the Brazilian activists and international organizations present resulted in creation of The International Network of Articulation of Daisies of the World, composed by 17 countries. We are concerned with understanding their success in building alliances across old divides such those between different types of rural labour (extractive workers, agrarian workers, fishers), between different types of political organizations (trade unions and other agrarian movements), as well as between rural and urban movements (through feminism). Starting with the challenge identified by Harvey of building bridges across the two types of movements – over expanded reproduction and over accumulation by dispossession – we move on to find theoretical inspirations that develop new languages to make sense of such coalitions. We rely on Gibson-Graham and their intellectual project of a postcapitalist politics to understand how class-, identity-, issue- and community-based movements present at the Daisies' March have crossed their divides. In this

paper we argue that the daisies have built strong political coalitions that respect and articulate difference in order to fight together against multiple inequalities. They have a clear organizational face to make demands on the state and influence the political system. They are a sustained, coordinated, political process of articulation differences to inform and suggest other type of politics, economy and society.

We Are Fed up: Politico-Ecological Coalitions for Food

The paper aims to understand about the power of food to intermediate new alliances between consumer groups, environmentalists, farmers, youth movements and development aid in the German campaign *Meine Landwirtschaft* (My agriculture) since 2011. In dialogue with theories of gender and environment and feminist political economy, we suggest the concept of postcapitalist political-ecological coalitions to analyse the role of animals to bridge the consumer-producer divide in demonstration *Wir haben es satt* (We are fed up) that the campaign organizes annually in Berlin. Based on a rich description of the march, on a qualitative analysis of text and images, and interviews with the leaders of the organizations behind the campaign, we argue that the animals have been engaged in this political-ecological coalition – not without conflict – due to the power ascribed to them in articulating various forms of injustice present at the agrofood industrial model, crossing identity, categorical, geographical and spatial borders. We also assess the limits and possibilities of electing this topic to create solidarities between consumers and producers and beyond.

Power, Domination and Intolerance: The Conflict between Fundamentalists and Sociologists in Contemporary Brazil

Mainline Brazilian sociologists tend to take very seriously their role as heirs of Comte and Marx. They are convinced that “the criticism of religion is the premise of all criticism”. Even though its final demise is expected, religion’s withering away may require an indefinite period to be completed. It would then be incumbent upon social scientists to assume the management of this interim, putting to the best possible use the moral and material assets of surviving, but decaying, religious institutions. This has led, in Brazil, to strong sociological support for the mundanization, indeed for the “unecclisification” of the Catholic and the so-called “historical” Protestant churches (Presbyterian, Methodist, Baptist, and others), the “theology of liberation” representing a good example of this tendency. On the other hand, the almost exponential growth of Protestant fundamentalist churches in Brazil, mainly Pentecostal, for the last 40 years or so, has been fiercely resisted by social scientists, who have themselves been no less fiercely resisted by the Fundamentalists, unwilling to yield to the values and attitudes of sociological modernity. In a kind of apparent paradox, social scientists have strongly favored the ecclisification of the highly syncretic Afro-Brazilian cults, which, possessing no consistent theology concerning guilt, sin, or redemption, would spontaneously share some of the basic assumptions of mainline sociology, playing the role of a religion that helps leading to the end of religion.

To Thwart the Managerialism in the French Criminal Courts ? the Consequences of the LAW of 2014

For more than 20 years, the French criminal courts have been committed in a vast movement of managerialization, which has deeply changed not only the courts’ organization and the magistrates’ work, but also their professional habits and their culture (Bastard & Mouhanna, 2011). They are now embedded in a more restrictive social system in which they have to produce mass decisions, measured by work statistics. They have to use scales in their decision-making process. And they don’t have enough time to assess each case and each personality. As a result, the courts’ organizations, based on quickness and race for productivity -more decisions in a shorter time-, have assigned the magistrates and clerks to specialized positions, where they only have a limited sight of the overall system. Each actor focuses on his own work and doesn’t have a clear idea of the « production » of the decision chain, i.e. what will be the final penalty if there is one. In that sense, the judicial process could be likened to an assembly-line work, in which each person has only a fragmented view of the process.

A French law of 2014 tried to break off these excesses of the courts’ management. Because it leads to increase the number of people jailed, the new law has encouraged the magistrates to stop their isolation and to cooperate together in order to examine more deeply some cases -the ones with people who risk short-

term prison sentence. The aim was to decrease the number of inmates, but also to avoid the bad effects of prison on these people. We will examine the concrete consequences of this Law on the courts, which are very different from one place to another.

Toward a Multilevel Approach to Perceptions of Justice: The Case of Restaurant Workers in France, Quebec and the United States.

Perceptions of social justice can be analyzed at three different levels. At the macro-level (state level), theories of empirical justice analyze the extent to which the major political and social institutions are perceived as being fair (Hochschild, 1981; Forsé and Parodi, 2010; Forsé et Galland, 2011). At the meso-level (organizational level), organizational justice relates to perceptions in the treatment of individuals within a given organization (Greenberg, 1995; Colquitt and Greenberg, 2014), and puts forward a four-dimensional framework for justice: distributive, procedural, interpersonal, and informational (Colquitt, 2001). At the micro-level (individual level), the approach of the economies of worth (Boltanski & Thévenot, 2006) identifies the principles used by individuals in articulating their advantages/injustices and François Dubet (2009) shows that workers refer to three main principles of justice -equality, merit, and autonomy- when they perceive themselves to be victim or witness of an injustice at the workplace.

Analyzing justice in the workplace thus presents a twofold challenge. First, there is a need to grasp a multilevel approach of justice that takes into account the redundancies and complementarities of these three levels of study. Second, comparison must succeed in assessing a wide scope of norms, principles and procedures which vary depending on national, sectoral or local contexts (Elster, 1993). This presentation will discuss this twofold challenge by focusing on the case of restaurant workers (whose work is characterized by flexible work hours, customer relationships, poor supervisory communication and structural division of work between tipped dining-room employees and kitchen hierarchical staff) in three different contexts of labor standards, welfare protection and tipping etiquettes: France, Quebec and the United States.

“I Am Not a Hijra”: Gender, Class and the Emergence of Transgender Women in India”

This presentation examines the emergence of the transgender woman identity in India, where there is a large, historically recognized (yet socially marginal) group of gender non-conforming (GNC) people, hijras. Transgender women have emerged in a moment of intense social change connected to the proliferation of sexual rights NGOs and the liberalization of the Indian economy, discursively symbolized by the figure of the emancipated ‘new Indian woman.’ Transwomen are eager to emphasize their difference from hijras, enabling them to align themselves with middle class standards of femininity. The possibility for visibly GNC people to obtain respectable office employment in sexual rights NGOs enables transwomen to position themselves in opposition to hijra sex workers. Transwomen’s desire for upward class mobility via respectable office employment both necessitates and enables them to align their identities with middle class standards of feminine propriety. Through an analysis of 18 months of ethnographic fieldwork in Bangalore, India with transwomen, hijras and NGO workers as well as a textual analysis of current media representations, I argue that instead of challenging stereotypes of gender non-conformity most evident in the marginalization of hijras, transwoman are at pains to highlight their difference from hijra; they employ the figure of the hijra to contain these negative stereotypes, thus allowing transwomen to position their identities in proximity with middle class femininity.

Collective Impact: The Experience of Networks of Educational Communities in Brazil

So far, social organizations have worked primarily in individual way, through isolated interventions. This strategy works very well when it comes to "technical problems", that is, well-defined problems, with a solution known in advance and in which an organization alone has competence for its implementation as a whole.

The approach of collective impact, however, implies that organizations from different sectors (public, private and third sector) work collectively in a coordinated and integrated manner, each in their area of expertise, with the goal of achieving together the desired social change, in a long-lasting and large scale, instead of an individualized set of activities.

The present summary, under the light of collective impact, is about the experience of implementing a project called Networks of Educational Communities in two Brazilian cities, presenting the obstacles and advances of establishing a common agenda of expanded learning.

First of all, we intend to focus on the profile of these cities, understanding the local demands raised through participatory diagnoses. Secondly, the focus is analyzing the conditions necessary for the implementation of this project on a large scale, with the involvement and articulation of several local social actors. And finally, present the experience of operation of this Network based on the concept and methodological assumptions of collective impact.

Engaged Journalism: Understanding the Adaptation of Media Practices to Changes in the Sociopolitical Context

This study focuses on the media practices actors engaged in the alternative coverage of protests movements perform, create or adapt, as conditions on the ground and the political context change.

Drawing from the methodological resources of grounded theory, such as expert interviews, I analyzed the case of the protests that took place in the city of Fortaleza, Brazil, during 2013 and 2014, a period that captures various changes in the country's sociopolitical context between the first protests during the Confederations Cup in 2013 and the demonstrations during the FIFA World Cup in 2014.

The actors I interviewed were experienced former newsroom journalists, freelance photographers, students, activists. In common, most of them had a formal education in media, a loose network of personal relationships to each other and to social movements, and a strong will to cover events beyond the criminalizing representations provided by Brazilian traditional media.

I generated a theoretical model based on the experiences relayed by the interviewees, encompassing a broad spectrum of practices, from protection practices against police violence to newsgathering practices amid increasingly repressive conditions. All the while actors sought to establish non-hierarchical decision-making structures and forms of relating to social movements as partners and main sources of information in their coverage.

As alternative media and protest movements continue to rise in importance all over the world, I hope this study provides the basis for further analysis of these phenomena from a perspective grounded in practice theory instead of the more frequent techno-centric viewpoint. Through their media practices, actors are formulating new understandings of how journalists and media practitioners should relate to the various sources around them and to principles such as neutrality and information verification.

MOWATT, RASUL* (Indiana University)

Leisure Settings As Contested Spaces

Leisure settings often predominantly fall into two types of spaces: 1) Public Space, and 2) Private-Public Space. Public spaces are situated in this discussion as location managed by governmental entities at the behest of the general citizenry. While private-public spaces are presented here as locations managed by private commercial interests but are generally accommodating to a variety of

people in society based on the payment of a fee, the earning of membership, or an invitation. Despite a greater access to utilize and enjoy the provisions in these two spaces in contemporary societies, they are still rife with exercises and abuses in power alongside displays of perceived and actual violence. What is posited here is that public and private-public spaces are contested spaces in the erection of gender dominance and for the creation of disposable populations of Race and class. Thus, in order to envision and build more "just" spaces it is imperative for researchers to explore a range of emancipatory theories from an even more diverse set of scholarship. The thoughts of Amílcar Cabral, the Guinea-Bissau leader, on contested and liberated zones are incorporated into this discussion to better situate the risks and dangers in the contested spaces of the public and private-public. Within this discussion, there is an overt critique of leisure settings as historically and presently rendered. Lastly, Cabral also provides additional consideration for the question of what type of new spaces must be created to overcome the social control that is inherent in gendering and disposability.

Women's Breakthrough? Unpacking the Agency of Women in Rural Development in the Eastern Cape, South Africa.

Debates about how gender differentiation and patriarchy have relegated some women in many developing societies to domestic unpaid roles (mothers, housewives and nurturers) are not new. Such socio-culturally defined roles have been shown to restrict women's effective participation in wider socio-economic development activities. However, in development thinking and practice, the 'tide' seems now to be turning. Women now, at least in theory, play a central role in human development plans and programmes portrayed by their beneficiaries (governmental and non-governmental agencies) as 'gender sensitive', 'inclusive' and 'sustainable'. In this paper, focus is on the authenticity of claims of 'women inclusivity', 'full participation' and 'sustainability' made by Non-governmental organisations about community development programmes funded and supported by them in Raymond Mhlaba Municipality in South Africa's Eastern Cape Province. A three-year multi-method study of NGO-funded sustainable rural development projects in selected communities in the region found that women played pivotal roles in the design, implementation and sustenance of the selected projects, thus making important contributions to food security in the households of project members. The deep level of women's involvement in the projects bore robust testimony to the sponsors' claims of inclusivity. However, the study found that the supported projects epitomised what may be termed a "transformation paradox", as they were deemed by certain segments of the study communities as "women's jobs" – that is, they were projects in which men could not, for cultural reasons, ordinarily participate in. Besides, the sustainability question remained debatable as some of the women participants were still economically dependent on welfare grants provided by the state despite their full involvement in the projects.

Elites' Discourse and Action Toward Inequalities in Italy: The Role of Banking Foundations.

The paper investigates the role of elites in reframing the concept of inequality and how they tackle it: how is it shaped and defined by Fobs programs and by the elites who play a role in them? Which kind of actions do they implement in order to reduce it?

In order to tackle our research questions, we developed an investigation on Italian Fobs and their action in the realm of social policies. Fobs are an exclusive Italian institution: born with the privatization of public banks in 1992, they were entrusted with the philanthropic activities and constrained to invest their assets mainly locally and in defined policy areas. Real institutions of government, Fobs influence public issues at local, national and international scale. They are a place where political, economic and financial power is thickened, so it is here that it is possible to observe elites, co-opted in fob because they are already powerful in other fields. Italian elites' action and discourse about inequality can be thus analysed in Fobs intervention in orienting and shaping the public discourse and action while tackling inequalities.

In order to carry out the investigation, we analysed the discourses and action of the two main Italian Fobs. Both based in the northern part of Italy, Fondazione Cariplo (Milan) and Compagnia di San Paolo (Turin). An interpretative and comparative approach was used to enlighten similarities and divergences between the two Fobs elites' emerging visions and actions on inequality, studied longitudinally and diachronically over a medium historical time. Using qualitative methods, a discourse analysis has been carried out on documents produced by the Fobs in the area of social policies (call for bids, online websites about projects and strategic official reports), as well as on in-depth interviews with CEO, managers and executives of the two selected Fobs.

RC44-748.10MROZOWICKI, ADAM* (*University of Wrocław*)TRAPPMANN, VERA (*Leeds University Business School*)CZARZASTY, JAN (*Warsaw School of Economics*)GARDAWSKI, JULIUSZ (*Warsaw School of Economics*)LORENZEN, JULE-MARIE (*Freie Universität Berlin*)*Precarious Lives and New Solidarities: Normalisation and Resistance Against Precarity in the Biographies of Young Workers in Poland and Germany*

This paper aims at understanding the conditions and mechanisms of the mobilisation and demobilisation against the precarity in the contexts of two distinct political-economic regimes in Poland and Germany, the former representing a semi-peripheral embedded neoliberal economy and the latter the coordinated economy type. Despite political-economic differences, in both countries young people tend to be systemically disadvantaged in terms of greater risk of poverty, temporary employment and unemployment than general population. Even though research noted relatively high level of satisfaction and limited involvement in protests of the Polish and German youth, we can also observe emergent forms of political and labour mobilisation in both contexts. This mobilisation includes new forms of self-organisation (e.g. academic, NGO and restaurant workers) but also non-progressive forms like protest voting. The paper will address this paradox by referring to the results of the research on young (18-30) precarious workers within the NCN-DFG funded PREWORK project. The qualitative module contains 120 biographical narrative interviews collected in economically diversified urban contexts in East and West Germany and Poland. The quantitative module is based on the representative CATI survey of young people in both countries (N=1000). The paper will firstly reconstruct the main traits of economic consciousness of young Poles and Germans pointing, *inter alia*, to the persistent support for neo-corporatism in Germany and rebirth of the support for domestic capitalism in Poland. Next, the comparative typology of life strategies will be presented linked with the diversified forms of mobilisation and demobilisation. It is concluded that inconsistencies and contradictions both at the level of economic consciousness and life strategies of workers present some space for resistance against the precarity. The latter is more present in Poland than in Germany in which the tendency of reproduction and normalisation of social order seems to prevail despite precarisation.

RC07-156.3MTSHALI, MDUDUZI* (*University of KwaZulu-Natal*)SOORYAMOORTHY, RADHAMANY (*University of KwaZulu-Natal*)*Challenges for Higher Education in South Africa: The Case of Universities of Technology*

South Africa introduced technikons in the early 1980s. Changes in the political dispensation from apartheid to democracy saw a significant restructuring of the South African higher education landscape. One such change in 2003 resulted in technikons being converted into universities of technology. This move by the South African government was considered radical, but in line with the world trends, by granting technikons degree-awarding status. Now that technikons have become degree-granting institutions and since current policies define degrees as taught by staff engaged in research, many staff now had to develop skills in research. Technikons lacked a research culture and research-capacity building therefore, in technikons today, the tradition of research is limited, research audits for the institutions are low, and a research culture is not engendered. In the proposed paper, we are examining the following issues of higher education occurring in the universities of technology in South Africa.

1. How does the transformation of technikons to the universities of technology affect the functions of teaching and research?
2. What are the existing research cultures at the universities of technology and how do they relate to their core function of conducting research in the changed structural environment?
3. What strategies have been put in place to adapt to the changes in terms of promoting a research culture in the new universities of technology?
4. What can be expected in regard to the future of these universities of technologies in terms of research culture and research productivity?

RC12-247.4MUANPAWONG, SUNTARIYA* (*Dr. Jur.*)ANUKUL, CHOLNAPA (*Center of Just Society Network*)*People-Oriented Justice Reform: Challenge of Thought, Political Will and Action in Thailand*

Far and wide, Thailand is facing with economic inequality, social injustice, political conflicts and a deep-rooted cultural transition. Trust and confidence are needed, especially from the meta-trust generator: The justice system. Still, modernization and reform are essential for justice system as well. This study analyses justice principles with scope of change from previous justice reform programs in Thailand and develop strategic actionable policy recommendations. Mixed methods including literature reviews, expert interviews, focus groups and policy dialogues were applied. It is found that prior justice reform focused mainly and predominantly on criminal justice. Furthermore, improvement of justice service focused only on diminishing delay process. But then and again, disregard cost of justice process and non-assessment of quality of justice decreased public trust in justice system. In the past, the justice reform idea emphasized merely the justice service, but overlooked other determinants outside justice system. As the results, the justice system dealt mostly with trials and adjudication, but did not solve the problem of social and economic injustice in a wider sense. Additionally, the affected people from justice system were excluded from reform processes. The people-oriented justice reform is a new important paradigm, which will interweave among interpersonal justice, distributive justice and procedural justice. Wider justice sphere should be deeply discussed, while interdependence between distributive and adjudicative justice should be more demonstrated. To develop reform feasibility, the inclusive participation process should be introduced. These are challenges of thought, political will and action of all stakeholders in Thailand. Expanding the concept of justice, democratizing the justice system and empowering the citizen are recommended as the new model strategies.

RC31-570.6MUCHOW, ASHLEY* (*Pardee RAND Graduate School*)BOZICK, ROBERT (*RAND Corporation*)*Exploring the Role of Legal Status on the Labor Market Outcomes of Childhood Arrivals in Los Angeles*

Over a million undocumented immigrant children are growing up in the U.S., attending its schools, and experiencing similar processes of incorporation as their documented peers. Federal law grants these minors the right to a public education through high school, but upon graduation, their legal status limits access to formal employment. These missed opportunities in early adulthood can initiate processes of cumulative disadvantage in subsequent life stages, risking poverty and extreme hardship (Abrego and Gonzales 2010).

Undocumented youth face challenges to incorporation and adaptation common to both first and second generation immigrants, and face two primary challenges to employment: (1) legal status that prevents them from securing jobs in the formal sector and (2) uncertain access to informal or enclave economies. Studies of immigrant assimilation routinely consider the role that cohesive social networks play in providing economic opportunities to those who share a common ethnicity or immigrant experience and live in close proximity. Access to this form of social capital is typically dependent on identifying and affiliating with the ethnic group characterizing the enclave. Given that undocumented youth may not share the cultural or linguistic characteristics of immigrants traditionally embedded in these enclaves, it is plausible that even informal economic opportunities may be out of reach for these individuals.

Despite the recognized vulnerability of this group, little research has considered the experiences of undocumented youth who do not make it to college or do not complete high school. We address that gap and empirically examine to what extent legal status affects the labor market outcomes of immigrants that arrived as minors. We use a survey of immigrants in Los Angeles County to evaluate employment, labor sector, and earnings outcomes, and consider whether neighborhood social cohesion and ethnic concentration attenuate the hypothesized negative effect of undocumented status.

RC55-898.1MUELLER, GEORG* (*Univ. of Fribourg*)*Limiting the Policy Space of Authoritarian Regimes: An Exemplary Analysis of the Effects of the Freedom House Indicators*

Candid social reporting is not only of interest for scientists but also for the politically informed citizenry: periodic reports help to control the powerful and to compare their promises with social reality. This also holds for the annual publications of *Freedom House* (<https://freedomhouse.org/>) with internationally comparable indicators about political rights and related liberties. They shape the political expectations of the directly concerned national societies as well as an international community of politicians, human rights activists, etc. The latter group is especially important in political situations, where the national society is paralyzed by an authoritarian regime with a poor Freedom House rating.

An obvious and important scientific question is, how successful such reports really are in limiting the policy space of autocratic regimes. With regard to the Freedom House indicators we are especially interested in answering the following questions: i) How effective is the critique of the Freedom House indicators in restricting the violation of political rights by authoritarian national regimes? ii)

To what extent is the respective impact of Freedom House paralyzed by counter-strategies (e.g. censorship) of these regimes?

In order to tackle these questions, the author first presents a model of the governmental policy space, which has two major theoretical elements: a) The formation of national/international expectations about political rights by the Freedom House reports. b) The voluntary or politically imposed tolerance of the national/international public for deviations from these expectations. The unknown model-parameters are estimated on the basis of historical Freedom House data by a novel statistical technique, based on iteratively reweighted least squares regression. The extracted parameters are subsequently used in order to answer the above mentioned research questions about the limits of the governmental policy space.

The Impact of Refereeing-Practices on Scientific Progress: Results from a Computer Simulation

The resistance of journals to publish articles with non-results (publication bias) is in so far a problem for scientific progress, as it encourages intentional biasing in order to avoid non-results. Such false "knowledge" is relatively immune against critique by replication studies, which show the true facts but are hard to publish due to the mentioned resistance against non-results. As a refutation of fake-results, their only advantage is their newness. However, in general the appreciation of newness is not encouraging replication studies, although they may show errors in earlier publications. So the question is whether the appreciation of newness really corrects the negative consequences of the avoidance of non-results.

In order to tackle this question the author presents a computer simulation, where a scientific community tests 1000 bivariate correlations, which are in reality partly zero and partly significant. Scientists may un/intentionally deviate from this reality but in any case they attempt to publish their investigations. Whether they succeed or not depends on the refereeing-practices of the editorial boards with regard to the resistance against non-results and the appreciation of newness. At the end of the simulation it is possible to compare the true with the last published correlations. This way it is possible to determine the share of the significant and of the zero correlations, which have correctly been identified in the publications of the scientific community. The advantage of computer simulations is the controlled variation of the following model-parameters, which influence these measures of scientific progress: a) the error rates in the submissions about the significant and the zero-correlations, b) the strength of the resistance against non-results, c) the strength of the appreciation of newness. Obviously it is also possible to determine the influence of these parameters on the number of published replication studies.

How Does Job Turnover Affect Subsequent Employment Instability? an Analysis of Inequality Among Job Leavers in Japan

This study explores the effects of job turnover on subsequent employment instabilities for individual careers in Japan. The Japanese labor market has been known for the long-term and inflexible employment. Since the late 1990s, however, the unemployment rate has risen beyond five percent, and also the rate of non-regular workers has also grown dramatically. Currently, Japan shares the common problem of unstable employment with other countries. Here, we study that how to leave the previous job affect the separation rate from workers' subsequent job, with a special focus on the reasons for job turnover and the job mobility through unemployment.

The data we use is the 2015 Social Stratification and Mobility survey conducted in Japan, with detailed information on the retrospective job histories of individuals. Descriptive analyses show that those who have entered new jobs for involuntary reasons and after a period of unemployment are more likely to leave their new jobs than those who come from voluntary, job-to-job transitions. These results are also confirmed by discrete-time event history analysis with other control variables and unobserved individual-level heterogeneity. Men who leave jobs for involuntary reasons and with a period of unemployment are 1.3 times more likely to leave their subsequent job than those who leave for voluntary reasons and without unemployment; this corresponds to 1.4 times for women. More importantly, those who have once lost their jobs are more likely to (re-)experience displacement and (re-)enter into unemployment.

These results indicate that the opportunities to access stable employment are not equal among job leavers in Japan. In particular, it is difficult for those who leave their jobs for involuntary reasons and experience a subsequent period of unemployment. Job turnover causes unstable employment and cumulative disadvantage, especially for those who lose their jobs without immediately getting a new one.

Researching Collective Action and Social Change: Extending Michael Burawoy's Extended Case Method

This paper proposes a socio-spatial ethnographic methodology to research projects and processes of neoliberal mainstream contestation. We build on Michael Burawoy's extended case method and the notion of 'global ethnography', which we put in dialogue with theorisations of place, space and scale. We argue that a case can socio-spatially extend out beyond a particular place-bound 'site' or 'case' in order to account for multiple interconnected places at different geographical scales. This approach allows for empirically sustaining how neoliberalism as a project and as a process of social transformation is being counteracted and displaced in different geopolitical configurations. Muhr's spatial ethnography of the construction of the Bolivarian Alliance for the Peoples of Our America-Peoples Trade Agreement (ALBA-TCP), as a distinct post-neoliberal democratic project, illustrates the deployment of our methodological proposal.

MULERAS, EDNA* (*CONICET/ UNIVERSIDAD DE BUENOS AIRES*)

From the Meritocratic Illusion to the Notion of Social Equity in Working Class

Is social equity still a substantive value for working class in our contemporary societies? Is social inequality observed by those who suffer its consequences? Which is the conception of social justice that prevails when evaluating their own situation? A meritocratic conception according to which the situation is exclusively attributed to individual responsibility? Or a distributive conception that presents personal situation as restricted by unequal conditions, rights and development possibilities among social classes? Diverse conceptions of social justice were empirically surveyed in an exploratory research on working class moral identity, in Argentina, in the last years (2010 -2015). The study offers valuable clues to analyze some of the preconditions of the electoral success of the new neoliberal governments in the region, even though they drive structural changes which affect the extension of rights previously achieved by working class. We have identified some of the factors that provide the acceptance and moral justification of current policies, despite they lead to a progressive worsening in workers' social situation. A meritocratic conception of social justice reinforces an atomized working class. It is an epistemological obstacle to observe the interrelation of actions in social order. Workers are made responsible for their low wages, the unemployed for their dismissals and the poor for their poverty. Either accusing workers of low productivity, inefficiency, corruption, etc., as individual faults needed to be sanctioned, or explaining welfare acquired in the past as an excessive or undeserved prize. It promotes an ideological normalization of class inequality and it offers utopian resolutions by deceptive means in an always imprecise future. The conceptualization of social equity is a result of a complex stage in human reflection on social order. It urgently demands democratic, autonomous and participatory cooperation in the production and distribution of material and symbolic resources socially generated.

Putting the Money Where the Men Are: Homonormativity and HIV in Malawi

Increasingly, activists use public health arguments to advocate for human rights for queer people in African countries where same-sex activity is criminalised. These arguments, coupled with an increase in health-related donor-funding and development aid, have led to the inclusion of men who have sex with men (MSM), and, at times, transgender people, into a number of national HIV health policy documents. While these have been celebrated as significant achievements towards challenging heteronormative health policy, and realizing the right to health for sexual minorities, it also raises questions about who is included in these conceptualisations, and under which conditions. Drawing on in-depth interviews with healthcare providers and representatives of advocacy organisations in Malawi, participant observation, and critical discourse analysis of published research on sexual minority health, we argue that the dominance of aid-incentivized 'MSM' and HIV/AIDS discourse has led to a homonormative understanding of sexual diversity. As a result, sexual and gender diversity is equated with 'MSM', which invisibilises sexual minority women and transgender people, and results in a comparative and absolute absence of health programming tailored to them. By focusing solely on sexual health, this homonormative discourse ignores the wide range of health, including mental health, concerns, which affect queer people everywhere, and which may be more pronounced in a conservative context like Malawi, where consensual same-sex activity is criminalised. Male-centred homonormative discourses also raise important questions about the recognition

of women's (sexual) agency, and about queer women's inclusion in queer activism and organising. Finally, we argue that by solely relying on aid-incentivized public health arguments focusing on HIV and MSM, the break in heteronormative healthcare practice and policy affirms an existing tendency to reduce the lives and health needs of queer people to sexual behaviour, closely associated with the spread of disease, and creates new homonormative identities.

What Do You Mean By Gay? Measuring Sexual Orientation and Gender Identity in Public Health Studies

Sexual orientation and gender identity (SOGI) are increasingly recognized as social determinants of health. Public health studies, the majority from the US and Europe, show disparities in mental and physical health that are attributed to queer people's marginalization, discrimination, and poorer access to healthcare. While such evidence is important for improving healthcare delivery and queer health advocacy and activism, most current studies do not explain how they define or operationalize their participants' sexual and gender identities. However, what we understand as lesbian, gay, bisexual and transgender (LGBT) identity emerged from a particular historical and geographical context, and queer identities are specific and contested from place to place. What does this mean then for studies about SOGI-related health disparities? What do we measure when we measure SOGI, and who do we include and exclude as participants?

Using empirical evidence from a comparative quantitative study on SOGI-related mental health disparities in Kenya, South Africa and Swaziland, we present challenges and contradictions in trying to make queer identities identifiable in a public health study. We present our strategies to determine participants' sexual orientation and gender identity, and show how the contradictions in our results raise crucial questions about how to measure health inequalities related to contested social identities, even more so in postcolonial contexts where concepts of sexual and gender identity differ from Western understandings of lesbian, gay, bisexual and transgender. We argue that the process of operationalizing sexual or gender identity into survey questions and variables - by choice of language, terms, and concepts - invariably delimits who is identified as LGBT and thus counted, and that this represents a crucial limitation in studies that take such categories for granted. We end our paper by discussing the implications for the globally emerging field of LGBT Health.

Marginalized Youths' Constructions of Identity in the Context of Self-Organized Sports: An Ethnographic Exploration at Urban Football Grounds

In public and political debates young ethnic minority men are commonly labelled as a 'problem group' and in scientific discourses researchers attest them difficulties with identity development. Taking into account that young ethnic minority men are primarily keen on sports in informal contexts, the study focuses on the self-organized football activities of underprivileged, poorly educated boys from culturally traditional migrant families and aims at exploring the various meanings of sport for these youths with regard to their constructions of identity. Based on semi-structured interviews, ethnographic conversations and (participant) observations the study investigates the narrative as well as (unintentional) nonverbal constructions and presentations of identity. Findings show that the 13 interviewed and observed young men suffer from spoiled identities and negative self-images due to educational failure and perceived inferior social positions. Furthermore, the material reveals that the boys see sporting activities as a legitimate cultural sphere, where excellent skills are recognized and valued by their families and friends, but also in society as whole. It is concluded that for these youths - due to default of (legitimate) alternatives - sports are the most important (and maybe the only) practice for experiencing competence and success, allowing to compensate for perceived failure in other social domains, most notably, the educational domain. The urban football ground thus can be described as a 'counter world' to the lifeworld of school and becomes a place for coping and curing various threats to identity.

The Interest for Omcg Related Crime from a Sociological Perspective

Members of Outlaw Motorcycle Gangs (OMCGs) are frequently associated with crime and OMCGs as seen by the media or police are often understood as criminal gangs which are heavily involved in organized crime. The term "one percenter" allegedly implies that the last one percent of motorcyclists were outlaws even

though the origin of this comment is still unresolved. Some of the bikers embrace the term and decide to call themselves one percenters to express their outlaw status.

The answer to the question whether OMCGs are per se criminal or involved in organized crime is not a simple yes or no. The perception of OMCGs is most widely created by the media or law enforcement. The *Criminological Research Institute of Lower Saxony (KFN)* started a research project in January 2017, funded by the *Internal Security Fund of the European Union*, investigating rocker clubs and the broad topic of "rocker crime". This presentation will focus on the criminalization of OMCGs and look beyond common stigmatization. Instead, it will consider the subculture, lifestyle and group dynamics of OMCGs to give insight why they're such a "popular" target for police and law enforcement.

Towards a Neo-Eliasian Framework for Processual-Relational Sociology: The Case of Chinese Party-State Formation, 1920-1953

Taking its cue from Norbert Elias's methodological prescriptions for figurational analysis, the first part of this paper proposes a novel methodological framework for relational and processual sociology. Through a critical discussion of Michael Mann's celebrated, but static-substantialist Neo-Weberian framework, we develop a Neo-Eliasian model of analysis based on four crucial techniques: 1) disaggregating research objects, 2) constructing phase models, 3) emphasizing constitutive social relations, and 4) specifying figurational matrices. The second part illustrates the framework in action by engaging with one empirical case study: the formation of the People's Republic of China. We thus apply the model to discuss how the Communist Party of China (CCP) developed from an informal network of fewer than 100 individuals into a state elite in little more than three decades. We propose a testable 'phase model' of CCP development between 1920 and 1953 to show how the CCP did not enter the scene as a fully formed historical 'agent', but only gradually became constituted as one through shifting friend/enemy relations with the Soviet Union, the Nationalist Party (KMT), Japan, and the US. We distinguish three phases, each marked by the gradual, contested breakthrough of a new strategy for strengthening CCP power through popular mobilization: urban worker-based Bolshevization until Chiang Kai-Shek's crackdown on the CCP in 1927, peasant-based guerrillafication until the Red Army's successful Manchurian Campaign in the civil war against KMT in late 1948, and finally 'national-popular' statification until the stalemate with the US in the Korean War in 1953. Thus, we reject conventional knowledge that the Second United Front (late 1937) and the 'Liberation' of 1949 should be treated as 'turning points'.

The Politics of Difference: Union Responses and Attitudes Towards Migrant Workers in a Post Migrant Labour Regime

"The Soviet had to develop out of an organisation that bound workers together, regardless of their union, regardless of whether they were even in unions, around the point of production, an organisation that united their struggles with those other workers linked to them in the productive process, an organisation that could express their growing awareness of their unity, strength and ability to control production" (Gramsci cited in Harman, 2006:5)

In light of the statement above, this paper examines union responses and attitudes towards vulnerable and precarious workers in the shadow of globalisation. Various categories of 'at risk' workers have emerged in the 21st century; casual, out-sourced, labour brokered, seasonal, permanent temporary and immigrants. While all are vulnerable, it is important to accentuate the fact that workers as a social group are not homogenous and that the level and magnitude of exploitation varies. Besides 'bread and butter' issues, at the core of foreign workers' struggle is the issue of migration status (documentation) which to a greater degree underpins vulnerability and exploitation and xenophobia. In particular, this paper looks at union responses to immigrant workers in a post migrant labour regime. In his theory of hegemony, Gramsci argues that economic needs are not the only stimulant to mobilisation of workers as there exist other subtle factors. Thus, using ethnographic methods and through in-depth interviews with union officials, migrant rights organisations (MROs) and migrant workers in South Africa, this paper, argues that in their organising efforts, unions need to take into account the politics of difference and further examine the intersectionality of class in relation to other social markers such as ethnicity, nationality, regionalism, race, gender, education, age, religion, xenophobia including employment contracts.

MUNASINGHE, VIDURA* (*University of Colombo*)

Imagining a Homogenous Sinhala-Buddhist Sri Lanka in the Post Independent Era

When the independent Sri Lankan (then Ceylon) nation state was created it was intended to become a secular state. British took steps to introduce a secular constitution. By that time civil administration institutions had the experience of functioning almost half a century as pure secular institutions. As the secular thesis assumed, privatization of religion and restricting it to the private sphere as a mere spiritual matter was seemed inevitable. But after the independence overwhelming majority of the Buddhist population continuously demanded for the state recognition of Buddhist supremacy. Constitution, other legislations, governmental practices and policies were changed with the peoples' demand. Any policy change, claims for rights or even the demands for social justice could not be successfully legitimized in this new context, if it is not framed as something for the benefit for the newly coined Sinhala-Buddhist ethno-religious identity. Ultimately this led to a situation where all the non-Buddhist people have been treated as 'Homo sacer' in ancient Rome.

This paper examines the reasons behind this anti-secularist approach of Sri Lankan state by analyzing the nation building process of Sri Lanka in the light of Partha Chatterjee's concepts on the post-colonial nation building. Accordingly Sri Lankan nation state is understood as a Sinhala-Buddhist homogeneous imagined community which was created through the process of inner domain nationalism of Buddhist revival movement in the late 19th and early 20th century which later transferred into outer domain nationalism of Sinhala-Buddhist supremacy politics in the post-independent era. Accordingly any claim to be convinced in today's context has to be framed as something in accordance with the Sinhala-Buddhism. Thus the post independent Sri Lankan state has gradually shifted from the secular norms and become a religious state although it is still reluctant to accept the label of 'religious state'.

Social Theorizing and Human Cognition: Challenges to Integrative Strategies

I A common way of tackling the issues of theorizing in the social sciences is by assuming that they seek to understand human actions and their consequences. Accordingly, in the social sciences there has been a broad agreement on the basis that the descriptive categories that common sense has used since the dawn of history are the right ones. Folk psychology tells us that people do the things they do roughly because they want certain ends and believe these acts will help attain them. However, beliefs and desires may be understood as causes, but we can never find descriptions of them independent enough from one another to enable us to frame laws about them that do justice to the demand for improvements in predictive power. Problems of rational choice as a formalization of folk psychology are a good example of this. II On the other hand, the behaviourist program tried to deal with the problems of folk psychology by avoiding intentionality. It was a theoretical attempt that left an imprint in significant areas of the social sciences, but in the end was unable to overcome the explanatory and predictive limitations of folk psychology. III The hypothesis that new evidences in human cognition research could provide relevant answers to these unsolved problems deserves to be explored. We need to clarify how evolutionary psychology and social neurosciences, whether by focusing on the evolved information-processing mechanisms that comprise the human mind or by directing how biological systems implement social processes and behaviour, would supply the necessary causal connection between human cognition and the complex, irreducible social and cultural phenomena studied by sociologists, economists, anthropologists, and historians. IV We must take into account every serious attempt to overcome causal isolation in social theorizing. This also implies to integrate and reconstruct classical sociological works' understandings.

Una Propuesta Metodológica Para El Estudio De Las Desigualdades Sociales Desde Un Enfoque Biográfico Comparado.

Esta presentación desarrolla una propuesta metodológica para el estudio de desigualdades sociales con perspectiva comparada entre países que presentan desarrollos diversos desde el punto de vista de la presencia del Estado Benefactor y de políticas de protección social que se implementan con posterioridad a la crisis de 2008 en Europa y a las respuestas de protección generadas por los países en Latinoamérica.

La propuesta incorpora activamente al enfoque biográfico como una perspectiva teórica-metodológica atinente para el estudio de desigualdades sociales en clave comparada, analizando trayectorias de desigualdades de distintos grupos en diferentes países. Lo anterior permite, a esta propuesta metodológica dialogar con los estudios de desigualdad, movilidad y estructura de clases que desarrollan los investigadores asociados al proyecto INCASI- MSCA- RISE 2015 H2020. (Coubes, Solís y Zavala, 2017; Boado, 2016 y Gil, Marquez y Fachelli, 2017).

Los grupos de estudio serán contruidos a partir de las categorías que han levantado otras investigaciones sobre estructura social en distintos países, tomando como referente las categorías ocupacionales, de clase, de género, entre otras. Se pondrá especial énfasis en las inteseccionalidades entre generaciones, clase, género y raza. Para la construcción de estos grupos se incorporará más activamente esta última dimensión en los análisis comparados. Los marcos de comparación de los países se construyen a partir de una mirada general en torno al estado Benefactor y en particular sobre un conjunto de políticas que serán la base de la arquitectura de bienestar a comparar que han tenido mayor incidencia en los países con posterioridad al año 2008.

En el marco de las políticas adquieren especial preponderancia en esta propuesta ciertas políticas de fomento y protección del empleo; políticas de terminalidad educativa y de retención escolar; y políticas de articulación de educación y trabajo.

Juvenicidio: Las Vidas Precarias De Los/Las Jóvenes En América Latina

La palabra "juvenicidio" tiene estrecha relación con el feminicidio. No se trata solamente de asesinatos –casi siempre atroces– llamados "ejecuciones extrajudiciales", acompañados de "desapariciones forzadas" y múltiples formas de tortura..., sino de otras muchas formas de atentar contra la vida de los/las jóvenes: la precariedad laboral, la exclusión de la vida pública, el silenciamiento y satanización en los medios de comunicación, las limitaciones a sus derechos, la prohibición de la movilidad dentro de territorios acotados, el cercenamiento de las libertades, la abierta represión. Podemos ampliar el sentido de la noción de juvenicidio –más allá de la eliminación brutal– a las formas socialmente aceptables de quitarles la vida, de amputarles la posibilidad de vivir una vida digna y con sentido, de negarles una imagen con contenido de verdad, de representarles como pre-delinquentes o como causantes de peligro para la sociedad entera. Además del juvenicidio entendido como eliminación física también debemos hablar del juvenicidio social y moral, del juvenicidio simbólico, no menos violentos e inhumanos.

Diversas formas del juvenicidio están a la vista en Colombia y América Latina, toda una gama de situaciones conexas con la vulneración a los derechos humanos más elementales. Pondremos el foco de esta ponencia en tres categorías centrales que permiten comprender el concepto juvenicidio: necropolítica, estado penal y crímenes de estado.

En Colombia han sido notables los llamados "falsos positivos". En otras ciudades, como Lima, Guayaquil, Buenos Aires, México, Rio de Janeiro, San Salvador; así como en lugares más recónditos (como Ayotzinapa) muchas de estas matanzas siguen en la impunidad, no se investigaron por razones de 'estado'. La sociedad no ha entendido que se trata de prácticas sistemáticas y bien camufladas en defensa de la sacrosanta "seguridad" (de sectores dominantes, nunca nombrados).

Women and Conditional Cash Transfer Programs in Chile: Dilemmas, Tensions and Challenges

Conditional Cash Transfer (CCTs) programs are one of the most important public policy instruments aimed at reducing poverty in Latin America. Women play a central role in CCTs because they are usually in charge of managing the transfers and, at the same time, they are held accountable for complying with the conditionalities. Although Chilean macroeconomic indicators show a significant decline in monetary poverty, the analysis of the implications of these programs on women's capability development and empowerment processes has led critical and divergent readings. This article will deal with the "social maternalism" aspects of these policies and the challenges they entail for the de-commodification and de-familiarization of welfare. It also addresses some dilemmas and tensions in the processes of furthering women's autonomy, agency and basic capabilities. In particular, we will delve into the relationships between conditional transfers, women's double working day, the sexual division of labor, and care in a country with a market-based welfare provision regime. This article builds on the results of a case study in the city of Viña del Mar, Chile, as well as semi-structured interviews with experts and in-depth interviews with participant women. The data comes from a qualitative longitudinal panel study spanning 12 years of implementation of public policies linked to the Chilean social protection model.

The Rise of Anxiety: A Discussion on Youth Mental Health

This paper traces the social historical developments of anxiety diagnostic criteria and its treatment throughout the twentieth and early twenty-first

century. Specifically, the paper looks at how these developments have affected the organization of youth mental health systems and how youth are treated for anxiety today.

A major philosophical shift took place during the twentieth century; psychiatric diagnostic categories for anxiety expanded greatly and the treatment of these conditions began to be interpreted within the bio-medical model of care. Pharmacotherapy, which was once considered a "taboo" for children and youth, by the turn of the century, had begun to be a commonly accepted form of treatment for mood and anxiety conditions.

This review of social-historical literature was interpreted alongside data collected for the ACCESS-Mental Health project, a qualitative study of the youth mental health system in Atlantic Canada conducted by Dr. Kate Tilleczek and the Young Lives Research Laboratory. In this study, youth participants expressed ongoing tensions and increased marginalization as they navigated mental health systems and negotiated their access to treatment options for anxiety.

Anxiety in the twenty-first century has become ubiquitous among young people, with high rates of emergency department visits and prescriptions for psychotropic medications in Canada. The shift toward a bio-medical understanding of anxiety, with the expansion of diagnostic categories, has created the potential to reduce stigma and increase mental health treatment options. However, if mental health systems today are not equitable for youth, did these shifts improve the psychiatric discourse and treatment of youth anxiety; or have youth positions in mental health system been further marginalized, with limited and inadequate treatment options made available?

Gender Difference on Policy Preference and Social Status: Attitude on Restoration Policy and Nuclear Problem after the Great East Japan Earthquake

The post-disaster restoration and nuclear plant reactivation are important major issues in Japan after the 2011 Great East Japan Earthquake. However, the association between these policy preferences and gender or social stratification is not clear. This study uses original survey data from three areas, Fukushima city, Sendai, and Tokyo in 2014 and 2015, to examine the relationship between a person's social status and his/her policy preferences. Total sample size was 5400 and the response rate was 65%. The main hypothesis is that age, sex, and a person's social position are related to level of post-disaster policy preference. I consider economic resource, relational resources (having networks with influential people), informational resources (year of education), and some other variables.

On the result, the determinants of view on the pace of restoration are age, sense of social unfairness, gender role value, and political efficacy. Disaster related variables (e.g., evacuation, radiation area dummy) were also significant, as well as residence year. It means local origin people tend to say the pace is slow. There is an effect of age, sex and radiation area on nuclear policy preference. Older people and women are negative for nuclear power. It means older people have stronger memory of nuclear bombs at the World War II and they tend to think much serious about the negative side of nuclear energy. There is a possibility that women's social network is unique, and they are much concerned for negative effect of radiation problem because they are interested in pregnancy and child care more in general. Possibly women are interested in people who have evacuated from the nuclear power plant are because they have more experience of volunteer work or they have more information about them through friend and social network. I discuss possible causal mechanisms in the results.

Análisis De Las Creencias y La Percepción Del Contexto Social En Cadetes Argentinos

Para entender las conductas de las personas, sean éstas funcionales o disfuncionales, es necesario considerarlas como el resultado de aspectos culturales, tales como los valores, creencias y expectativas, y de los procesos psicológicos que aquellos moldean. En este sentido, es necesario conocer los valores, las creencias y las ideologías que predominan en un entorno determinado dado que los distintos patrones culturales generan diferencias intra e interculturales en relación a distintas problemáticas sociales, siendo una de ellas, el delito y la inseguridad. En este marco se desarrolló un estudio empírico con el objetivo de explorar la relación entre la percepción del contexto social, las creencias y los valores con distintos indicadores de inseguridad ciudadana. La muestra, no probabilística intencional, estuvo compuesta por 249 cadetes de una institución militar argentina. Los datos muestran niveles óptimos de bienestar social, sobre todo en lo que refiere a la contribución social. Sin embargo, los cadetes perciben que las emociones negativas son las que sobrepasan en el ambiente, dando cuenta de un clima emocional negativo. Se vivencia que la forma de resolver los conflictos es a través de la violencia, que el mecanismo del

respeto mutuo no es lo que prevalece y que hay una sensación de enojo, rabia y desesperanza. De manera coherente, la confianza en las instituciones políticas es muy baja así como lo es la percepción del predominio de emociones positivas en el entorno. Si bien el miedo al delito es bajo, la percepción de riesgo es alta y se exhibe una alta frecuencia de conductas de auto-protección, en especial de tipo prudente. Por último, se verifica que la percepción de inseguridad reduce el bienestar, la confianza institucional y la percepción del clima emocional de los cadetes, así como aumenta los niveles de conservación, de dominancia social y autoritarismo.

Emerging Hybrid Areas of Work in Italy: Blurring Boundaries between Self-Employment and Dependent Employment

Since the end of the 90s, the academic debate has focused on how processes of deregulation and flexibilisation have eroded the 'standard employment relationship' traditionally embodied in a (male) employee with an open-ended and full-time contract, and who enjoys the full protection of the welfare system. Specific attention has been paid to how the emerging 'grey zones' (Supiot, 1999; Countouris, 2007) have contributed to the creation of strongly segmented insider/outsider labour markets by inducing the growth of new forms of social inequality.

In our contribution, we intend to reflect on solo self-employment, a contractual arrangement which is growing apace in Europe, while the share of self-employed workers with employees remains relatively stable. We take the case of Italy, where solo self-employment represents 15% of the entire employed population. Moreover, Italy is one of the few European countries to have introduced new legal forms of employment in between self-employment and dependent employment.

Our findings are based on a qualitative study conducted in Northern Italy. Thirty narrative interviews have been realised with young-adult solo self-employed workers, with a tertiary education level, but experiencing different working conditions. Indeed, some research participants had a job consistent with their educational qualification and some others markedly distant from it.

The paper investigates, on the one side, the strategies enacted by solo self-employed workers to deal with the risks of their specific employment relations. On the other side, we analyse how the interviewed workers positioned their self-representation questioning the dominant discourse which counterposes (successful) self-entrepreneurs and (struggling) precarious workers.

In the conclusion, we discuss emerging social representations enacted by solo self-employed workers, who are not willing to be victimised, but who make explicit their difficulties in accessing social protection, as well as the fact that they miss a collective representation able to recount their working conditions.

MURJI, KARIM* (*University of West London*)

Rioting and the Politics of Crisis

This paper draws on selected explanatory accounts of rioting that occurred in England in 2011 for the purpose of illustrating the ways in which scholarly critiques frame quite different senses of what kind of 'crisis' the riots represented. On one side the riots are understood within a 'race and policing' frame placing in a line of continuity with events across time and space and in an on-going crisis of racial subjugation. In direct contrast, another side treats the riots as a crisis of post-politics, in which nihilism has replaced purposive political action. While different types of politics are centred in both approaches, they differ remarkably in relation to racism, with the latter treating race as epiphenomenal. These frames are instances of how critical scholarly understandings draw on events, and it is argued they miss potentially far reaching senses of 'crisis' that can be drawn out of some aspects of rioting.

Digital Scholarship, Higher Education and the Future of the Public Intellectual

Since its heyday, the role of the public intellectual as traditionally understood has waned considerably, with less visibility accorded figures who assume this mantle in contemporary world affairs. This may be down to the fact that the modern notion of the intellectual embodies a set of social contradictions, contradictions that become magnified in a world of open access, social media and accelerated knowledge production. It may also have something to do with a decline in public sentiment for the sage on the stage figure, part of a broader decline in the legitimacy of academic knowledge more generally.

Another source of contradiction can be found in the fact that, in tandem with this general decline in public intellectualism, many universities have adopted an

explicit concern with achieving societal impact via its intellectual activities. These universities are increasingly involved in knowledge exchange activities as a strategic response to calls for greater public accountability, and also as a method of ensuring the institution's financial sustainability.

Given this current situation in which notions of engagement and knowledge transfer have taken centre stage in the search for impact, it is important to ask: what does the future hold for the public intellectual? And what is the role of the university when it comes to sustaining and enriching a broader intellectual culture in the public sphere? This paper explores these questions, particularly in the context of the spread of digital scholarship in the academy. This form of web-based academic scholarship, which valorises openness and public engagement, has the potential to change the shape and substance of public intellectualism. The paper explores this potential in detail, while at the same time outlining some of the challenges faced by the digital scholarship movement and its efforts to further 'publicise' intellectual life.

Biopolitical Tattooing As a Policy Paradigm: Securitization Creep and the Governance of the Contemporary State

Critical security studies scholars and political sociologists have increasingly drawn attention to the problem of securitization as an instrument of public policy, not only for individual invocations of "public security risks" as impetus for emergency powers, but also for the forward momentum that a security policy can create. As the invocation of security becomes institutionalized as a tool of public policy development, the space of public political discourse is reshaped. Giorgio Agamben's theory of the biopolitical tattoo offers a paradigm for understanding the forward creep of security in contemporary politics, as well as the limitations placed on political discourse as a result of the granting of emergency powers. As the invocation of security becomes institutionalized as a tool of public policy development, the space of public political discourse is reshaped. While many scholars discussing the claim of emergency powers in securitization theory have engaged Agamben, his theory of biopolitical tattooing receives only passing mention in securitization literature. The concept of biopolitical tattooing arises as an historical complement to Agamben's earlier theoretical arguments on the relationship of sovereign power to bare life. This paper builds on these prior works that have used Agamben's theories of bare life and sovereign power, as well as the literature on "spillover securitization" and "iterative securitization." By conceptualizing the public policy programme of the contemporary state through a paradigm of biopolitical tattooing, we are able to understand the ways in which these policy prescriptions relate to the state's claim to sovereign power over the citizenry whose security it claims to protect.

MURPHY, MICHAEL* (*University of Ottawa*)

Destituent Resistance: Irregular Migrants As Paradigm of Agamben's Coming Politics

In a 1993 article "Beyond Human Rights," Giorgio Agamben identified the refugee as limit-concept for the nation state that would inevitably clear the way for a radical renewal of categories of politics, society, and human rights. Over the next two decades, he would continue his investigation into the contemporary Western experience called the Homo Sacer project, finishing with *The Use of Bodies*. It is here that he provides a theoretical sketch of his politics to come, a project of "destituent potential" that breaks the dialectic of power that enables sovereign violence against citizen and refugee alike. This theorization of the coming politics offers little in terms of practical examples; however, by turning to the everyday practices of irregular migrants, we can develop a more concrete understanding of what Agamben sees as the politics to come. In this sense, we are moving from the object of critique—the contemporary West embodied in the legal category of the refugee—to the extrajudicial coming politics—towards a destituent potentiality that finds its paradigm in the irregular migrants. Just as Marx and Engels saw the capitalist bourgeoisie creating their own gravediggers through exploitation of the proletariat, the Western response of shoring up border controls in the face of the "refugee crisis" has created the very environment for destituent resistance to expose the foundational crisis of sovereignty. Through a review of recent studies of everyday practices of resistance by irregular migrants, this paper will address two connected literatures: 1) by taking the case of the irregular migrant, I will engage social and political theorists engaged in questions of the practical application of Agamben's theory of the coming politics, and 2) engaging sociologists of migration and critical migration scholars with the "later Agamben," following the rich literature surrounding early works like *Homo Sacer*.

MURPHY, RAYMOND* (*University of Ottawa*)

Social Closure in the Anthropocene: The Environment As a Medium for Monopolisation and Exclusion

This paper introduces the Weberian concept of social closure to environmental sociology, and argues it helps elucidate the drivers of environmental problems, victimisation from them, and the resulting reaction. Closure refers to the process whereby one group monopolizes resources thereby closing off opportunities to others. It enabled Weber to analyse property classes, status groups based on race, gender, religion, ethnicity, etc., and the reaction of the excluded using one overarching coherent framework. The paper analyses emerging environmental social closure involving the appropriation of biophysical resources, including waste sinks, by the present generation disproportionately benefiting some, resulting in the risk of excluding latecomers from such benefits: 'issues of climate justice include the excluded non-living generations, who are going to suffer most' (Beck). The global biophysical environment constitutes a commons that present and future generations share, and is a medium that carries social relations of monopolisation and exclusion from risk makers to risk takers across space and between generations over time. Giving priority to near-term economic benefits to the exclusion of long-term costs constitutes social closure embedded in culture, practices, and physical infrastructures. Waste and pollution are dumped into "land fill", "atmosphere fill", and "ocean fill" to diminish present costs of production. Monopolisation of resources by high consuming humans also excludes other species from resources and habitats they need, resulting in high rates of human-induced extinction. Reaction against such environmental closure is led by environmental movements, impact scientists, social democratic governments, and nature as an actant whose biophysical dynamics can strike back against their manipulation by humans, and destabilize monopolies. Human activities driven by monopolisation are unleashing new frequencies and intensities of biophysical forces and letting loose threatening new constructions of nature, thereby socially constructing uncertainty about the consequences, with one possibility being the Anthropocene undermining itself.

Capitalism and the Body

Capitalism and the Body

What is capitalism doing now to the human body?

We argue that capital in its current neoliberal manifestation organizes the body to maximize profits. As such, it demands that bodies continuously *produce*: during work and during leisure. As consumer-producers, subjects in neoliberalism are always embedded in circuits of capital flows; it makes no difference if one is behind or in front of the counter. There is no possibility to negate exploitation - even apparent 'non-productive' activities, such as playing games, drinking, sleep, all serve to recover the body for more labour production. We ask, what is the extent of the demands that capital has made in the past, and makes today, on the body. Why has this changed? And are the limits to a body being exposed now?

We identify three major limits capital faces in regards to the body: **limitations internal to the body**, such as sleep/wake cycles, necessity for social connection or attention span limitations; **limitations external to the body**, such as environmental conditions (pollution, displacement of people due to climate change); **limitations of the demands itself**, due to incoherent or impossible demands (e.g. desirability of both obesity-inducing fast food and of a healthy body).

We then ask, what mechanisms are in place to stabilize this ultimately dangerous and unsustainable system: from pharmacological enhancers (from caffeine to adderall, weight loss supplements, nutritional substitutes) to physical optimizers (gym memberships, electronic calorie and exercise trackers, dietary guidebooks). We surmise that those who fail to integrate and to generate profit, become 'subjects' through secondary pathways.

It is from within this framework that we look at how the *human body* fits into the system. What is demanded of this body? How does it adapt? Is this sustainable? Are these developments desirable? If so, why?

PEETZ, DAVID* (*Griffith University*)

The 'Gig Economy', Technology and Piece-Wages

According to Marx, a "capitalist working with improved but not yet generally adopted methods of production sells well below the market price, but above his (sic) individual rate of production: his rate of profit rises until competition levels it out". (*Capital* Vol. 3: 231) But this in itself is not enough to explain the rise of platform technology ('gig work') corporations. These corporations also rely upon cutting labour costs as a key mechanism for achieving competitive prices, and

they do this by redefining time-wages as piece-wages. Here Marx is relevant as "piece-wage is the form of wages most in harmony with the capitalist mode of production." (*Capital* Vol 1:797). The piece-work employer initially sells the product below market price in the hope they can do so until they have a monopoly. Shifts in the power of capital and labour have created opportunities for capitalists to shape labour markets with high rates of casualisation, insecure labour and contract work, and developments in digital technology have produced a vehicle that enables these opportunities to be exploited. Thus the piece-rate model of platform firms is viable in modern labour markets. However, the cutting of rates creates resistance not only from workers but also from the state (and even finance capital, whose patience is not infinite). Thus the sustainability of many platform firms depends on the outcomes of this resistance.

A Reflexive Analysis on the Use of Social Spatial Network Games (SSNG) and Pictures for Institutional Ethnography: The Case of Children Living Under Shared Custody Agreements.

This paper presents the mobilization of two specific methods inside an IE about *MobileKids: Children in Multi-Local, Post-Separation Families* (ERC Starting Grant project – supervision: Prof. Laura Merla). The aim of this ongoing study is to grasp the standpoint of children living under equal shared custody agreements – particularly as children's own accounts and experiences of contemporary changes have largely been overlooked up to now. Considering children as active social actors that can, to various extents, exercise agency and influence on their own lives as well as on the lives of the people surrounding them, I look at the *process* of moving from one house to the other every week and ask *how* children maneuver inside this mobility. The specificity of this project lies in the parallelization between the analysis of the textual material present in the work that is done to move from one place of residence to the other, with an explicit production of texts by the children. To grasp their standpoint, I develop a sequential set of activities that represent creative ways to open their narratives about their everyday lives: (1) A session with Social Spatial Network Games (SSNG) – a kind of board game where children can concretely construct their experience of their multi-local everyday life; (2) children are asked to take pictures during the action of moving from one house to the other and we go over the meaning behind them; (3) I participate in the double move – from one parent's house to the other's, and back. In this paper, I shall reflexively and critically address the use of SSNG and pictures, which represent texts of a particular nature: they hold discursive meaning about the children's standpoint yet are not initially present in their everyday lives, as they are a production of the research design.

Conceptualizing Ethical Moral Capacity for Sustainable Decision Making about Public Energy Technology

National level acquisition and application of energy technology impacts the general people. The technology to improve the quality of life of general public is public technology. Ethical Moral Capacity (EMC) of decision makers takes to sustainable position available to the decision making process for public technology. Mostly decision support systems are comprised of information technology, economic, socio-political, or aptitude dynamics; while ignoring the dynamic of EMC of decision makers. EMC connotes the sense of care in the decision makers' thought, word and action would impact the relative individual, group, society or nation in space and time. EMC implies to make and act right decisions. The enhanced level of EMC may help to acquire better public technology. The assumption sets to harness the question: How to enhance EMC for sustainable decision making to acquire and apply public technology? The specific objective of this study is to explore the link between EMC and sustainable decision making and to assess the manifestation of EMC trend for acquisition and application of technology. The study utilizes the Focused Delphi to explore the link between EMC and sustainable decision making; and Delphi Exploratory measures the manifestation of EMC among the decision makers for sustainable decision making in contact to energy technology. EMC is offered here as an unrecognized conceptualization in the field of decision making and technology. The study would be an addition in the ethics and technology literature.

Ecofeminist Pragmatism of Female Founders in Sociology As Source of Women Empowerment in Academia and Society

First female philosopher Hypathia and her tragic death is less known while as Minoan era of governing the island Creta represents the egalitarian society, in

which females were equal as men, in profession, life and family. It is necessary to conduct the deconstruction and demistification of patriarchal approaches to society and education, in order to form contemporary sociological theory involving the female authors and their accomplishments. The ecofeminist movement was founded during the radical and turbulent social changes of the early 1980s. The aftermath of war, global environmental movements and minority rights movements have joined forces to create significant subversion and an imitative position towards the patriarchally-based theories. Major sociologist author and pragmatist, Nobel Prize Winner, who gained doctoral degree from Yale University and organized Hull House project for investigating the immigrant behaviour, influenced the ecofeminist pragmatism of the Charlotte P. Gilman, and Caroline Bartlett Crane. This position is later on found in works of famous neocofeminist and sociologists such as Ariell Salleh, Marija Geiger Zeman, Ivanka Buzov, and their ancestors, authors from different fields such as Val Plumwood, Karen J. Warren, Martha Kheel, Yenestra King, Françoise d'Eaubonne and Vandana Shiva have written about the ecological feminist movement, drawing attention to the need for scientific cognition of the way in which the logic of domination and oppression of women and nature is institutionalized. It is necessary to conduct the deconstruction and demistification of patriarchal approaches to society and education, in order to form contemporary sociological theory involving the female authors and their accomplishments.

Youth Work in a Colonized Context: Possibilities and Challenges- Case of Palestine

Youth work in Palestine is shaped with many systems of power that can be divided into both political and social. These systems are shaping the type of interventions, the ability of youth work to be affective tool for empowerment and inclusion. With regards to political front, youth work has to function in a setting of colonization, and internal Palestinian political division. On a social setting, the Palestinian society is similar to other Arab countries where it is functioning in a patriarchal society where power structures are based on age and gender, and has high level of poverty and unemployment, etc... Further, youth organizations interventions were related to enhance young people participation in local societies, tackle some aspects with regards of youth employability, and enhance their involvement in setting policies. Issues of gender, violence for example are seen as aspects to increase awareness about, yet still not perceived as structural factor to tackle. On political aspects, most organizations presents its work as unpolitical and their interventions on the political may be considered as shy practices due to the high risk that is faced. This created a division between youth and organizations, and there have been an increase in youth led initiatives that are introducing new visions on the ground for how youth work should be shaped. This raises a concern about youth work in Palestine and how it can be an approach not only for youth inclusion, but for decolonization. This research will explore the challenges and possibilities of youth work in a colonized context; It will identify with youth and youth workers what can be done differently so youth work can be a tool for liberation of young people within the systems of power whether political or social.

Regretting Motherhood As a Counter-Narrative Towards Therapeutic Cultures of Motherhood

During recent years, the deconstructing the motherhood myth has been visibly present in public discussion, in blogs and tv-shows that deal with issues regarding motherhood. It is becoming increasingly acceptable to discuss the 'forbidden emotions' of motherhood - to say that motherhood is not always wonderful or fulfilling. Mothers can complain about children going through terrible twos, lament over lack of time and criticise the pressures caused by the cultural ideal of intensive mothering. Even though these forbidden emotions have become more accepted, mothers are still in many ways attached to the ideal and practice of "good mothering". In our analysis we are interested in emotions and experiences regarding regretting motherhood, as they appear in a popular Finnish anonymous online discussion board vauva.fi. We are interested particularly on the narratives and counter-narratives that can be extracted from our data.

In the data, women who express regretting motherhood compare their emotions and actions with the cultural narrative of intensive mothering. The narratives lay out how in current cultural understanding of motherhood, it is acceptable to talk about the temporary difficulties of motherhood. Thus negative emotions, such as exhaustion and frustration, may be expressed. Expressing these feelings are entangled with therapeutic cultures, which promise that even though motherhood is complex and sometimes difficult, one can overcome these problems by talking about them and by (professional) help. The promise of therapeutic culture is that eventually, the love one feels towards one's child makes all the negative emotions and hard labour worth it. This is what we call therapeutic understanding

of motherhood. However, the women who express regretting motherhood neglect the therapeutic promise of overcoming negative feelings. Instead they build their own counter-narrative - where their regret is an embodied experience, a permanent state, where non-motherhood could be described even as an identity.

Women's Labour Market (dis)Advantage in Nordic Welfare States: Reconsidering the Welfare State Paradox

Women-friendliness has been described as one of the normative foundations of Nordic welfare states. Publicly funded welfare services and policies facilitate the reconciliation of work and family and promote women's labour market participation, especially those of lower income levels. However, the policies that are perceived as women-friendly can also have unfavourable consequences for women themselves. According to institutional theories (Varieties of Capitalism) women in Nordic labour markets face more difficulties in their career progression when compared to their female counterparts in less regulated labour markets and less generous welfare states. Glass ceilings and glass doors would persist in Nordic countries due to family leaves and segregated labour markets. Further, generous family policy framework is supposed to have classed effects, hindering especially the career progress of highly educated women in higher skilled occupations. This controversial phenomenon has been identified as the "welfare state paradox" (Mandel & Semyonov 2006), paradox which has gained both support and criticism in comparative studies. According to critics, the earlier results supporting the welfare state paradox have not been evaluated closely enough and much of the data used to support welfare state paradox is rather old, from the 1990's.

The aim of this paper is to look reconsider the hypothesis on women's higher disadvantage in occupational achievements in Nordic countries. First, this paper provides a critical literature review to most recent research evaluating the persistence of welfare state paradox argument, taking into account the gender-class nexus. Second, using European Working Conditions Survey (EWCS 2015) the paper analyses the gender gap in Nordic work life from comparative perspective: are women in Nordic countries more disadvantaged in terms of career achievements, supervisory and managerial positions, and quality of jobs? Preliminary findings are point towards diminishing but surprisingly wide and persistent gender gap in Nordic work life.

Factors of Code Switching Among Bilingual English Students in the University Classroom in Malaysia

This study aims to identify and evaluate the factors that affect code switching in the university classroom in Malaysia. The participants of the study comprised twenty bilingual international students studying in a language college in Malaysia. The data were gathered by mean of semi-structured interview with the students and classroom observation. The findings from the study revealed that the primary factor of code switching in international classroom is incompetence in the second language. Other noted factors were: to maintain privacy; to make it easier to speak in their own language than to speak in English; to avoid misunderstanding; being unfamiliar with similar words in English. However, code switching can be a useful strategy in classroom interaction if the aim is to make meaning clear and to transfer the knowledge to students in an efficient way. This study can have some implications for language learners, teachers and curriculum developers.

A Game Theoretical Analysis on Linkage between Groups Relation and Individuals Relation

Although Georg Simmel emphasized the three layers of society that are individual, organization, and society, there are few socio-mathematical or rational-choice models assuming the three layers in the previous research. Then I build up such a model using the game theory and social dilemma theory, aiming to explicate the complicated linkage between inter-groups interaction and inter-individuals interaction. Assume that the society in this model is composed of two groups named A, B that may be nations, companies, communities, organizations and so on. Assume that each group is composed of many individuals as members who play a kind of an N-person chicken game similar to social dilemma. Assume that the individuals rationally choose their action (Cooperate or Defect), whereas the Groups have no choice. The action of group A member influences not only the same group (A) members but also the other group (B) members through the cooperation rate of the group A. Assuming the groups to be nations, the cooperation rate of the nation may mean military power. High cooperation rate of nation A may let down the nation B members' payoffs through the war between

nation A and B. Cooperation may be not only good for self-group but also bad for other-group. The ambivalent nature of cooperation will be very familiar to us in our daily life but it has almost not been modeled. From above assumptions I show what happens in this model society.

"Sleeping with the Fishes": A Canadian Spectacle of Ethnicity and Crime in Dramatic Television

Embedded within the crime-enthused narratives of modern and traditional television lies a cavernous public obsession with the Italian mob boss. Displaying a fierce family loyalty, built on values of honour, prestige and retribution this glamorised figure is repeatedly revered as the grand patriarch, entrepreneurial genius and nucleus of a well-oiled criminal organisation. The pervasive ambiguities and idleness of liquid modernity generate a milieu wherein the audiences' insatiable appetite for transgressive familiarity is perpetually fuelled by mafia-centered storylines. The viewer is encouraged to temporarily disengage from their unrelenting, habitual fears and enlist in the ranks of these celebrated outlaws. Joining the extensive American productions of gangster representations, such as *The Godfather* film trilogy (1972-1990) and *The Sopranos* television drama (1999-2007), the new Canadian mini-series, *Bad Blood* (2017), works to depict the life and death of the real-life Montreal mob boss Vito Rizzuto (1946-2013). Though highly stylised, dramatised and infused with fictional elements, this series highlights the illicit enterprises and corruption that constitute the quagmire of Canada's intersecting worlds of business, politics, crime and law enforcement.

Addressing myths of organised crime, this paper attends to elements of ethnicity, spectacle and allurements infused in the six-episodes of the *Bad Blood* production. Referencing the recent trend in re-capturing the infamous stories of aberrant figures, such as *The People v. O.J. Simpson: American Crime Story* (2016) and *Law and Order True Crime: The Menendez Murders* (2017), we contend a process of audience pacification is underway within the docu-reality crime genre. The inclusion of celebrity, within all of these representations, only serves to re-exoticise the stereotypical images of glamorous lawbreakers. We are forever sleeping with the (televised) fishes!

Gendered Aboriginal-Immigrant-White Relations in the Canadian North: College Faculty Perspectives

Literature on the Canadian North, where several land claim agreements have been settled in the past few decades, is typically written from a patriarchal neoliberal economic development perspective that valorizes Aboriginal peoples who have made "progress" in successful industrial ventures as well as encouraging new Canadians to move to and work in the North. In sharp contrast, in a study of public colleges that included interior British Columbia, Saskatchewan, Manitoba and Labrador, it was discovered that several colleges have made it their goal to enshrine Indigenous knowledges (IK) in their curricula. What does it mean to grow up female and Aboriginal in such societies? Questions of gender and inter-ethnic relations examined by Cynthia Joseph in her study of Malaysia, are explored here from the perspective of faculty in Canadian colleges where the surrounding population is predominantly Aboriginal. There is a contradiction between the work and lives of those who teach literacy, early childhood education, nursing and self-determination from Aboriginal perspectives as compared to those who teach technology, trades, and business, oriented towards exploitation of local resources. Personal stories that involve celebration of Elder involvement in Canadian military service, White authorities attempting to remove children from Aboriginal families, and the challenges of engaging Aboriginal youth in literacy and IK education intrude on stories of Aboriginal communities caring for new immigrant families who have migrated to the north and who are eagerly involved in participating in Aboriginal activities. There has been a strong feminist standpoint in postcolonial studies of development historically, and this paper follows in this tradition, emphasizing the contradictions evident from the multiple perspectives present as compared to racist multiculturalist approach of colleges in southern parts of Canada.

Talking about Disability: Gains and Challenges in an African Context

In Kenya, as in many other parts of the world, disability in the traditional society was generally associated with factors such as curses, witchcraft, and punishment from the gods. Among the Masaai of Kenya, for example, children and adults living with disabilities were viewed as a bad omen to the society and labelled *oloibe enkai*, meaning "one hated by God". Thus, people living with disability were subjected to ridicule, rejection, ostracization, torture and even death in extreme cases. It is not surprising, therefore, that the terms used to refer to the various forms of disability were, and in many cases still are, less than flattering. However, among people with or without disability, there is no unanimity on what constitutes offensive terms in disability terminology. There is also variability among cultures and geographical regions. This paper sought to find out how the Agikuyu, a Bantu speaking community in Kenya, conceptualize and encode disability through language. Data in the form of expressions that refer to various forms of handicaps was collected through vernacular radio and television stations. Moreover, respondents were interviewed on their views about the said terms. The findings showed that nearly all the terms used to refer to disability are negative. Morphological evidence indicated that in most cases such terms have pejorative markers. It also emerged that opinion was divided on whether these terms are offensive or not. There were those who felt that one is simply calling a spade a spade in a context where the language hardly provides the cushion of euphemisms. Conversely, others felt that it is better to use descriptors that are more palatable. This is the direction the media has taken, probably due the rigorous campaigns by the National Council for Persons with Disability. The paper recommends that that is the way to go.

Handicraft Making, Community, and Livability from the Women's Perspective

In this paper I will explore how handicraft making, spirituality and participation in charity are affecting to the experienced well-being of women making handicrafts. I will also discuss the role of the group in the matter and its affects to the social livability. Based on earlier research handicraft making have strong impacts on not only individual well-being but also the whole community. Also religion and spirituality, community, as well as charity and doing good for others are seen as factors of well-being. In this paper I will look at all of these together. The paper is qualitative and based on the yearlong observation period of four handicraft-making groups as well as the interviews of sixteen crafting women from these groups. Groups included both religious/non-religious and charity/non-charity groups. I found that women give a variety of meanings, including well-being related to the handicraft making. It was also given spiritual meanings, both religious and non-religious. Getting friends and being part of the community was an important part of handicraft making and doing for charity was meaningful for some of the women. In this paper I am asking what kind of aspects of well-being and livability are relating to the handicraft making. In what extent is handicraft making and experienced well-being related to the livability of the whole community? How both spirituality and charity are linking to the social livability when it comes to the handicraft making? And finally, what is the role of participating in the group and belonging to the community in the livability of the society and how the nature of the group influences it?

Educational Tracking and Inequality: Towards Equity in Education in the Caribbean

Educational Tracking and Inequality: Towards Equity in Education in the Caribbean

Despite gains in educational outcomes in Caribbean countries including achieving universal primary education enrolment, their educational systems, curricular and pedagogical practices continue to bear colonial imprints from over 500 years (Rush, 2011; Whiteman, 1994). Structural reforms and advancements have done little to remove disparities between post secondary educational outcomes of different socioeconomic groups, as children from higher socioeconomic backgrounds remain more likely to have higher educational attainments than those from lower socioeconomic backgrounds (OECD, 2012). This paper explores explicit school tracking (formal/overt division of students into different school types and features) and implicit school tracking (informal/subtle division of students into different school types and features) systems in Caribbean countries and how these influence inequalities in post secondary educational attainment between socioeconomic groups. Grounding our analysis in postcolonialism and Boudon's (1974) positional theory, and utilizing empirical research (including ethnography of marginalized group in 6 inner-city communities in Kingston and St. Andrew, Jamaica) along with educational data from national/regional statistics, we tease out practices that mitigate educational success. We argue for a regional educational action plan that dismantles systems and practices (such as school tracking) that perpetuate stratification and exclusion, and hinder many Caribbean children from optimizing their full potentials.

'Structurally Imposed Inertia': Explaining the Iatrogenic Effects of Awareness Raising Interventions Aimed to Prevent Child Sexual Exploitation (CSE)

Growing concern about child sexual exploitation (CSE) has been highlighted by recent incidents exposed in the media. Resultant official enquiries, inspections and case reviews have revealed institutional failures. Concomitantly, expanding use of online digital technologies has affected the way in which young people conduct their social relationships, generating moral concerns about the distribution of sexually explicit images.

To address public concerns, calls have been made for proactive pre-emptive action to address CSE. The UK Government's CSE Action Plan (Department for Education, 2011) proposes that awareness be raised among young people, parents, carers and potential perpetrators prompting a small number of exploratory criminal justice-led initiatives designed to prevent CSE.

Drawing on empirical research involving observations and in-depth interviews with members of a multi-agency team set up to prevent CSE and focus groups with young people, this paper identifies the iatrogenic effects of risk focused interventions. Informed by Beck's concept of 'organised irresponsibility', the findings reveal a 'structurally imposed inertia' that restricts the ways in which interventions are delivered and, therefore, the types of messages that are communicated.

A critical assessment of the strategies and techniques used within CSE initiatives suggests that embedded structural and societal problems are reduced down to the aberrant actions of recalcitrant individuals unwilling to accept offers of 'help and support'. This itself promotes a form of dramaturgical governance that detracts from failures to develop a legislative framework that enables rational discussion and tackles the underlying conditions that give rise to CSE in the first place. Furthermore, distinct binaries between appropriate and inappropriate sexual conduct are reinforced, such that only young people who follow the advice provided by such initiatives are included, and those who do not are silenced, limiting the capacity for agency and consideration of alternative sexual experiences that do not fit the dominant normative framework.

NABBALI, ESSYA* (*Independent scholar*)*Structural Adjustment As Metaphor and Lens: Considering the Recent Passage of the Mental Health Act in Ghana, or, an Emerging Space for "Mad" Studies Globally*

"We are at a point in our work when we can no longer ignore the empires and the imperial context in our studies." —Edward Said, *Culture and Imperialism* (London: Vintage, 1994)

On 1 December 2012, Ghana passed a Mental Health Act (Act 846) to replace legislation from 1972 that had never been implemented. It came, after eight years of advocacy and the technical support of the World Health Organization (WHO), with hope of transforming the mental healthcare system as it existed at the time of colonial rule.

Heralded as a major milestone in justice work, Act 846 promises to decentralize mental healthcare from the three psychiatric institutions, concentrated in urban centres along the southern coast, per colonialist investment patterns. Furthermore, it seeks to allow the provisions for private psychiatric facilities and to relegate the oversight of alternative forms of therapy to a governing body for whom the Chief Executive Officer is the Chief Psychiatrist. In other words, Act 846 advances the medicalization of madness or the idea of "mental illness" as biologically rather than socially (over)determined, finding "solutions" in psychiatry (and a multi-billion dollar psychopharmaceutical-industrial complex).

This paper considers the sociohistorical locationing of Ghana and the trajectory being heavily influenced by international relations, such as the WHO. But a closely related, and perhaps more pressing debate to the place of sovereign power in a global context is the space and very circulation of counter-politics. The past 50 years in Canada has witnessed a burgeoning field of critical "Mad" studies to challenge the (bio)politics of psychiatry. How might we contribute to concerns of the increasing rise of psychiatry (e.g. Mills 2014; Titchkosky & Aubrecht 2015) and business of madness (Burstow 2015) without reproducing the violence of intervention, adjustment, and therefore, empire?

RC15-292.3

NABBALI, ESSYA* (*Independent scholar*)*The Tale of Two Acts: Disability v. Mental Health Policy (and Activism) in Ghana*

On 1 December 2012, the Mental Health Act (Act 846) would be passed in Ghana and heralded as a "major milestone" in justice work. It came on the heels of the Persons with Disability Act (Act 715) and establishment of disability as a political category some six years earlier on 23 June 2006. Whereas the Persons with Disability Act fell to the Ministry of Gender, Children, & Social Protection, seeking rights and entitlements for disabled persons (especially around accessibility, employment, and education), the Mental Health Act was championed by the Ministry of Health and Chief Psychiatrist, perhaps above all.

Previous scholarship brings into stark relief the divide between critical mental health, or what has increasingly been called "mad," activism and the wider disability movement. In particular, philosophies of the mind and its health tend to prompt concerns of consciousness, sentience, and rationality, brimmed with fears of unpredictability and dangerousness. Such assumptions have carried serious consequences for personhood, legal capacity, and "risk" management, under auspices of health and care.

Working alongside such a body of studies, this paper foregrounds the discourses (and hopes) that have circled the Mental Health Act and confronts the boundary conflicts between the many disability advocates who joined calls in its wake.

NADERI, SARA* (*University of Victoria*)*Iranian Women in the Global Mirror: A Study on How the Media Representation of "Real" Can Change the Reality.*

Since the 1979 Revolution, the Islamic concepts of women rights and identity in Iran have been defined in sharp contrast with western feminist ideas of gender equality and equal rights. Supported by the Islamic government's rules and media, this new "Iranian Muslim Women's identity" emerged as one of the most important symbols of the new, collective Iranian national and religious identity. This image of "Iranian women's Islamic identity" as the landmark of the new political discourse has dominated western media and promoted as one of the main sign of resistance or adherence of Iranian society to the hegemonic Islamic state discourse.

In this paper, I aim at studying the influence of the binary image of Islamic against western values on women situation in Iran. I am going to historically trace changes of the portrayal of Iranian women's rights in western media since 1979

up to now. Simultaneously, I will probe the changes in Islamic state's policies and their influence on Iranian women's rights debates at the same period. In this respect, I will go through the public speeches of religious and political elites and their influential policies regarding women to see how these policies have changed over the time and if these changes were influenced by western media's image of Iranian women or not. Thus, in this paper, I will investigate the changes in the representation of Iranian women situations on western media on the one hand, and the influence of this Western portrayal of Iranian women on the internal debates of women's rights in Iran, on the other hand. In brief, I am going to see how the real situation of women in Iran has been influenced by the media image of that reality.

NAGAMATSU, NAMIE* (*Kwansei Gakuin University*)*Non-Standard Employment and Increasing Wage Inequality in Japan*

Wage inequality has increased and low-paid non-standard workers have surged since the 1980s in Japan. This paper investigates how increasing non-standard employment has caused recent trends in wage inequality using a novel methodology and data from the Employment Status Survey (1987 to 2012), a Japanese official survey conducted by the Ministry of Internal Affairs and Communications. In order to decompose changes in the distribution of wages from 1987 to 2012, distributional changes are divided into a wage structure effect and a composition effect using a reweighting method and recentered influence function regressions of the unconditional quantile. We find that the effects of non-standard employment on distributional changes are different between men and women. For men, wage structure effects and composition effects linked to employment status have contributed to an increase in wage inequality. Although a small portion of non-standard male workers is well-paid, an increase in non-standard workers has formed a cluster of low-wage workers, which has resulted in an increase in wage inequality. On the other hand, for women, the effects of non-standard employment have contributed to a decrease and an increase in wage inequality. Because few female non-standard workers earn a high wage, their wage distribution has become compressed at the top end of the distribution, which has led to a decrease in wage inequality. In the meantime, female non-standard employment has spread to a variety of industries and occupations and skilled non-standard workers have become indispensable in many workplaces. Despite many non-standard workers are still low-paid, their median wage has risen, which has caused an increase in wage inequality at the bottom end of the distribution. Our findings suggest that institutional factors such as non-standard employment matter for understanding recent trends in wage inequality in Japan.

NAGASHIMA, MIORI* (*Hokkaido University*)WATANABE, MAKOTO (*Hokkaido Bunkyo University*)RICHARDSON, PETER (*Hokkaido University*)WADA, MASAKO (*Hokkaido University*)*The Opening up of Koyasan in the Age of Globalization---a Study of Temple Lodgings---*

This study investigates how globalization in the form of increased numbers of overseas tourists affects traditional Japanese Buddhism by focusing on how temple lodgings on *Koyasan* deal in diverse ways with the rapid internationalization and capitalization of religious goods and services. The sacred mountain of Koyasan hosts 120 temples and a vast complex of tombstones, in addition to being the world headquarters of the Shingon Buddhist sect. Many of the temples on the mountain offer dedicated lodgings or *shukubo* providing devotees with a place to stay while participating in religious practices. These devotees were traditionally distributed among the shukubos according to the region of Japan they were from, but this system is currently undergoing change as a result of an increase in overseas tourists due to Koyasan's UNESCO World Heritage Site designation in 2004. Taking Shimazono's (1998) four models of religious relations as a starting point, we investigate how the shukubos have adapted in different ways to cope with this one particular effect of globalization. We begin with a quantitative analysis categorizing the shukubos according to their level of support for overseas tourists, such as the availability and type of English-language or multilingual versions of brochures and web sites. This is then combined with a qualitative approach using participant observation and interviews with monks, shukubo workers, and tourists. We found that their responses ranged from granting free access to international guests not familiar with Buddhism to the continuation of restricting access only to recognized believers. Our conclusion was that their degree of acceptance of globalization and their willingness to adapt was influenced by attitudes towards religious individualization (Beck 2010), the perceived relationship between faith and commerce, and the value assigned to the World Heritage designation.

Leisure Time: Meaningful or Addiction: A Case of Whats App

From the mid-19th century onwards, the availability of leisure time generally continued to increase. Whether watching television at home or taking a holiday for tourism, leisure –time activities have been increasingly influenced by technology. Technology, as a consequence, has become more and more connected with both the economical conditions for the possibility of leisure and with the actual leisure-time activities themselves. As the world gets faster and faster, the digital technology is trying to make things easy, faster and learning skill easier in a single day. WhatsApp has been one of the most active mobile messengers in the last few years. WhatsApp application is utilized by almost everyone using smartphone. Its free facility (along data service) to exchange text, photos, videos, forward jokes, and other information has resulted in excessive use.

Most of us are constantly engrossed in the virtual world, be it facebook, twitter or WhatsApp or anything else. This paper analyses the pattern of use of Whats App among University students. The internet plays a huge role in all aspects of our lives today: work, leisure gaming or staying in touch with our friends and relatives. While all of us are dependent on technology, many of us are addicts who pretend not to care or believe. We are spending more and more time to our virtual lives, which results in addiction.

Imagining Vidarbha : Analysis of Discourse on Social Networking Sites of Vidarbha As a Region

Vidarbha is a region in Eastern part of the Indian state of Maharashtra which comprises of Nagpur and Amravati Division. The region includes 11 districts of the state. This region is home to 31% of area and 21 % of population of Maharashtra (Census 2011). From many years people of Vidarbha had been demanding for a separate state. This is conspicuous among other things on the Social networking sites. Significantly the region also has seen a major inflow of capital and infrastructural transformation. This paper will analyze the discourses circulating on the social networking sites in relation with socio-political developments since January 2014.

This paper is located in the era when the demand for newer and smaller states is gaining ground with mixed successes. This paper will identify the role of the sites in producing the stakes for those professing both the region and leadership of the issue. Using a framework set by Amit Rai's idea of digitality as well as Gopal Guru's idea of photosynthesis and the location of social movement and ideology within the new grounds of digital spaces, I look at the paper from a discursive point of view.

Data for this paper is drawn from a purposive selection of pages and accounts which profess a clear bias for the region and its issues. The sample is vetted also on the basis of its popularity and the trends it exhibited since their creation during the chosen period. A second sample with the discussion of the issue of Vidarbha on accounts and pages not overtly siding with the issue will be used to contrast the first sample to highlight the socio cultural contestations, discourses and resistances.

The paper would also entail the usage of social networking sites as an alternative space for mobilisation and organisation of the movement.

NAHKUR, OLIVER* (*University of Tartu*)

Rapid Social Change and Long Term Trends in Societies' and Regions' Level of Interpersonal Destructiveness

During past 30 years many societies and regions around the world have undergone rapid social change. Some of them have experienced political transformation to democracy, others economic transformation to a market system, and some of them have simultaneously experienced both. Rapid social change can affect quality of life in these societies. In this paper, the focus is on different societies' and regions' long-term trends in their level of interpersonal destructiveness, representing a negative side of societies' quality of life. Using Societal Index of Interpersonal Destructiveness (SIID), which is based on nationally representative subjective data of various sources (e.g. Integrated Database of World Values Survey and European Value Survey), and national statistics of 44 societies and 7 regions around the world covering 25-year period from 1989 to 2014, the following questions are asked: (1) Inside each region have societies' level of interpersonal destructiveness changed similarly, on the average?; (2) Inside each region how have the societies' level of interpersonal destructiveness changed?; (3) In which regions in what period was the societies' interpersonal destructiveness in the highest level?

Analysis demonstrate that inside each region the level of societies' interpersonal destructiveness have changed similarly, on the average. Societies inside their

regions spread out as expected: the societies' level of interpersonal destructiveness have decreased throughout former Soviet Union (except Caucasias), Catholic Eastern Europe, and MENA, Orthodox Balkan and Caucasias regions while being stable low in Protestant Europe, Catholic Western Europe and Anglophone regions. Moreover, the societies' level of interpersonal destructiveness were highest in former Soviet Union (except Caucasias), Catholic Eastern Europe, and MENA, Orthodox Balkan and Caucasias regions in between 1989 to 1999 when rapid social change were experienced. These results indicate that rapid social changes affect societies' quality of life in a negative way.

NAHKUR, OLIVER* (*University of Tartu*)

Societal Index of Interpersonal Destructiveness: Attempting to Provide More Candid and Regular Reporting about Countries' Interpersonal Violence Level on Global Perspective

Violence brings lots of misery to people's lives all around the world. Unfortunately, difficulties to quantify the magnitude of violence worldwide and therefore to undertake global-level analysis or develop interventions, have occurred. According to Diprose (2007) absence of reliable and comparable country-level data collected at regular basis can be considered as a key problem. Attempting to provide more candid and regular reporting about countries' interpersonal violence level on global perspective, a new social indicator - Societal index of Interpersonal Destructiveness (SIID) - is constructed by Nahkur et al. (published in Social Indicators Research in 2017) based on nationally representative subjective data of various sources (Integrated Database of World Values Survey and European Value Survey, WHO Online Mortality Database, World Bank Open Data, and the Standardized World Income Inequality Database), and national statistics of 89 societies around the world covering 25-year period from 1989 to 2014. Due to the problems with data availability and quality, indirect measurement approach is adopted in SIID—measuring the level of interpersonal destructiveness by factors that predispose or may be the result of destructiveness in interpersonal conflicts or relationships. Moreover, SIID offers new conceptual tool – interpersonal destructiveness of a society – to measure the level of interpersonal violence, aiming to grasp wider range of destructive strategies that individuals use in their interpersonal conflicts.

The paper reports SIID's scores for 89 societies and 9 society groups for the period 2005 to 2014, and compares them with the results of other violence-related indicators. Compared to WHO (Garcia-Moreno et al. 2013) estimated prevalence of violence against women in intimate relationships, partly similar results emerged. The differences are discussed in more detail. Also, it is analyzed which factors are mainly determining the level of interpersonal destructiveness in different society groups.

Disability and Social Change - Perceived Barriers to Participation in Physical Activity for Children with Disabilities

In 1996, the constitution of South Africa was adopted which promoted equal rights for all people, and specifically details the rights of people with disabilities and their right to equality. The importance of play for children's social development and wellbeing has been widely discussed. Something as important as developing social relationships and inclusion cannot be left to chance but should form part of a broad agenda for equality. However, disabled children and their families constantly encounter challenges due to the physical and social barriers within community play spaces. These challenges often deny children the benefits which play can provide within this setting. This presentation draws attention to the current situation surrounding public playground accessibility within the city of Durban, South Africa. There appears to be a growing interest worldwide in the concept of purpose-built public playground facilities that are intended specifically to provide play experiences for all children, regardless of their abilities. Child-centred or community-focused facilities are explored, in which participation in a playground is supported as a desirable social activity within a connected, inclusive community. This paper will provide an outline of legislation and policies in South Africa that are relevant to inclusive playground provision for social change and the principle of inclusion as the foundation concept of shared play in an inclusive playground. Using a case study approach, play facilities are examined for inclusivity, with the emphasis on the views of young disabled people and their families towards what constitutes an inclusive play area. The paper identifies the importance of not only addressing physical constraints but also creating a space where disability is viewed in a positive light. The paper concludes by critically examining the implications of the findings for the delivery of inclusive play spaces, to transform communities and promote social change.

Expanding Notions of Economic and Subjective Well-Being: A Case Study on Older and Non-Older Australians

While Australian studies have begun exploring the relationship between disposable income and global life satisfaction or happiness assessments, there is a lack of empirical investigation exploring the relationship between broader notions of economic well-being and subjective well-being. This paper addresses this gap by developing and comparing two alternative individual-based well-being frameworks. The first develops a more comprehensive measure of economic resources in line with the economic theory of consumption. A set of economic resource metrics is developed that append disposable income with income streams from non-cash services (including in-kind social transfers) and annuitized non-home wealth and home wealth, as providing the full range of potential consumption possibilities that affect an individual's economic well-being. The second develops a domain-specific life-satisfaction well-being indicator framework based on psychological references to individual subjective well-being. The results are based on person-level data from the Household, Income and Labour Dynamics in Australia (HILDA) survey. Empirical analysis involves comparing individual economic well-being to subjective well-being for older Australians (aged 65 years and over) and non-older Australians (aged 15 to 64 years), and also across the two age groups. In the context of an ageing population, these two cohorts face specific challenges. Macro-level challenges include the ability of government to mitigate declining labour force participation rates with increasing health, aged-care and pension-related fiscal pressures. Micro-level challenges include maintaining social cohesion across and within generations and the quality of life of individuals across the life-course. The four-way comparative analysis will provide insight into the nature of economic advantage and disadvantage within and across age cohorts, taking account of the role of wealth (particularly home wealth) and the provision of public benefits, to an individual's cognitive evaluation of their life.

Towards a Transactional View of Creativity in the Social Sciences, Education, and Everyday Life

In this presentation I will articulate a transactional and relational approach to creativity and highlight some of the social justice implications of this approach in the context of both education and broader society. Both within the broader field of research about creativity as well as within popular culture, creativity is generally conceptualized in self-actional or inter-actional terms (Dewey & Bentley, 1960). These perspectives continue to view creativity as primarily residing within or between particulate individuals relying upon and deploy vocabularies and metaphysics that understand creativity primarily as an inborn gift. Within this field of study a well-developed trans-actional approach is still lacking. The purpose of this paper is to work towards addressing that gap. In this paper I will articulate a transactional and relational view of creativity that, rooted in a pragmatist conception of situated action (Colapietro, 2009; Joas, 1996) displaces creativity from within the individual situating it instead within the collective and cooperative communicative processes of everyday activity.

To achieve this I will start with a review of the literature on creativity with a particular attention to how self-actional and inter-actional view-points feature into some of the major approaches. Following this, building on Dewey and Bentley's description of the transactional perspective, I will articulate a view of situated creativity that makes it possible to understand creativity as a property of collective activity while doing away with the essentialist overtones of prevalent viewpoints. I will conclude by arguing that by doing away with the compulsion to categorize and identify "creative types" this transactional perspective promises a more humane and inclusive approach to creativity in both education and society at large.

Film Festivals and Film Awards in China: History, Configuration, and the Transnational Field of Legitimation

Film festivals are one of important mechanisms through which the fields of film production and consumption are structured and related to each other. This paper—by analyzing their history and configuration as a "film festival field"—examines the government-sponsored, "official" Chinese film festivals including the Shanghai International Film Festival, Changchun Film Festival, and Beijing International Film Festival, as well as government-approved film awards such as the Golden Rooster Awards, Huabiao Awards, and Hundred Flowers Awards. 1) How and when did the festivals and awards come into existence? 2) What is the configuration (i.e., numbers and types) of the official film festivals and awards in China? 3) What are the organizational and institutional bases of the film festivals and awards (who sponsors, who organizes, who gives money, etc.), as well as different criteria of legitimation (e.g., Hundred Flowers Awards for popularity, Golden Rooster Awards for professional legitimation [film critics, filmmakers, film historians, etc.], and Huabiao Awards for political legitimation by the government)? 4) How are the Chinese film festivals connected to international film festivals abroad with what sort of consequences? Contra the widely shared image of official Chinese film festivals as sites of narrowly national political correctness, I show the dynamism and multiplicity of logics—at times even contradictory—within the world of official Chinese film festivals and awards. Moreover, official festivals—Shanghai and Beijing International Film Festivals in particular—have recently established agreements on exchanges of personnel and film works with international film festivals in Asia (e.g., Tokyo International Film Festival) and beyond (e.g., Venice International Film Festival; Hawaii International Film Festival). In sum, this paper examines the history, configuration, and legitimation of official Chinese film festivals—important sites that structure domestic markets for Chinese cinema—which are increasingly shaped by the broader, transnational fields of film festivals beyond China.

NAKANISHI, MACHIKO* (*Chukyo University*)

Japanese Reflexivity and Japanese Society

The purpose of my presentation is to discuss the transformation of reflexivity and to study reflexivity in Japan and Japanese society.

Reflexivity is the concept of reflecting on oneself in the presence of others, and changing oneself in relation to others. By repeating this feedback process, the agent changes who he/she is. Scott Lash and John Urry criticize the reflexive modernization theory of Beck and Giddens, as they presuppose that reflexivity is essentially cognitive and institutional. Lash draws attention to the aesthetic dimension of reflexivity over the cognitive. He insists capitalism opens up possibilities for, not only cognitive but also, aesthetic reflexivity. This can be seen in the expressive individualism in contemporary consumer capitalism. He also discusses hermeneutic reflexivity. In addition, I suggest that including other senses, emotions, and consumer behavior etc., new reflexivities can be born and transform in and through markets, which I call market reflexivity. Lash and Urry discuss Japanese systems that involve collective reflexivity. The strong ties of Japanese obligational contracting involve collective reflexivity in the sense of information-sharing, risk sharing and collective decision making. Collective reflexivity is so effective that the feeling of 'Kuuki' and 'Sontaku' – or, social bonding and meaning reproduced without discourse – are a dominant factor for decision making in Japanese society. Sometimes Japanese society and policies are changed without explicit discussion. Thus market reflexivity with collective reflexivity works very well in the Japanese market. In the global information society, market reflexivity with collective reflexivity will continue to change us ever more radically and quickly. I conclude that it is important especially for the Japanese, to be conscious of market reflexivity and especially collective reflexivity in order to predict its future affects of our society and market.

Increasing Family Diversity and Persistent Normative Conceptions of Childhood in Public Social Services and Early Education Services

Families have entered a 'late modern' epoch of 'de-traditionalisation' and 'subjectivity' with a variety of forms, practices and experiences of 'family life'. While

heterosexual married households still dominate across Europe, cohabitations and births outside of marriage are on the rise as well as one-parent families, blended families, same-sex parent families, and migrant families. Family diversity is introducing a further pluralisation of parenting, gender, motherhood and fatherhood models and representations of childhood. However, this change has not always been accompanied by an adaptation of public policies and practices towards the recognition of diverse patterns of parenthood and childhood.

This paper is focused on family diversity and especially on parent-child relationship in same-sex parent families and migrant families. By giving voice to both individuals belonging to these families, and public institutions, such as early care and educational services, pre-primary and primary schools (ISCED 0-1) and social services, at the forefront of everyday interaction with 'new' families, we aim at investigating what barriers parents and children concretely face in building and living their families and how especially local institutions respond to these needs.

In particular, the project tries to address the following research questions:

- Which barriers do children belonging to new family forms encounter when dealing with the public institutions above mentioned?

- In what ways educators, teachers, school administrators and social workers define normative models of "childhood" and the "good" family, and how do these frames shape their practices in a context of welfare state austerity?

The paper is based on qualitative interviews with key informants in social and educational services, migrant and homosexual parents and children with same-sex parents.

The research has been conducted in Italy, an interesting case for having experienced local 'best practices' in this policy area, yet still in need to better respond to the 'new' families.

ADAMSON, ELIZABETH (*Social Policy Research Center, University of New South Wales*)

The Social Investment Paradigm and Migrant Families: The Australian and Italian Case Compared

The social investment paradigm has received widespread attention as an approach to 'prepare' individuals, families and societies to respond to new social risks they are likely to encounter throughout the life course, particularly those associated with post-industrialisation and globalisation. Early childhood education and care (ECEC) and policies that support women to participate in employment have been a central focus of the social investment paradigm.

But while post-industrialisation and globalisation are closely linked to increases in migration, migrant families are largely absent from social investment policies. From a social investment perspective, access to ECEC and work/care reconciliation policy measures are crucial for migrant children and families. Yet there is a gap in the social investment literature when it comes to access to ECEC and work/care reconciliation policies by migrant families.

This paper compares social investment policies for migrant families in two countries: Australia and Italy. These two countries have markedly different migration, employment and care regimes, with both similarities and differences in the organisation of ECEC and policies to promote work/care reconciliation.

Against this backdrop, this paper asks: To what extent are migrant families included or excluded from ECEC and work/care reconciliation policies in the two countries?

Drawing on a comprehensive analysis of eligibility for and access to ECEC and work/care policies by migrant families in Australia and Italy, this paper critically examines the capacity of the social investment approach to respond to new life course risks associated with migration and mobility. It draws attention to the way in which the emergence of the social investment paradigm to address 'new social risks' does not take account of the importance of migration and mobility in the contemporary life course.

Creating the Talk: Anti-Female Genital Mutilation Movements in Kenya after the Anti-FGM Act

Female Genital Mutilation (FGM) is a widely practiced form of gender-based violence in 28 countries across Africa, with considerable variation in prevalence by country. For example, in Kenya the percentage of women undergoing FGM has evinced a slow but consistent decline, whereas in some countries in West Africa, more than 90% of women remain subjected to this harmful cultural practice (UNICEF).

Kenya provides a fruitful context for examining the success of the local anti-FGM movement and could provide a template for other transnational women's movements. The intersectional collaboration of both local and international movements in Kenya led to enactment of the "Prohibition of Female Genital Mutilation Act" in 2011. The Kenyan government was also the first to establish a

semi-autonomous agency, "The Anti-FGM Board," to advocate against FGM while empowering women.

Despite these positive changes, FGM is centered in rural locations in Kenya, rendering enforcement of the anti-FGM Act challenging. FGM is largely perpetuated by "community leaders:" traditional, non-bureaucratic decision-making bodies composed of elderly male authority figures. Moreover, because people in rural areas are largely unaware of the anti-FGM Act, law enforcers working against FGM commonly encounter resistance.

The research explores two questions: How do national level policy and activism affect grassroots level activities? Second, how are community leaders intervening in the anti-FGM movement? The project analyzes data from 20 in-depth interviews conducted with members of the Kuria, Kalenjin, and Maasai tribes in Kenya in 2017. These interviews with eight FGM survivors, ten runaways, and two FGM practitioners, explore women's reactions to the local anti-FGM movement and national policy.

Findings indicate that women are exposed to contradictory messages. Uncircumcised women encounter slut-shaming from community elders, whereas circumcised women encounter guilt-shaming from activists. The study suggests that anti-FGM discourse must attend to local contexts to be successful.

Where Do Women Stand in Social Movements?: Anti-Female Genital Cutting Movement in Kenya after the FGM Prohibition Act

Female Genital Mutilation (FGM) is a widely-practiced form of gender-based violence in 28 countries across Africa, with considerable variation in prevalence by country. Kenya provides a fruitful context for examining the success of the local anti-FGM movement and could provide a template for other transnational women's movements. The intersectional collaboration of both local and international movements in Kenya led to enactment of the "Prohibition of Female Genital Mutilation Act" in 2011. The Kenyan government was also the first to establish a semi-autonomous agency, "The Anti-FGM Board," to advocate against FGM while empowering women.

However, the challenge remains with local mobilization. Local women are exposed to contradictory messages. Uncircumcised women encounter "slut-shaming" from community elders, whereas circumcised women encounter "guilt-shaming" from activists. In progressing anti-FGM movement, it tends to generate negative messages on FGM excluding the survivors' presence. The young girls who experienced FGM become the victims of FGM profiling, especially in school environment. Although most of girls experience FGM in primary schools, due to their early marriage, and drop-out rates, they become minority in secondary schools, becoming the "outcast." On the other hand, local female activists, who were "outcasts" because of not experiencing FGM in primary school, become the majority in secondary school. Peer pressure functions in multifaceted level on both FGM survivors and runaways.

The research analyzes data from 20 in-depth interviews conducted with members of the Kuria, Kalenjin, and Maasai tribes in Kenya in 2017. These interviews with eight FGM survivors, ten runaways, and two FGM practitioners, explore women's reactions to the local anti-FGM movement and national policy. How can we incorporate FGM survivors in the anti-FGM discourse? Investigate feminist leadership influencing movements, and incorporating subjects oriented discourse for producing effective strategies of anti-FGM movement.

Young People in Informal Employment - It's a Job, but No Work, No Income

Namibia's socioeconomic context is characterised by high unemployment, especially amongst youth. Young people are first to enter unstable and informal employment in order to join the active labor force. Public spaces are increasingly becoming spaces through which living and livelihoods are earned. What in apartheid times once used to be spatial segregation induced by racial discrimination is now replicated by socioeconomic mechanisms. Post-apartheid reformed policies/laws aimed at creating opportunities for social mobility and economic advancement for Namibians seem to have benefited very few people and often connected to those in power. Young people voiced their disappointments at the deepening social inequalities in the country. This resulted in the emergence of youths' sociopolitical movements such as Affirmative Repositioning, often seen as precursor for potential social conflict. Yet, informality of housing and living is a daily reality for many people in Namibia. In as much as precariousness and uncertainties increasingly define informal life-worlds, sustenance of livelihoods of the vulnerable people in society is realised through informality in its different manifestations. This paper focuses on youth experiences in the labor market and the changing meaning of work. It centres on the income generating activities within the informal sector, through which youth's attempts to cope with being unable to find formal employment. It argues that work has undergone change, producing new varied spatial and temporal forms that both undermine and

increase young people's autonomy and freedom. It concludes by arguing that informality is not a negative social process. It is the unguided way society allows it to happen that produces inequitable results. As such informality individualizes the workforce, making the representation of labor rights difficult. Marginalisation and exclusion of those in informal employment is no longer tenable and the pervasive importance of informal activities should be recognized as essential in shaping the boundaries and meaning of work.

Performing Religion in Public between Italy and Sri Lanka

The paper examines the presence of religion in the public square by analyzing the Catholic Church's attempt to establish and maintain a new complex of religious practices addressed to the Sri Lankan migrant community in Italy. This attempt has led to the birth of a pilgrimage to St. Anthony's basilica in Padova, Italy which every year is attended by thousands of Sri Lankan migrants and has become one of the world's most crowded gatherings of Sri Lankans outside their homeland. The analysis focuses on the structure of the pilgrimage and the related public rituals, by showing how this religious celebration is made possible by a new production of meaning—in which the symbol of Saint Anthony plays a central role—and a renewed construction of the consensus around it.

Religion, Gendered Bodies and Social Roles: An Empirical Study

The paper presents the results of an empirical research, carried out through participant observation, on a religious procession, known as *Santacruzán*, celebrated by the Filipino Catholic community. The procession, which evokes the story of the discovery of Christ's cross (Santa Cruz), has a huge following in the Philippines and in many other Filipino migrants' countries of destination. Wherever it is celebrated, the *Santacruzán* implies the processional transfer of a statue of the Virgin Mary between two churches of the same town, along with statues of saints and Biblical characters, mostly women, as well as Christian virtues embodied by Filipino young girls accompanied by boys of the same age. The analysis of the ethnographic material gathered over several years during the course of the *Santacruzán* celebrated in Padua, Italy—where a large Filipino community lives—identifies the structure and dynamic of the religious representation and then focuses on the individuals who incorporate such representation and the system of social relations that ties them together. The primary role of the women in organizing and managing the celebration, the special recognition attributed to the girls who take part in the procession, the ritual performances of these girls in showy dresses next to boys who demonstrate their masculinity by showing off their virility are some of the factors that contribute to shift the ritual from a religious domain to a secular domain where the intersection of gender, ethnicity and class plays a key role in legitimizing and reproducing identities and social roles among the members of the Filipino community.

Lives on Hold – Intimate Relations and Care in the Lives of Asylum Seekers in Finland

This paper draws on the notions of intimate migration (Boehm 2012) and transnational care (Baldassar et al. 2007) to analyse the ways in which intimate relations motivate and direct refugee (im)mobility and asylum seekers' (im) possibility of providing transnational care for their families in the context of increasingly restrictive border and migration regimes. Existing research on refugee migration has focused on refugees and asylum seekers as *recipients* of (health) care and overlooked the role of asylum seekers and refugees as *providers* of transnational care. This paper is based on ethnographic research with Iraqi and Afghani asylum seekers conducted in Finland in the spring of 2017. The data include participant observation and interviews (N=30) with female and male asylum seekers who arrived in Finland in the autumn of 2015 and who still in the spring of 2017 were waiting for the final decision on their asylum application. The research participants were stuck in immobility because they were waiting either for the first decision on their asylum application or the administrative court's decision on their appeal. The study emphasizes the crucial importance of intimate and family relations in motivating asylum mobility and structuring daily lives of asylum seekers in Finland. It also documents the human suffering and hopelessness caused by an asylum regime that prevents refugees from providing transnational care for their families.

A Collective Experience of Active Participation in the Periphery

A Collective Experience of Active Participation in the Periphery

Brazil is in an impasse that hurt the real idea of democracy. After twelve years of left-center government, the social movements saw that each one were disarticulated, although that have provided them with some material gains, its on the other hand brought the demobilization and disarticulation between and inside them. It is in this context that the proposal of School of Citizenship Cidade Ademar and Pedreira is born.

Therefore a group of former social movement activists feel the need to seek an alternative to the leadership gap. They decided to act in the formation of new cadres supported in the space of citizen and communitarian coexistence. The formation provided a process of historical rescue that motivated in the many participants (workers, housewives, students, teachers, religious...) a desire to want to know more, to question, to problematize the lived reality and have the *political will* to join others in the quest for answers to the questions that have elicited all the debates, since these issues is not an aspect that should be treated with in isolation, but in a collective and communitarian way. People felt empowered, first by the learning they received. It was also noticeable the development of a higher self-esteem, by the horizontality of the relationships in all process. It was a sharing experience. The result of this "school" is that from this experience other actions in the neighborhood have emerged, like to participate in the actions of pro-housing groups, founding a Fight Committee in the region, which currently proposes specific actions on significant dates in the country, which requires reflection for the relevant political action.

This case study will be developed from interviews and narratives with the participants, and with a bibliographical research to anchor this work theoretically.

Youth and Violence: The Case of Rampage School Shootings

On March 24, 1998, two boys, 11 and 13 years old, ring the fire alarm at their middle school in Arkansas, USA. When their fellow schoolmates come running outside, they open fire, killing five and wounding ten. Many rampage school shootings have happened since – from Columbine, USA, in 1999 to Winnenden, Germany, in 2009. Events like the Arkansas Middle School shooting occupy media, public discourse, and politics. How and why do youths choose to go on a rampage against their fellow classmates? Why do these cases of youth violence cluster along some countries, like the US? What do they tell us about today's youth? And what can parents, educators, the community, and policy makers do to prevent school shootings?

Rampage school shootings are a drastic form of youth violence. They are thus seen as the epitome of cruelty and an indicator of youths' enjoyment of brutality – as a placeholder for everything that is going wrong with today's youth. This paper presents my comparative analysis of 30 rampage school shootings. I analyzed in particular the role of combinations of factors leading kids to commit such shootings (such as dysfunctional families, marginalization, and bullying in school), specific youth cultures, the relevance of aspired media fame, and easy gun access. Comparisons show that next to these factors, many perpetrators felt they were stuck in a no exit situation: a situation in life that they desperately tried to get out of, like a violent parent coming back home from prison, sexually abusive relatives, or the prospect of being sent to a foster home or boot camp. My presentation will discuss findings on the emergence and prevention of rampage school shootings and examine how their analysis can inform youth sociology.

Valuation Practices and the Formation of Academic Identities: Exploring the Epistemic and Social Impacts of Performance Indicators in the Humanities

Empirical studies of how performance indicators affect the work and career practices of researchers in the humanities are rare. Consequently, the ways in which humanities researchers themselves engage with indicators, and the new strategic possibilities they offer, has to a large extent been neglected. The aim of the present study is to contribute to a better understanding of how performance metrics affect valuation practices, epistemic decision-making, and identity-formation of researchers in the humanities. Combining bibliometric methods and qualitative interviews, the study highlights the interplay between different orders of worth and how researchers at a comprehensive, research-intensive university in Sweden live, work, and produce knowledge within academia.

Drawing upon the concept of "regimes of valuation", the study demonstrates that researchers in the humanities relate to different, and often contradictory, orders of worth when carrying out their everyday work. This heterogeneity indicates that disciplinary differences and academic age are important factors in order to understand how performance metrics affect valuation practices and epistemic decision-making in the humanities. Nevertheless, when making strategic investments in their future academic selves, humanities researchers tend to relate more narrowly to one dominant regime of valuing research; a regime in which performance indicators constitute a powerful discourse of what a successful academic subject is. This career driven mind-set, being most evident among PhD students and postdocs, impels humanities researchers to internalize rules of the indicator game. However, this does not occur in a non-conflictual way, creating tensions between epistemic decision-making and academic identity-formation. Regarding this, the machinery of performance metrics exists as an instrument of governmentality, producing a field of realities that researchers must act upon as they constitute themselves as a competitive and successful academic subject.

NASTOVSKI, KATHERINE* (McMaster University)

Bringing Race in: Transnational Whiteness and Philosophies of Social Partnership

Transnational solidarity and coordination is a principal challenge and opportunity for workers' organizations in an era of globalized circuits of production and care. As key civil society organizations, the prospects of building transnational labour alliances are not only central for the future of workers' organizations themselves, but also for broader struggles for social justice globally. However, the role of workers' organizations in struggles against global inequalities have been and continue to be fraught with contradictions. Examples include explicit labour imperialism on the part of some unions in the Global North, but also what Rebecca Johns' (1998) calls accommodationist solidarities, practices meant to be solidaristic that end up reinforcing competition for jobs and investments.

Exploring the ongoing relevance of these practices has been limited by tendencies to view these contradictions as sole products of the Cold War and therefore of no import for thinking about transnational labour relations today. I argue that assessments of organizational possibilities for international labour coordination and solidarity must tackle these contradictions. Drawing on my doctoral research on labour transnationalism in Canada from the mid-1940s to the end of the Cold War, I argue that besides anti-communism, the international practices of the Canadian Congress of Labour and later Canadian Labour Congress were grounded in a philosophy of social partnership characterized by ideas of race and nation arising from the specificities of Canadian class formation. Focusing on the case of the Caribbean and support for the Colombo Plan, my research suggests that transnational whiteness had a significant impact on the way union actors developing these practices understood their role in global politics. Consideration of the ongoing significance of ideas of race in shaping transnational labour solidarities is especially timely given the rise of right-wing populist movements.

Herdsmen Aggression on Settled Farmers As a Threat to Agricultural Renaissance in Nigeria: Sifting the Conflicting Narratives

Pastoral Fulani herdsmen account for the bulk of beef production in Nigeria. In the past, these herdsmen followed defined north-south routes as they moved their livestock in sync with the changes in the seasons. Clashes often occurred with sedentary crop farmers in the contest for resources in the communities along the routes which were officially gazetted. These were minor, and relationships between the herdsmen and crop farmers were generally cordial. Recently however these herdsmen have become so violent that their unprovoked attacks on unsuspecting farming communities all over Nigeria has earned them the position of the fourth deadliest terror group in the world. Their activities have sacked several farming communities from their ancestral farmlands, and added significantly to the pool of internally displaced persons. This has adversely affected the agricultural renaissance that is expected as a result of the renewed emphasis on agriculture occasioned by falling oil prices. Analyses of the problem dwell on climate change, 'development,' urbanization, cultural or political factors including the spillover of conflicts in neighbouring countries. This paper examines the various arguments and concludes that all the factors contribute to the problem, but the problem is much more complex especially given that the Fulani tribe are highly organized relatives in several countries in Africa, and that a significant proportion of the livestock involved are owned by powerful politically exposed persons. The paper recommends that the international community must get involved to provide neutral arbitration and support the exercise of strong political leadership that employs effective confidence-building strategies to reassure farming communities who perceive the state as being sympathetic to

the herdsmen. Herdsmen must also abandon the old tradition of transhumance and ranch their livestock in their indigenous states.

Social Conservatism and Legitimacy: Predicting Public Support for Police Violence in Brazil

Who supports the excessive use of force by officers in São Paulo? Brazilian Military Police are recognized for their history of violence, abusive use of force and lethality. In the last decade, more than 3,500 people were killed by the military police in the metropolitan region of São Paulo. This study aimed at investigating the predictors of public support for police violence, particularly testing the effects of a social conservatism ideology and the role of legitimacy. It is plausible to test the hypothesis that those who recognize the police actions as legitimate are the ones who actually support the abusive use of force. Using the second wave data of a longitudinal panel started in 2015, representative of adults in São Paulo in 2017, we asked the respondents how they would evaluate the police actions after describing three unlawful scenarios: a homicide, a torture, and violence against protesters on a demonstration. We then used generalized structural equation modelling to estimate the effects of the ideology and legitimacy. Both variables were significant and positive. The results we found contribute to discussions about the relation between the public support and the permanence of police violence in Brazil.

Socialism As Creative Democracy? on the Deweyan Turn in Axel Honneth's Critique of Capitalism

In his recent book, *The Idea of Socialism*, Frankfurt School theorist Axel Honneth elaborates a new conception of socialism as the establishment of social freedom in the three spheres of family, market economy, and the political public sphere – rather than just the economy as envisioned by previous theories. While Honneth has developed the Hegelian notions of social freedom and democratic ethical life in earlier works like *Freedom's Right*, his statement on socialism is unique for its rigorous incorporation of John Dewey's pragmatist insights about creative democracy and social cooperation. According to Honneth, socialism is to be realized through a cooperative enterprise of sustained problem-solving and experimentation by citizens, resulting in substantive institutional reforms that embody the principles of mutual recognition and social freedom. This paper will first review the basic argument of Honneth's book and highlight the influence of pragmatism on his critical theory. I discuss how Dewey's ideas enable Honneth to construct a cooperative model of democracy as an alternative to the three dominant models in political philosophy (liberal, republican, and procedural). The paper will then highlight two inter-related problems with Honneth's argument: because Honneth rejects external criticism and insists on an immanent critique that is grounded in normative principles inherent in existing institutions, it is unclear to what extent experimental reforms will bring about a post-capitalist transformation; second, the Hegelian-Deweyan framework does not provide Honneth with adequate conceptual tools to analyze the durability of capitalist institutions and obstacles for emancipatory social change. I ultimately argue that Honneth must incorporate a differentiated concept of power if his immanent critique is to address the strength of private interests and the capacity of civil society associations to challenge them.

Visual Research in the Post-Post-IsM Age: Genealogical Considerations

What could the genealogy of visual research contribute to contemporary debates on crises of representation, on post-truth and on other post-post-isms? By identifying several positions in the history of visual research (from visual anthropology, to visual sociology and visual culture), this paper will offer a relevant research agenda for our time. This agenda will identify the contemporary interplay between the desire for truthful and authentic representations of reality, which historically pushed for the development of the Camera Obscura, and the constant doubt, embedded in the tradition of critical thinking, which has always accompanied the desire for and production of truth. The theoretical and cross-disciplinary exploration will depart from discussing the photographs taken by August Sander and analyzed by John Berger, to those taken and analyzed by Claude Lévi-Strauss, Gregory Bateson & Margaret Mead, to new interpretations and re-appropriations of the photos of Native Americans taken by Edward Curtis, and to research on image-and-meaning-making in the digital age. Such

exploration would be a fertile ground for elaborating on contemporary debates, ranging from participatory research to visually-based algorithms (such as face recognition), and on their political ramifications. I will then outline a number of epistemological and ethical considerations for contemporary visual research in the social sciences, with particular emphasis on research related to social justice issues. Returning to the basic truths of image-and-meaning-making in the post-truth age would be able to remove part of the post-post-ism's smoke screen and strengthen the contribution of visual researchers in current public and academic debates, in critical and challenging ways.

Tourism and Gentrification in Mexican Heritage Cities. Social Exclusion through Urban and Architectural Transformation in World Heritage Sites.

Numerous historic city centres in Latin America have been gentrified as the result of tourist activities. This is the case of several heritage Mexican cities that transformed their uses and spaces according to the consumption needs of visitors. This research explores this trend in two of its most complete manifestations: Lifestyle migration and luxury hotels as a tool in the transformation of the heritage of the city. Analysis of the cases of Guanajuato and San Miguel de Allende (west central Mexico) reviews the main architectural and urban transformations derived from the gentrification of heritage tourist cities. The new tourist uses modify heritage and traditional typologies, giving rise to a façade-based architecture and exacerbate social exclusion and fragmentation processes in historic centres. Luxury tourism emerges as a contradictory transforming factor as it may threaten the natural, heritage and social resources that sustain this activity. In this context, the State, the market and a weak citizenship are deciding factors.

Can Place-Based Initiatives Remove City Inequalities?

The promotion of place-based initiatives is a common strategy used by public authorities to remove city inequalities. According to the multidimensional character of 'neighborhood deprivation', some of these initiatives promote integral interventions in deprived neighborhoods order to: first, increase their quality of life, and second, increase socio-spatial cohesion as a reduction of urban inequalities among city neighborhoods. From 1990's European Union has promoted this kind of initiatives under the Cohesion Policy (as the well-known URBAN programme). Applying a quasi-experimental approach, this paper will analyze the impact of these urban-based interventions promoted by the European Union in Spanish cities using as dependent variable a composite index of socio-economic status. Have these initiatives increased neighborhood welfare?, have these initiatives increased socio-spatial cohesion in cities?

Citizen Lobbying As a Self-Management Movement: An Analysis of Spanish Policymaking System

The growing demand for transparency asked by the civil society has been living parallel to discontent and distrust of institutional policies, causing the appearance of new management phenomena of influence and legitimate pressure on decision-making public, anteroom to citizen lobby.

The study of the defense of private interests with the intention of influencing the legislative and executive powers has not been reciprocated with the detailed attention of the doctrine, and when itself has been studied the focus has been exclusively considered traditional, not adapting it to the reality of social and community movements not only in Spain, but in Europe.

Facing with this little doctrinal interest is proposed to extend the concept and adapt it to the European reality, which have been introduced the facts of 'grass-roots' and 'astroturf', two forms of community systems in lobbying that turns literally, the social perception of lobbying. The citizen lobby have put on the table a new form of pressure, so the first objective is the revision of the traditional concept of lobbying in order to include astroturfing and grassroots practices of different social movements.

This would show empirically whether this model of participation represents a new approach to concepts such as lobbying or revolving door, analyzing to what extent and modify the participation of new organizations of interests and lobbyists.

NAVARRO, PEDRO* (*Universidad de Zaragoza*)

Citizen Lobbying As a Systemic Social Force: An Analysis of Spanish Policymaking System.

Who governs? Who really rules in Spain? Who takes part in public policymaking and who knows it? Spain is formally a democratic system. However, the dominant framework has a lack of transparency and accountability.

This paper presents some results of a study about lobbying and the role of citizens in Spain using a participatory action research and sociocybernetical approach. Theoretically, we consider that lobbies and think tanks are necessary to maintain a proper functioning of the democratic system, if we understand that neither the government nor the civil servants have a monopoly on common sense and knowledge of the subject. However, lobbies concept as an imperfect systemic social force must be reformulated, as we, as a country, don't have a robust theoretical and normative debate over whether this is good or bad, the general opinion about the phenomenon is mostly critical.

Since the Spanish legal system is probably one of the most decentralized in the world, it allows more possibilities to be lobbied, so a new regulation proposal should analyze not only the national situation but also the regional and local one.

This would show empirically whether this model of participation represents a new approach to concepts such as lobbying or revolving door, analyzing to what extent and modify the participation of new organizations of interests and lobbyists.

The paper is divided in five sections including introduction and conclusions. First we describe the general context. Second we explain a concept developed in comparative law, 'traceability', a sort of legislative footprint as a memory accompanying any legislation in which it would expose everyone who has proposed concepts introduced and who has prevented others from entering. And thirdly, we characterized who's been lobbying and who's been lobbied.

High School Graduates' Transition from School to Work in Mexico: Differences between Academic and Vocational Programs

The purpose of this research is to compare the transition from school to work of Mexican high school graduates' according to their type of program: academic or vocational. The Integral Reform of Upper Secondary Education of 2008 was aimed to offer more opportunities to young people by standardizing the curriculum into a common curricular framework and the creation of a *National Upper Secondary System*, that includes academic and vocational programs. Among other things, the reform introduced three groups of competencies (generic, disciplinary and professional) in order to reinforce both the labour market skills for academic program and the academic skills for the vocational ones. Using a national data set of 8390 high school graduates aged 18 to 20 (ENILEMS), we analyze the factors influencing the probability of continue to college, being employed or inactive. The results show that the likelihood of attending college is significantly higher for academic program graduates, but there is no significant effect between programs regarding the other two situations. In a second stage of the research, we analyze the labor conditions between full-time employed graduates and we found no significant differences between programs, though we confirm the difficulties that young high school graduates face in the labor market: low salaries, informality, instability, among others. These reflect a probable skill mismatch that affects both academic and vocational high school graduates that needs to be addressed through educational and labour policies.

The Gender Sensitivity of Spanish Regional Parliaments: Reality or Fiction?

The representation of women in parliaments across Europe has increased in recent years. This is shown by the increase of the average presence of women MPs in national parliaments (EU-28) which stands at 28.4% of women representatives. However, despite this progress, some studies highlight the difficulty to get an equitable representation in parliaments due to the rigidity of political institutions (Phillip 1995; Wängerud 2008).

A quick process of feminization of all regional chambers has taken place in Spain; its relatively balanced composition of gender seems a fact nowadays. By contrast, less is known about if this increase in women presence within regional parliaments has also been accompanied by institutional changes in parliaments; specifically in terms of WMPs segregation at parliamentary committees. Therefore, we try to answer the following question: Does the increase of women's political representation relate to institutional changes in line with the notion of

'sensitive gendered parliaments'? Moreover, we want to explore whether this potential institutional changes have favored the power positions of WMPs within regional parliaments along time. Finally, we also discuss if there are changes in women representation, segregation and access to power positions within parliaments before and after the crisis period in Spain.

In order to answer to the previous questions, we use public data provided by spanish regional parliaments and extracted from the regional assemblies' website.

Humanizing Childbirth: An Emerging Protest Movement

A man and a woman come together to bring a new life into this world, through the body of the woman in a process, called childbirth. This, in most part of the world, is celebrated as a happy occasion. Among the communities such as Kgtlas of South Africa, Yorubas of western Nigeria, and Hindus of India, a married couple, especially the wife, acquires new dignity after giving birth to a child. Nevertheless, a sizable chunk of women today deal with pain, abuse, insults, disrespect and even death during the process of child birth. At times it becomes a nightmare for the birthing women when they face abuses in the hands of healthcare personnel who are supposed to care for them. This paper starts by discussing different forms abusive practices mated out to pregnant women in different parts of the world. It then goes on to briefly illustrate the genesis and historical development of the phenomenon. As a result of widespread abusive practices, a number of protest movements have been emerging throughout the world. After shading some lights on those emerging protest to humanize childbirth, the paper ends with contextualizing the phenomenon to Indian scenario and suggesting a roadmap that may lead to adopting humanizing practices during childbirth in Indian institutions.

Working for the Global Market: Lived Realities of Informal Workers in a Global Supply Chain

As developing countries are increasingly integrated into global economic system, devastating effect of global economic and financial crisis on incomes, government finances and labour market is translated into diverse social outcome in these countries. Various austerity measures that were adopted under auspice of neoliberal economic policies in most of developing countries has further exasperated the situation and tighten the belt of workers in informal sector. However severity and considerable diversity of effects of crisis on everyday life of millions of these informal working poor in developing countries is not fully acknowledged in official as well as academic discourse. Articulating a qualitative case study of the football industry of Pakistan as an example of general mechanism of social relations of production and reproduction in a global system of production organization, this research highlights that how and under what conditions informal workers, especially home-based workers are integrated into global supply chains at multiple intersection of gender, class, ethnicity and geopolitical location. Various dimensions of informal work at various nodes of global supply chain are explored through in-depth interviews to gain insight about the nature of work and employment conditions. This paper argues that there is a clear gap between the theoretical stance on informal work and the inner world view of the actors involved. This study questions the existing approaches towards home-based work and presents an alternative discourse that stems from voicing the concerns and experiences of homeworkers, which are too often voiceless groups.

NAZAROVA, ELENA* (*The Russian Presidential Academy of National Economy and Public Administration*)

Additional Education Is the Connecting Link between the Student and His Future Work

The most important target of education system reforming is to make education practical and operational.

Education should be the basis for the future employment. Currently, there are two different views on the relationship between the education system and the needs of the economy. The first option is that the professional orientation of the education system should be increased. The basis of this position is the satisfaction of the economy needs and the labor market through the education system.

The second point of view calls into question the relationship between the high level of educational standards and economic indicators. The supply does not always generate demand. There is no vacancies guarantee to the large number of highly qualified specialists. According to the sociological researches, the identification of the relationship between the level of education and the level of economic achievements becomes very problematic.

For today's Russia, the discrepancy and non-identity of the education system and the labor market are the normal things. This phenomenon forms an additional mechanism that fills the gap between the labor market and the professional education market, that is called the "additional education".

Graduates of modern Russian universities with knowledge and skills are not ready and do not know how to position themselves in the labor market. The main reason for this is the insufficiency of the communicative skills and inadequate understanding of their own market value. Thus, "the additional education" is a segment connected with the elimination of under-received practical knowledge in the university. This type of education can include a variety of didactic techniques, trainings and lectures.

A new educational segment can become a connecting link between the university and production.

Contemporary Multicultural Narratives and Immigration Politics: Intersections of Gender, Racialization, and Cultural Identity Among Asian and Latino Canadian Immigrant Youth

Background: The integration of ethnocultural and racialized minorities in Western immigrant-receiving countries has received growing attention in public and political discourses in recent decades, especially in the post 9/11 era. Mass movement of refugees into Europe, anti-immigration discourses, and hate crimes targeting religious minority communities, have reinvigorated narratives of identity, belonging, and inclusion in the West. It is in light of these events, and in the context of Canada's 150th anniversary, that a revisiting of Canadian discourses on multiculturalism and integration is timely. **Objective:** We revisit this discourse through the views of two groups of immigrant youth. We report findings of our study on the perceptions of Asian and Latino Canadian immigrant youth focussing on their experiences of cultural identity and integration in Canada. **Methods:** Through a qualitative community-based approach, data is being collected through in-depth interviews and focus groups with Asian and Latino Canadian youth between the ages of 18- 24, who live in the Greater Toronto Area. Coding and analysis is code-driven and guided by a grounded theory analytic approach. **Findings:** We apply a socioecological approach to help account for the multiple influences on youth's cultural identities, which we recognize as a complex and fluid phenomenon. Preliminary findings point toward the intersectionality of identity experiences: 1) for some youth gendered migrant identity plays a more salient role, 2) while for others racialized religious minority status impacts lived experiences, 3) and yet for others a sense of exclusion from mainstream narratives of multiculturalism shapes their perceptions of equity and belonging. **Discussion:** Multiple narratives on cultural identity have emerged, some of which highlight gender inequality, intertwined with racial discrimination for immigrant and minority youth. In all cases youth find spaces of resistance as they juggle their gendered, minority, and youth identity within mainstream multicultural narratives, while respecting their migrant histories.

Contested Citizenship, Local Identities and the Power of Othering in Post-Apartheid South Africa

The struggle against and subsequent demise of colonialism and apartheid was embedded with expectations of equal citizenship and freedom in the new South African democratic dispensation. However, this has been constrained by the expansion of neoliberalism characterised by privatisation of land and other basic services. This has severely undermined citizens' access to basic rights and other services and has propelled various forms of protests globally, challenging social inequalities while also trying to envision a different world order. The subject of citizenship has attracted significant scholarship globally. However, the imagination and conceptualisation of citizenship and/or citizenship rights has always been conceptualised in relation to the state. Presumably, it possesses the ultimate power to grant or deny citizenship rights. While the state remains an important player in determining citizenship, a state centred analysis of citizenship underplays the power of inter and/or intra community relations in the construction of meanings of citizenship. In this paper, I draw from an ethnographic study that triangulates archival work, eighteen months of participant observation, interviews and life histories of residents of Duncan Village township in East London to understand and theorise how the concept of citizenship has developed, contested, negotiated, and given meaning over time. I pay close attention to the construction and deployment of identities of *inzalelwane* (born-and-bred), *abantu bokufika* (newcomers), *amagrigamba/amaGhana* ('foreigners') that are used as markers of citizenship in Duncan Village to include or exclude (non)citizens from access to state resources. I draw from these nuances of language use and contestations of these identities to argue that in post-apartheid South Africa there exist a form

of contested citizenship grounded on community contestations over distribution of state resources. This contestation informs how and where state resources are distributed in Duncan Village.

Fractured Citizenship and Contestations of Belonging in Post-Apartheid South Africa

In many post-colonial societies, the inherited nature of the colonial practices seems to undermine the primary requirement of citizenship characterised by certain rights. Many populations have been promised liberties, but following neoliberal expansion in the global South, actual experiences of these rights have been very limited, affecting mostly the marginal groups. This has propelled many struggles across the world to challenge social inequalities. In South Africa, the adoption of some of the neoliberal principles in economic policies has undermined the promises of democracy. This has affected the previously disadvantaged groups as they continue to protest over limited resources. This subject has attracted a number of scholarships both locally and internationally. However, most of them focus on understanding marginalisation of communities by the state whilst underplaying the struggles and contestations over scarce resources among and/or within members of the same community. This paper examines, through an ethnographic study, how community members deploy identities such as *inzalelwane* (the born and bred), *abantu bokufika* (new comers), and *amagrigamba* ('foreigners') to include or exclude fellow members from access to state's limited resources. Drawing from the experience of Duncan Village in the Eastern Cape Province, the paper argues that this form of a fractured citizenship emanating from contestations of identities and belonging undermines the efforts and possibility of collective action in mobilisation for basic services in Duncan Village. The only time when residents of Duncan Village come together is when they are protesting a common good, i.e. electricity. This therefore becomes central in understanding how the state is reconfigured and how citizenship is fractured as marginalised residents take to the streets in protest to challenge their exclusion.

Pentecostal Responses to Gender and Social Inequality – the Case of Celebration Church in Zimbabwe

In this study, the author examines how religion responds to gender and social inequality. Research on gender and African Pentecostalism has focused on the shifting roles of women and how women negotiate gender in an African context. In order to contribute to this debate, a study was conducted to investigate how Pentecostalism deals with gender and social inequality including issues such as democracy and egalitarianism within the context of the church. The study found out that the Celebration church in Zimbabwe embraces social equality, democracy and egalitarianism as it advances the notion of equality between man and woman. It acts as a 'trade union' of woman emancipation and advancement as it breaks the traditional patriarchal-based systems that are evident in African society. Women thus see Pentecostalism as one avenue towards upward social mobility.

When Good Intentions Go Bad: A Social Construction Approach to Alignment in Disaster Donations

In the aftermath of disasters, materiel convergence (the influx of materiel goods donations) can cause extreme negative impacts; it has been described as a "second disaster". Non-priority goods and donations that are in excess of the need can impact transportation into the area and create storage concerns both for the distribution centers and for the survivors. This paper features data collected after Hurricane Sandy in 2013 and two tornadoes outside of Oklahoma City in May 2013. Interviews were conducted with individuals involved in the donation supply to understand how they socially construct the need for disaster donations, and how the needs of donors aligned with the needs of survivors. The findings show that individuals involved in the donation supply chain differentially assign value to the donors' interests and the interests of survivors. Participants understood that the alignment of these interests was important to the successful functioning of the supply chain, however the findings reveal that while survivors' needs are highlighted as a motivation to donate, the interests of donors were prioritized over the needs of survivors. The preference to meet the needs of donors over the needs of survivors can directly contribute to the excess of donations that enter disaster affected areas.

Negotiating, Narrating and Modelling Terrorism - Using the Example of the "Munich Shooting" in 7/2016

Negotiating, Narrating and Modelling Terrorism - Using the Example of the "Munich Shooting" in 7/2016

Taking the Munich Shooting 2016 as an example, this presentation aims to investigate socio-cultural images and framings of violent incidents by tracing how they are negotiated and deployed in order to better understand the construction process of coherent narratives. Understanding that the public (i.e., media, legal and civic action) take an active part in shaping and modelling these narratives, this presentation will describe the conflicting debate of public negotiation that leads into a situation-definition that itself shapes and structures further images and understandings not only of history but also of future assessments.

It is crucial to investigate how the construction of a coherent narrative in response to fatal incidents works; in fact, it is necessary for shaping the communicative memory (Assmann) and collective narratives of a society. For that, the presented findings are based on a "Mass-Medial Dialogical Network"- Analysis (Nekvapil) focusing on media data of the Munich incident in order to gain an insight into the cultural knowledge used to meaningfully denote such events for the societal public. A phenomenological lens is deployed that looks at norms in action by taking the sequence of social action a (Garfinkel).

The Munich attack is an important example since the first definition (Islamist shooting) proved false, the motive of right-wing-extremism was then dropped and it was then defined as deriving from personal trauma. Furthermore, this presentation will take into account the biographical perspective of the attacker's fascination for violent right-wing extremism, documented in his manifesto.

Overall, this presentation will contribute to a better understanding of public debates that structure images and narratives of violence, spaces of memory culture and cultural knowledge. Also, it will investigate how forms of violence can be mediated through specific cultural narratives.

NELL, CHARLOTTE* (*Goethe University Frankfurt a/M*)

Rendezvous Via Skype? Investigating Virtually Mediated Long-Distance Relationships in Modern Times Using Skype As an Example

Taking the communication medium of skype as an example, this presentation investigates the structuring and modelling of long-distance relationships under the conditions of a contradicting, reflexive and liquid modernity (a.o. Bauman, Giddens, Berman). For this, the constituting "virtual space" is sketched due to a sociology of communication and systems theory (Luhmann), taking into account the social reality-oriented references within the medium in order to analyse the constituting structure within "synthetic situations" (Knorr-Cetina). This includes the dimension of time and space in modeling the virtual, building on Goffman's "situation".

Understanding Skype as constituted social space (Simmel), certain structural conditions, can be defined that shape the love communication between two actors in a distinct way. In order to investigate the structural characteristics as well as the specific designing requirements of Skype, and the role the medium takes in the stabilization and communication of love, the presentation will draw upon findings from five qualitative interviews. Through a phenomenological approach the medium Skype and the through it negotiated love-experiences by the actors will be reconstructed, demonstrating that the practice of skyping functions as a stabilizing ritual (Turner/Illouz), which requires and constitutes specific "requirements of elasticity" in order to establish proximity over distance.

Before this background, Illouz theory of increasing commodification and rationalization of love relations (especially through the internet) can be (re-)discussed. Thus, this presentation not only contributes to a sociological conceptualization of virtual media, but also a sociology of space, culture, love and social inequality (including gender).

The Incidence of Teenage Pregnancy of Female Youth in a Disaster-Prone Areas in the Philippines

The super typhoon Haiyan that hit the Philippines in 2013 rendered 3.5 million families homeless. These displaced families experienced stage by stage process of resettlement, from emergency shelters, then to transitional shelters and finally to permanent resettlement. Because of living in makeshift shelters with shared

utilities and the lack of reproductive health care in these shelters, the well being of female teenage youth particularly, the risk of pregnancy is a concern. A survey of 742 female youth, 12 to 21 years old from Eastern Visayas, Philippines found that incidence of pregnancy in 2013 is 18% in severely hit areas and 14% in moderately hit areas. The incidence of pregnancy by severity of typhoon experienced depends on the number of moves and number of days that the youth have stayed in these various shelters. Those who have changed emergency shelters only once, had stayed in relocation sites between 91 and 180 days, stayed less than 330 days in transitional shelters, had been staying for less than 120 days in donated permanent housing, and those who had been living in their own houses from 666 to 730 days were found to be simultaneously related to the incidence of pregnancy and severity of typhoon. But regardless of their experiences of moving from one shelter to the next and their length of stay in these various shelters, the youth with risk behavior characteristics such as alcohol use, exposure to pornography, suicide attempts and premarital sexual experience remain to be significantly related to incidence of pregnancy

I Am Alone and I Am Here! Ageing in an Old Age Home in Kerala, India

Aim

The present study is an attempt to understand how older people live and carry on with their day today existence in an old age home. After years of living as an integral part of the family the old person now faces a painful separation. Added to this situation is the fear of what the institution will be like. Is it a place to live or a place to die? Does old age home become a site of recuperation into the society, or does it deny the individual, through its restrictions, the constant sense of being in the margins? These are the main research questions that will be addressed in this paper.

Data and Methods

The research was an ethnographic study conducted among the elderly women residing in an old age home in Kerala, India

Results

The life experience of these aged women delineates a sense of ennui, a stasis of loneliness, maladies and death wish. In addition to the personal disenchantment of the residents, the politics of scrutiny, restriction and authority play upon the space of the old age homes, a site juxtaposing security and denial. One needs to ponder upon the contradictory sense of belongingness and that of being an outcast in the consciousness of the individual.

Conclusion

It can be concluded that old age home living is not a simple proposition and the perspectives and experiences of those living in the new 'Home' for elders are varied and much more complex.

The Embodiment of Queerness: Interpretations, Interactions, and Experiences of Gender Amongst Bisexuals

The Embodiment of Queerness: Interpretations, Interactions, and Experiences of Gender Amongst Bisexuals

Bisexuality is an under-researched sexual identity. Often considered as part of the broader LGBTQ+ spectrum, bisexuality has not received much individual attention within sexualities scholarship. This is despite evidence that bisexuals experience unique forms of discrimination, such as biphobia, bi-invisibility, and monosexism. The lack of specific attention to bisexuality has meant that bisexual experiences are often not represented in sexualities scholarship, or that bisexual specific issues are under-reported.

Where bisexuality is studied, bisexuality is simultaneously applauded as transcendent of binary thinking, and criticized for reinforcing gender binaries. Sexualities theorists such as Marjorie Garber have claimed bisexuality as the most progressive sexual social identity due to its openness to potential differently gendered partners. Other sexualities theorists such as Steven Angelides have suggested that bisexuality is a sexual identity complicit in the maintenance and construction of sexual social identities.

These conflicting theoretical backgrounds do not give a clear answer as to how bisexuals interpret, interact with, and experience gender - Do bisexuals embody their queerness in a unique way as they navigate heterosexual and homosexual spaces? Does the gender of bisexuals' sexual partners shape and develop their romantic relationships in different ways? These questions intend to explore the way in which heteronormative and gendernormative power structures shape the way in which bisexuals navigate sexualities and genders, for themselves and others.

This presentation will share interim results from a qualitative PhD project seeking to understand connections between bisexual relationships and gender performance. Following qualitative research techniques involving bisexual participants, the results will explore the way in which bisexuals embody their queerness, as well as how their interactions are shaped by different genders in a sexual-roman-

tic context. Whether bisexuality is transcendent, complicit, or as is most likely, both, will be explored.

Cause and Effect Analysis of Virtual International Challenge of "Blue Whale"

"Blue whale" is the name of a network based challenge appears as a virtual game in 50 stages for 50 days leads to asking players to commit suicide at the final phase which has had pervasive crucial consequences through the entire world. Analyzing Content of the stages of the phenomena, we decided to demonstrate the causes of addicting people especially teenagers to this game which can be led consciously to their death. Applying Delphi method to consider all dimensions of the "blue Whale", we invited international experts on the fields of economy, sociology, psychology, medical, religion and also IT engineering to respond our questionnaire about the aspects of the game in 2 categories: which aspect of the phenomena attract users with emphasis of girl teenagers to the game, and also in future how we can prevent the similar sophisticated difficulties.

In a nutshell, we tried to find the process of trapping teenagers in the circle of this challenge through sending open-ended questions to 30 experts in aforementioned areas consist of 5 experts in each of 6 contexts. For futurology of phenomena we asked them at the first phase to analyze the phenomena and elaborate their views on the reasons and effects of pervading the game. An outline of responses was sent to the experts in the second phase asking them to clarify their points of view for a true concluding. Eventually, our general finding was the issue of drought of special ties with the society mentally and objective in the modern era which can be filled through new ties on the virtual world. Such ties can be defined as some special subjective and real capitals one may found they have through their connections to the both virtual and real world.

Public Opinion and Migration Processes in Europe

The latest flow of immigrants and refugees is compared by the scientific community to the Migration Period. But is this really so? These processes have contributed to the uprise of serious social risks next to a humanitarian disaster on near-border and cross-border territories in particular. The ruling elites of some EU member states appeared to be not ready for the ongoing processes. In Europe, founded on the values of global equality and non-discrimination, they began to put up the "Berlin wall" again, thereby introducing on the agenda the issue of the termination or regression of European integration processes. How do public attitudes in Europe change regarding these issues? Is there any elite consensus on the threshold issues of European solidarity? According to Zaller's concept about public attitudes, in case of elite disagreement the society must also divide in the way that the segment supporting one of the parties is the more committed to it as he is more informed about the issue. Since the pivotal question is how European citizens use the information from mass media in the formation of their own social and political preferences on the issue of migration policy in the EU countries. How do these preferences influence their ideas about integration and solidarity within the EU states? How is the European opinion being created? How are the information flows being formed: the ones which create a highly-selective and stereotyped image? Is that way the method of political populism? Our report is going to give answers to these questions.

The Theory of Neo-Kantianism As Base of Modern Qualitative Research

The report is about the Russian sociological school of Neo-Kantianism which appeared in Russia at the turn of the 19th - 20th centuries. The ideas of neo-Kantianism are consonant to the development of a modern situation in Russian society and Russian sociological science. Recent political events in the country proved that quantitative research methods of social processes cannot cope with the given scientific and social task and explain the reasons of resulting changes. In this concern, the use of qualitative methodology as the strategy of researching social processes perfectly meets the requirements laid down by the scientific community to the social science. It is noteworthy that sociology, in order to recover from recession and solve the problems of self-determination, must strive for the maintenance of its subject matter, the structure of scientific knowledge and a method which should be the method of qualitative researches aimed at the investigation of goals of human activities and their correlation to the social hierarchy of values. The Neo-Kantian strategy of qualitative research include: 1.

Understanding sociology as a science of the spirit which is based on generalizing knowledge. Considering the quality first and not the quantity, a sociologist should be able to analyze in detail the individual, isolated facts which form the essence of social processes. Classification and typology of the key methods of qualitative sociological research. 2. The methodology of qualitative social research should be based on an idea of teleology as the basis of conscious human actions. 3. Attribution to value as the main method of the verification of the research results, as well as a collective scientific work as a means of avoiding subjectivity.

Risk-Taking Acts and Local Racialized Masculinities in a Japanese Auto-Parts Company in the United States

The auto industry has recently garnered attention because of some large recall scandals. Yet we know little about the workplace contexts in which these and other defective products have been produced and concealed in auto-supplier plants, or about how and why seemingly unethical practices were tolerated and sometimes legitimized. Also, regardless of increasing global competition and economic pressures in the auto industry, little research has been done to examine the organizational contexts in which the pressure to increase profits leads to managers and production workers engaging in risk-taking to achieve their goals. Based on the ethnographic observation at a Japanese auto-parts plant, this paper examines how workers and managers engage in profit- and productivity-driven acts and seeks to understand why some of these harmful customs are legitimized. It focuses on three groups of men—Japanese managers, American managers, and American production workers—in a financially struggling Japanese auto-parts company. The paper, looking at how profit-raising pressures legitimize masculine enactment, discusses the following findings: (1) that the local managers manipulate accounts and budgets, and non-managerial workers engage in fraternal validation; (2) that the local managers assert racial and gendered authority through their use of intimidation; and (3) that production teams protest and hide defective products. The firm's authoritarian management, lack of consideration for substantial management reform, and sole emphasis on profits seem to have made the managers' and workers' employment of deceitful leadership almost inevitable. The conclusion discusses some of the implications of these findings for global management and our understanding of local masculinities.

Balancing Two Cultures: Lives of Atomic Bomb Survivors in the US

This paper examines the relationship between migration, belonging, and changes in "we" and "I" through the case of atomic bomb survivors living in the US. In 1945 atomic bombs dropped by the US destroyed the cities of Hiroshima and Nagasaki in Japan. The survivors have suffered from scar, trauma, and radiation caused by the nuclear bombs until today. However, there are atomic bomb survivors who migrated to the US from Japan after the WWII. Some moved to the US for their career or marriage. Others were originally born in the US as the second generation of Japanese-American but went to Japan before the war, and came back to the US after the war. Those atomic bomb survivors in the US built an organization to ask for medical support from the US government first and then Japanese national government because the US rejected the support for its "enemy" in the past.

In this paper, I will explore the biographies of atomic bomb survivors living in the US to consider their sense of belonging. First, I will briefly explain the background of atomic survivors living in the US as well as the effects of atomic bomb. Second, I will describe survivors' life stories while answering questions such as why they migrated from Japan to the US and how they have lived in that country against which they "fought" in the past. Lastly, by drawing on the survivors' life-stories and narratives, I will examine how they have changed their sense of belonging such as being a Japanese, an American, and/or a survivor from the atomic bombing by the US.

Linguistic Vitality Among the Turks and Armenians of Tehran

Linguistic Vitality among the Turks and Armenians in Tehran*

Abstract: In this research, the demographic structure of Tehran is investigated according to Ferguson and Fishman's bilingual theory. Tehran as the capital city of Iran has its own distinct, prestigious, dominant and standard language variety. Tehran, due to its particular situation, attracts local immigrants who speak in different languages and dialects. Each individual tries to pick up and internalize this dominant variety of language according to his/her will or situation. Taking into account the fact that languages do not have the characteristics of superiority or

inferiority by themselves, and if the language is placed in the pyramid of hierarchy and enjoys the dominance, it is because of cultural, economic, political and even psychological factors. The use of either local or dominant varieties of languages in different settings as well as the factors that contribute to the stability and instability of multi-lingualism precisely among Armenians and Turks is the main goal of this research. This research consists of four parts: Part I: Ethnicity, language, bilingualism, diglossia and language vitality Part II: A brief survey on the historical background and demographic situation of two ethnic groups Part III: Research method, analysis and Interpretation of Information Part IV: Conclusion

Keywords: Tehran, Armenians, Turks, Bilingualism, Diglossia, Immigration

Occupational Erasure and the Work of Invisible Teaching

The contractualization of citizenship in the US is reshaping social membership structures and producing new institutional categories of people (Somers, 2008: 2; Walzer, 1983: 31; Hacking, 2007; Newman & Clarke, 2009). In schools, the "student" has been splintered into variants such as "gifted," "learning disabled," and our focus here, the immigrant or transnational "English Learner" (EL). Instead of 'citizen' or 'student' as an encompassing category attached to rights shared by all, the state attaches such fractured institutional identities to category-specific rights. More significantly for our purposes, contractualization generates new categories of workers – in the case of ELs, the English-as-a-Second Language or ESL teacher.

In this paper we examine how the work of ESL teachers is being assembled in one of the new immigration sites of the American Midwest, where the EL population has grown dramatically over the past 20 years from a tiny base. The paper is based on an institutional ethnography (Smith, 1987; 2005; DeVault & McCoy, 2005) – interviews with 38 elementary-school ESL teachers and 5 ESL administrators in five contiguous but socio-economically contrasting school districts in a Midwestern US metropolitan area. Our theoretical aim is to show how the processes that articulate the teachers' work with extralocal relations of control make that work visible at a distance but simultaneously place it under erasure at home through structurings of classroom time and space, and mobility regimes that decouple the work from specific school locations -- in some cases rendering the work "invisible" (DeVault, 2014; Star & Strauss, 1998). To do this we integrate IE with concepts from political geography, in particular ideas of scale and mobility (e.g., Herod, 2012; Cresswell, 2010). We conclude by considering the implications of these processes for teachers and students.

GRÜTTNER, MICHAEL (*DZHW*)

Does International Student Mobility Increase Social Inequality?

Students from a high social origin are more likely to study abroad than students from a low social origin. At the same time, studying abroad positively influences students' intercultural competence, personality development, and labour market prospects. Therefore, social stratification research tends to assume that international student mobility (ISM) fosters the reproduction of social inequality. This argumentation presupposes that students from different social origins profit from ISM at least to similar extents. However, this assumption has hardly been tested empirically.

Theoretically, two types of heterogeneous returns to ISM are plausible: Students from a high social origin could acquire more skills abroad, e.g. because they complete more valuable stays, or be able to better valorise the acquired cultural and symbolic capital in the labour market (cumulative advantage). Alternatively, their marginal utility of staying abroad could be lower because they already acquired solid transversal skills before their studies (compensatory levelling). While the first scenario should increase social inequality, the second one should actually reduce it.

We address the outlined research gap by examining graduates' labour income. We analyse longitudinal data from 2005 DZHW Graduate Panel, which follows graduates from German higher education institutions up until ten years after graduation. We perform a propensity score matching to reduce observable selection bias and calculate latent growth curves of labour income to examine the role of ISM for the potential development of inequality between social origin groups.

Our results suggest that, in terms of income gains, students from a high social origin profit more from ISM than students from a low social origin. The latter only start to profit in their medium-term career. Considering that students from a high social origin are also more likely to study abroad (36% versus 25% in our sample), our results imply that ISM fosters the reproduction of social inequality.

NEUBER-POHL, CAROLINE* (*Federal Institute for Vocational Education and Training (BIBB)*)

Premature Contract Termination in VET - a Job Matching Approach

In the German system of vocational education and training (VET), apprentices receive both a general school-based education as well as an on-the-job training at their training firm. More than 50% of high school graduates enter such a program after school. Being such an important part of the German education system its efficiency in guiding young persons towards obtaining a vocational degree is a key target for political action.

However, when applicant and company meet they have insufficient knowledge about each other. With little or no work experience or understanding of the task contents of the training occupation not only the applicant but also the company incur a risk of poor match quality. In poor matches firms forego gains from productivity and workers from earnings over their life cycle. Knowledge on match quality is only *learned* over time when working together. When the confidence in match quality falls below an individual threshold, matches are terminated. About a fifth of all contracts end before successful program completion, however occupational choice can hardly be compared with job shopping of labor market entrants as most apprentices in fact stay in their first match.

I propose a theoretical model following the job-matching approach, which predicts the key determinants for premature contract termination. Focusing on the learning mechanism and the risk sharing nature of VET programs, I can illustrate how wage shocks for skilled employees and financial motivation affect the termination decision more than the recent literature accounts for. I already validated this theoretic result empirically using aggregate data from official statistics. For causal inference, in the next step I will evaluate this model against individual level spell data.

Beyond Class? Why We Need an Elaborated Framework to Analyze Social Structure.

The current debate on middle class in Africa is a kind of turning point. For decades social inequality and questions of social structure focused on poverty. With the interest in middle class, the debate widens again. However, the current debate has serious shortcomings. The debate uses a class concept that does not consider that many middle class members combine different sources of income such as salary, small and medium enterprise, and agriculture. Classical social groups like "workers" "petit bourgeoisie" or "farmers" do not capture the reality; and the division between rural and urban population ignore that many families have urban and rural homes. Class concepts assume a certain stability of class affiliation. Nevertheless, a large part of the "Middle class" lives in uncertainty with up- and downward mobility. The socio-economic position is not simply defined by qualification or wealth but depends on but also on access to socio-political networks based on religion, ethnicity or patronage and on the access to formal social security and informal security networks. Research on gender shows that there is socio-economic inequality inside families. The improved options for consumption show especially in the middle-income stratum very different life-styles, attitudes and political convictions. This contradicts the assumption of a general class-consciousness

A Replication of the Experiment on Separating Scale Points from Non-Substantive Responses of Tourangeau, Couper, and Conrad 2004

Web surveys are commonly based on self-administered modes using written language to convey information. This kind of language is usually accompanied by visual cues. Research has shown the visual placement of response options can affect how respondents answer questions because they sometimes use interpretive heuristics. One such heuristic is called the "middle means typical" heuristic. It implies that the middle option serves as an anchor since it is seen as the most typical one. We replicate the experiment on "separating scale points from non-substantive responses" by Tourangeau et al. (2004) and extend it by using eye-tracking methodology. Specifically, we investigate respondents' response behavior when the conceptual midpoint of a response scale falls on one side of the visual midpoint – i.e., the conceptual midpoint is unequal to the visual one. By recording respondents' eye movements, we are able to observe how they process the questions and options to draw conclusions about their processing. We

conducted a lab experiment with three groups: In the first group (n=45) the non-substantive options were presented as additional radio buttons. In the second group (n=46) the non-substantive options were separated by a space. In the third group (n=41) the non-substantive options were separated by a line. Altogether, we expect a higher fixation count and time on the first half of the response scale and on the conceptual midpoint in the conditions with separation because it is assumable that there is no shift in respondents' perception of the response scale due to the consistent midpoints. In these conditions, we also expect a higher fixation count and time on the non-substantive options and more gaze-switches between substantive and non-substantive options. Finally, we expect a higher amount of non-substantive responses in the conditions with separation and a mean shift toward the visual midpoint in the condition without separation.

Respondents Attention and Response Behavior in Web Survey: Comparing Positioning Effects of a Scale on Impulsive Behavior

Previous research has shown that the quality of data in surveys is affected by questionnaire length. With an increasing number of survey questions that respondents have to answer, they can become bored, tired and annoyed. This may increase respondents' burden and decrease their motivation to provide meaningful answers which might lead to an increased risk of showing satisficing behavior.

This paper investigates effects of item positioning on data quality in a web survey.

In a lab experiment employing eye-tracking technology, 130 respondents answered a grid question on impulsive behavior that consists of eight items and a five-point response scale. The scale was randomly provided either in the beginning or at the end of the web questionnaire.

The position of the scale was predicted to influence a variety of indicators of data quality and response behavior in the web survey: item nonresponse, response times, response differentiation, as well as measures of attention and cognitive effort operationalized by fixation counts and fixation times. In addition, it is investigated whether the position of the scale on impulsive behavior affects the comparability of correlations with other personality variables.

The Permanent Crisis of Migrant Labor - Gender Differences in the Crisis Perception of Latin American Labor Migrants in Spain

It is widely assumed that the working and living conditions of migrants from non-EU countries in Europe are particularly affected by economic fluctuations. Migrant workers who are primarily integrated into the lowest and hardest-hit segments of the labor market are often the first to lose their jobs. In this paper, the impact of the economic crisis on labor migration is investigated from the perspective of Latin American labor migrants in Spain. Thereby, I draw on the qualitative analysis of group discussions and individual interviews with labor migrants in the working areas in which a large proportion of migrants are employed in Spain, which is the construction sector, paid domestic labor, and the hospitality sector. These sectors are not only differently hit by the economic crisis, but also largely segregated by gender. Thus, data on the Spanish labor market reveals a significant gender unevenness in the impact of the economic crisis on labor migrants, as for example the unemployment caused by the crisis had a greater effect on male than on female migrant labor. In the interviews, these gender differences are reflected in the different perceptions of the crisis by migrant men and women. While the male interviewees in the construction sector emphasize the drastic change brought about by 2008, the female paid domestic workers consider precariousness as an essential characteristic and permanent condition of their labor. By drawing on approaches from Feminist Political Economy and Critical Migration Studies, the crisis perceptions of the interviewed migrants are related to the broader picture of the political economy of migrant labor in capitalism. I argue that by contrasting female and male migrants' experiences, it becomes particularly visible that contemporary migrant realities are conditioned by a 'permanent crisis'.

Education As Promises of Social Advancement or Processes of Marginalization? an Institutional Ethnography of the Reproduction of Social Inequality in Lower Secondary Schools

Broadly outlined two opposite discourses shape the post-PISA debates about migrant lower secondary school pupils and their low educational performance in Austria. Some scientist and public media discourses blame migrant pupils and their parents for not willing to integrate into society. Their negative educational

performance is seen as result of their allegedly resistance to learning the German language and their different 'cultural' background, which has to be overcome by a German-only-imperative, by teaching European values and by a more authoritarian disciplinary teaching culture. Other linguists and sociologists criticize the monolingual school system and particularly teachers for not recognizing multilingualism and not reflecting their own racist prejudices.

Migrant pupils, their parents and teachers are held accountable for the negative educational performance of lower secondary school pupils. Though teachers have more power than pupils and their parents, I will argue that all three groups become scapegoats of broader societal and educational crises. By adopting the perspective of secondary school teachers on this situation, describing their ordinary practices and the related challenges they face, the aim of the paper is a change in perspective: As a sociologist and a secondary teacher I will analyze parts of the complex (institutional) ruling relations that structure teachers' and pupils' everyday school life and hinder democratic and quality education for migrant pupils. I will not acquit teachers of racism, but connect their practices with broader institutional and societal conditions in order to understand how education becomes an undependable route to upward social mobility.

NEVEN, LOUIS* (*Avans University of Applied Science*)

MAATHUIS, IVO (*Avans University of Applied Sciences*)

Resourceful Ageing: Countering the Paternalistic Stance By Viewing Older People As Innovators

While creativity and innovativeness is often seen as a positive trait for younger people, the use of everyday objects and technologies in unforeseen or creative ways by older people is often seen as cause for concern. Such behavior is deemed erratic and dangerous by for instance designers and care workers as they fear that such deviant use may lead to harm. Implicitly they adopt a paternalistic stance which allows them, and not the older people, to decide what technologies are safe and useful for older people. To counter this way of viewing older people and to improve our understanding of the ways in which older people solve problems in everyday life, we set out to investigate the resourcefulness of older people. In conjunction with a team of designers and engineers who were keen to break through the paternalistic stance we adopted a methodology which allowed in-depth analysis of the resourceful ways in which older people use everyday objects to (continue to) do what they want to do. The older participants were visited several times for a semi-structured interview and a tour of their home to discuss and photograph resourceful solutions. In between visits, the older participants were given an assignment to label artefacts which they used in everyday life, which they valued or used creatively. Our research shows that our older participants have their own technological literacy which allows them to craft creative solutions for everyday life problems. While it certainly is important to keep vulnerable older people safe, adopting the paternalistic stance and dissuading older people from solving their own problems is not wise. It reduces their autonomy, makes them passive and reliant on external help. Enhancing their resourcefulness in a safe way can lead to more autonomy and self-reliance and – we found – is often more fun.

NEWIAK, DENIS* (*Brandenburg University of Technology Cottbus-Senftenberg*)

Devices of Loneliness: Dysfunctional Communities in the Smartphone Drama Film Genre

Since the beginning of the 21st century, new mass media systems and technologies like 'social networks', serial videos on demand, and intelligent virtual assistants provide increasing communicative possibilities, making our world a 'global village' of growing virtual communities, producing new concepts of complex collectivities. But at the same time, those connecting screens, phones, and speakers generate a sense of being abandoned in front of the medial surfaces, the feeling of a 'nihilistic solitude' which Nietzsche predicted for our postmodern 'demoralized' era when he declared "God's Death" 130 years ago.

It is not surprising that lonely characters and their individual strategies of forming meaningful communities are 'standard repertoire' of almost every successful filmic dramaturgy: Movies as collaborative art works always refer to societal developments of their surroundings—and at the same time, they are actively involved in changing the way we live together, providing compensational communities in an era of increasing segregation. Whole film history can be read as a history of mediations between torturous solitudes and positively connoted (pair and group) communities.

With this in mind, film genres appear to be separable groups of films with similar approaches to procedures of communityization through their narratives and enactments: While Western and Super-hero movies create images of solitude as 'necessary tribute' to the 'just cause', Comedies live on their characters' inadequate methods to form romantic communities. In contrast, the contemporary genre of Smartphone Drama screens the loss of such communities in a highly individualized and urbanized world, focusing on omnipresent technologies and

devices as acting protagonists. On the basis of latest film theory and selected film excerpts from *Disconnected* (2012), *Men, Women & Children* (2014), and *Nerve* (2016), I want to demonstrate the similarities of such genre movies regarding their approaches to questions of loneliness and investigate their comments on current societal trends.

NEWIAK, DENIS* (*Brandenburg University of Technology Cottbus-Senftenberg*)

Forming Communities through Filmic Seriality: Approaches to Loneliness in Popular TV Series

Serial entertainment formats—especially those provided through new distribution channels like "Netflix" and "Amazon Video"—have gained more and more popularity in the last decade, but why? The expansion of series like *Stranger Things*, *Game of Thrones*, and *13 Reasons Why* coincides with the development of increasingly complex media technologies: Since the beginning of the 21st century, new mass media systems like 'social networks' and intelligent virtual assistants provide extensive virtual communicative communities, but at the same time, they generate a sense of being abandoned in front of the media surfaces, the feeling of a 'nihilistic solitude' which Nietzsche predicted for our postmodern 'demoralized' era when he declared "God's Death" 130 years ago.

This torture of loneliness seems to be the main topic of popular TV series: Formats like *The Office* and *Scrubs* as well as *Hannibal* and *Bates Motel* generate their entertainment value by transforming their painful solitudes to fictional communities through complex and yearlong lasting dramaturgies. Especially "sit-coms" like *Two and a Half Men*, *Mike & Molly*, and *The Big Bang Theory* live on their discourse on loneliness through narration and enactment: The focus of those apparently endless dramaturgies lies in the characters' individual strategies of coping with their inability to form viable (pair) communities. Equally, successful serial movie franchises like *James Bond*, *Twilight*, and *Spider Man* must be seen in this perspective.

Based on latest film theory and selected examples from contemporary television, I want to demonstrate how the situation of separated TV reception generates a substitutional conversation with an imaginary telemedial community, producing a common reference and sign system of life in a highly diversified society—both on the screen and in front of it. However, television does not neutrally 'mirror' social trends of individualization, but is indeed actively involved in this general societal development of increasing isolation.

NEWSON, JANICE* (*York University*)

POLSTER, CLAIRE* (*University of Regina*)

Toward Restoring a Holistic Conception of Academic Work: A Strategic Response to Precarity

In recent years, the poor working conditions and inadequate salaries and benefits of academics who hold part-time and limited-term contracts have become a flashpoint for progressive scholars, campus activists, and union leaders in mobilizing support for labour justice for these workers. Many of these mobilizations have aimed to rectify the precarious employment situation of these workers by creating new kinds of fulltime, teaching-only academic positions with improved pay and benefits, job security, and opportunities for career development.

This paper argues that this response to the plight of part-time and limited-term workers assumes a too narrow conception of precarity and in so doing, may not only exacerbate the precarity of these workers but also contribute to forms of precarity being increasingly experienced by most academic workers, including those holding continuing and tenured positions. It expands the notion of precarity by shifting focus from academic workers to academic work as a whole. Starting with the conception of academic work as an integration of research, teaching, and public service that prevailed three or four decades ago, it tracks how corporatizing processes have fragmented academic work and re-constituted it into tiered categories, each with its own range of responsibilities and privileges, and levels of pay and benefits. It shows how each tier experiences its own forms of precarity stemming from, interacting with, and reinforcing those of others.

While not denying that institutionalizing teaching-only academic positions may provide short-term improvements for some academic workers who currently hold part-time and limited-term positions, the paper questions whether this strategy addresses the increasing precarity of academic work itself, and proposes, as an alternative, political interventions based on a more holistic conception of scholarship that reunites research, teaching, and public service in ways that better serve academics, students, and the public interest generally.

RC22-410.7NEZHADHOSSEIN, ELAHE* (*Memorial University of Newfoundland*)*Intersectionality in Resistance Against Race, Ethnicity, Class and Gender Inequality Systems*

The theories of hegemony by Gramsci, Laclau and Moufe are more focused on the economic outcomes of cultural hegemonies, as well as Smith and Hall that are, respectively, more focused on gender and racial aspects of cultural hegemony and discourses. But an analytical focus on the intersection between different inequality systems and the intersectional aspect of counter-hegemonies' outcomes seems to be neglected. While hegemony and counter-hegemony are necessary for analyzing how people can challenge power and inequality systems, they fail to specifically discuss all the international and intersectional effects of social movements against hegemonic systems of inequalities. Drawing on theories of hegemony and discourse in media and networks of power and social movements, I explore how the discourses, including texts, language, and images in the US and Canada's mass media, have been affected or challenged/changed through women's activities in Iran, and how the social movement participants can be actively integrated into networks of power to challenge intersectional inequalities such as hegemony and discourses of race, class, gender or ethnicity-based inequalities in the media. My qualitative research study uses qualitative content analysis of four most circulated national newspapers as well as critical discourse analysis to explore the changes in Iranian women's representations in the media in the US and Canada. The data shows that participation of women in social movements attracts the attention of the mass media and challenges their misrepresentation. Resistance against one inequality system inside a country can challenge other inequality systems in local, national and also international level. This research provides a new vision of the intersectional counter-hegemonic process of social movements, how various inequality systems can be challenged unintentionally and internationally in different countries and shed light on intersectional effects of social movements, and the creation of intersectional counter-hegemonies against intersectional inequality systems.

RC14-262.1NEZHADHOSSEIN, ELAHE* (*Memorial University of Newfoundland, Canada*)*Iranian Women's Activities in Social Movements, and Their Representations in Canadian and US Mass Media*

Images of Iranian women in the West, as women of a Muslim and Middle Eastern country, are not accurate and do not show the reality of these women's lives. However, women's participation in social movements against power structures has the capacity to change women's oppressive representations in the media that are based on race, as such is the case with women of color, or based on ethnicity, as with Muslim women, through attracting media attention. Drawing on theories of hegemony and discourse in media and networks of power and social movements, I explore how the discourses, including texts, language, and images in the US and Canada's mass media, have been affected or challenged/changed through women's activities in Iran, and how the social movement participants can be actively integrated into networks of power to challenge different aspects of inequality such as hegemony and discourses of race, class, gender or ethnicity-based inequalities in the media. My qualitative research study uses qualitative content analysis of newspapers as well as critical discourse analysis to explore the changes in Iranian women's representations in the media in the US and Canada. The data shows that these inaccurate images shown in the media in the West are not a priority for women inside of Iran, but their (Iranian women) activities in social movements are more likely to gain the attention of the media and those images can be changed and made more realistic. Participation of women in social movements can have the attention and challenge their (women) misrepresentation on the mass media. This research shed light on new aspects of social movements' outcomes as global and intersectional effects of social movements, and the creation of intersectional counter-hegemonies against intersectional inequality systems.

RC27-501.5NG, KA U* (*National Taiwan University*)WAN, KIN MAN (*The Chinese University of Hong Kong*)LIN, THUNG-HONG (*Institute of Sociology, Academia Sinica*)*The Political Economy of Football: A Cross-National Data Analysis of FIFA Men's Scores, 1999–2014*

From the perspective of political-economic synergies, we argue that the interaction of economic development and democracy, the essential factor sustaining a strong professional football industry, improves the performance of men's national football teams. A professional football industry is a typical 'club good', a type of semipublic good that attracts people to take collective action in watching the game and investing their talent and capital. Moreover, economic

development increases the private sport consumption of fans whether their countries are democratic or not. In contrast to wealthy autocracies, wealthy democracies effectively shape the transparent and competitive institutional incentives of leagues and contribute to their prosperity, which benefits the national football teams' talent pools. We used panel data from 131 countries between 1999 and 2014 and fixed-effect regression models controlling the climatic conditions and population to show the effect of synergy between development and democracy on the performance of men's national football teams, measured using the Fédération Internationale de Football Association (FIFA) score. We found that democratically developed synergy, intermediated by a robust professional football industry, improved the performance of men's national football teams.

RC05-118.4NGOASHENG, ASANDA* (*Cape Peninsula Institute of Technology*)GACHAGO, GACHAGO* (*Cape Peninsula University of Technology*)*Engaging across Difference through Intergroup Dialogue: Two Lecturer's Reflections on Teaching Diversity.*

More than twenty years after the fall of the apartheid, South African student and lecturer's engagements across race are still tainted by the history of separate development. One of the key assumptions about engaging across difference is that the presence of diversity alone in a community can lead to community members being able to engage diversity without challenges. Real life experiences of multi-racial spaces however, debunk this myth and show that engagement is a difficult and challenging process riddled with many misunderstandings. This auto ethnographic study set in post-apartheid South Africa presents the reflections of two lecturers when trying to create classroom spaces to engage across difference. Framed by critical theory, critical pedagogy, decoloniality and literature on intergroup dialogue we unpack some of the moments of learning when trying to make invisible structures visible in the classroom - one of the core demands of critical pedagogy. This study also interrogates the necessary conditions for teaching as a diverse team and engaging across difference and finds that there are some requirements for inter-racial collaboration. This collaboration requires a focus on intersectionality, an awareness of the emotions accompanying difficult conversations and how these can hinder transformation when not engaged with critically. Established notions of safety in unequal spaces also need to be challenged for inter-racial collaboration to be successful.

RC40-705.6NGOH, MANKA* (*South Africa Sociological Association*)*A Sociology of Food Consumption Patterns in South Africa and Cameroon.*

A sociology of food consumption patterns in South Africa and Cameroon.
Sheila Manka, Mafikeng Campus, North West University, South Africa
manka_ngho@yahoo.com

Previously African countries lived on consuming indigenous food, which were grown naturally and thus void of chemicals. Such foods strengthen the body and make the individual healthier. In recent times, however, there has been a global nutritional transition, whereby many people shift to the consumption of more affluent food patterns (of processed and fast, packaged foods). These foods are not very healthy as they can lead to health related diseases such as obesity, diabetes, cancer, high blood pressure. The aim of this paper is to examine the reasons and effects of the shift in consumption in two African countries, that is, South Africa and Cameroon. The study seeks to understand the effects of the change, and to compare past to present modern food consumption patterns. A qualitative research approach is used, with in-depth interviews, with a sample of 30 participants stratified into different age groups. These include the youth, middle aged people and the elderly. This kind of sample has been chosen in order to understand the reasons for the shift in consumption patterns from the past into the present. The paper also seeks to make some suggestions on what needs to be done to reduce or avoid the shift in consumption patterns. One finding is that the shift in consumption patterns is due to many factors, including modernization, globalization, lifestyle changes, availability and accessibility to food varieties. The effects of such exposure can be linked due to negative health, as outlined above. One recommendation is that a shift towards indigenous diets is necessary, and that there has to be a reduction in the consumption of genetically modified foods.

RC06-142.5NGUYEN, MINH* (*Institute for Family and Gender Studies, Vietnam Academy of Social Sciences*)*Vietnamese Family Values: Similarities and Differences between Two Large Cities in the North and the South-Ha Noi and Can Tho*

This paper analyses similarities and differences on family values between two large cities which are representative for two cultural areas of Vietnam: 1) Ha Noi, a capital city of Vietnam, that characterizes for the Red River Delta culture in the

North of Vietnam and has many culture characteristics that are close to East Asian culture; and 2) Can Tho, a major city of South West of Vietnam, that characterizes for the Mekong Delta culture and has many culture characteristics that are close to Southeast Asian culture. Data are drawn from Ha Noi Family Survey in 2010-2011 with 1,219 respondents and Can Tho Family Survey in 2017 with 1,205 respondents. Both surveys are funded by the Kyoto University (Japan) and used the same questions about family values and practices as in Comparative Asian Family Survey (CAFS) and East Asian Social Survey (EASS), so their analysis results could be compared among Asian societies. Major issues analyzed in the paper are: attitude to marriage, attitude to divorce, attitude to living together with parents after marriage or separately, making decision in the family, and attitude to child value. These characteristics will be analyzed for several independent variables such as education, age, marriage status, urban/rural. As can be hypothesized, data analysis show that, even though Ha Noi and Can Tho residents live very far from each other, they still share many major family values on marriage and parents-children relationship, that expresses a traditional culture reservation at a certain level of Viet people in the process of migration to the South in the last few hundred years. At the same time, as a result of culture integration, family values of Can Tho people has fallen in line with Southeast Asian values in some respects that has made the development of Vietnamese family diversified.

Experiences and Pension Expectations of Older Women Workers in Ireland and the US – a Lifecourse Analysis

This paper focuses on the experiences, health and pension outcomes and retirement plans of older women workers in Ireland and the U.S. This is an issue of current societal importance in the context of both government's introduction of policies designed to extend working life. The latter policies are typically presented as benign and as offering the best solution to the pension demands created by demographic ageing. While it is acknowledged that women typically have poorer incomes and pensions than men, there remains a need to explore how women in different occupations may have very different outcomes in the years approaching retirement (Ginn, 2004, Ginn and MacIntyre, 2013). The fact that this paper adopts a feminist political economy of ageing approach to policy analysis allows interrogation of how welfare state arrangements may affect the experiences of older women workers and their plans for working into retirement. It is based on interviews with 30 women in Ireland and 30 women in the US, in three different occupations – health care workers, teachers and academic faculty – analysed using a lifecourse perspective. The qualitative life-course approach applying a critical feminist lens enables tracking of how individual workers at a micro-level experience changes in policy at a macro-level. There are some similarities in experiences for women in terms of being expected to provide unpaid care for family members. However, there are major differences in income, pension prospects and attitudes to late work between those in low-paid, physically-demanding work and those in high-paid sedentary work. It appears that union membership and better conditions experienced by public sector workers offers some protection, while those in precarious employment are vulnerable to poor health and low pension outcomes. The implications for policy and for future research are discussed in the context of Extended Working Life policies.

Neoliberal Development and Social Marginalization: The Struggle of Subnational Communities in Metropolitan Pakistan

Uneven development is a hallmark of neoliberal capitalist modernity that has cleaved national spaces into the rural-urban divide across the globe. This divide let loose investment capital to gravitate to urban spaces, where it created the new classes of nouveau riche, while leaving rural areas and rural communities depleted of their growth potential. The latter triggered a mass migration of the lumpen proletariat, and the future proletariat, from rural areas into city centers. This urban influx swelled the ranks of consumer classes in the service of urban capital. Overdeveloped urban spaces and underdeveloped rural spaces in turn created a vertically growing economy, whose horizontal base remained undergrown and underdeveloped. In social terms, uneven development unraveled the cultural and communitarian integrity of farm-dependent rural inhabitants, especially those marked with subnational identities that are place-centered and deeply invested in their native geographies – the place. Ironically, while these communities remained victims of underinvestment and underdevelopment in their native rural spaces, they remained so as migrants into urban spaces as well. On average, each half of urban populations of mega metropolitan cities in the global South consists of such socially and economically marginalized subnational communities that are housed in slums. This paper focuses on the rural-urban migration in metropolitan Pakistan, especially its overdeveloped and overpopulated mega city of Karachi. Empirically it examines the Pakhtun migration from the Pakhtuns' native habitats in the northern and southern Pakhtunkhwa into Karachi. It investigates the

underlying causes of Pakhtun migration, and tests the uneven and combined development (UCD) theory. Borrowing from social geographer Neil Smith, this paper deploys this theory both in conventional and classical terms (i.e., political economy) and in the contemporary ecological-social context. How capital creates the developed core and underdeveloped peripheries at the expense of human ecology is the central concern of this project.

Moral Panic, Television Crime Shows and the Failure of Public Security Policies in Brazil

This paper aims to analyze the connections between public security policies in Brazil in the last 15 years and the resurgence of sensationalism and exploitation of moral panics in Brazilian television crime shows, especially from the end of 2000's. As well as in other Southern American countries in the first decade of the 21st Century, Brazil experienced left-wing governments in the federative sphere with progressive and reformist positions in several areas, with emphasis on efforts towards minimum income and policies that included significant portion of the population in the consumer market. In terms of public security policies, despite the higher volume of investment between 2006 and 2010, the results regarding the necessary reformation of police model and reducing the levels of lethal crimes were weak. At the same time, there was a considerable increase in the number of television shows with a sensationalist approach to deal with cases of urban violence and police actions. The hypothesis developed here points to a consistent relationship between the recent failure of public security policies to solve concrete issues in Brazil – such as the high homicide rates – and the resurgence of populist discourse in terms of criminal policies, as well as sensationalist television shows with considerable levels of audience. The analytical approach is based on mixed methods using documents, official reports on budget and crime rates, television audience reports and video data. The research has been developed over the last two years within the framework of the activities of the Research Group on Violence and Citizenship and the Postgraduate Program in Sociology of the Federal University of Rio Grande do Sul.

NICHOLS, LESLIE* (*Ryerson University*)

Unemployment Benefits Program for Self-Employed Canadians: Are Women Disadvantaged?

Self-employment is growing in Canada, due in part to an increase in precarious employment and unemployment (Bahar and Liu 2015). Self-employed people experience the same work interruptions as those in standard jobs. Because they are not eligible for standard employment insurance benefits, the Government of Canada created the voluntary Special Benefits for Self-Employed Workers (SBSE) program in 2010 to provide support for five life events that interrupt work: giving birth, caring for a newborn or newly adopted child, personal illness or injury, caring for ill family members, and caring for a critically ill child. Enrollment in the SBSE program has been low. By 2014, only 14,000 self-employed workers had signed up for the program despite the government's prediction of 500,000 enrollees (McGregor 2015).

People may be pushed into self-employment during periods of high unemployment (Bahar and Liu 2015) or due to barriers to obtaining standard employment, such as gender, age, immigrant status, language, disability, and childcare responsibilities. Those barriers create a subgroup of vulnerable people among the self-employed, characterized by multiple intersecting conditions that create socioeconomic disadvantage. This study seeks to understand the experience of marginalized self-employed people with the SBSE program in order to identify problems with the program and how they might be corrected to increase enrollment and equal access to benefits. I will interview 30 participants through semi-structured interviews. The study will contribute to public policy, labour studies, and women and gender studies to offer a new perspective on how to support self-employed workers during work interruptions.

NICHOLS, NAOMI* (*Faculty of Education, McGill University*)

Participatory Institutional Ethnographic Analyses of Youth-Serving Institutions – a Human Rights Perspective

Historically, access to justice has been sought through public interest litigation, legal aid, legal education and judicial reform. More recently, scholars note the mobilization of the concept of access to justice to enable divergent and strategic efforts to address multiple forms of structural inequality within and beyond the legal system (Bhabha, 2007; Macdonald, 2003, 2005; Roach & Sossin, 2010). Conceptually and pragmatically, the pursuit of access to justice supports efforts to address systemic inequality in any institution where law is "debated, created, found, organized, administered, interpreted and applied" (Macdonald, 2003, p.

2). The idea is to ensure all people experience the "enjoyment and protection of rights" (Bhabha, 2007, p. 154). Building from the results of four-years of participatory institutional ethnographic research on the institutional contexts of youth development, this paper illuminates how young people's experiences of procedural and relational fairness on the frontlines of the public sector – that is, during everyday interactions with teachers, immigration offices, the police, municipal transit operators, social workers, and so forth – shape their experiences and interpretations of gendered, raced and class-based patterns of inclusion and exclusion more broadly. Research proceeds from young people's knowledge of their work and lives; the analytic focus is the social organization of legal and bureaucratic processes, which shape inequalities of access to public sector resources and the distribution of punishments. Findings illuminate youth development as a complex of socially organized processes, which are shaped by and shaping the institutional and policy contexts of young people's lives.

Telling and Showing: The Un-Constraining of Children's Bodies to Enable Communication of Meaning

The early years of schooling have seen the intensification of standardised testing accompanied by a return to, or reaffirmation of, teacher-directed transmission pedagogy. While the constraining of children's bodies and voices is not new in early education, current pressures are reinforcing the importance of what many teachers call the "five Ls": legs crossed, hands in laps, lips locked and listening. The project reported here investigated children's word knowledge prompted by a concern about limited vocabulary being taught in early schooling. The focus in this paper will be on the impact of permitting children to use their bodies when asked to provide definitions of moderately challenging words. A total of 65 children from schools characterised by moderate to high levels of social disadvantage and cultural diversity, participated in individual interviews which elicited their word knowledge. Children were explicitly invited to "tell or show" what words mean, with researchers explaining that "you can use your hands or act out the word". This approach is underpinned by a semiotic concept of literacy which views communication as encompassing the full range of semiotic resources including spoken and written language, visual images, sounds, gestures and the use of objects, often deployed in combination rather than separately. In this presentation, I will report the extent, and the ways in which, children responded to the invitation to deploy their bodies semiotically. I will consider how bringing children into spaces other than the classroom contributed to a shift in norms of engagement. I will highlight how children whose literacy and language abilities were considered below average were enabled, through this un-constraining of their bodies, to communicate meanings of words that they were not yet able to read or write. Affectively, children's enthusiasm to communicate word knowledge using embodiment in combination with oral language, was strongly evident.

NICOLAU NETTO, MICHEL* (*State University of Campinas - UNICAMP*)

Brazilian State and the Symbolic Economy of Sport Mega-Events

Sport Mega-events (SMEs) have become a platform to enhance the status of emergent countries in the global stage. So it was in Brazil as the country hosted the two most recent SMEs: FIFA World Cup and the Olympic Games. Both were understood by the State as part of a strategy to promote a modern image of the country globally.

However, the MediaSpace of a SME is of a special sort. Most of FIFA, IOC and their partners' profits come from two sources: broadcasting and marketing rights. It means that they base their profits on a symbolic economy, producing symbolic forms with economic value. This is a consequence of the process of globalization that may be seen in the history of SMEs, since the end of the 1970s, in two senses. First of all, this economy has been globalized as the capital involved in it started coming from multinational companies, with global market interests. Secondly, the multinational sport institutions have gathered more control over marketing and broadcasting rights strategies and negotiations, retrieving them from national agencies.

In order to make this economy work, the sport institutions must guarantee that the landscape of the SME will be suitable for the economic valuation of the symbolic forms. Therefore, they demand from the State to produce the landscape of the SMEs as one in which they have the authority over the symbolic forms.

It means that, if the State produces the country image to be promoted globally, it also needs to produce a landscape in which the authority over the symbolic forms has been denationalized.

In this paper I want to analyze both roles of the State and the conflicts that were related to them. In order to do so, I will present results of a research carried out in Brazil since 2013.

Navigating between Modernization and Patrimonialization: The Institutionalization of Geographical Indications in Brazil

Similarly to most developing countries, Brazil started to internalize Geographical Indications (GI) as a mandatory condition following on the signing of the TRIPS Agreement. Nevertheless, the way this mechanism was incorporated by the Brazilian Law on Intellectual Property (LPI n.9.279/1996) suggests that local actors have not only introduced innovations not covered by the international agreement, but also defined a very flexible model. This is one reason why the country has advanced relatively fast in recognizing a variety of regions and products. Until August 2017, Brazil has registered 45 Indications of Provenance and 10 Denominations of Origin for national products. These registers cover a wide variety of goods, from traditional agri-food products such as wine, cheese and coffee, to non-agricultural artisanal goods, and even services. This paper analyses GI institutionalization focusing on how the organizations directly involved in this process interpret the Brazilian model. Research was conducted over the last four years within the scope of a multi-institutional project sponsored by the Brazilian Council of Scientific and Technological Development (CNPq). It involved interviews with policy makers, researchers and stakeholders, as well as case studies in different regions and sectors. The results reveal conflicting understandings not only about the regulatory framework currently in force, but also on the employment of this mechanism. On one extreme, GIs are seen as normative constraints used to promote technological modernization. On the other, they are conceived as part of an effort to patrimonialize traditional practices of production. In most cases, however, projects are navigating between these two extremes. At the same time as this has been considered a positive effect of the 'soft' institutional Brazilian model, it has increased apprehension about the risk of the 'de-characterization' of this mechanism, even before it becomes recognized by Brazilian consumers, another critical point for GI development in this country.

NIELSEN, GREG* (*Concordia*)

Simmel's (in)Difference: Live Entering into the Act

This paper argues the most enduring legacy of Simmel's philosophical sociology is seen in how he theorized modernity as objective culture in general and as the opposite of a live entering into an act of a unique life history (subjective culture) that it uses but that it can never fully objectify or exhaust. The more specific question I raise is how to theorize the blasé attitude toward an ethics and politics people take-on in the example of the street (objective culture) but also understood as a place where thresholds of (subjective) sociability are derived from difference. To this end, the paper is a work in progress that presents a reading of Simmel's sociology and philosophy via his observation of the blasé attitude adopted in modernity as a response to the over stimulations of city life. I position the blasé attitude (The Metropolis essay) in his formal sociology and *Philosophy of Money*, first in in the Berlin context he writes in, and then link it to his later neo-Kantian ethics (1913 *Das Individuelle Gezet*; The Individual Law), and a more contemporary discussion for our time. My main point is that for Simmel, the blasé attitude that citizens adopt to cope with the over stimulation of conflicts and nervous energies in the city provides the possibility for a creative disposition that expands thresholds for multi-sided association and differentiation. I draw the counter-intuitive conclusion that Simmel's legacy teaches us that "live entering" into an act of a unique life history (difference), requires a measure of productive indifference for contemporary (subjective) sociability, ethics and politics to be possible.

NIELSEN, GREG* (*Concordia*)

Truth and Democracy: Journalism, Politics, Social Science

Journalism (real and fake) and the fate of democracy (its truths and post-truths) has become a hot topic around the world. A veritable political and media storm has social critics and pundits perplexed as to how to explain many of today's events. The storm has spread out from the unexpected results of the American presidential elections along with the return of right wing populism, islamophobia, white supremacy, and the subsequent series of attacks on immigrants, DACA, LGBTI, and many other vulnerable communities. It comes with a return of ethnic nationalism and the Brexit referendum, a new Cold War, and the globally publicized impeachment ("constitutional coup") of the President of Brazil, Dilma Rousseff just as much of South America is sliding into the breach. These examples are not simply explained as a shift toward some new authoritarianism, but in

many instances the fabulous denial of social facts journalists, politicians and social scientists are expected to trust in order to produce democracy.

This paper seeks to update Bourdieu's insights into the intersecting fields of journalism, politics, and social science in this new context. In many ways, for example, the political and media storm around the world has occurred because the strengths in these fields have given way to their weaknesses. Many believe the political field is weakened to the point of absurdity (endless spin) and that journalism's professional culture (as gatekeeper) of values of accuracy, reliability, autonomy, and truth are simply a cover for the interests of the most well off. The social science "thinkers" have not been able to dam the storm surge either perhaps because of their own long divisive debate over the relations between knowledge, truth and power. Are these the failures of multiple fields? Systems? Or the crisis in one planetary mode of production?

Which Future Scenarios Can Affect Retirement Timing and the Outcome of Pension Reforms? a Finnish Case Study

Researchers and policymakers widely agree that ageing populations necessitate pension reforms, if pension schemes are to remain financially sustainable. As a result, governments across Europe, including Finland, have begun to introduce reforms that delay the average timing of retirement, meaning the age at which people start receiving pension benefits. To reach this aim, policy makers need to consider the factors that will affect retirement timing, which will depend on a range of possible future developments, i.e. scenarios. This study identified such scenarios for the next 20 years in the context of Finland. This was done using the Delphi method: a panel of 15 experts were first interviewed individually and then surveyed, providing the possibility of re-assessment of their views after feedback. The experts consisted of researchers and representatives of think tanks, pension-related organizations, trade unions and pensioners' associations. While continuing health improvements and policies of the state retirement age being increased and early retirement options being made fewer were generally thought to inevitably raise the effective retirement age, some scenarios were considered as significant in determining the degree of this trend. The most commonly identified scenarios concerned changes in working conditions and the labor market. Some scenarios less prevalently featured in the interviews, such as growing responsibilities in caregiving, were also highly acknowledged in the survey round. Differences in retirement timing between socioeconomic groups were predicted to widen. The clearest disagreement among the experts concerned the significance of political changes, as well as the role that pension funds are likely to play.

The Silver Linings of Joblessness: Aging Workers Finding Meaning in the Unemployment Experience

This paper investigates how a select group of workers – those age 50 and older who lost their job between 2007 and 2014 – find meaning in the unemployment experience. The study is situated against the backdrop of an unprecedented confluence of socio-economic conditions: a severe economic recession, followed by a long term jobless recovery; a collapsing housing market; a continued weakening of institutional protections for workers; and a growing aging population. The data informing this study are drawn from 62 in-depth interviews with White, middle- and upper-middle class workers residing within Minnesota's greater Twin City region, Minneapolis/St. Paul. While interviewees share stories of increasing medical needs that must go neglected, shrinking retirement accounts, ageism in the labor market, and downward mobility, what is surprising is the number of interviewees who nonetheless emphasize the so-called "silver linings" of their job loss. In the stories interviewees share, job loss is often reframed in a variety of positive ways including: an opportunity for personal growth, the development of new career directions, and an emphasis on improved health. Our paper adds to the literature on how individuals make sense of the job loss experience and also addresses the theoretical and applied implications of our findings.

Community Unions As Strategic Field Challengers in the Japanese Labour Movement

Organised labour in Japan is characterised by a dominance of corporatist enterprise unions. Despite a growing casualisation and precariousness of work as well as signs of a legitimacy crisis due to a decreasing unionisation rate, most mainstream trade unions remain hesitant to expand their scope of representation beyond their core constituency of regularly-employed workers. In comparison,

locally-based or social group-constituted community unions strategically target these niches in focusing on the organisation of the growing group of irregularly-employed, as the most vulnerable workforce. Often inspired by examples from abroad and with a strong rooting in civil society, these grassroots-level organisations of labour activism develop innovative and much more flexible forms of workers' representation. This research paper elucidates transformations within the broader Japanese labour movement along examples of diverse forms of community unionism. It aims to find out, how decision-making about organisational structures, approached agendas as well as applied tactics by the involved actors impacts field transformations. The strategic role of community unions as challengers vis-à-vis mainstream trade unions as incumbents within the organisational field of the Japanese labour movement is analysed through the application of the theoretical model of *Strategic Action Fields* by Fligstein and McAdam (2012), which intersects between social movement- and organisation-theory. This research paper argues that despite their peripheral position and limited dimension, community unions serve as influential field entrepreneurs. In interaction with other field actors, they point out imitable alternatives to the established corporatist trade union system and thus can induce field transformation of Japanese labour. This paper's analysis is based on in-field research conducted in Japan, including interviews with organisers and members of trade unions and several different community union organisations as well as participant observation within group activism.

NIKAJ, IRENA* (*University of Korça, Albania*)

Challenges of the Socio-Cultural Development of Korça's District Under the Territorial Reform of 2015

Our topic aims to treat social and cultural challenges of Albania, especially of Korça's region within the administrative and territorial reform of the 2015. Over the ten or eleven years following the decentralisation reforms undertaken in 2000, the country has undergone a number of demographic, social and economic changes. The demographic map of Albania has changed as a result of people's internal migration and emigration abroad.

One of the main challenges for the current local government in Albania is to fulfill the growing expectations of citizens for better services and governance, social and cultural development of people's life. Decentralisation and urbanization have resulted in higher pressure on local government units for funding public services and facilitating economic development.

Overall the country's achievements over the past two decades in terms of both economic growth and political reform have been impressive. However, the benefits of economic development have not been evenly distributed and the pattern of the Gini index since 1997 seems to demonstrate an inherent trend towards inequality within Albania's growth patterns. The country's Gini coefficient is the third highest in the region which would seem to indicate a need to recalibrate the national development strategy towards a more equitable model.

In order to examine these social and cultural consequences and need to reconstruct central/local interventions we have conducted analyzes, interviews and questionnaires with Korça's people that show what has really changed in the lives of people and how they perceive these changes.

The Role of Universities in Modern Economic Development of the Russian Region

The present paper is dedicated to the analysis of the collaborative activities among Universities, research institutes, business structures and the State, what is becoming a new trend in modern economic development of the Russian region. In this example the small innovative enterprise was presented as an independent legal entity related with universities for exchanging of experience, transferring information, transmission of initiative innovative projects to each other. In applied sociological research on the basis expert poll we generalized structuralized and analyzed technoparks and innovative-technological centers. So the authors of this manuscript found out that the majority of the surveyed organizations created the peculiar production clusters round themselves, what becomes a new trend in economics. The main problems of the organizations of innovative infrastructure were revealed by authors. Personnel, financial, logistical, institutional ones were named and analyzed. The authors of the paper came to the conclusion that the government has to play a crucial role in building strategic research relationships between universities, research institutes and industry.

RC26-485.2NIKOLAEVA, ULIANA* (*Lomonosov Moscow State University*)*Globalization, Counter-Urbanization and Archaic Trends in the Rural Communities in Northern Russia*

Contemporary technological and social modernization, on the one hand, and various pre-market and archaic forms of social and economic interaction (reciprocation, exchange of gifts, exchange of help, 'blat', nepotism, the use of kinship ties, etc.), on the other hand, are still widely present in modern rural communities in Russia. The social life of rural communities is organized as a "multi-layered pie": simultaneously, different models of social interaction and different "epochs" of the past coexist. Among the most archaic patterns one can indicate the relations of reciprocal intra-family and inter-family mutual assistance and reminiscent tribal kinship. Rural people, who find themselves in difficult situations and need help, receive it from their relatives (at no charge) or from their neighbors (on a free and partially paid basis). Such assistance is, as a rule, of a non-monetary nature (assistance with work, provision of services, and voluntary donation of food). However, even in such "archaic" forms of social physical survival, the use of the newest means of communication - cellular communication, the Internet, fast electronic banking transfers become more important. The spread of the newest means of communication in rural areas in Russia has brought into being changes in the relations of reciprocity. For example, more often than not neighbors and non-relatives, but previously unfamiliar people who learned via, say, Facebook or other social networks about the problems and needs of rural families - provide assistance (transfer money, send clothes, food, come and provide on-site assistance). Thus, the development of global capitalism and modern infocommunications in the countryside in Russia, does not always displace pre-market economic relations. New technical and financial resources are organically integrated into the basic reciprocal/archaic economic relations.

RC48-JS-57.2NIKOLAS, ANA-MARIA* (*Ruhr University Bochum*)*Measuring Cooperation through Events. a Social Network Analysis of Cooperation between Social Movement and Trade Union Organizations in the Anti-Austerity Protests.*

Austerity politics in Europe is said to have facilitated a new wave of cooperation between social movement organizations and trade unions. Yet while joint mobilization of those two types of organizational forms has empirically been observed, we don't now in which incidents what specific kind of organizations cooperate. Are rather big and resource rich movement and union organizations cooperating, or ideologically similar organizations? Or do they cooperate to form insider outsider -coalitions using different tactics to reach a common goal? And under which conditions is cooperation more likely to emerge? Taking the example of the *Alter Summit* anti austerity network, this paper tackles these questions by using a social network analysis to study cooperation events. These events can be protest events but also less visible, but nevertheless crucial manifestations of collaboration, like background meetings and joint position papers. I use resources, culture, and political-economic opportunity factors from both social movement and industrial theories alike to explain the observed cooperation patterns in the *Alter Summit* network. Understanding this pattern of cooperation can contribute viral insights to our perception of transnational collective action between actors from different movement backgrounds.

RC34-613.11NILAN, PAM* (*University of Newcastle*)*What's in a Name? 'Muslim' Youth Gangs in Australia*

In Australia, so-called 'Muslim' youth gangs are said to pose a risk to the public. Yet the term 'Muslim' might not signify anything of consequence. This paper examines some 'Muslim' gangs to see if the label means anything. The first example is the outlaw *motorcycle* gang - *Soldiers of Islam*, which was alleged to be terrorising citizens on the Gold Coast in Queensland. It was disbanded in 2013. The second example is an ethnic *criminal* gang in Sydney that purposefully chose the name *Muslim Brotherhood Movement* to create a strong position in the underworld of crime. It was disbanded in 2011. The final example is the *Apex street* gang in Melbourne, which was disbanded in 2016. Even though labelled a 'Muslim' gang by the media, *Apex* was not much more than a loose affiliation of young men from diverse backgrounds, including Sudanese youth. In all three cases, rapid police intervention followed a public outcry driven by media reporting. Although the three 'gangs' were different in form and purpose, their short-lived notoriety tells us something. When the adjective 'Muslim' is added to the term 'gang' this intensifies moral panic among the citizenry. The appellation 'Muslim gang' synthesises public fears of ethnic youth criminality^[1] with the perceived threat of Islamist terrorism. Yet the 'Muslim' reputation of a gang gains tremendous kudos, even if short-lived. We may consider this phenomenon using an interpretive framework drawn from the work of Pierre Bourdieu.

^[1] Notably, only a very small number of young men from stigmatised ethnic backgrounds ever get involved with gangs in Australia, despite so many experiencing conditions of economic marginality and daily struggle for legitimacy.

RC53-886.3NILSEN, ANN CHRISTIN* (*University of Agder*)WÆRDAHL, RANDI (*Oslo University College*)SAN, SOPHANY (*Pannasastra University*)*Negotiating Children's Work/School Balance: Cambodian Parents' Rationales*

Despite a decline in children's work and an increase in school attendance, children remain to be a part of the workforce in Cambodia. It is widely assumed that child work is an effect of poverty and keeps children out of school. Moreover, child work is commonly associated with exploitation and maltreatment. Yet, several researchers have pointed out that children's work may also be judged as educational. Seen in this light child work may not only occur out of necessity and at the cost of education, but may be a matter of choice. In Cambodia, research has revealed that a large share of children who do not attend school, neither work. This indicates that work cannot be perceived as the only barrier keeping children out of the classroom, but that it also should be addressed as a matter of choice and priorities.

In this paper, we explore parental rationales for child work. Based on data from qualitative interviews with parents in 20 households, located in an urban and a rural community in Cambodia, we address the following questions: What are the benefits of children working? What do the parents regard as a good work/school balance? Are the rationales the same or different for sons and daughters? The paper highlights and discusses the relevance of post-colonial perspectives to analyze parenthood and childhood across cultural contexts.

RC01-29.1NILSSON, JOEL* (*Swedish defence university*)OSTERBERG, JOHAN (*Swedish Defense University*)*Diary of Military Life***Abstract**

Individuals who undergo military education are trained in developing leadership skills, to work together in a group with others and, in a longer perspective, commit to a societal purpose larger than themselves. At the same time, they are confronted not only with organizational and hierarchical challenges, but also stressful conditions, which imposes high demands on performance, motivation and handling with emotions. The aim of this study is to explore motivation, leadership and group cohesion by applying sociological, social psychological and gender perspectives. The study aspires to get a clearer insight into the social life world of military recruits. Based on a case study approach, this inductive study takes advantage of the possibility of being able to make thorough observations over time, by using a diary approach design. The sample consists of six recruits, three male, and three female, as they are undergoing their nine-month basic military education in the Swedish Armed Forces. Against the background of our theoretical frameworks, we will search for patterns regarding for instance; emotions, organizational culture, norms and values, gender roles and effects of socialization. We anticipate this study to be a starting point for a longitudinal case study spanning over a three to five-year period of time. The findings aims at giving a deeper understanding of which factors that subsequently affects the individual in their future military career choices. Furthermore, the study aims at bringing additional value of what elements that influence turnover intentions.

RC10-211.4NINA-PAZARZI, ELENI* (*University of Piraeus*)*The Impact of Crisis on Female Entrepreneurship in Greece*

Small and medium sized enterprises play a significant role in the development of the national economy in Greece and constitute one of the main sources for the creation of new job positions. The role of female entrepreneurs in the development of this branch of economy becomes evident as more women choose to create their own companies. Many reports focus on the great potential of women owned enterprises for increasing employment, job creation and innovation. Female owned firms are considered as one of the main trends in entrepreneurship and the raising of the visibility and awareness about the economic and social role of women entrepreneurs is emphasized in order to encourage female entrepreneurship. This presentation will deal with the recent trends of female entrepreneurs during the decade of the crisis.

RC15-295.3NING, ANA* (*King's University College at Western University*)***Traditional Chinese Medicine (TCM) As "Authoritative Practice": Practitioners and Users' Perspectives of TCM Evidence in Canadian Contexts***

Drawing upon multi-sited ethnographic research with practitioners and users of Traditional Chinese Medicine (TCM) in British Columbia and Ontario, Canada, regarding constructions of TCM evidence of safety and effectiveness, this paper focuses on the complex and sometimes contradictory ways in which the production and use of a particular type of CAM knowledge take shape within specific socio-cultural contexts. The narratives of TCM practitioners and users will uncover the legitimacy of multiple evidence frameworks beyond the confines of bioscience to validate diverse therapeutic outcomes. As such, the production of scientific evidence as a presumed universal to constitute "authoritative knowledge" (Sargent & Floyd, 1996) – the knowledge that gets to count, and upon which decisions can be made – will be debunked in light of TCM practitioners and users' engagement with "authoritative practice" (MacDonald, forthcoming) – the health provider who gets to count, who gets to make decisions, and who is entrusted with solid understanding and use of traditional and scientific knowledge. Thus, the question of *who* can deliver TCM is just as important as *what* TCM itself can do.

RC14-269.8NISHIDA, YUKAKO* (*Nagoya University*)***Differentiating Power for Developmental Disabilities: Representation in an Influential Japanese TV Programme***

In Japan, 'developmental disabilities' (DD) has become a generic term used to refer to disabilities such as attention deficit hyperactivity disorder (ADHD), learning disability (LD), and autism spectrum disorder (ASD). Throughout 2017, Japan's national public broadcasting organization, the NHK, aired the 'DD project' series featuring numerous TV programmes.

This presentation analyses the primary function of the most influential programme in the project; a discourse analysis is conducted to examine how differentiating powers are exercised.

The analysis revealed that the programme uses narratives and visual aids to differentiate between people with and without DD; it emphasises the sensory differences between them by employing explanatory narratives, experiential reports from those who identify themselves as having DD, and research findings. A graph of a test result comparing differences in auditory sensibilities could be considered an example of visual differentiation.

The differences between people with and without DD are also described as being cerebral. Unequal power relationships have been constructed between them, particularly in the discourse of cerebral differences. Unlike many other NHK programmes, this programme does not define DD as partial brain dysfunction; however, the use of expressions such as 'having difficulty' and 'does not work well' intensively implies that the sensory characteristics of people with DD are disabled.

Furthermore, in this programme, people with DD are described as the minority, compared with the majority without DD. In the discourse of majority-minority relationships, people with DD are depicted as suffering because the rules created by the majority are not suitable for them. Here, the social model of disability may emerge.

The programme includes both biomedical discourses and discourses based on the social model of disability. Although the former and the latter differ in identifying the position of disabilities, neither of them may be considered free of differentiating powers.

RC49-830.1NISHIDA, YUKAKO* (*Nagoya University*)***The Birth and Spread of an Unofficial Diagnostic Term: A Case of Developmental Disabilities in Japan***

Annemarie Jutel (2011) argues that an official medical diagnosis plays a significant role in contemporary society. She further mentions that a diagnosis operates beyond official medical jurisdiction, which implies that paying attention to unofficial or alternative disease classifications is essential for future sociological studies on diagnoses.

This presentation explores a case whereby an unofficial diagnostic term originating from an official psychiatric diagnosis arises in both medical professional discourses and discourses among laypeople.

The term 'hattatsu shougai' (meaning 'developmental disabilities' [DD]) has been used as a generic term for attention deficit hyperactivity disorder (ADHD), learning disability (LD), and autism spectrum disorder (ASD) in Japan since it was defined in Japanese law in 2004. Similarly, a new term, 'hattatsu dekokoboko' (meaning 'developmental unbalance' [DU]), has gradually gained popularity.

The latter term was coined by a leading ASD medical expert in his 2011 book for the general public. He describes DU as a predisposition and DD as a full-blown disease. Therefore, DU can be related to the concept of risk.

DU might also be intended to mitigate stigma, as he notes that this term is necessary to avoid the negative connotations of the term 'shougai' (i.e., 'disability'). DU is a widely accepted term and can be found in the titles of some books and academic articles, as well as in many homepages.

Furthermore, a new phenomenon is being observed. The term 'dekokoboko' and a similar term 'outotsu' (i.e., 'unbalance') are being used in lay discourses to describe many types of minorities, including those with DD/DU and mental illness and members of the LGBT community.

The phenomena described here might help enhance our understanding of the social function of an official diagnosis, problems related to that diagnosis (e.g., stigma), and the tension between official and unofficial diagnostic terms.

RC24-464.1NISHIKIDO, MAKOTO* (*Hosei University*)MARUYAMA, YASUSHI (*Nagoya University*)***Energy Transition and the Development of Community Power Movements in Japan*****Introduction**

The purpose of this presentation is to clarify the dynamics of local energy autonomy in Japan and to discuss the conditions for community power movement to manage a renewable energy business independently. Since nuclear disaster in Fukushima in 2011, the policy promoting renewable energy was introduced. Then big companies rushed into the business and have dominated the market for building and maintaining renewable energy plants. Moreover, these projects give little benefit to local areas, certain amount renewable energy projects are criticized by local residents and nature conservation groups. On the contrary, more local people looked for ways to create energy autonomy. We grasp the dynamics of energy autonomy in local area, and consider more equitable and environmentally sustainable energy systems.

Data and Method

We research some "community power movements" to grasp the current situation of energy autonomy in local area. Community power movement was defined as a social movement or social business that creates renewable energy which benefits local people or local areas. We have joined the community power movements' demonstrations and conducted in-depth interviews.

Results and Conclusion

We can find out that it's important for community power movements that intermediary social business which supports energy autonomy in local area. For example, community power movements organized the renewable energy company and the company have started training a local company which had not previously been involved in the renewable energy business. This means that community power movements can independently build and manage renewable energy plants without involvement of big companies.

More importantly, community power movements could bring local people not only monetary incentives, but also other "derivative" merits. Such derivative merits as the network of human resources, and cultural exchange between the urban area and the local area have a potential to revitalize local communities.

RC35-636.4NISKA, MIIRA* (*University of Helsinki*)***Relational Perspective on Employability and Career Management Skills***

The number of unemployed jobseekers with academic degrees is increasing in many parts of Europe. European Education Ministries have, thus, highlighted the need to foster graduates' employability. Individual employability refers to ability to find a job, remain employed and progress one's career. Previous research has placed *career management skills* in the core of individual employability. Career management skills include self-knowledge, knowledge of available job opportunities, career decision-making skills and transitions skills, like ability to write job applications. Given the societal importance of graduates' employability, previous studies have been surprisingly homogenous; employability and career management skills have been mainly studied from substantialist perspective. In this research I adopt a relational perspective; employability and career management skills do not consist of pre-given entities but of dynamic relations. Theoretically the research combines Goffman's dramaturgical sociology and discursive social psychology. From this perspective, graduates' must be willing and able to adopt a position of a working life agent with career management skills and credibly present it to others. But are students willing and able to adopt such positions? Do they have *rhetorical resources* for skillful self-presentations? The data analysed in the research includes interviews with Masters students of the University of Helsinki.

RC22-405.10NISSILÄ, PAULA* (*University of Tampere*)*Creating Religious Space: Young People at a Revival Summer Event*

This paper asks how religiosity is constructed in celebratory settings through examining youths' experiences of rituals and activities. The relation between the institutional practices and the individual needs and desires is central to the post secular, liquid religion. The religious affiliation and public participation have continued declining in Europe. This applies also to the protestant Nordic countries where the state church has traditionally been strong. Yet in Finland, the activities of the traditional revivalist movements within the state church, especially the hundred years old open-air summer gatherings, attract masses. These gatherings compete in attendance rates with many secular events in the best holiday season.

This paper explores this traditional, and yet strong, collectivity with special attention drawn to the form, context, and young people. The appeal to the younger generations is essential for the religious communities. Based on interviews, narratives and observation, this paper details the meanings that firmly involved participants (aged 14-18) attach to the summer event of the liberal Awakening movement, the second largest revivalist movement under the Evangelical Lutheran Church of Finland. This movement emphasized already originally personal faith and grass-root religiosity, which correlates with the postmodern spirituality. Sociohistorically, the movement has also intertwined with national identity.

This paper highlights how this community with its rituals constructs a religious space for the youths. It shows how the peer group acts as the most influential in formulating the religious identity. The appeal of the event rests on the peer solidarity created through social activities in the festival context separated from everyday life's social structures. Concerning the belonging, the liberal communalism of the movement is especially valued setting the orthodoxy on a minor role. The spiritual substance of the movement appears embedded in rituals and the participation creates a religious space of solidarity, autonomy, and seeking for this youth.

RC15-282.3NIUMAI, AJAILIU* (*Centre for the Study of Social Exclusion & Inclusive Policy, University of Hyderabad, Telangana, India*)*Women's Sexual Health and Gender Hierarchies: An Empirical Study of Menstruation in Hyderabad Slums*

The issue of women's sexual health especially menstruation is a new pertinent academic discourse. It needs to be examined from an interdisciplinary perspective. This paper is an empirical study conducted in Rasoolpura slum and Sultan Sahi slum areas in Hyderabad, Telangana, South India. The concept of 'purity' and 'pollution' using Emile Durkheim's jargon leads to difference in the way girls and women undergo menstruation. Theoretically, Freud (1962) asserts that menstrual taboos are prevalent in different forms such as controlling women, castration anxiety, and the like which is apt to understand Indian women. The aim of this study is to explore the challenges which women face in their everyday lives that limits their access to feminine hygiene products, to identify the factors associated with unhygienic disposal of sanitary napkins and its related health hazards. It also attempts to study the level of freedom of choice that women enjoy with regard to their sexual health. Purposive sampling, interview and case study methods were employed. Research reveals that 23% of school going girls in India 'drop out' permanently when they begin to menstruate owing to lack of feminine hygiene, particularly sanitation facilities in schools. The girls who drop out of school lack skills for life and tend to search for their livelihood as bonded laborers, housemaids, nannies, sale girls and also become victims of child marriage and trafficking. Due to lack of proper sexual health care, women and girls lose their chance of education, economic empowerment and are unable to negotiate for freedom in patriarchal society.

RC22-407.5NIXON, ALAN* (*Western Sydney University*)*The Case of Atheist Asylum Seekers and the Category of 'Religion'*

In the last 10 years there has been increasing focus on the plight of non-religious and atheist peoples being persecuted in various countries. Some of this focus has come from cases brought to the attention of atheist organisations such as *Atheist Alliance International*, *International Humanist and Ethical Union* and local atheist groups. Cases are being reported by atheists in countries where their views are not acceptable and can end in imprisonment or death. For example, occurrences have been reported in Saudi Arabia, Afghanistan, Bangladesh, Pakistan, Morocco and Indonesia. Due to many of these countries being Muslim majority, there is also a strong connection to what has become known as the 'ex-Muslim' atheist movement. There have been general concerns over the status of non-religious and atheist refugees due to the wording of the *1951 Convention Relating to the Status of Refugees*. The UN has recently (2016) confirmed the inclusion of non-religious and atheist refugees under the "religion" criteria and some countries, such as the UK and Canada have accepted refugees based on atheism as a religion. However,

atheism as a religious category is not clearly accepted by all countries of asylum, with the US particularly being seen as an ambiguous case. This paper will look at the need for atheist asylum, atheist asylum cases, the structural difficulties for seekers and the organisations involved in the cases.

RC40-707.5NIZAM, DERYA* (*Izmir University of Economics*)*Designing Geographical Indications- Local Taste, Local Borders and Local Community*

This study analyzes the potential for GIs to create, capture and distribute rents in ways that promote a reflexive localism that empowers rural producers and communities through alternative schemes that reduce their dependence on the agro-industry. In the literature, there seem to be only a few case studies that focus on different expectations and concerns raised by different chain actors in the design process of a particular GI project. Understanding the consensus and conflicts that emerge during the design and implementation of a particular GI design is important to analyze the potential for GI labeling movements in the current global era. This study contributes the GI literature by presenting a comparative case study that shows how different approaches to GIs, and various nuances in implementing GI policies at the national and international levels, can shape the scope of GI protection in the long-run. Case studies of GIs from Turkey are presented, using commodity chain analysis. There are two significant implications of this study: first, it presents an understanding of whether GIs challenge or reproduce conventional standards, depending on how the local actors designed them; and second, it offers an analysis of the conditions through which GI protection may potentially protect local products, traditional techniques and small producers in general.

RC10-208.3NIZIOŁEK, KATARZYNA* (*University of Białystok*)*Theatrical Practice As a Means of Citizen Participation in Social Research*

Participation and social effectiveness seem to be the catchphrases of the day when it comes to art, and social research as well. On one hand, participatory action research has already become a well-established practice in the world of qualitative methods in sociology. On the other, the so-called "social turn" has placed the arts closer to sociological concepts and methodology as a means of not only interpreting art, but also constructing artworks. These changes are opening new doors for both sociologists and artists interested in working together and exploring the "in-between" areas of art, science and social involvement. One such niche is being occupied by participatory theatre - a wide array of diverse and largely innovative practices that create conducive contexts not only for interdisciplinary collaborations, but also for citizen participation. Hence, in my presentation, using the participatory theatrical projects that I have co-created or actively observed myself as examples, I intend to provide an empirically grounded and self-reflective insight into five distinct and at least to some extent original methodologies of direct audience/public engagement. Each of these can be referred to as a different role of the participant that one performs in the process: a protagonist (or content provider), a user (directed or animated by the artist in a theatrically constructed situation), a co-creator of the theatrical piece (enjoying a certain degree of agency and autonomy), a player (in an interactive game-like event), or a subject of induced self-reflection. The analysis is completed with some notes on the possible research and social uses that such practices - via embodiment, empathy, imagination, and understanding, to mention but a few defining qualities - may effectively serve.

RC15-291.4NJOAGUANI, OLUWATOBI* (*Covenant University*)FOLARIN, SHERIFF (*Covenant University*)*Regional Health Governance in the Ebola Outbreak: The Need for African Solutions to African Problems*

The need for context specific health policies and interventions in health systems in Africa cannot be overemphasized. Amongst many recommendations, the roles that regional organizations can play in health governance and policy implementation are important to this paper. Regional formations are already playing a significant role in shaping the formation of new socio-political intra-regional agendas. They also have the potential to engage as global actors through extra-regional diplomacy and bloc activism in support of those agendas. They can also act as bridge organizations between global initiatives for health cooperation and national health policy implementation. Regional organizations have great utility, owing to their familiarity with the region's specific political and cultural context. In terms of representation, they can provide leadership in translating global goals into regional context-specific priorities, a forum for the exchange of views and negotiation of legal instruments. The roles that regions can play are

obviously enormous. The goal therefore is to understand how regional institutions in Africa, especially in West Africa, are taking advantage of their immense potentials to affect global policies and governance for health. Also, in light of the Ebola outbreak in West Africa, the paper seeks to assess the roles played by the African Union (AU), Economic Community of West African States (ECOWAS) and its health organization, the West Africa Health Organisation (WAHO) in response to the epidemic. The paper recommends that regional organizations in Africa can play central roles in health governance, by steering global governance for health priorities in Africa, thereby reducing the burden of diseases.

Can Child Welfare Coexist with Diverse Families? Case of Children in Need of Social Care in Japan

This study explores factors preventing children's access to family care by focusing on social care systems (institutional care, foster care, and adoption) in contemporary Japan.

Since diverse families have become more widespread, the modern family model as the standard one has been criticized for being narrow and repressive. However, the Japanese social care system as substitute care regards the modern family as the best model in which children should be raised. Therefore, social care systems not only contradict diverse families but also paradoxically prevent children access to family care in Japan. This study portrays how social care systems conflict with diverse families and cause the underdevelopment of family care systems (foster care and adoption) in Japan.

This issue was investigated by analyzing laws (civil law and social welfare law), policies, white papers, statistics, and previous research, including research which I conducted.

The findings of this research are as follows: First, the priorities of various stakeholders of social care systems (birth families, social workers, foster parents, adoptive parents, children's homes, local child protection centers, and Ministry of Health, Labor and Welfare) differ and conflict. Second, only modern families or quasi-modern families can become adoptive and foster parents (single persons and same sex couples cannot become adoptive parents, and it is difficult for them to be foster parents in Japan). Third, only a few children without complex backgrounds and disabilities can enter adoptive and foster care.

This study concludes by criticizing contemporary Japanese social care systems that stigmatize and rank children in social care systems.

Making Home : Strategies, Tactics and Daily Practices of Children from Separated Parents, Living in Equal Shared Custody Agreements in Belgium

Since the 1960s, the definition of the family has changed greatly. From the nuclear family, immobile and sedentary, associated with a single place of residence, we move on to a wider and more mobile family associated with different places of residence (Widmer and al., 2008). As part of my doctoral thesis, I am particularly interested in these multilocal families and more specifically in the way in which the children from separated parents, living in equal shared custody agreements, maintain their family relations from one house to the other (Schier and al., 2015). Considering children as social actors (Gullov and al., 2015, James and Prout, 1997), I aim at understanding how they define and construct their 'home' in this context of circular mobility.

My field of research is conducted in Belgium (Brussels and its periphery), among children aged 10 to 13 years. I mobilize with them different visual and participatory methods (photography, drawing) and others coming from social geography (Socio-spatial network game, commented path).

Participating in this session would be an opportunity for me to share some preliminary results about a central dimension of my research project: how these children, for whom their different living spaces are fragmented and multiplied, establish potentially links between them, what represent here, there and the in-between for them, how an "archipelisation" of these different living spaces is created (Duchêne-Lacroix, 2010). I will highlight different strategies, tactics and daily practices that children would develop to deal with these absences and presences and to establish links as well as discontinuities inside these spaces (Schier and al., 2015; Winther, 2015).

50CIAIS Project: Five Decades of Resistance, Empiricism and Transdisciplinarity from Ceará Sociological Thought.

This article is the result of a transdisciplinary project of multi-media recording of the memory of a regional sociological thought of a Brazilian state in the context of extreme struggles, inequalities and conflicting power relations. The 1970s represents an embryonic turn to the collective thinking of sociologists who decided to base their struggles, thoughts and voices of resistance in the epistemology of the South in choosing the state of Ceará to live to live and formulate your thoughts. This decade also represents the significant strength of Latin American sociological thought in the midst of the dictatorial military regime dictatorship in Brazil. The Journal of Social Sciences ("Revista de Ciências Sociais"), launched in 1970, as well as the creation of the Postgraduate Program in Sociology of the Federal University of Ceará in 1976 was the beginning of resistance, struggle and the creation of a peculiar identity of what this work considers as "sociology of Ceará". Along this time, could it be considered that there is an identity of thought of a "Ceará sociology"? Methodologically it was made quantitative research with the identification of thematic principles debated year after year in the Journal of Social Sciences, as well as qualitative research interviews with sociologists who participated collected from the foundations of the main academic institutions the state of Ceará. Authors like Karl Mannheim, Karl Marx, Max Weber, Émile Durkheim, Norbert Elias, Michel Foucault, Pierre Bourdieu, Thomas Luckmann, Boaventura de Sousa Santos, Peter Berger and Bruno Latour are debated according to the thematic has been explored in the interviews. Traces of resistance, strong empiricism and transdisciplinarity can be seen from Ceará sociological thought. The "50ciais project" demonstrates that visual sociology through audiovisual techniques is an important way of the record of the history of struggle of the construction of the Brazilian sociology.

MARQUES CARVALHO, PEDRO* (*Getúlio Vargas Foundation*)

Big Data in Brazilian Politics

The study aims to understand the digital environment in Brazil, the behavior of social networks in the main political events of the country and how they will possibly impact the presidential election of 2018. For this, we compare the availability of data in the digital environment of the United States with the availability of information in Brazil. The aim was to verify if Brazilian politicians play a similar role to American politicians like Donald Trump and Hillary Clinton regarding digital communication strategies, where both used big data demographic and behavioral data to outline their communication strategies and public relations. In addition, the research contemplates patterns of Brazilian behaviors on the Internet and how these may be useful in the 2018 election. To do this, we will cover some case studies such as the impeachment of President Dilma Rousseff and how the debate reverberated in the digital environment. Our hypothesis is that the lack of Internet access and lack of connectivity between segments - credit card companies and social networks, for example - hampers predictions such as those made by companies like Cambridge Analytica. For the hypothesis, we take into account the behavioral difference of the Brazilian population with the United States, allowing forms of measurement that are possible only for the Brazilian reality. The preliminary results highlight the very characteristic political groupings in the networks. The former center-left government was heavily criticized by the center, the right and the extreme left. In addition, we can see the growth of far-right political publishers, both in the Brazilian presidential race and in the creation of new news portals. These portals have significant influence on the Brazilian population and possibly will impact the 2018 election.

RC08-172.3NOBREGA, RODOLFO* (*Universidade de Brasília*)*Determinants of Publication in Sociology Journals*

The study investigates who are the authors that publish in the high impact journals of sociology and what are the determinants that allow this major profile to publish. For the empirical research, information was collected from 10 sociology journals between 2004 and 2016. The journals were selected according to the impact positioning indicators and acceptance of articles of any sociological theme and from any country. Five of them have major impact and the others were drawn. The determinants considered for analysis were: country and region of the institution of the author, language of the country of attachment, ranking of institution, ranking of periodical; and thematic of the article. Logistic regression was used to analyze the result. The hypothesis is that, despite the significant increase in the number of articles by journals, the current publication profile remains similar to that of 10 years ago: the United States and Europe continue to be references, mainly by the language and the hegemony of these localities within the publishing scene. Preliminary results confirm the hypotheses found. The countries of the Global South publish more than in 2004, however, this amount has increased in the face of the growth of the number of publications in these periodicals. In the general percentage, these nations continue being minority and the authors of these localities publish less in the magazines of high impact. Regarding the determinants, the chance of Southern authors' publication is much inferior than that of the United States and Europe. Well-ranked universities are also more likely to publish than others. Thus, authors located in the Global South and of the 'modest' institution rank were those with the lowest chances for publication in the journals with the greatest impact. The publication in Sociology field is still very concentrated in certain regions, generating intra-regional and inter-regional inequality.

RC53-883.5NOCETI, MARIA BELÉN* (*Instituto de Investigaciones económicas y Sociales del Sur, CONICET- Dpto de Economía UNS*)SANTOS, MARÍA EMMA (*Coauthor*)QUIROGA, ANA FLORENCIA (*Coauthor*)*El Trabajo Infantil Como Manifestación De La Pobreza En La Ciudad De Bahía Blanca, Argentina. Diversidad Del Fenómeno y Desarrollo De Políticas Públicas Locales Para Erradicarlo.*

Según datos estadísticos del Instituto de Estadísticas y Censos de la Argentina, el trabajo infantil en Bahía Blanca es sólo del 1.11 % para el periodo 2004 al 2016, sobre un promedio de 25.000 niños. La población bajo la línea de pobreza alcanzó, en promedio, un 19% para el mismo periodo, sobre un total de 400.000 habitantes. Estudios cualitativos realizados en tres barrios carenciados de la ciudad, arrojan cifras mucho mas disímiles, mostrando que en poblaciones de 1500, 450 y de 833 niños, el promedio de niños que trabajaban respectivamente fue de 63 %, 47% y de 52%, con mayor representación del trabajo doméstico. Esta situación demuestra, por un lado la disparidad de apreciaciones que se pueden generar según el tipo de metodologías utilizadas. La aproximación cualitativa posibilitó la descripción de los diversos trabajos infantiles diseminados en la ciudad. A partir de estos datos el Municipio de Bahía Blanca elaboró un programa de política pública orientado a la erradicación del fenómeno por tipo de trabajo infantil, diferenciando acciones a fin de generar mayor efectividad en su meta. Esta presentación refiere tal proceso.

RC01-29.4NOGAMI, GEN* (*University of Tsukuba*)*Cultural Aspects of Postmodern Military in the Case of Japan Self Defense Forces*

This presentation investigates military 'postmodernism', focusing on Japan Self Defense Forces(JSDF), particularly its strategy of public relations for recruitment.

It is well known 'Postmodern Military' framework(Moskos, 2000) enables international comparative studies of armed forces confronting the age of 'New War' and new tasks such as disaster relief and humanitarian assistance.

However, those studies seem to exclude JSDF, with fifth largest budget in the world. I focus on JSDF and provide a cultural approach to the postmodern military framework.

Of course, the framework had already been examined from cultural aspects such as Hajjar(2014). He pointed out its tremendous complexity, fragmentation and flexibility armed forces face today. However, those examinations need to become more 'cultural' one, in other words more interpretative one, at the days when armed forces use the popular culture aggressively, offering their equipment and human resource to movie production for example.

For that, I think self-presentation and cognitive manipulation in recruitment is an indispensable theme for comparative research today when mass drafting had passed.

Research on recruitment activities of JSDF adds a concrete example in the framework because of its unique cultural origin. After the defeat of WWII and demilitarized, JSDF was born as 'National Police Reserve' at first. Thereafter, despite its huge budget, much consideration has been paid to not pose a threat to Japan and Asian citizens, by using unique nomenclature and interpretation for its reasons for being, like its naming of 'Self Defense'. Many contradictions can be seen around it, but it also results JSDF gains high degree of freedom in using semantics on contemporary culture.

JSDF's recruitment activities sometimes impairs its basic value such as toughness and masculinity(Frühstück, 2000). Furthermore, JSDF often adopts 'cute' icons recently for the purpose to get applicants.

Moskos' framework is challenged by whether it is postmodern military or not.

RC04-88.2NOGUEIRA, MARLICE* (*Universidade Federal de Ouro Preto - UFOP*)WINDLE, JOEL (*Fluminense Federal University*)*The Strategies of Parent-Teachers in Provincial Brazil: Mobilisation for Academic Success and Personal Fulfilment in the Context of Socially Segregated Schooling*

The aim of the current study is to understand the impact of parents' belonging to the teaching profession on their offspring's schooling, through analysis of the educational practices of families in which at least one parents is a teacher. A survey was completed by 114 teachers of the final grades of Middle School working in public and private schools in a city in the state of Minas Gerais, Brazil, who were parents of children aged between seven and fourteen years old. A subsample of 40 families was selected for semi-structured interviews, summing up 80 interviewed subjects (40 parents and 40 children). Classic and recent studies that analyze the family-school relationship served as theoretical references for this study (Pierre Bourdieu, Agnès Van-Zanten). The results show that the parents who are teachers are more intensely mobilized to support their children's education, but that such mobilization does not happen homogeneously among the different families, related to the precarious class status of the teaching profession in Brazil. The social origins, the objective living standards, the networks of professional activity, the teaching experiences and the different configurations of family dynamics affect the educational practices of such parents. Detailed analysis of the data revealed the configuration of three types of families: "school success oriented families", "personal fulfillment oriented families", and "families whose school success depends more heavily on advantages of the profession". The analysis of the education practices of these families led to the conclusion that they contribute to produce in their children dispositions for school success, responding to a context of sharp divides in school resources and social and racial composition and their own uncertain class status. Further, this educational activity is the fruit of the possession of certain "bonuses" obtained from the teaching experience and the hybrid condition of parent and teacher.

RC50-839.6NOGUES PEDREGAL, ANTONIO MIGUEL* (*University Miguel Hernandez*)CARMONA-ZUBIRI, DANIEL (*Universitas Miguel Hernández*)*Framing Time and Power in Tourism Contexts*

Tourism is not simply an industry that produces commodities or provokes millions of people to move all over the world. Social scientists have overall mostly approached tourism as an external force inducing all sorts of changes in receiving societies. However, social sciences cannot approach tourism as such any longer for it has been overtly present in the world for almost sixty years. Besides, it can be said that tourism is the most sophisticated elaboration created by capitalist forces and interests. It is so because the tourism industry constantly occupies new places for the leisure consumption of certain social groups. It contributes to the renovation of dependency relations among regions by relocating the economic capital and the labour force. It soaks through the social structure, inducing cultural patterns of consumption. It presents itself as the sole "passport to development" for many communities and territories. It marks rhythms and impose new uses of the places. It markets the intangible and thus produces meanings and sense. Tourism has the capability to spread all over the world producing new social actions, to name them, to create differences among them, to order them, and, most importantly, to manage those differences by means of distinctive policies. In this paper we analyse how in tourism contexts the past is continuously re-enacted and re-visited through policy-making in terms of using the past (i.e. resource) to be projected onto the future (the idea of development through tourism).

RC40-703.4NOIA, ELEONORA* (*Catholic University of the Sacred Heart, Milan*)MOLLI, SAMUELE* (*Catholic University Milan*)*Patterns of Rural Innovation in Italy: A Comparison between Two Regional Networks Part of the Wwoof Association*

In the last years, the increasingly attention to food, its production and its consumption, was accompanied by a growing interest on the agricultural side, especially within the youth field. Literature talks about "new farmers", or "back-to-the-landers", to define those people who choose to live in country-side, even without an agricultural background. This choice is linked to sustainable reasons, opposed to intensive production methods or chemical methods, but is also related to identity, political and ethical issues. The entrance of young people with an elevate cultural capital, high skills in knowledge, the capability to create new networks, also using new technologies, creates opportunities and innovative strategies in order to answer the economic, social and environmental change.

Indeed, we propose a deepening of the WWOOF association - World Wide Opportunities on Organic Farms - that from the 70s internationally promotes the organic agriculture through the work-hospitality exchange. In particular, through mixed methods (network analysis and qualitative interviews) we propose a comparative study between two different local areas where the agro-network has developed: the first in Piemonte, North Italy, characterized by the closeness to big urban areas and city markets, in which WWOOF has a long history. The second network is in Basilicata, South Italy, region in which the association increased its members in the last few years, and where there aren't big urban areas. This comparative methodological choice provides significant added value, because scholars have exclusively focused on case studies. Furthermore, a comparison provides important insights to understand composition of different networks, diversity on ethical-political values and their link with official markets. This research wants to show how these factors influence the patterns of local innovations in the Italian context, where the great differences described above determine different solutions and strategies.

RC19-356.4NOLLERT, MICHAEL* (*University of Fribourg*)*Welfare Marketization, Tax Reform, and Redistribution: Cross-National Findings*

Welfare states in the highly developed world of welfare capitalism still limit economic inequality. For Western Europe, many studies suggest that inequality of primary income (salary, return on capital) is reduced by public social transfers and progressive taxation. However, neoliberals argue that private organizations supply cheaper and better services than the welfare state while OECD-statistics show that private social expenditure (mandatory and voluntary) has gained importance. Further, neoliberals claim that taxes are too high for workers and companies. As a result, in many countries, taxes on top income and on top wealth have decreased.

In comparative social policy research, there is a controversy regarding whether these trends affect the extent of redistribution. Thus, rising old age and disability expenditures foster redistribution whereas trends in taxation imply less redistribution. In consequence, the redistributive impact of social transfers increases while the impact of taxes decreases.

My presentation focuses on three issues referring to OECD data. First, I discuss the extent to which public and private social expenditures affect economic inequality. Contrary to private social services, social transfers provided by the welfare state reduce primary income inequality. Hence, redistribution to the poor might decrease if private social expenditure substitutes public social expenditure. Second, I focus on the impact of current tax reform. Multivariate analyses suggest that redistribution is indeed lower than direct income taxes and social security contributions. In contrast, indirect taxation and progressivity of taxes don't matter. Finally, a redistribution regime typology is presented that discerns, among others, between a small cluster of countries with high public social expenditures, high income taxes, high social security contributions, and high redistribution (Belgium, Denmark) and a cluster with very low levels on each dimension (Chile, Mexico, South Korea).

RC48-804.4NOMIYA, DAISHIRO* (*Chuo University*)*"We Need to be Remembered": Hiroshima's Story-Telling Movement in Post-War Japan*

In its transformation from the site of total destruction to the site of global peace, the city of Hiroshima has ridden on one particular movement: movement to preserve story-telling of those directly exposed to the mass destruction by the drop of the atomic bomb in 1945. This paper, by tracing its historical trajectories, attempts to identify the conditions and factors necessary for the development of a collective story-telling movement in Hiroshima.

An original form of the movement can be found in scattered individual story-telling practices by parents to their children. In the last decades of the 20th century, it surged into a huge movement. The movement started as a civil collective response to the inevitable human oblivion. The collaborative effort by citizens of different generations, together with the city government, turned itself into a huge rally to fight against the war. Today, it has come to the point where the movement has a significant impact on contemporary Japanese society through its influence on city, regional and national cultural policies. How is it possible, then, that it has grown into a big cultural movement?

The movement poses serious methodological problems in our effort of observation. With no obvious scenes of resistance, no clear demarcation of membership, it easily escapes the eyes of the observers. To capture the developmental phases of the movement, we need to observe the change in the discourse sphere, together with events and incidents taking place here and there.

Findings to date are: (1) the biggest juncture that led the movement to take-off was a cognitive turn, in which hitherto individual efforts of story-telling became a collective to a fight against human oblivion, and (2) its policy influence came into reality when the movement provided a cultural justification on which the governments claim its intended policies.

RC34-626.1NOONAN, MEAVE* (*RMIT University*)*Young People, Gender, Race and the Aestheticisation of Enterprise in a De-Industrialising City*

This paper will explore the ways in which particular, aestheticised understandings of youth, gender and race are mobilised in representations of young people's 'enterprise' in the de-industrialising city of Geelong, Australia. In these kinds of globalised, de-industrialised, precarious labour markets young people's employability skills, innovation and enterprise are understood as providing the 'solution' to the problem of youth unemployment. The paper draws on a larger project that is examining how is it that, at the start of the 21st century, we have come to understand the problem of youth unemployment largely in terms of employability skills, innovation and enterprise?

As part of a broader concern to explore the ways in which ideas of young people's enterprise are represented in different contexts, this paper will present a critical content and discourse analysis of a selection of stories in *GT Magazine* – a weekly, large circulation magazine in Geelong. The analysis illustrates a number of key themes and concerns of enterprise in the 21st century, including: the way in which the self is imagined as an enterprise, and must carry the responsibilities for his or her differing abilities to be 'enterprising' (Kelly 2006, 2013); the enhanced role that the aesthetics of cultural and creative enterprise are said to play in the economic and spatial reconfiguration of 'Rust Belt' cities and regions (Florida 2002, 2005); and the significance of the gendered and aesthetic dimensions of enterprise in the making of the confident, adaptable 'Can-Do Girl', a figure that Harris (2004) suggests is most capable of turning the opportunities in globalised, precarious labour markets to her advantage.

The analysis raises significant questions about the 'aesthetic' dimensions of the figure of the 'enterprising young person', and the ways in which this figure produces and reproduces gendered and racialised understandings of young people, work and 'enterprise'.

RC52-861.2NOR-AREVYAN, OXANA* (*Southern Federal University*)MOSIENKO, OLGA (*Southern Federal University*)*Integration into the Profession of a Doctor and Barriers to the Formation of a Professional Identity*

The professional identity of physicians is often explored in the context of the theory and practice of everyday life. From this position, the professional identity of doctors is analyzed as a complex and dynamically developing construct, interdependent from the social practices of the doctor, sustainable professional interactions, everyday communication and interaction in the work environment. In the context of everyday practice, the identity of physicians is seen as a life strategy (Eisenberg E., Niemi P., Ryyänen K., Winslade J.).

The most recent foreign research in this field is the formation of the professional identity of physicians through the process of integration into the profession and the influence of family social ties (Amies E., Baernstein A., Chang T., Mann K., Oelschlager A., Vondracek F., Wenrich M.).

Russian scientists are actively engaged in researching risk factors and level of tension in the professional work of doctors during their entry into office, as well as factors that influence the development of their professional self-awareness in the process of university training (Alekseeva L.F., Bohan T.G., Moreva S.A., Rumyantseva T.V., Fitmova A.A., Shabalovskaya M.V., etc.). The results of Russian studies reflect the transformational tendencies of the professional identity of a physician with the predominance of negative perceptions of his professional identity (Vodyakha A.A., Mayakovskaya N.V., Mosienko O.S., Nor-Arevyan O.A., Prisyazhnyuk D.I., Sukhova E.N., etc.).

The study of deviative tendencies in the profession of a doctor, conditioned by unmet expectations and the effect of status inconsistency on quitting and internal job changing (Creed W. E.D., Saporta I.), and leading to the emergence of a crisis of professional identity, is becoming urgent.

RC38-JS-3.4

NORKUS, MARIA* (*Technische Universität Berlin*)

Precarious Employment and Inequality in the Context of the German University System

The German university system, as part of the public sector, has been subject to comprehensive reform efforts for years, changing not only the structures of scientific research but also working and employment conditions of the university staff. Part-time and temporary employment is increasing and permanent contracts are becoming very rare for scientific staff. But also the non-scientific staff has to handle insecure forms of employment. This trend can also be described as an increasing precarisation. The way in which different social groups are affected by precarisation is intimately linked to dimensions of inequality and to how these axes of inequality intersect: while certain groups can cope with precarious working conditions, others may be genuinely disadvantaged.

This study is based on biographical-narrative interviews with different groups of university staff members. By choosing a biographical approach, it can be shown how the different axes of inequality affect people's life courses and how this is connected to precarisation. With regard to the theory of intersectionality, the qualitative design allows to explore which dimensions of inequality are crucial, in which way they are interwoven, and how they shape individual biographies. Furthermore, by adopting the framework of intersectionality, this study also contributes to the theory of precarisation.

Capitalist Restoration or Dismantling of State Capitalism? Post-Communist Transformation from the Viewpoint of the Comparative Historical Sociology of Restorations

Scheming the restoration of capitalism (along with the dismemberment of the USSR) was the top indictment and crime punished by the death sentence in the show trials against trotskysts and members of right Opposition of the Bolshevik/Communist party in 1936-38, known as „Moscow trials“. In fact, none among the defendants planned or even contemplated this (mis)deed. However, the restoration of capitalism is what Gorbachev, Yeltsin and other late communist reformers really achieved. But was the Stalinist political economic system really non-capitalist? The paper discusses implications of different models of the political economic system which emerged in the wake of the „October revolution“ for the analysis of post-communist transformation and suggesting an outline of the general theory of modern social restorations, applying it to post-communist transformations as specific cases. While comparative research on revolutions is well-established research field, there is still no sociological theory of restorations. This asymmetry reflects a dominant assumption of both modern societies and social sciences that (radical) social innovations are intrinsically positive. In fact, many of them fail or end as disasters or historical deadlocks. Classical cases of modern restorations are the Stuart restoration in England 1660 and the Bourbon restoration in France 1815. However, not only monarchies or dynasties can be restored, but also democratic regimes, states (e.g. by liberation from foreign occupation), economic systems (e.g. capitalism), and classes. In addition to macro-restorations, there are also mega-restorations (e.g. of empires, international systems) and micro-restorations (e.g. of friendships, families). In some cases, restorations of different kinds take place simultaneously, as it did happen when restoring the Jewish state (Israel). From the new viewpoint of the comparative historical sociology of restorations, the post-communist transformation was a multiple restoration, encompassing the restorations of capitalism and of capitalist entrepreneur class, of democracy, and in some cases – of independent states.

Emotional Abuse on OLMs: Evidence from Indian Freelancers

OLMs offer new means of livelihood (Chan & Wang, 2014), creating earning opportunities for increasing numbers of workers across the world (Lehdonvirta & Ernkvi 2011). India is ranked second after the United States of America/US among freelancer nations (Elance, 2013), with Indian freelancers topping the list in terms of volume of work completed (Menon, 2015). Our study shows that Indian freelancers on Upwork report various forms of emotional abuse including aversive racism on OLMs. Mistreatment from fellow freelancers occurs on project teams, during the bidding process or via general interaction fora, being attributed

to insecurity linked to the competitiveness of surviving and excelling and to racial bias. Mistreatment from clients which stems from concerns/miscommunication over task completion, issues about freelancer integrity and racial bias could also be linked to a sense of superiority derived from their pseudo-employer status which brings in the element of hierarchy. While Upwork offers platform-based redress mechanisms to tackle bullying in cases where proof from the site is available, instances where the low media richness associated with the abusive communication on the site constrained availing of this option, were reported. The unregulated context of OLMs whereby they operate beyond any form of democratic oversight by way of legislation or collectivization (Bergvall-Kåreborn & Howcroft, 2014) deprives bullied freelancers of the opportunity to seek extra-platform interventions. Moreover, freelancers' personal initiatives (eg, directly talking to the perpetrator) to deal with the abusive situation were reined in by the critical role of reputation and relationality which are the cornerstones on which OLMs function (Kneese et al, 2014). Undoubtedly, OLMs warrant regulation and, to this end, calls for an internationally co-ordinated approach through ILO's C177 convention on home-based work are often raised (Risak & Warter, 2015).

Local Struggles Confront Decentralisation: Organising Brick Kiln Workers in Gujarat, India

For about a decade, the Int Bhatta Majdoor Union in Ahmedabad, Gujarat, has been organising brick kiln workers both at the source and destination on issues related to minimum wages, free housing, electricity, drinking water facilities, bonded labour and access to basic health and education. Workers are mobilised through various actions like submitting memorandums, holding discussions and resorting to work stoppages. Besides this, the Bonded Labour Act, the Minimum Wages Act and the Indian Penal Code have been effectively used to initiate action. In spite of this, the nature of their work, the difference in labour market conditions and their ethnic backgrounds makes it difficult to initiate industrial action that combines workers across various categories. Consequently, the state-wide strike held in Gujarat in 2010 failed. The main reasons for the failure were: only workers contacted at source could be mobilised at the destination, the 10-14 days strike was too long to sustain and the ethnic divide among workers was difficult to overcome. Moreover, employers used violence against workers, got the police to disrupt union meetings during the strike, restricted access to the workplace, stopped the payment of subsistence allowance, issued death threats to organisers and filed cases against union activists. Since then, employers have signed separate settlements with different categories of workers and have replaced the more militant Rajasthani workers with those from Uttar Pradesh and Chhattisgarh (various Indian states). The union too has decided to support workers' local struggles in different clusters, activating the Bonded Labour Act and Indian Penal Code against employers trying to restrain workers from leaving the kiln. As decentralised bargaining is confronted with local mobilisation, this presentation will look at how cluster-level strategies are working to overcome the failures of the 2010 strike.

Patterns and Experiences of Modernity and Their Issues in Iran and Turkey

Modernity refers to those theories of life and social structure which began from 17th century onward in Europe and it gradually spread globally. Such theories assume incipient modernity with the advent of modern societies and recognize Western Europe as the birthplace of modernity. With comprehensive and driving thoughts, modernity has left numerous consequences on society, culture and politics both in the West and Islamic states. These countries did not confront modernity equally and it can be said that they are experiencing different patterns of modernity. Iran and Turkey are two nations sharing similar fits of experiences in terms of being introduced to modernity and the way it has been rooted in them notwithstanding that the results and consequences of modernity have not been of similar nature there. Modernization in both countries moved in a parallel paradigm albeit its commencement happened earlier in Turkey before Ata Turk by Ottoman's amendments. Turkey got familiarized with modernity sooner than Iran mainly owing to its neighboring borders with Europe although its joining with Europe left direct effects on Iran's destiny. Indeed, Turkey has been Iran's path to Western civilization and modernity. As a result, waves of modernity entered Iran from Turkey with a little delay. Even though modernity and modernism were superficial in terms of technology and politics and official administration, Modernism and modernity brought forth trends of opposition among which one can refer to Islamism which denounces modernism for its opposition toward historical, religious background and traditions. According to different positions they adopt against modernism, Islamicists fall into several categories.

RC23-432.3NOVELLO, NOEMI* (*Università di Milano-Bicocca*)*Merton's Institutional Imperatives Today: The Case of Mixed-Methods Community in the Social Sciences.*

Robert K. Merton's work on the normative structure of science [1] is undoubtedly a widely recognized essential contribution in the sociology of science. In particular, ethos of science is expressed by Merton through the definition of four institutional imperatives: 1) universalism, 2) communism, 3) disinterestedness and 4) organized skepticism.

This contribution focuses on the scientific field – and the related scientific community – of mixed-methods in social inquiry. Combining different methods is nothing new in the area of social sciences. However, in the last years the praxis of merging qualitative and quantitative methods for data collection and analysis is increasingly inscribed within the label “mixed-methods”. The paper will draw on an ongoing doctoral research, which applies a methodological research synthesis of published articles that declare the use of a mixed approach.

The objective here is to explore the application of the Mertonian imperatives in the contemporary pinpointed field of mixed-methods in social inquiry, understanding whether the original conception of the author is attended or not. In this second case, a reflection upon circumstances that are related to the lack of awareness of the norms in question will be delineated. Whilst imperatives are inevitably interconnected and it is difficult to distinguish among the single norms in science, the four points will be discussed one by one. Universalism in the mixed-methods community is questioned by the adoption of diverse approaches to integration; communism (as common ownership of goods) is challenged by the property rights employed by academic publishers; disinterestedness may be under attack whenever statements are not empirically proven; finally, organized skepticism open up to some epistemological issues for what concerns the academic community of focus.

RC44-748.13NOWAK, JÖRG* (*City University of Hong Kong*)*Decentering the Workplace As Space of Mobilisation and Decentering Trade Unions As Organisations: New Methodological and Historical Perspectives on Working Class Action*

Much of industrial relations and labour studies have focused on trade unions as organisations of workers. Although early theorists of strikes and working class action had a much broader view, the perspectives in the field got increasingly narrow during the course of the 1960s and 1970s. Empirical developments in a small geographical area and in a certain time period became a role model for social sciences, and a certain type of corporatist form of working class organisation in the Global North has been reproduced and reified in academic scholarship. In the past few years, several works on ‘community unionism’ and agency-centred approaches in labour geography increasingly challenge the dominant perspective. Linkages between community issues and workplace issues, and the relevance of the local or regional community as a vibrant factor for workplace struggles are underlined more often in recent academic work.

Following this trend, I call for a decentering of trade unions as the focus of research on forms of workers’ organisation. We only do get the full picture of working class action if other types and forms of workers organisations are recognised, and if the multiple interactions of workplace mobilisation and different forms of community organisation are explored.

RC02-58.3NOWAK, JÖRG* (*City University of Hong Kong*)*The Return of the National Imperialist State*

The ultimate political consequence of the great financial crisis is the retreat into and renewal of the national imperialist state, centred around an authoritarian-nationalist project. Nevertheless, this ‘return of the state’ that was never absent is deeply embedded into the neoliberal form of today’s global capitalism. It pretends to cater to working class interests of its citizens to some bigger extent; but this remains largely a symbolic gesture. This fake interpellation of the national proletariat – not much unlike classical fascism – is accompanied by a profound political weakness and instability of these regimes. While this tendency itself seems to be a global phenomenon, it is at the same time fraught with the challenge to establish an economic nationalism in the framework of a globally interconnected capitalism, thus placing an enormous contradiction in the heart of this very tendency. Not only are they haunted by their promises of welfare and employment, they also are confronted with deeply divided and fragmented state apparatuses in which different state agencies pursue radically different strategies. The splits within state elites and state apparatuses are profound and radical.

Thus, the national imperialist projects are fraught with the paradox that renationalization is no viable option on the economic plane, but part of the elites

feel they need national rhetoric in order to tie the middle classes to the existing economic order. The move to engage in large infrastructure projects seems to represent a rather desperate attempt to relieve some of the political and economic deadlocks than a viable long-term project of accumulation and political rule. It remains to be seen if socialdemocratic or more radical left movements are able to offer another way out of those impasses. But it is obvious that political tensions and economic bottlenecks are rather increasing.

RC25-467.4NOY, CHAIM* (*Ashkelon Academic College*)*Museum-Audience Interactions: A Threefold Comparative Study of Identities and Entitlements*

Museum-Audience Interactions: A Threefold Comparative Study of Identities and Entitlements

This presentation, based on a book project, undertakes a comparative study of audiences’ discourse (comments) in three history museums: The National Museum of American Jewish History (Philadelphia, PA), the Florida Holocaust Museum (St. Pete), and the Ammunition Hill National Museum (Jerusalem, Israel). The presentation brings together a theoretical focus on language and power, as specifically articulated by research in Critical Discourse Studies and Linguistic Anthropology, and the richness of naturally occurring discourse, produced by ‘lay’ visitors to museums (during and as part of their museum visit ritual). In this way, the project looks at power and language across sites as well as media.

The presentation commences with background information on the institution of the museum, and on the far-reaching changes it is currently undergoing – changes that centrally embody a shift from collections and knowledge to audiences and experience (Macdonald, 2006). I then proceed to discuss the different onsite media which these institutions offer their visitors/audiences, and through which the latter produce public contributions to the museums’ display: what audiences write becomes instantaneously part of the public display.

The comparison looks at the audience-museum interactions specifically in terms of how the former and the latter establish entitlements (communicative entitlements) for participation in the public sphere, and relatedly, how audiences’ identities are publically constituted (Montgomery, 2010; Shuman, 2005). Pursued via institutional media, these interactions are conceptualized as producing institutional identities through communicative entitlements involved in accessing the (institutionally afforded) public sphere. The study thus also illuminates struggles over knowledge and legitimacy.

RC24-450.19NOZAWA, ATSUSHI* (*Japan Society for the Promotion of Science*)*Bridging Environmental Sociologies in Japan and the United States Via Environmental Justice: Minamata Disease in Comparative Perspective*

Environmental justice (EJ) is clearly a fundamental perspective of environmental sociology in the United States. Similarly, an EJ perspective can be applied to central themes in Japanese environmental sociology, which has long had a strong emphasis on ‘victimology’ stemming from early work on Minamata Disease—one of the worst technological disasters in Japan's history. This presentation will link environmental sociologies in both countries by applying an environmental justice framework to the Minamata disaster.

Minamata Disease refers to methyl mercury poisoning caused by eating fish and shellfish polluted by wastewater from a large chemical factory in South Japan, poisoning that creates devastating health problems for victims and stigmatizes them. In total, approximately 2,000 people have been officially certified as the victims, and over 60,000 people are registered as uncertified victims. 2016 marks the 60th anniversary of the discovery of the disease, and its negative health and social consequences are still evolving. This presentation will examine the Minamata disaster from the viewpoint of an environmental justice framework, making comparisons between Japanese analyses framed in terms of ‘victimology’ with U.S. EJ perspectives.

The injustice has continued from the original contamination to the recognition and then social treatment of the victims. Differing dimensions of injustice are apparent at different stages of the six-decade long Minamata controversy: Analyzing these aspects of injustice will be carried out by using documents, existing sociological analyses, and results from interview surveys, as well as insights from EJ work in the U.S.

The presentation will conclude with a comparison of environmental justice frameworks in Japan and the U.S. to show the similarities and some differences due to national settings. The goal will be to contribute to the development of a common EJ perspective for use in environmental sociology in comparative context.

TG07-1000.3NOZKA, MARCJANNA* (*Jagiellonian University*)*The Phenomenon of Inclusion and Exclusion in Public Spaces through the Prism of Mental Representations of Space By Persons with Various Sensory Deficits and Preferences*

In the framework of the presentation I will discuss the assumptions of the project: Analysis of the phenomenon of inclusion and exclusion in public spaces through the prism of social practices and mental representations of space by persons with various sensory deficits and preferences: A comparative sociological study. This project aims to develop current knowledge about the causes and mechanisms by which people are socially included or excluded in public spaces.

Impairment, disability, handicap of the senses constitute variables which distinguish people from one another, as do dominant sensorial modalities. All of these variables are treated in the project as socially vital characteristics, creating not only barriers, but also possibilities which are affected by real experiences – being in a space, ways of mapping space, spatial mobility, a sense of socio-spatial inclusion and/or exclusion. Among the objectives of this research project is identification of alternative ways by which material space is interpreted.

On this stage of research, I would like to present my method [eg. sketched maps; sensory walks documented in photos and video] and ways of collecting data as well as methods of verification of collected material. Furthermore, in the framework of the presentation I will discuss the working concepts of the sensorially mixed society and sensorially varied mobility. Linked to this will be the identification, followed by the comparative analysis of the contents of mental maps produced by the research subjects. It is hypothesized that the contents of mental maps disclose certain related characteristics: unique perceptions and utilization of space; factors which hamper the navigation and usage of public spaces; and factors which facilitate negotiation of these spaces. Examining precisely the ways that space is comprehended, I am seeking out limitations and potentialities as well as the causes and symptoms of social inclusion and exclusion.

RC32-JS-37.2NTHIGA, PURITY* (*KENYATTA UNIVERSITY*)KIGURU, GATITU (*Kenyatta University*)*Language and the Fight Against Gbv: The Voices of Students from a Kenyan University*

Central to the fight against gender based violence (GBV) is an understanding of the meaning of and the various forms of GBV. Additionally, the fight can be enhanced through an understanding of how language use promotes GBV and on the flip side how the same language can be used as a tool to fight against GBV. Research has shown that GBV is prevalent in schools and in universities and therefore the need to raise awareness on how to fight it in these settings. We therefore sought to find out how well students from a selected university in Kenya understood GBV and the role of language in the promotion of as well as fight against GBV. Through FDGs and individual interviews the study aimed to : establish the students' understanding of the meaning of GBV, determine their knowledge of different forms of GBV and their occurrence in campus, collect and describe the students' views on how language promotes GBV and lastly gather the students' ideas on how language can be used in the fight against GBV. This paper reports the voices of the students and makes recommendations on how to harness the power of language in the fight against GBV in universities.

RC49-828.4NTOIMO, FAVOUR* (*Federal University Oye-Ekiti, Nigeria*)EGBEYEMI, ENIOLA (*Federal University Oye-Ekiti*)*Familial and Personal Predictors of Mental Well-Being of in-School Female Adolescents in Ado-Ekiti Nigeria*

Nigeria has one of the largest population of adolescent girls in the world and most of them are exposed to adverse outcomes arising from economic deprivations and entrenched gender inequalities and social norms that disadvantage women compared to men. The country has a national policy on the health and development of adolescents and young people, but little or no research, advocacy or programmes are in place to promote the mental well being of adolescents. Using scales for measuring self-reported mental well being and physical health adapted from previous studies, we investigated the personal and familial factors associated with the mental wellbeing of in-school female adolescents in Ado-Ekiti, Southwest Nigeria. Data were obtained from in-school female adolescents aged 10-19 years old in Ado-Ekiti, the capital of Ekiti State, Nigeria. The respondents were randomly selected from four purposively selected secondary schools. Using a formula for deriving a small sample when population is known, a sample size of 383 was derived from a population of 1656 female students in the four schools. With 10% added to adjust for non-response, a total of 421 students were involved in the study. Categorizing the mental well being scores into a tertile, 11.3% reported poor mental well being, 51.7% moderately

good and 37.0% good. Younger adolescents ages 10-14 were more likely to report poor mental well being than their older counterparts aged 15-19 years old. Multiple regression models revealed the following significant predictors of mental wellbeing among the respondents: working to earn a living ($\beta = -8.04$ $p < 0.01$), good physical health ($\beta = 7.9$ $p < 0.001$), polygynous ($\beta = -6.28$ $p < 0.10$) and single parent ($\beta = -6.74$ $p < 0.01$) households. The results underscore the need for more studies with wider coverage and programs to promote adolescent mental health, particularly targeted at the vulnerable categories identified in this study.

RC41-713.2NTOIMO, FAVOUR* (*Federal University Oye-Ekiti, Nigeria*)EGBEYEMI, ENIOLA (*Federal University Oye-Ekiti*)*Single Parenthood and Mental Well-Being of in-School Female Adolescents in Ado-Ekiti, Nigeria*

Most of the health problems adolescents suffer from are associated with poverty and inequality inherent in their family type. For instance, single-parent family may affect an adolescent's mental health adversely because a single mother/father might not be entirely capable of catering for the needs of the adolescent with regard to proper nutrition, educational needs and social integration. Using a scale for measuring self-reported mental wellbeing, adapted from previous studies, we investigated the association between single parenthood and the mental wellbeing of in-school female adolescents aged 10-19 years in Ado-Ekiti, Southwest Nigeria. The respondents were randomly selected from four secondary schools. Using a formula for deriving a small sample when population is known, a sample size of 383 was derived from a population of 1656 female students. With 10% added to adjust for non-response, a total of 421 students were involved in the study. Categorizing the mental well being scores into a tertile, 11.3% reported poor mental well being, 51.7% moderately good and 37.0% good. Younger adolescents ages 10-14 were more likely to report poor mental well being than their older counterparts aged 15-19 years old. Two multiple regression models predicting the association between single parenthood and the adolescents' mental wellbeing were fitted. In the unadjusted model, mental wellbeing significantly decreased for adolescents in single-parent households compared to their counterparts in two-parent households ($\beta = -8.06$ $p < 0.001$). The inverse association remained significant in the second model that adjusted for self-reported physical health, personal and other family characteristics ($\beta = -6.88$ $p < 0.001$). The result indicates that the family is a key determinant of adolescent mental wellbeing in Nigeria. To enhance the country's prospects of attaining the SDG target on mental health and other development goals, the mental wellbeing of female adolescents, particularly those in single-parent households would need priority attention and intervention.

RC01-33.1NUCIARI, MARINA* (*University of Torino Italy*)*A Career in the Military: Gender Gap in Senior Positions in the Military Compared with Civilian Corporate and Public Organisations. a Crosscultural Research.*

According to last available data on military retention and career of women in the Armed Forces of NATO nations members and partners, gender gap in career advancement is slightly lowering in medium-high ranks, while recruitment and retention rates are growing fast especially in former-eastern countries such as Hungary, Latvia, Slovenia and Bulgaria (Summary of the National Reports of NATO Member and Partner Nations to the NATO Committee on Gender Perspectives, Brussels, 2015). The hypothesis discussed in this paper is that, being public policies and affirmative actions present in rather all 27 NATO countries, the highly different gender proportion in presence and advancement in the various countries is affected much more by specific socio-cultural traits than by legal actions and supportive policies.

Usually gender gap in the military is observed *per se*, not considering the gender gap in career advancement and senior leader positions for women in the civilian sectors of parent society. A comparative research on several NATO countries has considered existing gender gaps in civilian as well as military careers inasmuch as senior positions are concerned. Data are drawn from NATO Committee on Gender Perspective Archives, from yearly Global Gender Gap Reports (WEF) and other well-known international databases on gender diversity and career in corporate and public organisations.

RC20-370.6NUGUS, PETER* (*McGill University*)*Advancing Comparative International Ethnography through Conceptually Comparable Sampling: Lessons from the Organizational Work of Emergency Clinicians in Australia, the US and the Netherlands*

This paper examines the way transferable concepts and data points can render qualitative samples comparable across boundaries, including of nations. It does so through a study of the relationship between policy, professionalization and situated interaction in an ethnographic study of six purposively sampled emergency departments (EDs) in Australia, the Netherlands and the US. Ethnography, and, in particular, the social action theories than underpin it, has been criticized for being too locally specific, and "astructural" on account of its intense interest in local action and interaction. The study aimed to examine the extent to which, or how, conceptually comparable concepts and data points could render international samples comparable. The study draws on the equivalent of 24 months of deep and immersed observation in the EDs of large, well-known metropolitan teaching hospitals in the above three countries. Through thematic analysis of transcripts and policy documents, we found comparable associations between the dimensions of macro, meso and micro social life. In the US, where the primary care system was relatively weak and EM a well-established and respected sub-discipline, EDs had the power to admit patients to the hospital and determine the terms of such transfer. Emergency personnel in the Netherlands, with a relatively strong, publically-supported primary health care system, and only informal EM training, struggled for legitimacy and influence in interactions with in-patient clinicians. Australia occupied the middle ground between these positions on all dimensions. The ability to account for macro-level differences inherent and observable in the micro of everyday interaction depended on conceptual comparison of criteria in the integration of theory and data. The paper advances the conceptual and methodological tools for learning lessons across national systems. Furthermore, the application of "conceptually comparable" criteria for data collection and analysis raises new possibilities and questions about the "reliability" and "validity" of qualitative research.

The Decline of a Welfare Market. State-Subsidized Private Pensions in Germany

Since the mid-1990s, the transformation towards a three-pillar system has been the most important development in pension policies. In Germany, the political establishment of a three-pillar model was closely linked to the introduction of a state-subsidized private pension scheme in 2001, which was named "Riester pension". and a new 'welfare market' was constituted. After several years of growth, the market has passed into a continuing process of decline and stagnation. This development is pretty surprising and contradicts the expectations about a worldwide establishment of three-pillar systems. This paper will give indications how to measure 'decline of a welfare market' (1). Subsequently, the paper will try to explain rise and fall of the German welfare market for Riester pensions (2). It is also remarkable that no policy change has taken place, although the expected growth of the market for private pension provision have failed to materialize.

It is therefore essential to explain why the political actors adhere to the Riester legislation (3). A specific causal mechanism, the self-enforcing power of policy discourses, stands in the center of the presented explanatory approach. Policy discourse is defined as the entirety of all public statements on a specific policy including evaluations of the policy as a whole, of individual reforms or specific policy instruments and levels of provision. The paper includes the analysis of the policy discourse on Riester pensions from 2002 to 2016. The initially promoted success story transformed in the establishment of a 'low return frame' and afterwards in a 'failure frame'. The failure frame became more and more intensive and deployed the strength to create political and economical effects, it develops a self-enforcing power to decrease the public image of Riester pension products and to undermine further attempts to privatization.

The Vaccination Debate in the Post-Truth Era: Examining Social Media As Sites of Multi-Layered Reflexivity

On 8 January 2016, the Facebook CEO Mark Zuckerberg posted on his Facebook profile a picture of his two-month-old daughter, accompanied by a comment: "Doctor's visit -- time for vaccines!" In only few days, the post attracted more than 83,000 comments. The debate that followed the statement provides a unique insight into the public debate about vaccination, and medical knowledge more broadly, in the so-called post-truth era. Furthermore, the analysis empirically informs the theoretical debate about citizens' reflexivity in relation to health care.

The following theoretical and empirical questions are addressed: To what extent do social media stimulate reflexivity and empowerment of citizens in relation to health care? What topics and arguments were articulated in relation to vaccination? What sources of "knowledge" about vaccination legitimized their standpoints? How were the cleavages between proponents and opponents of vaccination deepened and mitigated?

A combination of quantitative content analysis and qualitative discourse analysis is used. The contribution of the paper is threefold. First, the paper examines the dynamics between proponents and opponents of vaccination. Second, the analysis is situated within the context of previous debates on vaccination. While we argue that the key themes and arguments mirror the previous debates (e.g. Blume 2006, Hobson-Best, 2007; Kata 2011), we also highlight that the vaccination debate has its own history which has had post-truth attributes since ever and that this history is considered by participants in the debate. Third, this paper extends the notion of patients' reflexivity, previously elaborated in the discussion of the role of Internet and informed patient (e.g. Lupton 1996, Adams 2010). We introduce the notion of *multi-layered reflexivity* and emphasise that in the post-truth context, reflexivity is not expressed only in relation to the topic of vaccination but also in relation to the post-truth conditions, within which this discussion takes place.

Spaces and Places - Comparing the Music Festivals in Lisbon, Portugal to Those in São Paulo, Brazil

This paper reports interim findings of the project the Cultural Festivals in Lisbon, Portugal by comparing the scenario of Cultural Festivals in São Paulo, Brazil. This is the first study to make such comparisons. The aim of the project is to understand how the music within the music festivals which has been run in urban areas plays an important role not just to support the traditional structure of music festivals such as, the sequence of events and the linear program that the public normally expect to take place. In stead of that, we intend to show how the music works as a particular experience that trigger both: the design and production of places which the public choose to use for leisure. Our research field look at two important events: The Vodafone Mexefest" which is run in Lisbon and "The Virada Cultural" which is run in São Paulo. This research is based on qualitative analysis of data from ten interviews (show business, journalists and the public). According to the results in both festivals, the reason that makes the urban festivals as a distinctive object of leisure is how the public associate music as a relevant element to address significance to spaces where the festivals take place. In this case, we utilized the concepts of space and places as tools in providing a greater understanding of how the music is being capable to turn the space (a physical location) into places (a process of place-becoming), a particular

process that illustrate how music can be defined through the emotional bonds part of people culture.

Brazilian Jury Trial - a Trial Analysis from Two Perspectives

This paper intends to describe a trial from two perspectives: the audience's and the legal agents'. It comes from our fieldwork, at Brazilian Trial by Jury, when we attended a trial that deals with an abortion case. From the audience, one of us could see how the trial took place from that perspective and the other could observe it beside the prosecutor. It is important because Brazilian Court is organized in a way that separates – physically and structurally – people who are there only to watch it, from those who are working or participating on the trial, as the judge, defensor, prosecutor, defender and jurors. So we intend to describe both perspectives through the description of this case we attended together by chance, while we were doing fieldwork on different research. Through this description we intend to think about space arrangements and how power and symbols work on space.

Legal Capacity and the Search for an Equality-Respecting Decision-Making Law

Most of us take for granted that we will be permitted to make decisions that govern our personal lives. Decisions in matters large and small are expressions of autonomy. Yet, decision-making rights – regarding medical, financial, and many other matters – are subject to a caveat: We must have legal capacity, a socio-legal construct that varies across time and place. Today's capacity and decision-making law, in particular, is at a crossroads. Domestically and internationally, policy makers and stakeholders are actively engaging difficult questions about how to render decision-making during periods of vulnerability from, for example, cognitive, mental or intellectual disability, more consistent with autonomy and equality, while also providing necessary safeguards. Much of the current debate centers on two groups of alternatives. One, a conventional approach to decision-making law, pairs a cognitive functional approach to legal capacity with a "substitute decision-making" system wherein persons deemed incapable have another appointed to decide for them. Critics argue that this model wrongly disenfranchises individuals and fails to reflect the social model of disability. The other is "supported decision-making" which, in its strong version, sees legal capacity as universal and law's role as providing the supports required for the exercise of that capacity. Critics of this approach say making people legally responsible for decisions they might not have understood amounts to abandonment. Against this background, this paper considers a third model, "joint decision-making", which locates decisions within a collective. Joint-decision-making has received far less academic attention, even while some jurisdictions are adopting it in policy. The paper discusses the meaning and role of joint-decision making by locating it among substitute and supported models; reviewing some joint decision-making tools – namely co-decision-making and personal support networks – in use in Canada and Ireland; and considering some possible implications for Canadian law and policy.

Demands for Justice in a Rural Community

With focus on the demands for justice in a rural community with a population of ten thousand, this discussion features multiple demands made of public officials with responsibility for legal protection of the rights of citizens to their property and security. It highlights the failure of elected officials, local attorneys and law enforcement to respond to the articulated demands of an elderly woman for justice in an environment increasingly dominated by large landowners describing themselves as 'the landed gentry'. Documenting the demands for justice between 2013 and 2017 exposes a corrupt system for denying justice to anyone with the courage to demand it in an environment where most citizens are afraid to do so.

Beginning with a bulldozing operation without warning, followed by abuse and threats from law enforcement and legal maneuvers designed by attorneys to force sale of family property to expand the land holdings of 'the landed gentry'. These are influenced and supported by false reports from law enforcement which provide the legal foundation for elimination of anyone who resists the objectives of 'the landed gentry'. It discusses responses to this bulldozing operation and never-ending complaint process required for exposing the corruption network embracing attorneys and law enforcement for influencing judicial decisions and abuses.

The 'watchdogs' at the local, county and state levels simply dismiss demands for justice, whereby complaints are either ignored or responses so abusive with the intention of intimidating heightened demands for a democratic process support-

ive of justice. In a corrupt system of justice embracing local officials, law enforcement, attorneys and judges, documents show this 'landed gentry' threatens the livelihood and elimination of anyone demanding justice.

Food Sovereignty and Land Grabbing: Case Study in Rural USA (2013-2017)

Participant observation is the methodology employed to document a four-year process beginning with land grabbing, involving environmental destruction, and denial of food sovereignty, especially food safety. Analysis exposes a land grab support network involving a self-proclaimed 'landed gentry', attorneys, elected officials, law enforcement, a justice system and oversight agencies.

This land grab began without warning when a bulldozer secured a one-acre expansion. Organic soil preserved for decades and used for production of livestock, vegetables and fruits for family use were destroyed within hours as law enforcement supported this bulldozing 'landed gentry' with shouting and threats.

When forced to face the property owner, the operator simply laughed and shouted: "You can do nothing!" as four law enforcement officers ran away and the bulldozer continued destruction of structures, soil, trees, bushes and plants. Compost was removed and everything was destroyed and removed within hours.

Documentation includes photographs detailing this initial destruction along documentation of land use over decades. Thereafter, photographs document destruction to land and plants by pesticides/herbicides added to sprinkler water which destroyed mature trees (aerial photographs US Department of Agriculture).

Taken every 2 days during growing season, photographs show water turning leaves pastel and stems red as organic soil was contaminated and it use was no longer safe for food production. Instead as chemicals and their drift killed plant life and land use became restricted to production of corn which required constant spraying of pesticides and herbicides to support its growth to maturity.

The 'landed gentry' unleashed a reign of terror with a bulldozer. Law enforcement issued reports legitimizing elimination of an elderly landowner who continues opposition to future land grabs of the one-acre with the family home.

Global Capital: The Case of IT Workers in a Transnational Space

Information and technology (IT) professional workers possess a form of capital based mostly in their specific technical knowledge. Following Bourdieu's social theory, it is possible to understand the IT labor market as a field, where workers compete for better positions drawing upon the capital they possess. While in more classical labor markets the ability to do things and to respond to routine tasks is at stake, in the field of IT, the knowledge and skills play a central role. In Bourdieu's terms, in the IT labor market cultural capital is highly valued. The ability to understand and resolve non-routine problems involves not only explicit technical knowledge but also a specific way of thinking, which is not easy transmissible and must be acquired over time.

Since IT professionals are highly requested in the Global North as well as in the Global South, moving between countries is a constant possibility. Whether skilled migrants find adequate occupation in the country of arrival depends on their ability to negotiate their domestically acquired capital under new institutional frameworks. The IT sector presents an exceptional case of study since it is very flexible and deregulated in terms of credentials and institutionalized entry barriers. Thus, IT workers can be seen as the prototype of the global knowledge worker. The capital they possess is valued beyond the national-state borders reaching transnational spaces where symbolic analysts can use their problem-solving abilities at their best.

The paper presents findings based on narrative interviews with IT workers in two countries: Germany and Chile. Using a transnational comparative design and showing IT professional immigrants' trajectories in these two countries, national and transnational values of capital will emerge as a central aspect to discuss and understand the transformation of labor in our globalized world.

Whose Consent Matters Most? Ethical Dilemmas on Public Display of Participatory Visual Images Produced By Teenage Mothers in a Low-Income Urban Context in Nairobi, Kenya

This presentation will explore some of the ethical dilemmas in doing participatory visual research in negotiating consent on public dissemination of visual products by teenage mothers in an informal urban context in Nairobi, Kenya. Participatory visual studies have recently been adapted by researchers working with excluded groups of population living in marginalized areas.

Participatory visual research is a collaborative process which is anchored on a feminist framework to promote collaboration between the researchers and participants, and give participants more control of the research process and emancipation due to the collective processes engaged by participants who have similar lived experience. Participants' conceptualization of a common problem, creation of symbolic representations through visual images, and public displays of the visual images to a wider public to initiate a community conversation are the key principles of participatory visual research. Participatory research helps to bring to the centre the voices of marginalized participants such as excluded girls and women in order to stimulate their agency for social transformation of their situations and that of others within their communities. However, public display of images created by participants in general, and those created by minors in particular can create ethical dilemmas that require both participant and researcher reflexivity. How can participants and researchers strike a balance on what images to display, to whom, and where in order to uphold the principle of least harm and at the same time, taking caution not to silence the very voices that the research seeks to bring to fore and centre? What are the ethical implications of the researcher representing the visual images produced by participants versus participants representing their own visual productions? How as researchers do we navigate this tricky terrain with Research Ethics Boards?

Popular Politics in the Age of Uncertainty: Is South Africa Fast Becoming a 'Protest Society'?

This paper addresses a central question on the nature of contemporary politics in South Africa. It examines whether the various incidences of popular resistance within South Africa provide fertile grounds for an argument that considers the events in South Africa as emblemising a 'protest society'. I juxtapose such incidences of protest and resistance to others occurring elsewhere to argue that although the resistance in South Africa resembles those of other localities, it has its own distinctive peculiarities. The paper therefore aims at discussing the activities or resistance of the South African subaltern in comparative terms and also highlight how the South Africa case fits into the larger scheme of global political resistance. Central to this discussion will be the need to examine how popular (subaltern) resistance in South Africa is both informed by local and global currents. Essentially, the paper attempts to provide insights on why do South Africans protest and their subjective interpretations on what it means to protest. Finally, through this paper, I attempt to provide answers to why there has been a steady increase in the number of protests since 2009 and what does this increase mean in qualitative terms.

Violent Cultures, Acting Citizens and the Passive State: Contesting Political Morality in South Africa

In this paper, I discuss how the use of violence has become a mechanism for mostly poor citizens in contemporary South Africa to contest the moral functioning of government and state institutions. More essentially, the paper locates the place of violence within the broader state-society relationship. The paper argues that this interaction between the state and ordinary citizens in South Africa reveals the everyday appropriation of violence by either party to foster an 'effective' social and political contract. By taking cues from the everyday social struggles of the poor that manifest themselves through social protest, this paper argues that the use of violence in such struggles is largely an outcome of a weakening moral order on the part of political authority. My evidence for this claim is purely qualitative and ethnographic. I engage with this evidence in this paper to reflect on the agency of the figure of a "violent citizen". In this reflection, I show how this agency is shaped mostly by everyday moral concerns related to the normative/democratic practice of government and party politics especially at the local level.

Educational Reform and Labor Market Outcomes for Swedish Early School Leavers with Migrant Background

This study explores the effects on tertiary education and labor market outcomes of the Swedish 1994 educational reform. The educational reform drastically increased the frequency of early school leaving among Swedish youth. However, it also strengthened the meritocratic aspect of the educational system, making academic performance in compulsory school a stronger predictor of school leaving. Female students and students with migrant background are often found to exhibit stronger academic preferences. According to the dominant discourse, reducing early school leaving will produce beneficial outcomes at

both individual and aggregate level. However, if structural factors outweigh the increase in productivity, such aggregate level effects might be absent. From this point of departure, three questions were asked (1) Did the 1994 educational reform have long-term effects on the propensity for tertiary education? (2) What impact did the reform have on labor market outcomes for early school leavers? (3) Did the 1994 Swedish educational reform impact students differently, depending on their gender or immigrant/non-immigrant background? Data for the study was drawn from the longitudinal databases of Statistics Sweden. The labor market and educational outcomes for 970,422 students graduating from compulsory school in 1991 through 2000 were followed over fifteen years. Results show that women and students with migrant background were less negatively affected by the reform with regards to education, and that non-leavers became more likely to pursue higher education. However, the increased educational polarization between school-leavers and non-leavers did not produce increasingly polarized labor market outcomes. This questions the idea that reducing early school leaving is a panacea for social ills, instead suggesting that general changes in educational levels might make other factors, including gender and ethnicity, more important in producing labor market outcomes.

Organized Activities As Social Closure: Effects of Social Capital on Educational Outcomes Among Swedish Youth with Migrant Background

Research has found a consistent link between access to social capital and educational outcomes. Since it is not purely a private good, social capital has been suggested as having a leveling potential between students with and without migrant background. The empirical evidence for this has often rested on the assumption that access provides similar outcomes for migrants as for non-migrants. However, since social capital can be mobilized both in gaining and maintaining advantage, there are reasons to question this assumption. Swedish schools and residential areas are segregated. Consequently, people in formally similar situations can face substantially different outlooks. In this study, we address whether youth with migrant background benefit from their access to social capital in the same way as non-migrants do. To do this, we ask three questions: 1) Are the effects of social background on educational outcomes similar for migrant and non-migrant students in Sweden, 2) Are the effects of participating in organized activities on educational outcomes similar for migrants and non-migrants; and 3) Do these effects vary between migrants from different regions, and if so, how? To get sufficient statistical power, we pool observations from three studies on social capital and educational attainment, resulting in data on 4266 persons, whereof 1190 with migrant background. The results show that while students with migrant background benefited from their access to family social capital, the effect was smaller. Furthermore, while the educational outcomes of non-migrant also benefited from their participation in organized out-of-school activities, migrants did not. The differences were even more pronounced for migrants from Africa, Asia and South America than for migrants from other parts of the world. This indicates that the effects of social capital, as conventionally measured, vary with racialized hierarchies, highlighting the need to factor in social closure in the conceptualization of social capital.

Social Inequalities in Mental Health and Illness – the Significance of an Interconnecting, Multi-Factorial and Dynamic Approach

Social inequalities in mental health and illness grow out of a dynamic interplay between individual, organizational and societal factors and conditions. Individual's health and well-being are shaped by an interactive process where the social context and social position play a vital role. This paper discusses how welfare institutions could affect social inequalities in mental health through direct and indirect mechanisms. Beyond medical reasons, health disparities also arise from a multitude of differences in living and working conditions influencing access to resources such as material, emotional and informational support. Hence, a successful way of reducing social inequalities in mental health requires a multilevel approach as well as a theoretical approach framing actors and structures in interaction. Despite this knowledge, health care and welfare service institutions in contemporary societies have developed towards specialized work organizations with a more unidirectional perspective and stricter regulations. Moreover, research has reported that individuals with multifaceted social and mental health problems through this institutional development face an increased risk of falling between different support systems resulting in unmet needs. Dynamic models which emphasize an enhanced understanding of the complex pathways and mechanisms in institutional structures that may affect social inequalities in mental health and illness are therefore warranted.

O'BRIEN, JOHN EUSTICE* (*Portland State University (ret.)*)MARTIN-O'BRIEN, JOSIANE (*ESCP-Europe*)*The Problem of Universalism As Collective Representation for Societal Organization: A System-Culturalist Analysis*

Dating from Plato vs Aristotle about particulars and universals, the figure of universalism energetically resurfaced during the Italian Enlightenment. Displacing theology and hereditary aristocracy as structuring principle, after penetrating the symbolic space of social organization, the figure fueled the Revolutionary Age, opening the way for parliamentary democracy. From that foothold, universalism was diffused as justification for a special mode of Western future: *Political Organization* was to be free and representative; *state organization* was to be social-welfare accountable; and the *legitimate world view* was to be based on the lingering aura of Humanism, allowing freedom of thought, expression and belief, assuring the West would be forever safe from ideological usurpation. Alas, something went wrong.

Sociology developed in that 19th-century transitional space and has struggled to deal with it ever since. Although Durkheim's collective-representation is a useful descriptive tool for modeling this war of socio-cultural worlds, it is difficult not to agree that Marx got it right. The technical side of 19th-century development fueled opportunity and by that a rapacious appetite of capital for evermore of it itself. The Humanist Universalist Ethos slid off the screen, replaced by a pragmatic ideology of efficiency and effectiveness.

Despite the crisis of alienation it is fostering at home, expressing a heavy dose of false-consciousness, Westerners are racing to impose this self-serving mode on the world. To exemplify the resulting dilemma for the non-Western world, case material is discussed about the consequences of attempting to export a Western Version of Managerialism into the Industrial Structure of India, via MBA-like training of engineer-managers. With the Indian Symbolic Space occupied by a powerful strain of generic spirituality, penetration by a managerialist ideology meets resistance. An original General Systems Model is used to exemplify these historical-cultural developments, based on which possible paths of redressment are proposed.

O'BRIEN, ROBERT* (*McMaster University*)*Energy Democracy and the Struggle over Climate Change Infrastructure*

This paper examines the intersection of the movement advocating energy democracy and the corporate struggle over climate change infrastructure. The energy democracy social movement is primarily union led and focuses on democratizing the production and provision of energy through public ownership and public control. The struggle over climate change infrastructure is taking place across a range of economic activities and features a competition between sunrise and sunset industries to influence state regulation of large scale infrastructure in fields such as the electricity grid, public transportation and automobile use. This paper will map the terrain of the two conflicts with the goal of seeing where the energy democracy and infrastructure regulation struggles overlap or diverge. The contest takes place across scalar levels from local municipalities to international institutions and part of the paper will examine the connection between these levels. It will also investigate the degree to which everyday struggles over the regulation of energy impacts the larger climate change infrastructure struggle and the possibilities for a just transition to a better future.

O'CONNOR, PAUL* (*Lingnan University*)GIAMARINO, CHRISTOPHER DANIEL (*Lingnan University*)*Skateboarding Mega-Events As Preparation for the 2020 Olympics: A Case Study of the Vans Park Series Championships in Shanghai*

This research provides a case study of the Vans Park Series (VPS) Skateboarding World Championship held in Shanghai in September 2017. Over the course of 14 days a concrete skatepark was constructed on Shanghai's picturesque Bund, used for the event, and then demolished. The live stream of the competition was watched by 1.4 million people globally, making it small in comparison to other global sporting Mega-Events, but considerable regarding the sport of skateboarding. This study explores the significance of the new development of skateboarding Mega-Events. It highlights how VPS and Street League Skateboarding (SLS) have become the premier skateboarder controlled events that will feed, through the International Skateboarding Federation (ISF), qualifying skateboarders into the 2020 Olympic games. At the heart of this case study is the concern and control that skateboarders exert in communicating and

persevering the values and ethics of skateboarding as it makes the final transition from a street subculture to an organized sport. In the process, many veteran skateboarders generate business and entrepreneurial opportunities tied to these transformations. The Shanghai site of the case study corresponds with the interest of Vans in generating new markets for the consumption of their products, and the importance that skateboarding holds for Chinese aspirations for gold medals in the Olympics. Thus, the study touches on the recruitment of a Chinese national skateboarding team made up of former child members of the Shaolin temple. Both politically and financially, collaboration with Asian skateboarders, Chinese business elites, and government officials provides additional insight to the organisation and impact of the event that extends beyond the spectacle of the Mega-Event.

O'NEILL, COLLEEN* (*Utah State University*)*Civil Rights or Sovereignty Rights? Understanding the Historical Conflict between Native Americans and Organized Labor.*

Unions have played important roles in Indigenous struggles in Latin America and in campaigns that fueled civil rights movements in the United States, including efforts to organize agricultural, hospitality, and health care workers. But, Native Americans have had less of a connection with organized labor. Indeed, in the current climate, labor and tribes seemed to be locked in an adversarial relationship. Tribal leaders see unions as a threat to their sovereignty. Unions, such as Unite/HERE and the United Food and Commercial Workers, clearly see their rights to organize as part of a larger civil rights struggle.

Since 2004, federal district courts have sided with unions, asserting federal authority over tribal governments, and confirming the National Labor Relations Board's authority to regulate labor issues in tribally owned and operated enterprises. Congress is now considering legislation that will overturn those decisions and exempt tribal governments from the National Labor Relations Act. Given the current make up of Congress and Trump's presidency, the Tribal Labor Sovereignty Act seems likely to become law.

Comparing the labor campaigns and the associated historic legal battles that prompted that legislation in San Manuel, Chickasaw, and Mashantucket Pequot reservations, this paper examines the paradigmatic impasse that continues to fuel the conflict. Examining struggles between tribal governments and unions (that largely represent workers of color) reveals how distinct historical experience produced divergent types of political strategies and notions of citizenship.

O'REILLY, MATTHEW* (*United Steelworkers*)*Job Quality or Equality? Labour Union Engagement with Inuit Workers in Northern Mines.*

Proponents of resource development often cite wage employment as a key benefit that Indigenous communities receive from resource development. This is based on the assumption that there is a sufficient supply of desirable employment and that job quality is high. Accordingly, provisions in Impact Benefit Agreements often focus on hiring and promotion and neglect job quality even when the latter arguably affects the desirability of mining employment. At the same time, labour unions, pivotal to improving work conditions, wages and benefits in mining, have been losing ground as global firms expand their use of subcontractors and shift to smaller, more skilled and mobile workforces. In this paper we investigate the complexity of the shifting industrial relations in Northern Canada, drawing on case studies of two mines with Impact Benefit Agreements in Nunavik: Raglan mine owned by Glencore, and Nunavik Nickel mine owned by Canadian Royalties. Drawing on document analysis and interviews with representatives from mining companies, unions and Inuit governments and organizations, this paper highlights how the complex relations among unions, companies and Inuit governments, as mediated by Impact Benefit Agreements, influence employment and job quality for Inuit workers. We propose that greater alliances between unions and Inuit governments are critical to Indigenous employment initiatives.

O'SOUP, COREY* (*Advocate for Children and Youth Saskatchewan*)BRODA, LISA* (*Advocate for Children and Youth*)BRAUN, CONNIE* (*Advocate for Children and Youth Saskatchewan*)MACOMBER, MARCI* (*Advocate for Children and Youth Saskatchewan*)*Understanding Youth Suicide from the Voice of Youth in Northern Saskatchewan*

There is very little research asking youth in Canada about suicide in spite of the rates of suicide for Indigenous youth in Saskatchewan being extremely high over the past five years. This gap in research highlights the need to understand youth suicide from the experiences and voice of youth. The Advocate for Children

and Youth office in Saskatchewan conducted a qualitative study in northern Saskatchewan to obtain youth voice on suicide. The purpose of this study was to answer the following questions: To understand youth experiences with suicide; to obtain youth voice in this area and to understand it from their view; and, to gain a youth centered understanding on their needs to address it. This study incorporated a qualitative methodological, culturally sensitive framework to data collection and analysis. Findings emphasize the importance of learning from the experiences of youth and contribute to a contextual understanding of the issue in their words.

Exploring Trends in Gender Parity in Higher Education Enrolments 1970-2015

This paper explores trends in gender parity in higher education enrolments in OECD countries. One key feature of contemporary higher education systems is rising participation rates, fuelled to a large extent by a growth in female participation. While at a global level in 1970 the female rate was 60 percent that of males, by 2002 parity had been achieved. By 2013 there were more women than men in higher education (Clancy and Marginson, 2017: Table 2.4), albeit that the number of male entrants has not fallen. Recent evidence points to a new trend of a decline in the size of the female majority (Leathwood and Read 2009: 31; Clancy and Marginson 2017), a trend that, to date, has not attracted much attention from higher education scholars.

The Gender Parity index is one useful measure for capturing female participation and allows for trends to be captured and comparisons to be made between different national contexts. We divide OECD countries into three categories based on their score on the Gender Parity Index (GPI) in 1985: (1) Early Parity countries <1 (2) Later Parity countries 0.8-0.99 (3) Delayed Parity countries >0.8. We examine the extent to which system level features such as gross enrolment rate, distribution of enrolments by field of study and sex segregation by field of study are linked to scores on the GPI. We also explore whether features of the gendered labour market such as female labour force participation and pay inequalities explain differences in GPI scores. We critically evaluate the relationship between gender parity in higher education enrolments and issues of gender justice. Attention is paid to how variations in gender role attitudes and welfare regimes help explain both GPI trends, and differences within and across early, later and delayed parity countries.

Critique, (Unconscious) Bias, and Saving Face: Gendered Talk and Performance in Higher Education

In the sociology of design, a field that investigates the objects and processes of design (from buildings and consumer products to fashion and visual communications), it has become widely accepted to analyze the conversations that occur within professional and pedagogic contexts. Such scholarship often uses methods associated with the micro-sociological approach of Conversation Analysis (CA), to produce studies that investigate the social interaction that occurs in meetings between designers and clients or between professors and students in design education. This paper draws upon such methodological perspectives to investigate University-level product-design education and in particular the social situation of 'the critique', wherein students publicly present their work for discussion by their instructors and fellow students. Through an examination of transcripts we show how a critique that involves a professor and a group of students indicates a gender bias wherein the male instructor only invites male students to verbally assess the design work of other students. However, when the transcripts are also accompanied by frame-by-frame images of the setting, it is apparent that, while the male students are overtly being asked to talk, the female students somewhat covertly resist speaking through non-verbal behaviours such as gesture, posture, and gaze direction. Through an analysis that considers the verbal and non-verbal aspects of this interaction, alongside the instructor's face-saving requirement to impose upon students to speak (in order to perform the class), we demonstrate how unconsciously gendered talk in pedagogic settings may emerge within the complexities of relatively straightforward moments of social interaction. This paper has implications for considering how gendered practices in higher education (particular in programs that include assessment through the performance of relatively informal conversation) can occur and continue through following tacit norms of social behaviour.

Appnography: Queering Digital Ethnography for an App-Based World

More than 3 million users log in to Grindr daily (Grindr, n.d.) and more than 10 billion user matches have been made on Tinder (Tinder Inc., 2017). Though relatively new to the technological scene, geo-social networking applications (GSNAs) like Grindr and Tinder have quickly become a locus in the social lives of their users. Despite their prevalence, however, relatively little work has examined their implications for users and social cultures (especially beyond sexual minority men). This dearth of research on GSNA use belies the many rich opportunities for novel theorizing and insights into human behavior that we believe GSNAs offer. To address this lack of research, we draw on queer theory to inform our articulation of *appnography*, a new digital ethnography that eschews a digital/"real" divide and is a robust and appropriate way to undertake the study of GSNAs.

Borrowing from Pink and colleagues (2016), theories on the multiplicity of subjectivities (Pavlidis & Fullagar, 2013) and the queering of digital spaces (Keeling, 2014; Lupton, 2015), we argue that an appnography of GSNAs must: (a) incorporate the many ways users intersect and interface with the digital; (b) be transparent and reflexive about the how and why of the appnographic project, and the communication with and involvement of participants; and (c) acknowledge the non-centrality of the digital spaces or media objects within the appnographic study, recalling the intersections of individual, social, technological, personal, and public that interpolate the user. We explore these elements of appnography from a queer theoretical perspective as we seek to understand (a) the overlay of physical and virtual spaces, exposing the false dichotomy of digital/"real"; (b) user profiles; and (c) the digital space and place of GSNA interactions. This exploration will create a set of guideposts others can utilize when planning and conducting appnographies of GSNAs.

Negotiation and Development of New Intimate Relationships in Later Life

Contemporary family theory proposes that late modern relationships are guided less by external norms and more by internal negotiation between equal partners. This insight is often lost in research about intimacy in later life. The purpose of this paper is to study the initiation and development of new intimate relationships in later life, with a special focus on negotiation and change. The study is based on relationship histories from qualitative interviews with 28 persons, 63-91 years, who have established a new intimate cross-gender relationship after the age of 60 or who are currently dating singles. Interviews were analyzed based on the principles of analytic induction. The results illustrate the paradox that while relationship ideals often seem fixed and unchangeable with regards to prospective life changes, actual relationship arrangements often appear very open and changeable when described in retrospect. LATs recall having been determined not to initiate any new relationships, cohabitants to retain their own home, remarried informants never to marry again. The analysis unveils the negotiations leading to relationship change, and the issues that typically have to be resolved. We discuss and question prevailing implicit assumptions about older people's relationships as non-negotiated and unchangeable.

Patterns of Inequality: a Social Psychological Perspective

Abstract

This review paper examines the various patterns of inequalities from a social psychological perspective. Inequality is a social-psychological phenomenon that cut across all societies and all social spheres; to a very large extent, inequality affects the adequate functioning of the society. Over millennia, as society evolved, the patterns of inequality have also eaten deep into the society. This paper investigates its universality and variability, the forms that it takes and the unique features of inequality processes across social entities. It revealed that growing inequalities may be socially and psychologically disruptive, not just within a country but beyond national and global boundaries. Consequently, social inequality cannot be exterminated in any society and it recognizes the power of economic and political elites to preserve an inequitable status quo. Inequalities among people are inevitable because people are not born with the same abilities, attitudes and emotions; hence they occupy different social statutes and have different life

chances. The advantaged people enjoy an inordinate share of income, wealth and other valued resources while others struggle. Valued resources and desired outcomes are distributed unevenly in such a way that people have unequal amounts or access to the basic necessities of life. Hence, to achieve relative equality, it entails the removal of various barriers to human capabilities, freedom to acquire quality education, access to quality health care and livelihood.

The Multi-Dimensions of Religion on Contraceptive Use in Nigeria

The correlation between religious beliefs and use of contraception vary from one country to another depending on how homogenous a country is. This paper seeks to understand the varying dimensions of religion on contraceptive use in Nigeria through individual beliefs, community practices and state or country of origin. The belief system of people in any given society determines the level of contraceptive use and its effects on fertility rate. Religiosity continues to play a non-trivial role in reproductive outcomes; more religious people usually have higher fertility and lower contraceptive use. In today's sub-Saharan African settings, this burgeoning religious diversity and a correspondingly large role that religion plays in everyday life create conditions for a strong influence of religion on demographic and specifically reproductive behavior and outcomes. Fertility rates are higher in Africa than in any other major region of the world; consequently controversy surrounds the likelihood of these rates declining in the near future. Based on literatures reviewed, it can be concluded therefore that there is sufficient evidence that religious beliefs and practices have an influence on contraceptive use in Nigeria. Christians are more likely to use contraceptives than their Muslim counterparts. The study also shows that other factors that influence use of contraception include education and occupation of women, number of living children and region of residence. Efforts to increase contraceptive usage in Nigeria should target religious leaders and put more emphasis on raising the status of women and promoting region specific programmes.

Neglected Aspects of Triangulation in Nigerian Social and Behavioural Research

This paper examines five central aspects of triangulation and observes that only one of these has received adequate attention and development in Nigerian social and behavioural research. These aspects of triangulation are, in order, data collection, analysis, presentation, explanation and reporting. I have represented them in the acronym *Data CAPER* to describe the logical and chronological sequence in which the generation and use of empirical data moves. As processes, they complement the conventional structural focus on triangulating individual personnel, mixing methodological approaches (whether within or across methods), synthesizing theoretical frameworks, and contextualizing data (in recognition that they reflect the time and place in which they are collected). The failure to apply triangulation to these dimensions has profound implications for the veracity of results, the policy trustworthiness of sociological research findings, and how far such findings capture the comprehensive nature of social phenomena. The paper suggests that the confinement of triangulation to data collection, as is the common practice, raises considerable epistemological doubt because such restriction implies that the other components of the research process do not, or should not, follow the laid down principles, logic and procedures of the mixed-methods approach. A case is made for the application of triangulation to the various phases of research with equal consistency, commitment and rigour, and as the dialectical means of embodying the micro-macro dynamics currently reshaping scholarship in the field practices and epistemologies of contemporary sociology.

Cultural Consumption in a Globalized World : From Omnivorism to Cosmopolitanism

Subject to wider and wider global diffusion, cultural products today are increasingly consumed by audiences that are geographically distant from their sites of production, and that are moreover at times unfamiliar with the specific aesthetic and cultural codes being disseminated; this is especially true for young people's cultural repertoires. This presentation seeks to examine how young people engage with the globalization of culture from a cosmopolitan perspective, i.e. by putting at test the post-national dimension of cultural consumption. We

shall draw on a French survey (N = 1,605) that was designed to describe how young French men and women (aged 18 to 29 years old) consume widely circulated international cultural products and subsequently structure transnational artistic and cultural imaginaries for themselves. Even if this form of aesthetic and cultural cosmopolitanism is socially stratified, it appears so widely shared among young people that we must reconsider the distinctive effect of 'good taste' in a post-national frame. First, with regard to the scale of consumption: although the Bourdieusian concept of 'good taste' applied to a national framework has been amply discussed (Lamont and Lareau, 1988), the notion of cosmopolitan 'good taste' seeks to encompass consumption at a larger scale. Second, with regard to the use of this 'good taste': Bourdieusian 'good taste' applied to a small segment of society that was highly educated and characterized by its penchant for distinctive artworks (such as operas); it thus served as an intra-national social marker (Bourdieu, 1984 [1979]). Third, the cosmopolitan 'good taste' takes into account a new shift after omnivorism, in a context of proliferation of cultural lifestyles.

CICCHELLI, VINCENZO* (*Gemass Paris Sorbonne/CNRS*)

The Cosmopolitan Amateur : Understanding the World through TV Series and Movies

This presentation describes the logic of the reception and appropriation of cultural products by proposing a new figure of the consumer in the era of globalization: the cosmopolitan amateur. We shall focus on how individuals develop an aesthetic relationship to the world based on the myriad interactions with the fictional Otherness through consumption and imaginaries, stemmed from the consumption of foreign TV series and movies in France. This new figure of consumption is deeply linked to the rise of the capitalistic dimension of emotion (Illouz, 2006), the addictive capitalism (Amselle, 2013) and of "creative capitalism" (Lipovetsky and Jean Serroy, 2013). Focusing on reception allows to go beyond what producers and programmers of global cultural industries had intended (Lessig 2008).

We present the narratives of French young cosmopolitan amateurs (N=80, 18-29 y.o.), who use foreign TV series and movies to hone their relationship to the world, acquiring cognitive and emotional skills, albeit not always coherently, in an iterative and reversible fashion. We shall focus our attention on how these various forms of reception help young people to decipher the world, to orient themselves in a global world seen as a cultural mosaic, to reconsider their local/national belongings. We highlight three mechanisms: feeling, reasoning and negotiating the world, which derives from the process of *mise en genre* that entails the categorization of cultural products according to their national origins and their attributed aesthetic characteristics, a process that sometimes operates based on clichés and stereotypes. Cosmopolitan amateurs do not boil down to a coherent structure, but rather compose, with bits of knowledge, a kind of textual 'poaching' (De Certeau, 1990, Jenkins, 2002) that challenges linear, cumulative and organized patterns of learning and understanding.

Continuing Success of Females Towards Management Levels in Project Management in the Construction Industry

Over the past decade the construction industry and further the project management sector has been predominantly male oriented. This gender disproportion has decreased over time globally but remains stagnant in South Africa. The way we work, how we define and express ourselves reflects the formal workplace based representation of the individual within their work environment. It further shapes the goals and aims of the person. In order to reflect these aims and goals identity work at work and at home, operating through a negotiation process can be identified as an action-based solution. The process allows for individual based barriers to be identified and solutions formed through identity work strategies. This input-output process allows for tailored solutions that individuals use on a daily basis at home and at work. In order to gain a better understanding of one's workplace, a consideration of the individual's role within the organisation, in relation to their internal and external co-workers needs to be identified and used for self-regulation. Regulation relates to the identification, analysis and regulating of one's identity/work identity in order to better one's current and future state. Conceptual models are formed through the input-output process of barrier vs strategy. Qualitative data collected is used to gauge the applicability from theory-based strategy to practice in South Africa. A goal-based conceptual model is recommended for analysing individual barriers and thus regulating their identity in the practical project management environment within the construction industry.

MONYATSI, GERALD (North West University)

South African Sport: The Rugby Franchise System, and Emerging Soccer Unionism**South African Sport: The rugby franchise system, and emerging soccer unionism**

Kiran Odhav, Sociology, Mafikeng campus, North West University, South Africa, kiran.odhav@nwu.ac.za

Gerald Monyatsi, Sociology, Mafikeng campus, North West University, South Africa, 16479726@nwu.ac.za

The paper examines two most popular sports in South Africa, that is, rugby and soccer, by providing a background on the history sports in South Africa.

The first part describes and analyzes its rugby, a recently corporatized finance system emerging almost overnight out of a 100-year old amateur and voluntary system. In this changeover, problems arise, of contradictions and fissures, alongside the development of rugby as a highly specialized field but with franchise power, particularly in the top rugby clubs. Thus one top club, monopolistic as it is, recently faced bankruptcy, even as an iconic club. The drive to gain black fans may be due to such bankruptcy. In sum, the role of rugby franchises in this scenario is analyzed, and what are the possibilities and problems of professional rugby in the new political dispensation.

The second part focuses on South African soccer, to outline an emerging unionism in professional football. Player unionization has been relatively neglected by industrial sociologists. Professional player unionization in South Africa began in 1997, with the formation of the South African Football Players Union (SAFPU). Prior to this, professional football players have always been at the mercy of their employers, that is, club owners who would take unilateral decisions on matters pertaining to players' contracts and the like. This section seeks to focus on particular issues that relate to players' rights and their playing conditions, of aspects relating to contracts and development, and to the kinds of avenues that are open (or are being opened up) and if these are being fully exploited by some players in the Professional Soccer League (PSL).

ODOK, GODWIN* (Department of Sociology, Federal University, Dutsin-Ma, Katsina State, Nigeria)

Schooling and 'Learned Helplessness' in Northern Nigeria

Education largely reflects that aspect of culture that seeks freedom as well as facilitates survival, wealth creation and retention. Within northern Nigeria, western education (Boko) is conceived to have served in imparting wealth creation and earning ability to children of the sarakis and alkalis (aristocratic class), excluding children of the talakawas and mallamis (commoners). In this way, children of the aristocratic class receive a kind of instruction in certain 'schools' that enable them climb the social and economic ladder over and above their peers who have a different kind of education in 'almajiri' schools that diminishes their social capital and bequeath an estate of 'learned helplessness' (insufficiently preparing students to gain skills that help them change their 'circumstances' of modern life). Adopting an ethnographic research design consisting of archival investigations, interviews, oral tradition and life histories in Katsina State, the paper examines the social processes of social inequalities within northern Nigeria. The paper concludes that many improvements can still be made to influence social, economic and political processes within northern Nigeria to serve the interest of the majority of the people when almajiri school administrators incorporate critical-life-skills acquisition and self-esteem building subjects that deliver basic skills in reading, calculating, thinking and communicating into the almajiri school system.

English Language in Public Space - between Inclusion and Social Exclusion. Pilot Studies in Poland and Portugal (STUDY SPONSORED BY NATIONAL SCIENCE CENTRE, POLAND, Grant NO: 2017/01/X/HS6/00316)

The empirical study is socio-educational and not a linguistic one. It focuses on citizens' perceptions of English language expansion in Europe and also in their own country. It looks for meta theories concerning access and social environment. The preliminary study is funded by the National Science Centre (Poland) and encompasses the Warsaw and Lisbon area. Poland and Portugal incorporated English language into their educational system at a similar time. The main research questions are:

- how is English is perceived by different social groups?
- who learns English and why?

- in which circumstances or places is English used in Poland and Portugal?
- is the expansion noticeable and how is it perceived?

In the introduction it will be discussed how widely spoken English is in Europe, with a time scale showing the gradual expansion (visible in age cohorts). The expansion of the English language will be analyzed as a 'governmentality' strategy of neo-liberal political elites. It will be argued that for middle-class and working-class people, the English language has become a prerequisite of social inclusion in the world of globalized economy and globalized science. Piketty's "Capital" (2013) outlines the problem of the center and the periphery of the US-centric and therefore English speaking, global economy. The discussion will be embedded in critical theory, with particular emphasis on the works of Michel Foucault, who questions the 'reasons' we use as rational beings and asks about the risks of our rationality. This question may be applied to the rationalization of learning English. Moreover, Foucault's concept of bio-power, advanced by James Marshall's (1995) "busno-power" and Louis Althusser's (1976) interpellation concept (*interpellator*) will be married with Pierre Bourdieu's ideas of social reproduction through education practices.

Community Engagement and Building Institutional Resilience: Exploring Quarantine Ethics, Social Processes and Options for Nigeria

The burden of infectious and parasitic diseases in Nigeria is high. The outbreak, in recent years, of Ebola, Lassa fever, and Meningitis among other diseases is a signal that more outbreaks are on the horizon and Nigeria's health system must adequately focus on building strong communities and institutions. In conjunction with effective health surveillance and contact tracing, quarantine remains one of the few effective ways to arrest disease outbreak. Among health workers and community people, there is an aggregation of unwholesome experiences which increases vulnerability. The paper examines the use of force; post-quarantine labeling/stigmatization of health workers and quarantined persons; problems of social re-integration; and class discrimination in quarantine administration. The paper adopts Arjen's Theory of Planned Behaviour. Through a review of literature from 2000 to 2017, using databases (PubMed, CINAHL Plus and the Cochrane Library), the paper develops narratives on themes such as: social class disparities, appropriateness and scope of quarantine, use of experimental drugs, and the ethics of coercion. This study provides new ways for implementing quarantine within culturally acceptable contexts. This will provide local solutions to the challenges of- how quarantine is set-up, administered, and managed in Nigeria.

Contemporary Practices of Social Innovation: Collective Action for Collaboration**Contemporary practices of social innovation: collective action for collaboration**

Peter Oeij, Steven Dhondt, Wouter van der Torre & Karolus Kraan - TNO (Netherlands)

A large-scale international project 'SI DRIVE: Social innovation, driving force of social change 2014-2017', collected more than 1000 cases of social innovation across the globe in seven policy fields: Education, Employment, Energy, Transport, Poverty, Health and Environment (Howaldt et al). From those 1000 cases 81 were selected for in-depth case study. Our purpose is to contribute to the mapping out of the innovation landscape: how are these social innovations developing; is there a resemblance with the 'innovation journey' (Van de Ven et al) of innovations in technology / business?

Social innovation exemplifies experiences that are developed in the field of mutual aid and solidarity, and stress social value rather than economic competitiveness. Part of social innovation are initiatives of individuals / communities, of private entrepreneurs, of public organisations, and of combinations of those. Over time they may become either fully private, public or a public-private partnership.

The innovation journey is a process model that makes a distinction between the initiation, developmental and implementation / termination period of inno-

vations; it looks at drivers and barriers, like innovation managers, investors, set-backs, adaptation, infrastructure. We operationalise this model, its periods and variables and apply it to the process of social innovation, to gain insight in the dynamics of these rather new practices of (social) innovation and in the character of collaboration between actors.

Identification As Power, Body As Risk but Resource: The Colonial ID Systems Applied to the Neoliberal World

Surveillance systems today are massive and individualistic, identifying the population as individuals, accumulating data on an individual basis across spheres, and tracking individual movements physically and virtually. Identification (ID) is central to today's formation of power politically and economically. Among ID technologies, biometrics is seen and spread as the ultimate identifier of the 'truth'. The body is targeted as the final evidence of self and the original source of data in both markets and security systems.

Although the ID technologies found the best opportunity to proliferate in the ongoing 'war on terror' since 2001, the modern origin to govern individual bodies can be traced back to some basic institutions: the nation-state, bureaucracy, capitalism and colonialism (Weber 1946, Marx 1976, Foucault 1977, Lyon 2009). Among them, biometrics shows strong connection to colonial governance, as fingerprinting was invented in British India and applied to South Africa (Cole 2001, Breckenridge 2014). In Northeast Asia, Japan issued fingerprinted ID cards to identify the Chinese population when occupying Manchuria, northeast China, in the 1920s-1945.

The Manchurian ID systems performed dual tasks: preempting potential rebellion among the local Chinese and using them as cheap labour power for the empire. Their bodies were treated as *risks*, as source of resistance, but profitable *resources*, by the colonizers. Colonial ID systems classified racialized bodies for both exclusion and inclusion. The dual characteristics are theoretically framed by biopower (Foucault 1978), the state of exception (Agamben 1998), and necropolitics (Mbembe 2003). The same purposes are still alive with technological enhancement in the postcolonial, neoliberal world, for preemptive surveillance and proactive profit making. Japan's Manchurian ID systems reveal the political economic origin of ID systems that manage to force and cajole oppositions to work in unison and to make them serve the same reality in concert (Bauman and Lyon 2013).

Migration and Care between the Philippines and Japan for the Past 40 Years: Analysis through the Lens of Intersectionality

This paper will give an overview of the interrelated nature of care and migration between the Philippines and Japan for the past 40 years, and will explore how national policies of care and migration in these two countries have created gender and class-specified migration. This paper will also argue the "familiar" consequences of this flow of Filipino women to Japan: the existence of Japanese Filipino Children (JFC) and their relationship to the Japanese state.

Since the 1970s, Filipino women migrated in different ways to Japan, which has been refusing to accept so-called "unskilled labor" from foreign countries. First, women entered Japan as "entertainers" and worked as hostesses at night clubs for Japanese male customers. Many of those women got married to Japanese men and created their own families in Japan afterwards. They offered care work as "wife" within the Japanese family. Nowadays, more and more Filipino women engage in different types of "care" for elderly people in Japan as a profession.

Simultaneously, JFC, as "born out of place" offspring of migrant Filipino mothers and Japanese fathers, began to come to Japan as migrant workers in the care sector. The existence of JFC mirrors the intersectional discrimination in Japanese society; they were born as a consequence of the inequality based on gender and ethnicity between the Philippines and Japan, then they were ignored by the Japanese state, and now they have begun to be exploited as "unskilled labor". This also reflects the nature of the Immigration Control Policy of the Japanese government which has been clinging to its restrictive principle, in a complex way.

This paper will provide an overview of the evolution of migration between the Philippines and Japan to explore how the feminization of migration and "care" in Japanese society have been interrelated across state, market and family dimensions.

Corruption & the Escalating Boko Haram Insurgency in Nigeria's Northeast

Till date, defenceless Nigerians have continued to die under attack by Boko-Haram insurgents despite promises by the present Buhari's regime to end insurgency in its first year in office. Are these terrorists more tactful than Nigerian Army that is renowned for being exceptional in peace keeping mission within the African continent?

The arms deal scandal involving the immediate past NSA Sambo Dasuki and other charges of corruption against Let-Gen. Ihejirika (Rtd.), Let-Gen. Minimah and Chief of Defence Staff Alex Bade speaks volumes of the height and depth of corruption in Nigeria especially within the Military that is charged with the task of ensuring that peace is restored to the most populous African nation after Boko-Haram's invasion of its territory. There no doubt that these highly placed officers and other Nigerian elites used the fight against insurgency to enrich themselves' at the expense of the country. For Vice President Osibanjo, \$15 billion was lost in an arms deal that was marred by fraud. For Katherin Dixon of Transparency International - "corrupt elites have profited from the conflict in the northeast and driven Nigeria to a crisis point."

What is the place of corrupt practices in the failure to win the war against Boko-Haram? Corruption has a multiplier effect and has been the reason Boko-Haram insurgency has continued to escalate in a disappointing manner. This paper which is solution based, seeks to give an insight into some of the corrupt practices perpetrated by those charged to fight insurgency in Nigeria and how deliberate effort at ending institutionalized corruption, making the welfare of soldiers a priority and qualitative training programs will contribute in no small measure in ending the armed conflict ravaging N/E and by extension, other neighbouring Africa nations in the past 9 years.

Victimization & Stigmatization of Newcomers: Approaches in Handling Female Genital Mutilation in Canada

Female genital mutilation (FGM) is an important human rights and health issue in both Canada and Africa. The Canadian government has made efforts towards eradicating this practice by making it a criminal offense, a solution popularly used in Africa as well. Despite the efforts made by governments, law enforcement, along with international human rights organizations, female genital mutilation persists among African immigrants living in Canada and is still practiced by some in Africa. Canada has become the home of refugees and immigrants from African countries (Gutbi 1995). According to the 2011 Census, there were over 766,000 people of various African origins in Canada, mainly in Ontario, Quebec, British Columbia and Alberta (Statistics Canada 2013). Even though a large majority of female genital mutilation is of African origin, it has become an issue of concern in Canada according to Society of Obstetricians and Gynaecologists of Canada (SOGC) (Kielburger & Kielburger 2013, FORWARD 2002-2014). Some Africans who have undergone the practice or who come from communities where it is accepted, still subject their daughters to the procedure despite their intention to live in Canada long term. This poster presentation aims to address the question; **Has the Canadian attitude towards female genital mutilation been effective in addressing the challenges and experiences of African immigrants and their families in Canada?**

Social Relationships and the Mental Illness Experiences of Pregnant Nomadic Fulani Women in Southwestern Nigeria

Residential pattern of the nomadic Fulani and conflicts between them and their host communities in Ibarapa Central Local Government Area of Southwestern Nigeria has been widely reported. However, there is dearth of empirical data on how their residential pattern and conflict serve as drivers of mental illness among Fulani pregnant women. Hence, this study assesses the perceived sign of mental illness behavior, factors influencing the behaviour and the influence of social relationships which reduced or complicate the behavior of the pregnant women.

Biopsychosocial model of mental illness was adopted by this study. Non-participant observation and 20 in-depth interviews were conducted with pregnant women purposively selected through snowballing technique from five Fulani settlements. Data collected was transcribed and content analysed thematically.

Mental illness experiences among the pregnant women were on the negative extreme similar to signs of being sober, withdrawn and moody. Factors influencing these behaviors include financial challenges, cultural and language barriers inhibiting free interaction with people of other ethnic group and lack of access to public health services. Strained relationships between the Fulani and their host communities partly due to incessant conflicts further exacerbate their negative reactions to others relationship. On the other hand, segregated residential pattern of the Fulani strengthened their ethnic bound and enhanced social networks that pitch them against perceived outsiders. Their negative attitude hinders effective maternal and child health care services provision to the them.

The Fulani's lack of harmonious relationships with their host communities endangers exhibition of anti-social behavior which sometimes get to the negative extreme.

Hate Speech and Oil Politicking in the Niger Delta

The discovery of crude oil in Nigeria is one that has further buttressed the paradox of the 'resource curse hypothesis' which implies a negative association between natural resource-abundance and economic growth, that is, a situation where a particular region is rich in natural resources but ironically lacks the economic and social development that should be synonymous with such area. This discovery is said to bring untold hardships to the people of the region where it is discovered more than blessing. Competition for oil wealth has fueled violence between ethnic groups, the government and International Oil Corporations (IOCs) operating in the region resulting in the militarization of nearly the entire region by ethnic militia groups, Nigerian Military and police forces. This militarization is said to have led to protests and agitations against the government and IOCs and by extension other ethnic groups also giving rise to several layers of voices of discontentment which has been described as hate speeches. This paper interrogates the appropriateness of the labeling of public addresses by ethnic group as hate speeches and the politics involved in oil exploration in the Niger Delta.

Oil Spillage and Internal Displacement in the Niger Delta

The Niger Delta is a region endowed with natural resources and is a location of massive oil deposits which have been extracted for years by the government of Nigeria in collaboration with International Oil Corporations (IOCs). The exploration of crude oil and its transportation is said to present social problems, leading to environmental degradation, the violation of human rights and internal displacement of the locals as their farm lands, water ways and houses are affected by oil spillage. Internal displacement resulting from the exploration and drilling activities of the IOCs operating in the Niger Delta has become an issue of topical concern, due to the human tragedy, insecurity and conflict associated with it. The theme that dominates discussions on internal displacement at global and national levels is oil spillage-induced displacements leading to conflicts and massive migration to the urban areas. The objective of this paper is to bring into focus, the linkages and challenges between oil spillage during crude oil exploration and transportation; and internal displacements in the Niger Delta. The framework of analysis sees displacement as a definite social condition that diminishes individuals and group capacity to pursue interests that may or may not involve relocation. The study concludes that oil spillages have diminished the productivity of Oil Producing Communities, resulting to occupational and income losses that set in both voluntary and involuntary migration.

Physically Challenge People's Accessibility to Productive Resources: Dream or Reality: A Case Study of Southwestern Nigeria.

Inequality in distribution of productive resources has adverse effect of sustainable livelihood for Physically Challenge People (PCP). This study assess Physically Challenge People's access to productive resources such as ownership of land, livestock or other agricultural resources; management of agricultural resources; use of financial services and other inputs for agriculture; access to education, knowledge and skills related to agriculture; and participation in

agricultural labour activities, social service and health. Specifically, the study examine PCP access to productive, constraints to PCP access productive resources and propose effective strategy to address the constraints.. One hundred and five respondents that belong to physically challenged associations were interviewed through the use of structured interview schedule. Data analyses were carried out using frequency counts, percentages, mean, standard deviation and correlation. Results of the study shows that more males were found in this category compared to females, and they were of productive age. Majority was illiterate and relevant pieces of information were sourced from relatives and friends. All the PCP claimed that access to productive resources were of necessity for sustainable livelihood but in real sense it has turn to ordinary dream. Most of the PCP claimed that the productive resources such as education and information, training, appropriate technology and social welfare were not provided and those one provided were inadequate. Positive and significant correlation exists between PCP access to productive resources and socio-economic characteristics such as education and income source of information at $p \leq 0.05$. In conclusion, there is the need to create enabling environment through provision of adequate productive resources in order to make life meaningful for PCP.

OĞUZ, MELIS* (*Beykent University*)

Perception of Safety within Paratransit Systems: The Case of Minibus in Istanbul

Fears and concerns about personal safety are important factors in the travel preferences of passengers. The preference of certain travel routes or stops for certain time intervals is a critical indicator for transportation planning. As a matter of fact, according to the results of the survey on fear of crime conducted by Tandoğan and İlhan in 2016, 56.7% of the participants stated that they were afraid of metro stops and public transports especially during the late evening and when traveling alone. Taking measures to ensure that passenger safety concerns are eliminated or reduced, it is expected that the daily temporal distribution of the demand for public transport will be balanced and quantitatively increased. Reducing the number of passengers using private cars on certain routes and during specific time intervals due to security concerns, increasing the freedom of travel preference for non-car owners as well as for non-car-prefering passengers should be among the policy goals of every democratic city.

The informal system sometimes fills the gaps that are left by the formal system. It even becomes a part of the formal system, in circumstances when the formal cannot keep up with the emerging demands and/or is not prepared for the changes in the social and urban structures. As informality provides a solution for the lacking services, it may be tolerated for a short term or overlooked broadly. The aim of this study is to comprehend the features of the informal public transportation system, particularly the minibus system in Istanbul, which has a great share in the public transportation of this metropolis. It is crucial how such a paratransit system becomes part of the formal transportation network and why it is demanded highly by urban residents despite all of its un-reliabilities and weaknesses in terms of safety and security.

OH, INGYU* (*Kansai Gaidai*)

Globalization and Income Inequality in South Korea: The Sweeping Land Reform and Inequality during Rapid Globalization

Along with Japan and Taiwan, South Korea prides itself on the low GINI coefficient it has maintained during rapid economic development due to the sweeping land reform. In addition to the rural bias with its infamous income redistribution policy that tried to balance the widening urban and rural income gap, the sweeping land reform allowed landowning farmers to invest large sums of private funds in education for their children. However, behind the veil of the low GINI coefficient in South Korea was the burgeoning class differentiation of people according to their home regions, gender, and occupational classifications due to the rapid urbanization that commenced from the early 1970s. The ensued globalization since the 1990s further reinforced income inequality between urban and rural residents on the one hand and between affluent and backward regions on the other, including the usual class polarization in urban areas. Status distinctions through global educational credentials also emerged for the first time through the globalization of educational opportunities. Nonetheless, the overall GINI coefficient for South Korea is substantially lower than other emerging markets, while it is close to the OECD average without any comparable OECD redistribution policies. This study investigates the enduring impact of the sweeping land reform and the rural bias in South Korea on its widening inequality due to urbanization and globalization. This study argues that the land reform and rural bias are not easily found in Western societies, as they together produce unexpected consequences of persuading people to invest more in education than others (i.e., equalizing effects), although educational fervor induces stiff competition among educational attainments in the job market (i.e., differentiating effects). The paper then discusses suggestions for future improvements.

RC27-499.4OHHASHI, MITSUNORI* (*Kurume University*)*A Comparison of the Japanese Sports Blogosphere and Newspapers*

The purpose of this study is to examine the influence of online and traditional media sports coverage by comparing the content of blog posts to newspapers. Previous internet-based studies have demonstrated research significance, however, the research has not examined the convergence of the "virtual" and "real" user experience (Millington and Wilson, 2010). Additionally, Meraz (2009) pointed out that further study is needed to analyze "traditional-media-to-citizen media influence." Drawing from the content analysis of daily newspaper and sports blog coverage of a Japanese high school baseball tournament, this study focuses on the virtual sports context. The online coverage of a Japanese high school baseball tournament was identified in sports fan blogs. The blogs, *Sportsnavi plus*, were published on *Sportsnavi.com*, a sports fan website which includes more than 100 sports articles. Blog posts were analyzed and compared with issues of the newspapers *Asahi* and *Yomiuri*. The analysis showed that most blog posts referenced information from the newspapers as primary sources. The bloggers added very few of their own opinions and were rarely offensive or critical. Most comments to replies were agreeable in nature. These findings indicate that bloggers for Japanese sports do not feel free to post their own opinions and might limit opinions to individual messages. Although other research shows that some bloggers insert their own opinions in the blogosphere, the results of this study indicate that bloggers may not post their own opinions or critiques for fear of alienating readers. Previous studies have shown a strong influence of blogs in a political context, but the results of this study suggest that sports blogs have little effect on public opinion. The analysis suggests that bloggers can find more valuable content to post at sports fields and stadiums, therefore future research should focus on the "authentic voice" for sports websites.

RC05-108.5OHTSUKI, SHIGEMI* (*Tokyo Metropolitan University*)*Factors Shaping Inter-Ethnic Interactions in Suburban Tokyo: The Perspectives of Japanese and Migrant Residents*

Global mobility is on the rise and Japan is no exception. Due to its shrinking and aging population, Japanese society, characterized by a high degree of ethnic homogeneity, is faced with a massive shift toward accepting immigration. In particular, in contrast to the way in which the central government has been reluctantly moving forward with immigration for economic reasons, local governments and local communities have increasingly focused on the role of immigrants as community members. Thus, the promotion of interaction between Japanese and immigrant residents has become a significant challenge for community-level multicultural policy.

This study examines the factors shaping inter-ethnic interactions from the perspectives of both Japanese and immigrant residents. The uniqueness of this study lies in its use of data from a quantitative survey of both majority and minority group members living in the same region. The survey was conducted in 2015 with Japanese (N=6000) and foreign national (N=892) residents of Hamura City in the Tokyo Metropolitan Area. The proportion of foreign nationals in Hamura City is approximately two percent, which is higher than that in Japan as a whole. In addition, Hamura City is known as an area of visible immigration, given its concentration of automotive and other manufacturing industries, as well as the US military base in a neighboring city.

This paper focuses on the factors that shape the interactions between Japanese and immigrant residents within a local community, and the results of the analysis point to the particular importance of the length of residential history, Japanese language proficiency, and building relationships with neighboring residents. Based on the analysis results, the paper discusses the possibility of multicultural policy for minority residents being promoted alongside QOL policy for the majority group.

RC34-627.3OINAS, ELINA* (*University of Helsinki*)*What Politics? Youth and Political Engagement in Africa*

This paper provides an introductory note to the anthology *What Politics? Youth and Political Engagement in Africa*, setting the analytical landscape for the chapters. It is emphasized that the notion of engagement serves here to examine the various stakes young people in today's Africa have in their present and future lives, and their personal and collective ways of tackling them. The volume underscores the importance of going beyond dualist accounts of youth by promoting empirical openness to what matters to young people as an aspect of change in their everyday lives. The paper outlines the contents of the book in three sections: 'Envisioning', 'Entitlement' and 'Embeddedness'. The section 'Envisioning' emphasizes creative agency and youthful aspirations for personal and collective autonomy, often through cultural expressions. The second section,

'Entitlement', highlights young people's efforts to claim and justify their pursuits of material justice and life chances in the future. The third section, 'Embeddedness', discusses youth participation in formal political arenas.

RC55-907.6OISHI, AKIKO* (*Chiba University*)NISHIMURA, TOMO (*Kwansei Gakuin University*)*Nonstandard Work Schedules and Their Effects on Mothers' Subjective Well-Being*

With the prevalence of '24/7 economy,' an increasing number of mothers across the industrialized countries work hours that fall outside of a typical daytime. Japan is no exception. Faced with the challenges of shrinking population, the Japanese government has been encouraging mothers to work long hours by increasing capacities of day care centers and relaxing employment regulations. This labor market trend has raised concerns about its potential impact on mothers' subjective well-being and life satisfaction because those who work nonstandard hours often find it more difficult to reconcile work and family responsibilities than those mothers who work only daytime. The issue is more important for single-mothers as they are more likely to work nonstandard hours than their married counterparts despite their being the sole earner and carer of the family (Li et al. 2014; Oishi 2017). Notwithstanding the growing concern over the prevalence of long working hours, there have been few studies that explicitly focus on mothers' nonstandard work schedules and their possible impact on mothers' subjective well-being. Thus, using longitudinal data set on mothers with children, we investigate how mothers' work schedules affect their subjective well-being and quality of life, by paying special attention to the family structure. Our research departs from existing studies in that we control for mother-specific fixed effects by utilizing a panel data.

RC28-519.3OISHI, AKIKO* (*Chiba University*)*Seeing the Unseen: High-School Students Who Work Part-Time*

With Japan's public spending on education being the lowest and its child poverty rate among the highest among the OECD countries, a number of high-school students face economic hardships. It is a well-known phenomenon that a substantial proportion of high-school students work part-time after school although their working conditions and family background have seldom been investigated in the previous research. However, the issue is important because part-time work may have detrimental effects on students' educational development by depriving them of time to study. There is also growing concern about student workers' rights because a recent survey from the Ministry of Health, Labour and Welfare reveals that more than 30% of high-school students who work part-time have experienced illegal employment practices (such as non-payment and forced overtime, harassment, etc.).

Using a unique survey of 2560 high-school students and their parents in Tokyo Metropolitan Area conducted in 2016, this study explores factors affecting students' decision to work by paying special attention to gender differences and socio-economic status of the family. Preliminary results are as follows: 1) female students are approximately 1.5 times more likely to work, and work longer hours than their male counterparts, 2) the poorer the student's household is, the higher his/her probability to work, 3) among students from poor families, male students are more likely to work to supplement their family income although their probability to work is lower than their female counterparts. Further investigation on gender differences will follow.

RC32-591.4OISHI, NANA* (*Asian Institute, the University of Melbourne*)*Transnational Care Migration of Women from the North: Au Pairs in Australia*

This paper examines the transnational migration of female domestic workers and caregivers from industrialized countries to Australia. In recent years, a growing number of young women from Europe (especially the UK, France, Germany) and Japan are now working in Australia as *au pairs* to take care of children and household chores for local families. Due to the lack of regulatory frameworks in care and domestic sectors, many of these women have fallen into exploitative working conditions. Their invisibility and isolation in private homes as well as the exploitative nature of short-term contract compound their vulnerability. While many migrant women from the South have access to pre-departure orientations in their countries of origin and other state and non-state assistance in destination countries, migrant women from the North receive little information or help in Australia. This study delineates the factors behind these young women's decision to take up low-paid and unpaid care work in Australia, and also the ways in which the cultural capital (especially language proficiency) of *au pairs* contributes to differential autonomy that they experience. By highlighting the crucial roles

that these women play in social reproduction in Australia, this paper argues for regulating the care sectors, re-assessing the working holiday visa scheme and introducing protective measures for all young women and men from exploitative employment practices in Australia and beyond.

Grandfathers As 'family Savers': Class and the Nordic Welfare State

Earlier studies on grandparenthood have noticed that in the context of the Nordic welfare state grandparents often act as back-up resource or 'family savers' in child care: they are ready to step in when needed, but usually not on a regular basis. In the Nordic childcare model, grandparents enable normal family routines particularly in emergency situations, such as sickness, that the public childcare and school system do not cater for. Based on interviews with 17 middle and working class Finnish 50+ grandfathers, we explore gendered and class-based features of the Nordic 'family saver model' from the perspective of grandfathers.

The Nordic countries are characterised by mothers' high labour market participation rates. Therefore our interviewees explained their active grandfather role in terms of pressures set by working life: the caring and assistance they provided was thus not only directed towards grandchildren but also towards their own adult children. The class-based grandfathering practices appeared to be systematic in our sample. Among working-class men these practices revolved around raising grandchildren in collaboration with the middle generation. For middle-class men, the grandfathering practices were based on their purpose to promote their own children's careers by taking care of grandchildren.

Our study shows that the Nordic welfare state is not flexible enough to meet the needs of many middle-class families whose work demands are set by global enterprises. Day care services cover only normal office hours, and therefore middle generations working in global businesses need help from grandparents. The notion from Anglo-American research, which points to grandparents' important role in rendering possible low-waged women's paid work, does not fully apply to Nordic welfare states. Rather it could be claimed that it is the welfare state which facilitates Finnish working-class women's paid labour through heavily subsidised childcare whereas grandparents' support is most needed for middle-class families.

The Employment of Wives and Income Inequality in Japan

The objective of this paper is to examine the kind of impact a wife's employment has upon income inequality among households, focusing upon employee households. Along with changes in household composition (the spread of the nuclear family and increasing numbers of single-parent households), a wife's employment pattern and her income impact upon the changes in income disparity among households in the same age-bracket.

The Equal Employment Opportunity Law was enacted in 1986 and revised in 1999. Its introduction is one of main factors that changed women's labor force participation. The employment rate of women has risen since bottoming out in the mid-1970s, and the numbers of women working as employees, including married women, have been increasing. Scrutiny of workers' households in the Labour Force Survey show that 'dual-income households' have come to account for half of all households since the beginning of the 1990s, and from the 1990s onwards, 'dual-income households' have outstripped 'full-time-housewife households'. Nowadays, 'dual-income households' accounts 60% of workers' households. These social circumstances imply the enlargement of wives' role to income inequality between households.

Using the Employment Status Survey data, the official statistics in Japan, from the seven waves of 1982, 1987, 1992, 1997, 2002, 2007 and 2012, we analyze two aspects of wives' contribution to household income. First, we reveal the change of wives' employment ratio based on husbands' income ranks. We expect that a difference between ranks has decreased during three decades. Second, we analyze the contribution of wives' income to income inequality between households based on the decomposition of the Gini coefficient of the couple's combined income into that of husbands' and that of wives'. Based on these analyses, we characterize the change of wives' role in income inequality in Japan.

Mobile Bodies: The Gender Performance and Migration Experience of Filipino Trans Women Entertainers in Japan

The growing visibility of Filipino trans women in media, politics, and activism happened after decades of struggles. One of their unique stories is how their work experience in Japan has mattered in this visibility. Although there has been scholarly works on Filipino entertainers in Japan that usually pertain to women,

there is absence of extensive literature on Filipino trans women. This study aims to contribute to understanding an understudied group of entertainers in Japan--the Filipino trans women or the transpinay, a portmanteau of "transsexual" and "Pinay" (Filipino woman). It recognizes how the flows of migration to and from Japan have affected their lives. This research explores how they engage in gender performance before their migration, post-migration, and when they extend their stay in Japan or become return migrants.

Using a qualitative approach to my research, I gathered data through participant observations, semi-structured interviews, and focus group discussions in Tokyo, Manila, and Cebu. The twelve interviews and two FGDs comprised questions related to their personal background, gender identity, visa and job application process, migration and work experience in Japan, romantic relationships, and personal beliefs. In the course of their narratives, a collection of perceptions regarding gender identity, performance, and mobility arose. The analytical lens focuses on how they as performers, migrants, and romantic or life partners negotiate gender and race both in their private and public lives. Mapping the journey of these transpinay entertainers in the 80s, 90s, and 2000s, I argue that their experiences in Japan as transpinay migrants have affirmed their gender identity and strengthened or weakened their sense of belonging to the Philippines where transgender visibility and activism has drastically changed over the years.

Foreign Language As the Medium: How Japanese People See English Language and How This Relates to Globalization

In the age of globalization, English has become an indispensable common language across the world. This has led many people to worry about cultural, or linguistic, imperialism. Do we have to speak English just like native English speakers? Or is Google translation enough for global conversation? A common language of the world should acknowledge and embrace every local culture, thought and language, but how can we do this? To answer these questions, it is necessary to regard foreign languages not just as transparent means of communication, but as "media," which have their own depth and influence communication and the people involved. Many media, such as written language, money, telephone and the Internet, once existed outside our life and then gradually permeated into our society, where they shape up how we communicate with each other. Media are, however, not the mighty driving force of social change. Their function depends on how people recognize and use them. Foreign languages are no exception. They penetrate into societies through certain social configurations but, at the same time, transform themselves through negotiation between local people and political and economic power structure. After Marshall McLuhan's famous saying "The medium is a message," we can say "English is a message." So what is that message? In Japan, one such dominant message is "individualization." English language in movies, textbooks and songs tacitly requires audience to be an autonomous and independent person suitable for globalization. English language education has been a controversial issue for decades, but oppositional codes (Stuart Hall) against such message are not clearly seen in Japan. One possibility would be that people keep distance from English and separate their mind from the message. The sense of distance may play an important role in the negotiation process of encoding/decoding of the message English language delivers.

How Can We Secure Commons of Information?: A Consideration on Lawrence Lessig's Argument on Commons and Innovation

In the age of so-called information society, the protection of intellectual property rights is becoming increasingly strong. One of the greatest opponents of this trend is cyber-law jurist Lawrence Lessig, who argues that too much protection of intellectual property rights can suffocate creativity and innovation.

Lessig's argument is based on the distinction between commons of rivalrous resources and those of nonrivalrous (i.e. informational) resources. The former was the main theme of "the tragedy of the commons" presented by biologist Garrett Hardin, where resources should be controlled to prevent their overconsumption. In the latter case, however, it is all about giving people enough incentive to create the nonrivalrous resource. This is the reason why Lessig is against toughening up intellectual property rights.

Lessig's argument is very strong, but it also reveals why information does not get on with capitalist economy. Market needs rivalrous resources, so we have to treat information just as if it were rivalrous. In past days there was little worry about this problem because information was embedded in materials such as books, canvases, and records, but today information circulates freely apart from material objects, which makes intellectual property rights indispensable.

Given this kind of dilemma, Lessig's view of the free flow of information seems rather impractical, but things look different if we assume plural channels of information flows. What we are concerned about is creativity, not consumption of information. If we can separate creative communal sharing of information from

consumption of information, we can secure creative informational commons, while giving creators enough incentives. This implies a system of multiple flows of communication in which capitalist market constitutes only one of such flows.

From Individual Sub-Politics to Cosmopolitics: A Case Study of an Anti-Nuclear Artist in Japan

This presentation aims at examining the building of cosmopolitics. B. Latour and I. Stengers interpreted the core of cosmopolitics as "common worlds". When Latour described the concept of "Gaia", he considered ways to tackle the "disconnect" between global phenomena and individuals. In the same vein, cosmopolitics must assemble plural and diverse individual politics. The present research argues that this could be achieved using U. Beck's concept of "sub-politics", especially in an individual form. To examine collectives of individual sub-politics, this presentation focuses on "281_AntiNuke", an anti-nuclear artist in Japan. 281_AntiNuke is active as graffiti artist in Shibuya and on SNS. He started his activity after 3.11 (Aftermath of the 2011 Tohoku earthquake and tsunami and Fukushima Daiichi nuclear disaster). The message he wants to convey through his activity to Japanese citizens living in Japan is that the Fukushima Daiichi nuclear disaster never ends and how dreadful the Japanese government with its nuclear policy is. This presentation interprets his activity as a form of individual sub-politics stemming from technological risks. Interestingly, his activity has not only received attention within Japan, but also outside. This was made possible not only through the (global) extensibility of SNS, but also through the high translationability of his artworks serving as a medium that transcends cultural borders such as a language. This process, which involves a gap between the artist's original intention and the actual result, could be understood as "cosmopolitization". This presentation illustrates the relationship among the artist, the sites of his activities, his artworks, and the interpreters of his artworks using "visual turn" theory, which could be understood as a form of actor network theory that emphasizes visibility. In conclusion, this presentation suggests that visibility has the potential to bridge diverse sub-politics, which jointly compose cosmopolitics.

An X-Ray of Violent Conflicts between Farmers and Herdsmen in Nigeria

ABSTRACT

The persistence of farmer-herdsmen conflicts portends grave socioeconomic consequences. Some of the factors fueling the conflicts include environmental degradation, population growth, regional instability that has altered migration patterns, limited access to arable land, unreliable water sources that have increased natural resource pressures, blocked grazing routes and destruction of farmland by Fulani cattle. Increasing availability of modern weapons has increased the intensity and violence of these disputes. These have accounted for violent clashes that have claimed thousands of lives. The response of government to the issue of herder-farmer conflicts is discouraging. This paper will examine the genesis of the problem, document the chronology of violent conflicts between farmers and herdsmen, frustration aggression theory will be adopted to explain farmers- herdsmen's conflicts. The paper will also examine the government response to the conflicts and suggest ways to curtail these conflicts.

Women, Violence and Power Structure in Nigeria: A Case for the Legalisation of Abortion Laws in Nigeria

In Nigeria, there are laws restricting abortion and to that extent the procurement of abortion is deemed to be illegal. Unfortunately, available evidence has shown that abortion is being carried out by women on regular basis despite the enabling laws against it. Arising from this development, this study examined abortion laws in Nigeria and the factors influencing the procurement of the abortion amongst women. Some hypotheses were tested and the study discovered that the enabling laws do not in any way restrict or deter the women from carrying out abortion in Nigeria. Data were collected using a pre-tested questionnaire and similarly, Chi-square statistics was used to analyze this study, 393 respondents participated in this study. 171(44%) respondents agreed they are aware of the abortion laws in Nigeria. 84% of this population would opt for an abortion if confronted with an unwanted pregnancy while only 16% said they will be prevented by the presence of the law. 192(49%) respondents are unaware of the existence of abortion laws; while 90% of the population will ignore the law if

they have to deal with an unwanted pregnancy. Only 10% said they will be prevented by their knowledge of these laws. This paper therefore recommends the legalisation of abortion laws in Nigeria. This is being suggested against the back-drop of the many complications that have arisen with clandestine abortions when women had to resort to quackery in the event of unwanted pregnancy.

Decomposition of Inequality Among Time-Constant Variables By Counterfactual Mediation Modeling: Evidence from the Gender Wage Gap in Japan

The decomposition of inequality among time-constant variables (e.g., gender) into explained and unexplained components has been a major research agenda in social inequality studies. Explained components of the gender wage gap in the decomposition method correspond to the indirect wage effect of gender that operates through these mediators. Meanwhile, unexplained components correspond to the direct wage effect of gender on wage that operates through unobserved mediators (e.g., discrimination).

This paper links conventional decomposition methods such as DiNardo-Fortin-Lemieux (DFL) based on propensity-score weighting and counterfactual mediation modeling together by introducing sequential ignorability assumption discussed in Imai et al. (*Statistical Science* 2010). The reason for linking these two methods is that conventional decomposition methods typically control for post-birth variables that lie on the causal pathway from gender or race (which are basically randomly assigned at birth) to wage but neglect the potential endogeneity that may arise from this approach. Moreover, we never directly test the assumptions that lie in conventional decomposition methods and mediation modeling. Based on the newer literature on counterfactual mediation modeling, this paper therefore shows more attractive identifying assumptions and the sensitivity of the results to different sets of assumptions.

This paper also aims to bring time-constant variables back to the center of causal analysis in social inequality studies. The analysis focuses on the decomposition of the gender wage gap in Japan. Empirical results show that explained components with four mediators (education, occupation, employment status, and position) account for around 50% of the gender wage gap in hourly wage.

The Medicalisation of Social Problems Relating to an Increase in Absent Workers with Depression in Japan

The number of people who are absent from work with a diagnosis of depression is on the rise, and this has become a social problem due to economic losses incurred by companies and society. The aim of this study was to address our research question of whether social factors, separate from medical factors such as the increasing number of illnesses, are influencing the medicalisation of individual and social problems. These social factors include the psychological state of workers who wish to be absent when experiencing stress in strict working environments, responses from patients' doctors and industrial physicians, corporate in-house systems and state policies relating to mental health, and pressure to use prescription medication. The roles of markets (e.g. companies) and the state (e.g. health policy) were investigated based on semi-structured interviews with 50 male and female workers who had been absent from work due to depression, re-diagnosis of cases by six psychiatrists for case development, international comparisons, and media analyses.

The results revealed the following aspects: (1) patients wish to receive a diagnosis of depression in order to avoid stressful workplaces; (2) patients consult doctors on the belief that they have depression after seeing disease awareness campaigns, advertised as part of sales strategies, by pharmaceutical companies; (3) doctors diagnose depression in order to prescribe medication even though the patient's symptoms do not correspond to diagnostic criteria, such as those in DSM-5; (4) industrial physicians place too much importance on the diagnoses and treatment policies of patients' doctors; (5) ironically, companies which have established in-house systems and comply with state policies have higher numbers of absent workers who have been diagnosed with depression.

OKUYAMA, MICHIAKI* (*Nanzan University*)

Religious Nationalism in Japanese Politics in the 2010s

Japanese politics has experienced major changes involving coalition governments and governmental changes since the 1990s. This domestic transition has been influenced by the international political transformations that have taken place since the end of the Cold War, including the strengthening of China's economic and military power, and the military adventurism of North Korea. In

addition to these severe circumstances in East Asia, the aging and depopulation of Japan presents somber prospects for Japan's future.

After one year of the Abe administration in 2006-2007, the second Abe Shinzō administration (2012 onwards), almost continuously supported by a conservative patriotism among the public, has strengthened its inclination toward Shinto nationalism. This is illustrated by Abe's commitment to Shinto-related ceremonies conducted in major Shinto shrines such as at Ise and Yasukuni. Abe's appropriation of Shinto traditions culminated in the hosting of the G7 Ise-Shima Summit in May 2016 that included a visit to Ise Shrine by the G7 leaders without any consideration of the Constitutional separation between religion and the state.

The current emperor now in position for almost thirty years, delivered a special message in August 2016 reminding the nation of his old age and of the difficulty he faces in continuing to carry out his duties as the emperor. This message has been received as his wish to abdicate. The abdication or death of an emperor, and the enthronement of the next, will involve a detailed series of rituals and ceremonies, and the present situation is stimulating a general interest in the Shinto rituals of the imperial household.

The current relationship between religion and politics in Japan presents an issue of national identity that entangles Shinto, the imperial system, and conservative politics. This paper will delve into this focal issue from the perspectives of contemporary history, sociology of religion, and regional politics.

Prayer, Spatial and Health-Seeking Beliefs in Ghana

Few studies have examined the relationship between religiosity and health seeking belief outcomes in Ghana. Yet, religion functions to influence individual and groups' perceived outcomes and by extension behaviour. Using in-depth interviews conducted with 32 members and 2 group discussions of informal prayer groups in Accra, Ghana, the study explores interviewees' conceptions of illnesses and the significance of the forest as a place of gathering in order to understand the pathways of care-seeking beliefs. There are several reasons why prayer group members in this study resort to the forest, such as finding a serene sacred space in a crowded city to confront the vicissitudes of life. Disease, for the prayer group members, has spiritual and physical origins, making them seek both biomedical and spiritual care. Interviewees were convinced that hospitals can help with physical diseases, but spiritual diseases require spiritual solutions, such as prayer. According to interviewees, one's predicaments of ailment can change, by means of prayer, from a positive virus to a negative one, for example. There was a salient differentiation between treatment and healing. The interviewees shared in the general belief that doctors can treat certain conditions, but only God heals. While there is the need for public health practitioners to engage spiritual/religious leaders and adherents in behavioral change communication strategies to alter beliefs and cultural practices in the field of health care in Ghana, works aiming to support women and men's health also need to pay attention to their religious beliefs.

Religion and Mental Health Intervention in Ghana

Using an exploratory qualitative study through observation, in-depth interviews and focused group discussions (FGD) in Christian prayer camps, Islamic and traditional healing centers in Ghana, the study contributes to the discourse, from a cross cultural point of view, on religion and health-seeking beliefs and practices by studying centres of intervention belonging to the three main religious traditions afore-mentioned. The specific objectives of the study are to find out the types of treatment offered men and women with mental health challenges and the religious underpinnings of such interventions in order to help determine how state policy regarding mental health intervention could be influenced, drawing on religious principles. A total number of six (6) religious centres will be observed in this study. Specifically, we will study the Edumfa prayer camp in the Abura-Asebu-Kwamankese District of the Central Region and the Mount Horeb Prayer Centre at Mamfe-Akuapem in the Akuapim North District of Eastern region, a private Islamic healing centre in Greater Accra, and traditional healing centres in Kintampo in the Brong Ahafo region and Bongo in the Upper East region. The findings of the study and resulting benchmarks will serve as a springboard to interrogate current practices and policy regarding mental health intervention in Ghana. Knowledge, thus, generated from such a wide ranging study would present outcomes that could contribute to formulating policy benchmarks regarding mental health intervention in Sub-Saharan Africa.

Prevenir La Violencia De Género: Muchas Voces, ¿Un Discurso?

La Ley Orgánica 1/2004, de Medidas de Protección Integral contra la Violencia de Género (LOMPIVG) supuso en España el reconocimiento formal de la violencia machista como un asunto de Estado por tratarse de una vulneración de los derechos humanos. Entender esta violencia como el resultado del desequilibrio histórico de poder entre hombres y mujeres y de la constante discriminación que estas sufren exigía una respuesta integral y una apuesta clara en materia de prevención. El reconocimiento de los crímenes y la violencia machista contra las mujeres ha permitido desarrollar nuevas fórmulas jurídicas, sociales y tecnológicas para dotar a las víctimas de mayores derechos, aun así, los incesantes casos de violencia de género manifiestan que el camino recorrido hasta ahora no es lo suficientemente efectivo como para disminuir el número de víctimas. Tanto las exigencias de la Unión Europea como el reclamo de la propia sociedad civil evidencian la necesidad de incidir con mayor compromiso en dos campos pendientes, la prevención y la evaluación. Una frase repetida por las mujeres supervivientes impulsa la investigación: "Si hubiese sabido lo que me esperaba, no hubiese denunciado". Es evidente que hay un fallo en la respuesta institucional que subsume a estas mujeres en un proceso de "doble victimización". Con el objetivo claro de aportar algunas ideas críticas respecto a la teoría y a la praxis de lo que se denomina prevención secundaria de la violencia de género, surge este trabajo que indaga, a partir de los discursos analizados, en cómo los operadores de los principales ámbitos implicados: social, policial y judicial, definen y comprenden conceptos claves como violencia o administración/gestión del riesgo y cómo implementan y valoran las estrategias de prevención destacando los principales "puntos de choque y de encuentro" entre ellos.

Discourses of Professional and Enterprising Agency: Overlaps and Conflicts

The cultural ideal of enterprising agency is gaining new grounds in modern societies. Although enterprising agency can mean many things, in general, enterprising agents are conceived as creative, innovative, proactive, reflexive, self-governing and target-oriented agents who can develop themselves, solve problems in their societal environments and, finally, make things happen. In an increasingly strong sense, the cultural ideal of enterprising agency seems to align with the cultural ideal of modern, individual agency. In contemporary societies, actors in various settings – from schools to welfare provision and business organizations – are expected to act in enterprising ways. Professional actors make no exception.

On the one hand, the ideals of enterprising agency sit well with conventional ideals of professional agency. Professional discourses, as well, highlight professional actors' self-governance, reflexivity and ability to make things happen, among other enterprising attributes. In theory, professional actors should, therefore, find enterprising ideals ethically appealing. On the other hand, enterprising ideals also highlight flexibility, including actors' ability to overcome societal and cultural structures and boundaries. Such boundaries can also include traditional divisions of labor and established fields of knowledge and expertise, conventionally conceived as pivotal to professional collectives.

This paper has two aims. First, it examines the general overlaps and conflicts in professional and enterprising discourses, along with their socio-political and organizational consequences. Second, it examines the overlaps and conflicts in professional and enterprising discourses, and their consequences, in a particular empirical case: in social care work organization in Finland.

The Relational Construction of Interest Alignments: A Perspective to Organizational Change

Language and discourse play a central role in societal and organizational change. Language is a medium for justifying and criticizing societal phenomena, including forms of production and divisions of labor in societies and organizations. A central feature of modern, liberal forms of government is the alignment of interests between different actors. These forms of government, including work government, avoid impressions of open force or acting against anyone. Instead, they invite all actors to cultivate their own agency and serve their own interests, but mainly in alignment with more distant, organizational, governmental and economic objectives.

Sociological tradition offers different avenues for studying interest alignments – and interest conflicts – in work organizations. Traditional, substantialist sociology conventionally examines how different material, economic and socio-political entities, things and forces affect organizational life, including actors' abilities to act and serve their interests. From the perspective of relational sociology, in contrast,

interest alignment is an ongoing and dynamic process in which the interests of different actors receive meaning and significance in relation to each other and their environment. In this paper, I draw on relational and, in particular, dramaturgical sociology to examine such processes of interest alignment, and misalignment, in social care work organizations in Finland, among care work managers and migrant care workers. The paper demonstrates how the empirical analysis of interest alignments offers a productive framework for the study of organizational change.

Narratives of Widowhood: Conversations with Widows in Southeastern Nigeria

This article contributes to ethnological discourses of the contexts and personal experiences of the role of culture on widowhood rites. Over the years, academic discourse have not always captured the personal narratives of widows. It is most often lost in statistics, convention and media reports of humanitarian responses. However, this article presents a documentation of the unedited narratives of widows, their personalised experiences in southeastern Nigeria as it relates to widowhood rite procedure they have been subjected to. Not only does it explore their personal, experiences, it also investigates the extent to which violence against women still continues due to certain factors; one of which is culture as identified in this article. It is interesting to view how culture has normalised violence against women through widowhood rites which usually include practices like shaving of the hair on the head and the pubic region, days of co-habiting with the deceased, confinement in thatched houses and seizing of properties, among others. Therefore, this article examined the extent to which culture has influenced gender-based human rights violation particularly amongst the widows in Oshimili-North Local Government Area, Delta State. The theories of cultural relativism and universalism were employed in this article to understand the dynamism of culture. It was discovered that, there was a degree of willingness among the women to go on with these practices despite acknowledging the negative effects that accompanies the process. There is the dire need to champion the cause of getting women to understand their rights and come out of the shadows culture has built around them. It is time women begin to see themselves not as recipients but as participants of culture.

Violence, Injustice and Discrimination in the Management of People Living with Mental Illness in Nigeria

Mental illness presents lots of challenges especially in developing nations, Nigeria inclusive. People living with mental illness (PLWMI) are more at risk of self-harm, suicide and homicide. The rights of PLWMI to healthcare facilities have received little or no attention. More resources have been provided to other areas of health concern. There have been harmful traditional practices in the management of PLWMI. This study examined treatment and the management of PLWMI in Ogun State, Nigeria, and its implication on their full recovery, rehabilitation and reintegration into the society. Labelling theory provided the theoretical framework. Twenty In-depth Interviews were conducted among caregivers of people living with mental illness (PLWMI) (those who are receiving treatment and those who have recovered) and thirty Key Informant Interviews were conducted for orthodox practitioners (psychiatrists and social workers), community members and traditional healers that reside in Ogun State. Qualitative data were content analysed. Findings revealed that there was gender discrimination in the treatment and the management of people living with mental illness. Facilities were inaccessible and inadequate, limiting access to mental healthcare facilities by PLWMI. The study concluded that violence, injustice and discrimination in resource allocation in management of PLWMI existed. The government should increase the allocation of funds to mental healthcare and to protect PLWMI from violence inflicted on them during treatment.

Migration for Achievement: The Life Strategies of IT Professional Migrants in Australia

Based on 25 interviews with highly skilled immigrants in Australia, this paper examines the migration of IT professionals from Ukraine to Australia in the post-communist period between 2004 and 2013. The focus is on the popular among the interviewed IT migrants the dynamic, risk-taking and future-oriented 'achievement life strategy' that is structurally and individually framed and enacted with the help of migration. The migration experience of the IT professionals is examined across Ukraine and Australia in three ways. First, the paper sets out the migration policy context for migration and the formation of the achievement life strategy: (1) the emergence of the IT industry in Ukraine during the early 2000s and the growth of offshoring (outsourcing) in Ukraine after 2003, in combination with (2) shifts in Australian migration policy triggered by the growth of the innovation economy, a demand for highly-skilled migrants and decreases in the Australia's assessment level for Ukraine. Second, it examines migration decision-making and the individual motivations, values, aims and agencies that the Ukrainians formed in their country of origin. Third, the paper explores how achievement life strategies are recreated after migration by looking into the migrants' adaptation, occupational outcomes, language and national identity, future plans and aspirations. The narratives of the highly skilled IT migrants form a collective story of well-integrated members of Australian society, active agents of social and economic life who demonstrate effective usage of new opportunities that emerge in the recipient environment. Given their capacity to successfully maintain their social and economic status after migration, along with their positive contributions to Australian society in terms of social cohesion, innovation and economic production, this group can be considered a "brain-gain" for Australia.

Feeding Families: Class Inequalities in the Embodied Experience of Home Cooking

Family feeding situates embodied experiences of taste, emotion and physicality at the intersection of paid work, intensive parenting, and normative health and beauty ideologies. Within North American neoliberal health ideology (i.e. healthism (Crawford 1980; 2006)), home cooking is a lifestyle practice that parents deploy to "achieve health", both for themselves and their children, and its enactment signifies individual characteristics deemed important for healthy social citizenship such as control, attention and care (for both bodies and families) (Bowen, Elliot and Brenton 2014). Yet research indicates that class inequalities shape food work such that it is differentially experienced across classed groups (Brenton 2017; Daniel 2016; Naccarato and LeBesco 2012). While cooking can be enjoyable, it can also encompass time pressures, moral trade-offs, and the burden of pleasing others. These pressures are especially strong for low-income parents, who face financial constraints limiting their ability to manage them. This paper draws on interviews and cooking observations with 30 parents in Toronto, Canada to examine differences in the embodied experience of family food work across classes. It shows how class-based lifestyles and practices fashion emotional relationships to cooking that, in turn, impact the tendency to cook and the experience of cooking and eating. For example, how individuals perceive of the cooking act, encounter it corporeally, and come to prefer particular foods, cooking environments, or smells are all shaped by classed-based cooking habitus. At the same time, this classed habitus does not necessarily predict the pleasure derived from cooking or eating. This research contributes to scholarly research on how economic and cultural capital structure embodied tastes and practices, yet, through its attention to emotions, also allows for insight into how actors create social worlds beyond those determined by their class status.

Social Networks and the Institutional Reinterpretation of Chilean Pentecostalism

Pentecostalism is a religious movement, charismatic, highly active and militant. In South America and in Chile it has penetrated strongly in popular sectors of the population. Institutionally, it generates control over the social structure, the administration of religious knowledge, the discourse and actions of its members through the management of dogma, time and space (axis mundi) in its faithful. Currently, technological development has involved the generation of new scenarios where the formal religious institution is omitted, modifying the traditional religious scenario by the creation of new networks. The introduction into the churches of generations with higher education and the management of social networks has reconfigured a new type of virtual pentecostal.

Through the methodological framework of virtual ethnography, we analyze the semantic structuring (through analytical protocols and axial crosses) present

in religious communities discourses expressed in forums, blog, social networks. Basic codes are identified, structured through theory and discourse. It describes the modifications of the fundamental dogmatic constructs, role generation and religious restructuring in a digital space and its implication in the construction of daily life.

The analysis of results evidences the existence of believers who attend religious ceremonies, but who participate actively in social networks building knowledge parallel to institutional. The use of networks incorporates neologisms into religious discourse, redefining the concept of divinity, authorities, church among others, suppressing or reinterpreting complex theological constructions of Pentecostal dogma. The reinterpretation is democratized and built in the form of wikis in forums and networks in an evolutionary, complex and radical way. The behavior in the network is based on institutional criticism, conceptual reinterpretation, dogmatic modification and religious socialization. In the process, spontaneous Pentecostal virtual communities are configured and constantly re-structured. It is not enough to constitute a cyber religion, but if it establishes an anomic network religious and virtual.

Adolescent Mental Health in a Mexican Border City: Experience, Cultural Meaning, and Social Context

This paper is based on an ethnographic study of adolescent mental health in a high school (ages 14-17) in Tijuana, B.C., México. A focal area of the study is the investigation of how the sociocultural context shapes adolescents' experience of anxiety and depression and how adolescents develop strategies to manage these experiences. The aims also include examination of cultural perceptions of emotional wellbeing and help-seeking from multiple perspectives, including teachers and parents. For the past two years, we have conducted focus groups and semi structured interviews, including individual students (N=35 students). The interviews included assessments of depression (PHQ-9 modified for teens) and anxiety (GAD-7). The results of the study highlight the relevance of an interdisciplinary approach of Social Science research to understand the subjective experience, cultural meaning, and the social, cultural, economic and political contexts of contemporary life for adolescents in the border region of Mexico and the United States. Daily life situations faced by those adolescents, such as family interactions, peer relations, and neighborhood characteristics in terms of security and violence, are key elements that we discuss in relation to adolescent mental health.

Notes about the City of Rio De Janeiro: Scrolling Maps and Musical Scores

This research intends to analyze and also compare the discourses produced by touristic cartography and samba music about the city of Rio de Janeiro since the beginning of the 20th century. 7 different maps of the city, printed between 1914 and 2016, were selected to pinpoint differences, from a chronological perspective, in the aforementioned discourses

In parallel, I analyze contemporary samba songs in the light of the previously mentioned maps. Such an analysis provides us the means to confront the discourses produced, both in samba lyrics and cartography, with the urban transformations the city has undergone

The theoretical framework chosen for this paper surpasses the discussions on samba music, cartography, tourism, territory, quotidian and heritage. Cartography, in this case, is used not only as a source of information but also as an analytical tool. The result of such an approach are eight maps that specialize and compare the distribution of references made by touristic maps and samba lyrics about the urban tapestry.

I discuss the lack of representation of the inhabitants quotidian in the touristic maps. In addition, I point out, from a chronological standpoint, how the changes occurred in Rio de Janeiro are directly related to the shift of places of interest in the city and to the history of samba music.

Collective Boundaries and Ethnoracial Repertoires in Contemporary Brazil

The paper argues that there is a shift in core conceptions of identity and belonging in Brazil's national identity narrative. Analysing affirmative action in favour of black people in contemporary Brazil, we discuss three differentiated repertoires with implications for the construction of collective boundaries of an ethnoracial nature, which the author calls *dilution*, *negotiation* and *salience*. These

frameworks make it possible to organise the perception of ethnic and racial diversity. The importance of narratives of national identity in the ways these frameworks are structured is highlighted. The article also posits the need to consider the role of the state and its agents in the establishment of the legitimate codifications of belonging.

Migration and Diversity in the Entrepreneurial City: Setting the Scene for the New Urban Imaginaries.

Drawing from field work in Lisbon, Porto and Buenos Aires, the paper examines how processes of regeneration of the inner-city have been consistently linked to cultural diversity mobilization. Ethnographic and qualitative research was carried out in specific urban spaces where culture-led regeneration is underway. The selection of such spaces was premised on the idea of avoiding the usual suspects in urban studies such as the big capitals of the northern hemisphere. We argue that migration cultural traits are brought into such processes through cultural mediatory mechanisms that are specific to entrepreneurial cities models. We integrate in our analysis a wide range of actors involved in urban governance, from municipal authorities, through immigrant organizations, to diversity seekers and gentrifiers, in order to provide a complete interpretation of such mechanisms. Findings show that cities pursue similar strategies of coping with migrant-driven cultural diversity implying three main dimensions: aestheticization, place marketing and "ethnic showcasing". We conclude by raising some conceptual and policy related questions about new regimes of visibility and forms of social organization of difference specific to the entrepreneurial city.

Adolescents and Legal World: A Brazilian Longitudinal Study

One of the main challenges to democracy stability is the ability and willingness of individuals to obey the laws and cooperate with public authorities. Adolescence is a crucial moment for people to form their attitudes and behaviors toward laws and to internalize social norms and orientations toward different legal authorities. This process, called "legal socialization", includes individual understandings on how rules and laws are applied, the institutions and authorities responsible for its creation and enforcement, as well as the values that sustain them (Cohn and White, 1990; Fagan and Tyler, 2005; Trinkner and Cohn, 2014; Jeleniewski, 2014).

In Brazil, although there are considerable studies on juvenile delinquency, there is not investigations about the process through which adolescents learn about laws and authorities, and the aspects that create their decisions to comply or violate rules. Considering this scenario, a longitudinal research is been developed to understand legal socialization process with 800 adolescents born in 2005 in the largest Brazilian city, São Paulo.

This presentation explores data from the two waves (2016 and 2017) of São Paulo Legal Socialization Study (SPLSS). The main questions from this survey investigate the interactions between adolescents and authorities (parents, teachers and police officers) and explore the impact of these experiences in the development of legal attitudes. The judgments about the decision-makers' procedures and fairness, and the way they are personally treated by them – the "procedural justice" – impact on how people will react to law enforcement and on people's willingness to accept and comply with legal authorities (Tyler, 2004; Bottoms and Tankebe, 2012).

The longitudinal research permits to analyze the changes in the perceptions of the adolescents about the authorities and to observe how this process affects the legitimacy over time.

Building Toxic Neighborhoods and Creating Environmental Injustices: Public Development Projects on Former Municipal Waste Sites in New Orleans

Following Katrina, New Orleans city officials embraced a neoliberal reimagining of state commitments to urban redevelopment, housing, and education, though their respective local government institutions charged with financing and regulatory oversight – the Housing Authority of New Orleans (HANO) and the Recovery School District (RSD). While both state institutions had already begun moving to embrace neoliberal policies for some years prior, Hurricane Katrina provided a new avenue for moving further away from public responsibility for

financing projects and shifting to newly developed "public-private partnerships" as part of a post-Katrina broader strategy of economic redevelopment. In this paper, I illustrate these processes by examining two New Orleans public housing developments and schools involving mainly working class communities of color. Both neighborhood developments involve a shift from public funding to public-private financing resulting in development on previously identified toxic sites - locations Lerner calls "sacrifice zones." I argue that local government officials sought out this new financing as a strategy to avoid some of the policy and regulatory constraints that would have been placed upon them through any reliance on federal funding. This creative new form of state neoliberalism served to exacerbate existing inequities by not just degrading the quality of public education and public housing but also by continuing to "sacrifice" these working class communities of color to the accumulatory excesses of past industrial development in the service of future capital investment and accumulation. To do this I will examine two public housing projects and two public schools situated upon the two largest municipal waste sites in Orleans Parish: Agricultural Street and Silver City landfills

Civil Society Taking the Lead in Combating and Preventing Sex Trafficking of Women

Historically, women's and civil rights movements had a major influence on raising awareness about sex trafficking and on the development of international anti-trafficking policies. Contributing also, to the conceptualization of sex trafficking as a type of violence against women, as well as a complex social oppression linked to racial inequalities, poverty, gender issues, among other social disadvantages (Addams, 1912; Leppänen, 2007; Giner, Ruiz, Serrano & Valls, 2015). Since the 2000s, global policies concentrate their efforts on the prosecution and protection of victims in coordination with key partners such as NGOs (United Nations, 2016). However, there is little scientific knowledge about the informal participation of civil society and citizens against sex trafficking. Some studies highlight the relevance of bystander initiatives to address sexual exploitation (Wilson, Critelli, & Rittner, 2015). For instance, in Atlanta (USA), a coalition of women's organization & neighbors, successfully mobilized their community to develop a long term strategy to stop sex trafficking (Boxill & Richardson, 2007). Under the research project END-TRAFFICKING, Changes and social innovations for preventing and reducing trafficking for sexual exploitation, led by Dr. Lidia Puigvert (2015-2017, Spanish Ministry of Economy and Competitiveness): (1) we analyzed the evolution of 65 international & European anti-sex trafficking policies, examining the role granted to civil society in these policies; (2) We explored international civil society initiatives that are having political and social impact on the prevention and overcoming of sex trafficking; (3) And, between 2016 and 2017 we conducted 10 in-depth interviews in the USA and Spain with representatives of social organizations that are implementing anti-sex trafficking policies. We achieved to identify 5 international bottom up transformative and solidarity-based initiatives that contribute to fighting sex trafficking, showing that its overcoming demands the commitment and global action of all citizens and sectors of society.

Racialization and Counter-Racialization in Times of Crisis: Taking Migrant Struggles in Italy As a Critical Standpoint on Race

Migrant struggles in contemporary Italy offer a critical standpoint for understanding the uses of race in times of crisis. This paper analyses racialization first as a structural feature of neoliberalism in Italian society, and then as a crisis management strategy in the transition to late neoliberalism. Against this background, migrant struggles – for freedom of movement and the right to life, for equality at work, for the right to housing – will be interpreted as examples of counter-racialization. Through the development of counter-discourses on the crisis and austerity, in terms of causes, responsibilities and alternatives policies, and through practices of solidarity those struggles deconstruct the dominant frame of 'ethnic competition for scarce resources' and try to reunite 'those below' against 'those above' across national and other racializing lines.

Gender Differences in Military Families: Towards a Redefinition of Roles?

Title: Gender differences in military families: towards a redefinition of roles?

Key words: military families, family relationships, gender differences

There are numerous studies on the changes of gender roles within families. Have these happened in military families, in which one or both partners are in the military? If so, to what extent and how similar is it to what is happening in civilian families? Furthermore, how are gender roles defined in military families? Has the man-military role undergone the same transformations as the corresponding father/husband role in families in general or do major distinctions based on gender continue to exist? Lastly, what and how have roles and gender identity changed in young military families compared to those of past decades?

A qualitative research, with in-depth interviews, will try to answer these questions by studying a reference population consisting of two groups of families: those in which the military partner is now elderly, on leave or close to leave; and those of younger military families, married or with partners, with or without children.

The research, which aims to integrate the framework of international studies on the subject, has revealed clear differences in the distribution of gender roles in the more mature families compared to those composed of younger partners, the disappearance of the traditional male role, assimilation by the latter of actions traditionally assigned to the other role (take caring of children and helping with housework, etc.). This shows that, even in this traditional institution, role transformation processes are taking place which more or less mirror the changes that have happened and are underway in civilian families and their society.

Anti-Immigrant Sentiment in South Africa: Any Dimension from the Commercial Road Transport Workers?

Violence is endemic in South Africa. Many analysts see it as an untoward legacy of apartheid, together with inequality and social discrimination. Anti-immigrant sentiment is a defining feature of xenophobia, which at least in the South African context is but a form of violence and social discrimination targeted at black non-South Africans locally referred to as *makwerekwere*. Incidentally, this xenophobic act of violence takes on different dimensions and appearances that continue to define the South Africa of today. While much of the development has found its way into academic circle in terms of scholarly interrogation, the critical link between xenophobic attitudes and the culture of violence amongst road transport workers in South Africa has been far less researched. Hence, this paper will focus on the aspect of xenophobia that involves commercial road transport workers in South Africa. In doing this, it seeks to explain how xenophobic tendencies have been intensified by the culture of violence, particularly among commercial road transport workers in South Africa.

A Redefinition of Woman, Voice and Development: New Nigerian Novels and the Burden of Being

Speaking with one voice at the face of anti-woman tyranny has always been a tough nut to crack in African / Nigerian novel. This could have been as a result of the tradition that allows the woman to be seen but denies her the opportunity to be heard. This has however become history as the new Nigerian novels are succeeding not just in discovering the voice of the woman but actually amplifying same. Lola Shoneyin in *The Secret Lives of Baba Segi's Wives* narratively signposts the comity of women who beat the man at his games. The stereotype woman who waits for providence appears dated giving way to the woman to whom providence is a design - the pencil of which she places of the canvass by herself. The discovery of the voice has led to such brazenness, boldness, assertiveness and expressiveness alien to traditional African writings.

This study engages relevant aspect of postmodernism to examine the pot-pourri of voices being unearthed in the new novels in Africa especially in Nigeria. Of note is Adichie's *Americanah*, Nwaubani's *I Do Not Come to You by Chance* and Adeniran's *Imagine This* as postmodern novels creating the needed platforms to amplify the liberty of the woman.

This study attempts to answer the questions how best the woman can realize her voice and contribute more meaningfully to advance her society? What is the impact of her personal development on her society?

Reversed Migration and the Trauma of Dislocation and Injustice to the Child

REVERSED MIGRATION AND THE TRAUMA OF DISLOCATION AND INJUSTICE TO THE CHILD

Whereas the subject of migration has occupied a prime position in global discourse; it is seen as a one dimensional flow from often time economically deprived location to economically advantaged clime; from a war ravaged society to a supposedly peaceful one and also from a religious 'upended' place to a more tolerant place. This dimensional flow which has remained as it is from time has been the focus of migrant and diasporic discourses and writings. However, another dimension also equally important has to do with those involved in 'reversed migration', which also comes with some forms of compulsion that tend to dislocate, disorientate, traumatize and negate the choices of the victims from seeking the respect of his/ her preferences. The victims of this dimension of migration as shown by the third generation Nigerian novelists are children and minors who are often helpless.

This study engaging literary sociology examines Sade Adeniran's *Imagine This and When We Speak of Nothing* by Oluide Popoola to x-ray the dehumanization and disenfranchisement involved in forceful or sometimes subtle uproot of minors from their land of birth without any thought about transplantation, replanting and acclimatization. The dispatch and forceful relocation therefore gives birth to a sense of dislocation and trauma. Even though reversed migration is presented as a sort of homecoming – a return by the adults or parent figures, this is without consideration for the minor whose sense of home and nativity become complicated. This study seeks to answer the following questions: What are the rights of the dislocated child that must be respected? What preparation is made to help in seeking redress when the minor matures and feels the dislocation has negative impact on his / her quality of life?

Itinerary of a Migrant Identity

I was born 3 months after the end of Second World War, in 1945. My parents migrated from Japan to Brazil intending to enrich and return to Japan after some years of hard work in that unknown land. So my siblings and I received Japanese education at home. When began to attend elementary school, I got in touch with the Brazilian world. During the childhood I suffered bullying. I spent whole period of adolescence with a lot of quests about my identity. When I was 16 years old, went to São Paulo city, moving from a country to a metropolis, about 650 km far from my home. Then I felt indeed my Japanese education into collision with Brazilian demands. Attempting to become Brazilian, I stopped to speak Japanese and I stood back from Japanese community. With the progressive economic recovery of Japan, the Japanese and their descendants became well accepted. My entrance to University was another moment to strengthen the identity conflict, since my past experience of being country worker until 16 years old became motives of many colleagues' curiosity. Thus, the identity conflict had accentuated. I am professor at a public University for last 40 years. In my area of study, the Special Education, I am considered an important researcher in my country. My approach highlights the importance of surrounding social environment of disabled people to understand their capability and performance. I believe that the option for disabled people was something fortuitous. My interest is in relation to the minority groups in general. In that context I analyze the issues related to Special Education. I believe that my occupational course is a consequence of my life history. I believe that the study in that area helped me to understand my life trajectory and to deal better with my identity.

Micro Finance in Traditional Mutual Help Networks in East Asia: A Comparison of Rotating Savings and Credit Associations in Japan, South Korea, China, and Taiwan

This paper presents micro finance as a traditional system of mutual help networks in East Asia. These are called "rotating savings and credit associations" (ROSCAS), and can be also seen in other areas. Micro finance means that invested money is small and managed by members. The paper discusses the results of an interview survey and fact-finding fieldwork study in South Korea, China, and Taiwan. It has been called *tanaomoshi* or *mujin* in Japan. ROSCAS in East Asia have different names in each country and area: South Korean *kye*, Chinese

gokai, and Taiwanese *hyokai* can be compared with the already well-studied Japanese case. Mutual help actions are divided into three categories. One is reciprocity in helping to plant rice and re-roof houses by exchanging labor. The second is redistribution. In exchange for the right to get goods from a common store, local people have the obligation to maintain a common pool of resources. Finally, unidirectional help refers to support in funeral and wedding ceremonies requiring no monetary exchange. The content of redistribution is labor, goods, and money. ROSCAS are the redistributive action of money. In the case of having insufficient funds, local people would often give rice or other goods instead of money. Micro finance encompasses gathering money for buying cows and digging wells among local people. The purpose of the paper presentation is to show that ROSCAS are important in not only economically but also socially in terms of friendship and bonds. The economy is embedded in social relations and institutions. While ROSCAS have almost disappeared from modern life and some are interest-oriented, they contributed to sustainable communities and can still be identified in East Asia. The paper concludes that modern societies might do well to reconsider ROSCAS such as mutual help networks in search of ways of reconstructing communities.

Complex Relationship of Digitalization and Societal Innovation in Disaster DATA

Recent methodological discussions are mainly on institutionalized data mechanisms and the necessity of seeking new ways of data deriving and usage processes in research centers; complexity and ethical issues of digitalization of data, usage of social media as it was in RC33 Regional Conference in Taipei, September 2017. When it is the case for disaster researches it is not away from these discussions. Digitalization of data through institutions such as FEMA, EM-DAT, AFAD and others, differing disaster types, regularity-unregularity of natural events for each country, climatical changes requires increase in awareness of available informations and new strategies to classify publicity of data. However, they may bring sometimes better conditions for smart living or sometimes they can be threats in loss in privacy, unethically, cyber-violence, control by algorithms.

This paper will be elaborating discussions under the light of fieldwork experiences and study results accumulated through years. Examples will be given from Turkey, South Korea, Japan, Taiwan, Europe and America. Moreover it will be revealing complexity in interchangeability, interplay of constructive, deconstructive, reconstructive forces of digitalization and societal innovations by considering macro, meso and micro levels.

The paper will consist of four sections; introduction, methodology, findings and conclusion.

Ethnic Communities and Their Contact Channels in Japan: A Case of the Islamic Area in Inner City Tokyo.

This study focuses on the Islamic Area in Okubo district of Shinjuku Ward which is located in inner city Tokyo. And, I will try to clarify the features of the current inner city of Tokyo through the people and the ethnic facilities which are forming multicultural space in this area and their contact channels using these people or ethnic facilities.

The sociological study focusing on the "City" especially, the "inner city" started in the early 1920s and was developed in Chicago University. Sociology in Japan which focuses on the study of the "inner city" had started later in the 1980s. In the late 1980s of Japan, foreign workers had increased rapidly because of a lack of labor caused by the bubble economy in Japan. In such a social context, the study that focuses on the "inner city" had begun and has clarified mainly features of the urban way of life related to ethnicity.

Shinjuku Ward which is inner city of Tokyo has the highest number of foreign residents in Tokyo. The foreign population in Shinjuku has increased rapidly after 1985 and the growth is continuing slowly until the present. But in the period between 2011 and 2013, the population decreased because of the Great East Japan Earthquake. But regardless, Shinjuku Ward continues to have the largest number of foreign residents. According to the Shinjuku Ward, the number of foreign population in September 2017 is 41,915 and the percentage of the total population is 12%.

The current inner city Tokyo, analyzed through the Islamic area in Okubo district in Shinjuku Ward, has many circuits of migrant transnational practices and is a multicultural space that migrant transnational practices which used to be invisible to the host society has come up to a head.

RC32-594.3ONWUMAH, ANTHONY* (*Covenant University, Nigeria*)*Language Style of Hate Speech and its Implication for Gender and Cultural Transmission*

Hate speeches, involve all expressions, intended to offend, and discourage love and peaceful co-existence. It could be out of the desire to aggravate an already bad relationship. Hate speeches which could be interpersonal, or communal are usually borne out of the desire to spite, protest against real or perceived marginalization including political and socio-cultural intolerance. Expressions differ, it could be polite, courteous, aggressive, assertive or rude and provocative. The study is designed to examine the language style of hate speeches and the degree to which they heighten situations in the context of gender and cultural transmission. It seeks to answer questions as how do men and women articulate hate speeches and what are their implications for peaceful co-existence, love, unity and development. It is instructive to note that language style and hate speeches have implications for cultural transmission. For instance, people and particularly children born in a hostile environment, replete with hate speeches conveyed in offensive languages are prone to imbibing wrong cultural values and passing same to upcoming generations. The study, which is quantitative and qualitative, posits that if development is to occur at all levels of our society, hate speeches must give way to creative, courteous, polite and assertive expressions. The study finds that hate speeches have multiplier effect, as one hate speech will engender a counter hate speech. Hate speech breeds fear, mistrust and uncertainty. It should be discouraged as much as possible.

RC31-557.8ONYIGE, CHIOMA DAISY* (*University of Port Hartcourt*)*The Criminalization of Human Trafficked Female Victims from Africa*

Human trafficking is modern day slavery. According to the International Labour Organisation (ILO), it is estimated that around 21 million people around the world are in slavery. Contrary to common misconceptions that slavery affects everyone, some groups of people are much more susceptible to slavery than others. People who suffer discrimination and prejudice due to their gender, ethnicity, race or caste are also likely to be subjugated to exploitation. Modern day slavery is likely to occur in countries where corruption is the norm and the rule of law is weak. There is no doubt that the root cause of modern day slavery is poverty and inequality of power, however globalisation has intensified the problem. The increase of migration from Africa to Europe has resulted in prostitution businesses breeding rapidly. Consequently, at the destination countries, women and children who are sexually exploited and abused as victims of human trafficking are often treated as criminals. Most international actors are more interested in stemming illegal immigration, and therefore consider trafficking cases as an illegal migration issues. The law and order approach to victims of trafficking from Africa is usually criminalized. They blame the victim and the victim's gender and race. The combined effects of racism and gender discrimination on migrant women, especially black women have legitimised the criminalisation of trafficked victims. This paper contends that a comprehensive and integrated approach to understanding the various forms of discrimination that African migrant women face should be studied to ensure that the human right of female African migrant is not abused.

RC05-116.2ONZIMBA LENYUNGO, ZHANNA* (*RUDN University*)*Traditional Way of Living for Indigenous Peoples of the Russian North As the Basis for the Ethnos Preservation*

Indigenous peoples of the North are peoples who live in the territories of their ancestors traditional settlement and preserve their traditional way of living, husbandry and crafts. The traditional way of living for the indigenous peoples of the North is based on traditional land use — a historically established way for life support, based on their ancestral historical experience in natural resources exploitation.

Recently, the problems of indigenous peoples of the North have been related to the realization of the indigenous low-numbered peoples' basic right to own and use their land. Its acquisition is often antagonized, which is not only due to ignorance of these peoples' specifics, but also their lands rich in natural resources. The special importance of the land issue is currently connected with the modern Russia realities: privatization, land leasing and private property rights. Without proper safeguards, indigenous peoples are being squeezed out of the occupied territories and their ability to use natural resources has been reduced. Many norms of the current legislation aimed at ensuring the rights of indigenous peoples are declarative and they do not provide for a legal possibility of granting lands to indigenous peoples for gratis use in places of their traditional habitation.

The indigenous peoples ancestral lands should be recognized and remain not least because the land for them basis in their life activity. Without land, indigenous peoples are doomed to disappear or, at best, lose their distinctive culture.

Traditional natural resources exploitation should remain for the indigenous peoples of the North the material basis of their traditional culture and way of living preservation. Indigenous peoples' integration in modern society should be based on their special legal status and should be implemented primarily on the basis of not dominant but traditional society values, thus creating conditions for their ethnic identity preservation.

RC50-833.3OOI, CAN-SENG* (*University of Tasmania*)SHELLEY, BECKY (*University of Tasmania*)*Leveling the Playing Field? Building Cultural Capital through Learning Destinations*

Cultural capital refers to cultural competences, either in the embodied sense of valued lifestyles or in the institutionalised sense of educational credentials. Bourdieu's concept of cultural capital has enabled researchers to view capital as a resource – one that provides scarce rewards and under certain conditions may be transmitted from one generation to the next. Children from lower socio-economic backgrounds may not exhibit the embodied sense cultural capital that supplements or enhances achievement in the formal education system.

In this ongoing project, we look at the Children's University Tasmania, and how it attempts to use tourism places as resources to build cultural capital in the local community. While it is a project to support children in local communities, it employs a tourism framework to enhance learning. These are done through improving access to extra-curricular 'Learning Activities' to children aged 7 to 14, and engage the wider community as 'Learning Destinations' in the process. When a child becomes a member of the *Children's University Tasmania* they are given a 'Passport to Learning' in which they record their participation in activities at 'Learning Destinations'. The activities may include visits to galleries, museums, dance schools, music, sports clubs and heritage sites. After completing 30 hours of validated learning, their achievement is celebrated at a formal graduation ceremony, a significant cultural experience itself. The Children's University builds a bridge for parents and guardians to visit places that they do not normally go in order to expose children to diverse cultural experiences.

This project arises from our good intention to support the Children's University's aim to promote social mobility by providing high quality learning out-of-school hours learning activities to children. But we now begin to question the research knowledge we are producing: Are we sanctioning particular types of "level playing fields"?

RC03-80.4OOSTERLYNCK, STIJN* (*University of Antwerp*)SWERTS, THOMAS (*University of Antwerp*)SCHUERMANS, NICK (*Free University of Brussels*)*Communities of Solidarity in Superdiversity: Recognizing Interdependencies in Place As a Source of Solidarity*

The increasing ethnic and cultural diversity in Western societies challenges established national communities of solidarity, which are rooted in a presumed shared history and a set of national norms and values that are transferred from one generation to the next. As migration and globalisation erodes national boundaries and disrupts the perceived historical continuity on which nation-states and their institutional solidarity arrangements are predicated, we call for a shift of our analytical focus to specific places and joint projects as vehicles for building superdiverse communities of solidarity. This analytical shift entails the mobilization of interdependencies in place as source of solidarity, contrary to the focus on shared values and norms as the privileged source of solidarity in many public diversity policies.

We develop a transversal analysis of 20 case studies of the conditions under which superdiverse communities of solidarity in places such as factories, schools, sports fields, cultural projects and superdiverse neighborhoods develop. Our analysis highlights how superdiverse communities of solidarity can be constituted through 'joint projects' in which a diverse group of citizens recognizes their interdependencies and takes joint responsibility for the places they share.

Our analysis contributes to existing scholarship on communities of solidarity in a superdiverse context in at least three ways. First, we show how the recognition of interdependencies in place is a powerful, but much ignored driver for the constitution of communities of solidarity in superdiversity. Secondly, we observe how interdependencies are rarely sufficient as a source of solidarity for communities, but are articulated in many different ways with one or more of the other three aforementioned sources of solidarity. Thirdly, we argue that the value of a contribution to a community of solidarity (in case of interdependence), should not be pre-defined, but negotiated with everyone present, if solidarity is to be nurtured in superdiverse places.

Can Market-Based Interventions Contribute to Sustainable Consumption? Developing a Conceptual Framework on Analysing the Impact of Consumer-Oriented Initiatives Towards Sustainability in Globalising Food Chains.

In the debate on environmental change and sustainable consumption market-based instruments, such as certification and labelling schemes, are sometimes rejected because they are considered as ineffective and only resulting in cosmetic change. Real environmental change, as the argument goes requires more fundamental societal transformations. Nevertheless, market-based sustainable governance arrangements are proliferating and becoming increasingly popular in many different domains.

This paper takes a closer look at these instruments and thereby conceptualising consumption as a social practice embedded in a bundle of multiple practices that constitute a combination of networks and flows. Environmental change therefore entails transformations in these bundles of practices structured as networks and flows. Empirically this paper builds on previous work on the global palm oil and global seafood supply chains.

From these cases it becomes clear that innovative market-based arrangements create a complex landscape of private and sometimes public-private consumer-oriented initiatives. Analysing them shows that these initiatives may result in important reconfigurations in global supply chains and in actual transformations towards sustainability in the networks and practices involved. Innovative sustainable global food governance arrangements may be effective, for instance because they (re-)connect material and non-material flows and provide additional information along the supply chains (transparency and traceability), or because they bring in public and private actors in area-based approaches (landscape governance).

The paper concludes that these reconfigurations are connected with the transforming roles of consumers, retailers, producers, governments and NGOs in the sustainability governance of global food supply chains. On this basis a research agenda is formulated on consumer-oriented environmental governance arrangements.

OPPELT, MARTIN* (*Bavarian School of Public Policy - Technical University of Munich*)

Forced to be Free? Reflections on an Agonistic Citizenship

Political Theory traditionally distinguishes two ways of being a "good citizen". The liberal strand focusses on the righteous citizen, fulfilling his or her minimal civic duties (taking part in elections, obeying the law, paying taxes) and therefore receiving state guaranteed liberties and safeties in order to interact with fellow citizens as market participants. The republican strand on the other hand highlights the meaning of virtues and the intrinsic value of political participation and therefore demands from "good" citizens to subordinate their self-interests to the public will and the community's wellbeing.

Facing profound political and social changes within democratic societies, it nowadays seems high time to critically overcome these two ideal types, as well concerning their normative as their analytical quality. They both don't match the post-foundational conditions of modern democracies (Laclau) and the individuals' experiences resulting from them. This incongruence in my point of view contributes to the development towards "societies of fear" (Bude) in which neither interests nor virtues, let alone solidarity and tolerance are the civic leitmotifs, but mistrust, hate and isolation, replacing the "good citizen" by the return of the "good underling".

Subsequently the "attack of the anti-democrats" (Salzborn) and their continuing successes in democratic elections entails a general shift towards a dismantling of historical achievements and a deconstruction of democratic rights which is driven by what I call the "democratic fear" of citizens, who are overwhelmed by not knowing how to deal with the postmodern condition (Lyotard) of a general absence of stable and reliable social fundaments (Lefort). Against these alarming developments I suggest to elaborate a theory of agonistic citizenship from current theories of radical democracy (Rancière) and agonistic politics (Mouffe), which not only accept but welcome the "dangerous liberty" (Tocqueville) and contingency of 'modern' democracies as the condition of possibility for liberty at all.

Artificial Intelligence (AI) Dystopian Scenarios and Projected Sociotechnical Disasters: Engendering Fear and Uncertainty in Public Discourse

Artificial Intelligence (AI) application methodologies and research agendas have suffered dramatic setbacks as well as considerable successes since their origins prior to WWII. This presentation explores the recent discourse that links AI to various kinds of dystopian, disaster, and apocalyptic scenarios (including mass unemployment, robot takeovers, and human enslavement and dependence) engendering fears that that can be used opportunistically to influence public policy. Both developed and developing nations are reportedly facing challenges involving AI, with various forms of workforce displacement being projected in economic studies. Dystopian futures have indeed been outlined in science fiction narratives of past decades; however, many recent portraits of the future are being proposed by entrepreneurs and scientists (including Elon Musk and Stephen Hawking) who often buttress their projections with specific technological details, timeframes, and even full-blown research agendas. The presentation maps the themes of AI disaster projections and links them to overall societal anxieties about the future of society in relation to AI (including surveillance and cybersecurity concerns). It also discusses modes through which AI disaster themes are reaching the public, with various social media venues and thinktank efforts along with more traditional books and television outlets conveying information about potential threats to humanity. The AI hype and backlash factors are also explored in this presentation, with historical background on how "AI winters" emerged when many well-funded AI advances did not provide adequate return on investment and failures appeared to outpace successes.

Emerging Innovations in Cheating Detection in Online Educational and Workplace Contexts: Social Dimensions of Dishonesty Surveillance

A growing number of research and application initiatives involve the detection of cheating and deception using biometrics along with various demographic characteristics and behavioral patterns. For example, gesture and keystroke analyses are increasingly incorporated into cheating detection efforts in online education; they are also used in predicting and detecting deception in workplace settings and some border security checks. The use of brain scans and other forms of neural analysis in dishonesty detection is also being explored in research and development agendas. The fact that one often cannot prove that someone is indeed cheating or deceiving even with a confession adds uncertainty to the system development efforts involved. Since the ramifications of being labeled as potential "cheaters" and "deceivers" may be severe and continuing, conscientious attention to the sociological and ethical issues engendered by these initiatives is imperative for system researchers, developers, and implementers. Constructions of cheating can differ among systems, possibly resulting in anxieties and cognitive dissonance in subjects (often children) as well as confusions for individuals called upon to interpret system-produced data. Many of the hand gestures associated with deception are related to intimate personal expression involving critical judgement and ethical decision making; influencing these expressions could lead to disruption of the subjects' moral consideration of the situations involved. Social and legal questions about educational applications of these technologies include considerations of whether children as subjects should be given particular protection. Currently, many developers of cheating-related approaches in education are third-party organizations not directly affiliated with educational institutions, the latter which are generally bound by specific privacy and children's welfare constraints. The presentation reviews several historical perspectives on the dangers of the use of polygraphs in social settings; the implications of new forms of deception detection in everyday organizations present new and comparably frightening challenges.

ORBEGOSO, ALMENDRA* (*Pontificia Universidad Católica del Perú*)

Entre La Frontera y La Posfrontera: Agendas De Desarrollo y Medios De Vida En Una Comunidad Nativa Minera De La Reserva Comunal Amarakaeri.

Se propone discutir la influencia de las agendas de desarrollo por parte del Estado (Sernanp) y de las organizaciones no gubernamentales (ONG) en los medios de vida de comunidades nativas mineras de la Reserva Comunal Amarakaeri (Madre de Dios, Perú), pertenecientes a la etnia indígena Harakmbut.

Se emplea el marco analítico que brinda el post-desarrollo (Esteve 1992; Escobar 2007; Gudynas 2014) para aportar al debate sobre las dinámicas del desarrollo sostenible que se desprenden de las agendas de desarrollo (ONU 2015) en comunidades nativas mineras, así como las nociones de frontera y posfrontera

(Larsen 2016), que ayudan a comprender y problematizar los medios de vida (Scoones 2010) de estas comunidades. Desde una aproximación metodológica cualitativa, se realizó un estudio de caso, y se recolectó la información a través de entrevistas a actores y observación participante en la comunidad elegida para el estudio (Puerto Luz), con el fin de obtener las percepciones de dichos actores y construir los resultados.

En ese sentido, la presente investigación concluye que, en el contexto de las comunidades nativas mineras, las agendas de desarrollo no logran influir en la configuración de medios de vida de posfrontera sostenible, por la fuerte predominancia de las actividades de frontera extractiva, situación caracterizada por tres factores: la presión creciente de la extracción de oro sobre el territorio de la comunidad; las dificultades debido al control burocrático y conocimiento experto que manejan las organizaciones; y la desconfianza de las mismas respecto a la actividad aurífera como alternativa para el desarrollo de la comunidad. Esto, a su vez, genera que dichas agendas no favorezcan la consolidación de actividades de posfrontera lo que, en última instancia, limita la configuración de medios de vida sostenibles según la percepción indígena, caracterizados en el Plan de Vida Plena y Gobernanza Territorial de la comunidad.

OREKH, EKATERINA* (*St. Petersburg state University*)
BOGOMIAGKOVA, ELENA (*Saint Petersburg University*)

Parenting and Children's Videogaming Experience (the case of St.-Petersburg, Russia)

The research is focused on an analysis of contemporary St. Petersburg urban practices related to children's computer gaming. We analyze the strategies used by parents in their actions in relation towards children computer gaming. We also aim at uncovering the background assumptions about the world we live in, children, parents, childhood and parenthood, which are implied in these strategies. We used semi-structured interviews with parents whose children play computer games, as well as with parents whose children do not engage in computer gaming. Interviews were conducted in 2016-17 in St. Petersburg. The parents with different social characteristics (gender, types of completed education, employment, income, religion, number and age of children, etc.) were included in this research. As analytical framework of this research, we applied ideal-type construction of models of parenting resulted from intersection of two types of dichotomy. One of them is the opposition between viewing of childhood as a period of immaturity and as a distinct part of human life. Another is the differences in parental styles of interaction depending on the level of freedom allowed to a child when it comes to decision-making. Some conclusions of the research are following. St. Petersburg parents studied show a growing tendency towards viewing childhood as a period in which a child should become an adult as fast as possible. There is a connection between parents' gaming experience and overall positive attitude towards child's gaming. At the same time, parents' frequent use of computer at work does not entail a positive attitude towards videogames and child's involvement into them. The parental legitimization of their practices is in many ways inherited from and reproduces the Soviet attitudes towards parenting and children. However, it goes hand in hand with a (neo)liberal rhetoric in relation to the use of computer.

Boomerang Effect of Proxy Warfare: Terror, Social Disturbance, and the Rise of Neo-Nationalism in the Core

Within the political battleground of Middle East, which has vast variety of ethnicities and sects, proxy warfare is used as a means of rearrangement, especially just after the Arab Uprisings, for the sake of the interests of the core states. Though it has been used during the Cold War, as a result of the substitution of the religious-ethnic splits in place of the ideological splits, proxy warfare emerged as a more suitable form of war for the core states.

For the organizational structures of these religious, ethnic, and sectarian groups are loose and for most of these are dependent on economic rent, as a result of frequent changes of conditions within the region, these manipulated groups easily run out of the control of the core states, or whoever manipulate or control them.

However, apart from the effects of proxy warfare over the deepening of ethnic and sectarian splits, it affects directly the states that appeal to this form of war. It would be reasonable to classify these effects as follows: (i) terrorist attacks organized by proxy organizations may lead to loss of lives and create a fear atmosphere (ii) in the core the increase of migration from the destabilized regions to the core states; (iii) as a result of these migration, in the core states, which has already been adversely affected by economic crises, recession and labor demand increases; (iv) within the migration-receiving regions, terrorist attacks organized by proxy organization or the change of social fabric, together with the economic distress, cements xenophobia; (v) as a result of these changes, the social adaptation of the immigrants become more and more difficult, and (vi) within the political

environment of the core states, the racist or neo-nationalist movements and political parties become stronger gradually.

Proxy Warfare and Long-Lasting Violence Spiral in the Middle East

Restructuring of the Middle East in the wake of the Iraq invasion and the Arab uprisings have had two important socio-political effects in the region: Authorities of regional powers weakened and different ethnic groups, that are the inhabitants of this region, appeared as local powers. These new local powers, covertly or overtly, operate as proxies for core states or wittingly or unwittingly act in accordance with the policies of core states.

Since Iraq war and subsequent rearrangements met with strong international reactions, the cost of invasions and direct wars increased, and the core states started to be seen as the primary suspect for the destabilization of the region, the core states withdrew from the region to organize and equip their proxies and to give mandate to them. Proxy warfare provide some crucial advantages for the core states. Through this new warfare, these states can easily overcome the institutional obstacles in their domestic politics, can minimize the public reactions, and can mobilize the groups existing in their rival states to widen their own hegemony or to disturb the rival state's production of consent.

However, proxy warfare creates a multi-level violence spiral in the region. Firstly, arming existing ethnic groups means investing long-lasting violent struggle of these groups which eventually undermines peaceful conflict resolution options. Secondly, since the Arab uprising's promising democratic transformation opportunities are damaged the peoples of Middle East lose their faith in democratic transformation. Thirdly, since the regional powers attempt to manipulate existing proxy wars or to create their own proxies, armed actors in the region diversify. Lastly, since the regional powers concern their own security and territorial integrity, they may hold on to some strict measures which may eventually escalate the violence in the region.

Dynamic Effects of Migrant Remittances on Macroeconomic Variables in Nigeria (1981-2016)

The growing number of Nigerian migrants abroad in recent times and the resultant effects of their remittances on the economic well-being cannot be ignored. In this study the dynamic effects of worker's remittance flow into Nigeria on macroeconomic indicators were investigated. The study employs annual data for the period 1981-2016 using Structural Vector Autoregressive (SVAR) model to analyse the effects of migrant remittances on key macroeconomic variables- Consumption Expenditure per Capita, Gross capital formation and imports. The analysis was carried out with the purpose of estimating their respective contributions to economic growth. Findings indicate that there is a positive but insignificant effects of remittances on economic growth largely induced by investment. The analysis further shows that, although the workers' remittances are mostly used for private consumption and partially for imports. At the individual level, it provides immediate income for different households and can be used as a brake on poverty. However, migrant remittances contributes majorly to economic growth through the multiplier effects of investment. The study therefore concludes that Migrant Remittance can be a propeller to economic growth as well as economic development in Nigeria, if financial institutions are well organized and be made more competitive to provide remittance services at reduced cost, so that funds can be remitted through official channels. In addition people should be encouraged to invest larger proportion of such funds in productive sectors of the economy.

Forming Social Movements in Nonviolent Christian Social Action on Poverty: Engaging with Power and Justice through Relationships across Diversity and Scale

This presentation will draw on research with those involved in forms of nonviolent Christian social action on poverty and debt to explore how their work links with that of others working on these issues. In particular, it will explore how participation in this work can lead to the development of wider social movements which involve:

- (i) wider relationships with others who share concerns about these issues, in the form of various networks across local and wider scales.
- (ii) developing understandings of what forms of action are needed, and how these might work together, to tackle these issues in holistic ways that take account of different dimensions of power within them.

This analysis draws together insights from the findings of two different research projects:

- (i) One which explored Christian responses to debt in the North East of England and London through 35 participatory local discussions (involving around 580 people in total) and a national conference (involving 90 people) with those interested and/or taking action on this issue;
- (ii) One which explored transnational ecumenical Christian networks of social action, primarily through interviews with key activists within these networks operating in one or more of the Brazilian, Argentinian and UK contexts.

Examples which explore key questions of how such action relates to the work of those within wider communities and civil society, as well as policy actors, and their different conceptions of justice, will be considered in the process.

A Qualitative Analysis of Contemporary Youths' Response to Diverse Issues of Social Justice in Nigeria

The study sets out to document the perception of selected youths about the possibility of achieving social justice in Nigeria against the backdrop of ethnic and religious divides synonymous with the present Nigerian State. Specifically, the study interrogated the beliefs of popularly acclaimed future leaders' perception about the Nigerian state, identified their perceived positionalities, privileges or disadvantages, and their reflections about diverse issues of social justice. The study engaged an exploratory research design. A total of 20 university students were purposively selected in one of the foremost tertiary institutions in the South Western part of the country. The selection was based on the following; ethnicity, religious affiliation, class and gender. Primary data were generated through the use of semi-structured interviews guides with a vignette component and written assignments by the participants. A phenomenological approach was used in analyzing the data. Findings reflected primordial sentiments held by three major ethnic groups in Nigeria. While the participants from the Northern parts of the country believed that they were highly privileged judging from their ability to consistently hold on to political powers, the Igbo youths averred that they are the least privileged and the most victimized group in Nigeria. The Yoruba youths affirmed that they were also privileged judging from their ownership of major educational institutions. Similar divergence in opinion was revealed in relation to religion which was congruent with the religious sentiments expressed by the Christian and Islam adherents across the nation. The study concluded that not much has changed in the trajectories of trying to build a new Nigeria as many youths are unconvinced about the reality of achieving the Nigerian project that will ensure social justice for all and sundry.

OSHIMA, GAKU* (*Hitotsubashi University*)

Incorporating AIDS Activism into Erotic Bodies and Images of Gay Men: The Hidden History of Resilience of People Living with HIV (PLWH) in Sexual Minority Communities in Japan

Previous research reveals that PLWH (people living with HIV) face tremendous challenges such as stigma based on one's HIV status and/or sexuality and mental health issues. Although many studies have focused on vulnerability, few have highlighted resilience in such situations.

Based on the transcripts from the peer-to-peer life story interviews with twenty-one long-term HIV survivors, this report illuminates how PLWH have created hope against the homo-/AIDS-phobic era of the 1990s and 2000s. The research collaborators were recruited via an advertisement in the newsletters of the Japanese Network of PLWH (JaNP+).

As stated by two research collaborators, AIDS activism has been incorporated into the erotic bodies and images of gay men, especially in the culture of sexual adventurism. For example, In the gay magazine 'G-MEN', the editor-in-chief and HIV-positive activist, along with gay erotic artists, health experts, and bartenders in Tokyo's gay district, produced and published various sexual stories and images that they believed were erotic in nature. Furthermore, they provided the latest information in regard to sexual health. As a result, the readers aspired to "fit in" with these stories and images, and many even shared their erotic desires with the magazine.

Through the ongoing construction of individual biography as a series of dialogues and joint action, the distinction between consuming sexual fantasy and practicing actual safer sex in everyday life has been constructed and directed towards a less stigmatized understanding of the actual lives of PLWH.

Overall, the findings in regard to the aforementioned processes are in direct contrast to the generally passive image of PLWH with the hegemonic medical context. This paper seeks to bring these experiences to the fore through focusing on the significance of visual materials in individual biography and overcoming social stigma, and highlighting the active resilience of PLWH.

"Exploring the Quagmire of Violence Against Women: Family, State and Society in Southern Africa"

The Southern Africa region has a long history of high rates of violence against women and girls, which are generally considered among the highest rates in the world. While there are many forms of gender-based violence, this paper will explore domestic violence and sexual assault against women and girls specifically in Zimbabwe and South Africa from the period of late colonialism to the present. Although the maintenance of power is a major cause of men's violence against women, in Southern Africa, the situation is more complex. In the region, domestic violence and sexual assault have deeply rooted structural explanations linked to the long history of colonialism, apartheid and white minority rule, political transition, economic crises and adjustment, changes in expected gender roles in the family and the HIV/AIDS pandemic. For example, the current phase of globalization wrought major changes in employment opportunities for poor women and men, which threatened the long-history of men's advantaged position in the labor market and in the home. Although the increased options for women were most often in the low-income microenterprise sector, they subsequently experienced increasing violence in the home at the hands of their male partners. In the past 25 years, Zimbabwe and South Africa attempted to address violence against women and girls through the development of laws as well as the creation of non-governmental organizations (NGO's). Reforms in the criminal justice systems, especially in police officers' responses to women who experienced violence, were also encouraged. The Southern African Development Community (SADC) has also developed legislation to address this violence. Despite these efforts, South Africa and Zimbabwe have not been able to significantly decrease violence against women and girls. This paper will comprehensively explore this situation, informed by over two decades of research in the region, and provide recommendations for the way forward.

Muslim Female Travellers in the West

This study presents data from a research project on the experiences of Muslim female tourists in the UK. It forms part of an ongoing exploration of the intersection between tourism, Islam and gender. Previous research in this exploration looked at the experiences of western female tourists in Egypt, the researchers decided to reverse the focus. A narrative research approach was implemented to interview 20 participants from a variety of Muslim countries. Participants were invited to

consider how their tourism experiences were influenced by their gender and their cultural background. They were also encouraged to talk about their up-bringing in a Muslim culture and how that shaped the way they see the world. Participants were also reflecting on their gender roles in their conservative societies and the impact of their travels on their lives. Initial findings revealed that gender and religion shaped and influenced the experiences of the female tourists while travelling in the UK. Whilst the experiences were mostly positive, judgement of the destination and the host were in many cases influenced by the participants' religious views and up-bringing.

"New Emigration" from Spain after the Economic Crisis: A Tale of Continuity with the Crossover of Migratory Cycles

The aim of the paper is to analyse emigration from Spain, following the 2008 economic crisis. It analyses the 'new emigration' in relation to previous migratory cycles and specifically: a) Spanish emigration to Europe during the 1960s-1970s; b) immigration to Spain from the 1980s onwards. We posit that rather than a 'new' phenomenon, the mobilities that emerged from Spain following the crisis must be seen from the perspective of the reactivation of transnational fields that have been built up between Spain and a number of European and Latin American countries over the course of the intense history of mobilities within the framework of various migratory cycles.

The methodology includes the analysis of the principal statistical sources available in Spain to measure emigration flows (Migration Statistics and the Residential Variation Survey-Spanish National Institute of Statistics, INE). The intention is to shed light on this crossover of mobility and migratory cycles, identifying the typology of these 'new emigrants'. This will reveal the link between 'native emigrant' migratory flows and the Spanish migration cycles of the 1960s and 1970s. Our study also considers the way in which the new mobilities are related to the return of the actors of immigration cycle to their countries of origin. It also analyses re-emigration from the perspective of the complex links and their articulation with various transnational fields.

Finally, based on the fieldwork conducted with 25 Spaniards that emigrated to Paris following the economic crisis in 2008, the article highlights the connections between this new form of emigration with the traditional Spanish emigration to France that occurred during the 1960s and 1970s. It reveals the reactivation of a number of labour niches that were traditional sources of employment for Spanish emigrants.

SUAREZ-GRIMALT, LAURA (*University of Barcelona*)

Indicadores Cualitativos Para El Estudio De La Migración Latinoamericana y Las Trayectorias De Movilidad Social En El Espacio Transnacional

Desde la literatura sobre migraciones internacionales, los trabajos sobre movilidad social han sido abordados desde un enfoque cuantitativo, centrándose en estudiar las trayectorias laborales y ocupacionales de las segundas generaciones migrantes en los países de acogida. No obstante, los migrantes pueden desarrollar una trayectoria de descenso o estancamiento en el contexto receptor, en el marco de una estrategia colectiva que permita a la familia ascender socialmente en el país de origen.

Frente a la limitación de fuentes de datos estadísticos existentes en este campo, este trabajo pretende contribuir al estudio del nexo migración-movilidad social adoptando una perspectiva cualitativa que considere cómo los migrantes se mueven en varios espacios sociales para diseñar sus estrategias de ascenso social (contexto de origen, destino). Y, al mismo tiempo, estudiando estas trayectorias en el marco de estrategias familiares transnacionales. Para ello partimos del uso del método biográfico y del desarrollo de una etnografía multisituada y un trabajo de campo longitudinal (69 entrevistas biográficas con migrantes latinoamericanos en España y su familia en el país de origen, en varios cortes temporales).

El objetivo de la ponencia es avanzar en el diseño de un sistema de indicadores de naturaleza cualitativa, que permita estudiar las trayectorias de movilidad geográfica y de movilidad social en el espacio transnacional. Pretendemos desarrollar una herramienta analítica para identificar las transformaciones en los itinerarios de movilidad social que los diferentes miembros de los hogares transnacionales experimentan a lo largo del tiempo y en los diferentes espacios sociales. Y que posibilite estudiar las percepciones y las experiencias subjetivas que subyacen a sus estrategias de ascenso social en relación con los proyectos migratorios. Buscamos igualmente trascender el plano individual, subrayando la importancia de incorporar en el análisis a los miembros de la familia que permanecen en el país de origen como agentes de movilidad social.

The Unplanned Effects of Racialised Counter-Radicalisation Policy in the UK

The transition from the War on Terror to counter-radicalisation policies in Western countries most likely to host a home-grown terrorist attack has ushered in a top-down racialised society. The main transition consisted of a shift in the focus of security logic from an external threat to an internal one. Counter-terrorist reaction to external threats was displayed through military intervention in the Middle East and the establishment of state of exception security schemes to limit international organizations from plotting further attacks against Western interests. Counter-terrorist reaction to internal threats later extended exceptional law enforcement towards a preventive logic to detect and interrupt home-grown terrorism. How efficient have these policies been securing the lives of civilians? Furthermore, what are the unintended side effects of policies that underline religious and racial divides? Security seems to fall one step behind terrorist logic as lone-wolf domestic attacks in Europe increase, most of which require close to zero strategic preparation, training or sophisticated tools, inspired (not directed) by terrorist networks. Meanwhile, the reconfiguration of law under the logic of prevention has three inevitable consequences: 1) providing citizens unequal access to the law through the racialization of preventive policing, 2) forcing the use of policies that favour specific practices and interpretations of Islam (Peter in Eckert 2008; Sadiq & Raissa 2015), and 3) perpetuating the growing presence of racism and 'us' versus 'them' rhetoric in society. This paper will analyse recent data published in the UK by the Social Mobility Commission (2017) which shows that Muslim youths face increasing discrimination and racism that considerably limits their socio-economic development. It will compare this with the socially alienating effects of the counter-radicalisation programme Prevent, to discuss to what extent there is a linear effect between counter-radicalisation policies, racialized security and Muslim social mobility in the UK.

Implementing a New Basic Military Training

A new concept for the basic military training in Sweden was implemented in 2016. The reasons for this was that the Swedish armed forces had problems in recruiting sufficient amount of soldiers and officers. In 2016, the SAF struggled to recruit 2.300 individuals, and the requirement was 4.000. In 2021, the amount of soldiers recruited/year aims at being 8.000. The SAF have had a long period of downsizing, and depending on events in the Scandinavian region and the increased threat of terror, the SAF now needs to increase their organization.

The new basic military training implies that the former 3 month basic training, plus 3 month probationary employment, was replaced by a 9 or 11 month long training before getting an employment within the SAF.

A project was launched in order to evaluate the effects of the new system, and officers training recruits in the new system, were the target group for the evaluation. Interviews with officers were conducted at the beginning and in the middle of the military education training. Results show that there were fears about not being able to provide the recruits with requested equipment, and the lack of officers at the home unit was a source for misgivings. Interviews midway through the training showed that in general, the officer corps were satisfied with the way they have trained the recruits, but there was also big dropouts, up to 50 % in some units.

After just one year with the new basic military training system, Sweden re-instated conscription, gender neutral and still relying on voluntariness. The new basic military training will still be operative during conscription, and results from this first year is further discussed.

Responding to Sexual Violence on Post-Secondary Campuses: Models of Response, on-Campus Investigations, and Best Practices for Supporting Survivors of Sexual Violence

Responding to sexual violence at post-secondary schools continues to pose challenges to police, campus security, and post-secondary officials. Recently, the province of Ontario, Canada, mandated that all post-secondary institutions in Ontario adopt some form of sexual violence policy for their campuses. Yet, little is known about how this mandate has been implemented by post-secondary schools. Drawing on in-depth interviews with post-secondary school officials and

police officers, this paper explores the perspectives of individuals responsible for responding to sexual violence on campus. More specifically, we examine the best practices regarding responses to sexual violence on campus while paying particular attention to how post-secondary institutions and police services collaborate. Utilizing a critical feminist framework, we critically assess these responses to argue that this current structure is problematic.

Surveillance, Control and Technology: A Study of the Supermarket Sector in São Paulo

The subject of this research is the possibility of formation of a control culture in contemporary society and its consequences in daily work. The purpose of this research was the control and surveillance systems in hypermarkets. We investigated the video surveillance systems, which includes employees, but also customers, the watchmen and all those who are within the stores. This video surveillance is a system which control bodies and behaviors in several spaces of our actual society. Observing local stores of the three largest supermarket groups in São Paulo: Carrefour, Multivarejo (Pão-de-Açúcar) and Wal-Mart, the question we tried to answer were how surveillance is organized in workspaces through control bodies. The criterion for selection was sales, number of stores and employees. In recent years these three major retail companies increased their investments in security and surveillance technologies. A lucrative market around the security systems was developed, emerging specialized companies that brought innovations in technology for retail. Some important companies in the technology industry are monitoring the Arius and Tyco Fire & Integrated Security, both working in Brazil. Through direct observation of surveillance systems was also possible to investigate the punishment systems created in stores. Thus, both the monitoring and the punishment were contemplated. Semi-structured interviews were conducted with customers, employees and executives of the stores management and logistics levels. The management manuals and working procedures of the three major companies selected were also be research sources. The work control by technologies of surveillance is a way to management people through their bodies. However, it is important to note the difference it in relation to previous studies: this study is not limited to ways employed to increase productivity, but it relates to how control is exercised in the store space on people bodies in all its expressions.

What Is Democratic Management for Localized Food Systems ? Lessons from a Case in France

For the last decades, Geographical Indications (GIs) have been expanding worldwide, with an expectation to contribute to the solution of various socio-economic problems in agri-food systems. In particular, it is anticipated that the democratic form of a GI organization, relying on a significant degree of bottom-up rules and collective decision-making, can stimulate a more sustainable development of the local agri-food system. Furthermore, in some countries it is possible that through participating in activities under GIs, people strengthen their capacity to realize the democratic development of a society.

This paper starts by reviewing literature to clarify which are the conditions of "democratic" management of a food system and why the activities in a food system have to be managed democratically. GI systems rely on multi-scale levels of governance: micro, meso, national and international. We look at a case in France (the "Lucques du Languedoc" table olives labelled under Protected Denomination of Origin) and scrutinize this example in light of democratic management. We focus first inside the GI scheme, on the structural functions that ensure democratic management; and then outside, on the interactions with excluded actors and the recruitment of new members. We show that the GI governance at "meso" level, i.e. the Inter-Professional body, plays important roles in terms of coordination, in capacity strengthening services, and in representing the producers' and the product's interests at higher regulation levels. The discussion establishes a comparison with other countries that have more recently introduced GI protection under different political contexts (Vietnam Brazil and Japan). Lessons are drawn from the comparison with this case in France. We conclude that because of their decentralized dimension and versatile mechanisms, GIs can either empower local groups or be inserted in large corporate strategies.

Democracy, Constitutional Supremacy and Legitimacy: The Case of Ukraine

While recent events in Ukraine attracted some scholarly attention and a number of publications were produced, in a field of Sociology few of them focus on the Constitutional Supremacy and Legitimacy, Human Rights and Judicial Reform. Thus, there is still a wide gap concerning a comprehensive sociological analysis of such issues, particularly with regard to the Constitutional (and Judicial) reform that is taking place since 2014 and changes it supposes to bring to the operation of Constitutional Court, appointments of its members, and to the overall Judicial Independence. Such analysis is not only valuable for comparing and understanding social and political process and changes in Ukraine, but for the wider discourse on democracy, constitutions and (social) transformation.

Another important aspect that I also discuss is the fact that the demands and/or appeals to the Constitution, Constitutional Rights and Supremacy, and principles of Division of Powers were one of the main themes of all significant civil protests (revolutions) in Ukraine – most particularly Student protests of 1990 (Revolution on Granite), Orange Revolution of 2004, and Maidan / Revolution of Dignity (2013-2014). I argue drawing on empirical data that underlining values and intentions which pulled people toward participation in Ukrainian revolutions are closely connected to the particular understanding of human rights and freedoms and to the vision of ideal rule of law, however removed it might have been from their actual everyday reality.

Thus I argue the need for a comprehensive sociological analysis of an ongoing Judicial reform in Ukraine and changes it will bring to the Constitutional Court and process and further to the political system and governance. Recent media discourse and professional legal discourse regarding the Constitutional and Judicial reform are analysed. I also discuss the ongoing debate if suggested reform of Constitutional Court will ensure democratic governance.

How and When Do People Move between Traditional and Modern Medicine in Post-Disaster Settings?

Background: In post-disaster settings across the world, humanitarian aid organizations have provided Western modern medical services. However, some of such services have been reported to neither exactly match local needs nor be sustainable in Asia and Africa. Recently, increasing attention has been paid to traditional and informal care practices that play a role in providing primary healthcare in disaster-affected communities.

Aim: This study aims to explore the role and limitations of traditional medicine and informal care practices in Rwanda and Japan and investigate how local people are moving between different healthcare systems in post-disaster settings.

Methods: A review of empirical reports from Japan after natural disasters and ethnographic fieldwork in Rwanda after war and genocide were completed as part of a larger qualitative study of community resilience. Collected data were analyzed by using techniques of grounded theory and narrative analysis.

Findings: Informal care and traditional medical practices provided primary healthcare in response to local health needs after disasters in Rwanda and Japan. Findings from fieldwork in Rwanda revealed that local communities assist-

ed members' healing process through providing economic, social, mental and spiritual support in everyday life. However such informal care practices also had limitations. One clear limitation was that communities were incapable of dealing with severe mental illness and took patients to traditional medicine ('prayer') or Western medicine ('testing'). Meanwhile, in Japan, somatic pain is significant suffering among disaster survivors but it was left behind the triage system of Western modern medicine in emergency. Survivors thus sake traditional medicine to mitigate their pain.

Discussions: Local survivors make sense of their suffering and pain and seek treatments based on blended theories of Western, traditional and ethno-medicine. Further research to explore boundaries of different healthcare systems is needed to develop healthcare services and policy that fit local needs.

Medicalization and Youth Support

This study investigates how the medical concepts of developmental disorder and mental disorder are understood in the context of support for young people in Japan.

In Japan, particularly since 2000s, the societal participation of young people living in a state of "*hikikomori*" (social withdrawal) was recognized as a problem, and a variety of measures were taken to address it. "*Hikikomori*" refers to a state in which a person neither goes to work nor school, has almost no interaction with people outside of his or her family, and is cut off from social relationships. However, certain facts have become clear in the process of institutionalizing support targeted toward such young people: among "*hikikomori*" youth, there are young people who are suspected to have more developmental disorders or mental disorders than anticipated, and youth support organizations not originally intended to support people with disorders are taking on this function, providing *de facto* support to young people suspected to have developmental disorders or mental disorder. Society has increasingly been paying more attention to developmental disorders, in recent years, and supporting young people has also become an important issue.

Under such circumstances, youth support organizations need to encourage young people with suspected disorders to be aware of and understand their own traits and symptoms and connect young people with the appropriate organizations and systems. Young people need to accept that they have disorders and work toward finding employment. This study conducted fieldwork in a certain youth support organization, analyzing what methods and ethics support personnel use to avoid stigmatizing the label of "disorder" and what kinds of resources young people use to understand and accept their own traits.

Based on the above data, we will raise questions about the medicalization of issues that young people experience and the scope of youth support policies.

Cold War Social Sciences Beyond Academia: The Case of Radio Free Europe As a Social-Scientific Research Institution

In this paper, I will argue that extending the historiographical research agenda on producers of "Cold War Knowledge" to media institutions such as *Radio Free Europe* (RFE) will lead to a more complex and nuanced picture of Cold War Social Sciences.

Studies in this field have mostly focused on US academic actors such as Harvard's Russian Research Center, but often neglected the crucial role of non-academic actors in the transnational construction and circulation of social-scientific "Cold War Knowledge." This is especially true for the field of Eastern European area studies which – next to Sovietology – quickly rose to prominence in early US Cold War academia and substantially shaped the bipolar rhetoric of the Cold War. Here, also media institutions played a major part.

The Soviet Satellites were quickly identified as focal points of Cold War psychological warfare, as embodied most prominently by RFE. Trying to win over the "hearts and minds" of the people, RFE provided in six languages full "surrogate radio" programs that sought to establish free access to information and open a marketplace of pluralistic opinions in the East European ether. To underpin the program contents, RFE established its own, multi-national Research and Analysis Department where up to 100 researchers with diverse social and national backgrounds conducted academic-style research on the target areas. Thus, RFE developed into a major Western social-scientific research institution on Eastern Europe, highly esteemed e.g. by scholars, intelligence services, or media practitioners despite its more or less covert CIA-ties.

As this research was also made available to such external recipients and thus found global circulation, RFE as a media institution became a major contributor to academic East European area studies. Hence, RFE serves as a prime example for the potentials of widening our historicization of Cold War Social Sciences beyond the academic realm.

Varieties of Plausibility? – Power of Interpretation in the "Post-Fact" Era

"Facts" are constructed. That is nothing new and that does not qualify them as incorrect. It is not a question of being true or false, but of how "facts" are constructed and how we verify that they are well constructed (Latour). In what is called the "Post-Fact" Era the criteria of knowledge evaluation appear to have shifted. While scientific ways of verification used to be accepted not only in the scientific community, but also by policy makers and populations, we now find more opposition to the validity of scientific knowledge in various fields. How can we explain this loss of authority?

When "facts" are superseded by "deep stories" of felt truths (Hochschild) changes in power relations are implied. In my talk I want to focus on these relations with a power of interpretation approach. A power of "world-making" (Bourdieu) that controls the gaze, directs attention, and orientates actions. From this perspective the contrast is not "fact" vs. fiction, but interpretation vs. interpretation. The consequence is not that everything is arbitrary; this fallacy is what populists are exploiting when they appeal to personally felt or imagined truths. Instead it emphasizes the fabrication of interpretations and draws our attention to the careers of concepts and ideas. They might gain the status of factuality for a period of time, they may be controversial or face the "limbo of the might-have-beens" altogether (Law).

I perceive the dissemination and "success" of interpretations as entangled with heterogeneous human and non-human associations. Their plausibility depends on the connection between the associations and the evaluation criteria of connections in the respective setting. To illustrate my theoretical considerations I will use the example of a right-wing science watch blog (sciencefiles.org) and discuss how the authors aim to weaken (social) scientific knowledge to empower their own knowledge claims.

Aggressive Wife, Caring Mother: Representations of Gender and Violence in the Biographical Narrative of an Incarcerated Girl in Brazil

This paper analyzes the biographical narrative of Helena, a 17-year-old girl who, at the time of the research, was incarcerated at a Juvenile Detention Center due to the homicide of a girl from her neighborhood, who allegedly had an affair with her husband. I interviewed Helena in 2015 at the Center for Social and Educational Services for Teenage Women in Porto Alegre, Brazil. In my analysis, I aim at understanding how Helena's representations of gender and physical violence (both suffered and committed) intersect in her narrative. I investigate the connections she establishes between violent practices and the positions she occupies as a young woman in her social space. I aim at understanding under which conditions the practice of physical violence is regarded as coherent with her representations of femininity, and under which conditions it is not. I identify three elements that are central to her narrative: i. the construction of an aggressive and invulnerable personality and, hence, the refusal of victimization; ii. the justification of the use of violence to preserve the stability of heterosexual relationships; iii. the notion of motherhood as a possibility of redemption. Her aggressive personality is narratively coherent with many aspects of her femininity, but incoherent with her role as a mother. To her, aggressiveness is acceptable in a context of "survival of the fittest". Such "survival" strategies, however, were not employed for self-preservation, but to defend her social role as a wife. Notwithstanding, by doing so, she jeopardized another feminine role she expects to play: that of the mother. Thus, the same violence that defies some aspects of her femininity is mobilized to reinforced another facet of it. This reveals the ambiguous and nuanced patterns of gender socialization within contexts of family and urban violence.

RC32-577.5

OTTO, NATALIA* (*University of Toronto*)

Professionals, Rivals and Survivors: Intersections of Gender and Violence in the Narratives of Brazilian Girls Who Committed Violent Offenses

This paper analyzes 8 biographical narratives of female juvenile offenders incarcerated for violent offenses (homicide, attempted homicide, robbery murder, and kidnapping) at the Center for Social and Educational Services for Teenage Women, in Porto Alegre, Brazil. I aim at understanding how these girls' representations of gender and physical violence (both suffered and committed) intersect in their narratives. Thus, I investigate the connections they establish between their violent practices and the positions they occupy as young women in their social space. I focus on how gender practices that seem contrary to *emphasized femininity* (such as the practice of violence) are regulated and

negotiated in these girls' social context. I ask under which conditions the practice of physical violence is regarded as coherent with the girls' femininity, and under which conditions it is not. I have found that the girls perceive their violent acts as coherent to their femininity in some contexts. Thus, some violent practices do not put them in conflict with their feminine identity and are not perceived as a form of resistance to gender expectations. In these girls' understanding, legitimate and intelligible reasons and social positions to commit violence and maintain their status as women are: (i) as "professionals", when they are in charge of the drug trade; (ii) as "rivals" or spouses, when they commit violence against other girls who threaten their heterosexual relationships; and (iii) as "survivors", when they feel they have no choice other than to commit violence to protect themselves or others. I argue that these girls do not deny *emphasized femininity*, but rather that the conditions under which this femininity is socially accepted and reproduced are transformed and negotiated in these girls' social context to accommodate violent practices.

OUELLET, ERIC* (*Royal Military College of Canada*)

Case Study on Canada's Decision-Making Process to Renew with UN Peacekeeping Missions

In October 2015 the Canadian government confirmed its intention to renew with UN peacekeeping missions, and in August 2016 pledged up to 600 troops and 150 police officers for a mission to be determined later on. As of September 2017, the actual mission has not been announced yet.

Scholarly literature on decision-making about the use of force tends to rely significantly on rational decision-making assumptions. This goes against findings in institutional theory showing the importance of non-rational dynamics, which has been used recently to study military-related decision-making. Considering recent developments in institutional analysis, providing greater roles to individual actors, a case study on Canada's decision-making process to renew with UN peacekeeping missions represents an interesting opportunity to advance both the application of institutional analysis to military-related decision-making, and make a case for better recognizing the centrality of non-rational factors.

This research focuses on cognitive and normative level justifications and perceptions used throughout the decision-making process by the various actors, and identifies their underlying mental schemata, norms and values as distinct institutional logics. These logics are then analyzed to assess their degree of alignment to one another, and whether they interacted in ways that were layered, conflicting, converging, or parallel.

This research will rely on documentary analysis of material available in the public domain, and as much as possible on releasable internal documentation on the topic. This will be augmented by semi-structured interviews with as many key actors as possible. A snowball technique will be used to find participants. The interviews will be used to identify institutional logics that might have been missed, or incorrectly interpreted through the documentary analysis. The empirical work is expected to be completed in early 2018.

OWINO, GEORGE EVANS* (*Kenyatta University*)

Health As Performance and Performance As Health: A Phenomenology of Life with HIV in Kenya

Being infected with HIV has long been associated with incapacitation and inability to fulfill social obligations. Before the widespread availability of highly active antiretroviral therapy (HAART), many people diagnosed HIV positive and those infected but not yet diagnosed were often bedridden and thus were incapable of fulfilling their social obligations. However, this scenario changed with the advent of HAART. The study, whose findings are the basis of this article, sought to provide an analytical account of how people living with HIV (PLHIV) but who are on ART have regained their health and capacity to fulfill their social obligations and how this has transformed their perceptions of what it means to be healthy. Data for this qualitative study was collected through in-depth interviews with 49 PLHIV in western Kenya. The data was audio recorded, transcribed into text and thematically analyzed based on the study objectives. The study shows that diagnosis and subsequent enrollment on HAART had a positive impact on majority of the PLHIV. They recovered their body stature and regained health and well-being. Most, who were hitherto bedridden, were able to rise from their beds and managed to resume their daily activities. The study concludes that the social definition of being healthy is pegged on capacity to perform social roles and meet other social obligations. As such, the ability to recover health and regain capacity to fulfill social obligations is crucial in providing a solid ground upon which PLHIV can rebuild their lives. The author recommends that PLHIV require support to regain capacity for optimal engagement in the affairs of everyday life as this would enhance their sense of well-being and self-efficacy.

A Comparative Discourse Analysis of Online Hate Comments on Political News Stories in Nigeria and Benin Republic

Although hate speech has been a global phenomenon since a long time, the advent and the liberality of internet mediated communication has made it so easy for people to freely engage in it even as it is today seen as a criminal offence in many countries. It is widely perceived as a form of organized reactions to economic, political, religious, and ethnic injustices and frustrations as perceived by individuals especially in countries where national cohesion is fragile. The subject of hate speech has received tremendous scientific attention in research areas such as Anthropology, Sociology, Peace Studies, etc. but has not been adequately studied from a descriptive linguistic point of view, especially as they concern internet trolls in Nigeria and Benin Republic, two neighbouring countries in the West-African sub-region of the African continent. Rooted in the theoretical provisions of descriptive linguistics, we undertake in this study, a comparative discourse analysis of the linguistic features of hate comments by Nigerian and Beninese online commentators on political news items in selected online media. The two languages involved in this study are English and French while the selected online media are *Vanguard*, *Punch* and *Sahara Reporters* in the case of Nigeria, and *La Nouvelle Tribune*, *La Nation* and *L'Événement Précis* in the case of Benin Republic. Our findings show that linguistic features such as morphological coinages, labelling, high level use of adjectives and adverbs, among others are common among Nigerian and Beninese online hate commentators. These features have implications for national development in both countries.

OYARZO, GEMITA* (*Escuela de Ciencia Política, Universidad Diego Portales*)

Life after Struggle: Transformation of Left-Wing Militant Identities during Post-Dictatorship Chile (1990-2017).

The paper presents some results collected in an ongoing research about left-wing militancy transformation in post-dictatorship Chile. Firstly, through a micro sociological approximation based on comparative case studies and an analysis of biographical itineraries, the research reviews various social and political processes of militant identities transformation. Three biographical levels are considered: in a first level, the work describes the forms of political participation; the relationships between political organizations during the dictatorship and, the disengagement or changes of political parties during the 1990s. In a second level, the paper approaches the career development and labor trajectories from 1990 to 2017. Finally, the research deepens into familiar and emotional histories of the interviewees. The paper shows how these three dimensions of the militant life are keys to understand the social mechanisms that explain the transformations of political identities of left-wing militants.

Secondly, based on those empirical evidences, the paper comment main analytical challenges posed by life stories methodological approaches: (a) the justification and advantage of its use and (b) the limits of interpreting evidence following the contributions of the sociology of militancy. The cases analysis allow the review of two new theoretical frameworks: political generations and the sociology of the individual. I argue that both approaches can better explain the transformations of the political identities of left-wing militants during Chilean post-dictatorship.

Identity, Recruitment and Initiation Ceremony of Youth into Cybercrime in Metropolitan Lagos

The increasing accessibility to the Internet is marred by new waves of crime such as website cloning. Although, there have been studies on cybercrime, the traits and recruitment system for youth involved have remained largely unexplored. The study adopted diffusion of innovation, globalisation, differential association and space transition theories. The study design was exploratory involving the use of qualitative methods of data collection. Four localities with preponderance of cybercrime in Lagos State were purposively selected: Surulere, Ikotun, Badagry and Bariga. Data were collected from youth involved in cybercrime (guided referral method), officials of Economic and Financial Crime Commission, Nigeria Police and cybercafé managers through In-depth Interviews, Case studies, and Key Informant Interviews. Through participant observation, youth involved in cybercrime were interacted with repeatedly over a period of five years to understand frequency on the Internet, online behaviours and offline activities. The data were content analysed. Cybercrime has local names that correlate with

the language of youth involved in cybercrime. Youth involved in cybercrime were mostly identified with pseudonyms such as *Package Boys*, *Apako Master* and *Mighty*. They often have physiological traits like hardened fingertips and end of palms and they dress excessively, adorned with jewelry. Recruitments into cybercrime were purely voluntary, but the initiation ceremony is a 6-stage process that includes Adaptation, Familiarisation, Integration, Independence, Collaboration and Identification. Youth involved in cybercrime evolved distinct traits and were sustained by the sophistication of both the Internet and cybercrime in Lagos State, Nigeria.

Cultural Drivers of Health-Seeking Behaviours Among Black Sub-Saharan Africans Living with Type 2 Diabetes: Ethnographic Perspectives

People of Black sub-Saharan African (BsSA) origin in the UK have increased susceptibility of being diagnosed with type 2 diabetes compared to the general White population. Self-management is central in halting the progression of diabetes-related complications. However, little is known about the cultural factors influencing self-management behaviours among this population. This ethnographic study explores this disjuncture, which results from the gap between the biomedical model of treatment and people's subjective practice of healing based on narratives of people living with type 2 diabetes among the BsSA communities. Care for people with type 2 diabetes needs to incorporate an understanding of broader socio-cultural perspectives of disease management.

Analysis of data was informed by the PEN-3 public health cultural model which moves beyond individualistic and bio-medical explanations of diabetes. This theory posits a multifaceted causal model in which cultural beliefs and identity operate in recognised illness experience, outcome expectations, and perceived facilitators in self-management behaviours and well-being. The study findings present the interface between these behaviours and health-seeking practices. Cultural belief was found to be of paramount importance in self-management of diabetes. Culturally appropriate advice and services from healthcare providers and the significance of narratives of people in managing diabetes, in particular for informing ways of optimising healthcare services among BsSA communities are critical. A broad interpretation of individuals' narratives of diabetes, their social and cultural context and their relationships with healthcare providers contributes to the debate about power relations between providers and users of healthcare. People's beliefs and experiences in their collective ability to achieve behavioural change play a fundamental role in the policy and public health perspective to health promotion and disease prevention.

OYEWOLE, DAMILOLA* (Nottingham Trent University)

Towards a Person-Centered Healthcare System: Experience, Voice and Needs of People Living with Type 2 Diabetes Among the Black Sub-Saharan African Communities in the UK

The prevalence of type 2 diabetes as a multifaceted public health issue has become a growing health problem, particularly among people from the Black sub-Saharan African (BsSA) communities. However, preventive treatment measures and management of this condition in these groups remain fragmented due to lack of consideration of the role of cultural values and beliefs on health-seeking practices. Cultural beliefs significantly influence individual's health-seeking behaviours, which consequently can have considerable implications on how they interpret treatments, self-manage their condition and engage with medical regimens. African health-seeking behaviours and choices of treatment are embedded in their cultural background and beliefs, often creating disengagement with formal health care and services. When such situation arises, they seek treatment from both conventional and unconventional care systems, which further reflect the impact of socio-cultural factors.

This study presents the narratives from 22 BsSA living with type 2 diabetes and 10 healthcare providers. The findings suggest that the experiences, perceptions and treatment goals vary among the BsSA communities. People seek treatment approaches that they trust and found to be liveable, manageable and efficient. Thus, they develop systems of self-management and healing suitable for their beliefs, values and personal priorities. Self-management play a significant role in the overall management of type 2 diabetes because it directly contributes to the effectiveness of other biomedical treatments and management measures. The study sheds light on the cultural strengths and synergic roles of people's narratives in their healing process in achieving optimal health outcomes. Developing engagement tools that are firmly grounded in individual perspectives, experience and identity could facilitate the development of culturally appropriate interventions to modify beliefs and support management behaviours among these communities.

Integrated Mobility System in the City: Urban Infrastructural Innovation Towards a Low-Carbon Society

Cities are a space that contains key systems for our lives, such as housing, transport and local energy networks. As national governments set targets to aim to reduce carbon emissions, cities are increasingly expected to play a major role in transitions to low-carbon society. Focusing on transport, this paper examines the case of an integrated mobility system in a Japanese city to understand how new urban infrastructures link to sustainable lifestyles. Our empirical study is situated in Kashiwa City, Chiba Prefecture. The city is located 31 km east of Tokyo and has a population of c.414,000. It is well communicated with three major railway lines, and 42 per cent of the population commutes to Tokyo. In light of climate change and global warming, and also aging society, Kashiwa aims to become a city where people can live without excessively depending on cars and can cycle and walk safely by improving local transport infrastructures such as public, community and shared buses, and associated facilities. This city-led integrated mobility strategy brings a diverse mode of transport together through ICT and provides people with necessary support for their daily lives. In this paper, we first investigate how the city facilitates such an integrated system and how actors in the local mobility system such as railway companies and technology providers envisage the local transition to a low-carbon city that are universal and inclusive. We then explore how users perceive and experience this new system and identify policy implications.

Power Struggles in the Construction of a Modern Nationalist State: Locusts, Kurds and the Turkish Republic

Inspired by the theoretical studies focusing on the modern nationalist state's characteristic to reshape both social and natural worlds, this paper sheds light upon the increasing swarms of locusts and Kurdish revolts seen in Turkey during the decade following the establishment of the Turkish Republic. The newly established nationalist state had to deal with the Kurdish revolt in the eastern province of Agri around the same period as the swarms of locusts. By means of an exploration of the documents from the Prime Ministry Republican Archives, Parliamentary Minutes, laws and the press reflecting nationalist discourse, I argue that both natural and social resistance by the locusts and the Kurds was represented from within the same discursive framework. Likewise, both of these natural and social resistance was crushed by the modern nationalist Republic by means by the use of state power. Inspired broadly by such critical fields of study as social history, Subaltern Studies, post-colonial criticism and environmental studies, this paper attempts a discourse analysis of the above-mentioned primary sources in light of the relevant secondary literature and in the political, historical and social context of early Republican Turkey. This paper extends the modern Republican representation of and struggle with locusts to its homogeneous nation-building project in which the Kurds are represented as beast-humans. This paper criticizes the official ideological discourse adopted by the modern nationalist state picturing the Kurdish population as primitive and savage drawing an analogy with beasts found a wide coverage in the press in that period. Imagined as beast-humans, the Kurds' revolt was also suppressed by the same military power deployed to suppress the swarms of locusts.

AI Labor Market: A Nightmare or a Chimera?

Technological enhancement can be rendered as a game of hazard for the working class. As a consumer, technological enhancement whets one's appetite, and yet, as a laborer, one can react as a luddist by the fear of unemployment. This fear of unemployment is not a mere illusion, especially for an unskilled labor. And it can be expected for an unskilled labor and for social groups, who are destined for supplying labor for unskilled jobs, to be against technological enhancement. But there is also a recently emerging form of the fear of unemployment because of the achievements of AI technology for skilled jobs. Till now, technological enhancement, while undertaking some drudgery and some occupations, has created new forms of jobs and new occupations. However, as a result of information revolution and the exponential progress in AI technologies, the latter does not seem to be a warrant for the relief of skilled human laborers. At the other end of the trade-off analysis, there lies the expectancy for AI technologies for better life conditions for all. The odds for the dangers of AI for skilled human laborer seem to be increasing. This can be rendered as a potential threat against technological enhancement. For the other part of the conflict, the most effective motivational instruments for the functioning of capitalist mechanisms, namely

money and consent, have no impact on any potential AI laborer, at least for now we do not have sufficient grounds to think otherwise. Furthermore, as a result of the increase in the unemployment of human laborers, the consumer population would diminish immensely, which would reduce the sales of goods. As a result, the enhancement of AI technology can be rendered as a threat both for capitalism and for the wealth of working class.

Free Speech on Hateful Thoughts: Building Barriers Vs. Setting an Open Discussion

Free and just society seems to be a widely accepted motto of our age. Yet, in certain cases being free and being just seem to be in conflict. The conflict between the concept of freedom of speech and the concept of hate speech provides a prominent exemplar.

In this paper, I compare various conceptions of hate speech and critically evaluate the assumptions behind these conceptions, and considering the goals of the use of this concept, I question the condition of freedom of speech in a public medium where hate speech is restricted.

In response to my standpoint, one can provide certain restrictions the notion of hate speech. And yet, under this restriction, this notion would continue to be in conflict with freedom of speech. Furthermore, it would undermine the grounds for a just society and reinforce the barrier between opposing or at least differing social groups.

In order to build a just society, following Mill, I propose to face with hate among individuals or groups and with discriminatory thoughts and understandings, rather forbidding individuals to express these sentiments and thoughts. Otherwise, the walls among individuals and groups will continue to be built by those who oppose to publicly discussing prejudices and real discriminations pervading our quotidian lives. In proposing this open discussion, I appeal real life examples, taken from Turkey, focusing on hate speech cases addressed towards different religious groups or taken to be addressing religion as a whole.

Cross Cultural Marriages in Toronto: An Ethnographic Study

This study focuses on immigrants living in Toronto migrated from Turkey and particularly married cross-culturally (mix-married). This paper is part of a postdoc research held in 2016-17. Turkish immigrants living in Canada work as skilled professionals (white-collar employees), qualified staff (blue collar employees) and workers. However, these three categories are not sufficient to represent all the immigrants, among whom there are refugees, investors as well as the women who are in Canada for the education of their children. Cross-cultural marriages are very common among Turkish immigrants. Especially, young immigrants tend to get married to the immigrants from other countries. But in some Alevi-Sunni and Kurdish-Turkish marriages, the families' objection might be a problem in the marriage even after many years. In this study, immigrants define themselves regarding their ethnic and religious identity (for instance Turkish, Kurdish, Muslim, Christian, Sunni, Alevi, and Canadian). Cross-cultural marriages are categorized as following diverse groups: Turkish-Kurdish, Sunni-Alevi, Canadian-Immigrant, and Immigrant-Immigrant. 12 families are interviewed; representing three from each category. In-depth interviews, photo elicitation technique and family albums (photographs) are used in data gathering. Each family photograph displays the traces of public or/and private domains, daily life and possibly presents certain details such as family life, class structure, belonging, political attitude, intellectual attitude and future expectations. It is adopted self-reflexive approach in this research. The snowball sampling employed to determine the participants is also self-reflexive. The researcher reached the participants through the key informants with whom the researcher met by virtue of her own experience. Although participants were determined according to the research categories, it was only possible with the researcher's cultural adaptation and her network of relations in this context. In this paper, family relationships and interaction, acculturation processes, religion and socialization as a family in community and cultural identity are analyzed within these families

Development of Service Innovation – a Transition to Electromobility in Urban but Rural Structured Regions in Germany.

Urban mobility solutions changed and new mobility in case of electromobility is intended with a huge potential of sustainable innovation. According to Sheller and Urri (2006), the dominant role of automobile path-dependency results in a

development deadlock. Development towards new mobility is a transformation of values and a social change by introducing new social and economic structure that change mobility habits, practices and values and are strongly socially influenced. Urban mobility solutions are changing.

Development is considered as the expanding of possibilities and capabilities (Sen 2003). Younger generations currently undergo a transformation towards a sharing and collaborative economy that includes a mobility change to share automobiles.

This paper presents a research project with the goal to promote the framework of service innovation for electromobility in an urban and rural structured area with a high automobile-dependency. We work with the contextual-relational approach by integrating all actors in this process. This is a networked innovation cooperation with regional companies and the city council. Changing the mobility culture takes time and is unlikely. But it becomes possible by recreating the context and framework of mobility.

The major results of our field study focus on two factors: the mental approach to mobility options and the infrastructural conditions. User acceptance of electromobility is indicated to play a key role in terms of new mobility. The probability of rational justified changes is lower than raising the emotional perception by using and testing electromobility that has positive effects on its social acceptance. Users share positive contagious emotions that we know from crowd research. We call it the "coolness resp. flow factor" of electromobility. Future mobility isn't about less mobility, but rather a different way of being mobile and using different types of mobility solutions.

ÖZDEMİR, FERIHA* (*University of Siegen*)

SAID, CHRISTOPHE (*University Siegen, Department of Innovation and Competence Management, Faculty III*)

Future Mobility in Case of Electro-Mobility in a German Regiopolis

The future of mobility, especially electromobility in the mobility culture of the industrialized countries, is a major challenge. Electromobility is intended with a huge potential of sustainable innovation and will emerge in urban areas. Urban mobility solutions are changing and become multi-modal sharing systems which combine different mobile alternatives. Nevertheless, changing the mobility culture means changing mobility habits, practices and values and allaying fear of new things.

Younger generations currently undergo a transformation towards a multi-modal sharing system and collaborative economy. Both are regarded as interventions against the automobile path-dependency (Urri 2006). The transition into electromobility is a chance for urban regions to design an environmentally friendly mobility form (German Federal Ministry of Economics and Technology 2016).

This research project works with the contextual-relational approach that integrates all actors in this changing process. The goal is to design and promote a framework of electromobility in an urban area in Germany with a high automobile-dependency. This happens by a networked innovation cooperation with regional companies and the city council. The transformation of the mobility culture towards new mobility solutions happens in four separate but collaborative service development processes.

One of our main results show that the emotional perception by testing and user experiences of electromobility has great impacts on our goal which raises the "coolness" resp. "flow" factor of electromobility. This positive effect leads to its social acceptability. Due to the emotional perception, we are currently testing a Canadian e-Bike-Sharing-System (electrobikes) in a two-month field test. The initial results confirm the flow factor and the social acceptability in case of e-bikes and stimulates interest for further electro-mobility. Experiencing electromobility by using allays the user's fears of them.

Future mobility isn't about less mobility, but rather a different way of being mobile and using different types of mobility solutions.

The Concept of Personality in Durkheim----Generality, Commonness, Abstractness, and Universality

Emil Durkheim, the founder of sociology, supposed the "society" as a domain of investigation and proposed the methodology of "sociology" which is applicable to the society. In this way, he declared the independence of sociology. This presentation is an attempt to reexamine his sphere of study and his analytical method by his concept of "personality."

First, about the domain of "society", as is generally known, Durkheim declared to regard it as a "thing" external to the individual. For that purpose, he made the subject of his research not an existential "person" who has vivid individuality but anonym "personality." furthermore, he introduced an expression of "impersonal personality" seemingly contradictory.

Secondly, about sociological methodology, Durkheim emphasizes the scientificity of sociology. For him, "scientific" method means to extract the common character from each concrete things and to abstract the other elements. The

point that this presentation will give attention is "to be general, is it the synonym of to be universal?" Durkheim considers that social "science" must observe, examine, and analyze the general human person, rather than individual person. However, such generality acquired by extracting empirical scientifically the element common to man, is it the universal explication of the essence of humanity? Does commonness guarantee universality? Does abstractness guarantee truthfulness?

In this presentation I will question again the appropriateness both of the Durkheimian idea of personality and the scientific methodology to elucidate it.

Agency and Intersectional Identities of Syrian Refugee Women: Refugee, Women, Widow and Religious

By using interviews of twelve Syrian female refugees who became widows during the civil war in Syria, this paper examines how the intersectionality of widowed Syrian women refugees' gender and class identities along with their religio-politic standing shape their expectations for their current life in Turkey. The paper scrutinizes the complexity of refugee identities, their multiple experiences and perceptions about the conflict and ordeals of being a refugee. The analysis suggests that being situated as widows in a foreign country along with their religious, gender and class identities affect their everyday agency while it reshapes their understanding of Syrian politics in the future. Findings also help to understand transborder re-making of the social interactions; that is, how, physically displaced yet emotionally embedded Syrian refugees in Turkey, who are at the intersections of gender and religion, are now facing the challenges of reproducing the social structure, caused by the tensions between the home and the host.

Hegemony of Visuality: Fashion and City Branding, the Case of Istanbul

In today's global capitalist world, city branding is one of the significant methods for the cities to appeal global interest and to claim global city identity. In this context, engaging with fashion turned into a kind of marketing and branding strategy for cities to attract global capital. Fashion is a vital sector for global capitalism. It persuades consumption by creating and imposing images of self representation, and also production relations in fashion sector are in accordance with global capitalism's dynamics.

Istanbul is one of the significant global city in where fashion sector expanded remarkably over the last decade in accordance with the integration of the city to global capitalist market. Istanbul branded as a fashion city with the appearing of different activities, organizations, publications. Branding of Istanbul as a fashion city has specific aspects that are in collaboration with both global and local dynamics.

This paper is going to analyze these conflictual and overlapping aspects by focusing on fashion sector's relations with global capitalism. How does living in an urban space that is dominated by fashion activities, fashion selling malls, fashion tv programs, fashion related jobs affect dweller's everyday relationship with the urban space and their way of self-representation? How can the organization of the urban space as a fashion capital be debated by using "right to the city" arguments? David Harvey asserted by referring to Henri Lefebvre that "right to the city is far more than the individual liberty to access urban resources, but it is a right to change ourselves by changing the city". How does fashion city image affect dwellers' "right to the city" experiences? How does new identity of Istanbul, being a fashion capital, affect the answer of 'what kind of city we want'? This paper is going to inquire this questions by focusing on Istanbul.

A Critical View to the Idea of Rising of Conservatism in the University Graduates in Turkey

A Critical View to the Idea of Rising of Conservatism in the University Graduates in Turkey

Even though it's getting weaker, there is still a common idea in Turkish politics that well-educated people support the left-wing political parties and contrary, under-educated people support the right-wing/conservative parties. In Turkey Values Atlas (by Prof. Yılmaz Esmer, 2012) the comparison of 1990 and 2011 data also indicates that conservatism has risen dramatically in university graduates.

It may partially -or at the end - true but, the situation is more complicated than this. It is necessary to know the political background in the meaning of populist and ideological policies. Hence, we can go to some paradoxes of liberal democracy.

So, main research questions here:

1. How are higher education and politics intertwined between 1990 and today?
2. What are the social and political effects.

Breaching Internal Confidentiality in Biographical Research

The violation of internal confidentiality is a pervasive and troubling ethical and epistemological problem. Confidentiality is a key ethical principle in the American Sociological Association Code of Ethics. However, it fails to address the potential harm from internal confidentiality. How do we expand the principle of confidentiality to avoid risks to insiders from other insiders? How do researchers protect privacy without harming integrity of research and writing? I highlight theoretical and practical aspects of internal confidentiality in relation to my biographical research on different generations of Turks in Germany. I seek to engender discussion of particular strenghts and weaknesses of potential institutional and individual solutions at different stages of doing biographical research: conceptualization, consent, interview, analysis and writing.

Military Leaders' Education and Training for Crisis Management Environments: Perceptions of Its Suitability for Adaptive Expertise

The paper analyses military leaders' perceptions of their military education and training for their missions. The main research questions are: (1) What are the military leaders' perceptions and understandings regarding their experiences of military education and training for their crisis management missions; (2) how do they evaluate the suitability of this preparation for their adaptive expertise? The study is based on interviews which focussed on officers with concrete command experiences in an asymmetric environment at a platoon, company or battalion level. The interviews (N=247) were conducted in 8 countries – Bulgaria (N=60), Cameroun (N=33), Denmark (N=26), Finland (N=25), Lithuania (N=4), Italy (N=43), Philippines (N=29), Spain (N=27) – by a native researcher using an identical interview protocol in every country.

The study's theoretical underpinning is linked to the concept of adaptive expertise. Hatano & Inagaki (1986) initially conceptualized routine and adaptive expertise. Routine experts are highly efficient in a specific domain due to habitual usage of knowledge and extensive experience (Pierrakos, Anderson & Welch 2016). They are fluent in applying known schemas or procedures to familiar problems or situations in a stable environment but lack flexibility and adaptability to new problems. Adaptive expertise is built on these skills, but the difference between routine experts and adaptive experts is that the latter can adapt their previous knowledge to novel situations and become quickly accustomed to change (Hatano & Inagaki 1986).

Adaptive expertise is particularly linked to knowledge transfer and the development of expertise. This requires interaction and different forms of cooperation between education, (pre)training and work environment. The results allow us to suggest the kind of training and preparation that is necessary to meet and transcend the challenges in crisis management environments. They will also enable us to determine whether a new kind of definition of leadership is needed.

Shifting Ground? Government Influence in Health Professional Governance in Australia

National reform of health workforce governance was implemented in Australia in 2010 in response to a series of public safety and socio-political concerns, risks and scandals. At the core of the changes was the creation of an operational agency – the Australian Health Practitioner Regulation Agency, working alongside fourteen profession-specific National Boards. The objectives of the National Registration and Accreditation Scheme for the health professions extended beyond the traditional and expected scope of protection of the public to encompass wider concerns of workforce mobility and workforce responsiveness to healthcare needs.

This paper reports on document analysis and key informant interviews conducted in order to analyse evolution of the national scheme. We have characterised the influence of governments in the new scheme as a hydra-headed monster. A hydra concurrently occupies a unitary and multiple identities, which is a helpful analogy for a collection of federal and state governments with individual interests who also hold standing as a single Ministerial Council.

This new national scheme is consistent with a model of 'quasi-independence'. The paper also canvasses critiques of the scheme, and concludes with a consideration of the relative influence of governments before after this most significant national reform in health professional governance.

Intra- and Extra-Marital Couple Relationship and Well-Being in Contemporary Japan

Delayed dating, kissing and sexual experiences among Japanese adolescence and (married) couples, who do not desire any sexual intercourse with their spouses are defining characteristics of Japanese couple relationships in contemporary society. Although sexlessness and passivity in romantic relationships are widely observable, recent survey data nevertheless reveal an increase of men and women in the age of 40s to 60s with sexual affairs other than their spouses. In addition, the social acceptance with regards to sexual affairs, under the condition that they do not negatively affect their family, has increased.

This paper focuses on the discourses revolving around sexless couple relationships and extramarital affairs from 2000 to 2017 and on interview research con-

ducted with 42 Japanese men and women in their 20s to 40s. The aim of this study is to clarify the transformation and the characteristics of the Japanese sexless phenomenon and extramarital affairs, including the changes in the meaning of sexuality in intra- and extra-marital affairs. More men and women want to discover their sexuality through extramarital affairs, which they cannot experience with their own spouse. Even if they desire a satisfying sexual life in their marriages, the lack of education regarding sexual health and the benefits of sexual satisfaction for both sides in a couple relationship leads to difficulties in understanding how sexuality and family-life can be combined. Alternative discourses that attempt to explain the Japanese particularities of contemporary sexuality in terms of the unique Japanese culture can be dismissed.

PAETAU, MICHAEL* (*International Center for Sociocybernetics Studies, Bonn, Germany*)

Stabilizing Normative Contradictions: A Sociocybernetic View on Power.

The challenge of "Critical Sociocybernetics" has to fight with a very essential antinomy: On the one hand there is the denial of the idea of an comprehensive rationality of society as a whole. This corresponds with the tradition of the scientific and rationality critique of »Frankfurt School« (Horkheimer & Adorno 1944) as well as with Luhmann's »Theory of Social Systems«. From the outset Habermas was in doubt if a complex society could emerge an reasonable identity (Habermas 1962). And already Adorno warned of any attempt for societal control, guided by references to a rationality related to the society as a whole. Adorno suspects that this kind of control generally will not hesitate to use media, like power, to accomplish an irrational state of society too (Adorno 1972). Luhmann makes a step further. He does no longer ask whether modern and functional differentiated societies could establish a rationality. For him there is no doubt: They cannot! But on the other hand, Sociocybernetics cannot ignore the question: How is critical thinking possible within a polycontextual society, not accepting universalism? An answer to this question we can expect from a scientific discipline facing complexity and polycontextuality and works with an adequate epistemological approach: the observation of the observation. For a critical view on society, based on sociocybernetic thinking, it can no longer be the task to develop a model to justify the ability for the agreement of universal norms. But in question is: How it is possible to stabilize normative contradictions within a functional differentiated and polycontextual society? In my contribution I try to give an answer to this question exemplified by the the concept of »Power« which plays a very important role for social steering in all cybernetic and socio-cybernetics literature as well as in plenty of post-structural and post-colonial publications.

PAHK, SANG-HYOUN* (*University of Hawaii at Manoa*)

Fantasy and Outrage at the Farmers Market

This paper examines farmers markets as a particularly resonant space of ethical consumption. Media panic about vendors selling nonlocal produce at state certified farmers markets in California prompted the passage in 2014 of a bill that enabled extensive surveillance of farms and increased penalties for violations -- including, remarkably, the possibility of jail time. Proponents of farmers markets and local food celebrated the bill without acknowledging the obvious contradiction. The question here: what kind of cultural logic endorses "know your farmer" and "police the farmers" at the same time? Based on media analysis and participant observation at farmers markets, I examine how ethical consuming subjects are constituted in discourse and material practice. Popular ethical consumption discourse (e.g. "vote with your dollar") tells us we are responsible for the effects of our purchases, but those effects are often difficult to untangle. Unlike supermarkets, farmers markets presumably allow us to "know" farmers and their practices, and thus happily take responsibility. Farmers markets are sites where we can consume the right things for the right reasons in the right way. Such consumption, we are told, produces desirable effects for the environment, our health, and the "community." But efforts to enable (from the perspective of market managers) or inhabit (from the perspective of consumers) this ideal mode of consumption inevitably fail, producing a range of affect-laden responses. These include the celebration of a bill that appears to contradict the whole point of farmers markets. These also include efforts to exclude consumers who show up at farmers markets for the "wrong" reasons or consume in the "wrong" way. All of these responses tend to exacerbate existing inequalities along classed, but the particular cultural logic at work renders those effects difficult to see -- even (perhaps especially) for the most well-meaning consumers.

Central Banking in Transition: Knowledge Production and Distribution in the Federal Open Market Committee

Central Banks have made an unparalleled career in the preceding and the ongoing century. Today they are the "master sensemaker" (Abolafia) in most of the economies around the world. The transition of central banking in the long run is not only based on modified ways of policy operations but also on historically different types of knowledge that are utilized for executing monetary policy. The presentation will give an insight in our current research project which monitors the changes in knowledge production and distribution in the Federal Reserve in the period between 1977 and 2010. It is conducted as a discourse analysis of the communication process in the Federal Open Market Committee based on the verbatim transcripts of its meetings. Our project is rooted in the recently emerging sociology of economics. The sociology of economics addresses similar issues as economic sociology but is processing them with the analytical instruments of the sociology of knowledge and the sociology of science. One of the most prominent approaches in this research area is concerned with the performativity of economics: the production of economic reality according to economics. Drawing on this strand of research, our leading questions are which kinds of macroeconomic knowledge are issues at the Fed and how the transformation of academic knowledge into policy-relevant knowledge is conducted. The analysis of our data shows that macroeconomic knowledge in the Federal Reserve of the 1970s and 80s is a different species than the one stemming from academia. And even if academic macroeconomic thinking became more prominent in the Fed in the 1990s and 2000s, this cannot simply be understood as a performative effect. In the Fed, macroeconomic models have to be pragmatically translated and merged with other types of knowledge to form a different regime of problem solving than the one found in academia.

The Resonance of Pegida: Right-Wing Populism Beyond the 'Losers of Globalization'

The rise of the right-wing populist protest movement Pegida (Patriotic Europeans Against the Islamization of the West) in Dresden since late 2014 signals a major shift in the post-reunification German political landscape. Its mass visibility and enduring presence indicate that the country can no longer be considered immune to expressions of unabashed nationalism, as made clear by the recent electoral breakthrough of the Eurosceptic and anti-immigrant party AfD. The unexpected character of Pegida's rise lies in its appeal to 'ordinary citizens'. The movement attracts a broad spectrum of people, including those from the middle class who don't necessarily identify with right-wing politics and emphatically distance themselves from neo-Nazis. What, then, explains Pegida's resonance? Drawing on participant observation at a Dresden rally, Pegida position documents and television interviews with Dresden demonstrators, this paper argues that Islam is not the single issue that mobilizes Pegida supporters. To be sure, the analysis shows that nativist and neo-nationalist sensibilities about Germany, Europe and Islam expressed by Pegida leadership and local demonstrators are permeated by attitudes of cultural pessimism, salient in fears of 'foreign invasion', demographic decline and 'parallel societies'. Yet, there is more to Pegida's appeal than its anti-immigration platform. Feelings of resentment tied to socioeconomic concerns occupy a prominent place in grievances voiced by Dresden protesters. This is most salient in expressions of economic chauvinism directed at 'parasitical foreigners', who are believed to put undue strains on the labour market and welfare provisions. The movement translates social insecurity fostered by neoliberal restructurings into a sense of cultural threat. Nevertheless, the paper takes issue with the oft-repeated claim that right-wing populism appeals chiefly to the 'losers of globalization', as Pegida supporters' cultural and socio-economic anxieties constitute less a reaction to actual loss of status than fears of losing out in the future.

Military Identity in French Air Force : A Paradoxical Trend to the Militarization

Military identity as professional identity is varied, constantly evolving and is the result of interactions. Therefore the classical theories of change in military profession are built on the existence of genuine, unique and homogeneous military identity. This point of view can be useful to demonstrate a process of convergence with the society. But it seems inappropriate when studies are focused on services, specific units within armed forces.

In other words, "to be military" can have different meanings according to the membership to one or another one part of armed forces. To study impacts of social, institutional and technological changes, it is necessary to consider this diversity.

The case of airmen in French armed forces is interesting because it allows to underline a different way "to be military", and how some evolutions tell about their military identity. Air Force can be considered as "Industrial Model" (High ratio combat/support units, well-educated people, over-representation of commissioned and non-commissioned officers, etc.). Airmen are considered sometimes in funny way as "not-practising military" (related to "practising Catholics"). Some airmen are considering themselves as far away from the military job. But since 15 years, organizational reforms (jointness), increase of interior and overseas missions and technological innovations transform their all-day life. In this case, airmen identity seems change in two different directions : reflections about military commitment by combat units and remilitarization of support units. This paper will try to enlighten these transformations in the French Air Force.

Bringing Relationality and Processuality to the Field: The Outcomes for Empirical Research

In my presentation I ask *how the theoretical underpinnings of relationality and processuality can be translated into the creation of the researcher subject and what kind of the challenges they pose for ethnographic praxis.*

The ethnographer is considered as an a priori condition for knowledge with a rather fixed set of qualities (e.g. ethnicity, class, gender) that make up the position of the researcher. Reflexivity towards the fixed position of the researcher is, then, needed before embarking on the fieldwork in order to assess how the subjectivity of the researcher affects the data gathered and the interpretations produced.

I challenge such a pre-fixed understanding of the researcher subjectivity. Drawing from A.N. Whitehead's (1985 [1929]) conception of subject, or superject, as emerging in concrescence, that is, in relation and contact with various elements at play in a given event, I argue that the researcher-subject comes to exist in the research process, and does not exist prior to it (cf. Barad 2007, Michael 2016). The researcher-superject is created and dissolved anew over and over again with entities in the present but also some stemming from the past. I analyse this process through empirical research in the settings of 1) children's day care, 2) activating workshops for the youth who have been left outside of employment and education, and 3) the home environments of children.

Interpreting the researcher-superject as emerging relationally and processually challenges the straight-forward use of reflexivity as the scrutiny of the researcher's position at the beginning of the research. I argue that this use of reflexivity cuts the process of emergence of the superject and detaches the researcher from the process of the research. To adjust reflexivity to processuality and relationality I suggest that it should be taken as one entity in the concrescence, not as a detached measure.

Role of Leisure in Development: A Study of Hill State of Uttarakhand, India

Modern societies are often characterized as leisure societies. Leisure is time to relax, relaxation from work and working atmosphere. India is a fast growing country but the difference between the economic groups is still quite wide. India has a variety of economic groups from top to bottom income level. Leisure industry is connected to both, top and bottom of the economic order, imparting leisure services to the top order and providing economic opportunities to the down order of economic groups. These leisure providing agencies give services to those having money and while doing so give economic opportunities to economically backward localities. Present study is an empirical study of leisure resorts situated in hill state of Uttarakhand, India. This is a descriptive as well as an analytical study in which role of leisure agencies or resorts in providing economic opportunities to the hill people is analyzed. In absence of these economic opportunities they are forced to migrate to other areas. Objectives of this study are: (1) To describe the leisure activities provided by these resorts. (2) To study the role of resorts in the development of local/ regional people. (3) To study the revenue generated for tourism industry by these resorts.

The resorts are providing a variety of good leisure/ recreational activities to people having busy working schedule. Some resorts are also organizing adventure camps. Popularity of some resorts is so good that celebrities from distant places come here continuously for their vacations. These resorts give job opportunities to local people. They also use locally grown vegetables and flowers and give opportunities for organic farming, horticulture, and floriculture. A practice of home stay is also there in which locals give a homely atmosphere to the tourists and this helps them economically and also boosts up the revenue for tourism industry.

RC04-90.2PALMA AMESTOY, CARLOS* (*University of Bristol*)*Privatisation and Social Reproduction: Higher Education in a Neoliberal Environment*

The wave of neoliberal reforms launched in the 1970s and crystallized during the 1980s and 1990s have brought a new landscape led by ideas such as deregulation and privatisation. Today neoliberalism is a hegemonic discourse incorporated in individuals' common-sense while the market seems to colonise every dimension of human action (Harvey 2005). Under these conditions, education has been one of the main targets of neoliberal policies. This means that the state withdraws in favour of the market while students become consumers of a private good: education. In the case of higher education, terms as marketisation, privatisation and commodification have been increasingly gaining attention. Although the situation varies from country to country, there is growing corporate culture (Giroux 2002) penetrating the area. At the same time, the composition of higher education has dramatically changed during the last few decades. Indeed, the population is increasingly entering this level of education (Marginson 2016), a phenomenon that has been called the massification and the universalisation of higher education (Trow 2007). The system, therefore, seems to leave its elitist character to integrate a broad range of social classes, which may be understood as the democratisation of tertiary education. It is in this context where the question about the reproduction of social classes and social inequalities through higher education becomes relevant. Focusing on the case of Chile – an experimental case in terms of neoliberal policies (Harvey 2005; Bellei and Vanni 2015) – and in light of the theoretical framework of Pierre Bourdieu (1979; 1990; 1996; 2010), this paper analyses the relationship between the growing privatisation of tertiary education in the country and social reproduction. As a conclusion, this work contends that privatisation has acted as a mechanism that has reinforced the segmentation of the student population and the reproduction of social inequalities in society.

RC04-82.4PALME, MIKAEL* (*Uppsala University*)*Family Assets, Habitus and Educational Strategies in Local Contexts: The Impact of the Swedish Market Reforms of Compulsory Education*

The paper synthesizes the results from a larger study of the significance for social groups' educational strategies of the market-oriented reforms of compulsory education in Sweden in the 1990s. The transformations of the supply of compulsory education is mapped out in three regions with different characteristics – the rural Bergslagen, the university city of Uppsala and the densely populated Stockholm region. Using correspondence analysis of indicators on inherited assets of all pupils changes are analysed of the social structure of the local educational spaces in which families' educational strategies unfold. Approximately 200 families representing different social classes and fractions are interviewed, exploring how families with different volume and composition of assets navigate in the educational landscape.

While the analyses confirm that compulsory education primarily is structured along an opposition between groups rich in capital and groups with weak assets, a second opposition appears between cultural and economic fractions. In demographically dense areas, where marketization has led to a sharply increased supply of schools, the culturally rich families, whose habitus traditionally favour public education and cherish Bildung-related values, find themselves in increased competition with families close to the economic sector who celebrate utility and competitiveness. While part of this struggle is resolved by the rise of schools with particular profiles, such as music classes, the educational competition promotes increased pupil mobility in search for the best education, imposing carefully monitored, strategic educational choices also on families who resent them. Interviews testify to that educational strategies need to be understood as part of reproduction strategies in particular local contexts where a multitude of concerns consumes families' time, effort and assets, such as habitation, work opportunities, economic conditions, transport, the availability of different leisure activities, the existing supply of education, and, not least at all, family and social networks.

RC16-304.3PALMER, DAVID* (*Hong Kong University*)*Spheres of Solidarity, Moral Codes and Civil Society in China*

Two dimensions of Civil Sphere Theory are broadly overlooked in the literature on civil society in China: moral codes and spheres of solidarity. Alexander conceptualizes the civil sphere as beginning with the performance of moral codes of inclusion and exclusion – norms that both define the boundaries of the sphere of solidarity, and that are invoked to restrict or transform non-civil practices in other social spheres. Although there is no institutionally autonomous civil sphere in China, there are "virtual" and "micro" civil spheres in which moral codes shape spheres of solidarity. However, the picture is complicated by the coexistence of three distinct moral codes derived from Chinese traditional values, from Western

liberal values, and from China's revolutionary tradition – each of which may both contribute to or detract from civil norms. I unpack and trace the genealogies of these three moral codes in modern China, and outline the binary terms by which the boundaries between solidarity and stigmatisation are drawn in each code. While the three codes appear to be contradictory, there are plenty of overlaps and circulations between them, forming norms of civility through which popular discourses hold state and social actors to account. This forms the basis of a virtual civil sphere that comes into being when state and popular actors engage with each other, creatively deploying the ambiguities and overlaps between the three codes. But these spaces, which appear primarily in local contexts, are unstable and subject to imminent collapse. In such situations, rather than strategically deploying and performing their moral codes to establish overlaps and work creatively with ambiguities, the state and popular groups each assert the purity of a single moral code, polluting and stigmatizing the other. The paper draws on cases from Chinese popular religion to illustrate the formation and breakdown of micro-civil spheres.

RC31-554.18PALMER, WAYNE* (*Bina Nusantara University*)MISSBACH, ANTJE (*Monash University*)*Enforcing Labour Rights of Trafficked Migrant Workers and Refugees in Indonesia*

The multi-directional nature of labour migration flows has resulted in an increasing number of countries having become both senders and receivers of regular and irregular migrants. However, some countries continue to see themselves primarily as senders and so ignore their role as a receiving country, which can have negative implications for the rights of migrants in their territory. Using the example of Indonesia, which is State Party to the 1990 UN Convention on the Rights of All Migrant Workers and Their Families, this paper demonstrates that irregular migrants have the legal right to protection against labour exploitation even when they work despite the government's prohibition on employment. It discusses the 'right to work', how the interpretation has been modified so that the right's underlying principles also apply to irregular migrants, how international organizations contribute to the interpretation's promotion, and how the Indonesian government has subsequently reported compliance. The paper then canvasses the institutional set-up for enforcement of labour rights in Indonesia, paying particular attention to the technical reasons why certain groups of irregular migrants are denied access. It offers two case studies about the Indonesian government's responses to an asylum seeker and person trafficked for forced labour whose situations had both immigration and labour dimensions before going on to discuss tensions between the competing policy priorities of employment prohibition and the right to protection from labour exploitation.

RC31-557.7PALMER, WAYNE* (*Bina Nusantara University*)*Prosecuting Recruitment Agencies for Human Trafficking: A Case from Indonesia*

Government and non-government observers agree that human trafficking is a feature of Indonesia's migrant labour export program. They single out the actions of recruitment agencies for particular attention. For example, the US Trafficking in Persons (TIP) Report claims that Indonesia's licensed recruitment agencies operate 'similarly to trafficking rings'. They often use deceit to secure consent, falsify identity documents and restrict the freedom of movement of female recruits especially. Scholarly work has examined how and why the state tolerates illegal behaviour on the part of agency employees. Missing from this narrative is a detailed analysis of the criminal justice system's response to evidence that these employees commit human trafficking as part of their job.

This paper demonstrates that Indonesia's criminal justice system lacks the capacity to successfully investigate, prosecute and punish corporations for committing human trafficking. First, it considers legal and political arguments for treating corporations as legal subjects in human trafficking cases. Second, the paper outlines Indonesia's current legal and policy framework for pursuing corporations that commit human trafficking and shows how the criminal justice system has treated corporations in the ten years since the Anti-Trafficking Law was enacted in 2007. Third, it presents a case study of the specific case facts and argumentation used to convict the first recruitment agency of human trafficking in 2015. In conclusion, the paper argues that in doing so, the state has set a legal precedent for handling similar crimes in the future, which has subsequently impacted practice in the recruitment industry.

RC23-440.7PALUCH, RICHARD* (*University of Oldenburg*)*Health Care without Borders? the Digitalization of Hearing Impairment*

Nowadays it is not necessary to mention digitalization's tremendous role in many areas of society. However, the digitalization process is not limited to the role of the internet alone. Laboratories as such are also becoming more technically advanced. For example, medical scientists simulate virtual scenes, in which animated characters (so-called *avatars*) interact with hearing impaired test subjects in various settings (e.g., in a cafeteria or urban road). The interaction between avatars and test subjects is recorded on video and the movement patterns of the test subjects are measured by head and eye trackers. This form of digitalization, which can be termed algorithmization, raises further sociological questions, for instance, to which extent social behavior can be measured and quantified.

This contribution deals with different forms of digitalization regarding medical care of persons with hearing impairment. Furthermore, the contribution illuminates whether and how the use of hearing aids structures the social relationships of hearing impaired persons. When persons with hearing impairment use hearing aids, it is assumed that their relationship to others and to themselves changes. The use of hearing aids is understood as technization both of care for others as well as care for oneself. Persons aided with hearing aids should be able to communicate as if they were no longer in need of care and at the same time have to be concerned if their relationship to the environment remains undisturbed due to use of hearing aids.

In order to investigate the underlying social mechanisms, an ethnographic field research was conducted for several months. The observation took place in an advanced audiological laboratory with virtual audio-visual environments. So far, not only medical researchers and test subjects were interviewed, but also observation protocols of laboratory experiments were written. The qualitative data were coded based on the grounded theory approach.

Evaluation Orientations and Working-Family Interplay Trajectories Among Different Cohorts in Transitional China: Evidence from Sequence Analysis

This paper aims to quantitatively "thickly describe" the interplay of work and family trajectories for Chinese people over 45 years old. Using China Health and Retirement Longitudinal Study (CHARLS) life course survey in 2014, by retrospectively tracing the family status and working status for the respondents from 16 years old to 45 years old, this study applies to the two most common sequence analysis methods (Multichannel Sequence Analysis [MCSA] and Global Interdependent Multidimensional Sequence Analysis [GIMSA]), and clusters the patterns of the working status and family status into five categories. We find that: the dichotomy urban and rural working statuses and the divergent number of kids after marriage are the criteria of clustering in each dimension of working and family status; patterns of working and family interplay for elder Chinese residents during their 16 to 45 years old are significantly influenced by the gender, birth of cohort, political label (red, black, or others in the 1950s), parental education level, and respondents' own educational level. Compared to the research (Aisenbrey and Fasang 2017) on the interplay of working and family status in Germany and the United States, we believe that the patterns in China are profoundly unique due to the influence of certain "socialism" and "post-socialism" policies. Heterogeneities of the working-family sequences among cohorts reveal the impact of the policies directly.

Attempts at Indigenizing Sociology: Achievements and Impediments

Modern social sciences, including sociology, developed in Western Europe and later in North America, and from there it disseminated to the rest of the world. This process created a hierarchical world social science system with its center and periphery. The critiques of this worldwide unequal division of scientific labor called for the development of independent/ indigenous sociology/ sociologies relevant to the conditions of 'southern' regions and nations. The discourse of indigenization of sociology started in the late 1970s. Since then this discourse/ movement has spread throughout the world, particularly in the developing 'south'. Many papers and books have been written, and some attempts have been made in order to indigenize sociology and create autonomous sociologies in the developing countries. After more than three decades of such efforts, it is worthwhile to study and evaluate achievements, impediments and prospects of this scientific process. In this paper, after discussing various levels of indigenization of sociology, including the subject of investigation, conceptualization, theoretical framing, methodology, data analysis and interpretation, we consider the epistemological, social scientific and political background of the indigenization discourse and the process of its development and spread throughout the non-western/ peripheral countries. Believing in the necessity of indigenization and development of independent sociologies, the proponents of this idea have attempted to indigenize sociology in their countries or regions. Based on the studies in this field, the paper then

evaluates the achievements, impediments and prospects of these efforts. Finally, supporting the idea of and the necessity for indigenization of sociology and the possibility of multiple sociologies, the paper proposes strategies to overcome some of these impediments.

Protection of Migrant's Rights and Improved Accessibility to Government Schemes: Exploring the Process of Seasonal Labour Migration in Rural India

Seasonal labour migration is a complex phenomenon, which involves long working hours, poor living and working conditions, social isolation and poor accessibility to basic amenities. Most of the migration goes undocumented, and the lack of regulation compounds vulnerability. This exploratory study aimed to examine various social networks which promote seasonal migration every year from the districts. It also explored the working and living conditions of migrant workers at the destination and the role of various stakeholders in the protection of migrant's rights and their access to various government sponsored schemes in origin and destination. The paper draws heavily on primary data collected from three migration prone districts of India. The paper is based on in-depth interviews with the migrant workers, government officials, migration brokers and owners of brick manufacturing industries and representatives of civil society working among the migrant labourers. The extensive field work reveals that the structural poverty, impoverished livelihood, geo-climatic conditions and seasonal cultivation and unavailability of alternative livelihood sources led to large scale seasonal migration from the districts to the brick manufacturing industries every year. This form of undocumented migration takes place through a social network comprising of the migration brokers either from same locality or from neighboring locality. Migration brokers distribute advances among the migrants before the start of the migration cycle. In return, they receive commission from the owners of the establishment. The migrant workers migrated with their family members who are capable to earn and work in the brick kilns till the advances are settled. In this process, migrants lack the access to the benefits of the government sponsored schemes in the origin. They can't claim the same benefits at the destination. Seasonal migrants have a different set of needs, which requires provision of special schemes for protecting their rights and accessibility to benefits.

Gender Sensitization: Problems and Strategies

Gender sensitization generally refers to theories which claim that modification of the behaviour of teachers and parents (etc.) towards children can have a causal effect on gender equality. As per the UNESCO document on Gender Sensitization 'Gender sensitivity is not about pitting women against men. On the contrary, education that is gender sensitive benefits members of both sexes. It helps them determine which assumptions in matters of gender are valid and which are stereotyped generalizations. Gender awareness requires not only intellectual effort, but also empathy and open-mindedness. It opens up the widest possible range of life options for both women and men.' Issues such as problem of sexual harassment, sexual stereotyping, dearth of counsellor sensitive to complexities such as caste, minority experience or sexuality, Lack of Special emotional and academic support of both at the personal and institutional level for students from marginalized groups, Issues pertaining to Infrastructural and Health Facilities, Lack of encouragement or recognition for research, patenting, innovation in gender sensitization etc. are pertinent to ponder. Gender sensitivity helps to generate respect for the individual regardless of sex. A change in perception is the need of the hour and requires orientation of policy-makers, curriculum developers, media professionals, adult learners and even the public at large.

Methodological Complications in Sociology:an Assessment of Reliability and Validity

In order to swap social science into the group of natural sciences, social scientists have always tried since the beginning, and the use of the methods of natural science is the reward of this effort. However, in social sciences the complex, qualitative, intangible and changing nature of the facts, the perspectives of time and space, reliability, the fidelity and the objectivity are some major problems which are the biggest question mark when it comes to science. Any subject comes into the class of science only after meeting the criterion of credibility and certification. Its Measurement will be reliable, when repeated measuring results the same conclusions. Many scales have been developed for reliability and validity in sociological research. As a result, more reliable findings obtained by testing

and re-examination. However, along with these scales, the above problems arise, and this is probably the root of the social sciences (especially in sociology where most of the research is based on intangible and behavioral variables). The nature of social phenomena is mostly qualitative and the variables keep changing according to their nature. There are different types of methods for measuring different variables by which more accurate measurement is possible. Anyway, absolute precision is not possible, even if in natural sciences. The research paper is an effort towards the behavioral dismantling of tools and methods, particularly focusing on the problem of reliability and viability in sociological research. The fundamental aim of this paper is to discuss the scientific status of projective tests widely used in social sciences (especially about the reliability and validity of techniques with special reference to Social Psychology).

Ethnic Politics, Madheshi Uprisings and the Question of Citizenship in Nepal

Nepal, formerly an only Hindu kingdom in the world and now a federal republic in making, first introduced citizenship law in 1952 to identify its citizens and non-citizens in the dawn of first municipal election held in 1953. Since then citizenship laws and constitutional provisos have passed through controversies, debates and disagreements. The main dissidents of these laws and constitutional stipulations are the Madheshis (Indian-origin ethnic group) living in the Tarai (southern plains) adjoined with Indian border. They have been expressing the dissent in various forms since the 1950s, which has now achieved the strength even to impede the national political course. The crux of the problem rests not in the articles and clauses of these laws and constitutions per se but on sociological debates on immigrant-native settlers contestation. The Madheshis due to their ancestral and cultural connection with north Indian people do not appear 'true' Nepalis for the non-Madheshis; simultaneously, the non-Madheshis (hill-origin ethnic group) of the Tarai are the 'encroachers' for the Madheshis. This form of immigrant versus native settlers debate first surfaced in the 1950s and burst out in 2007 in the form of Madheshi uprising that brought substantial shift in the discussion on the Nepali citizenship laws, particularly related with the naturalization. In this context, I try to unearth the trajectory of problem that the citizenship discourse has gone through on the backdrop of Madheshi identity formation and ethno-political contestation in the Tarai with reference to the constitutional provisions and other legal stipulations.

Orwellian Newspeak and Politics of Hate in India: Challenges for a Resilient Democracy

Orwellian Newspeak and Politics of Hate in India: Challenges for a Resilient Democracy

The resurgence of right-wing politics all over advocates new forms of nationalism, violence and exclusion that has important social and economic ramifications. Trump, Brexit and a wave of racism, communalism and nationalism are the landscapes of the world today. George Orwell in his masterpiece *1984* showed the power of language to control and manipulate people. The calibrated language of the media, creation of fake news on social media, discriminating voices and ideologies are breeding grounds for hate and intolerance. In India today, the thought which is independent and non-government invites an anti-national and criminal label. Suppressing dissent, spreading distrust and hate, hate speeches to polarize the electorate to win elections, trying to re-write history, changing words and symbols from public discourse are some of the tools and mechanisms to change a vibrant, multi-cultural democracy to a majoritarian rule and totalitarian regime. By giving various examples, this paper tries to analyze the slithering Fascism in India and how the resilient secular polity and civil society struggle to subvert all these authoritarian moves and climate of intolerance.

Contingent Civil Society: Adaptive Strategies of Citizenship Contestation Among Internal Migrant Construction Workers in Beijing and Delhi.

Scholars of citizenship and civil society have argued that a democratic civil society which is organizationally strong and autonomous from both the state and market forces is critical to the development of more socially-inclusive citizenship. However, drawing on over 19 months of ethnographic fieldwork conducted in Beijing and Delhi, I find that internal migrant construction workers in Beijing are more active citizens than their counterparts in Delhi, in terms of their rights consciousness, their preparedness for rights contestation, and their propensity to engage in public acts of claim-making directed towards the state, even though

the authoritarian state in China maintains tight control on civil society, and, in comparison to civil society in Delhi, civil society in Beijing may be considered organizationally weak, with far fewer voluntary organizations and limited participation in these organizations.

I posit that the organizational strength of civil society should not be measured solely by the presence of formalized or legally sanctioned voluntary organizations. The strength of civil society can also derive from organic linkages that emerge spontaneously among individual citizens. I find that, in the absence of voluntary organizations in Beijing, construction workers do the "dirty work" of fighting for their citizenship rights themselves, and as such, learn by doing and share experiences with one another. In contrast, the multitude of voluntary organizations present in Delhi re-route mediations between workers and the state through union representatives, NGO workers, and other civil society middlemen, giving rise to a form of brokered citizenship which does not augment workers' associational capacity.

The Role of Children's Digital Practices in the Creation and Maintenance of Family Routines and Feelings of Intimacy in Multilocal Everyday Life

The explosion, development and varieties of ICTs offer a new "polymedia" environment of communicative opportunities (Madianou & Miller, 2012). This polymediated universe contributes to shape a "connected presence" which is according to Licoppe the base of the interpersonal relational attachments of our time (Licoppe, 2012). However it remains difficult to evaluate the effects of digital technologies on family life, even more from the perspective of children.

In this paper, I present the preliminary results of the first wave of data collection of the doctoral project "Growing up 'connected': social ties and digital practices within and around the family mosaic" developed in the framework of the ERC Starting Grant project "MobileKids: Children in multi-local, post-separation families". This doctoral project highlights in particular how children who live between two homes in the context of post-separation shared custody arrangements (re) compose and maintain their social ties through their digital practices. I postulate that the use of digital media can be perceived both as a social resource to manage multilocal life, and a symbolic resource of mediated identity construction which leads to an almost permanent multimodal connectedness (Schroeder, 2010).

I will focus in particular on the characteristics and role of children's digital practices in the creation and maintenance of family routines and feelings of intimacy in a multilocal context. A special emphasis will be placed on the methodologies that I used to encourage children aged between 10 and 13 to share their experiences and practices, and which combine socio-spatial network games, virtual ethnography (as scrolling back on FB (Lincoln et Robards, 2017), and visual sociology.

SEDOVIC, MICHAELA (*London School of Economy and Political Science*)

A Cross-National Analysis of Variations in Majority Members' Attitudes Towards Immigrants: Are They Structurally Determined or Adaptable? Evidence from 18 European Countries in 2002 and 2014.

With rising numbers of immigrants living in Europe, the opportunities for majority members to be in contact with them increase. This contact may influence both attitudes towards immigrants (ATI) and immigrants' chances to be integrated. ATI research including only individual explanatory variables explains a modest part of the differences among ATI, therefore, it is important to consider also the moderating effect of the changing environment in receiving countries, such as economic development and population composition.

The aim of this paper is to observe and explain (i) variations in majority members' ATI among 18 European countries and (ii) their variation in a cross-temporal perspective, analysing the key elements forming them in 2002 and 2014.

Our focus is on the effect of intergroup contact – because the share of population with immigrant background has changed during observed time – and the economic situation. The innovation of this paper is the simultaneous observation of the effects of direct and indirect contact on ATI and the examination of their interactive effect. The focus on effects of the economic change stems from its complementarity with intergroup theory hypothesis and the availability of data that could be reliably used in a cross-country research.

We hypothesise, that with a greater share of immigrants, ATI were more likely to adapt to the changing environment and ATI were more dependent on individual explanatory variables. Complementary, we expect more stable ATI in countries with a smaller share of immigrants.

Data come from the European Social Survey. Two dependent variables will be operationalized as composite indexes measuring two dimensions of attitudes: towards immigrants and towards immigration. We will perform multilevel regres-

sion analysis with individual (demographic and socioeconomic variables, migrant friends and heterogeneity of neighbourhood), regional (unemployment rate) and national (unemployment and foreign-born population rates and index of similarity of populations) factors.

Immigrants' Subjective Integration: Life Satisfaction Among Immigrants in Italy

Research has recently pointed out that to understand immigrant integration is not sufficient to investigate only its 'objective' forms. Instead, one must also study 'subjective' integration, using immigrants' self-reported life satisfaction in order to take into account immigrants' perceptions and opinions. Life satisfaction has been defined as "a global assessment of a person's quality of life according to his chosen criteria". Due to its common use in estimating the "apparent quality of life within a country or a specific social group", immigrants' self-reported life satisfaction can be used to evaluate the integration process into the residence country. This paper aims to add to this research strand, measuring the effect of demographic, human capital and 'immigration' variables on the self-reported life satisfaction of young and adult immigrants residing in Italy, performing a stepwise ordered logistic regression. Data stem from the Survey on Social Condition and Integration of Migrants in Italy (Condizione e Integrazione Sociale dei Cittadini Stranieri) carried out by Italian Statistical Institute (ISTAT) in 2011-2012. The total sample is 25,326 individuals including first and second generation immigrants. The survey addresses the following topics: employment; languages; civic and political participation; family reunion; long-term residence and citizenship, health, education, discrimination, social network, relation with the country of origin. To pursue our research aim, we subset our sample to individuals aged 14 years and over, foreign born and foreign born naturalized Italian. The total new sample is 15,709. We perform a stepwise ordered logistic regression. We will use the following variables in the analysis.

PAPERNI, VLADIMIR* (*University of Haifa*)

Russian Revolutionary Discourse: Legitimization of the Political Violence

The Russian Revolution was in fact the longest political and social revolution in the human history. Revolutionary processes (i.e., a series of transitions of political power from one group to another accompanied by massive violence and a series of violent transformations of the economic and social structures of a polity) had taken place in Russia for more than 30 years, from 1905 until the end of the 1930s. The revolutionary discourse played a crucial role in those processes: it provided the universal ideological legitimization for using massive and even unlimited political violence. This discourse included two major and interrelated components:

1) quasi-rational and quasi-historical component: the revolutionary violence was legitimized (in spirit of ideologies of the Enlightenment, and later also of Marxism) as a necessary mechanism of destruction of the "old" and "bad" polity and of the transition to the "new" and "good" polity which must be based on the principles of freedom, egalitarianism, social justice, etc;

2) mythological eschatological component: the revolutionary violence had been interpreted as the main, desirable and morally justifiable tool of reaching the eschatological End of the human history: the Last Judgment (i.e., punishment of the "Old World" of sinners) and the subsequent creation of The "New World" of the righteous.

In the proposed paper, two main issues will be discussed:

1) the issue of origin of the Russian revolutionary discourse from discourses of Western revolutionary ideologies and from traditional Russian religious discourses;

2) the issue of functioning of revolutionary discourse in the Soviet polity in the revolutionary and the post-revolutionary epochs as an apparatus means of falsification of social, political and economic reality and as an exceptionally effective device for preventing attempts of the Russian civil society to stop the political violence and to humanize the Soviet polity.

Embodied Spatial Practices and the Power to Care

Drawing on an ethnographic study of teamwork in Critical Care Units (CCUs), this chapter applies Henri Lefebvre's (1991 [1974]) theoretical insights to an analysis of clinicians' and patients' embodied spatial practices. Lefebvre's framework draws attention to the political role of bodies in the production of conceived, lived, and perceived spaces. A narrative analysis of three ethnographic vignettes—"The Fight," "The Carnival" and "The Plan"—explores how embodied spatial practices manifest and contest power relationships among nurses, physicians, and patients in the CCU. Attention to embodied spatial practices can illuminate the complexities of healthcare delivery, making conformity and resistance to interprofessional and care hierarchies visible. The social orderings of bodies in space is consequential; to see it is the first step in redressing them.

Accountability Policies and Their Effects on Teachers: A Scoping Review of the Literature

Accountability is becoming a central policy in the global education agenda. Accountability is a polysemic concept that can lead to different approaches (namely political, market, managerial, professional, participative and so on), and can operate in different directions. Despite the different modalities of accountability that exist, in both developed and developing countries, we are currently witnessing a greater push for accountability systems that are linked to large-scale external evaluations of learning outcomes, that focus on the school and the teachers' level, and that have some level of consequences to those that give the account. This type of accountability is usually known as testing-based accountability (TBA).

The main objective of this research is to analyse the effects of accountability policies in education systems and in the social relations that configure such systems, with a particular focus on teachers' work and teachers' behaviour. Methodologically, this investigation is based on the so-called "scoping review" (n=150), which allows us to identify the main debates, agreements and disagreements in the literature about accountability in the education research field. This methodology is also used to identify the main gaps in this area of research and to point out to the main challenges and future lines of research that still need to be explored. Evidence about the real effects of accountability policies in teachers' autonomy, organisation, and pedagogical options is still inconclusive and shows variegated effects within different institutional and socio-economic contexts. Finally, evidence also shows that accountability is a contentious policy option. In this regard, the policy design and teachers' perceptions about accountability policies strongly mediate policy trajectories as well as individual and collective responses at the school level.

Inclusion Versus Exclusion: Framing Spanish Media Discourse on the Access to Health of Irregular Migrants

The Spanish post-Franco health model guaranteed universal access to health care—a system that was considered unique in the world, insofar as all residents in the Spanish territory were entitled to public health care irrespective of their legal status. Nevertheless, the Royal Decree-Law 16/2012, dated 20 April, was passed as one of the "urgent measures to ensure the sustainability of the National Health System and to enhance the quality and safety of its services". It constitutes one of the major reforms under Rajoy's cabinet (Partido Popular), that radically re-defines the system of the right to health. The RDL explicitly links entitlement to contribution to the system instead of "residency". This change entitles those who pay or have paid some social security contribution (together with their beneficiaries) and excludes other categories, being the irregular immigrants the main group.

We critically examine Spanish mainstream media constructions regarding the irregular immigrant's access to health care. The paper asks the following question: What are the main frames that support (frame of inclusion) and exclude (frame of exclusion) the irregular immigrants' entitlement to health insurance coverage? We argue that different discourses are shaped based on the analysis of a sample of articles dealing with the Royal Decree-Law 16/2012, from two major Spanish newspapers: El PAIS (with progressive stand) and ABC (with conservative leanings). The study corpus includes a sample of 278 articles from 2012 to 2016. Regarding "frames of inclusion", we identify both, a human rights narrative and arguments that appeals to the universalistic vision of the Spanish political culture concerning the entitlement to health care, as reflected in the Spanish Constitution. When analyzing the "frames of exclusion", our results highlight the cost-saving approach (in terms of overly-generous concessions concerning welfare benefits, the need to combat "health tourism" and the loss of quality of health care)

RC44-744.7PARET, MARCEL* (*University of Johannesburg*)*Exclusive Nationalism from below in Post-Apartheid South Africa*

In May 2008, a wave of anti-migrant attacks spread through the townships and informal settlements of South Africa, leaving more than sixty people dead, many more injured, and up to one-hundred thousand displaced from their homes. In the wake of the 2008 attacks, xenophobic antagonism continued, though more sporadically and on smaller scales. Persistent attacks increasingly targeted foreign-born traders from East Africa and South Africa.

Xenophobic attacks shattered the myth of South Africa as a "rainbow nation". Yet they mirrored official nationalisms, which frequently portrayed migrants as a threat to the nation and an ongoing liberation project. Taking place within poor areas ravaged by unemployment and precarious work, the attacks also represented popular frustration about the failure of democracy – won in 1994 after decades of resistance – to deliver significant economic transformation.

Drawing on ethnographic observation and interviews with residents of impoverished townships and informal settlements around Johannesburg, conducted between 2010 and 2017, this paper illuminates the local political dynamics that lay beneath anti-trader xenophobia. I argue that understanding such attacks requires attention to three interweaving forms of popular expression: resentment of foreign-born residents, driven by conditions of economic insecurity; the reconstruction of apartheid-era racial categories to assimilate foreign-born residents, particularly migrant traders; and collective resistance, including both the coincidence of protest and xenophobic antagonism, and the ways in which activists sought to counter xenophobia through discourses of solidarity. The latter expression underscored the significance of "xenophobia" as an important terrain of struggle in post-apartheid South Africa.

RC47-JS-22.6PARET, MARCEL* (*University of Johannesburg*)*From Passive Revolution to Fractured Militancy in South Africa*

In recent years, scholars have increasingly deployed Antonio Gramsci's notion of "passive revolution" to describe capitalist development and state formation in the Global South. The concept refers to a reorganization from above in which elites absorb and demobilize popular forces through limited reforms, rather than significant social transformation. What are the implications of passive revolution for subsequent patterns of popular resistance?

This paper focuses on the case of South Africa, where the democratic transition of the late 1980s and early 1990s – an instance of passive revolution – led to a re-activation of popular struggles in the 2000s. Drawing on extensive ethnographic fieldwork and in-depth interviews with activists and residents living in impoverished townships and informal settlements around Johannesburg, I argue that in this instance, passive revolution led to fractured militancy: the simultaneous proliferation and fragmentation of popular resistance.

Fractured militancy reflected two entangled dynamics. On the one hand, passive revolution preserved the fundamental features of the social structure, including widespread unemployment, poverty, and inequality. This produced popular revolt, demonstrated by numerous protests for recognition and public service delivery. On the other hand, passive revolution produced weak leadership, marked by elite pursuit of narrow interests through the state. Mirroring this scramble for scarce state resources, activists engaged in highly localized and isolated struggles, and sometimes turned inward against targets such as workers and migrants. They also pursued divergent political projects. This fragmentation undermined attempts to build a coherent and sustained left movement in the post-apartheid period.

RC25-476.4PARISEAU-LEGAULT, PIERRE* (*Université du Québec en Outaouais*)BUJOLD, AUDREY (*Université du Québec en Outaouais*)*Lire Entre Les Lignes : Que Faut-Il Comprendre De L'imputabilité Des Acteurs Chargés De L'application De Mesures D'exception Aux Droits Des Personnes En Contexte Psychiatrique ?*

Plusieurs acteurs, discours, aménagements et institutions composent le dispositif de soins psychiatriques et autorisent parallèlement son déploiement au sein du champ social. Les lois d'exception autorisant l'internement forcé font également partie de ce dispositif. Bien qu'elles soient souvent comprises par leur force déclarative et contraignante, ces dernières représentent plutôt une forme de cristallisation institutionnelle des rapports de pouvoir entre les personnes recevant des soins psychiatriques et ceux chargés de leur organisation. Sans surprise, ces lois sont donc simultanément décrites comme levier et comme frein à l'action. Cette communication propose une analyse discursive des différents modes de signification portés par les lois d'exception appliquées au sein du domaine psychiatrique. En postulant qu'il existe une relation ambiguë entre les normes du droit et ses normes de réalisation, cette réflexion soutient

une compréhension intertextuelle de la manière dont ces mesures d'exception s'arriment, s'opposent, renforcent ou s'allient à la culture psychiatrique. Ce faisant, elle suggère d'interroger l'imputabilité des acteurs à qui de telles mesures confèrent différents devoirs et responsabilités. Ce questionnement évoque donc la nécessité de comprendre la portée juridique de leurs actions (perçues comme étant extérieures au droit), mais également de questionner le rapport essentiellement juridico-discursif entretenu à l'égard de leurs obligations. Alors que plusieurs acteurs de la société civile remettent en question l'efficacité de ces lois d'exception, cette réflexion apparaît essentielle afin d'éviter une polarisation des rapports de pouvoirs pré-existants et persistants entre les institutions, ses acteurs et les personnes recevant des soins psychiatriques. Plutôt que d'aborder les enjeux aux droits des personnes de manière strictement déclarative, il sera finalement proposé d'analyser de manière plus soutenue les conditions d'existence spécifiques à ces derniers.

RC32-577.2PARK, HIJIN* (*Brock University*)*An Intersectional and Structural Analysis of the Crimes Experienced By and Perpetrated By Racialized Migrant Women in Canada*

This paper analyzes the relationship between female offending and victimization by examining how the intersections of gender, race, class and immigration shape the crimes experienced by and perpetrated by racialized migrant women in Canada. It does so by focusing on two cases in which racialized migrant women have been charged with manslaughter or homicide. In 2002 Rie Fujii, a 23-year-old Japanese national who had overstayed her visitor visa, received an eight year sentence in the deaths of her two Canadian born children. In 2008 Theresa Pohchoo Craig, a 49-year-old Malaysian woman, who met her husband, Jack Craig, on an online dating website, was found guilty of manslaughter in the stabbing death of Jack Craig. In both cases the criminalized women were physically, emotionally and/or sexually abused by their white Canadian partners. Through an analysis of the publicly available judicial documents relating to the crimes of Rie Fujii and Theresa Pohchoo Craig, this paper explores how the law's individualization and medicalization of crime and violence may obscure the multiple forms of everyday and structural violence that racialized women in Canada experience and may perpetrate. My interest is not in proposing causes and solutions for maternal filicide and spousal battery related homicides, or suggesting ways that the Canadian criminal justice system can better meet the needs of criminalized racialized women. Rather, I focus on the availability and construction of certain narratives as truths, and as a corollary, I highlight how the negation of contextual and structural elements can prevent the violence of white settler colonialism, gendered racism and heteropatriarchy from being considered.

RC19-352.4PARK, JAE HYOUNG* (*London School of Economics and Political Science*)*The Effectiveness of Social Investment Policies: Training and Childcare in OECD Countries*

What is the relationship between expenditure on social investment policies (SIPs) and socio-economic outcomes across OECD countries since mid-1990s? Even though SIPs such as active labour market policies (ALMPs) and work-family policies (WFPs) aim to provide opportunities and reduce barriers for labour market entry, there is a debate on whether these policies are actually biased toward or against vulnerable groups more susceptible to new social risks in terms of the 'Matthew effect' (Cantillon et al 2001; Cantillon 2011; Cantillon and Van Lancker 2013). Furthermore, a growing number of scholars argue that SIPs should be complemented by social protection policies (SPPs) in order to compensate for a perverse effect of SIPs (Esping-Andersen et al 2002; Vandembroucke and Vleminckx 2011; Leoni 2015). This paper focuses on what has been the impact of public spending on ALMPs and WFPs on the labour market outcomes of low-skilled workers and women in terms of three indicators: equality, job quality, and gender equality. We narrow down the critical elements of SIPs into spending on training and spending on childcare, most representative one of ALMPs and WFPs programmes respectively. Training, a major 'building block' of ALMPs, aim at improving the prospect of finding a job or increasing earning capacity, while childcare as a work-family reconciliation policy linked to increasing mothers' participation rather than to increasing children's human capital formation. When evaluating the effectiveness, we also consider the possibility of interaction between spending on training and spending on unemployment benefits as part of traditional SPPs. A time series cross-section (TSCS) analysis of the OECD countries is conducted for empirical estimation. In a process of model specification, we control for non-stationarity (i.e., highly persistent or strongly dependent time-series) and time-lag problem choosing the correct lag structure.

RC24-444.13PARK, JINYOUNG* (*Seoul National University*)*Between Promotion and Safety: Legal and Policy Obstacles to Achieving Environmental Justice in Korea's Nuclear Energy Act System*

The first nuclear power plant of Korea, Gori No. 1, has been permanently closed in 2016, but 24 nuclear power plants are running in six regions. After the Fukushima disaster in 2011, the social debate has been arisen about nuclear safety. This study was aimed to analyze the legal and policy obstacles existed in Korea's nuclear energy law system pursuing the environment justice. In order to vitalize the nuclear industry, the Nuclear Energy Act was enacted in 1958, which stipulated the principles of nuclear energy research and management. Two members of the National Assembly in 2009 proposed that this act should be amended to the Nuclear Energy Promotion Act, but it was failed. Then it was separated into two acts, the Nuclear Safety Act and the Nuclear Energy Promotion Act without any objection in 2011. The separate existence of laws to achieve promotion of nuclear energy and to pursue safety shows contradictory aspects- the unlevel playing field- of energy policy. In Korea, the "promotion" of the nuclear industry is still the policy priority, and "safety" is merely a means for controlling the nuclear industry. This system confines responsibility for nuclear risk only to the Nuclear Safety and Security Commission and can cause problems in policy implementation due to organizational fragmentation. In fact, in 2016, the commission passed a construction permit for the Shingori 5 and 6 units. However as the new government has entered the post-nuclear policy, the debate over the role and status of the commission is still continuing. Therefore, in order to prevent legal and policy cracks and to pursue environmental justice, this study argues that the "Nuclear Regulation Act" should integrate both laws and create a single control tower. This will help lower the social cost of the nuclear industry and contribute to sustainable energy policy formation.

RC23-425.3PARK, JINYOUNG* (*Seoul National University*)*Legal Reconstituting Scientific Evidence in Korean Tobacco Litigation: Analyzing the Debate on the Research Results Published By Korea Ginseng & Tobacco Research Institute*

In 1999, six smokers and their families filed a tobacco lawsuit against Korea Tobacco and Ginseng Corp. and the government of the Republic of Korea claiming damages for smokers' cancer. This paper analyzed the controversy of scientific research published by Korea Ginseng and Tobacco Research Institute, a research institute under the Korea Tobacco and Ginseng Corporation. The plaintiff tried to disclose the scientific research results of the Korean Ginseng and Tobacco Research Institute in the Korean lawsuit, paying attention to the fact that the internal documents of the tobacco company were disclosed in the United States. However, the defendant used three strategies and made internal tobacco research documents not accepted as reliable evidence to prove plaintiff's claim in court. The defendant first questioned the hazards of the substance itself contained in cigarettes and the credibility of the experimental results. Second, the research subject of Korea Ginseng and Tobacco Research Institute was limited to 'domestic tobacco'. Third, the research capacity of the researchers was lowered by themselves. Due to the defendant's strategy, the tobacco research document released by the plaintiff's efforts was not accepted as reliable evidence in court. In addition to analyzing the defendant's strategy, this paper examines the effect of defendant's refusal strategy on judge's judgment. In particular, during the court dispute over the tobacco research paper of the Korea Ginseng and Tobacco Research Institute, the defendant conducted a boundary work on tobacco, scientific evidence, and ability to conduct research. This understanding of the tobacco lawsuit, which focuses on the controversy between plaintiffs and defendants in the actual court, the defendant's strategy and the constitution of the value of the evidence, can be interpreted as a new interpretation of the judgment.

RC04-95.8PARK, JUNGWEE* (*Statistics Canada*)*Job Mismatches Among Aboriginal Workers: Findings from the Programme for the International Assessment of Adult Competencies (PIAAC) Data*

Using data from the Programme for the International Assessment of Adult Competencies (PIAAC), this study examined education mismatches and skill mismatches among Aboriginal workers in Canada. Educational mismatches for a job were determined by the education-occupation matrix (HRSDC, 2011) while skill mismatches (over-skilled or under-skilled condition) were based on direct measures of skill competencies in numeracy and literacy provided by PIAAC data. Aboriginal workers were more likely to be under-educated and under-skilled than non-Aboriginal workers. As well, Aboriginal workers were less likely to be

over-educated and over-skilled than their non-Aboriginal counterparts. This may be explained by the fact that the level of education as well as the skill scores of Aboriginal workers were significantly lower than those of non-Aboriginal workers. When education was controlled, however, there was no differences in being under- or over-educated and no differences in being under- or over-skilled in literacy between Aboriginal and non-Aboriginal workers. That is, Aboriginal workers' education level played an important role in determining skill levels as well as job mismatches. It was also found that certain job-related conditions were associated with the likelihood of job mismatch among Aboriginal workers. Compared to full-time workers, part-time Aboriginal workers were more likely to be over-educated and over-skilled; compared with employees, self-employed Aboriginal workers were more likely to be under-educated and less likely to be under-skilled; Aboriginal workers with post-secondary education who received job training were less likely to be over-qualified; and a higher level of skill-job mismatches were found among Aboriginal workers who majored in the field of STEM in their post-secondary education. Compared to matched workers, over-skilled workers were not different in job satisfaction whereas over-educated workers reported a much lower rate of job satisfaction. Among Aboriginal workers, job dissatisfaction was related more directly to mismatches in educational credentials than mismatches in skills.

RC12-240.2PARK, SARA* (*Kobe University*)*Making up Citizenship: People with Dual-Nationality in Japan*

This paper tries to clarify what constitutes citizenship in Japan through case studies of people with dual nationalities. Japan claims itself as ethnically homogeneous. Although it is not formally stated, many people believes the country prohibits its citizens to hold dual nationality. From the summer of 2016, a famous female politician was accused by having two nationalities, and debates on the dual-nationality heated a lot, ending up the resignation of the female politician and wide spreading disdain to the people with dual nationality.

However, although the number is still small comparing to other OECD nations, 1 child in 30 now has his/her ethnic roots in countries other than Japan and international marriage is getting more and more popular over the 30 years, and some of them have and keep nationalities of other countries. How do they obtain other nationality and keep it? What kind of troubles do they face? How do these people handle the problem? Through documentary research of illustrative rules on the Japanese Nationality Act and interviews to people who have multiple nationalities, this paper casts light on the importance of street-level bureaucracy and social interaction when people obtain and hold dual nationalities and solving problems. It is face-to-face interaction and negotiation with functionary at the inquiry counter that decides the possibility of dual nationality, and understanding of the Japanese Nationality Act and its use prepares the common ground for the negotiation. The norms and assumptions shared by Japanese functionaries and people (or often parents) of dual nationalities often goes against especially on the meaning of being a "Japanese", which often puts mental burden to the people with dual nationality, but at the same time, can be highly interesting topic for sociologists.

RC38-JS-3.7PARK, SARA* (*Kobe University*)*"As a Japanese Woman, I...": Gender, Nationalism and Post-Colonialism in Biographies of Japanese Female Supporters for so-Called "Comfort Women" Issue*

War-time sex-slavery system by Japanese military has caused serious political, diplomatic and academic concern in international debates. In Japan, academia often concerns two topics, (1) facticity of oral testimony and (2) conflict between nationalism and gender. Especially, the second topic still causes serious divide in Japanese academia. Well-known feminist in Japan, Chizuko Ueno argues that there were various types of "comfort women" in Japanese military, other colonial empires also had similar problems on female status, and nationalist movements which call for official compensation from Japanese Government actually hinder resolution of the problem. On the other hand, some scholars are strongly against the above-mentioned discourse and actions by Ueno, accusing them as "violence of relativism by Japanese feminists" (Lee 2015). They argue that Ueno blurs the vital question how Japanese and international society judge Japan's war crime under the name of female solidarity while she blames indictors as nationalists. At the same time, this issue is first and foremost political/social issue supported by non-academic activists in the country of concern, including Japan as well. Then, how do they, especially Japanese female supporters, support women's rights and at the same time face their own responsibility as Japanese, namely a member of the perpetrating nation? In search for answers to this question, I conducted interviews of the activists in Tokyo, Osaka and Kyoto. From their narrated biographies, we could see that the Japanese female activists regard formal apology by the Japanese Government and former comfort women's recovery of dignity as inseparable; they take the problem of "conflict between nationalism and gender" as pseudo-problem that is caused by ignorance of imagination for lives of individual victims and their recovering process. Recovery of women's rights and

holding account of Japanese citizens consistently managed in personal friendship and supporting surroundings of victims and Japanese female supporters.

Coproduction of a National Water Resource and a Postwar Political Order: Korea's Water Resource Development Projects after the Korean War

This paper investigates the water resource development programs in South Korea after the Korean War (1950-1953). In 1961, President Park Chunghee (1917-1979) launched a national project, dreaming of an urbanized, industrialized, and modernized nation to overcome postwar turmoil and legitimize his military regime. One key to realizing this was an abundance of water. In 1966, the Korean government started to survey major river basins with the aid of foreign agencies, such as the United States Geological Survey.

The essential work of the surveys was to make river water calculable and set a specific water supply plan. Based on past precipitation and water levels data, the survey teams estimated the average water flow, thereby quantifying the rivers. They also constructed stream gauge stations, trained Korean personnel, and standardized measurement methods to establish and maintain a stable water management system. These infrastructures allowed the Korean government to transform the rivers into national resources and rationalize a rush of dam construction.

My research explores how the messy reality of river systems turned into manageable national water resources through the construction and operation of technologies designed to simplify, quantify, and standardize the rivers. I argue that this implementation of water management projects repeatedly envisioned and produced various forms of national identity, power configurations, political economy, territorial environment, and the citizens' bodies. I especially focus on how the projects invented devices to control natural water from a distance and how experiences of local communities around the rivers were excluded from environmental governance.

This research is theoretically informed by a toolkit for studying the mutual construction of technology and politics developed in the field of science and technology studies (STS). Following the idiom of co-production in the STS literature, I examine how water management technology and political orders were created, stabilized and transformed through constant interaction.

PARKER, LINDSAY* (*University of Victoria*)

Promotion and Tenure in the Collective Agreements of the U15 in Canada As an Emblem of the Everyday: The Coordination of Arbitrary Individual Decisions As Performance Culture

The university is a community of scholars: *universitas magistrorum et scholarium* refers to the community of scholars and teachers. In the U15 research universities of Canada, this community is nominally self-governing over academic matters such as tenure. Collective agreements determine the conditions of research faculty employment for universities across Canada. As individually negotiated formal documents between employer and employees, their design, language, and form reflect the exigencies of unique institutions and capture the contours of institutional cultures. Opacity in collective agreements undercuts self-governance of faculty associations by opening informal, everyday channels of authority. This study draws on radical theories of the everyday to compare formalized discourses and agreements against anecdotes of the violation of said formal processes. Vague and opaque language in collective agreements includes some of the most important power relations to continuation of employment. This qualitative comparative study inductively codes the collective agreements or comparable documents of the U15 group of Canadian research universities, focussing specifically on discussions of tenure for research-based faculty positions. Grounded inductive coding was completed using Atlas.ti to track five topical areas: definition of tenure, definition of assessment standards, criteria of assessment, the sequence of authority in the tenure decision-making process, and cumulative authority in the tenure decision-making process. In all five topical areas, sub-codes were created for vague or opaque terminology.

PARKER, SÉBASTIEN* (*University of Toronto*)

Being and Time: A Study on Members of Casapound Italia

Previous research on members of far-right groups has often focused on initial motivations to join. In doing so, these studies provide insight into why individuals become activists for these beliefs but focus less on their experiences, and their variations, after joining (Goodwin 2011; Blee 2016; Pilkington 2016). It is thus less clear to us what it means to be in a far-right group. Using an interpretive and relational approach, this study explores sustained commitment over time

for members of *CasaPound Italia*. I propose that we need to focus on continued interactions between individuals and their organization, in that it allows us to see how both meaning and experience can differ while maintaining participation. Through ethnographic fieldwork and 30 semi-structured interviews with members of CasaPound Italia, conducted between January and March 2016 in Rome, Florence, Nettuno, and Varese, I investigate three interrelated dynamics for both sustained commitment within the group and everyday activist experiences: (I) actions and ways of being, specifically how members incorporate them; (II) ideas and ideals promoted, and how members understand and use them; (III) interactions within and outside the organization, and how they help foster participation.

PARKER, SÉBASTIEN* (*University of Toronto*)

"Do You Own a PS4": Interpreting Youth Involvement in a Far-Right Group

This paper highlights the diverse ways young people come to join and stay in a far-right group. Through ethnographic fieldwork and semi-structured interviews with members of *CasaPound Italia*, an Italian far-right group constituted in the early 2000s, and its youth organization, *Blocco Studentesco*, it is argued that young people are attracted to the group's style of activism but choose to stay because of the sense of community and the relationships created from within the organization. Particular attention will be given to members who first joined the youth group and eventually joined *CasaPound Italia*. Interviews reveal that young members, more so than the older members, did not join by pursuing a specific political objective (Blee 2002; Pilkington 2016). Further, the findings reveal that young members' trajectories should be interpreted as a process: specifically, one which involves continued interactions between youth who are receptive to varying degrees because of (1) outcomes stemming from social life, (2) efforts from the organization to recruit members, and (3) conducive social contexts.

Multiple Modernities and Popular Religions: Towards a Renewed Theoretical Framework

This paper attempts to understand contemporary popular religious phenomena from a comparative perspective in the context of multiple modernities.

The main purpose of this work is to shed light on old and new phenomena: religious transformations within the globalized and globalizing world. The classical theories of religious evolution are no longer useful to understand recent changes. The elaboration of a new theoretical framework for understanding the varieties of popular religions (folk religions and urban popular religions) in the world today with special focus on popular rituals and beliefs in the Global South, is needed.

The growing religious diversity and contemporary evolution of popular religions and spiritualities, mainly in Latin America, Africa and Asia, in comparative terms with Western Europe and North America reveals new cultural and religious patterns of changes that can only be explained and understood within the context of what has been called 'multiple modernities' (Eisenstadt), a dynamic process that shapes and characterizes current globalization.

The reflexive turn proposed here aims to counter-balance classical sociological theory of religious phenomenon that lack a comprehensive perspective to understand the meaning and ritual shifts that are taking place in popular religions all over the world. We discuss, extend and deepen a series of works already advanced by the researcher and many other scholars on lived religion (McGuire) and popular religions (Possamai), and to systematize accumulated recent knowledge from different sources to outline a new non-western-centric approach to popular religions.

Socio-Political Dimensions and Sociotechnical Knowledge in Energy Transition in South America: Analytical Framework.

This paper addresses the challenge of rethinking analytical concepts to understand energy transition (ET) processes in Southern countries, since the analytical framework for ET as it is framed by central and Eurocentric paradigms is inadequate.

Based on the theoretical and empirical results of a field research in several municipalities in Argentina and Chile, a proposal for new analytical frameworks about the multiplicity of social actors involved in the ET, and the change towards non-conventional renewable energies, is elaborated. Process that can no longer be understood as modernization and socio-economic change.

The main hypothesis highlights the relevance of political-institutional and cultural factors (especially those related to unequal knowledge distribution and production) and their interrelationships within the ET processes. A holistic, multi-ac-

tor and multidimensional view is suggested, starting up with the recognition of an asymmetric distribution of power, sociotechnical and ecological knowledge. The basic question is how to advance in a renewed and pertinent conceptual framework about local ET processes oriented towards socio-ecological-cultural change and the empowerment of local actors in the South.

PARMAR, LEENA* (*University of Rajasthan*)

Indian Army Veterans and the ISSUE of O.R.O.P. – a Conceptual Reality

INDIAN ARMY VETERANS AND THE ISSUE OF O.R.O.P. – A CONCEPTUAL REALITY:

This paper is focused on the concept of O.R.O.P. (*One Rank One Pension*); O.R.O.P.—implies that uniform pension be paid to the Armed Forces personnel retiring with the same rank & same length of service irrespective of their date of retirement. The concept includes bridging the gap between the rate of pension of current pensioners and past pensioners. Factoring inflation rate, the financial condition of a soldier who retired in 1979 compared to a recent retiree is deplorable. Following several failed conversations on this topic, public appeals, protests, veterans held a MAHA SANGRAM RALLY & hunger strike at Jantar Mantar, New Delhi and 50 other locations nationwide on 15th June 2015. This type of protest by the veterans was un-parallel in the history of Armed Forces (*India*). The methodology of this paper is content analysis along with interviews of some veterans (*taken during the protest, New Delhi*).

This paper will discuss the concept of O.R.O.P. in details; analyze its partial implementation by the Department of Defense and current scenario & challenges faced by the veterans. Despite diverse political parties, the topic of O.R.O.P. has unified the country as one with the veterans. This phenomenon is rare in a country like India.

Rethinking the Black-White Child Poverty Gap: Race, Social Assistance, and the Risk of Poverty Among the 50 United States

Poverty rates among black children in the United States nearly double that of white children. While past research has primarily pointed to family structure or employment patterns to explain this phenomenon, this paper instead investigates the extent to which state-level heterogeneity in the administration of the Temporary Assistance for Needy Families (TANF) program contributes to black-white child poverty gap. The primary finding is that the estimated racial bias in states' TANF spending priorities contributed to the impoverishment of an estimated 525,000 children per year from 2011 to 2013, the disproportionate share of whom were black. To arrive at this finding, I first review state legislation and TANF spending data to identify four conceptually distinct TANF spending priorities, each with its own set of policy instruments, desired social outcomes, and implications for low-income families. Building on prior findings that highlight the link between federalism and racial inequity, I then apply an integrated fixed- and random-effects model to state-year panel data and conclude that the racial composition of a state is the primary determinant of a state's TANF spending priorities: states with larger percentages of black citizens, *ceteris paribus*, are less likely to prioritize the 'provision of cash assistance' and more likely to allocate funds toward the 'discouragement of lone motherhood.' In a counterfactual simulation that reverses the estimated inequity in the allocation of cash assistance, I find that even a modest move toward racial neutrality in states' governance of TANF would reduce the black-white child poverty gap by approximately 10 percent. Recognizing the role of decentralized social policy as a source of racial inequality, and state governments as critical actors in shaping the opportunities facing households within their respective jurisdictions, deserves increasing focus as American poverty research moves forward.

PARRACHO SANT'ANNA, SABRINA* (*Universidade Federal Rural do Rio de Janeiro*)

Avant-Garde, Art and Politics in Rio De Janeiro, Since 2013

This paper attempts to discuss the relationship between museums and the avant-garde, regarding the practices of innovation in the arts and their critique. As Andreas Huyssen after Peter Burger has shown, the avant-garde project of relating art to life, once hosted and exhibited by museums, has given shape to new practices. The preeminence of curators, the emphasis on the foundation of

cultural centers and the educative policies on exhibitory institutions are some of the consequences now related to a series of exhibitions that hosted and welcomed avant-garde art. In recent years, however, although many have proclaimed the end of the avant-garde and the dissolution of the effectiveness of its discourse once incorporated by art system, political critique has been once again reinforced in young artists works of art.

Since 2013, Brazil has been going through a major political crisis that has growing impact in artistic practices. This paper aims to discuss recent movements forged in the city of Rio de Janeiro that have been building a narrative in which performances and art installations have been gaining space inside and outside the institutions as forms of political action. Collectives, activism and institutional criticism are some of the new forms of action that challenge the limits of the avant-garde and blur the boundaries between the art and the public sphere. Therefore, this paper aims to understand new art institutions that have been emerging in the city, changing not only the urban scenario but also mainstream institutions that are urged to react.

PARRACHO SANT'ANNA, SABRINA* (*Universidade Federal Rural do Rio de Janeiro*)

The Creative District and the Political Crisis in Rio De Janeiro after 2013

In times of social change in Brazil, this research investigates the emergence of exhibitory institutions as instruments for intervention in the urban space. I shall here analyze the creation of a creative district in Rio de Janeiro and the foundation of the Museu de Arte do Rio, in March 2013. Conceived in times of optimism and prosperity in expectation for mega events such as the Olympic Games, in 2016, the creative district and the museum were built as new icons for the city.

Nevertheless, just when the museum was founded in March, 2013, it became the target of demonstrations that anticipated the massive protests that spread in the country since mid-2013. As a target of new disputes in the city, museal institutions in the creative district were challenged to incorporate new categories to face the demands for change. The critique of activism and outsider artists have, then, received unexpected attention.

However, since the worsening of the political and economic crisis, unpredictable consequences might have been taking place. In one hand, from the political point of view, financial support to critical discourses has become uncertain and private groups are withdrawing controversial exhibitions. On the other hand, from the economical perspective, although the construction of the creative district still generates new audiences for the region, the project has been threatened by the interruption of capital flows, postponing processes of gentrification and generating dystopic scenarios.

PARRY, DIANA* (*University of Waterloo*)

Fourth Wave Feminism: Possibilities for Leisure Studies

Since its inception, leisure studies has faced a number of discussions and challenges posed by the use of various research methodologies to further our understanding of the complex phenomena called leisure. One perspective that has made significant contributions to this line of discussion over the years has been the voice of feminist scholars. Indeed, feminist scholarship has been a key contributor to the development of leisure studies, highlighting androcentric biases, correcting omissions/oversights through a gender lens, providing important directions for future research, noting the gendered nature of leisure experiences, and encouraging epistemological and methodological exploration (Parry & Johnson, 2015). Feminist critiques and contributions have influenced leisure studies for over three decades with feminism(s) evolving to reflect various theoretical perspectives, issues, and forms of social activism (Parry & Johnson, 2017). In this way, the various 'waves' or stages of feminism reflect the changing political landscape within and beyond leisure studies.

To understand the history and future of feminism(s) in the field, my presentation will trace the evolution of feminist scholarship within leisure studies with a focus on insights learned along the way. I will conclude by exploring contemporary debates through the lens of fourth 'wave' feminism, which takes up the micropolitics of the third wave and combines it with an agenda of political, social, and economic change similar to the second-wave (Maclaran, 2015). Although emergent and dynamic, the fourth wave is characterized by the use of technology to mobilize an immediate online and in-person response to sexism (Chamberlain, 2016). My presentation will explore the implications of fourth wave feminism—topically, theoretically, substantively, and methodologically—to leisure studies (Parry & Johnson, 2017).

TG06-996.5PARSON, LAURA* (*Auburn University*)*Neoliberalism and STEM in Higher Education: An Institutional Ethnography*

In this Institutional Ethnography I explored the neoliberal climate in STEM in higher education. Specifically I asked how STEM institutional practices were related to the institutional practices of higher education as an institution. Data collection and analysis focused on how the interface between undergraduate women and STEM education was organized as a matter of everyday encounters between students, faculty, and administration through exploration of their experiences inside and outside the classroom. This exploration began with in-depth interviews of female undergraduate STEM students and extended, as the institutional processes shaping their experiences were identified, to texts that mediated these processes such as institutional policies, state policy, accreditation requirements, and ranking organization metrics. Document analysis revealed that the discourses, goals, and assessments of external organizations including the state governing body, ranking organizations, and accrediting organization requirements were reflected in institutional policies. Characteristic of a neoliberal policy climate, findings revealed a policy map that illustrated how neoliberal goals of increased profit, student performance, faculty research, and enrollment are overseen by lines of accountability. The hierarchy created by neoliberal policies and assessment procedures led to a multi-layered and often complicated policy map: departments were accountable to the college and institution; the college was accountable to the institution; the institution was accountable to the governing board, and the accrediting body, and also expected to meet the student as consumer's needs, represented by the ranking organizations. These findings suggest that there is an opportunity create clearly measurable metrics related to diversity and other outcomes that suggest an improved condition for women if those initiatives are implemented by ranking organizations, accreditors, and the governing body.

RC16-308.4PARTYGA, DOMINIKA* (*London School of Economics*)*Simmel's Eternal Returns*

This paper situates recent arguments on Simmel's relevance for social theory in the context of the elusive boundary between the sociological and philosophical polarities in his thought, dramatized in his encounter with Nietzsche, and modes of reception in which that encounter has been narrated. First, I discuss ways in which Simmel has used Nietzsche in developing his own project, from his rhetorical recourse to Nietzsche's reputation as a thinker of "fanatically excessive individualism" in *Soziologie*, to the Nietzschean overtones in Simmel's conception of life's self-transcendence in *Lebensanschauung*. Secondly, I contrast the ways in which aspects of Simmel's Nietzsche have been argued into contemporary sociological and philosophical areas of inquiry, with a focus on Simmel's reading, critique and rephrasing of the Nietzschean doctrine of eternal return. Specifically, I explore its echoes in various sociological frameworks that reengage Simmel today - such as theories of vitalism (Lash), social acceleration (Dodd) and biosociality of life (Kempel, Pyhtinen) - and the role it plays in recent discussions among analytic philosophers on the so-called "cosmological-hypothetical dichotomy" in Nietzsche's conception of time's recurrence (Loeb, Rogers). My aim here is not to bridge between those two interpretative modes of engagement, but to underscore tensions in Simmel's theorizing on life-forms, action and responsibility, hardly intelligible from within the disciplinary frameworks that we came to inhabit. Concluding, I draw on Goodstein's argument about the importance of situating Simmel's reception within the broader history of disciplinary reading practices to consider some of the stakes involved in his encounter with Nietzsche. Simmel's reworking of the eternal return, I argue, offers a counterpoint to the canonizing modes of reception in sociology, but it also testifies to the methodological difficulties involved in revisiting the last pages of *Lebensanschauung* from the perspective of the 'transdisciplinary' present.

RC25-468.2PASCALE, CELINE-MARIE* (*American University*)*Confronting the Politics of Disinformation: What Can Sociologists Do?*

Governments, corporations, and political groups are advancing massive disinformation campaigns around the globe. Composed of lies, propaganda, and misdirection, these campaigns invite social sciences in general, and sociology in particular, to fight back by entrenching ourselves in the world of "objective facts." This path is both important and perhaps irresistible when politicians and media openly make statements that are certifiably false and when sophisticated propaganda efficiently mixes fact and fiction. However, a retrenchment of empiricism will not deliver us from this historical moment, just as it did not prevent it from arriving.

In addition to holding empirical ground to combat disinformation campaigns, sociologists must also effectively offer a careful delineation of processes of signification intended primarily to coerce rather than to inform or critique. Since all systems of signification are intended to persuade, from this perspective, we are not faced with a radical change in public and political discourse but with a violent intensification of its coercive power. This keynote considers the importance of interpretive scholarship for addressing disinformation in public and political discourse—especially, in light of right wing extremism.

For people who have been historically disenfranchised and/or dispossessed, the violence of this current historical moment is not new. There is more continuity, more 'ordinariness,' in these times than one might like to admit. However, within this continuity, inevitably there are and will be new and novel challenges. This keynote touches on some of the continuities, intensifications, and disjunctures produced around the globe by the rise of disinformation campaigns. It concludes by opening pragmatic and epistemic conversations regarding various forms of resistance, subversion, and transformation.

RC53-877.5PASSOS, ELIA* (*University of Brasilia*)FREIRE, JULIANA (*University of Brasilia*)BARRETO, ALDECILENE (*University of Brasilia*)*The Media in Children's Play*

The culture influences the children's environment including their plays. The child will seek elements to create their representations, using the images, symbols and the tradition in which it is inserted. Thus, this study is composed of investigations about the interlocution between children's body and media. The aim is to analyze the meanings constructed by the children, and their representations in the play. For the comprehension of childhood was used Sarmento (2005) and Corsaro (2011). To understand body and childhood, Mauss (2003), Munarin (2007) and to mediatic process Thompson (2012). A field study with a qualitative approach was carried out at a public school in Brasilia, the capital of Brazil, with 23 children. The children's drawings were used as methodological instruments (GOBBI, 2002). The pre-defined theme of the drawings was "My favorite plays". The data were analyzed in two categories: Plays with media influence and Traditional plays. The analysis suggested that the children of the masculine gender presented a greater incidence of media aspects in the moments of play. Based on the results found, it was confirmed that the media messages are manifested in children's body in the way of seeing, acting, relating and imagining. But this body is not only formed by values, customs, and attitudes transmitted by the media. It also depends on the world understandings of each child and the definitions made in contact with the school, their pairs and other contexts in which the children are inserted.

RC14-264.3PASTOR, RAQUEL* (*University of Cadiz*)MARTÍN ARAGÓN, MARÍA DEL MAR (*University of Cadiz*)*The Power of Mass Media within the Social Construction of Crime: Analyzing the Pederasty Case in the Spanish Newspapers*

It is well known that the main function of the media is to inform and, therefore, to bring reality closer to the citizenry, but we cannot ignore the fact that they are also generators of opinion. These capacities are especially relevant when the news event is related to a criminal phenomenon and, even more so, if the freedom and sexual indemnity of the minors is the legal right violated.

On the other hand, the possibility that this crime typology may cause great social alarm may depend not so much on its real incidence based on crime rates as on its media exposure, and this last, not only by placing first in the public debate a certain subject/issue "agenda setting" but also by the way it is (re) presented "framing".

Based on these premises and the hand of the literature on the media and crime, this paper aims to analyze the socio-media conversion of the criminal phenomenon in the news, taking as a case study the conduct related to the field of crime pederasty. The empirical material used comes from the press reports published in the main national newspapers in Spain (ABC, El Mundo and El País) that became an echo of this phenomenon.

The temporal framework for the selection and qualitative analysis of the news began in 2010, due to the modification that LAW 5/2010 made in the Criminal Spanish Code to introduce chapter II bis regarding sexual assault and abuse of children under 13 years (age limit that was extended to 16 years by LAW 1/2015).

This paper has attempted to show how is the issue of pederasty symbolically constructed in the main Spanish Newspapers and what kind of implications can such a media construction have in terms of attitudinal orientations and behaviors of the citizens.

TG07-1001.1PATERSON, MARK* (*University of Pittsburgh*)*Fatigue, Physiology and Modernity: The New Physiology of Fatigue and the Mapping of Bodily Interiority*

This paper tells the story of how, as a result of the intensification of labour in munitions factories in Britain and France 1914-18, the phenomenon of fatigue came to be observed and measured by physiologists, forming a new disciplinary subfield. Formerly considered as indistinct bodily sensation alongside pain and touch, the 'new' physiology of fatigue offered up practical means to further map somatic interiority. The implications of the proliferation of observation techniques and measuring apparatus were far-reaching, offsetting the emphasis on efficiency of Gilbreth (from 1907) and the 'scientific management' of Taylor (1911), and leading ultimately to more mobile forms of measurement and quantification (e.g. the 'quantified self', Lupton 2016) now familiar to us.

In the summer of 1915 Sir Charles Sherrington, a world-renowned scientific authority based at the University of Oxford, cycled to Birmingham to spend three months in the Vickers-Maxim munitions factory. This physiologist worked regular shifts at the factory and wrote a quasi-ethnographic account of it in order to conduct research on industrial fatigue at a time of war. Sherrington was lead author of the first ever report of the Industrial Fatigue Research Board (IFRB) in 1920. Subsequent reports directly influenced the 1937 Factories Act, which ruled on acceptable working hours, ambient conditions, and rest breaks. Forms of physiological attention to labor processes fostered new instruments and techniques for measuring muscular strain and movement. In France, meanwhile, Jules Amar's *Le Moteur humain* (1914) had also compiled extensive observations and data on the forces, movements, and thermodynamic processes involved in human labor, including the physiological effects of fatigue on workers. Finally, I discuss how Amar's adoption of Helmholtz's *Arbeitskraft* ['Labor Power'], which conceives of forces that operate across humans, animals, and machines, opens a pathway for thinking about the hybrid spaces of factory-based human-robot interaction.

RC24-450.8PATIL, ASHA RAMAGONDA* (*SNDT Women's University, Churchgate, Mumbai*)*Community Participation in Municipal Waste Management: Case of Mumbai*

Urbanization is increasing globally. It has its ramifications on human beings and environment. Traditional occupations in India are vanishing in rural areas. Stagnant and low paying agriculture sector, declining job opportunities in rural areas are forcing factors for migration resulting to urbanization. This has increased slum population in cities. This rapid population growth in cities has increased burden on corporations/municipalities, who are responsible to provide basic amenities to people. Urbanization directly contributes to waste generation, which adds additional financial burden on corporations/municipalities. Changing lifestyles and increase in consumerism contributes to increase in waste generation. Waste dumped on the outskirts areas creates a serious environmental and public health problem.

Effective management of Municipal Solid Waste is need of the day. Inappropriate waste collection practices and improper solid waste disposal raises the chances of local epidemics of disease, regional water resource pollution. Hence, there is a need to find concrete solutions to the disposal of waste. One of the effective ways is increasing community participation in waste management. Creation of awareness among people about reducing waste creation, reusing, recycling, improving and adopting good practices of waste collection will help to improve waste management. Preparation of manure from wet waste at housing colonies will reduce waste thrown on dumping grounds. Proper segregation of waste and training in handling waste will solve many problems.

Municipal Solid Waste Management (MSWM) though an essential service, is given low priority. One needs to design a sustainable MSWM system to meet the future challenge.

RC24-450.7PATIL, BAHUBALI* (*C.S.I.B.E.R., University Road Kolhapur (Maharashtra), India*)SARMA, T V G (*C S I B E R, University Road, Kolhapur*)PATIL, USHA (*Mahvir Mahavidyalaya*)*A Study on Ngos, Groups and Government Organizations Participation in Environment Protection*

India is the largest democracy in the world. But without its lively Individual, Groups and NGOs on the scene, many ills in the society would continue unchallenged. Civil society drives its strength from the Gandhian tradition of volunteerism, but today it expresses itself in many different forms of activism.

Due to the development activities, one can see that there is disjuncture in the relationship between human beings and nature. The disjuncture is manifested through various forms of environmental degradation. The quality of natural resources like land, air, water and other supportive life system, like forests, is being downgraded. This is happening all over world. In response to the worsening environmental conditions at various places, the local people have organized themselves in groups and they are registering their protest against environmental degradation. Here individuals, groups, NGOs and Government organizations are playing a significant role in creating environmental awareness among the masses. The role of the organizations working in the field of environment protection is of crucial importance.

Great heritage of art and culture is associated with Kolhapur. It is also a prosperous industrial town. Being a prosperous upcoming urban center, Kolhapur is also experiencing environmental imbalance due to air, soil, water and sound pollution. As a result a number of groups, Government organization, NGOs and institutions have emerged to control the pollution. In order to know their main activities and efforts the research study covered all organizations working for environmental awareness and protections in and around the Kolhapur city. The study throws up new dimensions relating to causes of pollution and efforts of the mentioned organizations in this direction.

RC32-590.1PATIL, VRUSHALI* (*Florida Atlantic University*)*Intersectional Routes*

This paper considers racialized constructions of bodies, genders and sexualities from the perspective of empire. Following imperial practices which cross and connect the Americas, Africa and the Indian sub-continent, it considers how racialized imaginings of sex, gender and sexuality shape these crossings, as well as how these imaginings are in turn shaped by these crossings.

RC48-805.11PATITNAIK, BINAY KUMAR* (*Indian Institute of Technology Kanpur*)DAS, MANORANJAN (*Indian Institute of Technology Kanpur*)*Analyzing the Anti-Posco Movement in Odisha Beyond Identity Issues: A Critical Examination of New Social Movement Theory*

Unlike earlier resistance movements of Odisha which were studied on issues of R&R, ecological degradation, loss of livelihood, and local identity, this anti-POSCO movement with a nuance is studied, through a novel variable called the Politics of development. The formation of networks of solidarity groups and emergence of their umbrella organization as social movement organization (SMO), strengthened processes of mobilization, invited wider attention of civil society organizations (CSOs) and through that intellectuals at national and international level (with strong media linkages) to join the movement. *Navanirman Samiti* was an organization that initially played a stellar role in the anti-POSCO movement. Thereafter *Posco Pratirodha Sangram Samiti* (PPSS) had been spearheading the anti-POSCO movement as the SMO. Loss of livelihood involving primary produces like, *Dhana, Pana, Meena* and loss of native place (*Bheeta Matee*) were the initial issues of identity (local peasantry) for the resistance movement.

The analytical thrust of this paper is the politicization of the movement by various political parties. Engaging the organizational networks, deploying strategies for dis-information/ mis-information campaign to mislead the PAP, using covert coercion tactics for mobilizing PAP, shifting their identity issues, etc were the major strategies of the PPSS backed by CPI. The mobilization process continued in spite of counter mobilizations by another pro-project SMO. This strong hand tactics could be deployed by the SMO and the local solidarity groups because of their political patronage. Hence as a victim of politics of development, POSCO's mega-project faced closer. This questions here the new social movement theory, as the movement is not found to be based on voluntary collective actions, instead is fomented through a wide network of a national political party and its affiliate CSOs as well as solidarity groups. Further it questions the autonomy of the CSOs which were to play a conscientious role.

RC48-809.3PATITNAIK, BINAY KUMAR* (*Indian Institute of Technology Kanpur*)NAYAK, AKHAYA KUMAR (*Indian Institute of Management Indore*)*Rise of Self-Help Groups As a Social Movement: A Study of Alliances in Indian State of Odisha*

The micro-finance based income generation for empowerment through the Self-Help Groups (SHG) of women in the Indian state of Odisha has been a widely reached programme for empowerment and socio-economic development of women. SHGs have been playing a key mediating role to empower the rural women. Collective mobilization of the millions of rural women to form their institutions through lakhs of SHGs, thousands of NGOs, MFIs, and bank branches give this phenomenon a movement dimension. Hence, firstly, the present paper

is an earnest and novel attempt to examine the evolution and development of the phenomenon of SHG in the state of Odisha from social movement perspective (i.e. from mobilization to institutionalisation). It further discusses if the phenomenon is a social movement at all and examines the applicability of different social movement theories to study it. Secondly, based on both secondary and primary data the paper uses the resource mobilization theory of social movements as the analytical framework to explain the emergence and functioning of SHG system through two cases studies of SMOs, like Mission Shakti and TRIPTI. Thirdly, based on the social constructivist theory the political and cultural opportunity structure in Odisha was enquired into and it was found to be very much supportive of making the said movement wide spread. At the same time operation and control from the top affects the rigor of the movement and also changes its very nature. Thus women SHGs in Odisha have emerged as a kind of social movement actor that forges alliances with the Govt. department of women and child development on the one hand and forges alliances with the civil society organisations (NGOs) and MFIs on the other. These new alliances are forged at the grassroots level.

Negotiating Integration and Mobility – Experiences of Highly-Skilled German Immigrants in Canada

Many Western European countries are currently experiencing high emigration rates, notably of their young and well-educated population. So far, there exist only few attempts to explain this recent phenomenon. However, in a time where countries increasingly compete to attract and keep the best and most qualified individuals to secure both a country's competitiveness in the world market and cohesive nation-building, understanding the decision-making process lying behind these individuals' mobility patterns, as well as their integration and settlement behavior becomes crucial. While individuals belonging to the group of the mobile elites are often portrayed as rational actors whose migrations are relatively "uncomplicated" as they often possess high human, social and cultural capital, the complexity lying behind their decisions of whether to stay or go, as well as their integration experiences are often ignored. This paper aims to shed light on these processes by examining highly-skilled, self-initiated German expatriates moving to and from Canada. Drawing on narrative interviews it will particularly explore how my interviewees negotiate processes of integration and belonging in different spheres of their lives (e.g. in their neighborhoods or cities, at work, or by participating in different social groups) and how these factors impact their decisions of whether to leave, stay, or return.

Transnational Resonances of the World March of Women in the Americas

The World March of Women (WMW) is a transnational feminist network that originated in Quebec, Canada, in the mid-nineties with the Bread and Roses march against poverty and violence against women. Today, the WMW counts with more than 60 National Coordinating Bodies spanning over five continents and has become the largest transnational feminist network, with the Americas region being one of the core regions for the emergence and development of the March in the world.

Drawing on qualitative semi-structured interviews, direct and participant observation and documentary analysis of secondary sources collected between 2013 and 2016 in Peru, Mexico and Brazil, this paper has the following main objectives:

1. to explore the dynamics of resonance across borders and scales of place-based struggles of the World March of Women in the Americas.
2. to investigate the relationship between the experience of the World March of Women, that pioneered and transformed the imaginary of transnational feminist solidarities and contemporary experiences such as the *Ni Una Menos* platform.

The March is characterized by complex multi-scale politics and governance, that enacts a form of transnational feminism simultaneously global in reach and rooted in specific place-based struggles. As such, the WMW constitutes a unique case for studying relational processes of transnational resonance and dynamics of political solidarity-building.

Dude, Where's My Ranking?: Causal Effects in the Implementation of New Rules at Secondary School, for the Access to Universities in Chile.

The research explores the transition process from secondary schools to selective universities and the effects produced by changes in admission criteria and rules.

Specifically, the research attempts to explain how the change in the required scores used in the Unique Admission System (SUA) to entry academically selective universities (which include as a new element the relative position of the students in the context of his generation of classmates), configures the so-called "ranking effect". This effect consists in the migration from secondary public schools of excellence to ordinary secondary schools, a process that this research links to individual decisions made by students and families in order to optimize their chances of a place in a selective university.

The research develops a paradigmatic case study in the context of a specific neighborhood in Santiago de Chile, in which a specific and remarkable flux between two secondary schools is noted. By means of interviews with directors, teachers, students and parents, the study traces the decision-making process that the students undergo while facing this unexpected change in the rules for application and admission to selective tertiary education institutions.

Finally, the research explores some dramatic situations in the context of which the students were victims of bullying in their new schools.

This research is relevant as it questions the non-expected results at the biographical level of public policies, from a sociological perspective, usually neglected both in policy design and evaluation as well as in social research on secondary education and college admission systems.

Exposing the Power of Globalization: Visual Approaches to Researching Global Interconnectivity and Inequality in the Urban Everyday

This presentation explores how visual approaches to globalization as expressed and enacted in everyday life may enrich and complement the more abstract and mainly quantitatively supported discourses around this convoluted phenomenon. Visual methods, with their focus on empirically observable aspects of culture indeed have the capacity to uncover forms of global interconnectivity and power play in urban settings, by looking carefully at the material environment and artifacts as cultural expressions and at visual practices and performances of people within those spaces. This contribution will cover the visual dimensions of globalization both as a directly observable and as a 'mediated' field. Empirical (non-visual) data on aspects of globalization can be 'visualized' in the sense of being transformed from symbolic into more iconic and metaphoric form and thereby provide a better understanding of interrelations and trends as well as adding a spatial dimension to the data. However, one can also depart from visible elements of (urban) culture (artifacts and behavior) and instigate the production of visual records of those aspects for further scrutiny. Finally, a visual approach may not only document a phenomenon in rich detail (while inevitably a selective and reductive act) but also involve more metaphorical and constructive approaches that go beyond depicting the world but seeking to reveal a specific take on a phenomenon rather than simply depicting aspects of it. Such an 'expressive', interpretative effort embodies the transition from mere data to the visual (multimodal) materialization of insight. Visual approaches to globalization and cultural exchanges thus may provide a more valid, unobtrusive way to assess and understand the impact of culture in the daily life of inhabitants of cities around the world and add a unique 'localized', cross-cultural empirical perspective to the many divergent views and discussions about the presumed beneficial or detrimental nature of these processes.

Immigrant Children in Chile: Discrimination, Rights and Agency

This presentation presents results of FONDECYT study about immigrant children in Chile. Based on a mixed methods and child-centred approach, this presentation discusses institutional and experiential aspects of right and agency regarding violence, discrimination and racism. We first review quantitative data from the state regarding the immigrant children in Chile. We also present qualitative data from interviews with immigrant children between ages six to seventeen, and we interview to their parents and social workers. We attend to how they negotiate their rights and agency in front of violence, discrimination and racism.

Transnational migration in Chile has only in the past decade grown more diverse, visible, and in unprecedented rates and numbers, thus provoking national debates and policy changes in recent years. In 2014, there were approximately 411,000 foreign persons in the country, or 2.3% of the total population (Rojas and Silva 2016: 10). The majority of recent migrants come from other South American and Caribbean countries facing political and/or economic and natural crises, such as Peru, Bolivia, Ecuador, Colombia, Venezuela, Dominican Republic, and Haiti. Today, many migrants in Chile do not only suffer symbolic violence due to ra-

cial discrimination (Pavez-Soto 2012; Tijoux and Cordova 2015), but also confront structural discrimination and abuse in the labour, property, and rental market. Migrants tend to command lower wages in informal work sectors (Stefoni et al. 2017), and pay higher rents with poorer living conditions (Rojas and Silva 2016: 37). Processes of racial exclusion to labour and residential access constitute new symbolic and material challenges that effects the reclusion of migrant families to particular neighbourhoods and jobs (Margarit and Bijit 2014). In a public survey, 19.2% disapproved of migrants children' access to social rights; such hostility is more intense in Santiago than other parts of the country (CEN-OPCION 2012: 33-35).

Social Consequences of the Restricted Language Development in Migrant Youth in Austria

During the biographical qualitative research with young people of migrant origin conducted in 2016-2017, we noted the variety of integrative models our interview partners adopted for internalising their spoken languages. The interview partners were chosen from groups of young people who grew up in Austria, and experienced the entire education process in this country, and are coming from the families with both parents originating from one of the three largest ex-Yugoslavian countries: Bosnia and Herzegovina, Croatia, and Serbia. The language environment in Austria is relatively diversified, in terms of the variety of languages one can experience in the open social spaces, but it is also very limited in the usage and expansion of administrative languages, and the languages present in the education system. The official language in Austria is German, and there is limited support for the learning of any other languages, including the first language, still referred to as "the mother tongue", and any other languages. Along with the lack of support, there are also differences in the acceptance of foreign languages – namely, from the narratives of our interview partners one can note various situations where they or their siblings experienced the lack of support, and even discrimination, restricting the usage of their first language in social environments outside of their family. This in turn had affected their choices of and chances for social group belonging, and arguable consequently their chances in the socio-economic sphere. This perceived ripple effect caused by the differences in language development support or the lack thereof can be observed in the interpretations the young people we interviewed, describing the life chances of their siblings, and their interpretations of the causalities leading to lifestyles of their families of origin. This was among the analytical challenges before the four-country multilingual research team on this project.

The Cartography of Aesthetics: On Making the Urban Visible

From the lighting speed of financial markets to the petrified pace of climate change, from the ubiquity of urbanisation to the instant-sharing of everyday life via social media, we face processes whose scale, speed and impact we are less and less able to envisage, let alone handle. In the meanwhile, novel knowledge and technology provide us with ever-new potentials to widen perception to inhuman scales and temporalities. The late Félix Guattari argued that the crucial political question of our time is that of making visible, sensible, and thus amenable to action, the structures, forces and processes that traverse and shape our reality. Conceiving new measures and drawing new cartographies of our condition, that is: an eminently aesthetic task. The role of art in *making* the visible, rather than simply reproducing it, as Paul Klee famously put it, is thus forcefully called into question yet again, as is the age-old interrogation on the relation between art and politics, in dire need of a radical update. A challenge that requires art to be disentangled from its most common, instrumentalising misunderstandings: on the one hand, as the more or less unwitting phenomenological tool of the ever-sophisticated experience economy of contemporary cities; on the other, as the more or less redundant tool of political activism. Focusing on the relation between art and visibility in the age of planetary urbanisation, this paper will seek to navigate conceptually, through relevant examples, beyond this impasse.

What Is 'Urban Violence'? Steps Toward a Theory Beyond 'Violence in the City'

Urban violence is omnipresent in political, media and public discourse; and it has been a topic for academic discussion for decades now. However, the nexus between 'violence' and the 'urban' remains under-theorised: possibly because violence itself is under-theorised (Kilby, 2013) and consensus lacks on what violence even means (Springer, Le Billon, 2016); possibly because the 'urban' is a field of much theoretical oscillation and contestation (e.g. Brenner and Schmid, 2014). This paper will start from the acknowledgement that not only is 'urban violence' under-theorised; but that it lacks a precise and unanimous definition – as we shall show by mixing qualitative literature review and scientometric analysis over academic production about urban violence. Then, we shall take some steps toward a definition and theorisation of urban violence in a process able to constitute a theoretical and strategic advance with respect to its common, simplistic understanding as 'violence in the city'. On the one hand we deal with the phenomenological aspect of violence, making explicit how the apparently self-evident experience of violence is far from being so, and rather dependent on a series of socio-cultural-historical factors shaping the regime of visibility within which violence is perceived as such. On the other hand, we argue for the need to take into account the ontological aspect, how urban violence is tied to that peculiar formation which is the city and that peculiar process which is urbanisation.

Street Art in the Times of the Crisis: Social Protest or Artistic Expression

People usually consider that Art exists outside the realm of politics, as an absolute conception of uncorrupted aesthetic value, source of a divine gift. However, it's impossible to distinguish between political art and non-political art because every form of artistic practice either contributes or not for the reproduction of the dominant social order. In this sense consciously committed 'political' art represents that kind of expression that intentionally comes out of the artist's ideology. Reflecting on the concepts of power, violence and justice this study provides a spectrum of discourses concerning the relationship between street art and politics traced through interviews with genuine graffiti performers of Athens in the times of the crisis. RC24-460.3PEARSE, REBECCA* (*University of Sydney*)***Renewable Energy Labour and the Contradictions of Energy Transition***

This paper investigates the social organisation of different kinds of renewable energy labour (wind, solar, hydro), reflecting on the broader political economic implications of energy transition. Using renewable energy workforce data in Australia, I discuss emerging evidence of the spatial re-organisation of energy workforces associated with energy industry transition, as well as the implications for collective organising if a comprehensive shift toward decentralised energy production were to be realised. Workforces of renewable energy industries are much more geographically dispersed and precarious than those of established, centralised fossil fuel industries. For instance across regional Australia, numbers of solar installation jobs have grown and retreated rapidly amidst energy policy uncertainty. By considering the new regional geographies of energy work in transition, the socio-political complications of re-embedding energy markets within 'safe' climate limits are revealed. In one sense, a forward march toward renewable energy is a key element to mending the biophysical disruption historically associated with fossil fuel capital accumulation. In another sense, renewable energy represents a source of precarious contract work that is more socially dis-embedded and ephemeral compared to coal workers in regional Australia. The new geographies of energy work illustrate that renewable energy transition reconfigures, but does not resolve, eco-social contradictions of capitalism.

RC52-872.9PEDERSEN, INGE KRYGER* (*Department of Sociology, University of Copenhagen*)***Challenged Workforce Boundaries: The Implementation of Prevention of Lifestyle-Related Diseases in Danish Hospitals Considered As a Trans-Local Health Professional Project***

Noncommunicable diseases are the leading cause of death globally and reducing the global burden of such chronic diseases is an overriding priority of The World Health Organization's work. This paper will trace the emergence of 'prevention of lifestyle-related diseases' as a trans-local professional jurisdiction, focusing on profession-driven interventions and initiatives in Denmark. The notion of 'trans-local' refers to projects where professional groups seek wider than local or national changes, but also across scales of local, regional, and global forms of acting and organizing. Thus, this paper focuses on how professionals impact upon, and are themselves influenced by, changing local as well as global contexts of health professional work - which is a question yet to be systematically explored within sociological research on the topic of global transformations and changes of professional's work.

Empirical materials include documents (standard procedures, registration forms), reports, articles and debates; qualitative in-depth interviews conducted with health professionals, managers and key persons about goals, dilemmas and practices related to health promotion and prevention of chronic diseases; 'site-visits' at Danish hospitals and centres of lifestyle and health promotion. This qualitative approach stresses the concrete relations, settings, and situations in which professional power is shaped and exercised. The choice of interviewing provides access to agendas, understandings and opinions about interviewees' daily work and experiences.

Findings and conceptual considerations focus on professionals' work, health political changes and new educations related to prevention of lifestyle-related diseases. The discussion addresses the conceptual challenge to 'ecologizing' trans-local professional projects and 'transnationalizing' their linked ecologies (Abbott 2005), such as professions, universities, and health policy. Important political and organizational changes within the latest two decades will demonstrate how professional disease prevention projects draw together local, national and transnational stakes, resources and arenas of interaction.

RC52-870.7PEDERSEN, KIRSTINE* (*Department of Organization, Copenhagen Business School*)***Professionalism between the Authority of Expertise and the Authority of Office***

According to Charles Perrow (1972) it was a footnote in Talcott Parsons' introduction to his translation of Weber's *Economy and Society* that made the hard-lived dilemma of expertise and discipline famous. Parsons (1947) declared that Weber confused two types of authority; one based on technical competence and one based on legally defined office. Perrow notes that although Weber never himself made such a distinction, Parsons' footnote is 'possibly the most important in the history of organizational theory' as it has led to an understanding of professionals as being in a conflict between their 'professional values' and more

bureaucratic values and obligations linked to their professional office. Following Parsons' seminal writings, this imagined discrepancy has led to a myriad of images of professionalism as a kind of resistance or power struggle against bureaucratic or hierarchical control within the sociology of professions. Most prominently perhaps Eliot Freidson *Professionalism, The Third Logic* (2001) in which he argues for professionalism and bureaucracy as to contrasting institutional logics and thereby for an inherent conflict between the authority of expertise and the authority of office.

In this paper, I take the medical profession as a case to rethink the relation, interdependence and possible overlap between these two types of authority. Based on readings of classic medical sociology and on fieldwork conducted in a Danish university hospital, the paper investigate the question of authority in the clinic and it is shown how it is impossible to understand medical professionals as merely extra-organizational selves in supposedly collegial organizations. Rather, it is shown how medical expertise is often transmitted exactly through hierarchy and a clear distribution of responsibility, duty and role-obligation.

RC23-438.4PEETZ, DAVID* (*Griffith University*)***'Digital Humans' and the Development of Cyborg Technologies***

Cyborg work is 'the performance of work or holding of skills that is related to cybernetic devices in a human'—that is, technologies that become embedded within the body itself, linked to the ear, the brain, or other parts of the body. Examples are technologies that enable individuals to think or process information substantially faster, perceive matters substantially more efficiently, or work more quickly. Humans and machines, to some extent, merge to become 'digital humans'. Unlike some aspects of technological predictions, which at the moment seem indeterminate (will artificial intelligence create as many jobs as it destroys? will it enable machines to achieve consciousness?), the process of moving towards 'digital humans' appears inexorable, the only barriers being technical and not insuperable. So this may seem (and perhaps is) a long way in the future, but 'a long way' here might be less than a century, well within the time frame considered relevant for climate change policy. We presently witness the initial signs of cyborg technology being developed that could have a fundamental effect on people's relationship with technology and with each other (one of the earliest high-tech examples is the Cochlear implant). Organisations such as Neuralink are taking this technology to the next stage. Eventually, people might merge with machines (in the very long run, measured in say millennia, this is highly likely) and individuals will mostly comprise machines with only a minority of biological parts. But in the meantime, the more interesting questions concern what happens when people integrate parts of machines into their bodies that massively increase their capabilities as individuals. The first, longer, part of this paper examines developments to date and in the expected future. The second part considers potential consequences from a sociological perspective.

RC48-805.7PELIVAN CEMGIL, GÖZDE* (*University of Amsterdam*)***Holding the Lines: Responses to Movement Fragmentation in the Follow-up Networks of the Gezi Movement***

It goes without saying that in Turkish history the Gezi movement represented a turning point aligning institutional and non-institutional political actors with unprecedented diversity in its initial phase in 2013. Appropriation of urban commons by authorities for the use of private capital through the reorganization of urban space was one of the major factors that contributed to the alignment of diverse protestors in the genesis of the 2013 protests. The movement also proved to be resilient particularly in Istanbul, despite widespread government crackdown. It transformed itself first into a series of public park forums, then a number of neighborhood solidarities and defenses in Istanbul, campaigning for a variety of causes ranging from environmental concerns and women's rights to more everyday agendas in the face of the ongoing neoliberal onslaught on urban space and different contours of life. In time, numbers of activists within the suggested networks diminished. Meanwhile, in the face of both external and internal factors fragmenting these groups, a set of practices have been developed to maintain diverse activists inside the group by fellow network members. Drawing on this, this presentation problematizes the democratic practices in the follow-up phases of the Gezi movement. It explores the practices to preserve differences inside the movement networks, major limitations in achieving this, and to what extent the said follow-up networks have been successful in going beyond the sources of fragmentation. The ethnographic fieldwork carried out over a period of twelve months in 2016 suggests that sustaining movement practices peculiar to the initial phase of the movement have been influential in maintaining diversity. Furthermore, despite limitations, 'the local' played a binding role in the face of fragmenting fault lines in politics at national scale.

The Digital Granny: Straggler or Avant-Garde in a Digitized World?

The digitalization is an epochal social upheaval. However, it seemed as if a group was almost completely excluded from this development: the elderly. They were described as skeptical towards technology. The digital division of society seemed to be mainly a division along the "age gap". In this sense, older people could be described as *straggler* in a digitized world.

However, recent research shows that the digital skepticism of the elderly is changeable. Women advanced in years, who have only little experiences with technology, but who are now more and more concerned with digital media, are particularly remarkable. These women experience digital media as a great, late opportunity to emancipate and acquire new opportunities. In a double negation of age and gender-specific stereotypes, they use it to create their own, self-determined life in old age.

But the few findings also point out the dangers associated with their specific form of use the media. Due to the lack of prior experience with technology, these women use digital media inexperience and learning by playing. Despite their "objectively" low level of technical expertise, they consider themselves competent. Due to the increasing dangers in the use of digital media – especially with regard to data security and privacy – significant risks are associated with these usage patterns. We can identify an ambivalent relationship between emancipation and threats, which is involved in the increasing penetration of society by digital technologies. To this extent, the digital granny could be understood as an *avant-garde* in a digitized world.

The aim of this paper is to describe an ideal type of these digital grannies out of a praxeological perspective, based on qualitative research. In doing so, the potentials of modern technology become visible, without neglecting their dangers.

M3D143N717Y: Taking the Network over and Bringing It Down

Published as a hardcover comic book in June 2017 by éditions Delcourt, *MediaEntity.04* closes the first cycle of a transmedia series titled *MediaEntity* that was first released online in episodes starting November 2012. Marketed as a "thriller d'anticipation paranoïaque" (a paranoid science fiction thriller), the series follows the misadventures of a victim of "mediatic mutation", Eric Magoni, who must flee when his login is used to cause the bank where he works to lose five billion euros. A "mediatic mutation" occurs when an online identity takes on a life of its own and as the series unfolds, readers come to witness the downfall of other celebrities due to such mediatic mutations.

Originally, the series focused primarily on the dangers of sharing personal information through online social networks and warned readers with statements such as "Switch off your life! Become invisible! The network will take over you! [sic] identity..." while also relying on its readers' knowledge and use of such networks. With time, however, the series has become less paranoid and advocates human collaboration and contact to bring down the all-seeing and all-controlling network.

To what extent does the series fit its label as a "paranoid" thriller? What is the place of social media in this series? To what extent does it promote collaboration and solidarity to overcome the ostracizing effects of mediatic mutations? I argue that through fiction and real-life online tools, the series attempts to bring down online networks from within to favour human contact.

Communicating Research. Scientists in the Public Space of Communication.

Research on Public Communication of Science and Technology has been focused on non-experts and mediators. Scientists as communicators has not been explored yet although they are involved in communicative practices. The SHARPER project, in the "European Researchers Night" framework, carried out a study to evaluate the researcher communication strategies. During the 2014-2017 events, information about researcher expectation, preparation and communication strategies were collected using observation and interviews. Moreover, information on the event organization, management and development have been recorded. The results showed different strategies that scientists used based on the researchers culture and skills adopting particular communication styles and tools. In this presentation it will be proposed results coming from quantitative and qualitative methods used during the first and the second wave of the research.

Series in Digital Media: A Study with Young Brazilians on Habits of Transnational Consumption

The research project "Youth Cosmopolitanisms in Brazil" adopts the concept of aesthetic cosmopolitanism to analyze the relationship between young people and the phenomenon of globalization, as a transnational cultural process that does not erase local cultures and that transmutes the feeling of national cultural singularity. In this perspective, youngsters have an aesthetic predisposition that, thanks to cultural hybridization, was emancipated from a previous locally oriented and rigidly shaped scenario. One of the spheres of transnational consumption of young Brazilians today is the consumption of TV series, especially from digital access. In this digital relationship with the series, young Brazilians present different forms of consumption, both in relation to time, without the need to wait between episodes, as well as in relation to frequency/quantity, in the multiplication of hours and in the number of episodes assisted. Their repertoire is primarily North American, but they also embrace series produced in a similar transnational format in other countries. Based on these perspectives, we present a study carried out with young Brazilians between the ages of 13 and 18, students of Sesc High School, which is a boarding school. Their campus in Rio de Janeiro gathers 465 youngsters from all 27 federal units in Brazil. The research sought to understand their consumption of series, both quantities and frequencies, as well as the diversity of genre and nationality of production, through the application of a questionnaire (N=450), a focus group (N=8) and interactive game technique developed by the research team (N=30). Faced with the possibility of series' consumption in devices and digital platforms, these youngsters present consumption habits involving high quantity and frequency, as well as genre and nationality diversity, which allows contact with different cultures and countries represented in the narratives.

Editorial Making of Criminal Groups in Michoacán, Mexico. Study from a Legitimacy Perspective

The idea of legitimate crime is everything but new. However, the Robin Hood ghost does not work to explain all cases. Even when criminals are not entirely agents aside from the state, every set of social features triggers different paths for how criminals look for legitimacy. With this basis, this paper analyzes the case of the editorial production, printing, and distribution of pamphlets, rule books and codes that certain criminal groups carried out and disseminated in the state of Michoacán, in the West of Mexico. That happened approximately between 2005 to 2010, in the middle of the war on drugs declared by the former Mexican president, Felipe Calderón. This paper aims to conduct an analysis of these editions from legitimacy approach and seeks to understand how those books worked for 1) building the identity of the criminal group, 2) constituting their narrative and 3) justifying their criminal agency and activities as well. The analysis ranges patterns that go from gaining sympathy and achieving people's collaboration and trust to produce fear, obedience, and respect. Besides, this proposal uses this case to discuss two premises on criminal groups nature. On one hand, refutes the suggestion that they are exclusively economic motivated -on the contrary, political motivations might drive their actions. On the other hand, it implies the necessity for re-think and contextualizes the study of crime and legitimacy.

What's in It for Us? Visible Minorities in the Royal Australian Air Force.

In 1988, the first two women to graduate as Pilots in the Royal Australian Air Force (RAAF) received their 'wings'; an event that seemed to promise a bright future for female pilots in Australia. But in the intervening 30 years, the representation of women in both the Pilot category and the broader organisation has exhibited little growth. Despite significant efforts to increase the representation of women and other visible minorities in the RAAF, a stubborn perception prevails that to do so would necessarily reduce the capability of the organisation. This paper seeks to circumnavigate this 'capability argument' by shifting the burden of proof onto those who oppose a more representative military. Drawing on political philosophy, (such as Hannah Pitkin's *The Concept of Representation*) I argue that a compelling human rights argument exists to remove all possible barriers that act to limit minority participation (in the sense of minorities *within* the organization, such as women) in national defence. Moreover, as distinct from capability considerations that are frequently subject to revision and renegotiation in the armed forces, this human rights argument suggests that the representativeness of a military

organisation is a fundamental condition of its legitimacy as a Government entity. At its core, this paper argues that contemporary efforts to diversify the RAAF have stalled due to a dominant preoccupation with judging the utilitarian worth of inclusiveness.

Care Economy and the New Contours of Inequality

The ascent of care economy may be both a boon and an adversity for women. On the one hand it affirms the centrality of care in social and economic life and opens up much needed spaces for recognition, reclamation and revaluation women's hitherto invisible and undervalued care work; on the other, it also comes with a great potential to create and intensify new forms of inequalities, between women, and across race, ethnicity and citizenship. This paper explores opportunities and challenges posed by the rise and expansion of care economy. The paper discusses how changes in culture, demography, and family and gender relations have contributed to the expansion of care economy, and how national policies have contributed to the different contours of inequalities. Using the example of China and Japan, the paper illustrates how changes in provisions, institutionalization and regulation of elder care work in the two countries have contributed to different forms of inequalities in the two countries.

Unpacking Sexual Assault: The Intersections of Violence in Canadian Law

This paper examines *R. v. Wagar*, a sexual assault case heard in the Provincial Court of Alberta in 2014. This case attracted media attention and public outcry when, following the acquittal of the accused, it was revealed that the presiding Justice Robin Camp had made shocking sexist and victim blaming comments during the trial. At face value, *R. v. Wagar* exemplifies the Canadian criminal justice system's failure to meaningfully address sexual violence against women; however, in a trial where a young, Indigenous complainant was repeatedly referred to as 'the accused', there is clearly more to be unpacked. In this paper, I bring together sociological, feminist, and Indigenous analyses of the criminal justice system and the settler state to critically analyze the trial transcript. I discuss the intersections of gendered, racial, and colonial violence that linger – *sometimes invisibly* – in *R. v. Wagar*, shaping the conditions of the case. Moreover, the paper seeks to disrupt conventional narratives around gendered violence by questioning the way some feminist discourses posit state violence as a meaningful solution to sexual assault. Finally, it emphasizes the usefulness of utilizing sociological, feminist and Indigenous analyses when examining the intersections of power, violence, and justice.

The Causal Effects of Advanced Mathematics Coursework

We examine the causal effects of being placed on an advanced mathematics course trajectory using statewide administrative data from California schools. Using a novel approach to identifying schools with discontinuities in the odds of student course placement based on prior achievement, we use a regression discontinuity design to estimate the effects of advanced course placement in several hundred schools. We combine estimates from these schools using meta-analysis, finding that on average advanced math course placements boost later achievement by roughly .10 standard deviations. There was considerable variation in the size of the estimated effects, with smaller effects in lower achieving schools and schools with more students from disadvantaged backgrounds. Our results thus suggest that taking an advanced mathematics course helps students in advantaged schools, but that as currently implemented advanced mathematics coursework in lower achieving disadvantaged schools may not yield the benefits that one would hope for.

Carving Space and Staking Claims: Defining Crisis Relief

Crises can generate response needs that exceed the capacities of local resources and trigger the involvement of outside actors to meet crisis demands. As these actors converge on the affected area, they must develop an understanding of the response context and set parameters around their own activity. Using interviews, observation, and document analysis, this study examines how relief effort participants developed definitions and boundaries as they planned and implemented international crisis medical relief efforts. This study focuses on governmental and non-governmental relief workers involved in efforts responding to one of two events: the 2015 Nepal earthquake and the 2014-2016 Ebola epidemic in West Africa. In some cases, these actors generated completely new definitions in planning the response. At other points, they applied pre-existing definitions to the situations they faced, often adapting them through selective bridging, breaching, and alteration. Relief workers employed numerous definitions and boundaries in their work to both define the event and to define the response itself. Specifically, responders defined the event, the target areas and population, the problem they aimed to address, their goals and objectives, temporal boundaries of the event and response, and defined who the responders themselves were. Importantly, similarities appeared across both events. Study participants from both cases and a variety of group types utilized similar types of definitions, and relief workers ultimately came to define both crises as issues of public health. The definitions each group used guided their decision-making, and differences between the definitions used by different actors presented additional challenges in executing the response. These findings reflect the centrality of the defining process in planning and implementing crisis medical relief efforts, and indicate significant parallels in this process between responding to disasters and large scale epidemics, suggesting similarities in the responses to these two types of crises.

Mechanisms of Racial and Ethnic Wealth-Building Inequality in U.S. Government-Sponsored Mortgage Finance from 1983-2013

Prior research has revealed racial and ethnic inequalities in access to traditional prime mortgage lending, with Black and Hispanic households being more likely than White and Asian households to be denied a loan, or to receive a subprime loan rather than a prime loan. However, less is known about racial and ethnic inequalities *within* the traditional prime mortgage market, which is often heralded as a key tool for closing wealth gaps. Using American Housing Survey data, this paper measures the extent to which the traditional mortgage market created divergent wealth-building trajectories (measured as the *cost* and *rate* of building equity through mortgage amortization) for White, Black, Hispanic, and Asian borrowers from 1983-2013, and analyzes the changing mechanisms driving this inequality.

After measuring racial and ethnic inequalities in wealth-building trajectories within the traditional market by year from 1983-2013, this paper tests whether these inequalities are attributable to: (1) differential sorting by race and ethnicity between government-home-purchase, conventional-conforming-home-purchase, government-refinance, and conventional-conforming-refinance submarkets; (2) incorporation of new underwriting techniques within individual submarkets; or (3) inequalities net of underwriting controls within individual submarkets. This paper finds evidence that: (1) throughout the 1990s and 2000s, submarket segmentation within the traditional market contributed to wealth-building inequalities, with Black and Hispanic mortgage recipients being less likely to receive (lower-cost) conventional-conforming mortgages, especially during periods with the most favorable amortization trajectories; (2) during periods of market expansion to minority borrowers, racial and ethnic inequalities persisted within the conventional-conforming markets, net of underwriting controls, likely due to mortgage-product differentiation; and (3) during periods of market contraction to minority borrowers, risk-management techniques contributed to inequality, with property-associated underwriting criteria accounting for a significant portion of Hispanic-household disadvantage, and wealth- and income-associated underwriting criteria accounting for a significant portion of Black-household disadvantage. This paper concludes with theoretical and policy implications.

Informality: A Concept in Search of a Theory

In the face of the transformations of the "labor world", the debate on the term informality required conceptual re-elaborations in order to be adjusted to the "new times". Initially, the present essay addresses the first formulations about the term, specially the concepts of informal sector and informal economy. Subsequently, it

sheds light on the main critiques to these initial formulations. Lastly, it presents three analytical approaches developed in an effort to re-elaborate the concepts, as well as their theoretical and methodological unfoldings, namely: Informality Process and the "new informality"; the approach that identifies the porous boundaries between the legal/illegal, formal/informal and the illicit; informality as the social form that labor takes in certain (theoretical) regions of the social order. The respective concepts are operationalized by different empirical researches. The intended aim is to evaluate the analytical potentialities of each approach through case studies.

Migrants Worth Less? an Analysis of the Role of Migrant Musicians in the World Music Market

This paper addresses the role of power and inequality in the production of World Music, concerning specifically the experience of migrant musicians. Although it is a very disputed concept, World Music is considered here as a market category carried out by the trade fair WOMEX—The World Music Expo, the World Music Charts Europe and participants radio shows, the European Forum of Worldwide Music Festivals, and the magazines fRoots and Songlines – although the phenomenon is not restricted to these organizations. The World Music market is seen by these actors as the positive side of globalization, in which a certain inversion of power relations occurs: small firms in Western countries import music from the world in order to make them known in the West, working ethically as an ethnomusicologist and, in this way, bridging cultures and fighting racism. Despite their achievements, the establishment of this market in the last thirty years reveals the emergence of new forms of inequality. Specifically, migrant musicians have less opportunities in this market than musicians travelling directly from their home countries, although they have the same nationality or are identified with the same musical tradition. For example, data on WOMEX showcases (1994-2011) reveal that 25,5% of participant musicians are migrants and, among them, only 6,6% play in mixed bands with musicians from the country where they current live. All other musicians do not have migration background or do not mention this information in their biographies. This paper aims to offer an accurate view on the participation of migrant musicians in this transnational market until today, discussing the reasons for this kind of discrimination: perception of authenticity in this market, position of migrants in the country where they are current living, and access to funds to finance their musical projects.

PEREYRA, DIEGO* (Gino Germani Research Institute / Universidad Nacional de Lanús)

Reflections upon the Use of Sociological Knowledge in Latin America. Instrumentalisation and Critical Thought in Gino Germani's Ideas.

Gino Germani was certainly one of the key figures in Latin American sociology. Still today, his ideas are an indispensable theoretical framework to analyse social dynamics in the region and its meandering modernization process. Both Germani's actions and ideas had been classified in many ways and levels: theorist of modernization, antifascist untiring warrior, academic impresario, imperialist sociologist; but all these categories seem to be unsatisfactory to understandably think his complex work. Besides he did not offer openly a framework from the sociology of knowledge, his ideas are actually interested from this point of view. His readings and interpretations on the relations between politics and science, his ideas on the role of contemporary sociology and also his own life story fighting against totalitarian regimes all set a map to draw a systematic interpretation of the scientists and intellectuals in modern societies. In that pattern, Germani put sociology and sociologists in the centre. So, this paper aims to present and discuss Germani's contributions to the sociology of knowledge. Looking to his ideas and actions, this work wants to understand the ways Germani proposed but also used sociological knowledge, both in terms of instrumental and critical framework, in the study of modernization theory and in his public participation to orient policies in Argentina.

"They Are Contributing, They Are Speaking, They Are Being Heard": The Implications of What Remains Unspoken for Building Trust with Marginalised Social Groups in an International Climate Change Project.

The Adaptation at Scale in Semi Arid Regions (ASSAR) project aims to minimise the adverse impacts of climate variability on vulnerable groups of people, to avoid exacerbating existing marginality. Scenario planning workshops are an established

method to reflect on and respond to uncertainty, through an analysis of stories about what might happen in the future. The ASSAR project experimented with different types of scenario planning methods. One of which had proved valuable in the context of political issues, characterised by mistrust between stakeholders, but had not been applied to problems related to climate change. This research is a comparative analysis of peoples' experiences of the ASSAR project in Namibia, Kenya and India. I observed the scenario planning process and interviewed participants over a six month period, with a view to understanding the extent to which trusting relationships were formed. Using a combination of thematic and discourse analysis, I interrogate the connection between participatory scenario planning and trust. My findings showed that the dynamics were different in each case, largely depending on workshop participants' prior experience and interpretation of 'the local community'. In each location, although colonialism was not mentioned in the workshop itself, historical power relations bubbled beneath the surfaced in my conversations with both workshop organisers and attendees. I conclude that scenario planning, although orientated towards collective long-term futures, cannot mask the historical power differentials between marginalised and powerful social groups. Furthermore, the extent to which trust can be forged in the ASSAR project is significantly constrained by the ubiquity of workshops. The implication is that it is difficult for climate change projects to make themselves heard amid the din of the development industry. Thus gaining the trust of people most threatened by the impact of climate change is likely to remain elusive.

PEREZ, TERESA* (University of Cape Town)

"They're Homeless, They're Stinking": How Stigma Constrains the Impact of Policies Designed to Create Green Jobs in South Africa

The South African government is working towards producing zero waste by 2022. Concurrently, job creation targets pledge to reduce unemployment to 15% by 2020. Green jobs are seen as a way to meet both these policies, partly via the organisation of informal reclaimers. But the formalisation of 'waste pickers' has yet to transpire to the extent that has been documented in other parts of the world. Using Goffman's theory of impression management, I present a body of evidence to illustrate the interactions between 'waste pickers' and residents, from the perspective of 'waste pickers'. My analysis sheds light on why collectivising waste pickers in South Africa is likely to be met with resistance – by both waste pickers and residents. I build a case using conversations that took place over the course of a year, while I worked as a waste picker with a group who picked from bins on the streets of Cape Town. Waste pickers tended to judge residents based on the contents of household rubbish. Residents' interpretation of the people that they saw sifting through their bins was based on waste pickers' appearance and behaviour, viewed from a distance. Overall, the verbal interactions that I witnessed between residents and waste pickers tended to be stilted, awkward and infrequent. As a result, it was difficult for the people with whom I worked to overturn the stigma of historical constructions of race and rubbish. Furthermore, stigma was reinforced by local government policies that exacerbated anonymity and animosity between informal workers and residents. The implication is that the effectiveness of national policies, to reduce environmental degradation and create decent work, are constrained by stigma and local policies that foster an atmosphere of mistrust.

PEREZ MURCIA, LUIS EDUARDO* (The University of Manchester)

Remaking Home: A 'journey' of a Lifetime

Drawing on the life experiences of those who in the aftermath of conflict have fled within Colombia, this paper explores the extent to which and, in which ways, conflict-induced displaced people remake home. The paper's overarching argument is that despite displacement consistently results in a significant loss of home, home can be remade on the move. Analysis of detailed interviews shows that following conflict and displacement, the process of remaking home not only entails the reconstruction of a material shelter but foremost the reconstruction of a social world, a familiar landscape, and the emotional and existential feeling of being at 'home'. Material and symbolic dimensions of well-being therefore play a central role in the reconstruction of home. Indeed, for many, the reconstruction of home signified the reconstruction of their place in the world. The empirical findings also show that the reconstruction of home tend to take years, decades and even generations and it is in part shaped by experiences of violence, the extent and persistence of persecution, and the ethnic identity and life stage of those compelled to move. Many of those who have fled after being raped or having witnessed relative being killed, consistently struggle to remake home. The same appears to be true for those who belong to the black and indigenous communities and who tend to root home in their 'ancestral land' and the elderly who aspire to die 'at home'. The paper ends by highlighting that both social constraints and individual decisions and aspirations interplay over time and space in the process of remaking home.

RC04-84.1PEREZ-CASTRO, JUDITH* (*National Autonomous University of Mexico*)*Equity and Mass Participation in Mexican Higher Education. an Analysis of Two Vulnerable Groups.*

In Mexico, the issue of equity in higher education began to be part of public policies until the 1990's. Higher education institutions assumed equity as part of their mission, based on two principles: the expansion of opportunities and the leveling of startup conditions. In this paper, we present the results of a research, whose objective is to analyze the possibilities and limitations that people in vulnerable situations have to enter, stay and graduate from higher education. Especially, we are interested in two groups: people in poverty and people with disabilities. The results show us that, although there has been some progress in the last two decades, only 10% of the youngsters between 18 and 22 years old from the decile I are able to reach higher education, while, in the decile II, the proportion is 14.5%. In contrast, 100% of the youngsters in the age group from the decile X and 68% from the decile IX attend tertiary education.

Regarding persons with disabilities, only 5.7% from the 7 million 184 thousand Mexicans with some kind of limitation are able to study at least one year of higher education. The average years of schooling among this population is 4.7, it means, half of the national average, which is 8.9 years. The relationship between poverty and disability increases the risk of exclusion, since it is estimated that around one third of Mexican households with one or more members with a disability comes from the two poorest deciles. So far, the most important program to expand educational opportunities has been the Maintenance Grants, which has operated since 2001. Although, its results have been more important in terms of the permanence, rather than in access to higher education.

RC11-226.3PERKINS, MOLLY M* (*Emory University*)KEMP, CANDACE (*Georgia State University*)BALL, MARY (*Emory University*)BURGESS, ELISABETH O (*Georgia State University*)FITZROY, ANDREA (*Georgia State University*)HOLLINGSWORTH, CAROLE (*Georgia State University*)*Assisted Living Residents' Informal Care Convoys: A Focus on Non-Traditional Helpers*

Broad social and demographic trends increase the likelihood that many assisted living (AL) residents will lack traditional informal helpers (i.e., children and spouses). Yet, non-traditional support arrangements are not well understood. To address this knowledge gap, we present an analysis of qualitative data from a 5-year NIA-funded study (R01AG044368-01A1) guided by the "Convoy of Care" model (Kemp, Ball, and Perkins 2013). Using grounded theory methods and an ethnographic approach involving 2,224 hours of participant observation and informal and formal interviewing with residents and formal and informal caregivers over two years in 4 AL communities in Georgia, we examine residents' care arrangements when traditional helpers are absent. Our aims are: 1) to understand the structure, function, and adequacy of non-traditional networks; and 2) to identify the factors that influence how they operate. Twenty-five residents (13 White and 12 African Americans aged 42-96 years) had informal networks led by distant kin, friends, volunteers, and others. These networks typically were small and often vulnerable (e.g. helpers had personal or health challenges of their own). Each resident experienced some marginality (social, economic, cultural) that influenced their care, quality of life, and ability to age in place. Four intersecting human conditions shaped residents' and other stakeholders' capacity to negotiate marginality which we define in terms of symbolic capital (material, human, social, and psychological; see Perkins et al., 2012). Core contexts in which participants negotiated marginality included *situational contexts* (objective conditions of participants' lives and the ways in which they defined various situations they encountered); *facility contexts* (e.g., model of operation and aging in place philosophy); *cultural and community contexts* (e.g., Jewish ethnicity, small town, African American, rural); and *larger socioeconomic, political, and regulatory contexts*. Findings have implications for interventions aimed at strengthening residents' informal care networks.

RC44-746.2PERO, DAVIDE* (*Nottingham University*)*Making Solidarities in the Context of Precarity. Grassroots Organising Among Low-Paid Migrant Workers in London*

Despite migrant workers' social and economic significance their organizing practices have been overlooked. Through an interdisciplinary and intersectional approach, this paper examines the innovative organizing practices that low-paid and precarious migrant workers in the UK have been articulating to promote their interests and combat their exploitation and exclusion. In examining practices of representation and self-representation of migrant workers, this paper addresses

the following questions: What do the organizing practices of new migrant workers look like? What do they provide that traditional trade unions approaches do not? What is the role of identity, emotions and non-material rewards in such practices?

Grounded in ethnographic fieldwork, the paper will contribute original insights into contemporary industrial struggles in the service sector revealing how existing 'opportunity structures' of representation can be inadequate for these workers who then often have to develop bottom-up alternatives to be better represented. Indeed, the paper will outline how migrants' labour initiatives can have crucial representational functions that mainstream British unions are often not able or willing to provide. It will also illustrate how migrant workers' industrial agency and organizing practices can be rewarding both in material and non-material terms, providing a sense of the role played by subjectivity, culture and emotions.

RC55-903.11PEROSA, GRAZIELA* (*University of Sao Paulo*)LEBARON, FRÉDÉRIC* (*École normale supérieure de Cachan*)*Social Indicators and Social Space in Paris and São Paulo*

This paper presents an empirical study of social divisions in the cities of Paris and São Paulo. These urban configurations have been selected in order to understand the relationships between universal factors of differentiation and those which appear specific to a given urban context. In particular, the notion of social space, as developed by Bourdieu in *La distinction* (1979), allows us to develop a new perspective by insisting on the objective dimensions of social life, without abandoning the "subjective" dimensions.

On the basis of data produced and made accessible by INSEE (the French National Institute for Statistics and Economic Studies) and IBGE (the Brazilian Institute of Geography and Statistics) at various spatial levels, our approach consists in exploring the social space of these cities, and more precisely in analyzing the spatial distribution of social groups, living conditions and of various sets of practices, especially those related to schooling.

The analysis is therefore based on a relevant set of "objective" social indicators, such as socio-demographic characteristics, residence conditions and access to public infrastructure, but other indicators on the aspects of behavior likely to be perceived as "subjective" will also be included. The comparison of this common set of variables between both cities makes it possible to grasp the different structures of variations insides both social spaces.

Methodologically, Geometric Data Analysis helps us to analyze simultaneously a large set of variables, to synthesize the most relevant dimensions of social spaces, to proceed to comparisons by constructing clouds of points and visualizing with simple tools the deviations between various spatial units.

This research investigates the objective living conditions, practices and beliefs together, and, in its conclusion, particularly insists on the particular relationships between education and employment in both contexts and on the prospects for social advancement for popular and middle classes families.

RC04-JS-58.7PERSSON, MAX* (*Uppsala University*)*Bringing Emotions into Elite Education Research: How Swedish Students Learn to Feel, Express and Manage Self-Confidence in Elite Schooling*

Scholars of elite education debate how to understand "ease" and "embodied ease", as well as its exact relation to (re)production of social and educational inequalities. In this presentation, I demonstrate that in order to understand inclusion and exclusion in elite school settings, it is crucial to pay attention to the emotion of self-confidence. Whereas the sociological literature on confidence and self-confidence to a large degree is theoretical, my presentation adds an account of how this emotion can be empirically studied and understood.

The current study is based on ethnographic field work where we follow students from two elite high schools in Sweden, with different educational and social profiles, when they participate in a parliamentary role-play game. Methodologically, the study combines participant observation during the game and qualitative interviews with students, teachers, and staff. The competitive game lacks a teacher authority and is not a graded activity, putting pressure on students to cooperate as well as negotiate what constitutes winning and losing. The findings suggest there is an ongoing negotiation among the students on what should count as correct/incorrect expressions of elite self-confidence, which in turn is linked to processes of inclusion/exclusion in the student group. Furthermore, the particular experience and expression of, as well as the ability to manage, the embodied emotion of self-confidence, is shown to be interlinked with gender and social class.

The role-play game is used as an ethnographic site letting us explore emotional socialization in an educational setting. It is shown that students learn to feel, express and manage the emotion of self-confidence both as an intended and unintended consequence of elite schooling. These results adds to the understanding of self-confidence within sociology of emotions. Furthermore, the findings challenge the previous debate on ease, showing that the research can benefit from a sociology of emotions approach.

RC16-309.3PERULLI, PAOLO* (*University of Eastern Piedmont*)*The Place We Have Lost*

Loss of place and globalization are two main *topoi* of contemporary social sciences in different domains, from sociology and philosophy to geography and anthropology. Starting from the re-reading of early texts of the 1990's on local/global and neoregionalism, a genealogy and analysis of current trends of "place" and "local" are proposed. The paper's thesis is that the ongoing global passage doesn't close with the local past, on the contrary it projects the local towards a future to be fully investigated.

The argument will be organized around two thematic nuclei: sense of belonging and openness.

The former nucleus contains the idea of "being part": to keep apart but at the same time to belong, to take part in, to be part of, to be in our own place which belongs to us. However the terms "place", "local" and "locality" have an unclear, even obscure meaning in the ancient, classical theory: the seduction of place and genius loci are ideas elaborated by the moderns.

The latter nucleus is centered around the idea of openness: to the global, to space, to sharing, to pooling, to the event (ex-venire), to occur, and so on. Future is seen as this novelty. With the risk of forgetting what is essential to our social and spatial identities.

Why elaborate around these words? Because words have strong performative roles, and our language is losing control over the meanings of words in global capitalism's epoch.

RC05-118.6PETERSON, GABRIELLE* (*University of Michigan*)*Tipping the Scales: Addressing Issues of "Racial Imbalance" in the Jones School through Integration*

I am proposing a segment of my research on Black migration and structural integration processes in Southeast Michigan. While scholars have analyzed the establishment, persistence, and effects of segregation, the process and the entities involved in undoing that racialized structural inequality receives less attention. Understanding this process and resistance to it helps us contextualize the racial conflict in metropolitan areas internationally, and critique society's former solutions. My research uses case studies to analyze how citizens and state institutions executed and resisted school and neighborhood structural integration in Washtenaw County and how that process varies across cities and time. I have reduced my sites to Ann Arbor, Ypsilanti, and Saline, with much of my focus on Ann Arbor history. My presentation will chronicle the transition from segregated Jones [Elementary] School to the integrated Community High School as chronicled in archives and recorded by local stakeholders. This process started in '63 when a report from the Committee to Study Racial Distribution in the Public Schools of Ann Arbor concluded that Black students' school experience is related to their segregation in neighborhoods. Between 1960 and 1985, Ann Arbor Board of Education and City Council sponsored four studies on the segregated schools in the city, and had exhaustive meetings about how to integrate what is now 21 schools. By June 1965 The Jones School closed its doors and over the next 7 years before Community High School opened, parents, city officials, and activists not only deliberated over what to do with the Jones School, but the larger school system, which was still reeling from segregation. This analysis will help ground similar processes that occurred in the past and present within international history.

RC26-482.5PETRAKI, MARIA* (*University of Athens*)*Local Development Challenges through Dynamic Partnerships with Civil Society Actors*

During the economic crisis, which has severely affected Greek society since the end of the decade, the stakes of the Welfare State the reform have gained special interest. However, apart from central government interventions in the critical areas of employment, health, social security and social welfare, the role of local government in exercising social protection policies has been defined as a major challenge. On the other hand, despite the strong regional and local variations of poverty and social exclusion, the research debate on social protection policies at the level of Local Authorities remains limited.

The paper investigates the social and economic factors that affect the exercise of social protection policies by the Local Authorities, while at the same time highlights the (potential) role of "local" in designing and implementing the respective initiatives.

It also makes an overview of community empowerment policies through international, national and local civil society actors.

In cases where communities are empowered through civil society actors we would expect to see a range of benefits: local democratic participation boosted; increased confidence and skills among local people; higher numbers of people

volunteering in their communities; and more satisfaction with quality of life in a local neighborhood.

The possibilities and challenges of developing a model of a Local Welfare State in Greece, which is part of the general framework of the debate on an Active Welfare State, are being systematically explored, as it is geared to linking public social interventions to development policies and promoting employment, opportunities and personal choices for people in need.

RC14-JS-69.2PETRAKIS, COSTAS* (*TEI of Ionian Islands*)ZAHARIADIS, ANDREAS* (*co-author*)*Mass Media Representations of Internalised Violence of Suicide during the Greek 'Crisis' in 2017*

The multifold violence observed during the Greek 'crisis' reflects to the many-faceted character of the recession and to its intensity, as the country continues to reel under the shock of cultural, societal and political rifts. The following presentation focuses on internal forms of violence and specifically on behaviours of suicidal or quasi-suicidal character. Our primary aim will be to outline the many different ways this type of violence is presented by the Greek media. The study has been conducted with a content analysis, through the prism of which we examine the way internalized violence is represented by two of the mainstays of the Greek media, namely the press and internet. Specifically, we will introduce a number of popular blogs and sites with a high traffic volume and some well-known newspapers with a large readership. Secondly, through the method of content analysis we will focus on the correlation between violence and social inequality and the diverse ways in which these social phenomena have been approached by the news information media. Thirdly, we will classify these representations on the basis of content analysis of representative excerpts from articles and reports on the particular self-destructive form of behaviour that has come to be associated with the 'crisis.' Fourthly, we will analyse the ways in which the electronic and print media target the social status and ethnic background of victims compared to our results of 2013. Finally, we will analyse experimentally the effect of critical variables revealed through content analysis on the convictions of study participants with respect to the topic of the study.

RC51-843.3PETROCCIA, SARA* (*University Gabriele d'Annunzio, Chieti-Pescara*)FERONE, EMILIA* (*University Gabriele d'Annunzio, Chieti-Pescara*)*Global, Transnational and Cosmopolitan Sociology*

This work analyzes some social changes derivatives on globalization process, their interdependence and global consequences. More in details, the focus of this paper is the concept of citizenship and its evolution. The processes of definition of citizens are always more dependent from models, relationships and situations that occur in distant places with respect to the physical space within which their biography is materially lived. The privileged audience of our citizenship narratives is not necessarily placed in the contexts of our material life and it nor constitute part of networks of our direct relations. Instead, it can be reached in mediated ways and can be part of a virtual or a spatially imaginative context of reference. The growing interdependence and the contemporary erosion and multiplication of boundaries make it possible to think of oneself as freed from local ties, in constant motion, immersed in global flows that enable remote relationships, the rapid transition from one context to another and the ability to overcome and establish distinctions. They allow individuals to recognize themselves within a cosmopolitan outlook, which could mean: "Global sense, a sense of boundarylessness. An everyday, historically alert, reflexive awareness of ambivalence in a milieu of blurring differentiations and cultural contradictions. It reveals not just the 'anguish' but also the possibility of shaping one's life and social relations under conditions of cultural mixture. It is simultaneously a skeptical, disillusioned, self-critical outlook" (Beck U., 2000)

RC04-102.1PETROV, VLADIMIR* (*Novosibirsk State University*)*Entrepreneur Universities Development in the System Crisis Context*

The number of scientific research universities in Russia practically reduced twice during last 13 years, and at the same time a number of Institutions of High Education that conduct research also grew twice. Science and education should be inseparably connected with each other: in classical western perception the Universities create ideas and produce science knowledge, the government forms regulatory framework, and business provides with resources, but there is another approach in Russian model of science's development where the institutes of the Academy of Science are created particularly for scientific research and the universities were primarily responsible for educational function. In modern sociocultural conditions integrative processes of science, education and industry

being under globalization influence still can preserve Russian science and also can lead to entrepreneur universities creation that can launch innovative ideas and elaborations to the world market. The model of the world class university can be given as an example of the effective science development that was elaborated by the World Bank member Jamil Salmi, who appeals to a solid list of research that reveal characterological features of modern universities and point out 24 criteria for the university effectiveness evaluation. The research led by Russian scientists in 1990-s revealed 19 similar positions. The Russian model was called "Lavrentyev's triangle" as an example that was formulated as "science-implementation-staff training", which was realized in Novosibirsk Academytown. In the current model every participant still keeps safe their autonomy and does everything that he can do the best in the process of tight interaction: Institutes of High Education train the specialists according to criteria of modern science; research institutes do fundamental and applied research attracting the specialists that are trained in the Institutions of High Education, and technoparks launch applied elaborations.

The Problem to Define the Concepts Religion and Secularity When Their Components Become Individualized and Differentiated

The concept "religion" is a multifaceted concept. It is used in very different ways in different social, cultural and academic contexts, often without specified definition. This is relatively unproblematic in daily life when talking about religion as part of private life. But the concept "religion" becomes problematic when it is used without definition in social practice like public debate, political discourse or applied in cases of conflict. Especially when it becomes decisive and affect people's practical lives in serious ways. One significant example concern references to the principle of "Freedom of religion", both aspects of having the right to practise your own religion, and the right to freedom from religion. Since the principle "Freedom of religion" is highly valued in many legal systems, it is of need to critically scrutinize the concept "religion" as well as it's supposed opposite, secularity. Empirical research often implicitly define individuals' religion in terms of belonging, believing or practicing, or by combinations of these three dimensions. Along with society's increasing pluralisation and individualisation, the divergence between these three increase continuously. What has previously been regarded as religious practices thereby becomes increasingly visible as "secular" cultural practices, not directly linked to belonging or beliefs of a certain religious tradition or group. This highlights the questions: How should we define the concept religion? What practices should be regarded as religious? Should religion primarily be regarded as an issue of belonging and perceived identity? Or is religion in its core an issue of beliefs and confession? What should be regarded as religious rights when these three dimensions appear functionally differentiated, and an individual can be secularised in one dimension, a Buddhist in the second and Christian in the third dimension? The aim of this paper is to contribute to this critical conceptual discussion, relating it to social practice.

Picturing Midlife Body Image and Physical Activity: "It Changes with Every Little Environment"

Between the ages of 35-55 years, women's bodies can undergo a variety of changes that impact body image (Ballard, Elston, & Gabe, 2005). Body image can be both a motivation for and a barrier to participation in physical activity, and is influenced by whether exercise is undertaken for appearance or health concerns (Prichard & Tiggemann, 2008). It is difficult to get a clear picture of the body image experience for midlife women as much of the research involves young women and much of the literature that considers women's midlife body image focuses on appearance. Furthermore, quantitative studies tend to focus on one or two measures of body image and may therefore fail to capture nuances of the midlife experience for women whose bodies are in a state of flux. The purpose of this paper was to investigate through photo elicitation how midlife women describe body image and its relationship with physical activity. Participants included English speaking women between the ages of 35-55 years who were willing to take ten photographs that represented their perspectives on the relationship between body image and physical activity and then discuss those photographs. Findings of the study illustrate the complex nature of body image for midlife women in the context of their lives. For example, physical activity was used to fight against aging, but could also serve to remind women that they were no longer young. Further, this research offers insight into the role of physical activity in both supporting and challenging the complex understanding of body image for these midlife women.

The 'New' Far-Right in Australia: Networks and Narratives Online and on the Streets

Radical far-right and right-wing extreme parties and movements have attracted significant research attention in North America and across Europe for decades. The aftermath of the global economic crisis and the 'refugee crisis' in Europe has reinvigorated research in this area as new or revitalised groups and movements become seemingly more popular. In Australia, however, research on the radical far-right and contemporary forms of right-wing extremism has been notably under-developed. While Australia does have a history of far-right activism, which has at times also resulted in violence, these groups have for most parts remained marginal and with very little organised support for their views. More recently this has changed as a far-right political party has achieved representation within the Australian parliamentary system and far-right activist groups vigorously recruit and disseminate their messages through online and offline engagement with a growing community of sympathisers.

Systematic and targeted research on these 'new radical right' movements (Dean et al. 2016) is still very limited and little robust evidence is available on their narratives, tactics and connectedness. This presentation will discuss selected empirical findings from an innovative mixed-method study on the activism of more than a dozen different far-right groups in Australia. After providing an overview on the main groups and their divergent and shifting key propaganda themes, the presentation will explore the networks and relationships between these groups. The analysis of data reveals a high level of social interconnectedness between most groups, based on a shared pool of active supporters and information sharing. However, pockets of isolation and fragmentation also became evident.

Migration Speeches and Hate Speeches. the Sociological View on Migrants' Representations between News and Ugc in Europe

Every day migrations are represented by the language of politics, journalism, other media which significantly contribute to their collective perception and to the public opinion building processes. The pervasive presence of new media enlarges the complexity of the topic, as those allows an increasingly wide and diversified audience to access information and react with comments that enrich, transform, and redefine journalistic contents. In the digital public sphere each social actor is able to introduce information into the media circuit (mediator), redefining its significance in processing and sharing it (producer role) (Jenkins 2006) and building new frames (Goffman, 1974). Bloggers, social networkers, media activists or simple citizens involved in the information flow activate public discussions where each one broadens the field of his knowledge through a dense interaction with the others (Dahlgren 2009, 2013), even though this "distributed" word right doesn't guarantee that it gives voice to a positive or public interest.

The story of migrations is perhaps one of the most sensitive and divisive narrative of the media landscape; user generated contents take part to the framing processes, even if they could often become a source of discriminatory arguments and of hate speeches.

Exploring and identifying which frames on migrations are arising in the contemporary society, sociology could contribute to understand better how social problems are collective built, opening new perspectives on them.

Through the analysis of readers' comments on 3 Italian online newspapers (IlGiornale, Repubblica, Il Post) and on 3 European newspapers (Le Monde, The Independent, Frankfurter Allgemeine) we try to understand the shifting boundaries between professionals and prosumers contents and if these frames could favor or discourage discriminatory attitudes and hate speech, rediscovering how a sociological view could give advices to redefine and understand a central social problem that today put our lives at risk of conflict.

Caste, Knowledge, and the Politics of Becoming: Young Dalits' Choices in Contemporary Nepal

The personal trajectories of young Dalits (members of castes previously classed as 'untouchable') have been significantly affected by the thoroughgoing social transformations that have taken place in Nepal over the last two decades. Changing value systems buttressing the quest for social justice as well as the increased connectivity have opened new avenues for political activism. At the same time, Dalit aspirations and choices, desires and hopes impact upon the pace and nature of these dynamics. Powerful social boundaries, including caste boundaries, are now subject to social reflexivity and critique; yet, they have not lost their

salience. Lived experience often collides with such ideological notions as 'social inclusion' and 'political empowerment,' because social mobility, such as the Dalits' entry to social spaces previously closed to them, tends to instigate resentment and even open conflict. Social boundaries are therefore simultaneously challenged and shifted, while also being re-drawn and accentuated.

From the point of view of young Dalits, different tensions affect their choices and aspirations – that will be discussed in this presentation. First, we need to learn more about the (development of) commitments embraced by Dalit students and young professionals. Here, the process of knowledge production acquires the key-importance. Following on this, we need to establish how professional and political choices are weighted against each other and/or combined. How are individual strategies shaped vis-à-vis collective concerns, in particular within and across specific caste-boundary-lines? In the same vein: which resources are deployed for rendering these strategies effective? How do young Dalits navigate under the conditions of these tensions? -This discussion of Dalit self-assertion in Nepal will draw on comparisons and entanglements with Indian Dalit movements while also paying attention to the globalized nature of these struggles.

The Contribution of Disability Movements and Disability Studies to Human Rights

In our presentation, we examine the intricate relationship between social theories about disability as a social barrier, the international disability rights movement and the UN Convention on the Rights of Persons (UN CRPD). Our argument is that ideas pertaining to a social model of disability gained influence through the disability rights movement and the field of disability studies. Secured by the UN CRPD's human rights provisions, these ideas now become socially relevant and effective. Based on a literature review and empirical research, we make this argument by firstly focusing on the origins of the UN CRPD and secondly on its use in different countries.

Originating from Anglo-American debates of the disability rights movement and strengthened in the emerging field of disability studies, a social model of disability informs the UN CRPD. According to this model, disability is caused by the way society is organised and not a person's impairment or difference. With these ideas, the focus shifts away from an individual's body to social barriers that impede participation and inclusion; a crucial paradigm shift for policy-making. Based on empirical examples from developments in Germany and Nigeria, we show how the UN CRPD provides an effective instrument to challenge current provisions for children with disabilities in the field of education. In effectuating educational change, the UN CRPD eventually extends social theories on impairment, disability and stigmatisation into the political and eventually societal realm.

Varieties of Women's Part-Time Employment and Labor Market Segmentation

The paper aims at revealing how welfare states with the institutional construction of different forms of part-time employment may have contributed to a segmentation within the field of women's part-time employment. Part-time work is a form of employment that many women choose in order to combine employment and parental childcare. In sociology of work, labour market theory and comparative welfare state research, part-time work is often characterised as precarious type of employment that is performed by marginalised groups who are 'outsiders' of the employment system. This paper challenges this argument. On the basis of theories of labour market segmentation, the paper argues that part-time work is a heterogeneous field of work that may comprise jobs in the "internal" segment of the core workers as well as in the "external" segment of marginalised workers. With the institutional construction of different forms of part-time work that differ fundamentally with regard to the conditions of the work contract, welfare states may contribute to the segmentation of part-time work and the inequality of social risks of women who are working part-time work.

Using the case of Germany, the paper examines with German panel data (GSOEP) how different institutionally constructed forms of part-time work are connected to different segments of the employment system, indicated by the characteristics of women's part-time jobs and the related social risks, and how women due to their individual and biographical characteristics are distributed between these different forms of part-time work and employment segments.

The paper is innovative in that it provides insights into the ways in which welfare state policies may contribute to the segmentation of women's part-time work and thus promote inequality among part-time working women.

Intergenerational Transfers and the Concentration of Wealth within Family Lineages

We study the role of intergenerational money transfers for the reproduction of wealth using sibling and cousin data from the Panel Study of Income Dynamics and its 2013 Rosters and Transfers module. We assess the pattern of within-family variation in intergenerational transfers – i.e. whether all, some, or no children receive transfers – and the contribution of this variation to the concentration of wealth within family lineages, not just one but potentially two generations down. Do parental transfers have equalizing or stratifying influence on the sibling's wealth attainment? Furthermore, are these equalizing/stratifying effects are still observable in a third generation? If so, differential intergenerational transfers may serve to pass on advantage across multiple generations and thereby contribute to long-term rigidities in the wealth structure.

Initial analyses reveal that the concentration of wealth within family lineages is high: 42 percent of current family wealth can be traced to the common origins of siblings who have reached later adulthood (ages 45-64) and a fifth of attained wealth can even be traced to the common origins of cousins (i.e. grandparental environments), reflecting concentration of family wealth within family lineages beyond just two generations. Parental transfers play a significant role in this process: Their occurrence explains a fifth of the sibling correlation in wealth and 15% of the cousin correlation. We have begun an investigation of the pattern of differential transfer patterns within families and find that among families who have multiple children and who send monetary transfers to the next generation, only 22% of families transfer to *all* their children while the remaining 78% of families transfer to just *some* of them. For this session, we will more describe in more detail how these differential transfer patterns relate to the wealth outcomes of offspring one and two generations down.

The Impact of Human Values and Corruption on the Level of Trust in the Police Force in Europe

This article discusses the impact of individual values on the population's trust in the police force. To illustrate the issue, the individual value-system will be used. As Schwartz's value theory explains the value-system of different individuals, this theory shall compose on part of the theoretical basis for the argumentation.^[1] The police is depend on the trust of the public in them to be able to fulfil their purpose. And to manage the complexity of world it is important that people trust in stable institutions. On the other side corruption in a system lead that the trust of people in institutions will be vanished.

The main concern is to find out how the mechanism is between human values, corruption and trust in the police. We hypothesises that if corruption is high trust in the police is smaller, while if the level of corruption is low the effects of the values are more important to explain trust in the police.

To answer these questions, we will compare different cantons within Switzerland and also European countries and conduct a secondary data analysis of different kinds of databases. The data from the European Social Survey 2014 allows us to analyse the value system and the trust in the police and use structural equation modelling as well as multilevel analyses.

Ensuring Care through Exclusion of a Workforce?

Capitalist societies are structured by the separation of the private and public sphere. While the commodification of unpaid work keeps pulling women into household-related services, it takes shape very differently from what materialist feminists as Silvia Federici had demanded in the 1970s: The 'wages for housework'-campaign sought to shake up capitalist reproduction by including the unpaid work of the proletarian housewife into wage labor. Today, the rising number of domestic employees as well as their poor working conditions are instead contributing to a global care crisis.

Analyzing paid domestic work in the context of authoritarian neoliberalism today, it shows that the home has long been a site for class struggles. In Spain, over 700.000 people work in private households today and their number keeps rising.

Only a third of the workforce is registered, almost half are migrants, and over 90 percent women. Their marginalization within the workforce and labor regulation seems to ensure the provision of social reproduction within a society in crisis.

Building on critical feminist political economy, this paper interprets the labor relation of domestic workers in Spain from a historical-sociological perspective: Delineating the exclusion of the servant from basic rights of citizenship in the 19th century, I then analyze the interplay of ideological and economic processes in Franco- and post-Franco Spain through archival documents, statistics and interviews gathered in 2015. I elaborate the role of religion, gender ideology, workers' organization as well as the politics of austerity in the (un-)making of a female working class.

3D Food Printing and the Altered Food Fabrication

3D food printing (3DFP) represents the contemporary turn in mechanization applied to the food sector. Mechanization has been a driving force in major societal transformations since the industrial revolution. In agriculture, it has given rise to substantial agricultural yields, sometimes resulting in unintended ecological consequences and social issues emerged, but it is yet to be implemented (efficiently, according to some) in the final stages of meal production. Processes of mechanization have been central in the food processing industry to respond to mass demand, in the making of the industrial way of eating. Relatively recently mechanization have reached homes and catering activities, moving from a macro (industrial) dimension to a micro (civic) one. 3DFP represents the final end of this shift, having entered massively the food processing sector, part of the hospitality industry and also households. Integral to additive technology (Campbell et al., 2012), 3DFP allows consumers to literally create some food items using a computer program and 'small' equipment, that is, the printer itself and few other tools. The practical (manual) activity intrinsic to cooking and its knowledge (Trubek, 2000) are marginalized, also reassembling previously accepted categories such as industrial and artisanal or popular and elitist, to name a few. 3DFP's advocates (eg. Council and Petch, 2015) highlight its convenience and low-cost customized food fabrication, and claim its benefit extend from food security and nutrition to development, sustainability and reduced food waste. Such a 'possibility' perspective though underplays the alteration of production itself and the world orders (sensu Boltansky and Thevenot, 1986) we associate to it. This paper presents a preliminary investigation on 3D food printing and questions the narratives that accompanies it, highlighting the (neglected) live materiality embedded in food fabrication.

Provenance for Whom? A Comparative Analysis of Geographical Indications in the EU and Indonesia

Current debates over Geographical Indications (GIs) revolve around old/new world (more than developed/developing countries) models for protecting and promoting domestic food production within the political, cultural or economic interest of the country of origin. Despite an agreement to attach value to place-based production, new world-model advocates currently contest the validity and practicality of the EU model of GIs. In the literature, the debate revolves around differences in legislation, but neglecting three dimensions belonging to GIs: (1) *sociocultural dynamics* (since the role of actors in creating -or maintaining- a GI goes well beyond the legal inception), (2) *power relations*, which implies a power differential between actors at both intra- and inter- levels of analysis (and which may lead to the reconstructing of geopolitical paradigms); and (3) the materiality embedded in the *local ecology*.

This paper proposes this three-dimensional analysis to make a comparison between established and emerging GIs systems, using the EU and Indonesian cases respectively. The EU, a conglomerate of states, established the original model of place-based recognition with a rich variety of products. Indonesia, a singular nation state and world's fourth most populous country, has recently seen an upsurge in the interest over GIs, with a single item (coffee) claiming many of the awarded protection. The former relies on multiple-niche production and a structured legal, bureaucratic and cultural apparatus that ensure GIs procedures; the latter has so far relied on mass commodities and domestic market creations, but is still developing the necessary organization. This framework therefore offers ways to deeply understand the socio-cultural constructions of GIs in each region, the way power is exerted along the process, and the different ecological realities that shape the materiality of their GIs. We then acknowledge the nuanced way in which GIs are enacted, along with some of its political implications.

The Criminalisation of Youth-Led Political Dissent in Contemporary Britain.

Successive governments in Britain have intensified their efforts to criminalise traditional and new forms of political dissent in the twenty-first century. Young people have been the major actors in protests on numerous issues using a variety of methods; therefore, they have been particularly affected by governmental changes in the management of political protest.

First, this paper will outline briefly how British governments have made changes to legislation and policing methods regarding protests in recent years. These developments have been characterised by more repressive legislation and a move to greater surveillance and storing of information on searchable databases.

Then, the paper will examine the impact of legislative and policing changes on Freedom of Speech, Freedom of Association and the Right to Protest in relation to youth-led protest and dissent more widely.

Last, the paper will discuss the legal, political and ethical implications of turning peaceful protests in criminal events and young protesters into criminals.

Constructing Access to Reproductive and Sexual Health Services (RSHS) in Small Urban Settings: An Institutional Ethnographic Approach

There has been a significant gap in knowledge about the effects that neoliberal policies and institutional practices have had on women's access to, and experiences of, reproductive and sexual health services (RSHS) in small Ontario urban communities. Little attention has been paid to how services within these urban centres have adapted and responded to cuts in welfare state and health programs, and the resulting effects of these neoliberal policies and approaches to governance on the community's cultural and moral climate, as well as the provision of local RSHS and other social services. This paper investigates the potential of institutional ethnography as a method of inquiry for examining how young women's choices and experiences in accessing community health and social services are shaped, regulated and governed by institutions and policies, and in turn, how these institutions modulate community-based RSHS.

Access to appropriate, timely, and affordable reproductive and sexual health services is essential to the establishment of equity and equality for women. Yet, some of the most vulnerable individuals, such as young women and those who live within the confines of poverty, still experience limited access to appropriate reproductive and sexual health care. This can be particularly pronounced in small urban centres, where there are fewer health and social resources than in the larger cities. My analysis builds on existing research on social determinants of women's health and explores how the neoliberal erosion of welfare state programs has influenced front-line RSHS within small urban centres, and shaped women's access to and experiences of those services within these settings.

Quality of Life, Social Quality and Societal Sustainability: A Diagrammatic Multi-Dimensional, Multi-Level Framework

In recent years, a diversity of theoretical approaches and models of quality of life (QoL), social quality (SocQ) and societal sustainability have been proposed focusing on different aspects and levels each employing own concepts. There is a need for a meta-framework which is itself theory-grounded, but does not claim to be a "grand theory" of the entire research field. Needed is a framework linking different approaches, facilitating communication between disciplines, indicating issues for a more comprehensive theory and further research, and providing a general model for more specific applications in design, planning and technology. This presentation proposes (first steps toward) such a meta-framework and chooses a diagrammatic strategy for conceptual modelling and visualization.

Besides references to theoretical discussions, the analysis will focus on approaches and visual material used by participants of the 15th Annual Conference of the International Society of Quality-of-Life Studies 2017.

First, the multi-dimensional, multi-level conceptual framework is introduced. In a comparative perspective, different theoretical approaches are considered (including psychology, environmental psychology, capability approach, rational choice, social choice and social action, networks and systems, cultural anthropology, social philosophy).

Second, key elements are re-framed in diagrammatic models using (not exclusively) diagrams presented at the conference as starting points. The aim is to externalize and visualize underlying concepts and propositions (not info-graphs). The methodology is based on the emerging discipline of diagrammatology with roots in the pragmatism of Charles S. Peirce.

Third, the relevance and feasibility of the strategy is demonstrated by application to an on-going research project PROMEQ. It develops multi-level interventions (individual-community services- social policy) for the promotion of welfare and health of four vulnerable groups (young NEETs), older multi-users of care, long-term unemployed, immigrants). The groups are understood as "paradigmatic" cases for a comprehensive strategy for more equity and societal sustainability.

Doing Middle Age: Evidence from Finland and the U.S.

Age differs from other forms of inequality in that people talk about aging as a process, and recognize themselves and others as necessarily changing statuses. As they do so, they negotiate the boundaries between age categories in various everyday interactions. In this regard, previous research shows that people will resist being categorized as "old" because of its denigrated status.

In this paper, we draw on data collected from Finland (N= 33) among metal workers and engineers aged 50-55, and 65-70; and from the U.S. (N=19; ages 42-61). Respondents all claimed to be middle aged, even those in their 70s. We suggest that they do so in an effort to avoid being categorized as old. Chronological age does not seem to be the sole basis of age categories. Respondents also suggest that they are middle aged quite differently from previous generations, and they characterize this as active versus inactive. Finally, they ascribe to middle age other positive characteristics, such as maturity and freedom, which compensate for the loss of their young bodies, and which further differentiate them from old people whom they see as more constrained. We conclude that the expansion and positive valuation of middle age, and the invidious comparisons of their parents to themselves together position them in a status higher than that of old age. As the one inequality in which all people assume they will shift in status over the courses of their lives, age invites an expansion of the last status prior to the most stigmatized one, old age.

Personal Names and the Indexicality of Identities

Sociologists have overlooked the part played by personal names in the construction and communication of identities. My paper explores how personal names (forenames and surnames) are used alongside other (embodied) resources to communicate identity components that together offer the semblance of authenticity. I examine how personal names can also be important in 'denaturalized' identities, where there is a dissemblance of authenticity arising from perceived contradictions between the name(s) of an individual and their other (embodied) identity components. I focus on the examples of sex categorised forenames, forenames and ethnicity, marital surnames, and transgender forenames to show how naming is at the foreground of processes employed in the indexing of identities as being, or not being, 'authentic'.

A Socio Political Perspective to Tourism Studies: Proposing the Concept of Tourism Field

This theoretical article aims to propose the concept of "field", derived from the sociological theory of Pierre Bourdieu, to tourism and explore some implications, from theoretical and practical orders, to tourist destinations. For this discussion, we first resort to the theoretical approach of the sociological theory of social fields of Pierre Bourdieu to deal with the social interactions that exist, in what is considered empirically a social field: tourism. In this way, we discuss the interference of organized collective action in the transformation of the tourist field, as a way of problematizing the social interactions of the actors present in this dynamic. The collective action has a greater weight in relation to the action of individual actors, thus having more power of interference in the decisions of the field, since they have a greater force. Specifically, we argue that a small group of actors can determine the direction of activity according to their private interests, leading to the exclusion of weaker groups. This relationship may be related to the strictly economic emphasis given the activity, afterwards the social, cultural and environmental spheres, keeping some actors in the centrality of the field. In this way, the inclusion of new actors in the scope of collective action is presented as a potential path to rebalance the existing asymmetry of power. It should be emphasized that this relationship is influenced by pre-established social structures and may depend on a causal moment for its actual effectiveness.

PIMENTEL, THIAGO* (*Federal University of Juiz de Fora / UFJF*)

An Ontology for Organization & Collective Action

This theoretical essay seeks to explore the insertion of critical realism in contemporary social theory, as a basic *intermezzo* from which it is necessary to draw up a realistic social theory of organizations and collective action. It is argued that the theoretical convergence between organizational and the collective action sociologies (O&CAS), identified by Friedberg (1993), can be explored within a critical realist perspective of social theory, where the theory of collective subjectivities (Domingues, 1995; Vandenberghe, 2007) plays an important role as a new form to consider causality.

The application of the principles of stratified ontology proposed by the critical realism (RC), as well as the paradigmatic commensurability between the natural and social sciences – that is possible by intransitive level of sharing the reality –, results in a sociology of levels (Brante 2001; Vandenberghe, 2007a,b; 2010). So it makes possible to localize the organizations and institutions at an intermediate level of the relationship between agency and structure (Archer, 2000; Fleetwood & Ackroyd, 2004; Fleetwood, 2005; 2008a; 2008b; Elder-Vass, 2010; Vandenberghe, 2010) as a real entity with its own existence and causal powers that can interfere with reality. It is, therefore, a legitimate instance of studies in social theory – and, by extension, within the O&CAS – and a supposedly appropriate level to deepen the knowledge about the processes of constitution of society (Ackroyd, 2000).

Conversely, the focus of the debate on O&CAS can be fruitful for its own social theory, as a hole, in that the opening of the "black box" of meso-sociological level (Bourdieu, 2001) may reveal processes and mechanisms related to the agency issue, as this is an intermediate category in the relationship between agency and structure (Fleetwood, 2008b; Elder-Vass, 2010), considering that to date there is no due attention to it in social theory (Ackroyd, 2000).

Leisure & Role of Technology in Social Transformation

Historically there has always been a relationship between technology and leisure, but the increasing use of the internet and computer gaming technology during leisure time is facilitating a transformation in contemporary leisure activity. Due to this technologization things have come to an ease and have become entertaining. Anywhere in the world millions of mobile phone users are chatting, messaging, spending their times, socializing with other users and entertaining themselves. These technological advancements have covered many aspects of human life titled as boredom & escape, engagement, socialization, entertainment, dependence and explore new experiences.

Among these techno gadgets mobile phone has become a natural, fixed, stable part of daily life and is adopted more quickly and passionately by marginalized individuals, groups and countries. They have increased the socializing skills of people and youngsters especially have been using these cell phones to expand their external social network. Selian(2004)stated that "the youth market today is an extremely technology-savvy one, a segment of society that has been active in transforming the application and use of digital technologies in unprecedented ways".Lepp(2014a) in his article exploring the relationship between cell phone use and leisure: an empirical analysis and implications for management stated that "mobile phone use is associated with an array of behaviours and behavioral outcomes, there is a need to better understand the potentially multi-faceted relationship between mobile phone use and leisure. Because the cell phone is so pervasive in modern life, an improved understanding of this relationship could have important implications for leisure service providers."

Advancements of information society has led to building a shell around people where they'd spend their entire leisure time engaging on their techno gadgets

which is in turn affecting their social inclusion and involvement into outdoor activities, ultimately has an effect on their health to a greater extent.

On the 'stickiness' of Stigma: Exploring Diverging Resident Experiences of Territorial Stigmatization in Amsterdam's 'most Notorious' Neighbourhood

On the stickiness of stigma: exploring diverging resident experiences of territorial stigmatization in Amsterdam's 'most notorious' neighborhood

Fenne Pinkster, Myrte Hoekstra & Marijn Ferier (*Universiteit van Amsterdam*)

Abstract

In Western Europe, a select number of 'problem neighborhoods', 'no-go areas' and 'ghettos' are at the forefront of public debates about urban inequality and the emergence of so-called dual societies. Residents in these 'notorious' neighborhoods are confronted with processes of spatial othering (Driver 2014, Sibley 1995), which may exacerbate their already precarious position and contribute to internal processes of estrangement and spatial alienation (Wacquant 2007, Slater 2015). This paper explores such experiences of territorial stigmatization in the Amsterdam Bijlmer neighborhood, a high-rise, modernist public housing estate that has long been represented in popular media as *the* Dutch 'ghetto' (Aalbers 2011, Van Gent & Jaffe 2017). Through interviews with residents, we investigate how they perceive, and are directly affected by, the stigmatization of their neighborhood. Interviews highlight the complex layered nature of stigma at the intersection of place, race and class as the imaginary of the Bijlmer as a marginal place brings together assumed physical characteristics of place – high-rise buildings, degradation of public space – and notions of a racially marked, criminal underclass. We argue that it is analytically fruitful to untangle these dimensions of territorial stigma and question how they are consequently differentially experienced by residents on the basis of their own classed and racial identities and their personal identifications with place. This allows us to critically examine the 'stickiness' of stigma and the ways in which residents of different social positions encounter, negotiate, internalize and are able to distance themselves from the blemish of place.

Becoming 'Tolerable': Tolerance Zones and the Excluded Exclusion of Central American Migrants Selling Sex in Mexico's Southern Border Region.

In the shadow of the Central American migration 'crisis,' hostility towards irregular Central American migrants in Mexico's southern border region has also been institutionally performed by other state agencies, including those under the biopolitical mantle of securing public health. In the southernmost state of Chiapas, public health laws authorize municipal governments to establish the spatial separation of commercial sex towards the urban margins, in locations referred to as 'tolerance zones.' Based on the assumption that sex workers are central to the spread of sexually transmitted 'diseases,' designated tolerance zones enable the surveillance and control of the bodies of sex workers, inadvertently locating predominantly female Central American migrants as a threat to public health and social order. In this paper, based on ethnographic research conducted in Mexico's southern border region between 2015-2016, I signal that the construction of bodies in *need* of tolerance intersects the historical displacement of sex workers with the contemporary exclusion of irregular migrants, whose economic incompetence with the state, devoid them from pathways to regular status. This work suggests that 'tolerance' serves as a depoliticizing discourse, removing the historical emergence of sex work regulation in this region and naturalizing the participation of Central American migrants in the local commercial sex trade. Under the guise of tolerance, the gendered, racialized and classed encoding of sex work regulation, that subjects Central American migrants to segregated zones and routine public health inspections, is normalized. I examine the transcendent and intersecting 'epistemic violence' (Spivak, 1988) of tolerance, accomplished at the structural, everyday and symbolic level, to discuss the ways in which these forms of violence collude in constructing bodies in *need* of tolerance and shaping the 'excluded exclusion' (Sanchez, 2003) of female Central American migrants selling sex in Mexico's southern border region.

Promise Lost? Persons with Disabilities and the Right to Social Protection in Algeria, Morocco and Tunisia

Comprehensive social welfare systems are fundamental to ensure a minimum standard of living and income security to any citizen^[1], but are especially beneficial to persons with disabilities in light of the additional costs faced by persons with disabilities and their households^[2]. Accordingly, the CRPD^[3] establishes in Article 28 the "right to an adequate standard of living and social protection".

Tunisia, Morocco and Algeria are signatories to the CRPD and the three countries have ratified the Convention. They have known recent political transformations in the aftermath of the Arab Spring. It then becomes interesting to understand how their welfare regimes have changed to tackle new human rights obligations and how these are being translated into political commitments (*rights in principle*), policies and programmes (*rights as policy*) and concrete practices (*rights in practice*)^[4].

This paper will present the outcomes of a comparative study of the social welfare systems in three North African countries and their impact on the conditions of living and social protection of persons with disabilities. Results were obtained through a comparative analysis of national laws, policies and programs, as well as semi-structured interviews (N=180) and questionnaires (N=180) applied to a sample of persons with disabilities 12-45 years-old, in urban, peri-urban and rural settings in Algeria, Morocco and Tunisia. Results will highlight key factors that enable or inhibit the enjoyment of social protection and adequate standards of living by persons with disabilities in the region and draw recommendations for more inclusive social policy design.

PIOTROWSKI, GRZEGORZ* (*Södertörn University*)

Anarchist Activism in Illiberal Democracies.

Studies of contemporary anarchist activism are focused on liberal democratic systems, mostly the US and Western Europe. However, looking beyond those geographical limitations, one can draw a different picture of anarchist practices and ideological changes adapting the movement actions to different opportunity strictures.

The empirical basis for this paper comes from results of the project 'Anarchists in Eastern and Western Europe: a Comparative Study' that included Sweden, Germany, Denmark, Poland and Russia. Most of the empirical material is coming from interviews with activists and is supplemented with interviews with anarchists from Czech Republic and Hungary as well as protest event and other data on anarchist activists from other countries.

The main difference in the actions of anarchists in Central and Eastern Europe (gradually more and more falling into the category of illiberal democracies) is the different discursive environment in which they operate. Using the concept of discursive opportunity structure, I want to show that being active in an environment hostile towards leftist groups (as it is the case of CEE), anarchists not only need to have a different self-identification (making self-labeling as part of the broader left more challenging) but this heavily affects choices of potential collaborators as the broader radical left-wing libertarian environment is much smaller.

This situation results in two things: firstly, different self-identification and thus different prognostic framing, mobilizing newcomers and aligning anarchist claims to existing master frames. Secondly, because of the limited availability of potential allies, the whole logic of alliance-formation is different, and stresses intersectionality and cooperation with grassroots activists where the politicization of the claims and struggles is a long-term gradual process and is often implicit. In this regards the anarchists in CEE countries (and beyond as it is observed in the US) are becoming the leading force on the left wing of politics.

Black Monday and Womens' Strike in Poland: Lessons from the Field.

On Monday, October 3rd 2016 Poland has witnessed a massive mobilization of women protesting against plans to change and even further restrict abortion rights in Poland. Since the taking over of power by the conservative Law and Justice party in 2015, numerous areas of conflict have opened up, but none of them were as successful as the Women Strike. According to national polling data,

4% of the population took part in the protests and the number of supporters were much higher. Street demonstrations took place in over 70 cities and police reported over 140000 people on the streets.

The demography of protesters and the scale of the campaign are pointing to a significant shift within the Polish womens' movement: for the first time feminist arguments have reached (on such a scale) women in smaller cities, older and with lower education. Linking - traditionally rejected within conservative Polish society - feminist claims with more general frames of democracy, degree of accepted state intervention into one's lives and finally with economic arguments, the protest has mobilized numerous newcomers into feminist groups.

Moreover, the protest became a blueprint for similar campaigns in Latin America and in South Korea, similar tactics were also used during a protest campaign against changes within Polish judicial system in July 2017. Feminist initiatives became active in other social campaigns pointing out the threats of newly proposed laws for women and bringing up the importance of womens' participation in democracy.

The main purpose of the paper - based on analysis of range of keywords in the internet, observations of the author and interviews with protest organizers - is to show not only the dynamics of the protest and the shift in claim-making strategies, but also the reconfiguration of the Polish womens' movement functioning in more and more illiberal democracy.

Academic Production Styles in Argentinian Social Sciences

Several studies have analyzed the development of a "universal" language and writing style for the social sciences. The extent to which this style has permeated diverse national academic contexts has also been a matter of interest. Argentina is an appealing case for analyzing this phenomenon because in recent years there has been a robust increase in public funding, which gave way to the expansion of research, the recruitment of hundreds of new full-time researchers, and the consolidation of fellowships for PhD students. All these, in turn, resulted in a remarkable increase in publications. However, even though these processes have occurred in the midst of professionalization (which implies higher levels of attachment to international academic standards), recent studies have shown that in Argentina still prevail two contesting models: one that conforms to international standards and practices, and another one of a more endogenous nature, with its own logic for knowledge production, evaluation and circulation. In order to examine the impact of the international standards in Argentinian social sciences, in this paper I analyze the styles of academic production. This implies the study of three closely related dimensions: research processes & models (theoretical foundations, methods, techniques, etc.); writing formats (structure and organization of academic texts); publication logic (types and profiles of journals where these texts are published). The analysis is based on a large sample of articles (grounded on empirical research) that were selected by peers in order to carry out a comprehensive review of Argentinian literature with regard to six key themes of the social sciences. But the articles were also examined meticulously to produce a dataset with several variables related to the three above-mentioned dimensions. The results show that regardless of the recent process of professionalization, a "heterodox model" of academic production is still largely pervasive within Argentinian social sciences.

PIPER, NICOLA* (*University of Sydney*)

The Right to 'Decent Work': Global Social Governance and Migrant Precarity

In recent years migration, especially 'irregular' or unauthorised migration, has become the principal political issue in many OECD member countries, with 244 million people estimated to be on the move globally. Labour migrants from less-developed regions move internally and internationally in response to poor working conditions and a lack of basic security in their home communities, but often find similarly difficult conditions abroad. They are disproportionately employed in 'three D' jobs (the dirty, dangerous and difficult) epitomized by construction, agricultural and domestic work, within countries of destination. Yet, national and global policymakers commonly celebrate such migrants as 'agents of development', mostly for the macroeconomic contributions they make in the form of monetary remittances. This paper argues that current migration and labour regulation generate a situation of *protracted precarity* (i.e. at home and abroad) which undermines migrant social rights, while fostering a regional economic reliance on migration as a survival strategy. Employing a global social governance approach, the role of global institutions will be reviewed in developing a better understanding of the transnational character of labour markets, hiring and employment conditions that is essential for effective migration governance. More concretely, the paper will be about ideas and models of 'decent work' as they emanate from various institutional levels (local, national, regional, global), and will develop an institutional and process-oriented perspective of 'decent work' in the

transnational context of migration by addressing working realities in countries of origin and destination. The Asian region serves as a 'test case' for the global social governance of migration by global institutions.

PIPER, NICOLA* (*University of Sydney*)

Uneven Development and Displaced Care in Sri Lanka

Temporary labour migration has become a defining characteristic of Sri Lanka's economy. The concentration of production and services in and around urban Colombo has produced a lopsided pattern of development that undermines traditional rural livelihoods and necessitates practices of 'survival migration'. Such migration has been starkly gendered: export production has been explicitly feminised through the creation of garment factories operating in export processing zones, and through the displacement of care in the form of internal and international migrant domestic work. This paper examines the displacement and commodification of care through the lens of domestic worker migration. It situates this at the intersection of gender, ethnicity and class, both geographically and historically, and analyses the relationship between internal and international migration. This framework is then used to explore the changing dynamics of, and attitudes towards, domestic work. Migrant domestic work is explicitly bound up in uneven development, articulated through a continuum of gendered and ethnic subordination. There are many differentiated outcomes and experiences of agency within this process.

La Violencia En El Fútbol Argentino: El Desarrollo De Los "Barras Bravas" En La Argentina Democrática y Su Reflejo En Los Medios Gráficos

El fenómeno de la violencia en torno al espectáculo del fútbol en Argentina, se hizo presente casi desde que comenzó a practicarse este deporte a comienzos del siglo XX. Los "barras bravas" han ido con el paso del tiempo adquiriendo un protagonismo inusitado que trasciende lo estrictamente deportivo y se entrelaza con el mundo de la política, el sindicalismo, la venta ilegal de tickets y el comercio habilitado para los espectadores en los días de partido. Todas estas, se manifiestan como prácticas mafiosas que vienen acompañadas de altas cuotas de violencia y delincuencia. Las formas de acción han ido evolucionando a medida que nos aproximamos al presente especialmente a partir de la última etapa democrática, comenzada hace ya 35 años. A partir de allí, los grupos violentos toman un protagonismo inusitado que ha puesto en jaque a la existencia misma de la práctica de este deporte tan popular. En esta presentación analizaremos la evolución del fenómeno y el seguimiento que han ido realizando los principales medios gráficos de comunicación de nuestro país. Intentaremos también reflexionar sobre lo ocurrido en nuestro país a la luz de los teóricos de las ciencias sociales nacionales y extranjeros especializados en el tema: Eduardo Archetti, Amílcar Romero, Norbert Elias, Eric Dunning, etc.

Social Sociological Care to Improve the Quality of Life

Essentially, professional practice is characterised by a **practical orientation** towards working not on research alone, but on finding **solutions** for people and groups in situations of difficulty. It is a question of doing research and finding solutions that are not simply resources in themselves, but which represent relationships with others that induce **confidence**. And transmitting this trust builds **social capital** which sustains growth, change, and the strength to overcome critical situations. The consequence of all this is the achievement of a new well-being paradigm and the reformulation of the meaning of quality of life in the context of the needs of the "disadvantaged". Therefore, in our capacity as clinical sociologists, it is not a question of **problem-solving** and translating our ability to read social situations to the application of **problem-solving** skills; rather, we strive to frame the context within the confines of a **social project** - going beyond the restrictive reference to the model of a functional human organism, as usually applies to the work of psychologists - which is an expression of a **scenario of forces**, wherein the sociology operator and disadvantaged individuals or groups are engaged together and towards which they offer their respective contributions. Thus, the former support change or aid in solving the problem, the latter commit their efforts to overcoming a situation of crisis and achieving a redefinition of themselves as resources for their reference communities. This contribution will seek to illustrate how sociological counselling can be interpreted as an **enabling approach** which enhances the resources and project-handling capabilities of people, groups and organisations in order to achieve new well-being or an acceptable quality of life. In particular, we will consider two elements crucial to the sociological work here intended: that of **creative adaptation** and of **contact experience**.

Commuter Challenge Towards Community Sustainability: Healthy Commuting As Continuous Perspective

Since 2016 the United Nations officially commenced implementation of its 2030 Agenda for Sustainable Development. The term of sustainability became extremely popular and a part of governmental and community policies all over the world. Many communities in Canada including the province of Alberta identified their vision for sustainability. As an important part of a governmental policy, complex and interdisciplinary trend, sustainability covers many fields including environmental issues, not-for-profit, corporate strategies, health assessment and planning, leisure and wellbeing of citizens, and many others. The Active Alberta Policy (Ministry of Tourism, Parks, and Recreation) provides a ten-year vision for recreation, active living, and sport. Communities in Alberta are working to improve infrastructure that encourages people to use active transportation. One of the most successful and long-term (more than 25 years) national projects working in Canada in this direction is Commuter Challenge. Its mission is to promote and facilitate sustainable mobility through education and engagement. The main goal of Commuter Challenge national project run by Sustainable Alberta Association based in Calgary is to improve personal and environmental health as well as healthy communities through encouraging individuals to commute by foot, bicycle, bus, train, and carpool or telecommute. The study of Commuter Challenge focused on identification and evaluation of the organization activities, benefits and measuring the impact of this national event on the wellbeing of its participants and communities population in general, as well as defining the strategies for its future development in terms of sustainability and quality of community life.

PITLUCK, AARON* (Illinois State University)

How Financialization Is Raced, Gendered and Classed

Dating from the 1970s, financial markets, actors, institutions and motives have become increasingly influential in social life. However, the leading causal theories of financialization are notably blind to gender and race except insofar as class is gendered and raced (e.g., 1. financialization as a functionalist evolutionary process to solve societal problems; 2. as a temporary reprieve from a crisis of accumulation; 3. as performativity theory in which elites reshape the economy to fit their neoliberal theories or ideologies, or 4. as a pragmatic replacement for the dissolution of corporations in organizing economic and social life).

Drawing on existing empirical research, this paper theorizes well-specified links to how financialization is altering these durable modes of social stratification. The point of departure is the commodity chain literature which specifies how economic growth and profit-making can be created by finding or creating a low-competition niche or bottleneck in a commodity value chain in market space. This paper makes an analogous argument for finance; the finance industry is composed of commodity chains extending across geographic space that shift capital across time. Financialization is the consequence of actors inserting themselves in these chains to extract profits and/or expand financial markets to new areas of social life. Such disintermediation and entrepreneurship can be productive, but it need not be. Unique to finance, financial actors' profits are also drawn from exploiting information asymmetries up and down the chain, or by shifting risk up or down the chain. Drawing on empirical research, I demonstrate how these chains are gendered and raced, and contrast this with mid-century social stratification. I argue that while financialization has entrenched these durable forms of inequality, it can also empower disadvantaged groups; the net effect of financialization in the future is therefore very much open to contestation.

PITTELLI, CECILIA* (Instituto Universitario de la Gendarmería Nacional Argentina (IUGNA))

Building the Professional Profile of the National Gendarmerie in Argentina

Argentina has in the present four federal security forces that depend organically on the Ministry of Security, created in 2010. The analysis of this paper will be centered in the professional profile of Gendarmería Nacional Argentina (GNA).

That corps was created in 1938, with the mission of consolidating the international borders and ensure the safety of the inhabitants of those regions, with a profile of security militarized corps, in the style of the French Gendarmerie or the Italian Carabinieri, but focused on border control.

Since the 90s of the last century it has been producing a transformation of the profile of the force, pointing to a more professional. So, a change was beginning to be built, for example, with the assignment of the Gendarmerie to United Nations peace keeping missions.

Moreover, since 2005, a comprehensive review of the formation and operation of the security forces was made, which culminated in the creation of the Security

Ministry. Accordingly, it was also developed a policy in each of the security forces to create university institutes for the training of officers and/or for the rise of the same.

In the case of the Gendarmerie, also sought a change of profile that would increase functions - some already had been incorporated-, such as safety on federal jurisdiction routes, control and prevention of drug trafficking and security to certain disturbances which could become federal crime, such as breaking traffic in routes.

This paper seeks to describe and analyze the efforts of improving the quality of training of officers, noncommissioned officers and agents of the Gendarmerie, as well as the redefinition of the professional profile of it since the creation of the University of the National Gendarmerie Argentina (IUGNA).

"Remember That We Are Still Ultras": Dynamics of Recognition and Resistance in Youth Subcultural Styles of Participation

Since the '70s, the concept of subculture has been used to highlight youth capability to criticise common cultural norms through daily practices of participation in communities sharing a "focal concern", that is a specific interest and cultural taste around which a given life-style is developed. Commonly defined in terms of new forms of collective identification emerging within a mainstream culture, subcultures are communities that are enough homogeneous on the internal level and heterogeneous in relation to the outside world to be able of defining consistent distinctiveness and identity. Distinguish themselves from "the outside" through the elaboration of a specific "style", subcultures engage in a relationship with the external world through which both instances of resistance and recognition are expressed. Aiming at reflecting on the interplay between these opposite dynamics in youth subcultures' strategies of action, the paper presents the findings of a qualitative study conducted between 2015 and 2017 within an Italian ultras group composed of young people aged between 18 and 30. In 2015 the group has opened a self-managed social centre where different social projects and leisure activities (i.e. free gym, kindergarten, free concerts) are carried out with the aim of promoting a dialogue between the ultras community and the external world. Following the process of progressive "opening" of the subculture, the papers explores the evolution of: a) the internal relationships between the young individuals and the ultras community; b) the interactions between the group, the neighbourhood, and the local institutions. Multiple identities expressed through different styles of participation are adopted by the young ultras in order to foster a dialogue with "the outside" while preserving their antagonistic, subcultural identity. Data have been collected through ethnography and biographical interviews with young ultras conducted within the projects Youthbloks (Horizon 2020 -MSCA) and Partispace (Horizon 2020 - Excellent Science).

PIRO, VALERIA (University of Bologna)

Voluntary Illegality: Political Lawbreaking and Ideas of Citizenship in Young Activists' Practices of Help Towards Migrants

Following the so-called European migrant crisis, a series of critiques addressing the inadequacy of EU's management of the phenomenon of migration have emerged both at the institutional level and in civil society. The outdatedness of the model of citizenship conveyed by the current European laws on migration has been denounced by several grassroots social movements that, especially at local level, have proposed alternative solutions to address the issues of migrants' welcoming and integration. In many cases, young people have been at the forefront in this fight for a more inclusive Europe and, refusing the distinction between "legal" and "illegal" people, have engaged in different experiences of solidarity aimed at helping all incoming migrants. In so doing, they have frequently gone against the law in order to pursue a different idea of citizenship.

Aiming at reflecting on the relationship between citizenship and political law-breaking, the presentation intends to show how, in young people's perspective, "illegal" practices of involvement becomes a mean perceived as necessary to give substance to an idea of citizenship able to put the respect of human dignity ahead to the loyalty to outdated laws.

The proposal focuses on the analysis of two case studies consisting in projects of solidarity towards migrants and asylum seekers carried out by two radical left social movements in Italy and Sweden. Both groups are composed by young people aged between 20 and 30. Subjected to harsh repression, the considered projects imply the adoption of a series of "illegal" practices of participation, such as occupation of abandoned spaces for the creation of shelters and other forms of help to "illegal" migrants. The data have been collected through ethnography and biographical interviews with young activists conducted between 2015 and 2017 within the projects Youthbloks (Horizon 2020 -MSCA) and Partispace (Horizon 2020 - Excellent Science).

RC06-143.4PLANG, JANET* (*University of Jos*)*Challenges in Effective Parenting Among Domestic Workers in Plateau State*

CHALLENGES IN EFFECTIVE PARENTING AMONG DOMESTIC WORKERS IN PLATEAU STATE, BY DR. JANET PUNYIT PLANG, UNIVERSITY OF JOS, PLATEAU STATE, NIGERIA.

Parenting is one of the most basic and necessary obligations of responsible parents and guardians in any society. Effective parenting yields in the production of well cultured and responsible people. It is a role when not properly handled leads to a lot of chaos, disharmony, conflict and many other social ills, retarding the development of any society. Parenting entails a lot of commitment and sacrifice. The need to survive and provide for children has therefore witnessed many parents getting employed for income. Sometimes while generating income, the nature and conditions in carrying out job responsibilities affects family members especially children. Such is the case of parents in hired domestic service. This study aimed at identifying challenges in effective parenting as domestic workers. Its objectives were to find out to what extent working as domestic workers affects parenting, and to identify challenges in parenting as domestic workers. The methodology design is a social survey where questionnaires were used as instrument for data collection. Simple frequencies and percentage were used for data analysis and drawing conclusions. Findings showed to a large extent working as domestic worker affects parenting. Poor remuneration, inadequate time spent with children, literacy status of parents and irresponsible spouses among others are challenges in effective parenting as domestic workers. Recommendations made included, government enacting social welfare policies on regulations of salaries for non formal workers such as domestic worker, and boosting of adult education among such category of workers.

KEYWORDS: CHALLENGES, EFFECTIVE PARENTING AND DOMESTIC WORKER.

RC28-512.3PLANTE, CHARLES* (*McGill University*)*Measuring the Cumulative Effects of Embeddedness on Earnings Trajectories in North America in Psid and Slid*

According to leading sociological theories, economic action is embedded within social relations and customs. This "embeddedness" should give rise to path dependent and cumulative dynamics in earnings trajectories when large and/or, especially, unexpected changes in earnings move people into new social positions to which they have not yet adapted. Over the life course, these effects will induce negative autoregressive biases in earnings trajectories which are not accounted for by the kinds of earnings models ordinarily used by economists. In this paper, I model and evaluate this hypothesis using dynamic panel data methods and estimation, and longitudinal earnings data in PSID and SLID. I find robust evidence in support of the sociological concern with embeddedness: large changes in earnings, positive or negative, do in fact induce a long run negative effect on earnings over time. Moreover, these effects are more pronounced among the poor.

RC14-272.3PLANTE, NATHALIE* (*Université d'Ottawa*)NEGURA, LILIAN (*University of Ottawa*)*Représentations Sociales Et Pouvoir. L'Exemple Des Jeunes Femmes Francophones En Contexte Minoritaire Souffrant De Dépression Au Canada.*

Les représentations sociales constituent, selon la théorie, des guides pour le comportement et des grilles pour les prises de position des membres d'un groupe social sur un objet qui constitue un enjeu pour ce groupe. Sauf quelques exceptions notables, peu d'études se sont penchées cependant sur les dynamiques représentationnelles associées à la manifestation de pouvoir d'une manière générale et encore moins dans le contexte spécifique d'usage des services professionnels. Une étude portant sur l'accès aux services de santé mentale des jeunes femmes appartenant aux minorités francophones dans trois provinces canadiennes : Ontario, Manitoba et Nouveau Brunswick nous permettra de mieux comprendre cette réalité. Cette enquête qualitative a été effectuée auprès d'un échantillon non-probabiliste par choix raisonné de 47 hommes et femmes, âgés de 18 à 30 ans et de 45 à 60 ans, anglophones et francophones et qui rapportent avoir souffert de dépression au cours de la dernière année. Les données ont été recueillies par les méthodes du réseau d'associations et des entrevues individuelles semi-dirigées. Après une délimitation du concept de pouvoir en nous appuyant sur les travaux de Foucault, Arendt et Bourdieu, nous avons analysé le rôle des représentations sociales dans la manifestation du pouvoir dans un contexte d'offre des services de soin de santé mentale. D'abord, les représentations sociales orientent les actions et les réactions, en définissant les champs de possibilité en fonction de l'appartenance à un groupe social dominant

ou dominé. D'autre part, le pouvoir, pour s'actualiser, repose très largement sur la légitimité qui lui est accordée. De par leur fonction justificatrice, cette légitimité est tributaire des représentations sociales. Les représentations sociales subissent à leur tour un effet d'hiérarchisation en se divisant en hégémoniques, polémiques et émancipées en fonction de leur pouvoir d'imposer des pratiques symboliques et matérielles dans le champ social d'une communauté.

RC28-514.17PLATT, LUCINDA* (*Department of Social Policy, LSE*)NANDI, ALITA (*UNIVERSITY OF ESSEX*)*The Relationship between Political and Ethnic Identity Among UK Ethnic Minority and Majority Populations*

Recent decades have witnessed a rapid expansion in sociological analysis of minorities' ethnic and national identity, and the ways this is linked to both levels of marginalisation and to constructions of belonging and anti-immigrant sentiment in countries of destination. Relatedly, a body of research has explored the link between minorities' ethnic identity and their political engagement. The drivers of majority ethnic identity have less often been examined alongside those of minorities, though studies that suggest that both context and contact between groups shape identities of majority and minority populations. In addition, the political mobilisation of majority ethnic identities by right wing populist parties, renders a more detailed understanding of how ethnic and political identities and the connections between them of substantial contemporary interest. Using *Understanding Society*, the UK household longitudinal study, a large-scale, nationally representative study with a substantial ethnic minority boost and a suite of multi-domain identity questions, this paper explores the relationship between ethnic and political identity across UK majority and minority populations. Locating the analysis within social identity theory, the paper posits that there will be underlying factors driving ethnic and political identity for both majority and minority. Jointly modelling the strength ethnic and political identity, net of individual's general identification propensity, we find clear underlying associations of the unobservable factors driving both political and ethnic identity. We also observe that the latent drivers are stronger for majority and for more conservative / traditional respondents. Observed factors largely have similar associations for both political and ethnic identity for majority and minorities. However, the share of right-wing voters heightens ethnic but not political identity among both majority and minority populations, while discrimination shapes minorities' political but not ethnic identity. We also find that both political and ethnic identity both are stronger among second generation compared to immigrant minorities.

RC22-412.4PLECITA, KLARA* (*Institute of Sociology, CAS*)HAMPLOVA, DANA (*Institute of Sociology, CAS*)*Believe or Behave. the Importance of Religion and Customs/Traditions for the National Identity of European Countries*

Language, religion, and traditions are considered parts of the cultural understanding of nationhood (Shulman (2002). Religion (especially the dominant one) has played an important role in shaping the nations. Even in the more secular nations, religious emblems (institutions, symbols, customs and traditions) are an important part of national identity. Europe has been Christian for centuries. Religion served as a mode of social organization, a way of framing, channelling, and organizing social relations. Nevertheless, in the secular states of Europe, Christianity is not an equally important criterion of belonging to the nation. Immigration from non-Christian countries brings, however, concerns about national identity and the urge to define community on the basis of religion or traditions. Analysing the data from ISSP (2003 and) 2013 and using multilevel regressions we will show that in more religious countries, people rather define belonging to national community on the basis of Christianity, while in less religious countries they rather define belonging on the basis of sharing traditions. Research also shows that people with foreign-born parents stress the importance of religion and especially traditions less often than people with the long ancestral ties in the nations.

RC47-783.2PLEYERS, GEOFFREY* (*FNRS-CriDIS/UCLouvain & CEMondiales*)*Eight Years after 2001. Social Movements and Social Movement Studies in a Polarized World*

Since 2010, citizens' movements have risen in all regions of the world and shaken many regimes asking for democracy, social justice and dignity. Today, we have to acknowledge that democracy has not expanded as citizens (and researchers) wanted but that authoritarianism and conservatism is the dominant trend of the second part of the 2010s. What went wrong? Does it mean that social movements have lost their capacity to transform society?

In this paper, I sustain that social movements remain major actors of our time, but that epistemological biases and the double hermeneutic have led to overestimate the agency of progressive movements while underestimating conservative actors and the power of "movements from above".

RC47-786.4

PLEYERS, GEOFFREY* (*FNRS-CriDIS/UCLouvain & CEMondiales*)

In Defense of the Concept of Social Movement. Social Movements As Meanings and As a Dimension of Action

The concept of "social movement" has been criticized by all sides for different and sometimes opposite reasons. In the global North, scholars have suggested replacing it by "mobilizations", "contentious politics" or, more recently, "protest". These concepts focus on the contentious relationship with the state and street protests as the core of movements' activities. Conversely, some scholars of the global South see "social movements" as too closely associated with institutional actors and the idea that the state is the main actors of social change and thus propose to replace "social movements" by "resistances", a concept aimed at shedding light on popular resistances and daily life.

This paper draws on a Weberian perspective to revisit the concept of social movement as it was used by Alain Touraine and other leading sociologists of the field and suggest to use it as an analytical concept defined as "a specific meaning of action that challenges a society major normative orientations". Similarly to ideal types, a social movement is never fully embodied by an actor but is a meaning shared by a range of actors. The paper will show how this definition contributes to solve a series of epistemological challenges faced by scholars who study movements as diverse as food movements, Nuit Debout, citizens' movements in Romania and student movements in Latin America.

PLUSS, CAROLINE* (*University of Liverpool in Singapore*)

Cosmopolitanism Questioned: Mid- and High-Skilled Chinese-Singaporeans Migrants in Global Cities

The transnational lives of privileged migrants, who live in different global or metropolitan cities, are often viewed as cosmopolitan (e.g., Ley 2004). This paper researched the present transnational lives of middle-class, and mid- or high-skilled, Chinese-Singaporean migrants in multi-sited research: In: Hong Kong, London, New York, and Singapore (researching Chinese Singaporeans who have 'returned' to live again in Singapore). Several transnational contexts of the Chinese Singaporeans are considered Those of education, work, family, and/or friendships/lifestyle (as they apply). This paper shows that rather than experiencing these different transnational contexts as cosmopolitan, the Chinese Singaporeans foremost often experienced these contexts, and intersections among them, as *incongruous*, characterized by multiple displacements. Furthermore, this paper shows that place-specific characteristics of the four global cities of research, despite being global cities (Beaverstock et al. 2002), significantly impinged upon ruptures and disjunctures in the Chinese Singaporeans transnational lives. The implications of these findings for the scholarship on privileged transnational migrants (Bauman 1998) – whose (multiple) displacements are foremost driven by neoliberalism – are given in terms of that minority-majority relations, in different global or metropolitan cities in which the Chinese Singaporeans lived, often led the Chinese Singaporeans to develop ambiguous, if not incongruous, views of self, others, places, and societies. This paper will conclude that the cosmopolitanism of high-skilled migrants, who lived in different global or metropolitan cities, might be much more elusive than previously thought.

RC01-38.1

POCIENĖ, AUŠRA* (*The General Jonas Žemaitis Military Academy of Lithuania*)

The Reintroduction of Conscription in Lithuania: Society's and Youth Attitude Towards State Defense and Military Service

The Lithuanian armed forces consist of professionals, conscripts, volunteer soldiers and active reserve soldiers. Conscription has been reintroduced in 2015 after a seven year break as a reaction to current military threats. Over 3000 young volunteer conscripts have joined the army during the openings. Despite that fact, the question of motivation to serve in the army remains important. It is directly linked to other questions: does society perceive military threats?; does it trust Lithuanian armed forces?; who/what do they believe would guarantee military safety for Lithuania?; are citizens themselves prepared to defend the state?; do

they support reintroduction of conscription?; and do they agree that their family members serve the army as professionals? In this way society serves as a milieu that can encourage or discourage young people to join the military. Young people are the main potential of the state's defense. Therefore it is important to know: do they intend to defend the state in the face of military danger?; what is their opinion on conscription and military service on general?; what main drivers motivate them to serve in the army? In this context, former conscripts' opinion is crucial as they are a uniting link between the military and society. What kind of message about military service and Lithuanian armed forces will they convey to society so it can significantly influence young men's motivation to serve. Therefore, it is important to identify the drivers that motivated the "first wave" conscripts to serve in the army and factors that determined their satisfaction or dissatisfaction during the compulsory service.

The issues mentioned above are analyzed in a longitudinal research that encompasses several quantitative surveys: public opinion surveys (2015 and 2017); youth surveys (2016 and 2017); "first wave" conscripts (the first to serve the army after reintroduction of conscription) surveys.

PODLESNAYA, MARIA* (*St. Tikhon's Orthodox University, Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences.*)

The Parish Community of the Russian Orthodox Church Abroad in the Process of Adaptation and Integration of Its Parishioners.

The empirical findings of our extensive international research "The Parish of the Russian Orthodox Church in Russia and abroad: social structure and non-liturgical practices", which we have been carrying out since 2010, show that orthodox parish communities abroad are not only the centers of the Russian world, due to which one could immerse into the habitual atmosphere of the Russian language and culture, but also that social structures, which take on the role of social adaptation and integration of migrants and their descendants. We observed it almost in all countries, where our research took place in different years – Germany (2010–2014), USA (2014), Switzerland (2014), Greece, Cyprus (2015).

We also found out in our research that a parish is a multiple-aged formation, which includes migrants of different generations; older generations, therefore, are related to socialization in the USSR and Russia, younger generations of parishioners – to the country of their current residence. Due to this, there's an interesting effect: younger generations of parishioners who do not know the Russian language well, but fluently speak the language of the country they were born and grew up, become a peculiar kind of "outsiders" for older senior generations of parishioners, and the parish has generally to make efforts to bridge the emerging gap. These efforts are also due to the fact that the older generations of parishioners by means of their children try to build themselves in the environment they are living in. Religious socialization also plays an important role in this process. Religious socialization is different in different generations since older age groups of parishioners born in atheistic USSR and post-atheistic Russia have to go through it for the first time or anew; younger generations do it overcoming the impact of confessional background diversity.

POFERL, ANGELIKA* (*Technical University Dortmund*)

The Social Meaning of Human Rights. Perspectives from a Sociology of Knowing and Experience

The social meaning of human rights. Perspectives from a sociology of knowing and experience Phenomena of vulnerability, the closely linked need for protection, safety and security, a minimum of social participation and the idea of dignity are among the basic prerequisites and conditions of human existence. However, even such a statement of "facts" depends on the extent to which social conditions are understood to be historically variable and rationally formed. Only then do conditions that were previously categorised as given by God, nature or tradition become a social and political problem: they appear to be in need of treatment and intervention; they represent social grievances, forms of inequality and injustice, which must be eliminated and transformed into "better" realities. From a sociological perspective, both the "self-evident" affirmative notion of human rights as well as growing criticisms (e.g. referring to ethnocentrism) are unsatisfying, because they usually presuppose the very thing that stands in need of analysis: namely, the creation, "invention" or, to be more precise, the construction and constitution of human beings as human rights subjects. This is the question that this paper addresses. It is based on a theoretical and a diagnostic interest of present modernities. The thesis is that human rights represent the paradox of a historically contingent construction with a universalist claim. It contains the attribution of a 'last' status category and 'absolute' figure of meaning: "This is a human being." In a human rights culture the contours of a specific human image and 'postheroic' subject concept become visible. It points to the supposedly unambiguous, at the same time brittle borders of the social world, it is inseparably linked to the vulnerability, fragility and dependence of

human existence and it is structured by the cosmopolitan dynamics of "inclusive difference".

PÖGGE, KAROLINE* (*Leuphana University Lüneburg*)

From the Niche Cuisine to the Mainstream Kitchen? a Communication Perspective on Drivers and Barriers in Popu Larizing Local Alternative Food System

This project engages with local alternative food systems (LAFS) as an alternative to the conventional industrial agro food complex, considering them as an important part of transformation to sustainability (Maye et al., 2007). With a specific focus on the communication practices emerging from these alternatives, my research explores which communication strategies enhance the transformative potential of LAFS. This requires to understand how framings of sustainable food practices, through different media and instruments, are used in order to popularize LAFS. The way identity is communicated in and outside the network of LAFS arranges the theoretical frame around their communication practices, conceptualizing them as prosumers. Prosumers are perceived as market actors shaping local value chains and expecting in their consumption a piece of their own identity, and are therefore capable of reproducing their values and establish LAFS through their 'prosumption' (Sahin & Dogdubay, 2017). Approaching this from a communication perspective with a specific focus on identity allows to investigate how communication practices lead to the inclusion and exclusion of certain actors, which helps to create a more effective communication to make LAFS more accessible and attractive for a wider public. The first part of the research establishes a typology of sustainability communication within LAFS. Based on a systematic literature review, this considers the effectiveness and effects of different formats, instruments and messages as well as framings, media and communication formats/instruments employed. As second inquiry, the research aims to systematize variations of LAFS as social innovations (e.g. foodsharing, community supported agriculture, wasteless packaging stores, seasonal diets) according to different aspects (e.g. innovation type, social groups involved, identity, inclusion/exclusion). Through its focus on communication, the project contributes to a further understanding of the transformative conditions for social innovations and highlights how alliances between production and consumption can lead to a more sustainable food system.

POGHOSYAN, GEVORG* (*Armenian Sociological Association*)

Armenian Migrants in Russian Labor Market

Starting from the mid-1990s, after the actual disintegration of Soviet Union, a large outflow of population began from the former soviet republics. Armenia among the newly independent states transformed to the donor country of labor force. Over the past 25 years about 1 million 200 thousands citizens left Armenia. The main flow of migrants rushed to Russia (80%) and other countries of CIS, as well as to Europe (15%) and the United States (5%). The lion's share among all migrants is men aged 18 to 55 years. Actually this is the export of labor force, the core of which is the economically active population of the republic.

In January 2015, Armenia officially joined the Eurasian Economic Union, along with Russia, Kazakhstan and Belarus. Within the framework of this union, as economic integration deepens, in addition to the actual movement of people across the state border, the free movement of labor force is also implied. Thus, in the process of integration, after the commodity and financial markets the labor market is gradually open too. Russia, as an receiving country, provides jobs and opens up its labor market for migrants from Armenia.

In July 2014 Armenia and Russia have signed an agreement, according to which arrivals from both countries are exempt from the obligation to register at the place of stay within 30 days.

However, despite this, customs regulations and their application in practice create numerous various obstacles. The migratory flow of labor resources is actually controlled by the provision of limited quotas for various professions, depending on the different geographical zones and cities of the Russian Federation. Thus, in general, the legally enforceable right to free movement of labor resources in practice is limited to controlling legislative flows of migrants.

POGHOSYAN, GEVORG* (*Armenian Sociological Association*)

Transformations of Social Structure in Armenia Towards the Western Modernization

The social structure refers to the number of very difficult affected and inertial subsystems of society. However, if the changes affect the social structure, they usually are hard reversible.

Beginning from the 1990 the post-soviet societies experiencing deep transformations. The social structure of pre-reform societies was universal for all of

them; it was historical triad of classes – the working class, peasantry and servants, including "layer" of intelligentsia. But this old model no longer exists. For the expired 25 years Armenian society has undergone fundamental reforms. First of all it is a change of the ownership. The state economy was changed to a multi-sector economy with a large variety of forms of ownership – state, private, municipal, rental, shareholders, mixed, etc. Transforming structure of the Armenian society today is multi-faceted. There are the new class of large and medium private owners (mostly in the field of service and maintenance) and a huge number of farmers. The level of social stratification and social differentiation is much increased, at the same time dramatically increased trends of deepening of social inequality.

For the Armenia the main characteristic of transformation model is a very small percentage of the middle class, and a sharp increase of marginal and social exclusions. The share of employed in agriculture increased three times. It is result of a full stop more than 40% of the country industry. In Armenia, once the leading and the most numerous (66%) working class, partially dissolved in the growing service sector, and partly joined the ranks of the small proprietors and entrepreneurs, but mostly joined the army of unemployed. The greater role played by the sharp decline in living standards, unemployment, impoverishment and migration.

Agreeing on Value, Disagreeing on Evaluation? Contested Evaluation Regimes in Cooperatives

My contribution is about (e)valuation as a social and inner-organizational process inside cooperatives. These cooperatives developed their (e)valuation regimes and practices as a critique of mainstream economic and organizational practices. I use examples from my PhD project on justification work in cooperatives in three different sectors to illustrate how the process of finding adequate test arrangements (Boltanski and Thévenot 2006) and related measures and calculation devices (Callon and Muniesa 2005) is entangled with questions of justice. Furthermore, I show that conflicts around evaluative justice are not necessarily only about finding appropriate measures and principles of evaluation. The question of evaluating persons and objects itself can be contested. Depending on the situation and the involved actors and entities, trying to formalize and measure relations according to one, 'universal' principle of evaluation can be viewed as fundamentally unjust, because it ignores particularities. I explore this tension between a generalist and a particularist idea of justice and show, how organizations use coordination mechanisms and arrangements with varying degrees of formalization to cope with it.

Biographical Processes through Narration and Images: Epistemic Considerations about Materiality

Processes of constructing biographies are carried out by oral narratives but also by private photographs. In this context, photographs are a special medium and differ from narrative principles; they are able to show something that can't be told or that is not allowed to be told, and they prove that 'something has been' (Barthes). Empirically it is still an open question, in which way photographs constitute biographical processes and which differences and similarities to biographical processes in narrations can be identified. Approaching these two main aspects I want to present biographical narrations and visual practices of descendants of a family whose (grand)parents were resistance fighters against the Nazi-regime. Based on this data I want to discuss following questions: In which way narrations and images can be used by subjects to construct their biographies? Which role does the materiality of narration and image play in this construction process? To what extent does the combination of narrations, images and visual practice offer epistemic chances to investigate complex social phenomena?

POKROVSKY, NIKITA* (*outdated*)

Urbanization and Counter-Urbanization in the Global and Russian Context

Over 100 years ago the urbanization and population booms in megalopolises throughout the world created highly concentrated population centers that were fraught with social problems. It was not a coincidence that the institutionalization of the discipline of Sociology in the 20th century was largely associated with the study of cities and urban life by the representatives of the Chicago School, Park, Burgess, Wirth, Thomas, and Znaniecki. However, since the 1950s and, even more so in the last 20 years, social thinkers have been compelled to reconsider the ideas that were proposed by the Chicago School and have dominated the field of urban sociology for almost 100 years. However the modern trend of counterurbanization (or de-urbanization) is a social phenomenon that cannot be reduced to a single common denominator. This term has many components which include among

other variables, the study of recurrent migration patterns from urban to rural areas. It is possible to detect modern forms of socialization that are the result of the counterurbanization phenomenon and have been super-imposed upon traditional rural infrastructures. In rural sociology studies, the transformation of rural life by the social forces of globalization has been defined as "cellular globalization" [Pokrovsky, 2014]. The global processes have penetrated all of the "cells" of previously purely rural communities. The globalization matrix has equally transformed both city and rural settlements. The paradigm shift in thinking about rural societies is a relatively new approach to understanding Russian village life. The culture and the way of life of Russian agriculturalists were, in previous eras, solely based upon agricultural practices. Today traditional agricultural production is preserving its relevance where it is economically profitable, but it has entered a mode of production which is developing in tandem with other factors, which includes for example, environmental, social and recreational ones.

POLIVKA, LARRY* (*Florida State University*)

Neoliberal Long-Term Care in the U.S. and the Future of Public Programs

Until 2013 the home and community-based services part of Florida's public long-term care (LTC) system was administered by the Area Agencies on Aging and non-profit service providers. In 2013, however, most of the publicly funded HCBS programs were privatized through contracts with HMOs run by large insurance companies such as United Health Care. These contracts gave the HMOs the power to administer all Medicaid funded LTC programs including the nursing home program. This paper includes a description of the political (ideological and corporate) forces at both the state and federal levels that played major roles in the transition to a full scale for-profit managed LTC system in Florida, an analysis of the major problems encountered during the transition from both consumer and organizational perspectives, the impact of the new system on costs and quality of care outcomes through 2017, and the impact of MLTC on the Florida Aging Network, non-profit organizations in terms of their role(s) in the state's public LTC system and in other aging services. Finally, the paper will address the implications of this neoliberal approach to the administration of public LTC programs for a wider range publicly funded programs from educational and health care (Medicare, etc.) to corrections and public utilities (water). More broadly the paper will address the future of the state and public sector if the current neoliberal policy trajectories are sustained over the next several years. We will use Wolfgang Streeck's concept of the Hayekian state dominated by corporate, especially financial, interests and the five crises of neoliberalism as a framework for this analysis of current policy trajectories.

POLLOCZEK, MAGDALENA* (*University Paderborn*)

School-Enterprise-Cooperation Projects and Why Companies Get Involved

In Germany, low-achieving youth graduating from the secondary school type *Hauptschule* are most at risk of not having immediate prospects to enter vocational education compared to their age peers in other school types. Unable to find an apprenticeship position with an enterprise, they are placed into the so called transitional system, which keeps them in an uncertain waiting position and exposes them to stigmatization. The threat of social exclusion is especially high for those *Hauptschul*-pupils who drop out of school without any certificate. The school-enterprise-cooperation project *Praxisklasse* has been launched as a preventive mechanism to support these disadvantaged pupils with regard to their individual needs. Local enterprises as the project's key stakeholder form a strong network together with youth welfare organizations and the respective school.

My contribution presents results of evaluating the *Praxisklassen*-project and investigates the companies' motives why they are engaged. The conducted semi-structured interviews with recruiters as the in-house responsible for the cooperation project indicate that companies show a high level of motivation to partake because they expect to generate major future benefits for themselves: Resources spent on recruitment campaigns can be reduced, and the prolonged internships allow them to screen the student more extensively for their own purposes. On the other hand, the results confirm the high relevance of school-arranged and supervised internships shortly before graduation and highlight new chances for lower-qualified youth. They profit by compensating missing formal qualifications with positive personal traits or practical competences and gain easy access to apprenticeship positions. The study gives evidence that these kind of accompanied programs result in a win-win-situation for all involved parties and need to be further supported by the government.

POMA, ALICE* (*UNAM*)

Climate Change Perception and Responses of Grassroots Environmental Activists in Mexico City.

In Mexico City (CDMX), the effects of climate change (water stress, heat waves, accompanied by periods of environmental risk and floods caused by extreme rains) are joined by the effects of the urban development model. Even when these effects do not last long and do not become disasters, they can affect people's quality of life. When people live with these changes, they begin to assign them meanings in an individual and collective process.

The presentation's goal will be to introduce the first steps in a research project, the aim of which is to explore the local dimension of citizens' perception and response to climate change in CDMX in greater depth.

Through in-depth interviews with members of four citizen committees that defend the territory, this project aims to explore: how these subjects perceive the problem and the solutions proposed at different levels of the government, as well as the subjects' response to the problem.

The choice to involve citizens organized in the defense of the territory is based on the idea that these actors play a central role by working in the area, helping to disseminate information, ideas, values and pro-environmental practices at local level. Their experience, furthermore, demonstrates the contradictions between the official discourse against climate change and the unsustainable development model that continues to be encouraged in Mexico City.

The qualitative method and the ethnographic work will make it possible to analyze the socio-cultural processes that are at the heart of understanding climate change and the solutions for dealing with it, as well as people's different responses. Their understanding may be useful for promoting adaptation strategies and increasing resilience at local level.

Women's Participation in High Technology & Knowledge-Intensive Military Units: New Opportunities, Traditional Barriers

This paper examines how gender shapes the high-tech arena in the military, via the case of women officers who serve in high technology & knowledge-intensive division of the Israeli military. The participation of women in high-tech and knowledge-intensive units^[1] constitute an interesting case for the study of gender-military relations nowadays, because it is a highly prestigious organizational sector, whose centrality in the armed forces of our time is increasing. The research method combined quantitative and qualitative approaches. In addition to analyzing the participation rates of women according to ranks and positions, we conducted a qualitative study focusing on the experiences of women officers in different stages of the military career. The findings indicate that women's participation in high-tech units is characterized by tensions and contradictions. On the one hand, this military arena enables women to play challenging roles, to belong to the core of military action and to enjoy a high social and occupational status. However, alongside the opportunities inherent in it for women, this military arena is highly gendered. Masculinity is its underlying paradigm, and its reference point is that of an operational organization that requires full devotion. These schemes shape organizational climate and practices that push women to the margins of the military organization. The paper discusses the cultural and structural characteristics that preserve gender inequality in high-tech units, as well as the agency of the officers, who employ a variety of strategies in an attempt to overcome the difficulties involved in their military career. The picture emerging from the study enriches our understanding of gender and military relations, and can serve as a basis for an intervention program to promote gender equality in this important military arena.

[1] For convenience, I shall refer to them briefly as "high-tech units".

PONCE LARA, CAMILA* (*Universidad Católica Cardenal Silva Henríquez*)

"Youth in a Global Age: Subjectivities and Self-Construction of Chilean Alter-Activist Leaderships across Post-2011 Mobilization"

The year 2011 represents a key moment in the history of social movements, as many mobilizations across the globe took place, such as the Arab Spring, the M15 Movement, Mane student mobilizations in Colombia, Occupy Wall Street, Acampa Sampa in Brazil or student mobilizations in Chile. All these mobilizations show a horizontal character of protests, as well as the absence of leaders. However, in the case of Chile in 2011 student mobilizations, leaders continue to play a fundamental role. This research seeks to understand the emergence of these leaders in a context in which social movement literature has forgotten them. Therefore, the general objective of this project is to understand the subjectivities of the young alter-activist leaderships of the recent post-2011

movements and their construction as individuals. This research considered the anti-extractivist movement (in Punta de Choros and Chiloé) and the movement of people indebted for education. The specific objectives to be considered here are: investigate the characteristics and the construction of the alter-activist leaderships, from their subjectivities; contrast how the young alter-activist leaders of the anti-extractivist movement and the movement of indebted are constructed as individuals and political actors; inquire into how subjectivities of young alter-activist leaders are related among themselves and to other young alter-activist leaders in global mobilizations; and analyze the global character of the post 2011 mobilizations from their own actors. This research is qualitative and explanatory. Using in-depth interviews and focus groups as instruments, the analysis strategy seeks to contrast the alter-activist subjects and understand how they construct themselves, as actors and as leaders of a social mobilization.

PONOMARENKO, VALENTINA* (*GESIS Leibniz Institute for the Social Sciences*)

Wealth Accumulation in the Household. Whose Disadvantages Matter?

In this study wealth is employed as an often neglected but highly relevant well-being measure in sociology. I relate the employment history and especially accumulative disadvantages like non-employment and part-time employment to wealth in old age. In particular, I am interested in the household context and how gendered career patterns determine household wealth accumulation. Previous research showed that joblessness and career instability lowers income on the long-run. This study shows that also wealth accumulation correlates with experience of employment disadvantages. I use comparative data from the Survey of Health, Ageing and Retirement and combine it with the retrospective panel SHARELIFE to retrieve information about the complete employment history of couples. The relevance of wealth varies significantly across households and in the wider national context. The results show that cumulative non-employment has significant disadvantages for wealth accumulation in old age. However, large gaps between men's and women's contribution to household wealth persist. Whereas women interrupt their careers more often, their disadvantages hardly matter. On the other hand instabilities of men are associated to lower wealth. Other household factors like receipt of inheritances are decisive in the effectuality of these disadvantages.

PONTARELLI, FRANCESCO* (*University of Johannesburg*)

Precarious Workers and Students Solidarity in Action Against Outsourcing: A Case of (Partial) Victories in Johannesburg's Higher Education Institutions.

In 2015 and 2016, 'FeesMustFall' and 'OutsourcingMustFall' movements mobilised students and precarious workers across South Africa's higher education sector. Even though the movement started against fee increases and developed into the call for free decolonised quality education, it rapidly included the rejection of the exploitative working conditions of outsourced workers. Outsourcing labour relations were implemented in SA tertiary institutions in late 1990s - early 2000s and affected mainly the so-called 'non-core' services (such as cleaning, security, catering and gardening). During the last fifteen years, despite the constant challenge against highly precarious working conditions by different forms of workers' organisation, unions, as well as grassroots solidarity forums, it is only in the wake of the national mass movement (without the support of traditional labour organisations) that workers secured significant victories. Side-lined by public sector trade unions, outsourced workers in SA universities found in the momentum created by the student's movement and in the activism of radical youth an empowering partner in challenging the economic imperatives of the neoliberal education system. Student activists, despite their status as 'class in transition', were able to provide more effective support compared to the institutionalised and corporatist approach of traditional unions present in the education sector. From a series of in-depth interviews to capture experiences of students and workers, this paper explores the complex process of building solidarity in the University Johannesburg and University of Witwatersrand. The construction and consolidation of identities in alliance, which saw a complex interaction between race and class, was paramount for the mobilisation of a successful struggle. A struggle that was able to shift the practices of the ruling classes and to briefly establish the dominance of 'the political' over the 'the economic' in a context of 'organic crisis' of the African National Congress.

Work and Emerging Technologies: Socio-Historical Approach between Nanotechnology and Precariousness of Work and Its Impacts on Brazilian Workers

In 1965, Gordon E. Moore proposed that the miniaturization of components onto integrated systems would launch science to new achievements and emphasized that the biggest potential lies in the production of large systems. Nowadays, nanotechnology has taken on this task and shows itself as a great influence in the Fourth Industrial Revolution, being applied from automation to human enhancement. A socio-historical investigation of this potential related to the precariousness of work is the object of our article in an effort to answer the questions: Are Brazilian workers ready to withstand the negative impacts and adapt to new structural and organizational changes in the workplace? What are the impacts of these changes in our society?

NUNOMURA, MYRIAN (*University of São Paulo*)

The Sports Experience in the Curumim Program of Sesc Ribeirão Preto (Brazil)

In 1946, the Sesc - Social Service of Commerce - was created seeking to contribute to the improvement of the quality of life of workers in Brazil. Over time, Sesc has become an active institution in the field of Non-Formal Education (MAGALHÃES, MARTIN, 2013), offering access to cultural places and productions. In 1988, the socio-educational program Curumim, which cares for children from 7 to 12 years old of low-income families, was implemented in Sesc Ribeirão Preto and includes various contents, as well as the sport, aiming at the integral development of participants (SERVIÇO SOCIAL DO COMÉRCIO, 1986). According to Bourdieu's studies, it was identified the potential of the Curumim Program to expand the cultural capital and to attribute new compositions to the *habitus* (BOURDIEU, 2008) of its participants. This research sought to understand how the sports practice experienced in Curumim influenced the relationship of the former participants with the sport. The methodology used was the Grounded Theory (STRAUSS; CORBIN, 2008); six adults who participated in the Curumim in Sesc Ribeirão Preto and two people who have worked as educators in that program were interviewed. In data analysis, five categories were established: "Sports experiences in school and in other places"; "Sports experiences in Curumim"; "Loss of contact with the sport"; "Continuity of sports practice" and; "Curumim as 'an open window': discoveries, learning and influences", the latter being the main category. At last, it was possible to perceive that the former participants were influenced in adolescence and in adulthood by the sports practice experienced in Curumim, leading to the involvement of some of them in work activities related to sport, such as the Physical Education career. It has also been identified that Curumim can modify the *habitus* of its participants, as well as sensitize to a wider vision of their own lives.

POON, JULIE* (*University of Guelph*)

An Examination of Whether and How Court-Mandated Intervention Programs Address the Lived Realities of Women Who Perpetrate Intimate Partner Violence

In Canada, the implementation of pro-charging policies and the subsequent rise in women charged for intimate partner violence (IPV) has resulted in an increase in women being court-mandated to attend intervention programs as perpetrators of IPV. Canadian researchers have recently started to explore this area and acknowledge that existing programs that rely upon interventions designed for male batterers may not be suitable when responding to women's use of force because their actions may often be defensive rather than offensive. The types of IPV used by women, its severity, and its consequences are often gendered and intersect with multiple forms of oppression that inform how each woman perceives their use of force. This paper draws upon one-on-one interviews with twenty women who were court-mandated to attend Ontario's Partner Assault Response (PAR) program as well as three PAR program facilitators from a women-centred agency within a large, urban city in Ontario, Canada. Using their voices, the findings discuss how women PAR participants interpret their own use of force and whether and how the PAR program addressed their lived realities. Given the complex reasons that women engage in IPV and their diverse needs, implications for program and policy responses will be discussed.

RC31-574.4POPKIN, ERIC* (*Colorado College*)*The Emerging Movement to Confront Immigrant Detention in the United States: Strategic Challenges and Possibilities for Social Change*

Since the election of Donald Trump, U.S. immigration policy has increasingly emphasized the broadening of categories of immigrants eligible for removal. This drive has led to increased reliance on the detention of asylum seekers (including families) entering at the U.S.-Mexican border with Mexico and immigrants residing elsewhere in the country due to the aggressive implementation of interior enforcement tied to the further criminalization of immigration policy. Prolonged detention due to more limited possibilities to obtain bond/parole and poor conditions in facilities have led to an upsurge in challenges to the detention of immigrants in the U.S. This paper examines this emerging movement of lawyers, immigrant rights activists, and concerned citizens confronting immigrant detention emphasizing the possibilities and limitations of this effort. Specifically, the paper explores how these activists view their work (strategies/practice), assesses the possibilities for significant policy or social change, and considers the challenges confronted in the context of this work. The paper relies on semi-structured interviews with leaders within key organizations affiliated with this effort including the Innovation Law Lab ("transformative lawyering" effort based in Portland, OR.), the Southern Poverty Law Center (and affiliate project, the Southeast Immigrant Freedom Initiative with offices in Montgomery Ala., Atlanta, Ocilla, and Lumpkin, Georgia), and the American Immigration Council (facilitating the CARA network) and Detention Watch Network (coalition of organizations) based in Washington DC. The research demonstrates that important gains have occurred though the effort confronts serious challenges including: consensus among Democratic and Republican parties on the utility of immigrant detention, an increasing reliance on privatization of immigrant detention facilities supported by policy makers, a lack of substantial collaboration between movement participants and criminal justice activists/organizations emphasizing disproportionate imprisonment levels of the African-American population, and the lack of a unified agenda with prominent refugee rights organizations within the U.S.

RC48-809.6POPOOLA, ROSEMARY* (*Covenant University*)EGHAREVBA, MATTHEW (*Covenant University, Ota Ogun State, Nigeria*)FAYOMI, OLUYEMI (*Covenant University*)*Advocacy or Adversary: Interrogating Its Changing Meaning and Implications for Global Society*

The word advocacy is one that is readily used by Non-Governmental Organizations (NGOs), activists, developmental institutions, social movement groups but which concept is not clearly defined and operationalized. However, groups from secessionists, insurgents, activists adopt the word in propagating their mission without a clear understanding of what it represents in their struggle. This situation has raised questions as to who is an advocate? What qualify someone to advocate for a cause? At what point does advocacy become adversary to the society? This reality has been further exacerbated by conflict of identity as one person's advocate is another person's adversary and vice versa. This paper therefore seeks to interrogate the concept of advocacy and its changing meaning in a contemporary world and the implications it poses for peace and order. The paper relies on the use of secondary data since it is an exploratory discourse. The paper argues that although the concept can be manipulated for selfish interest while claiming to speak for others yet it remain a rallying word for people, groups, organizations, institution that stand for any social cause that seek to address issues of oppression, victimization, marginalization and underdevelopment. The paper recommends among others a constitutional definition of the concept of advocacy without infringing on the freedom of speech and association that allow people stand for the social cause that interests them. Vis-a-vis putting in place measures to punish those who go-beyond the limits of what the law allow for promoting advocacy.

RC04-95.6POPOVA, EKATERINA* (*Institute of Sociology of the Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences*)*Tertiary Education and Labour Market: Towards Ontological Inequality*

The study of educational reality and the interrelationship of the sphere of education and the labour market began to occupy one of the principal places in the analysis of social structure and social stratification. The gap between the sphere of education and the labour market reveals a serious discrepancy in the interaction between people and fundamental social institutions, and the gap

between the requirements of the real economy and the actual knowledge and competencies of employees is deepening.

The situation is further complicated by the fact that the so-called fourth industrial revolution will lead to an increase in the disproportionate professional structure of the population. By all accounts, a time comes when people need to be educated to cope not with one job for their whole lives but with a series of jobs that require different skills and abilities, or even to switch between different jobs fast and easily. What role higher education can play in these processes? What are the educational strategies of different groups of population? What are the new patterns of interaction with the education and the labour market?

The inclusion of the context of the technological development in the investigated problems will allow one to come up with an interpretation of the growing polarisation in a society that will result in the division of those who accept the changes and those who are not ready for them. More generally, the designated frame leads to inequalities that go beyond social inequality - towards ontological inequality.

Preliminary results of the project «Horizontal professional mobility and educational strategies of the population in the context of the technological development of the Russian Federation (sociological analysis)» (RSF, 17-78-10204) are going to be reported at the session.

RC23-425.15POPOVA, NATALIA* (*Institute of Philosophy and Law, Ural Branch of the Russian Academy of Sciences*)*National Scholarly Journals in the Era of Globalized Science: Problems of Adaptation Encountered By Russian Titles*

Without the scholarly journals that provide a medium for disseminating scientific knowledge, communication within scientific communities would be impossible. Today, when science has become a global collaborative enterprise, journals are striving to make their content accessible to a broad international readership. One solution is to be incorporated in reputable citation indexes; however, national journals often fail to meet their strict quality criteria. This paper analyzes the process of integration of Russian scientific journals into international databases that began about three years ago, primarily focusing on the research questions: what difficulties Russian journals encounter in bringing their editorial practices into compliance with international publication standards; whether the required changes are mainly of technical nature or involve fundamental reconstruction of the editorial work; what positive or negative effects this process entails for all the participants in scientific communication both within the country and globally. The hypotheses were formulated following a series of in-depth interviews (N=20) with experts of the Scopus Content Selection and Advisory Board (CSAB) and the Russian Expert Content Selection and Advisory Committee (ECSAC), and with editors-in-chief of Russian journals that have been included into Scopus. Subsequently, 145 editors of Russian journals, which were either preparing for inclusion or had already been included in international indexes, were questioned. Preparation for inclusion into international databases is shown to involve fundamental reconstruction of editorial practices in national journals in terms of content selection, peer-review procedure, requirements for authors and open access policy. Among the main difficulties experienced by Russian journals are the different traditions of peer-review, referencing literature sources, argumentation and text composition; the need to publish content in the English language and to select topics that are interesting for a foreign audience. Insufficient funding and a lack of trained personnel continue to hamper the transition to conformity with international publication standards.

RC37-667.4PORANKIEWICZ-ŻUKOWSKA, ALEKSANDRA* (*University of Białystok*)*Creating an Identity. Participatory Theater As a Tool in Sociologist Work*

The mainstream of my research will refer to the ideas of Jerzy Grotowski and will concern the question – whether, and to what extent may the activities of the participating theater form a research laboratory for a contemporary sociologist?

I will be interested primarily in the following issues:

First of all, can a participatory theater serve as a tool for constructing a personal identity? Following the thought of modern researchers (Anthony Giddens, Peter J. Burke et al.), we know that as a result of the transformations associated with globalization, the acquisition of personal identification has become the life-task of individuals. In addition, the process has undergone a great deal of complication in the sense that the participants in social life have to deal with the situation of too many choices and, consequently, to use the words of Ulrich Beck, they have to deal with greater risk in social situations. They need a variety of competencies in the processes of accepting and playing social roles and the ability to manage emotions whose natural laboratory seems to involve participatory theater. It is a laboratory not only for active viewers but also for the actors who make it.

Secondly, participatory theater can also provide a potential basis for exploring group processes (especially social identities). In this sense, it would be particularly

valuable because its social space, in the fashion of present-day communities, is not closed, in the sense that it is presumably reconstructed by the active participation of the ever-evolving audience.

And finally, in my opinion, it is worth considering the role of participatory theater in constructing collective identities. I mean here a lot of contexts in this issue. Theater as a facility to construct a multicultural identity, national identity, local identity etc.

PORCELLI, GIORGIO* (*University of Trieste*)

Between Media System and Sociological Empiricism: Toward a Critical Theory of Society

In 1985 Wolf Lepenies published: *Between Literature and Science. The Rise of Sociology*. In this essay, the author wrote about the emergence of sociology as autonomous science of the study of society. This path was not overwhelming. The nascent discipline had to be affirmed with respect to two main competitors in the field of social analysis. On the one hand there was the social novel, on the other hand, the positivist reductionism. By the end of the nineteenth century, the struggle was won by guaranteeing sociology a vital space in the scientific and academic domains. This paper intends to propose a possible analogy with the present state of the discipline. In the last phase of his scientific production, Luhmann discussed the contemporary crisis that afflicts sociological analysis. The theory of society has to face a new challenge that comes this time from the media system. We live everyday life immersed in a web of media descriptions of social reality. These descriptions enjoy a much more powerful impact than the sociological empiricism characterizing most social researches. Such investigations just tend to systematize and analyze the representations of social reality produced by the media system. According to Luhmann, this trajectory would condemn sociology to a subordinate role if it did not even represent the symptom of its irreversible crisis. Luhmann therefore suggests an exit strategy from this crisis. It would only be possible if sociological analysis turns into a theory of society capable of a critical dimension. The criticism proposed by Luhmann refers to the etymological meaning of crisis that is to make distinctions. Only a theory of society that is turning into a description of re-descriptions could therefore find an effective way to maintain its own independent way of competing with the media system.

PORCELLI, GIORGIO* (*University of Trieste*)

The Global Paradox of Intercultural Communication: The Strange Case of Social Work with Refugees in Germany

The case of Germany is emblematic of a global citizenship paradox due to the conspicuous number of arrivals of migrants/refugees in the last three years (2014-2017). Social integration and intercultural communication represent the main issue at stake. To analyse these phenomena and their implications with respect to the theme of cultural integration, a self-descriptive material that constitutes an ideal first order observatory will be presented and discussed: the first institutional research report commissioned by the BAMF (Federal Office for Migration and Refugees). BAMF research indicates how widespread is the cultural mosaic integration model among scholars. Its results have been amplified by the media system failing to convey the proper distance representation of the cultural diversity that should be according to Habermas and Silverstone the main goal towards the constitution of a global public sphere. The concept of counterpoint introduced by Edward Said provides a useful indication of how to restore a correct representation of cultural diversity. It allows at the same time to bind and separate and is crucial to making possible a global public space.

Climate and Disaster Risks, Resilience and Sustainability Challenges in Asian Cities

Eight of the top ten countries listed in The World Risk Report of 2016 are from the Asia-Pacific Region. Vanuatu, Tonga and the Philippines top the list for global hotspots for high disaster (i.e., impacts of climate change and related-disasters). Other countries located in the so-called ring of fire, Japan (ranked 17th) and Australia (ranked 121st), however, do not score badly as the other Asia-Pacific countries (Solomon Islands, Bangladesh, Cambodia, Brunei Darussalam, Solomon Island).

This paper argues that the policy and program investments made towards climate and disaster resilience by the low-risk countries in the region spell the difference in **reducing** their exposure and vulnerability to disaster. More specifically, it also argues that these **strategic** policy and program investments made by advanced countries like Japan and Australia have been largely shaped by the science-based planning and investment policy framework of these countries. Fo-

cusing on the Philippines and contrasting it with her Southeast Asian neighbours such Cambodia (ranked 9th) and Thailand (ranked 53rd), this paper examines the progress of these countries in achieving SDG 11 (sustainable cities and communities) and the investments they have made towards science-based planning for environmental security, resilience and sustainability. Finally, it will explore opportunities for accelerating the progress towards achieving this goal.

Public Views of Census Data and Population Predictions

Understanding the (changing) population within a country, its demographic distribution and its characteristics, are considered essential in order to allocate resources and plan the future. One means to do this is by conducting a census. Census data are infrequently collected (every 5 or 10 years) but are frequently used by governments to understand the population and allocate resources. How do the citizens or public understand the role of, and conceptualise the census? Do these understandings and conceptualisations have implications for government and society?

This paper will report findings from a research project conducted with a panel of citizens in Scotland to explore their views of: the census as a measurement of population, census collection activities and views of plans for the next census in 2021. In addition, findings will also be reported on citizen views of new means of projecting and estimating population demographics using administrative data.

Key issues explored will be; the value of the census in an increasingly data driven society, the utility of census data in rapidly fluctuating populations and expectations held by citizens about the role of census

La Hipersexualización De Los Contenidos, Otra Manifestación De La Violencia En Los Medios

Hablar de la sexualización cada vez más temprana de la infancia y adolescencia como colectivo especialmente vulnerable comienza a ser un debate ineludible en nuestra sociedad. En cuanto a los estudios que existen sobre el tema se pueden encontrar tres posturas diferenciadas: las opiniones pro consumo de contenidos de esta naturaleza; otra perspectiva intermedia más crítica que no condena esta presencia y tratamiento cotidiano de lo sexual sino que promueve un "consumo responsable" por parte de los prosumidores y, por último, un punto de vista más enfocado hacia dónde conduce esa hipersexualización de la sociedad de cara a la educación de las personas.

El fácil acceso, la asequibilidad y el anonimato con el que los menores pueden consumir y producir contenidos hipersexualizados contrasta con la escasa información disponible que existe sobre cuál es la opinión por parte de los educadores y las propias familias sobre esta realidad emergente. Esta investigación aborda un estudio sociológico de carácter cuantitativo para analizar la percepción y la actitud por parte de las instituciones educativas frente a esta situación. La masiva omnipresencia y la naturalidad con la que pornografía y los contenidos hipersexualizados están al alcance de cualquier menor hace que nos planteemos la importancia de analizar esta transformación social como otra forma alternativa de violencia mediática.

POSPECH, PAVEL* (*Masaryk university*)

Capitalism As a Universal End and the Two Lives of the Queue

The transition to capitalism in post-1989 Czechoslovakia was seen as inevitable: a free-market capitalism was considered a universal end of history. Why this inevitability? What made the appeal of capitalism so unquestionable? This paper suggests that cultural factors play an important part in the transition to capitalism. To prove this point, it analyses the "two lives" of the communist queue.

Queues for food and basic goods were a pertinent feature of life in pre-1989 communist Czechoslovakia. As the economy experienced shortages due to mis-guided central planning and ineffectiveness of production, the consumers were the ones to suffer the consequences: long queues had to be endured almost daily for meat, fruit and other basic consumer goods. The analysis will show that these queues were experienced as unjust, humiliating and absurd by contemporaries. This was the "first life" of the queue, as a real everyday experience.

The "second life" of the queue is a life of a symbol. After the 1989 revolution, queues disappeared from the streets but the symbol of the queue became solidified in the memory of the Czechs. Disembodied from the original practice of queueing, the memory of the "queues in communist times" became a morally and emotionally charged signifier which became a synecdoche for the communist regime as a whole. The paper argues that the symbol of the queue played an

important role in fuelling the post-1989 rush towards free-market capitalism. The strong neoliberal ethos which has been observed in post-communist countries of central Europe has been at least partly motivated by the desire to escape the queue. The transition to capitalism embodied a desire for system which, opposed to the memory of the queue, would be just, respectful and rational.

POSPECH, PAVEL* (*Masaryk university*)

Goffman, Culture and the "Authentic Self"

There is a popular misconception about Erving Goffman being a "sociologist of the insincere". In this line of thought, Goffman's actors are understood as strategists and manipulators whose actions are presented in opposition to those constructed as true, earnest and authentic. While this opposition is false, an important question remains here: how does Goffman's theory of the interaction order relate to the problem of authenticity and of the authentic self?

There are revealing places in Goffman's writing: his discussion of "universal human nature" in the Interaction ritual (1967) or his discussion of normal appearance as a "deep part of the self" in the Relations in public (1971). However, the key to the problem, I argue, is Rawls' reading of the interaction order as constrained by general needs of the self, rather than those of an individual or those of social structure. It is when studying these "general needs of the self" that the idea of culture comes in: the requirements on the self are of cultural nature and they invite a cultural sociological perspective into the study of the interaction order.

The "culture of authenticity", as a recent phenomenon, is a good example of this. Increasingly, a requirement to "be yourself" is articulated as a cultural imperative, sacralising authenticity, as opposed to a mere role performance. Where does this leave Goffman's theory of the performance though? What happens to the frontstage and backstage – are backstages even allowed, in a culture which sacralises the image of the authentic?

POSSAMAI, ADAM* (*Western Sydney University*)

Religion, Neoliberalism, the I-zation of Society, and the Compassionate Tax

As religion was the sacred canopy in Middle Ages Europe, and as nationalism and its politics were the dominant civil religion during modernity, today neoliberalism is the dominant, and perhaps the most global civil religion. Its hegemony dominates more and more all aspects of life, and religion is not left untouched. While some faith groups are embracing this hegemony, and others are simply following the sign of the times, changes have been so significant that religion is no longer what it used to be. Since religions are increasingly informed and influenced by the logic of capitalism, this paper makes the statement that religions must today be understood in a completely different light to that in which they have traditionally been, as they now make more sense to the self than to the community. The theories of Fredric Jameson and George Ritzer will be adapted to this century and will shed light on these changes. The theory of the i-ization of society will then be proposed to reflect the development of digital capitalism and its impact on religion. One logical implication of this argument is the revision of tax exemptions given to religious groups (specifically for their religious rather than their charitable activities). Through a sociological lens, this paper proposes the creation of a global 'compassionate tax' (i.e. a tax on non-charitable dealings by religious organisations). As religions are more and more mimicking, and even becoming, business groups, this paper claims that they should be tax exempt only for their specific charity work (acknowledging the hard work that many (not all) religious groups perform in the charitable sphere). Using the theories of Thomas Piketty, this proposed new global tax will be aimed at reducing the inequalities brought about by neoliberalism.

Digital Sociology and the Archimedean Affect

With the advent of the internet, particularly Web 2.0, sociologists have been called to take up the challenges and the promises of the Web. In the face of this, sociologists are caught up in debates and practices of how to ethically approach and develop appropriate methods/methodologies for the field. While these are important endeavours, more robust debate needs to be placed on the unintended consequences of the promises of the internet, as well as the power relations that are at play in what we term the digital social. Employing the metaphor of the Archimedean screw and Archimedean point, the presentation argues that the space we now find ourselves in is unprecedented. The Archimedean affect demonstrates that the promises of the internet have gone off track resulting in the evolution and de-evolution of the digital social framed by the re-enforcement of existing power relations. Yet, rather than viewing this time as a crisis, we should

see it as a defining moment for our discipline, one where the demands of public sociology need to be adopted broadly.

POSSAS, MARIANA* (*Federal University of Bahia*)

The Creation of the Crime of Feminicide in Brazil and the Dispute of Meanings Around Gender and Criminal Punishment

In March 2015, Brazil passed a new Statute, which established a new legal category: feminicide, understood as the homicide committed against a woman "motivated by the condition of the female sex". Feminicide got inserted into the Criminal Code as one of the modalities of first-degree homicide (implying, thus, an increased penalty as compared to the one for regular homicide) and it was also incorporated into the list of heinous crimes. This paper analyses the process of creation of the feminicide law in Brazil in its cognitive aspects, i.e. in the field of ideas and knowledge, which are gathered, mobilized, and translated in different forms within the realm of law creation. The research aimed to understand how some specific ideas concerning the problem to be faced [violence against women, more specifically the murder of women presented as feminicide] and the postulated solution [the creation of a new crime category and, thus, of a new corresponding criminal punishment] have penetrated into the realm of law and got translated and incorporated during the process of creation of the feminicide law. How does the production of meaning for the categories in the legal text take place? Which disputes were held during the process? What arguments are used to justify the necessity of creating criminal laws? In order to face these questions, the research methods adopted were document analyses and qualitative interviews. I've analyzed parliamentary documents such as law projects and its justifications, substitutions, assessments, transcription notes etc. and I've conducted 12 qualitative interviews with speakers that have participated in the process of creating the law or that have dedicated works in the matters of gender and feminism, being these speakers: 5 congresspeople; 3 feminist activists; 2 researchers on the subject; and 2 jurists.

The Regulation of Life and Death in the City of Salvador, BA: Homicides, Police Violence and the Process of "Legalization of Illegal Deaths"

This presentation is part of an ongoing research about police violence and its judiciary consent, in urban Brazil. Our research team is observing and analysing the phenomenon of elevating homicide rates in the city of Salvador, Bahia, Brazil, which includes the deaths committed by on-duty policemen. Despite its growing rates, the cases of homicides perpetrated by police officers are being systematically overlooked by police organizations and the by state courts. We are possibly witnessing an important change in terms of the social regulation of the killing interdict. The police has no longer to face the moral obstacle that prevent the killing of the so-called "bandits" and the state courts, who were the formal instance to address the problem in juridical terms, and ultimately, to control the possibility to kill "in the name of social security", are openly removing the interdict. "Killing the bandits" is becoming the new official "police practice" with judicial consent. Our field research is based on the analysis of criminal proceedings involving deaths perpetrated by the police during official operations and interviews with police officers, public prosecutors, public defendants and criminal judges, who acted in such cases.

The Demography of the Declining White Population in the United States: Will U.S. Whites Continue to Maintain Their Advantage or Will They Become Disadvantaged?

In this paper we document the demography of the declining white population in the United States. This is important because this reduction in the size of the white population has taken place in a country where whites have historically been the advantaged and privileged population. Whites over time in the U.S. have been, and continue to be, far better off economically and educationally and socially than the minority peoples. Levels of residential segregation by race and ethnicity these days are as high in the U.S. as they were decades ago. Yet, the share of the U.S. white population today (2016) is the lowest it has ever been. When the United States was established as a country in 1776, whites comprised roughly 80 percent of the population. The share of whites rose to 90 percent in 1920 where it stood until 1950. But the percentage of whites began declining in 1950, to 76 percent in 1990, to 69 percent in 2000, to 64 percent in 2010, and to

61 in 2016—the lowest percentage ever recorded. And Census Bureau projections indicate that whites will be in the minority by 2050; we suggest this will occur around 2044. After showing in our paper why and how demographically the white decline has occurred, we then ask what will happen to whites when they are in the minority. Will white supremacy experience a decline? Will the reduced share of the U.S. population that is white be accompanied by a reduction in the white advantage? Or will whites maintain their socioeconomic advantage despite being disadvantaged demographically? These are particularly important questions to address given the declining majority populations in many other countries of Europe and Asia.

Precarization Processes: Studying Military Personnel in the South Russia

The paper analyzes the influence of precarization processes on the professional positions of servicemen in southern Russian cities. An assessment of the financial situation, the dynamics of workload and administrative burdens, social guarantee and risks in the sphere of professional military service are examined on the basis of a sociological survey and in-depth interviews of servicemen from Rostov-on-Don and Novocherkassk (standardized interviewing of 436 military personnel and 16 in-depth interviews). This study was financially supported by the grant of the Russian Science Foundation № 16-18-10306. Authors conclude, that precarization processes partially influence on the sphere of military service. In times of the Russian economic crisis servicemen's financial situation has worsened. Most of the military personnel in two southern Russian cities report an increase in workload and administrative burdens in recent years. From one-third to three-fourths of respondents are very concerned with the risks of job loss, increase in official duties without rising wages, and the size of monetary allowances. At the same time, the interviewed servicemen are mainly oriented towards social guarantees and benefits that the state provides them. An irregular working day, non-staff activities, restriction of communication and mobility rights, dangerous working conditions, etc. are considered by military personnel as a trait of their professional activities. Therefore, many servicemen are more likely to appeal to a higher-ranked army command, but not to protect their social and labor rights comprehensively.

POWELL, CHRISTOPHER* (*Ryerson University*)

Autopoietic Networks of Humiliation and Grandiosity

A critical reinterpretation of Norbert Elias's theory of the civilizing process suggests that state formation gives rise to networks of asymmetrical shame-esteem relations. In these conflicts, weaker-positioned subjects perform deference in order to defer physical or symbolic violence from stronger-positioned subjects. This performance of deference creates a subjectively felt self-esteem deficit, which subjects seek to rebalance by demanding deference from others still weaker-positioned than themselves. The result for subjects at the bottom of social hierarchies is vulnerability to chronic abuse in society compounded by powerful tendencies towards self-contempt. The interlocking chains of these relations give rise to emotional economies through which honour and humiliation circulate in opposite directions. State actors attempt to exploit these economies for surplus honour, in the process constructing national identities with figurative or virtual sovereigns. Discrimination works to take advantage of, and simultaneously reproduce or extend, fixed differences between groups of actors within the shame economy. Genocide can result when certain groups are radically excluded from these economies, i.e. when no performance of deference is sufficient to defer violence. This paper supports this model with two types of argument. First, psychological research is cited to corroborate the notion of shame transference at the micro level. Individuals seek to compensate for humiliation by seeking some dominance over others and suffer when they cannot obtain this. Second, system theory is used to bridge micro and macro levels of analysis by showing that individuals do not need to be aware of the systemic aspects of their actions for their actions to produce systemic effects; economies of shame can, in principle, emerge without any individual intent and are thus self-organizing or autopoietic. Implications for combating discrimination are discussed.

POWELL, CHRISTOPHER* (*Ryerson University*)

Complex Adaptive Systems and Radical Social Transformation

In dualist epistemologies, the division between subjectivity and objectivity provides scientific inquiry with a standard of validity that is fairly simple to define,

although not easy to achieve: correspondence or fit between subjective cognition and objective reality. In relational epistemologies, however, subjects and objects of knowledge appear as mutually constitutive, making the notion of correspondence less meaningful. Likewise, complex system theory implies that the social world can be represented in multiple incommensurate ways with equal methodological rigour. Critical realism, with its assumption that the world has a singular nature, cannot quite do justice to this problem. Pragmatism offers an alternative, replacing correspondence with practical efficacy as the ultimately epistemological standard: knowledge is valid when it facilitates successful practices. But pragmatism must still contend with multiplicity: which practices, which evolutionary directions, are to be epistemically privileged? In this view sociology is always value-oriented. With this in mind, this paper outlines a research program which takes social equality as its paramount value, and co-operative decision-making as its specific pragmatic focus. In this program, complex system theory enables the reformulation of several problems on which classical critical theory has become stuck. Where workers align themselves with capitalism or women with patriarchal norms, for instance, we can replace notions of false consciousness and ideological hegemony with an empirically grounded analysis of local adaptations to perceived possibility spaces. The difficulty of achieving more egalitarian social relations shifts from being a problem of achieving revolutionary consciousness to a problem of goal-directed action in the context of emergent, nonlinear, autopoietic relational processes. Central to this investigation is the study of feedback loops as mechanisms for concentrating or distributing social goods, including power. Existing cooperative movements provide the natural laboratory for this line of research.

RC03-80.2

POWER, ELAINE* (*Queen's University*)

Opportunities for Cross-Class Solidarity and Political Activism in Community Food Programs

One of the most pernicious effects of neoliberalism is the competitive individualism that inculcates a sense of isolation. This is devastating for individuals but also for efforts to address the social, political, environmental and public health crises that we are facing. Growing income inequality and class segregation by neighbourhood, schools, and community organizations means that there are few opportunities for people of different class backgrounds to come together to get to know each other. The voices and concerns of those living in poverty are increasingly marginalized and invisible in the public realm, especially because politicians are obsessed with the "middle class." In a research project investigating the benefits of community food programs, I began to investigate the conditions in which clients and volunteers from different class backgrounds can develop cross-class solidarity and become politicized. Preliminary analysis of qualitative interviews with food program volunteers and clients, program directors, and social justice activists suggests that the development of cross-class solidarity and political activism may be possible if a number of conditions are met. These include the willingness of those from the middle class to have their belief system challenged and to be uncomfortable; the availability of an alternative frames of understanding; the deliberate fostering of the talents of those who live in poverty; and easy access to opportunities for advocacy and political action.

Something Good out of the Bad Times? Intergenerational Inequalities in College Enrolment during Great Recession in the United States

During times when labor market opportunities are few, the opportunity cost and risks of education diminishes resulting to an increase in educational enrollment. Even though this holds for the whole population, there is a more steady increase in immediate college enrollment after high school over time, regardless of the impact of the Great Recession. High school graduates are more likely to benefit from the family's resources but are also more vulnerable for the changes in them, than the older adolescents who possibly have also acquired personal resources from the labor market. At the same time, the net costs of education have grown increasing the importance of the resources of the family. This research examines whether the Great Recession has changed the socioeconomic inequalities in college enrollment in the United States.

Results of high school graduation cohorts 2006-2013 with data from the Panel Study on Income Dynamics show that female graduates from disadvantaged families are more sensitive to changes in opportunity costs by increasing their college enrollment during the Great Recession. However, men had a different reaction as those male graduates whose parents hold a college degree decreased their enrollment. For these reasons, the socioeconomic inequalities in college enrollment were reduced during the Great Recession. Further, the increase in enrollment is associated with the volume of the change in unemployment in all families, so that bigger growth in unemployment resulted to higher increase in college enrollment. To conclude, in addition to the tremendous negative impacts the Great Recession had on families and individuals, it also had a positive influence on intergenera-

tional inequalities in college enrollment, benefiting especially the disadvantaged families.

Fear of Muslims?

Contemporary anti-Muslim racism is often obscured by the denial that it is racism, as such, or by interpreting 'Islamophobia' as fear (justifiable or otherwise) of Muslims by non-Muslims. This paper examines two current forms of 'fear of Muslims' in 'Western' countries. It argues firstly that the 'fear' expressed by anti-Muslims or Islamophobes, is not really about fearfulness; it serves rather as a screen for the contemporary pursuit of colonialism. The paper asserts the salience of the second form of 'fear of Muslims', which is actually produced by the first. This is effected through processes whereby, minority Muslim communities are made afraid of openly expressing their faith – and, especially, radical political assertions of it – by vigilantism, public bullying, vilification, discrimination, and racialised state targeting. The paper draws largely from Australian instances since 11 September 2001, but includes a comparative dimension.

Towards a New Municipalism? Transforming Local Welfare Systems in Spanish Cities in Times of Austerity

Since the emergence of the crisis and the imposition of austerity policies, Spanish cities have witnessed the deepening of social and spatial inequalities. The rise of unemployment and the cuts in social policies at regional and national level have meant a weakening of their local welfare systems. Besides, such local welfare systems were under question even before the crisis, due to the economic transformation towards services economy, the diversification of the social basis of cities and the impact of global actors in local economies. Against this background, citizens of main Spanish cities started to develop bottom-up initiatives against social exclusion and brought new political coalitions into power with new redistributive agendas and promises of a reconstruction and re-imagination of forms of local welfare. Moreover, new city councils have emphasized the role of municipalism as a basis to widen democracy and social justice. Based on the case of Barcelona with the background of other three Spanish cities (Madrid, Zaragoza and Bilbao), this paper analyses the effective transformation of local welfare systems taking attention to the institutionalization of initiatives by civil society and local administration in the fields of housing and employment and economic development. The research is based on the analysis on policies and initiatives that promote providing welfare with the participation of the beneficiaries and the scope of social justice. The results show that there are attempts to foster new policy-making mechanisms to include citizens in the organization of the local welfare system following strategies of the solidarity economy. Nevertheless, the results are far from being consolidated into a coherent model and are still forms of experimentation.

GRAUSGRUBER, ALFRED (*Linz*)

Don't Care or Drifting to the Right? – Tracking Political Involvement in Austria from 1986 to 2016

Political involvement is a central pillar for democratic societies. Citizens are expected to participate in political activities – voting, demonstrating, being active in civil society and unions – and stay informed on recent political developments.

Using the definition of political involvement from political scientist Van Deth and data from the Social Survey Austria (four waves since 1986, each n=2000), it is possible to illustrate that the Austrian society – an example for many western democracies – has become less and less involved in politics since the eighties. 2016 more than 60% of participants had to be classified as distant or not involved in formal politics. Thus, a large amount of the population may not be identified as dutiful citizens at all.

Yet during the same period the populist right-wing party FPÖ – Freedom Party Austria – could expand its political platform. Calling for change and using an anti-immigration-position to push a nationalistic agenda, they accuse the establishment – primary other politicians and the media – to have lost sight of the "common people".

And indeed, established parties – in the case of Austria the SPÖ and ÖVP – lost their standing or had to reinvent themselves in more populist ways, as electoral losses piled up.

We argue that those two phenomena are interrelated and illustrate that the people who gravitate towards different types of political involvement since the 1980ties may have remained constant, but that the group of individuals, who express a distance to the political system, not only grew, but became the primary

recruiting grounds for populist parties in Austria. A paradoxical situation, as one would expect that those not involved would be non-voters or not affiliated with any political power. Using multilevel models and representative data from the social surveys Austria 1986 to 2016 these developments are discussed.

Using an Onomastic Approach to Gain Insights from Migrant Groups? Lessons from the Social Survey Austria 2016

The current political climate makes research on immigrants, their position in society, their values and attitudes essential. This includes second and third generation immigrants, as their input helps to understand their perceived position and experiences in host societies.

But they are only marginal parts of populations and representative population surveys only provide limited information on them, that is often unsuitable for statistical analysis.

Additionally, specialized research is difficult, as representative samples on such populations are hard to get a hold of. In most cases there are no adequate sampling frames, language barriers exist and interviewers have a hard time to gain access to the field.

Facing those challenges, the researchers of Social Survey Austria 2016 (CAPI; n=2000), decided to conduct an additional CATI, exclusively focusing on two sizeable migrant populations in Austria – Turks or Serbo-Croatians.

For the CATI the interview partners were recruited via an onomastic approach, searching for last names and that may indicate Turkish or Serbo-Croatian origins. Once identified, the interviews were offered in three languages and conducted by native speakers.

The resulting two n=300 samples provided more diverse and detailed data on the migrant populations, than the 82 Serbo-Croatians and 47 Turks in the main survey, especially regarding value orientation and societal standing. This will be illustrated by highlighting key dimensions in a comparison between the migrants in the main survey and the migrant samples.

Yet several other issues could not be addressed: Only a hand full of third generation migrants could be recruited, a large percentage of neutral dropouts was reported and bias towards larger cities could be observed.

Based on this, we illustrate that the onomastic approach provided a suitable approach to recruit people for these hard to reach parts of the population, but may only be used in conjunction with a general population survey.

Gender Justice for Sustainable Development: Converging Media and Community Action in India

Globalization has led to a race for fast economic growth in South Asia. In India, people are challenged by the collapse of welfare measures and rising levels of inequality. Women in India have borne the brunt of development that often is accompanied by large scale exploitation of natural resources which were available freely to them to sustain community development. Development paradigms that had neglected women's perspectives and issues in the past are now incorporating a gender component into its processes and strategies. The Millennium Development Goals (MGDs) adopted by several nations in 2000 and the Sustainable Development Goals (SDGs) adopted in 2015 were aimed at promoting gender equality and empowerment of women as the core goals of sustainable development. Community action has generated grassroots participation for gender justice that has gained wide support. Women's collectives are advocates for development that does not destroy their natural resources and carefully consider the environmental, social, and cultural costs of economic growth. With the convergence of various social movements contesting inequality, communication strategies have become more dynamic, integrating community media with indigenous channels of communication, theatre and film which have converged with the mass media and new media technologies including the internet and social media through which the social movements raise a host of concerning gender justice. This paper analyses the struggle for gender justice to ensure sustainable development through the convergence of media and community action in India.

Thriving Digital Culture amidst the Digital Divide: Opportunities and Challenges for Digital India

edew media in its myriad forms are gradually moving centre-stage to contour a digital culture even in societies sharply marked by the digital divide. India's ambitious *Digital India* Project, key to its administrative reform agenda, proposes

to extend the Internet to the remotest of villages by 2017. The foundation of this initiative is a program of e-literacy, capacity building, and installation of ubiquitous broadband-enabled computer kiosks based on entrepreneurial public-private partnerships, all aimed at promoting digital socio-cultural activities. For instance, there were more than 58 million tweets in the 2014 elections in India, a country which accounted for less than 5 percent of the world's internet users at the time. New media production practices have expanded the culture of online participation through processes that involve mass collaboration, crowdsourcing, open source, wikinomics and other forms of user innovation. News organizations have made social media as the 'second screen' by reading tweets and comments on TV, inviting the audience to raise issues and questions and even hosting debates. This paper will explore some of the issues pertinent to digital culture and the dynamic processes of engagement and negotiation, control and resistance through the new media. The growth of the digital culture has largely been seen through the deterministic technological lens be that can be distorted by the spending power of the middle class, which is large and growing but still unrepresentative of the reality on the ground for millions in the developing world. A better understanding of the socio-economic foundations of the new media, digital culture and class experience and power relations are needed to study the dynamics digital democracy in diverse societies.

Regional Growth and Inequality in Brazil: An Analysis Based on the Decomposition of per Capita Income in 2000 and 2010

This paper aims to explain the growth per capita income in Brazil and in its regions between 2000 and 2010, and the inequality per capita income in both years in Southeast and Northeast regions. The choice of this geographic cut is justified by the disparities within these two regions, since the Northeast has the lowest per capita income of the Brazilian regions and Southeast the highest. The model developed by Barros et al. (2004) which computes per capita income in its various determinants allows us to calculate the contribution of each factor to explain the intertemporal and interregional per capita income differentials. Most of the data and indicators used come from the Atlas of Human Development in Brazil, which is an adaptation of the Global Human Development Index produced by the United Nations. The results show that between 2000 and 2010 there was a generalized increase in per capita income in Brazil and that it grew in the Northeast more than in the Southeast reducing interregional inequality. Half of per capita income growth in Brazil and in Northeast and Southeast regions was due to the demographic factor and income from sources other than labor. However, there were significant differences between the regions in terms of labor market factors: the contribution of income per employed adult was small in the Southeast (13.3%), but large in the Northeast (41.1%) and, in turn, the contribution of the proportion of employed adults was significantly lower in the Northeast (10.5%) than in the Southeast (33.5%). These differences show the importance of income transfer policies for per capita income growth in the country and mainly the positive impact of the qualification of the labor force and the investment in physical capital in the Northeast region in order to reduce its inequality in relation to Southeast region.

Computer Art and Actor-Network Theory: Actants and Intersubjective Associations in Scene

The paper is a result of a PhD thesis, which establishes associations between the Actor-Network Theory (ANT) and Computer Art. ANT originated from researches investigating the dynamics of knowledge production within laboratory with the use of technological artifacts where humans and non-humans, called actants, were analyzed with the same level of importance. Computer Art finds its roots in Information Theory and in the signs systems that are proposed as objects from the perspective of Informational Aesthetics, as stated by Abraham Moles and Max Bense.

The research articulated concepts known as *actant*, *association*, *translation* and *inscription*, from ANT, based on definitions presented by Bruno Latour, with the terms *repertoire of elements*, *message*, *object* and *aesthetic states*, from Informational Aesthetics.

Developing the analysis of interactive installations, of my own creation, most of them being applied in theatrical staging, the work investigated how ANT contributes to the innovation of aesthetic states in artistic production and built a theoretical framework that collaborates to the creative process in terms of Computer Art. Expanding Informational Aesthetics with ANT, the research proposes an Aesthetic of Associations, which takes a different view focusing on the connections established between the actants participating in the art object.

Higher Education and the Post-Conflict Era in Colombia: A Review of Institutional Documents

Colombia is engaged in a national effort to build and sustain peace, emerging from the longest running civil conflict in the Western hemisphere one year ago. The Ministry of National Education looks to higher education to be a vehicle through which sustained peace is developed; providing extensive, inclusive and high-quality education.

Our umbrella research agenda asks: How can Colombia's public and private higher education institutions, faced with major financial, political and organizational challenges, fulfill the twin missions of education for all (social inclusion) and quality assurance (academic excellence) in the post-conflict era? At the center of this analysis is the Corporación Universitaria Minuto de Dios (UNIMINUTO), Colombia's largest higher education institution. A Catholic institution serving approximately 130,000 students across 56 campuses, approximately 98 percent of UNIMINUTO's population is within the lowest three socioeconomic strata, which ranges in level from one to six, and over 70 percent are women.

We are engaged in a longitudinal, mixed methods case study, of which the first step is document analysis. We present results of this analysis, a story of how UNIMINUTO creates an institutional narrative committed to social inclusion and academic excellence. Results are framed through the lens of mutual vulnerability as a humanizing pedagogical principle in post-conflict societies by Keet, Zin, and Porteus (2009), which critically engages educational contexts and centers social justice for the marginalized.

This work is an internationally collaborative effort. Results of the document analysis can inform higher education institutions across the globe faced with similar challenges of power, violence, and justice.

Financialization of Government Debt? European Government Debt Management Approaches 1980-2007

The aim of the article is to understand how European government debt managers responded to the growing demand for credit by governments in the 1980s, and how the introduction of the common currency area influenced government debt management. The thesis is that both resulted in processes of financialization of the government debt management. Government debt instruments have gradually become financial products with all the associated risks to the governmental debtors. The analysis indicated that in the 1980s because of the growing demand for credits a paradigm shift emerged. The relationship between governments and their investors shifted from stable bilateral credit relationships to risky anonymous market relations. A financialization of the relationship with private investors took place. The role of financial market principles became much stronger. The implementation of the euro resulted not only in the new European rules but also in the financialization of the regulatory framework. The participating governments lost the privilege to encapsulate their markets. The risk of the creditors withdrawing from a country increased. Because of these two processes, managing government debt in the single currency area meant handling the risk of the financial markets and therefore developing a strategy to successfully issue in a transnational market without support from public authorities at least until the crisis.

Musicians and Critics: The Posthumous Mediation of Resistance

Musicians uphold and challenge values in society through the themes they sing about, the styles of music they play and record, and the things they stand for as individuals. For genres of rock, hip-hop, punk and folk, music critics, as expert evaluators of music, value subversion as a principle of artistic legitimacy and authenticity (see Regev 1994; Koreman 2014:510 for examples from rock and hip-hop respectively). But what happens to this subversive character once the artist dies? Cultural experts exercise their ability to set the terms of evaluation of and engagement with art (van Dijk 1997:23; Adorno 1976[1962]:146-151) but systematic analysis of the ways cultural experts contribute to the ongoing posthumous careers of artists is lacking. This project aims to engage these concerns by considering the ways the political and subversive ideals of musicians

shift in the wake of their death. By drawing upon album reviews from major American and Canadian popular music publications, the analysis focuses on the patterns of the evaluation of musical works while musicians are alive and comparing them to reviews of posthumous releases. In doing so, this project sheds light on how the messages of resistance embedded in musical works are remembered, carried forward and fetishized.

Religion, Sport, and Gender: Preliminary Findings of Intersection

Tensions emerging in the intersections of religion, gender, and sport have recently been highlighted with issues of inclusivity towards the presence of religious signifiers in athletic spaces. FIBA's recent hijab ban, illustrates such intersections, as the inclusion of a religiously gendered identity marker became problematized through discourses of sport regulation and acceptable athletic performance wear. Such intersections of religion, gender, and sport have been largely ignored by scholars in both issues of public policy implicating issues in contemporary secularism, and the mutual imbrications of intersecting identity category performances. This paper presents the preliminary findings of my doctoral research on the intersection of religion, gender, and sport identities and explores through interviews with women from Muslim, Mormon, Christian, and Jewish identities, how sport identity and athletic performance has been shaped by their interactions within regulated athletic performance spaces.

Back to Where They Belong? How Social Origins and Educational Destinations Matter for Persistence in Gender-Atypical Educational Fields in Finland

Although men's and women's tendency to choose fields of study that are typical for their gender is well-established, we argue that insufficient attention has been paid to the ways in which gender segregation in education intersects with questions of social stratification. Previous research has found students from better-off social origins to be more likely to enter or aspire to gender-atypical fields. But to what extent does social class also affect persistence of men and women who have entered fields not typical for their gender?

Our aim in this paper is to investigate the role that dimensions of social class play for men's and women's persistence in gender-atypical fields of study. Drawing on large-scale quantitative data from Finland, we include into our analyses fields of study offered in the vocational sector of the upper secondary system, but also those located at the level of higher education.

In detail, we ask the following research questions:

1. Does persistence in gender-atypical fields differ between a) men and women, and b) across levels of education?
2. Does students' social background affect gender-atypical persistence?
3. Does parents' field of study affect their children's gender-atypical persistence?

Our preliminary results suggest that both women and men have a higher risk of drop-out if they have entered a field not typical for their gender. Compared to vocational training at the upper secondary level, this higher risk of drop-out in gender-atypical fields is somewhat lower at the level of higher education, yet only in the case of men. Furthermore, the role of social origins differs between educational destinations, suggesting that the experience of a double minority status (in terms of social class and gender) rather than the level of family resources in itself may affect students' persistence in atypical fields.

Ethnicity and Student Politics: A Study of Student Organizations As Political Pressure Groups in Assam

Social scientists working on questions of ethnicity and ethnic identity in Assam often raise arguments that view the question of 'ethnic' conflict in Assam as the articulation of 'subnationalistic'[1] aspirations that are at seeming odds with a singular modern nationalistic project (See Baruah 1994). However the rise of a majoritarian national party such as the BJP in a multi-ethnic state such as Assam invites serious enquiry into the claims of ethnicity made by the multitude of political organizations in the region, especially the student organizations based on ethnic membership that have often spearheaded ethnic assertions in the state.

In light of these developments, this paper seeks to identify and analyze the politics pursued by student organizations based on ethnic membership. How does one understand the two strands of competing ideology, one with a majoritarian thrust and two, with a particularistic thrust coming together to form a coalition and how does this shape the discourse of ethnicity in Assam? From a phase when organizations questioned the legitimacy of the state through a language of rights to the present context of pursuing agendas and coalitions based on particular interests, how do we read and analyze the transformation of ethnic claims (non-negotiable) to interest-group claims that are negotiable. For this purpose, I would be analyzing the politics of the All Bodo Students' Union and the All Dimas Students' Union in order to analyze and understand the patterns of continuity and break in organizational politics by studying the role of political leadership and cadre base in response to the larger sociopolitical context since the fall of Asom Gana Parishad to the rise of BJP in the 2000s.

[1] Baruah (1994) uses the term subnationalism to refer to the political and economic contestations pursued by political organizations as separate from the interests of the state.

The Climax of Alienation: Sex Robots, Cultural Dismorphism and a Second Look at 'the Fascism of the Skin'

Recent reportage of the advances in robotics have described entirely new lines of development in the manufacture and marketing of sex-capable, human-sized robots. With the use of silicon and high-tech plastics, these sex "dolls", both female and male, have been made eerily lifelike and given voices and programming so that they can be vocally responsive. Although people have been interacting with electronic devices for decades, this new apparatus presents another step into an alienating and alienated social landscape. Working from previous work on the commodification of alienation and "fascism of the skin," this development is analyzed as the latest and quite expensive commodity marketed by consumptive capitalism both to profit from the alienation it creates while producing ever new sources of alienation. Relying on a wide-ranging, inter-disciplinary literature, this paper explores the possible impacts of introducing machines into the most intimate aspects of human interaction. Ultimately, someone must apply criteria for the appeal of these machines. Already it can be seen that these robots conform to exaggerated standards of beauty and physique further exacerbating both body and cultural dismorphia. Following the logic described by "Fascism of the skin," the attempts to eliminate human imperfection from experience are exposed and set in context.

PROZOROVA, YULIA* (*Sociological Institute of Russian Academy of Sciences*)

Christianization and Byzantinization of Russia: Transmission of Axial Age Legacies

The profound formative influence of Byzantium on the Russian civilizational complex is a widely accepted fact. The paper examines the transmission of Axial Age innovations through the Russo-Byzantine encounters, their adoption, and reception by Russian culture. Christianity emerged after the original epoch of the Axial Age and is considered a "secondary breakthrough" (S.N. Eisenstadt). Christianization and the acquisition of the Byzantine Orthodox framework became a stepping-stone for the formation of the Russian civilizational structures. The diffusion of Byzantine civilization (law, religion and moral doctrines, political and ideological forms, literature, art, etc.) was welcomed by the Russians of the Middle Ages. The main cultural framework, institution, and promoters for the transfer of Axial Age legacies were the Orthodox religion, the Church, clerics and religious philosophers. They spread the new visions on transcendental and the mundane orders that produced a fundamental impact on the spirituality and cultural patterns, economic ethics, political imagination, images of power and authority with continuous effects and far-reaching implications in subsequent centuries. However, in the Russian context, some elements of the Byzantine complex were accepted, some were rejected or transformed. The paper devotes particular attention to the problematic of state formation, political structures and imaginaries that emerged in Russia as consequences of Byzantinization. The Byzantine civilization was more efficiently assimilated in regions characterized by evolving or already established centralized forms of government. The development of monarchical institutions and the acceptance of Byzantine culture were often reciprocal: political centralization paved the way for Byzantinization and vice versa.

RC45-756.1PRZEPIORKA, WOJTEK* (*Utrecht University*)HORNE, CHRISTINE (*Washington State University*)***Technology Use and Normative Change in Online Privacy Attitudes and Behavior: Experimental Evidence from Vignette Studies***

The recent privacy debate has been shaped by the so-called “privacy paradox”, i.e. the common finding that citizens’ stated privacy attitudes differ from their privacy behavior. Nissenbaum (2010) devises a theoretical framework that offers to resolve the paradox by accounting for context dependent informational norms. Her theoretical framework asserts that new socio-technical systems challenge common information transmission practices, which are directed by informational norms. The breaches of informational norms by new technology-based information systems and practices thus provide an explanation for citizens’ privacy behavior across different contexts. However, her framework takes informational norms for granted and focuses on injunctive norms, i.e. norms prescribing or proscribing behavior; it leaves unanswered the question how informational norms emerge and change.

Here we argue that individuals use descriptive norms (existing patterns of behavior) as a source of information about the social norms to which others adhere. These normative expectations, in turn, encourage decisions consistent with typical behaviors. In particular, we propose that (1) the popularity of a potentially privacy-violating technology has a positive effect on individuals’ normative privacy expectations (i.e. expectations that others approve of privacy-violating behaviors by the technology provider); (2) the frequency of privacy violations by technology providers in general has a positive effect on individuals’ behavioral privacy expectations (i.e. expectations that a specific technology provider will engage in privacy-violating behaviors); (3) popularity of the technology increases and violation frequency decreases trust in a technology provider; (4) normative expectations and trust increase and behavioral expectations decrease individuals’ willingness to use a technology.

We test our propositions in a series of vignette experiments in the context of smart meter apps for household energy control. Our results support our propositions and corroborate that descriptive norms and trust in technology providers are significant drivers of normative change in online privacy attitudes and behavior.

RC02-57.4PUGLIESE, MAUDE* (*McGill University*)LE BOURDAIS, CÉLINE (*McGill University*)CLARK, SHELLEY (*McGill University*)***Kin or Credit? Credit Use and the Withholding of Support to Kin.***

Kin often extend support to each other, such as help with child-care, repairs, and financial transfers. However, the extension of such support to kin often associates with wealth depletion and increased likelihood of experiencing stress and anxiety. For this reason, many individuals do not desire to support their kin and seek to avoid having to do so. Thus far, however, few studies have explored the strategies these individuals employ to limit their support to kin. In this study, we explore whether they use indebtedness as a strategy of kin support withholding. Specifically, we argue that individuals who seek to limit their support to kin must overcome two difficulties. First, they must find alternatives to the support they receive from their kin, so as to limit their own reciprocity obligations. Second, they must also find legitimate justifications for not extending support, so as to avoid damaging their relationships to kin when refusing to extend support. We suggest that the use of revolving credit, such as credit cards, can help individuals not to rely on their kin for support and limit their reciprocity obligations because these forms of credit can help individuals to generate liquidity and to purchase services in the market instead of asking their kin for support in times of financial crunches. We also suggest that using installment loans to finance the purchase of large ticket items, such as cars and durables, can help individuals to justify not supporting their kin, since installment debt has for effect to pre-commit income and to make it unavailable. Using the National Survey of Families and Households, we find evidence that individuals who prefer not to support their kin use credit in both of these ways to reduce their support to kin. Our analyses contribute both to the de-familialization and financialization literatures.

RC34-629.7PUMARES, PABLO* (*University of Almería*)BLANC MOLINA, ANDREA* (*University of Almería*)ORDOÑEZ CARRASCO, JORGE* (*University of Almería*)FERNANDEZ-PRADOS, JUAN* (*Universidad de Almería*)***The Current Return Migration of the European Youth***

Rusell King (2012) captures two dimensions of which are particularly useful to understand the international youth mobility. First, there is a temporal

classification, which includes permanent, temporary and circulation migration, with the last being subdivided into seasonal and shuttle migration. The second dimension concerns the sequencing of migration and recognises the following types: repeat migration, chain migration, onward or serial migration and transnationalism.

Both the temporality and the sequencing of migration influence how youth mobility mediates the transition from education or unemployment to employment, as well as the broader life-course transition from youth to independent adulthood. The decision to return is particularly important. There is a coherent human capital explanation of why migrants may return, drawing on the relative weights attached to earnings related to acquired skills, and costs of living, in different places. Beyond these economic considerations, return migration is also informed by concerns about security, the education of children, health, cultural detachment and social inclusion, and migrants’ feelings of homesickness or alienation. Moreover, return may not be the end of the migration sequence but a precursor of circular, serial or onward migration. Not least, this is because previous migration experience tends to have enhanced the willingness to engage in future migration, based on the acquisition of confidence, tacit knowledge and resources such as networks.

We present a exploratory results about the reasons and motivations of return migration from quantitative indicators that explore the individual, socio-demographic, labor and economic dimensions of young people in Europe (16-35 years old) were captured in the YMOBILITY online survey. In total, the GfK survey recorded 29,679 valid responses in nine European countries, in October and November 2015.

RC39-690.3PURDUM, J. CARLEE* (*Louisiana State University*)***Prison Populations in a Disaster: A Labor Force, a Vulnerable Population, and a Hazard***

Within the field of emergency management, incarcerated persons (prisoners) occupy a variety of roles and identities. Across the U.S., emergency management has been shown to utilize labor provided by prisoners to prepare for and respond to various emergencies and disasters. Emergency management and corrections officials alike have traditionally viewed prisoners as a hazardous population, concentrating preparedness efforts to respond to riots, hostage situations, escapes, and general violent disorder within prisons. However, in more recent history, scholars and policy-makers have begun to recognize prisoners as a vulnerable population lacking the resources and individual agency necessary to protect themselves in the event of an emergency or a disaster. Should a natural disaster or technological event threaten a corrections institution, prisoners must fully rely on the staff of the institution to provide for their safety and welfare. Despite this momentum, there has been little effort to comprehensively examine the differences in how prisoners are viewed by emergency management. This analysis examines the different roles and identities invoked within emergency management operations (source of labor, hazard, or vulnerable population) and how these roles and identities vary across states as well as the implications of these differences. With the use of Atlas.ti software, a content-analysis of 43 state-level Emergency Operations Plans was conducted. Results reveal that the majority of states identify prisoners as a labor resource, a hazard, and a vulnerable population while the second largest majority identifies them solely as a labor resource. Differences in how prisoners are identified prompt questions about their role within the disaster context as well as a need for further research. Differences amongst states and regions are explored.

The paper summarizes and reflects on some of the main results of a large-scale research project exploring the ways in which cultural classifications and hierarchies have changed from 1960 to 2010. Have the old distinctions between ‘high’ and ‘low’ dwindled and lead us into a more de-hierarchized, democratized and tolerant culture? The project tackles these questions through the lens of a specific institution in the field of cultural production – the culture sections in European quality newspapers – over the last fifty years, covering wide geographical variety. The newspapers included in the study range from two Nordic countries (Finland, Sweden) to two large Western European countries (France, the UK) and finally to two Mediterranean countries (Spain, Turkey). The newspapers are examined

by systematic content analysis, both quantitative and qualitative. The analyses focus on the supposed trend toward increased heterogeneity of the cultural content, the rise of popular culture and the corresponding decline of traditional highbrow culture. Moreover, special attention is paid on the ways in which aesthetic, commercial and political valuations are intertwined in cultural coverage and how the relationships among these evaluative principles have changed. The results substantiate and add to the previous knowledge on the post-1960s cultural change, which essentially can be conceptualized as two simultaneous processes of 'openings' of culture: the legitimization of popular culture and the popularization of traditional legitimate culture.

PURKAYASTHA, BANDANA* (*University of Connecticut*)

Seeing and Hearing through Silences: Reflections on Methodologies of Violence in Our Times

For years, researchers who have analysed violence, have pointed to processes of silencing as well as the silences that socially construct the universe of violence. This research has also expanded the ways in which global to local structures of violence create a continuum of violence that becomes routinized in everyday life. In this presentation I will draw upon two strands of my earlier work.

In my earlier work on ethnicity (Purkayastha 2005) I had argued that human beings are positioned exist within multiple layers of structures, where each layer is constituted out of the structures, boundaries, conflicts and coalescence that shape each layer. Consequently, multi-layered identities are fragmented, fluid, and disjunctured. Thus the structures we need to trace are far more complex than the simply local to global structures we typically consider within intersectional frameworks.

Further, in my work on life on web spaces (Purkayastha 2012, Narayan, Purkayastha, Banerjee 2010), I pointed out that the ways in which we understand structure and culture within nation-states offer limited maps for studying life on web spaces. Certainly, organizing on web spheres, which include assertions of hegemonies of power, construction of boundaries, force and coercion, are important for understanding violence of our times.

Drawing upon the work produced in countries within and outside the Global North, I reflect on the methodologies for studying types and structures violence and silencing *together* over social spheres that cover tangible and web geographies.

Ethical Dilemma in Legal Profession and Its Resolutions: Some Reflection from India

In light of the deterioration standard of legal profession and declining of public trust in it, paw way to rethink about the different notion of professional responsibility. Lawyer not only lamented from ethical sensibility but also departed from ultimate goal of truth and justice. A lawyer has the responsibility towards his client and sometimes if in-spite of his best efforts an innocent client has got to go to jail his professional capability is in shake. Another situation when he knows his client has done such heinous offenses, which is against the interest of public and society, morality mallet him. Here ethical dilemma arises, as a professional duty toward client and human duty towards court and society. The mosaic of earnest symbols -equity, justice and fairness entails a human being with a spirit of public good. The ethical dilemma is what to adopt public interest model or market (commercial) mode, this posses a divergence of duties and interest. Professionalism demands their service, private interest, and market tactics. Public interest demands ethical behavior as an independent person and discards the unethical and immoral behaviors. Issues like Client capacity, Confidentiality of information, Duty to the client, Duty to colleagues, Duty to disclose unprofessional conduct of colleagues, Duty to the court, Professional rapport, tactics, and communications with colleagues, examination of Witnesses also embrace dilemmas for lawyers.

Today's lawyers are a buffer between unethical demands of clients and duty to protect the social interest. Professional rules accede departure form idealistic principles but query ascends how far it is feasible? The Paper will deal how to integrate morality with professionalism. Paper would quest for a workable solution that may help Indian lawyers to reimagine and reconstruct legal profession in a responsible way.

Reflections on Fieldwork: A Comparative Study of Positionality in Ethnographic Research across Asia

This paper aims to reflect on positionality, in particular insider-outsider binary and gender, while conducting research across Asia in Uzbekistan, Tajikistan, Kazakhstan, Indonesia and Brunei Darussalam between 2008 and 2014. The paper addresses the following question: how does positionality under divergent conditions (in restrictive or in friendly research zones) facilitate or impede the qualitative research process? Ethnographic fieldwork was used to collect data. Two proxies of comparisons are used in examining the role of positionality, namely gender and insider-outsider in Central Asia (CA) and South East Asia (SEA). It is demonstrated that understanding one's position in the field is vital to be able to consciously reflect and negotiate space for fieldwork. Next, one's positionality is not an automatic result of one's native identity. Rather, choosing the stance to opt during the fieldwork can be a conscious decision for the researcher. This is decisive for the researcher's personal security and for the collection of the unique data. With regard to gender, despite being rather an unfriendly environment for conducting social science research, CA turned out to be a much easier space for a female researcher to manoeuvre, than SEA.

Towards Societal Relevance? Unpacking the Arrangements of Knowledge Flow in a Private University in Indonesia

The paper investigates the ways in which private university can contribute to the local community and private sector in terms of knowledge flow. It presents an organisational sociological study of a university located in the suburb of Jakarta. President University, the organisational case study, is a young and promising private university. Studies on university in Indonesia have been focused mainly on state universities. State universities in Indonesia and in Malaysia may well receive funding for its operation from the government. In contradistinction to state university, private university is usually self-reliant and primarily focused on teaching. Organisational study of how and in what ways, a private university can contribute to the knowledge base in Indonesia is under-researched. The study is based on qualitative interviews, participant observation, numerous informal discussions, focus group discussion, and documentary study in 2011-2017. It will delve into social practices within an organisation in its knowledge production and knowledge flow. The latter is shown in the functioning of a business incubator. The initiative of business incubator itself emanated from the central government i.e., Ministry of Research, Technology and Higher Education in Indonesia. Whilst the idea to establish President University itself came from an entrepreneur who had a vision of developing an education park in the suburb of Jakarta. Taking into account these facts, the paper will highlight findings of how knowledge flow is arranged in its social practices and the kind of contribution it provides to the society.

Migration Culture and Belonging: Polish Middle-Town Youth and Globalised Ethnoscapes

While Poland remains one of the most ethnically, racially and religiously homogeneous societies in the European Union, it also boasts one of the largest proportion of emigrants. With only 2% of the population being foreign-born but as many as 12% of citizens living abroad, Poland finds itself in a paradox regarding diversity. What is more, the mass-migration initialized by the 2004 accession to the EU, which currently translates to more than 4 million of migrants, was particularly relevant for the Polish young population (19-30-year-old), who continue to be the most internationally mobile group. In that sense, Poland has a pervasive migration culture with young people being "socialized to migrate", yet it also – through education and political climate – instills a rather uni-national sense of localized belonging. The aim of this paper is to present how young people from medium-sized Polish towns construct their sense of belonging to local and national communities, how they see their 'Europeanness' as well as forge or contest their relationship to the 'globalised ethnoscapes'. Notably, the findings stem from a large "Peer Groups and Migration" project funded by the National Science Center Poland (Sonata Bis 5, 2016-2020). With the methodological approach of this project rooted in the Qualitative Longitudinal Research (QLR) framework, we are able to walk alongside 130 mover and stayer respondents from the 19-34 age group through three waves of in-depth interviews. By retrospectively looking at individuals through the lens of their peer groups formed during adolescence, we are able to compare and determine the impact of both migration/mobility and immobility (staying in Poland) on feelings, plans and aspirations regarding one's identity and belonging. We contribute to the debates on the tensions between (super-)diversity and nationalism among the young populations, who are concurrently socialized with conflicting ideas of nationalism and transnational mobility.

RC42-JS-54.2PUTTERGILL, CHARLES* (*University of Pretoria*)*A Privileged Minority's Reflections on Societal Change*

The negotiated transition to a constitutional democracy in South Africa based on universal franchise, disentangled citizenship from race, reconfiguring the moral emblems, constraints, privileges and entitlements, as well as obligations and sanctions within society. Allocative processes to foster equity in society, threatened privileges enjoyed historically. These institutional changes reshaped the social psychological reality. Hence, questions of transformation are often grappled with, in daily conversations. In discussing transition, participants provide accounts of their own positioning in society and that of others, in a framework of what is deemed permissible within the public domain. These conversations provide insight into how participants manage their positioning in society and their local communities as well as the social capital they draw on to stake their claims to inclusion. This considers both continuity and disjuncture between the past and present. In addition, it raises the question of how whites, as beneficiaries of the previous system, relate to the past and view the future.

RC05-108.2PUURONEN, VESA* (*University of Oulu*)*The Change of Anti-Immigration Discourses in Finland*

The Change of Anti-Immigration Discourses in Finland
This paper deals with the development of anti-immigrant discourses in Finland since the beginning of 1990s. Large scale immigration to Finland began in the beginning of 1990s when the president gave an permission to so called Ingrian people, and the former Finnish citizens who lived in Soviet Union/Russia to immigrate to Finland as expatriates. At the same time first groups of Somalian refugees arrived to Finland. Since 1990 the number of immigrants has risen from 20 000 to more than 400 000 in the year 2016. Racist anti-immigrant, mainly white power skinhead groups emerged around the country during 1990s distributing anti-immigrant propaganda, organizing demonstrations and street violence. In the beginning of 21st century began the development of a political anti-immigrant movement, which became gradually a part of a right wing populist party The True Finns (later The Finns). The Finns forms at the moment important part of Finnish government (4 ministers) and has had a decisive role in defining the immigration and integration policies of the country. The paper is based on the empirical, qualitative discourse analysis of written statements, documents, interviews and parliamentary discussions about immigration.

RC34-625.6PUZANOVA, ZHANNA* (*Peoples` Friendship University of Russia (RUDN University)*)NARBUT, NICKOLAY (*Peoples` Friendship University of Russia (RUDN University)*)LARINA, TATIANA (*Peoples` Friendship University of Russia (RUDN University)*)TERTYSHNIKOVA, ANASTASIA (*Peoples` Friendship University of Russia (RUDN University)*)*Family, Sexual Relations and (a trance-) Gender through the Eyes of Youth: Cross-Cultural Research*

Ideas of family and personal relations, sexuality and gender identity undergo global transformation worldwide, therefore there are critical moments, which cause the ardent discussions in the world because of cultural distinctions. Public opinion, social norms affect people's perceptions of do's and don'ts. Consideration of a cross-cultural context of the attitude towards above-mentioned problems is the important and difficult task, which needs to be solved to understand what happens to the social norms concerning the sphere of family in the modern world.

In 2017 the sociological research by means of a questionnaire was realized at RUDN University. During this sociological research, the students from different regions of the world, who study in Russia (the CIS, Africa, Asia, Europe, Latin America, Middle East), have been interviewed. Projective questions, that allow to reduce the level of sensitivity of subjects, have been asked. These subjects are: relation to divorces, the appropriate number of sexual partners and the actual experiences in the past, the attitude to the forms of manifestation of feelings in public, the attitude towards gender identity (i.e., homosexuality, transgender) and the attitude to marriage traditions, existing in the world (polygamy, polyandry, the choice of the spouse by parents). Some questions were asked in the context of comparison to the Russian reality. As a result, it was possible to define typological groups in each block of a questionnaire and come to unexpected results. Thus, the attitude of students from the CIS and Europe coincides only partly, but there are much more similarities in the attitude of students from Africa and Latin America than could be expected.

RC16-311.5PYYHTINEN, OLLI* (*University of Tampere*)*Attending to Both Fluidity and Stability By Way of Relations: Simmel's Relationalism*

While relationalism has the purchase of challenging the still largely dominant reifying substantialist assumptions, which conceive the world in terms of categories and more or less discrete and static entities, the emphasis on process and dynamic relations easily has the downside of easily neglecting permanence and stability. In the presentation I argue that Georg Simmel's relational take on sociology helps us to avoid simply embracing becoming, fluency, and variation at the expense of being, stability, and permanence. His work is original in that it allows us to simultaneously meet two opposite aims: to attend *both* to how entities are produced in and by relations *and* how they may appear as enduring, relatively stable things. It gives us conceptual tools to consider entities as bundles of relations without disregarding their possible endurance. And it also gives us means to acknowledge their endurance without resorting to substance or an essence that sustains. While some of the features of an entity may endure even though many of its relations are eliminated, this is so, Simmel suggests, only because and insofar as there are a sufficiently large number of others that remain intact. So, in a sense, Simmel takes substance out of substantialism: there is indeed something in things that cannot be subtracted from them without them ceasing to exist, but this something is no essence or substance, but their relations. His work is suggestive of relations being one with the essence or the substance of a thing.

RC16-308.2PYYHTINEN, OLLI* (*University of Tampere*)*Transforming the Landscape of Sociological Thought: On Simmel's Relationalism*

In the presentation, I suggest that Simmel's legacy consists not so much in formulating answers to well-established sociological questions as in transforming the whole landscape of sociological problems by offering altogether different abstractions. I argue that Simmel transforms sociological enquiry in at least three ways: First, instead of explaining concrete phenomena by categories and abstract principles, his work is explanatory of abstraction. What sociologists usually take for granted as a cause Simmel tries to explain as an effect. His conception of society will be used as an example. The second move has to do with exactly *how* it is that his work comes to explain the emergence of the more abstract things from the concrete ones. Simmel cultivates a relational mode of thought by examining phenomena in and through relations, suggesting thereby the priority of relations against the overly substantialist perspectives that still populate many strands of sociology today. Third, while Simmel typically explores the objects that he treats as if *sub specie aeternitatis*, he also makes sociology (and philosophy) responsive to the situation and crisis of modernity. He analyses in detail what it is like to *live* in the modern world. All in all, the three points suggest that what we can take from Simmel is above all a certain mode of thought, a form of questioning. The untypical, strange, and transgressive aspects of his work provide lines of flight that present resistance not only against the dominant systems and modes of sociological thought but also current social conditions.

Chinese Women in Living Apart Together Relationships

The past decade has seen a rise in the western world of couples living separately, bringing about changes in individual personal life and a transformation of intimate relationships. Similarly, in contemporary China, some couples live in separate households, but still keep their relationship. Although some of the reasons for couples living apart in China are quite similar to those in western contexts, such as job/educational locations, others are different. Such differences can be seen with the category of Chinese “study mothers” who physically accompany and take care of their children full time to provide them with optimal living and study conditions, relocating their residences next to their children's school. Under such circumstances, the husbands have to work away from home for providing them with continuous financial support.

Drawing on 39 in-depth interviews with people aged between 23 and 57, this paper finds that even though some study mothers see positives and benefit from couples' living apart together (LAT) relationships, increased child-care responsibilities, financial dependence, and loss of a career and support networks all suggest a negative impact on women's personal and marital life. On the one hand, moving away from a focus on the role of wife can be somewhat liberating at the same time that the focus on motherhood can be overwhelming. And the result of these priorities can be a further distancing from the other part of the family—the husband. For men, finding jobs in urban areas and acting as the sole breadwinner has not only showed masculinity but strengthened his status in the family. However, men may also experience pain and anxiety because of work pressure and family separation. Therefore, in order to understand the embodied experience of Chinese study mothers in LAT relationships, we should recognise the differences in historical and societal context of each country.

Between Ignorance and Hope? Actors' Perceptions of Uncertainties Related to Intellectual Property Regulations in Creative Processes in the Music and Pharma Industry

Uncertainty about intellectual property (IP) regulations is prevalent in today's knowledge based and creative industries. In both, pharma and the music, the generation of novel and useful artefacts and products depends on inputs that are protected by either patent law or copyright. However, what inputs can be used under what circumstances and from whom they can be licensed for what purposes is often uncertain. Yet, so far very little is known about the social processes through which perceptions of regulatory uncertainty in these fields are constituted and shaped. In this paper, we address this question based on empirical research undertaken in the context of the DFG-research group “Organized Creativity – Practices of Inducing and Coping with Uncertainty.” By drawing on sociological and economic concepts of uncertainty (e.g. ambiguity (Camerer & Weber 1992; Weick 1995), substantive and procedural uncertainty (Dequech 2011)) and contrasting it with empirical evidence on perceptions of uncertainty reported in 80 interviews we conducted with a variety of actors in the pharma and music industry, we find that regulative uncertainty is far from being static or monolithic. Instead, we find actors addressing uncertainty with perceptions ranging from neglect and ignorance over strategic management to frustration and even fear. We argue that different actors (scientists, musicians, managers and IP lawyers) involved in creative processes have diverging understandings of the (regulative) uncertainties at hand. For example, IP lawyers tend to strategically frame substantive uncertainty as risks that are calculable to make them manageable whereas musicians tend to perceive the same phenomenon in less calculative categories. We show that this has a lot to do with the valuation and categorization of practices in processes of music and pharmaceutical creation. We thereby highlight the necessity to approach uncertainty as an actor framed phenomenon contextualized by field dynamics.

Dividing the Grey Divide: How Older Adults' Online Attitudes, Skills, and Activities Vary

Research has repeatedly demonstrated a “grey divide” of older adults less involved with digital media. Yet such research has tended to overlook differences in older adults' digital media use and treated them as a homogenous group. Based on 42 in-depth interviews with older adults (65+) in East York, Toronto, we develop a user typology that moves beyond seeing older adults as non-users and includes tech mid-rangers, middle of the road users, intermediate go-getters, and cultivated users. These older adults feel relatively deprived when they compare their digital skills to peers, family, and mass media accounts of hot new apps. For some, their narrative of low mastery comes from the perceived time needed for learning, the difficulty of learning, and the feeling of lagging behind younger generations. We relate the policy implications of our findings to the potential that learning about digital media has for older adults.

“They Weren't Prepared to Live in a Tower...”. Questioning Ecological Determinism in a Disappearing Social Housing Estate

Building on the results of a fieldwork-based research in a social housing estate located in a riverfront area in Porto, Portugal, which is currently under a demolition process, this paper wishes to discuss the role of the built environment in the organization of local social relations, and to address the ways through which public authorities envisage this relationship in urban communities deemed as “degraded” and “problematic”. The scrutiny of public discourses on the relationship between urban form and the “social problems” that could and can be found in this social housing estate – which became central to the legitimization of the political decision to demolish it – is the point of departure for a critique of ecological determinism in the reasoning of urban matters. Although it's evident local social relations and the everyday life of communities like this one are influenced by their physical set and surroundings, research among locals shows the built form is socially appropriated and adapted to significant social purposes and evidences that spatial and physical “solutions” such as demolitions are frequently inefficient solutions to the real social, economic and political problems faced by residents in segregated working class urban areas.

Participatory Theatre As Transformed Social Scientific Research Practice: Addressing Workplace Harassment with Health Care Workers

Workplace harassment is a pressing occupational health and safety problem. No industrial sector is immune, however, health care workplaces in Canada have especially high prevalence rates of repeated, sustained aggressive behaviour toward another within an interpersonal relationship characterized by a power differential. Most solutions to the problem of workplace harassment are top-down strategies (eg workplace policies, legislation) that are easily be interpreted by workers as lacking in credibility and not reflective of genuine attempt to cultivate safety and dignity for workers. In contrast to these conventional strategies, Participatory Theatre is an embodied form of PAR that energizes participants to become competent contesters of dominant discourses, heighten their reflexivity, and generate group solidarities. Empathetic bonds between the participants are fostered by the relational aesthetics of their creative outputs.

The objective of this paper is to report on a Participatory Theatre project addressing workplace harassment with caregivers in the anemic workplaces of Canada's restructured health care system. The paper will make explicit the challenges, delimas, and potentials of Participatory Theatre, a dialectic of Brecht's modernist liberatory tradition and postmodern dramaturgy's unresolved narratives and multiple stages, actors, and script.

The paper's analysis is based on data drawn from Participatory Theatre workshops with health care workers and follow-up interviews with the workshop participants. The results provide compelling evidence for the value of involving participants in the co-creation of knowledge that has immediate utility in their workplaces. The paper concludes by advocating for participatory theatre as a ‘bottom up’ approach of intervening in complex social problems, empowering participants to become protagonists in their own lives by recognizing that social problems, such as workplace harassment, can be experienced individually but have structural antecedents.

The Figurational Dynamics of the ‘Merger’ of the International Union of Mine, Mill, and Smelter Workers and United Steelworkers of America.

Local 598 of the International Union of Mine, Mill, and Smelter Workers (IUMMSW) held the certification for the International Nickel Company workers in

Sudbury for 18 years prior to the raid by the United Steelworkers of America in 1962. With each successive collective agreement, IUMMSW won wage increases and improved working conditions for the 17,000 members of Local 598. Along with other left-led unions, IUMMSW upheld the post-war vision of progress through labour unity and its active pursuit of the broader goals of social unionism. The raid by the Steelworkers resulted in disruption and division amongst workers in Sudbury well known within the Canadian labour movement. The usual explanation for the success of the raid is the protracted strike of the Local 598 members several years prior. However, a comprehensive analysis of the power asymmetries within the multi-tiered figuration of local, district, national, and international leadership within IUMMSW during and for the several years following the strike has yet to be done. This paper's working hypothesis is these power imbalances need to be understood in light of the expansion and intensification of inter-organizational functional interdependencies of oppositional forces outside IUMMSW. The paper's analysis is based on data drawn from archival records from six archives across Canada, including union constitutions, briefs, letters, reports, meeting minutes, bulletins, newspaper articles, flyers, and transcribed interviews. The Cold War and the resulting instabilities within the Canadian and US labour movements is the backdrop of the analysis. The figurational dynamics elaborated in the paper help to explain why Local 598, and ultimately the entire IUMMSW, was successfully raided by an international, bureaucratic union, despite its long-standing militancy, historical commitment to Canadian autonomy, and its members' well-etched occupational identity. The results aim to stimulate further comparative and detailed investigations within and outside the labour movement.

QUINLESS, JACQUELINE* (*University of Victoria*)

Decolonizing Bodies & Data Sovereignty: An Indigenous Perspective on Wellness in Canadian Urban Centres

The adverse effects of contemporary colonial practices have been identified as a determinant of poor health resulting in lower states of wellness in Indigenous populations. This has influenced indigenous peoples' efforts to shape and determine their well-being through the resurgence of indigenous worldviews as a strengths-based response to ongoing colonial practices. How does understanding well-being through a decolonizing research and supporting data sovereignty approach support an understanding of well-being that will be of benefit to urban Indigenous people and the communities to which they live? This research has been conducted in partnership with the First Nations Health Authority (FNHA) in British Columbia based in participatory action research, and guided by Indigenous ethical frameworks, principles of OCAP (Ownership, Control, Access and Possession) that relies on qualitative and quantitative techniques to inform determinants of health and wellness for urban Indigenous people across Canada. A decolonizing lens invites readers and users of this information to consider an alternative way to think about urban Indigenous health and well-being that is anchored in Indigenous traditional knowledge systems, community values, and an interconnected holistic approach to well-being.

QUINN, KAITLYN* (*University of Toronto*)

Constructing Criminalized Subjectivities: A Qualitative Analysis of the Penal Voluntary Sector in Canada

As sociologists, what terminology should we draw on in our research of individuals who were once incarcerated? The literature favors a combination of: *former offenders*, *ex-prisoners*, and *former inmates*. However, in perpetually anchoring identity to a stigmatized past, these linguistic conventions may indirectly make the transition from carceral to community settings more difficult for those who have been criminalized. Specifically, this paper problematizes the enduring use of the prefixes "ex" and "former" as indicators of subjugated group status long after individuals have been released from prison (Maruna 2001). In seeking to help individuals navigate this process successfully, volunteers who work in rehabilitative settings must arbitrate depictions of criminalized individuals that circulate in public discourses, are officially endorsed by voluntary associations, and are informed by their own lived experiences. In response, this paper explores the important relationship between volunteers and criminalized individuals as consequentially refereed by language. I draw on ethnographic research and interviews conducted in two Canadian cities to describe: *how volunteers may reinforce, challenge, and/or complicate existing boundaries drawn between criminalized and non-criminalized groups in their use of language*. My analysis is focused on when social divisions are hardened between volunteers and criminalized individuals, and conversely how these boundaries are challenged or interrogated. "Boundary transgressions" within which criminalized subjectivities are reimagined and expressed more productively are especially important to note as these narratives are largely absent from the literature. The broader goal of this paper is a critical turn upon our disciplinary conventions surrounding language in favor of a perspective that highlights how the terminology we use to describe our research participants is always embedded within relations of power and processes of domination. In doing so I hope to denaturalize and re-politicize the

language we call on to describe our research participants who have been released from prison.

No Real Return?: Peacebuilding and Justice in Post-War Sri Lanka

After nearly three decades of civil war, the formal end of fighting in Sri Lanka in 2009 has led to a peacebuilding process that is more of a 'waiting game' for local actors. The values and assumptions underpinning this process, however, and its implications for dealing with social and economic injustice and inequality in local contexts, are in need of more scrutiny. Sri Lanka provides a compelling demonstration of the challenges faced by civil society actors and international organisations to influence a strong, centralised state, but many of these challenges are also part of working with local elites and civil society actors around the world. The sometimes-fraught relationship between establishing peace and enabling systems of justice also illustrates how the shifting focus on reconciliation and restorative justice can play out in a variety of ways on the ground.

Against this background, my paper asks how peacebuilding and transitional justice processes in Sri Lanka (led by state, local and international NGO actors) address demands for land restitution and restorative justice, how this relates to the expectations and lived realities of affected individuals and communities, and how these expectations are managed. The arguments are based on PhD fieldwork research conducted in Sri Lanka in 2017-2018, primarily focused on the Eastern Province.

"En Esta Casa Se Habla Español": Conciencia y Diversidad Lingüística En Los Migrantes De Retorno Mexicanos

Entre los muchos aspectos que es necesario conocer para comprender la forma y dimensión de los hechos sociolingüísticos en los relatos de los migrantes de retorno mexicanos, destaca la manifestación de sus actitudes lingüísticas y el uso de estrategias comunicativas ante el inglés y ante su propia lengua, el español.

Martinell (2006) afirma que «una actitud ante una lengua extraña no se adquiere, y mucho menos se manifiesta, hasta que no se ha adquirido conciencia de la lengua propia». Moreno Fernández (2009) considera que la conciencia lingüística de la lengua propia se activa, por ejemplo, cuando el individuo entra en contacto con otra comunidad lingüística y toma conciencia de hechos lingüísticos y sociolingüísticos que le afectan; elige entonces unos usos lingüísticos específicos de acuerdo a sus intereses. Para Mollà (2002) «la elaboración de la conciencia lingüística es un proceso determinado por la estabilidad y la reproducción de una comunidad lingüística moderna. Las comunidades lingüísticas de tipo tradicional no necesitaban ninguna conciencia cohesionadora».

Desde una representación subjetiva del lenguaje, es posible analizar esos usos lingüísticos y las actitudes sobre los mismos, con la ayuda de las exteriorizaciones metalingüísticas de los hablantes. En nuestro caso, lo haremos examinando las valoraciones que los migrantes mexicanos retornados hacen acerca de su propia lengua y del inglés, a partir de sus creencias, de sus percepciones, de sus actitudes positivas o negativas, abiertas o encubiertas, sobre ambas lenguas. Para ello, nos apoyaremos en las aportaciones que han hecho al respecto Fishman (1979), Holmes (1997), Barrett (1999), Bukholtz (1999), Maryns y Blommaert (2001), De Fina (2003), entre otros.

Nuestra investigación se basa en una serie de narrativas surgidas en el contexto de entrevistas semiestructuradas realizadas a migrantes de retorno de los estados de Colima y Nayarit, entre los meses de enero de 2013 a diciembre de 2015.

Whither the Equality of Educational Opportunity in the USA?

The U.S. Supreme Court declared that school segregation was unconstitutional in 1954 and in 1964 the U.S. Congress passed a Civil Rights Act that called for the equality of educational opportunity. Later court decisions endorsed policies that sought to create parity between the educational opportunities of minorities and majorities. The 1964 Civil Rights Act mandated a nation-wide study of inequality and led to findings in the Coleman Report of 1966 that there existed a significant test-score gap between African American and White students. Subsequent findings found a similar test-score gap between Hispanic and White students. The belief of federal courts and Congress was that the test-score gap would eventually vanish.

Since the 1970s, one assessment of the magnitude of the test-score gap was derived from results of a national achievement test of reading and mathematics, the NAEP, or National Assessment of Educational Progress, administered to students aged 9, 13, and 17. While the gaps between White students and African

American and Hispanic minorities have narrowed over the past 40 years, they do persist. In fact, only when 13 year-old Whites are compared with 17 year-old African Americans and Hispanics do the gaps vanish.

Based on an elaboration of a chapter on the U.S.A. we prepared for *The Palgrave Handbook of Racial and Ethnic Inequality*, edited by Stevens and Dworkin (forthcoming), we attempt to explain the persistence of the gap in academic achievement between minority and majority group children. The analysis reviews sociological and educational research and data on student-level differences, family factors, neighborhood effects, school and teacher effects, as well as larger educational policies created under the aegis of neo-liberal pressures on school accountability and the emergence of color-blind racism. The analysis seeks to explain the struggle to attain equality of educational opportunity in the U.S.A.

White Do-Gooders or Good Doers in an African City?

More than two decades after the first democratic elections in South Africa, white South African citizens become increasingly aware of their minority status even though many are still in positions of power. In analysing marginalised youth in Pretoria, resource people were interviewed in their organisations' current roles in promoting social cohesion. A white primary school principal and a pastor in the inner city gave particularly reflective accounts of their life worlds, commitments and the changes in the city over the last two decades in this qualitative research project. The former is heading a primary school with a rich white heritage who now only hosts black pupils due to the larger urban changes since 1994. Many of the pupils live in dire poverty and hence have poor resources at home. Yet the principal's optimistic account of the children's future and the difference the mostly white teacher corps bring to the educational experiences is partly fuelled by his religious beliefs and partly by his empathetic way of looking at other people's lives. The pastor gave an account of innovative practices adopted by the former white church (his main employer) by transforming religious spaces into more utilitarian spaces. Despite the remarkable adaptations and pragmatic approach to engage with aspects such as childcare needs of sex workers and theft of homeless people's belongings, he is far more pessimistic about the future of the city and the impact that the church may have. Both men are open and honest about their own identity and their place in an African city. Their views and their opinions on their place in the world are discussed within the larger dynamic national and urban contexts.

RABELLO DE CASTRO, LUCIA* (*Universidade Federal do Rio de Janeiro*)

About the Violence and the Responsibilities of Naming: Childhoods of the Global South, of the Majority World or, Southern Childhoods?

This paper departs from the plethora of expressions about children and childhoods of Southern countries present in Child Studies today in order to discuss some implications of theory building about childhood, its communication and diffusion process between North and South. Of special interest here is how particular institutional and national actorships are favoured in detriment of others, and certain theoretical perspectives in the area of Childhood Studies become hegemonic. Insofar as this can be understood as part and parcel of a more general pattern of scholarship interaction between North and South, whereby authority centres of knowledge production are legitimated, the naming of childhood experiences in Southern countries *by Northern scholarship* seems to accomplish the expected division of scientific labour for both sides. It is argued therefore that naming, or whatever discursive practices and productions, concurs to either alienate or to integrate one's self or collective experiences. In the case in point, it is analysed how the expressions of 'global South', or 'Majority World', frequently deployed by those who do not live in this part of the world, tend to obfuscate relevant issues of globalization in these countries conducting Southern scholars to more obvious research questions that hardly meet the claim of their responsibilities concerning local demands of the study of children and childhood. This paper seeks to highlight the violent element inherent in those academic practices that needs to be extricated in order to decolonize scientific knowledge and build up new decolonial sensitivities and self.

Coworking - Individualism in Community

Modern society is struggling with transformation on the labor market caused by individualization expressed by among others: increasing number of freelancers, start-ups, accelerated the dynamics of change job, a new model of living and growing are uncertainties and risks related to eg. with flexibility, instability, informal agreements. The era of globalization is time for unfair social contract in which employees accepted flexible working in return for a promise to preserve jobs, it is also times for commodification, which has spread to all aspects of life.

In response to changes, we observe the emergence of alternative, often innovative forms of work. The aim of this paper is to analyze one of these forms - coworking understood as a response to changing conditions on labor market.

Coworking is a new phenomenon; it attracts attention because it has been recognized as having the potential of the "third way", located between the conventional experience in corporate work and individual work, performed in the isolation of space (office). Great freedom, both in space and time of work, and at the same time securing the basic needs of a worker, a sense of connectedness and acceptance from fellows makes coworking an attractive and desirable form of organization of work.

The main topics discussed is paid work understood as both a space organizations, as well as the institution that is the source of the identity of individuals. Transformations of the labor market are considered in the context of the process of individualization and a growing sense of risk and insecurity. Will provide a vision individual suspended between the desire and the need for individualization of community. Based on results own research autor will be discussed topics such as: Community building is one of the top tools to attract new members; Collaboration is mainly based on small tasks.

HELLEINER, JANE (Brock University)

"I Got My First Job": A Collective, Embedded Turning-Point

One key biographical turning point is getting a first job. Within our individualized, neoliberal context, this transitional moment is frequently framed as a marker of independence and autonomy. In this paper, we draw on interviews with Canadian young people between the ages of 11 and 17 about their first paid jobs, noting that while many of our participants focused on their individual choices, hard work and maturity, there are numerous ways that this transitional moment was a collective moment of dependencies and extensions (Lee, 2001). Processes of getting, keeping and even leaving their first jobs were deeply interwoven with advice, support and engagement from parents, siblings and peers. Our participants were also embedded in community connections, systems of transportation, discursive frameworks of 'becoming adult', political-economic structures of competitive individualism and material, collaborative, workplace tools and processes. Sometimes our participants noted how they were embedded in collective connections and supports, but frequently they did not: work was a step towards independent adulthood. To think about this extensive embeddedness of the individual in the moment of getting a first job, we draw on Deleuze and Guattari's dynamic notion of assemblage (1980), especially as discussed by Lee (2001). Assemblages (and extensions) help us to displace the idea of the autonomous, independent adult and think instead about our shifting, interconnected interdependencies, not just in terms of human collectivities but systems, discourses and non-human forces.

RADDON, MARY-BETH* (Brock University)

"We Have to Fit the Men in Somewhere": Explaining Gender Inequality in the Fundraising Profession

This qualitative interview study examines how professional fundraisers grapple with occupational gender subordination, including gender segregation, the gender wage gap, the speedier promotion of men to top-ranked positions, and the sexual objectification of young women fundraisers by affluent male donors. When fifty senior Canadian fundraisers were invited to reflect on the status of women fundraisers, they defaulted to neoliberal discourses of individualism, attributing gender inequality to personal choices guided by innate sex differences. Women were said to be drawn to work requiring the soft skills of fostering relationship-intuiting needs, listening, nurturing and communicating—in addition to multi-tasking and giving attention to detail. Men were thought suited to positions requiring technical, analytical, financial, or leadership skills, which happened to be better compensated. To interpret these patterns and responses, I analyze gender inequality as an embedded feature of neoliberalism, not merely an outcome or effect. Neoliberalism obscures gender inequality by making women's location in structures of constraint appear to be the free choices of equal market agents. The career success of certain women, who can operate socially as *homo oeconomicus*, the idealized entrepreneurial subject of neoliberalism, diminishes the possibility to speak about gender inequality as a political issue. Three neoliberal feminine subjectivities available to women fundraisers offered subordinate paths to career satisfaction: the self-sacrificing worker whose service and altruism sustains and subsidizes her struggling organization; the enterprising professional capable of instrumentalizing her emotional capacities and "people skills" for competitive advantage; and the "cute," hyperfeminine fundraiser, able to perform as a well-groomed accessory to the successful businessman philanthropist. Each of these subjectivities helped women fundraisers adapt to low pay, ghettoized work, or sexualization by configuring their adaptations as serving themselves and their worthy nonprofit causes.

RADFORD, DAVID* (University of South Australia)

Migrant Differentiation, Racism and Islamophobia in Rural/Regional Australia

Issues of (in)justice in relation to regional and rural settlement of migrants are part of the lived realities for many migrants. This is especially true for non-European migrants whose cultural and religious backgrounds are very different (Radford 2016; 2017). Within these diverse non-European groups there remains a continuum or differentiation around issues of inclusion and exclusion. Some groups of non-European migrants face greater or lesser degrees of inclusion/exclusion based on culture, religion, language and migrant status (Noble and Poynting 2010). Drawing from an empirical example in rural South Australia this paper explores aspects of this differentiation among Filipino, Korean, Chinese and Hazara Afghan migrants. The paper contends that those from humanitarian and Muslim backgrounds in Australian rural/regional communities face greater possibilities of exclusion through the twin social stigmas associated with being 'illegal boat people' and 'Muslim terrorists' (Forrest and Dunn 2013, as well as low English language proficiency (Leitner 2012). This underscores linguistic, racist and Islamophobic challenges to integration, social cohesion, and the opportunity for these migrants to be positive contributing members to the development and growth of rural/regional communities.

RADICE, MARTHA* (Dalhousie University)

"Throw Me Something, Mister!": Emotional Artifacts in Carnival Parades in New Orleans

During carnival season in New Orleans, between Twelfth Night (January 6) and Mardi Gras, social clubs known as "krewes" stage over forty parades through the city. All these parades feature "throws": trinkets thrown or handed from people on floats or on foot in the parade to people watching it in the audience. Some throws are mass-produced - strings of plastic beads made in China, flashing LED toys, plushies - while others are handmade - hand-painted coconuts, hand-glittered shoes, tiny comics or books of poems. The more elaborate throws are often witty and sometimes "intertextual", in that throws from one parade "cite" or reference the form of throws from another. All throws are coveted, and it is not uncommon for homes in New Orleans to feature displays of the most prized. Drawing on ethnographic fieldwork (participant observation and interviews) among carnival krewes, this paper explores the social and emotional significance of throws. How does "bead fever" - an insatiable, apparently irrational desire for supposedly worthless throws - come to strike even the most cynical spectator? How do krewe members labour to make throws that link to the theme of their float or costume? What feelings come into play as throws are assessed and valued, with some becoming treasures while others are instantly discarded? Scholarship on craft and making, on the social life of things, and on reciprocity and the gift will help answer these questions. The paper argues that the emotions that crystallize in these little gifts of throws say a great deal about the social significance of New Orleans' carnival as a whole, which remains quite a unique form of urban public culture in North America.

RADJAI, LEYLA* (Waseda University)

The Role of Regional Intergovernmental Universities: A Case Study of South Asian University

This paper examines the role that regional intergovernmental universities play at the national and regional levels, by looking at South Asian University (SAU) as a case study. Regional intergovernmental universities are universities that belong to multiple countries within a region, and their establishment is generally considered an outcome of the internationalization and regionalization of higher education. These universities often place an emphasis on regional development and peace as part of their mission by producing human capital and social capital that reflects the values of the region. These developments are accompanied by the fact that the internationalization and regionalization of higher education has promoted a liberalization of education and has allowed students to develop knowledge and their sense of belonging beyond the national context. However, these globalizing forces also impinge on nation-states' tendency to design education policies that carry their own national values, and not allow outside actors to get involved with national education policies. I examine this situation in the South Asian context. SAU is a regional intergovernmental university established by the SAARC member countries. With a campus in New Delhi, India, half of the students enrolled are internationals, and 80% of them are from the SAARC member countries. Given India's advanced position in the SAARC region, I raise the following questions: 1. To what extent does SAU actually reflect the values of the region in the university's policies and practices rather than only India's values? 2. What are the implications of this value-orientation on the national and regional levels? In conclusion, this

paper seeks to further this line of inquiry by (a) suggesting what lessons might be drawn from this case-study; and, (b) offering paths for future research.

FERNÁNDEZ, JUAN J (Department of Social Sciences, University Carlos III of Madrid)

Effects of the Perceived Sustainability of Public Pension Systems on Attitudes and Policy Preferences: Evidence from a Survey Experiment in Germany, Spain and the United States

Due to major pension retrenchment undertaken in advanced economies over the last decades, public pension benefits will be considerably lower in the future whereas statutory retirement ages will be higher. While many such pension reforms have been legislated, the consequent parametric shifts in regulation will typically be phased in gradually over various decades. However, it is largely unknown to what extent people are aware of these upcoming changes, and how much the technically complex public discourse on demographics and pension reform has transformed their perceptions of "the future of ageing societies".

This study presents new evidence from an online survey experiment on knowledge of the financial sustainability of pension systems carried out in the Autumn of 2017 in Germany, Spain and the United States. To better understand the formation of attitudes towards welfare reform, we examine how knowledge on societal ageing affects the support for concrete public policy reforms. By randomly exposing one subset of survey respondents to an information treatment, the first objective of the project is to ascertain whether providing hard, objective data on societal ageing to individuals shapes their political attitudes toward social spending and welfare state reform. The second objective is to discover whether this knowledge impacts on personal outcomes such as saving intentions or age norms regarding appropriate retirement timing. Finally, the study analyzes whether and how individual characteristics – such as age, gender, education, and prior knowledge – moderate any information effects on policy preferences and personal outcomes. The project has important implications for the dynamics of public discourse on welfare reform.

RADO, MARTA* (Hungarian Academy of Science)

The Present Study Investigates the Effects of Seating Arrangement on Academic Outcomes and Prejudice

Traditional desegregation policies were successful in creating mixed ethnic schools, but social networks within the schools are still largely segregated. Possibilities to intervene in students' relationships are limited, but teachers can determine the seating arrangement. Previous research shows that desk-mates are able to influence each other's academic achievement. Furthermore, contact with an ethnically different desk-mate has proved to decrease prejudices against the out-group. Thus desk-mate assignment can be a useful tool to achieve different policy goals. We aim to reveal the consequences of different seating arrangement scenarios on prejudice and academic outcomes.

This paper applies agent based modelling. The empirical foundation of the model is the "Wired into Each Other" project, a longitudinal piece of research carried out by HAS "Lendület" RECENS. Our model represents a classroom with one teacher and students. The teacher intervenes in the students' sitting arrangement. The students are agents who receive a new desk-mate based on the rules defined by the teacher. Further, they update their GPA and level of prejudice based on their desk-mate's characteristics and the characteristics of the classroom. We run the model for multiple classes with different ethnic compositions and observe how the GPA distribution and level of prejudice changes over time.

The results draw attention to the trade-off between policy goals. For example, seating the students with the highest GPA together with the students with the worst GPA narrows GPA inequalities and reduces prejudice, but does not allow the best students to thrive. In contrast, letting students decide with whom they want to sit allows the best students to perform better, but has little effect on decreasing inequalities and increases prejudice. Further, we show how the GPA and the level of prejudice can further be influenced by different classroom compositions.

Envisaging Post-Brexit Immobility: Polish Migrants' Care Intentions Concerning Their Elderly Parents

The research on transnational care underlines the importance of including in the analysis both receiving and sending countries' migration regimes (Kilkey & Merla, 2014). Leaving the European Union will mean rebordering for the United

Kingdom and abandonment of the European Freedom of Movement rules, which will have an impact on migrants' transnational and co-territorial care arrangements. The international scholarship demonstrates that when migration policies become stricter, migrants opt to stay, and settlement replaces circularity strategies (Massey, Durand, & Pren, 2016). The UK Home Office proposal disclosed in 2017 plans to regulate and circumscribe the migration from the EU. It is also to be expected that the access to the UK social benefits will be limited for the EU citizens (Kilkey 2017). All that can have practical consequences for the elderly care.

The paper analyzes the case of Polish migrants in the UK, the biggest migrant diaspora in the Great Britain, often brought up in the discussions by the 'Leave' voters in the Brexit referendum. Its aim is to **explain how Brexit affects Polish migrants' care intentions concerning their parents ageing in Poland and their perception of the changes that Brexit will bring about**. Polish care model is a family-by-default type and permanent outbound emigration can lead to care deficit in that country. Research on care intentions is especially important not only for the attempts to predict future care arrangements, but also to understand the meaning of care for the people engaged in the production of the care effect (Kordasiewicz, Radziwinowiczówna, & Kloc-Nowak, 2017). The analyzed data present a unique opportunity for a reevaluation of care intentions, as long as migrants have been interviewed before the Brexit referendum (in February and March 2016), and will be revisited three years later, in March 2018, a year before the looming Brexit.

Quiet Voices: Resistance Against Disciplinary and Biopolitical Practices in the US Immigration Prison

The literature names examples of resistance by the people in immigration detention: hunger strikes, self-mutilations, or destroying identification documents and passports (Dow 2004; Fischer 2015). This paper draws upon the narratives of Mexicans deported from the United States of America, interviewed by the author in Mexico between 2012 and 2014, who in retrospective described their pre-removal detention. The paper seeks to address two objectives. The first is to show the voices of resistance of the people in immigration detention. The second is to explain why the interviewees accepted their deprivation of freedom and future deportation from the United States.

The author of the paper argues that: (1) Contrary to the above-mentioned examples, rarely did the research participants resist immigration detention. Generally they accepted their subordination and unequal power relations with the detention center staff. (2) Biopolitical and disciplinary practices in the US immigration detention circumscribe the agency of the detainees and hence limit the scope of their resistance. More precisely, (3) technological instruments of surveillance employed in detention demonstrate the US power to the detained migrants. (4) However, it is not only through the state-of-the-art technologies that the US sovereignty demonstrates to the detainees, but also through the disciplinary practices, such as frequent counting of detainees, highly-planned schedule of meals, and punishments. (5) Technologies of surveillance dehumanize detainees and deprive their life of the socio-political dimension. (6) Research participants did not resist immigration detention, but sometimes they tried to build a sense of security in the inhumane conditions of detention. Since they acknowledged the dominance of the US immigration apparatus, we should rather say about their modest counter-hegemonic acts in the hostile conditions of detention. Building strong ties with other detainees and community building or mind-distracting activities (making sports) were the most common examples of the counter-hegemonic acts of detainees.

Anticipating the « Bilbao Effect »: Transformations of the City of Arles before the Opening of the Luma Foundation

By analyzing data from the 2006/07 and 2013 French census as well as data extracted from the Yellow Pages, this paper seeks to understand how the French city of Arles is preparing for the arrival of Frank Ghery's Luma Foundation landmark building, and how a big-scale construction site, still devoid of its future aesthetics and cultural function, "mechanically" impacts the urban core. We consider three hypotheses: (1) The Rise of New Audiences: a landmark building impacts the pre-existing cultural core, (2) Residential Pattern: a landmark building induces gentrification of surrounding neighborhoods, (3) Mobility: a landmark building induces the arrival of the "most talented and educated" people. We test these hypotheses with cartographical and statistical methods. Our findings demonstrate stronger support for Mobility, and mixed findings for The Rise of New Audiences and Residential Pattern. Even though the causal links between the landmark building and the new urban dynamics are difficult to prove, our results reveal that Arles is "customizing" itself to the forthcoming cultural and aesthetic dimensions of the Luma Foundation. Our conclusion highlights the importance

of an endogenous approach to urban sociology that analyses neighborhood dynamics independently from top-down and macro political decisions.

COLLEGE OF SOCIAL SCIENCES AND PHILOSOPHY - DARAGA CAMPUS)

Life Experiences of Mga Batang Ginto (Child Miners) in Paracale, Camarines Norte, Philippines: Tradición, Inspiración, Explotación y Aspiración

This study aimed to document the life experiences of child miners (CM) engaged in small-scale gold mining system (SSGMS) in Paracale. It employed ethnographic approaches, and sociological theories to understand their involvement as CM. Key informants were purposively selected from three Barangays.

Findings revealed that the SSGMS started even before the Spanish period. Two types of SSGMS (*pagkakabod*) – *pagbibitâ* (underground mining), and *pagkocompressor* (underwater mining) – were identified. Both employed CM and had common organizational structure and lax policies. Differences were in the nature of work, roles and functions, costs and income, equipment, and mining processes.

Majority of the CM are males, out-of-school youth, the eldest children, and have worked from two months to nine years. Personal and altruistic factors, which may be a source of inspiration, motivated them to engage on it. They deemed their families as poor, more difficult than other families, and mining as either their primary means of livelihood, family tradition, or bonding time with their friends. Their income is below World Bank's poverty threshold. Some claimed no work-related problems, but others admitted simple to life threatening challenges and harmful effects.

Only two aspired to have permanent employment and finish their studies. The rest considered studying as a waste of time and not financially rewarding. They also hoped to give their families a good life, send their siblings to school, and for a progressive and peaceful community. They identified perseverance and hard work as means to realize their aspirations.

With their experiences that create and include exploitation, lack of labor protection, destitution, frustration, and adaptation - devoid of developing their human potentials, their case is indeed a social concern. Espousing social development and community organizing frameworks, good governance, holistic alternative livelihood and learning system may minimize, if not end, the plight of *mga batang ginto*.

Teachers' Perceptions and Behaviours in Front of Racial Question: A Perspective from France

In France, teachers are in front of a contradiction: on the one hand, they grow in a racialized society, in an occidental and postcolonial area, on the other hand, they are trained as professionals in a logic of "indifference" to these issues, with regard to the sacred principle of a State's representatives' "neutrality". One can add a context of invisibilisation of social classes and visibilisation of religious, migratory and racial questions. This double phenomenon provides from the foundation in situ of family nuclei by the migrants originally imported to rebuild France, and from the successive economic crisis, which were the object of discourses and politics crystalizing always more the tenses around a "youth came from immigration's integration's problem".

I will show here how teachers, in their diversity, interact with pupils and face reel or fantasied ethno-racial expressions: according to their social background, race, religion, sex, if they have received the state's training or not... I will illustrate my speech partly with interactions in reaction or about attacks of Islamic extremists. Talking about religion indirectly permitting to ask for racial question.

My study mainly uses the Racial Studies, Sociology of Education and Sociology of deviance (especially labelling). It draws on a monograph in a secondary school for vocational training, in a Parisian suburb and which took place from October 2014 to July 2017. I did about one hundred fifty cumulative days of observation, completed with semi-structured interviews of thirty-two pupils, six teachers and two other persons from the staff. Above all, I had a lot of informal talks. The observation took place as well inside the classrooms as outside: corridors, playground, staff room, dining hall, outside the school...

Beauty Practices As Harmful Cultural Practices? Study of Female University Students in Iran

This research, drawing on a conceptual framework including notions such as harmful cultural/traditional practices (HCP) and beauty, and based on semi-structured interviews with young female university students in Iran, investigates the perceptions and experiences on beauty practices and cosmetic surgery. We explore how these notions are perceived, articulated, practiced and potentially resisted. The data suggests that despite existing criticism of the gendered aspects of beauty practices among women who practice them, they are still practiced on a large scale. In Iran, the female body as a contested space for expression of identity and social capital, is under influence by the globalized beauty ideals that rely on predominantly Western beauty ideals, and local accounts of appropriate and optimal appearance. Despite the popularity of particular forms of beauty practices in Iran, especially facial surgeries, beauty is not perceived as a common good but as a necessary evil by young university students targeted by this research. We discuss the harmful aspects of beauty and how it could be defined as HCP, as well as agentic aspects of performing beauty and body management practices.

Digital Spaces and Revolution of Gender and Sexuality: A Case Study of 'the Legend of Zelda: BotW'

Digital spaces, with their possibility of pushing boundaries of reality, and fantastic imagination, have offered new spaces and possibilities to portray, represent and narrate gender and sexuality. Although this has not always been the case, in many gaming spaces there have been ample possibilities for the players to adopt new identities and/or relate with pseudo and temporary identities other than their actual ones, in the characters, stories, and in relation to other players. Existing literature of digital gaming spaces have shown that gender and sexuality have existed in relation to other identity markers such as race, age, color, and have been presented in diverse ways in gaming spaces. In this research, I aim to investigate the content of the popular digital game 'The Legend of Zelda: Breath of the Wild' (hereafter referred to as BotW). BotW is a well-known fantasy action and adventure digital game, and the last release of the series 'The Legend of Zelda' in 2017. I discuss the prominence of a heteronormative narrative beside the queer subtext, and the possibility of an existing queerbaiting approach in this form of digital media. By this case study, and using existing literature of feminist digital media and gaming studies, I try to respond to the question whether the new digital media, such as gaming spaces could be pioneer spaces for applying the changing gender perspectives.

Prison Subculture and Drug-Related Crimes in Iran

The so-called 'war on drugs' or anti-drug campaign in the Islamic Republic of Iran has had irreversible and unexpected consequences since 1979. Drug-related offenders receive large fines, lengthy sentences, corporal punishment, and the death penalty (e.g. 21 executions in one week of January 2014).

The war on drugs, as Christie (1993) has argued, has had unexpected gains and costs. It is worth considering that one of the most important consequences of anti-narcotics laws and the war on drugs, which impose stricter sanctions for drug-related crimes, is the spread of criminal cultures within society. Before their arrest, drug-related offenders are not necessarily in regular contact with criminals, but they become familiar with criminals and prison subculture once incarcerated. Prison life is guided and organized based on official norms and inmate norms, the latter developed by prisoners to make prison life more bearable (Oleinik A. N., 2003). Incarceration does not occur in a vacuum and many theories frame prison as a society or community (e.g. Clemmer, 1940; Sykes, 1958) in which inmate subculture revolves around specific inmate codes."

The main objective of the proposed research project is to compare the subcultures of prisons in Iran, by paying particular attention to the most populated provinces like Tehran, Isfahan, Kerman, etc., as governmental institutions which have both custodial and treatment orientations simultaneously, with non-governmental institutions which are treatment-oriented and provide drug-users with medical and educational facilities. Therefore, the two main questions of this study are:

1- How do drug-related criminals and drug-users experience the context of prison and NGOs?

2- How do drug-related offenders approach their lives under the condition of contemporary confinement?

I intend to utilize Grounded Theory (GT) in my research. Therefore, participants' experiences, understandings, and perceptions about their lives will be central when conducting in-depth, semi-structured and open-ended interviews.

RC14-263.10RAHMAN, MD. MASUDUR* (*University of Dhaka*)*Emerging Hooking up Culture and Changing Pattern of Love Relationships: A Study Among the Students of Dhaka University*

The aim of this study is to examine the process of changing pattern of love relations of the youth in the context of hook up culture in Bangladesh. The youth of the university campus are free and culturally developed. They are becoming modern influenced by the western culture, western music and western dress up. They are becoming realistic in their relationships. There is little emotion and long-term relationships among them. They just want to have their partners for meeting their sexual demand. They love each other but they do not like to make a bond among them. Even the friends and classmates are becoming couple day by day through chatting until midnight, enjoying coffee and movie show together. They have no love bonding but they feel and treat each other as their partner. They are going to be sexual partner but not to be a life partner. They meet, they date and they pass their time with their partner whole day and night. They have no responsibility for them in this relationship. Even if they break down their relationships, they do not feel upset. They feel just so what (?) and say good bye to him/her. After all they make a new relationship. This study is conducted in mixed method. In quantitative research, face to face survey method is used to explore the numeric data about the tendency of hooking up culture of the youth. In qualitative research, in-depth interview is used to explore the hidden factors of changing pattern of love relationship. The study will be conducted on the students in the University of Dhaka. Sample will also be selected as randomly and purposively for both study. Nonetheless, this study is to explore the pattern of love relationships of the youth with the emerging hook up culture.

TG03-955.2RAHMAN, MD. MASUDUR* (*Dhaka University*)*Use of Right to Information (RTI) Act: A Vehicle for People's Empowerment of Bangladesh*

Right to Information (RTI) Act was enacted in 2009 for ensuring people's right to know the information. By using this RTI Act, people can challenge the public and private officials to ensure their accountability and transparency. The aim of this study is to examine in what manner RTI is empowering people by using Right to Information (RTI) Act and to determine in what extent Information Commission is able to ensure people's right to know. This is mixed method study that adopted face to face survey in quantitative method and case study in qualitative method. This study covered the different districts of Bangladesh with Dhaka City. Survey and case study method are conducted in Dhaka city area and telephone survey is conducted in outside of Dhaka in different districts of Bangladesh. The population of this thesis is the people who sought information in different institutions by using RTI Act. The total sample of this study is 150 and non-random purposive sampling is used to conduct this study. Right to Information (RTI) Act is a weapon for the common people to ensure their right to know. People are not satisfied with the role of Information Commission. Information Commission has some limitations in some instances and sometimes they become influenced by public officials and bureaucrats. The findings of this study are the both descriptive and numerical to realize the reality of the RTI Act. Though RTI Act is a vehicle for people's empowerment, most of the people are not empowering by using this Act. They sought information but did not get their expected information because of some obstacles of DIO and Information Commission. Information Commission, however, is playing some roles to ensure the accountability, transparency and reducing of corruption, but it is not sufficient.

RC33-602.5RAINFORD, JON* (*Staffordshire University*)*Challenges of Creative Research with Adults and the Role of Confidence in Creativity*

Creative methods can be a way in which to explore common sense terms and allow for critique of the everyday through enabling discussions in a more engaged manner (Gauntlett and Holzwarth, 2006). The use of drawing methods with adults is something that has had limited coverage in the literature. However as Kara (2015) outlines, these methods offer a way of going beyond categorical or binary thinking and to explore issues in a more nuanced way. They are, however, prone to challenges when individual participants do not feel confident in their creative abilities and therefore are prone to unpredictable and unforeseeable challenges which are not faced in the same way by interview based research.

For my research into understandings of practices surrounding widening access to higher education I felt it was useful to include some visual tasks to allow exploration beyond rhetorical discussions of over used terms such as aspiration and potential. Both these concepts are widely used and yet poorly understood and defined by both policymakers and practitioners. This has led to conflation of different meanings. The focus on the need to raise aspirations is also in spite of a

growing body of research that challenges the existence of a poverty of aspiration (i.e. Allen and Hollingworth, 2013; Archer, DeWitt and Wong, 2014)

Drawing on data from sixteen semi-structured interviews, this paper will explore two creative tasks as research tools that were adopted and contrast the success and the failure of these methods within the same interviews. One task used a structured drawing task and another involved construction with LEGO. This paper will draw upon the lessons learned to offer some ways in which we can consider how and when creative methods are useful with adult research participants.

RC04-84.2RAINFORD, JON* (*Staffordshire University*)*Who You Are Matters: How Backgrounds of Widening Access Practitioners Shapes Practice*

Since the increase in university tuition fees in England and Wales in 2012, all universities are required to spend a proportion of their fee income on measures to widen access and success. How this is done is delegated to each individual university. The majority, however, spend a large proportion on activities that come under the banner of widening participation or outreach (OFFA 2016). These are delivered often by specialist teams in each individual university. Whilst on paper, the work reflects institutional policies focusing on 'raising aspirations' and targeting students with potential, the enactment of policy and its interpretation by practitioners is often widely varied.

Previous research has focused mainly on policy at national (e.g. McCaig 2015) and institutional levels (e.g. Stevenson, Clegg and Lefever 2010). This paper will explore some of the emerging findings from a study into how work done to widen participation is shaped by those delivering these interventions. Drawing on data from sixteen semi-structured interviews in four institutions spread across England, I will argue that the approach to practice in each institution is not only shaped by institutional factors but by conceptions and understandings of success which originate in the life histories of these practitioners.

This paper will explore how the social, educational and employment backgrounds of individual practitioners can impact upon the way they interpret and enact policy. I will argue that no matter whether practitioners in my study work within selective or mass institutions of higher education, that their understandings of aspiration are shaped by their own experiences and educational trajectories. This can be seen through my data to often sit at odds with institutional visions and therefore create space for tensions within widening participation practice. The implications of this both for the young people involved in these interventions and the institutions will be discussed.

RC04-96.3RAIZER, LEANDRO* (*Federal University of Rio Grande do Sul (UFRGS)*)CAREGNATO, CELIA ELIZABETE (*Federal University of Rio Grande do Sul (UFRGS)*)*Secondary Education and Knowledge Society in Brazil*

As in many countries around the world, secondary education in Brazil has been in crisis in recent decades. Despite the reforms implemented over the years, including the current proposal of a National Common Curricular Base, the country still has not found a balance that should attend both education for citizenship and professional development. With a low percentage of students enrolled in vocational and technological schools, secondary education has only been one step before joining the higher education system, not having a relevant role in the development of innovation. Moreover, before being a propeller for reducing social inequality, secondary education is an important element in the process of formation and reproduction of the enormous inequality that marks the Brazilian society. The analysis of national macro and micro data, and interviews with students in selected schools (elite and mass), reveals the different trajectories of school success and failure, as well as their determinants. On the other hand, the study highlights the profound gap between the education system and the national development model, which constitutes a relevant obstacle to the development of the knowledge society in the country.

RC47-797.2RAJABI PAAK, MINA* (*York University*)*Precarious Labour and Neoliberal Universities: The Case of Food Service Workers at York*

In the winter of 2017, a group of food service workers at York University in Canada went on strike. The workers were employees of Aramark, a multinational food service corporation with questionable labour practices. The seemingly small and insignificant strike of this group of less than 100 workers soon turned into a big movement against indecent working conditions in universities and the complacency of neoliberal universities in creating a precarious and poor labour force.

The debates around the university sector's rapid move towards corporatization and neoliberalism in the last decade has focused mostly on the academic actors on university campuses, i.e. faculty, instructors, and students and the issues around precarity of academic work, the surge in contract faculty and sessional appointments and rising tuition fees. What often tends to be left out of the conversation though is non-academic work on campuses and the role of universities in creating a precarious, poor labour force.

The York strike brought about a community alliance of students, teachers, staff, and campus workers fighting the university administration for the rights of the workers on campus. It also intersected with a grassroots labour movement in the province fighting for an increase to minimum wage and decent working conditions for all Ontario workers. This resulted in not only a unique win for the workers who managed to win every single of their strike demands[1], but also initiated a broader debate in Ontario around the university governance and the turn from collegial governance to corporate managerial style of governance at universities that places profits above all.

As an active participant in the strike, my work employs the participatory observation method along with interviews with strike participants, community activists and university administrators to look at the possibilities of anti-capitalist and anti-racist movements and actions on university campuses.

Globalisation and Work-Life Balance : A Study of Women Scientists in Taiwan

Globalisation and Work Life Balance :

A Study of Women Scientists in Taiwan

Prema Rajagopalan

Department of HSS, IIT Madras, India

Globalisation and the IT revolution has made access to information and developments in science more equitable. In what ways has this impacted on the work-life balance of women scientists? For 'doing science' is neither a 9-5 job nor routine work. 'Social Circles' or informal networks among scientists traditionally has often excluded women both overtly and covertly. The real 'professional space' women enjoy has always been debated.

This paper discusses how government policy and institutional responses in Taiwan have enabled women scientists to manage their work life balance effectively. Interviews with women scientists would unravel the match/mismatch between policy and practice on the one hand and cultural facilitators and constraints on the other hand. An analysis of this dynamics would help us understand the nature and extent of career mobility of women scientists in Taiwan - Republic of China.

RAJAN, JOSEPH BENHAR* (*KILA*)

Deliberate Democracy and Inclusive Governance: Spacing Fisher People through Matsya Sabha in Kerala, India

The decentralization initiative in the State of Kerala (India) is unique with its participatory planning methodology, entitled 'People's Plan Campaign'. However the assumption that the marginalized and oppressed shall reap the benefits of decentralization by default is proved wrong in the case of traditional fisher people. Local Governments' (LGs) bottom up planning process, backed by 33 per cent of state budget allocation to encourage local economic development and social justice had elevated the expectations. Mandatory Village Assembly (Grama Sabha) is meant to encourage participation of all sections and development needs. However the living conditions of traditional fisher people have only worsened. The major concerns in fisheries sector that cut across continents, nation states, and precipitate to local communities are several. There issues of commons and commoner deepened the fisheries crisis unabated globally brought into existence the Code of Conduct for Responsible Fisheries (CCRF) by the FAO. The CCRF directed nation states to create institutional frameworks in the interest of resources as well as the community. This has well recognised by the State of Kerala in India by creating distinct space for fisher people within the formal institutional set up of LGs; the *Matsya Sabha* (Assembly of Fisher People) is considered appropriate and a right step in Kerala. This paper discuss the approach of deliberate democracy in Kerala in the context of marginalised traditional fisher people and attempts to portray the inclusive governance framework through *Matsya Sabha*.

RAJENDER, BUGGA* (*University of Hyderabad*)

Political Participation of Indian Diaspora in Canada: A Sociological Appraisal

Political Participation of Indian Diaspora in Canada:

A Sociological Appraisal

The paper attempts to explore how the Indian diaspora in Canada has emerged and shaped itself as a political group post 1980. Albeit incidents like Komagata Maru (1914) which reminds the exclusionist laws, pursued by the early settlers from Europe; Indian Diaspora confronts segregation of race, nationality, language, religion and ethnic identities, and it is fascinating to perceive how groups of Immigrants tried to establish its affinity with the political life in a new country. The primary objective of the paper is to look into history of Indian Diaspora, role of religious groups and political participation of Indian diaspora as a whole. The paper relied on secondary sources. Initially, the political activities were demonstrated through religious, non-religious associations like Gurudwara committees, National Association of Canadians of Origins in India (NACOI) and Khasla Diwan Society. It is evident from the Gurudwaras' role in uniting a Sikh community which turned to be centers for political mobilization despite the experience of racial discrimination and nationality. Canada is the first country to incorporate multiculturalism as an official state policy in 1971, enabling immigrants to take part in electoral politics as they recognized to be citizens with equal rights on par with the natives. It is in 1988 they participated in elections not only as voters, but also as candidates at both provincial and federal level.

The paper is divided into four sections. First section comprising the primary background discusses the definition of the term diaspora, and their journey in Canada. The second section looks into the tragedy of Komagata Maru (1914) the third examines role of Sikh religious associations. The final section evaluates how the diaspora assimilated with the political culture of the host country.

Keywords: Indo-Canadian Diaspora; komagata Maru; Gurudwara; immigrants; multiculturalism.

Environmental Justice: Threats, Policy Approach and Commitments

ENVIRONMENTAL ISSUES: THREATS, POLICY APPROACH AND COMMITMENTS

There have been non-judicious use and over use of natural resources on one hand while on the other the sustainability and environment policies have been ignored. Consequently the situation became alarming in the form of acute pollution, depletion of the Ozone layer; flood and drought, and many more threats to life are having a noticeable impact on the earth's climate. Annual storm damage has increased by 40 times since the 1980s, strikingly close to what climate models had predicted. With this backdrop the paper deals with environmental issues, policies and global level commitments.

Main objective of the paper is to understand and analyse the environmental issues related with threats to all livings. Further the paper is aimed to discuss the policies resolved and commitments made during UN conferences (Paris Climate Accord) and to examine the ground reality in context to developed nations verses developing and undeveloped nations.

The paper is based on secondary sources, analytical approach, critical examination and interpretations of the published reports, policies and the points focussing at the mutual agreements/ commitments made by most of the nations as well as certain projects like clean Ganga and installation of ETPs in India.

In view of the seriousness towards the hazardous caused by pollution and ecological imbalance we have been witnessing the growth of environmental awareness movements, environmental politics, which have been playing significant role in time to time amendments in national and international policies and planning to check the pollution and deterioration of environment at the local as well as global level. In India about 4500/- rupees have been spent for cleaning Ganga with re-naming the project during last decades but the goal seems far away. Similarly the results of world summits, policies and commitments are also very gloomy.

Excess Child Mortality Among Ex-Untouchables and Indigenous People in India

Excess Child Mortality among Ex-Untouchables and Indigenous People in India
Bali Ram, Carleton University, Ottawa, Ontario and Western University, London, Ontario (bram42@yahoo.com)

Abhishek Singh, International Institute for Population Sciences, Mumbai, India (a_singh18@rediffmail.com)

Awdhesh Yadav, Public Health Foundation of India, Gurugram, India (awdhesh.stat@gmail.com)

That India's ex-untouchables and indigenous people have been oppressed, disadvantaged and discriminated in social and economic spheres of life for centuries is well documented. Although discrimination based on caste has been prohibited, untouchability has been legally abolished and people belonging to certain lower castes and tribes have been provided special status and privileges in certain sectors such as education and employment, there is ample evidence that most people belonging to these groups still lag behind those from "upper/forward castes" on almost all social indicators. One such indicator is child mortality, which is the focus of this study. Unlike infant mortality which is influenced by "endogenous"

conditions associated with biological and genetic factors and inadequate sanitation and hygiene conditions leading to severe infections in the first few months of life, child mortality is caused often by "exogenous" conditions that arise when the child after having survived the most vulnerable phase of life has moved into a relatively healthy stage of life. Thus, child mortality not only reflects the conditions associated with quality and access to medical care and public health practices, but also social and health inequality in a caste-ridden society such as India. The major objective of this paper is to examine the reasons why children of ex-untouchable and indigenous groups are at a significantly increased risk of dying, compared with those belonging to forward castes. We do so by analyzing micro-data on child mortality obtained from the second (1998-99), third (2005-06) and possibly fourth (2014-15) cycles of India's National Family Health Survey.

RAM, G* (Assam University, Silchar- 788011, Assam, India)

The Culture, Power and Sanitation in India: Patterns of Transformation

With the growing population as well as urbanization, India has experienced the worsening of sanitation conditions over the decades. Open defecation and lack of proper disposal of garbage and human waste have contributed most to the deterioration of sanitation and public environment. Urban slums, public places and rural areas are infamous for open defecation and poor sanitation, generally due to poor or no infrastructure. Recently the government as well as non-governmental organizations took up total sanitation campaign for making India defecation free under the UNDP's development goals. Yet, toilets constructed specially for the urban poor and rural people, in many places, remain unutilized or non-functional, belying the goal. The problem is culturally embedded wherein individuals learn to keep their houses clean but responsibility for keeping environment clean is left for the government or somebody else- a class of scavengers in traditional power of the society. Such power hierarchy based on gender in family, as well as the scavengers' class itself, seems to be working as it is mostly females who carry out major part of sanitation works. The people haven't replaced their old habit with the new one of positive attitude which is essential for success of the national programme. Therefore, the need is to bring change in the culture (software) of the differentiated people, along with provision of toilets (hardware). Based on the data collected from local communities the paper analyses cultural and power bases of sanitation and suggests for combining of ideological change and infrastructural provision.

Thinking through Place, Space and Mobility: Domains for Understanding Children's Well-Being and Lived Realities

This paper will focus on a discussion of place, space (spatio-temporal) and mobility as domains of children's well-being, quality of life and accounts of diverse lived realities. How children (and youth) maintain, sustain or expand their activity choices, and action and interactional spaces and places has implications for their rights as citizens, their inclusion, development, participation, and well-being. Innate and biographical as well as proximal (family) and distal (institution and community) influences will shape and direct children's activities, interactions, networks, and livelihood and survival strategies. This will mediate in the choice of activities available for children to participate in, when they travel, rest, socialise, go to school or work, how they do this, can they do this in terms of independent mobility, immobility or infrastructure, who they do this with, what they do it for and how often they do it. This paper will draw from the results of a broader study on children's (re)imagining, (re)interpretation, and (re)negotiation of their everyday interactional and activity spaces and places in an urban locality. An exploratory, qualitative study will be undertaken with learners attending secondary schools in Northdale a Northern Suburb of the Msunduzi Municipality in Pietermaritzburg, South Africa. Using mainly semi-structured interviews, focus group discussions will be conducted with young people aged 15 to 16 years. The participants will also be asked to freely write and provide accounts on specific themes related to the broader topic. The adopted approach values and gives due weight to young people's knowledge, voices, agency and autonomy. The broader study aims to demonstrate that there is considerable potential and opportunities to expand this research space and consider the wider implications of the derived assumptions for children's well-being and quality of life in urban areas in South Africa post-apartheid and including developing and African countries.

The Economic Integration of LGB Immigrants: The Role of Social Networks

Canada has significant settlement services for its immigrant population, as well as progressive policies and anti-discrimination laws to improve the quality of life of its lesbian, gay, and bisexual (LGB) population. This makes Canada an attractive destination for LGB immigrants. Despite migrating to achieve social and economic integration, qualitative studies in the US and Canada show that LGB immigrants feel isolated from the LGB community, their ethnic community, and the general population. Because studies have shown that social networks can facilitate positive economic outcomes for immigrants by providing informational, material, economic, and psychological support, whether LGB immigrants are deprived of these resources is a cause for concern. This study uses data from the 2008 and 2013 Canadian General Social Survey to assess the extent to which LGB immigrants are disadvantaged compared to their heterosexual Canadian-born, heterosexual immigrant, and LGB Canadian-born counterparts with regards to their employment and income in Canada, and whether these differentials may be due to differences in the compositions of their social networks. As the first study comparing the employment rates, incomes, and social networks of LGB immigrants to those of their heterosexual and/or native-born peers, this study will provide insight to support evidence-based policymaking and practitioners who provide services to LGB people, immigrants, and LGB immigrants.

Global Economic Integration As the Outcome of Globalisation: Impact and Assessment on Indian Economy

India emerged as the fastest growing major economy in the world, registering 7.6 per cent growth in the GDP at constant market prices in 2015-16. India is presently known as one of the most important players in the global economic landscape. Its trade policies, government reforms and inherent economic strengths have attributed to its standing as one of the most sought after destinations for foreign investments in the world. Also, technological and infrastructural developments being carried out throughout the country augur well for the trade and economic sector in the years to come. In this backdrop the paper will discuss the global economy, economic integration in the light of innovation of developing economies, technology, liberal policies etc. In the present century of competition, innovation of technology; the term globalization involves harmonious integration of politically divided markets globally for higher level of international cooperation, which involves sharing of opportunities, profits through efficiency and competition in the wake of liberalisation policy which have been initiated to facilitate liberal policies and programmes. The paper will also assess the impact on economy globally and in India which needs to be discussed briefly as globalisation itself refers to the increasing integration of economies around the world, particularly through the movement of goods, services, and capital across borders. The term sometimes also refers to the movement of people (labor) and knowledge (technology) across international borders. Finally the paper needs to analyse the broader cultural, political, and environmental dimensions of globalization.

RAMANNA, SINDHE JAGANATH* (Gulbarga University)

Technology, Innovation and Social and Economic Growth: Impact on Social Equity and Justice

Innovation is defined simply as a "new idea, device, or method". The term "innovation" can be defined as something original and more effective and, as a consequence, new, that "breaks into" the market or society. In industrial economics, innovations are created and found empirically from services to meet the growing consumer demand. In this backdrop the paper will discuss about the developments in technology which have brought enormous benefits to almost all people in society. Most people today have access to goods and services that were once luxuries enjoyed only by the wealthy in transportation, communication, nutrition, sanitation, health care, entertainment, and so on. Further the social impacts of inequalities in access to ICTs depend in part on the social context into which new ICTs are introduced. It is also important to review the technological advancement of scientific knowledge, infrastructure and productive capabilities, educated and skilled human resources, entrepreneurial skills, commercial organization and a rapidly expanding global social network offer unprecedented opportunities for rapid social progress. In conclusion the paper will evaluate the impact of technology and social and economic growth of "socially just society" is one in which all people matter equally. The needs and interests of the poor and the powerless are just as important as those of the rich and powerful. While some inequalities are justifiable (such as those based on talent, for example), all unjustifiable inequalities are removed from a socially just society.

RC41-712.3RAMARAO, INDIRA* (*University of Mysore*)***New Living Arrangements: Are They Re-Defining the Situations for the Elderly?***

The past two decades have seen an increase in the number of women entering India's paid workforce. The diversification of the job market and the unprecedented impact of consumer oriented culture in the age of economic liberalization opened up opportunities for women to take up gainful employment outside their homes. While this development resulted in a large number of women gaining economic independence, it also brought up the need to make new child care arrangements. Given the fact that child support services are becoming not only expensive, but there is an increasing incidence of violence against children in many child care centres, many parents are entering into a new type of living arrangement with their elderly parents or parents-in-law for taking care of their children. The twin benefit of this arrangement is that there is 'cost cutting' on the one hand, and on the other there is an assurance that because of the emotional bonding between the grandparents and their grandchildren, children are in a safe ambience. But how do the elderly perceive their situations? Though it is believed that they are enjoying their life with their grandchildren and children and their needs are well 'taken care of', in the case of how many is this really true? Are parents who are in this type of living arrangement less prone to abuse than those who are living with their children under compelling circumstances? Is the inter-generational divide and conflict that is a typical characteristic of the times in which we live, less intense in the case of elderly who are in this new living arrangement? The paper seeks to find answers to these questions based on primary data generated from personal interviews and focus group discussions with elderly living in different types of family setups.

RC41-712.5RAMEGOWDA, AREGOWDA* (*KUVEMPU UNIVERSITY*)***Policies and Programmes to Prevent Abuse Against Elderly in India***

The global increase in longevity and in the proportion of old age in the Populations created new needs and challenges on the personal, familial and societal levels. The Indian traditional family elderly are still respected lot. But due to technical advances, changing value system and emotional and economic dependency on the family members' elderly are experiencing physical violence, verbal abuse, neglect, disrespect and abandonment. This present study focuses on the policies and programmes to prevent elderly abuse in the socio-cultural context of India. So far the elderly abuse was not regarded as the violence generally it is acknowledges as Maltreatment, disrespect or Neglect and sometimes it is justified by the younger generation.

The Main Objectives of the study are: to identify the causes and consequences for elderly abuse in the socio-cultural context of India, to examine the policies and programmes and legal interventions in preventing elderly abuse. This empirical study is conducted in Shivamogga city, of Karnataka State, India. 150 respondents in the age group 60-70 were selected on random basis and data were collected interview. It is noted that, the increased dependency of an older person causes stress for the family member's results in abuse and ill treatment. Due to marginalization they will suffer from loss of self-identity and remain susceptible to discrimination and abuse. Though Maintenance and Welfare of Parents and Senior Citizens Act, 2007 is enacted under the constitution and The National Policy of Senior Citizens 2011 is implemented to provide provisions for the maintenance and welfare of parents and senior citizens, many are not aware of the law. Elderly are reluctant – or unable – to place charges against family members. As long as elder abuse is viewed as a caregiver issue, legal actions and policies are not likely to be effective measures.

RC41-712.1RAMEGOWDA, AREGOWDA* (*KUVEMPU UNIVERSITY*)BAIG, RESHMA (*GOVERNMENT FIRST GRADE COLLEGE, SHIVAMOGGA (COLLEGIATE EDUCATION, GOVERNMENT OF KARNATAKA)*)***Undesired Aged: A Social Problem in Present Scenario- with Special Reference to Malnad Region of Karnataka State India***

Old age is an inevitable juncture. It is a natural course of action and everybody has to pass through this whether he likes or not. Old age is a very sensitive phase because of their dependency. Aged persons are known as torchbearer of our society. Their role is to transfer their experiences, culture, norms, folkways, rituals, etc., to the new generations. For this, they want some respect, regard, care, rest, and attention from the new generation. Our Indian society is famous for regarding their aged as treasures. But now a day, a family has been hidden and the nature of nuclear families has been changed. According to Oxford Dictionary of sociology (2007:221-2): 'The term nuclear family is used to refer to a unit consisting of spouses and their dependent children'.

The objective of this research paper is to discuss and try to understand the problems of our aged. To know the problems of these undesired aged in our social structure, we have selected fifty aged persons from different part of malnad region Karnataka. Their children are in other cities or in other countries or they have no child. We have selected them as per their availability and willing to openly share their problems without any hesitation or fear. And, do they feel undesired or lonely? How do they pass their time and solve their daily problems? In the era of communication revolution and instant relationship, how do they maintain their lifestyle, etc.?

This research paper will be helpful to show the conditions and social problems of old persons in present social structure and scenario. Findings of the research paper are enough to surprise us, and emphasize the need for a wide and fair timely study to solve the problems of our Indian social structure.

RC30-541.5RAMIREZ, DAVID FRANCISCO* (*Universidad Intercultural del Estado de Hidalgo*)GUTIERREZ, ADRIANA (*Universidad Intercultural del Estado de Hidalgo*)GUTIÉRREZ, SERVANDO (*Universidad Autónoma Metropolitana*)VALLADARES, CLARA ELENA (*Universidad Autónoma Metropolitana*)***Young Indigenous People and Their Work Expectations in High Vulnerability Contexts: Case Study in the Tenango De Doria Municipality in the State of Hidalgo, México.***

Even in 2017, there are two countries that coexist in Mexico: one poor and behind, and another relatively prosperous and with a view aligned with modernity. Data on the federal distribution of extreme poverty are eloquent. In many states of the middle and north of the country it decreases, while in others it remains and gets bigger. There are areas where extreme poverty is virtually irreducible: Chiapas, Guerrero and Oaxaca, as well as some regions of Veracruz, Hidalgo and Puebla. The compelling questions are: Why are there abysmal differences if Mexico it is a single jurisdictional unit and a nation-state consolidated with policies and institutions common to all? Why there? Why not in other states?

Some reasons for the gap between these two Mexicos point to several causes of poverty and secular backwardness of the deep south: widespread informality in economic activities and its low productivity, existential attachment to farming economies, cultural resistance, poor education, lack of entrepreneurship behavior, absence of infrastructure, lack of rule of law, corruption and violence, as well as limited urbanization without which it is impossible to increase productivity and social welfare; the persistence of a large percentage of the population in the countryside, dispersed in thousands of tiny and disjointed, settlements in very fragile ecological conditions (poor soils, high slopes, water scarcity).

In this context, the final results of the research carried out in Tenango de Doria municipality, located in the "Otomí-Tepenhua" indigenous region, are presented, in which it is investigated if the idea of "studying for a better future" has become a myth; or if they consider that their ethnic and social condition restricts their future expectations not only in the education scope but also in the workforce.

RC14-265.2RAMIREZ LOZANO, JULIANNA PAOLA* (*Universidad de Lima, Perú*)***Campañas Sociales De Responsabilidad Social. El Caso De "Peruanos Camiseta"***

Abstract

RC14 Sociology of Communication, Knowledge and Culture (host committee)

Language: English, French and Spanish

Campañas sociales de responsabilidad social. El caso de "Peruanos camiseta"

La campaña gestada por el Ministerio de Comercio exterior y turismo de Perú en alianza con el Grupo RPP, la empresa de comunicación radial más importante del país, busca recuperar los valores perdidos en la sociedad peruana. Este es el caso de la campaña "Peruanos camiseta" la cual tiene como objetivo buscar la reflexión e incentivar el cambio de comportamiento, promoviendo el cultivo de valores como la amabilidad, la honestidad, la solidaridad, el respeto por el otro, etc. En una sociedad en la que se ha perdido la confianza y resalta una cultura de la informalidad y la "viveza", resulta importante la puesta al aire de campañas que permitan fomentar la práctica de valores básicos en el comportamiento cotidiano de los ciudadanos. El estudio de esta campaña, emitida en todas las plataformas de esta empresa de comunicación, nos demuestra que los medios de comunicación cumplen un rol primordial en la sociedad puesto que pueden contribuir directamente en la recuperación de la confianza en la sociedad peruana previniendo la violencia y al mismo tiempo convirtiendo la campaña en una estrategia de responsabilidad social para la empresa de comunicación y medios de comunicación donde se difunde la campaña.

RC14-268.3RAMIREZ LOZANO, JULIANNA PAOLA* (*Universidad de Lima, Perú*)*Violencia En Los Medios De Comunicación y El Reto De La Gestión De Contenidos De Calidad***Violencia en los medios de comunicación y el reto de la gestión de contenidos de calidad**

Los medios de comunicación tienen un rol muy importante en la sociedad, puesto que sus contenidos tienen un aporte directo en la creación de la opinión pública y tienen además un alto nivel de influencia en la esfera pública y en general en todos los sectores y actores de la sociedad. Los medios propician tendencias, general modelos de convivencia y estereotipos que son seguidos por niños, adolescentes y jóvenes principalmente. En este sentido el estudio hace una revisión de casos emblemáticos de falta de un ejercicio ético de tres medios de comunicación peruanos: prensa escrita (Diario Perú2021), televisión (ATV televisión) y radio (Capital radio). Estos tres medios han sido protagonistas de episodios que han generado violencia y propiciado intolerancia en la sociedad. El análisis de estos tres casos nos permite determinar la importancia de la aplicación de políticas de autorregulación de parte de los medios de comunicación y la elaboración y cumplimiento de códigos de ética que permitan a los propios periodistas regular los contenidos que producen y emiten por los medios de comunicación. El gran reto de los medios de comunicación es transmitir información y entretenimiento con contenidos de calidad, que a su vez puedan resolver la paradoja de responder a las demandas de los públicos y la vez contribuyan con la rentabilidad de la empresa. En este sentido es propicio establecer políticas y prácticas de responsabilidad social en las empresas y medios de comunicación.

WG05-946.3RAMIREZ PABLO, FLORENTINO* (*Instituto de Investigaciones Económicas (IIEC) Universidad Nacional Autónoma de México (UNAM)*)*El Acceso Al Crédito y Los Programas Contra La Pobreza En México.*

Los programas contra la pobreza han sido un instrumento muy importante dentro de la política social en México, sin embargo no se ha alcanzado disminuir el grado de desigualdad y pobreza.

Bridar apoyo a los pobres con recursos financieros, es decir, ayudarlos a acceder a créditos, ha sido un componente de los programas de combate a la pobreza.

El no acceder al crédito coloca a las personas en situación de exclusión financiera, situación considerada como un factor de inequidad y perpetuación de la pobreza; así la perspectiva de inclusión financiera surge como una dimensión que debe tenerse en cuenta en la lucha contra la pobreza y de la exclusión social. De acuerdo con el Banco Mundial, se considera que la inclusión financiera es un elemento que propicia 7 de los 17 Objetivos de Desarrollo Sostenible.

Es necesario revisar cómo el acceso al crédito coadyuva de forma significativa al alivio de la pobreza. En este trabajo se analizarán las políticas públicas impulsadas por el gobierno mexicano durante el siglo XX y XXI, que han propiciado el incremento del acceso a los servicios financieros.

RC01-41.1RAMÍREZ PLASCENCIA, DAVID* (*University of Guadalajara*)*Social Media, Civil Society and Security Policies: The Case of the Drug War in Mexico.*

This paper outlines the counterpoints of more than ten years of security policies regarding narcotráfico in Mexico from 2006 until present days. During this time, besides the high investments on equipment and capacitation, and binational collaboration in between Mexico and The United States, the narcotráfico problem is far from end; the rise of casualties and insecurity are persistent issues in the public agenda across the country. The main aim of this chapter is to understand the role of social media in the impact of public security strategies regarding the drug war, more particularly how social platforms encourages the conformation of civil society organizations that have an active role not only in claiming for more security but in constructing and providing significant information like statistics and indicators to evaluate efficacy. Fieldwork will be focused mainly on reviewing data in social media, government and ONGs official electronic sites, newspapers, etc., regarding some relevant incidents along the time (Tlatlaya, Ayotzinapa, etc). As final outcomes will show, improving cooperation with civil organizations regarding security request a more decisive government position toward collateral and key issues like corruption and poverty as well.

RC25-JS-40.1RAMJATTAN, VIJAY* (*Ontario Institute for Studies in Education, University of Toronto*)*The Business of Accent Reduction and Interest Divergence*

Taking the form of in-person or online training, U.S. and Canadian accent reduction programs cater to English-speaking immigrant professionals whose "incomprehensible" accents hinder their opportunities for prestigious communication-based work. From a critical race theoretical perspective, this business of accent reduction seemingly becomes a site of interest convergence: while mostly racialized immigrants receive necessary training to professionally succeed in the U.S. and Canada, these majority-White nations simultaneously receive linguistically-qualified workers to bolster their economies. However, drawing on scholarly literature and promotional material from popular accent reduction programs in North America, this essay argues that the business of accent reduction actually encourages interest divergence, the notion that it is in the White majority's interest to continue to marginalize racialized groups (e.g., Gillborn, 2013).

Indeed, this interest divergence is first seen in how accent reduction programs treat foreign accents as pathological traits. That is, by framing the employment troubles of racialized immigrants as solely caused by their accents, these programs ignore the structural racism that truly disadvantage these immigrants. Moreover, the particular pathologizing of racialized accents serves as a cue for the need to subscribe to White linguistic norms, thereby alleviating White native English speakers' burden to understand varying types of foreign-accented speech. Interest divergence is lastly seen in the targeted clientele for accent reduction, who are highly-skilled racialized professionals in such White-dominated fields as business and technology and *not* racialized immigrants in low-paying service and care work. These examples all highlight that while accent reduction programs promote their services as a means for inclusion and equality in the North American workplace, they covertly communicate the opposite message.

RC08-176.2RAMOS, JEAN-MARC* (*IRSA - Université Paul-Valéry (Montpellier III)*)*Un Sociologue Au Service De La Propagande. Un Épisode Ignoré Du Rôle De Maurice Halbwachs Pendant La Grande Guerre*

La dispersion récente, en vente publique, des archives de Pierre Georget La Chesnais (1865-1948)[1] a permis de découvrir une correspondance inédite de ce militant socialiste avec les familles Basch et Halbwachs[2]. Dans cet ensemble, plusieurs lettres datant de 1916-1917 nous apportent un éclairage nouveau sur les activités de Maurice Halbwachs pendant la Grande Guerre, alors qu'il occupait un poste de conseiller au Ministère de la Guerre, aux côtés d'autres durkheimiens comme François Simiand et Hubert Bourgin.

Nous nous intéresserons plus particulièrement à un épisode totalement ignoré des biographies couvrant cette période[3], le rôle qu'a joué Maurice Halbwachs dans la « guerre de papier ». Dès le début de cette guerre moderne est apparue, d'abord en Allemagne et en Grande Bretagne, puis en France, une forme inédite de propagande exploitant la nouvelle technologie de l'époque, l'aviation. Avec la complicité de La Chesnais, Halbwachs va participer à la sélection des documents qui seront utilisés par le *Service de propagande aérienne*, fondé en août 1915, pour inonder « comme des papillons » les lignes ennemies.

Au-delà de l'anecdote, cet épisode pose le problème du rôle du sociologue en temps de guerre, et plus largement celui des liens entre la recherche et l'action. Dans le cas présent, il est curieux qu'Halbwachs n'ait jamais évoqué ses expériences de guerre dans son œuvre, et qu'il n'ait pas même théorisé sur une question aussi sociologique que la propagande. Peut-être que sa disparition en 1945 ne lui en a pas donné le temps ?

RC28-504.3RAMOS, MARÍA (*Universidad Carlos III de Madrid*)POLAVIEJA, JAVIER* (*Universidad Carlos III de Madrid*)FERNÁNDEZ-REINO, MARIÑA (*Universidad Carlos III de Madrid*)*Are Migrants Selected on Motivational Orientations? Selectivity Patterns Amongst International Migrants in Europe*

We present the first systematic cross-national analysis of migrants' selectivity on motivational orientations. Matching the European Social Survey and the World Value Survey cumulative datasets, we examine whether international migrants recently arrived in Europe are more achievement oriented, give more value to taking risks, and have a greater desire to make money than those observational

equivalents that do not migrate. We focus on migrants from nine different origins (France, Germany, United Kingdom, Poland, Romania, Turkey, Morocco, Brazil and Andean countries) sampled at different European destinations. We find instances of both positive and negative selection depending on both ethnic origin and country of destination. The observed patterns seem to contradict both the predictions of standard economic models of selectivity as well as the arguments about a common migrant personality. Our estimates are robust to controls for 1) migrants' human capital, 2) migrants' experiences at destination (measured directly using information on unemployment history and self-perceived discrimination), and 3) migrants' degree of acculturation (measured indirectly using information on frequency of social contact and interest in national politics). Reported findings are therefore not driven by educational selectivity and are unlikely to be biased by destination effects.

RAMOS, MARÍA* (*Universidad Carlos III de Madrid*)

Overeducation Among Spanish Graduates. Stepping-Stone or Dead-End?

The purpose of the paper is to determine whether overeducation is a temporary or permanent phenomenon in the working career of Spanish young employees. In other words, the aim to assess if (a) workers accept jobs for which they are over-qualified at the start of their working career as a "stepping stone" to a better one, as the theory of career mobility predicts (Sicherman, 1991). Or if, on the contrary, (b) overeducation are rather a "dead end" for some workers, who hardly get a job appropriate to their qualification. Additionally, I seek to explicitly assess the impact of past overeducation as a hazard when attempting to escape such a situation.

The analyses rely on the Continuous Sample of Working Histories (Muestra Continua de Vidas Laborales, MCVL), a representative sample of the four percent of individuals who at some point in the reference year had dealings with the Spanish Social Security system, selected by simple random sampling.

The main finding is that jobs with low requirements do not act as stepping-stones for Spanish graduates, but rather that these suboptimal posts might delay the transition to a more appropriate job. This is particularly true when the number of episodes in overeducation are numerous and prolonged in time. Looking at the results of the paper in more detail, I firstly show, at a descriptive level, that that graduates who are overeducated for their first job take much longer to access a position appropriate to their formal qualifications. Moreover, a "bad" access in the labour market is also associated with "bad" prospects in a working career: those workers spend more time out of the labour force, have working episodes of shorter duration and experience more involuntary turnover.

RAMOS ZINCKE, CLAUDIO* (*Department of Sociology, Universidad Alberto Hurtado*)

FALABELLA, ALEJANDRA (*Department of Education, Universidad Alberto Hurtado*)

The System of Educational Evaluation in Chile and the International Circulation of Scientific Knowledge, Justifications, and Instruments

From the early twentieth century, a device for the evaluation of the educational system, based on knowledge of the social sciences, began to be configured in Chile. Increasingly, it contributed to adapt the action of the educational actors to dynamics of meritocratic selectivity and competition, and, since the 1980s, to shape an increasingly consolidated market coordination of education. The result is that, comparatively, Chile is one of the first countries in Latin America to install a comprehensive system of national evaluation of the education system.

In the elaboration and implementation of the evaluative device, the processes of international circulation of scientific social knowledge played a key role. Here, I analyze three moments: (1) The training of Chilean academics in the Teachers College, Columbia University, which occurs since the beginning of the twentieth century. I focus on Erika Grassau, who later, during the 1960s, was fundamental in creating the PAA (equivalent to SAT). (2) Already between 1968-1971, Chile joined the international evaluations of school education pioneered by the IEA. In this process, Erika Grassau constituted the main link with that organization. Later, the sociologist Cristián Cox, situated in the State, established new connections to institutionalize the international tests (PISA, TIMSS, and others) in the country. (3) After the neoliberal transformations in education implemented under Pinochet's dictatorship, democratic governments tried to regulate them through state intervention, in which accreditation processes occupied a central place. One of the carriers of ideas and justifications was the sociologist José Joaquín Brunner, with multiple international connections, who displayed an outstanding participation both in the State and in the public and academic spheres.

The analysis seeks to identify the international and institutional networks associated with the process of circulation of knowledge, materials, tools, and justifications as well as to analyze the processes of translation and national anchoring.

Life Skills Workshop from a Gender Perspective

Gender-based violence against women is a growing phenomenon in Mexico. Ameca is within the eight municipalities in Jalisco that has been classified under the "gender alert" state. This classification is a demand to eradicate gender-based violence by both society and government. An interdisciplinary team of academic researchers and students from the University of Guadalajara, works this complex phenomenon from two spheres: a participatory diagnosis with a gender perspective; and the planning of participatory action research activities, among which stand out: a workshop based on the concept of the UN "skills for life", which has shown to be an alternative to strengthen the integral development of people. This work evaluates the effectiveness of the workshop from a gender perspective; two measurements will be carried out: one before the workshop and another after the workshop. An instrument will be used to measure life skills, as well as an instrument to assess gender-based violence. Among the results we expect to find is a statistically significant differences between pretest and posttest. Situation that would pay to transform the life of the community.

Same Words, Different Ideas? the Social Construction of Care Markets in Italy and UK

Privatization of care has been occurring in many European countries in the last decade, and mainly in Anglo-Saxon and Mediterranean countries where care regimes have been characterized by strong institutional inertia. While research has extensively explored the political and institutional mechanisms (i.e. the type of care policies as well as immigration controls) through which care has been increasingly privatized, so far only a few studies have studied the role played by ideas and public discourse in the social construction of care markets. Building on the Kingdon's agenda setting approach, this paper is aimed at reconstructing the public discourse about the privatization of care in Italy and the UK. Its focus is on ideas about quality of care, requirements and characteristics of care work that have supported the shift towards care market solutions. Our analysis is empirically based on the reconstruction of the public regulation of care markets in Italy and UK and a content analysis of the public discourse that has accompanied the rise of care markets in the last two decades (2002–2016) in both countries. It provides evidence on how care markets have been differently shaped and legitimized through distinct social and cultural dynamics in these two countries.

The Welfare State and the Middle Class in Southern Europe Under the Crisis

The recession and the austerity have exacerbated structural trends in the labour market profoundly affecting the stability of the middle class in Southern Europe. At the same time, reductions in social spending has constrained the capacity of welfare states to function as shock absorbers. While in the US "the squeeze of the middle class" has been the subject of considerable research, in Europe similar research remains limited. The aim of the proposed paper is to contribute to filling this gap by analysing how the middle classes have been affected by income losses in recent years in four South European countries: Italy, Greece, Spain and Portugal. The paper presents the results of a longitudinal analysis of income losses suffered by South European middle classes based on an analysis of the EU-SILC panel dataset. The data cover panel rotations from 2005 to 2015, allowing us to identify the impact of the financial crisis. The paper maps large year-on-year reductions of individual earnings and household income in terms of size, duration, and time profile (L- or U-shaped). Moreover, the paper looks at the extent to which income drops were mitigated (or reinforced) by changes in (i) labour earnings of other household members (including of adult children living in the parental home), (ii) other market incomes (e.g. rents), and (iii) social transfers (such as unemployment benefits) received by the household. The predicament of the middle class under the crisis will be compared and contrasted to the previous period, and to the performance of other social groups in the same countries. Finally, the paper will elaborate on the most relevant implications of these results for the analysis of the impact of the crisis on income redistribution,

and of the redistributive and protection capacity of current social welfare systems in South European countries.

RANGA, MUKESH* (CSJM University, Kanpur (INDIA))

Rural Empowerment through ICT for Farmers

India is a country with 638,596 villages scattered in different states and union territories. The villages are connected through classified and non classified roads. Quality Agriculture output depends on land fertility, seeds' strength, pesticides' quality, fertilizers quantity in combination with supported climate and watering. Due to perishability of agriculture output cannot procure by the farmers for longer time.. For getting suitable return of agricultural products the farmer has to proceed for (a) grading and packing; (b) storing until shipping lots are assembled; (c) getting a market; (d) shipment; (e) loss from deterioration of goods; (f) financing the sales. Farmers in rural areas have to put their enormous effort to get better output and after that he has to sell it to the target customers through number of mediators. Information Technology has emerged as a powerful tool for the farmer to take quality decision during the process of production and marketing of agriculture product. Employment of Information and Communication Technology by the movement has strengthened the farmers. ICT has enabled the farmers to get updated information related to climate, inputs and suitable markets. The aim of this paper is to explore the current and potential impacts of ICTs for farmers in rural areas.

Socio-Economic Impact of ICT on Rural Women: Problems of Prospects

Information technology revolution has tremendously changed the livelihood of the people around the globe. People are able to get the updated information in fraction of moments. In India, approximately 75% of population lives in villages and share of women population is 48%. Information Technology is aggressively adopted by the people of India. ICT has influences a lot the life of women. They are getting updated information in areas of education, politics, social and economics. ICT has also influenced the life of rural women by making them more aware about the social reforms, better sources of income and purchase of products for family and her. Increasing literacy and awareness of technology has improved the decision making power of rural women. Government has taken several initiatives to disseminate the awareness among the people. Rural women have to face the constraint in usage of information technology due to social sanctions and low awareness. Rural areas and local bodies are mainly male dominated and local rituals play a vital role in controlling social system. Although with the efforts of government the women participation in rural administration has increased but still they are lagging behind. Present study explores the socio-economic empowerment of rural women in Uttar-Pradesh.

HIV Risk Management in Gay Men's Virtual and Non Virtual Social-Sexual Networks in the Era of PrEP

Rational: The combination of new HIV prevention biomedical tools, like Treatment as Prevention (TasP) and Pre-Exposure Prophylaxis (PrEP/Truvada), and new digital technologies for facilitating dating and sexual hookups for gay men and men who have sex with men (herein GM) afford new possibilities for GM to be responsible sexual-health actors. These sites invite GM to reveal their HIV Risk management practices by stating their HIV status, testing practices, and adherence to medication regimes (TasP/PrEP/Truvada). Hook-up apps' user interfaces are also designed to incite GM's desire for intimacy and pleasure, while shaping user's ability to trade in their erotic capital. Despite expanding possibilities for intimacy and health risk management, social-sexual communities created in digital media platforms are not immune to the intrusion of intersecting forms of systemic oppression. Our research maps cultural and social forces (including biomedicine) at play mediating GM's practices and experiences of HIV risk, well-being and health navigated across virtual and non-virtual social/sexual worlds. Utilizing an innovative combination of qualitative techniques including digital ethnographies and body mapping, our analysis destabilizes the rational actor model of HIV/AIDS prevention.

Contributions: Our analysis suggests that despite individual decision-making preferences for risk management, the possibilities and expectations of new biomedical and digital technologies are not equal for all. Intersecting forms of systemic oppression in conjunction with cultural forces (including those produced by pornographic industries and biomedicine), impact the ways in which GM, and

racialized GM, in particular, are able to enact their health and sexual agency. Innovative qualitative approaches enable us to see subjects' risk management, and sexual decision making as embedded in the embodied and social logics of multiple temporalities produced at the nexus of digital and biomedical technologies.

An Analysis on Perceived Effects of Social Media in India

People have dramatically integrated social media into their lives and its power is hard to ignore. While social media has become a vital consideration in any communication strategy for a country where digital media is accessible, it has made the communication consumer a communication producer. India has close to 190 million social network users in 2016. The different forms of social media like Facebook, Twitter, Google Hangout, Instagram are easily accessed through a smart phone with an Internet connection. In developing countries, social networking is a means through which people acquire ICT. Seven in ten Americans use social media to connect with one another, share information, engage with news content and entertain themselves in America as per The PEW internet report 2017.

The multiple purposes for which online social networking is used include interpersonal and group communication, religious, health, political and business communication. They are fast becoming standard tools for professional practices. Major news outlets are using social media to deliver messages to the masses. While at an individual level, the authenticity and credibility of social media users can be doubted, it offers an accessible, widely available means of bi-directional flow of information between public and politicians. There are the anecdotal evidences of positive outcomes from the use of social media technology such as social activities like finding jobs via a particular social network or finding missing peoples during a natural calamity.. On the other hand, the negatives of social media correlated with the rise of narcissism in the society, creating short attention spans and sensationalism are enormously presented.

The usage and perceived effects of social media across India in the political, religious, social and other spheres will be presented. The study would focus on gender and income differences with respect to the perceived effect of social media.

Internet, Religion, Hindus: A Study on Virtual Pilgrimage of Temples

Since the 1980s Internet has been used by religious enthusiasts, they started exploring ways by which internet could be used to promote religion, faith or belief. The use of Media for sharing religious themes, experiences, interactions and connections already exists. Today all religions have their online presence in the form of websites, Facebook pages, Whatsapp group, blog posts and many other applications online. Online digital media is interactive and effective medium for religious communication. For millions of believers, the digital media has become a platform where one can easily find God-or at least his followers and participate in public spaces in a private and free manner.

Virtual pilgrimage on the Internet is an important religious phenomenon for understanding the new ways of being spiritual. Virtual pilgrimage has four key characteristics as a form of religious travel. The Characteristics are-(i) it creates a mythscape, (ii) it exists as an interactive visual-auditory medium for experiencing a sense of sacred presence, (iii) it generates symbolic forms of entertainment that are liminoid in character, (iv) as a leisure activity of individuals (MacWillaims;2002). The accessibility of Internet from their home or office computers, can create 'virtual travelling communities' of pilgrims who use the discourse of *communitas* to describe their experience.

The aim of paper is to carry out qualitative and descriptive analysis of cases of Hindu religion in India. The case studies will be analyzed to answer and understand the ways in which digital media are being used for pilgrimage and the experiences associated with it. The study aims to understand the way religious experiences are gathered with the aid of virtual pilgrimage.

RANWA, RUCHIKA* (Jawaharlal Nehru University)

Contextualizing Dance: An Analysis of Role of State and Society in Socio-Political Construction of Kalbeliya Dance

The analysis of dance has predominantly found mention in fields of anthropology, cultural history and dance history while sociology of dance remains a relatively unexplored field. In this backdrop, this paper focuses upon Kalbeliya dancers of Rajasthan and traces the trajectory followed by them from being entertainers earlier to earning status of folk dancers and intangible cultural heritage recently. The transformation reveals deep contrast between their elevated institutional status and socially defiled status owing to strongly-believed demeaning association of Kalbeliya women with dance, their lower caste

status and nomadic lifestyle. The paper examines this disjuncture as situated in broader socio-political structures which reflect upon hegemonic role of state and market in legitimization and promotion of kalbeliya dancers on the one hand and intersection of gender, caste, nomadism and dance degrading their status at societal level. The analysis of processes of negotiation adopted by these dancers through their dance to confront these dual contrasting statuses is another point under consideration in this sociological inquiry. The paper ascertains that dance which acts as medium for assertion of national identity and glory can simultaneously act as source of degradation at social level.

The paper further stresses that state's role is not limited to shaping institutional status of kalbeliya dancers but also their social status. The discourse propagated by state, in conjunction with market, around glorification of kalbeliya dancers and their promotion as icons of national identity at institutional level is accompanied with discourse of chastity disseminated by state after independence which continues to defile association between women and dance at ground level. The analysis of this socio-political construction and regulation of kalbeliya dance and dancers has relied upon secondary sources, concepts such as ideology, cultural hegemony and cultural capital, analysis of kalbeliya songs and dance along with ethnographic fieldwork in kalbeliya dominated areas.

Private Care Services Responding to Heat Wave - Case Finland

Global warming increases the amount of disasters. Consequences of weather related risks on social, economic and ecological environment are, thus, greater than before. As disaster impacts are worst for vulnerable people we need knowledge how these population groups have been protected in case of disturbances. Preparedness and continuity planning is obligatory for municipal care services in Finland. The legal obligation does not, though, apply to the private services, which produce more than one third of the residential care services in Finland. In our study we explored private residential care services' adoption of mitigation activities after heat wave in 2014 and preparedness measures taken. We sent a questionnaire to all private enterprises producing residential care services in Finland. Descriptive statistics were used to analyze the data. The clients in these services were the elderly, people with disabilities, clients with mental health and substance abuse disorders, and children taken into care. Our findings showed that especially the elderly and clients with mental health problems and neurological disorders were affected the most of heat. Even though the service units tried to do their best to alleviate the consequences of heat they had not considered heat wave could be a risk for their clients and the quality of the service produced. Only 19 percent of the respondents reported that they had a preparedness or continuity plan. The most vulnerable to disasters are people dependent on others such as clients of residential care services. Consequently, we recommend that private care services should be prepared for hazards and include heat wave as one of the risks to be prepared for.

The Role of Social Work in Disaster Management in Finland

This study explores the role of social work in disaster management in Finland. The aim is to obtain information on the role of social work in disasters, to conceptualize disaster social work in order to understand it better, and to link it with overall disaster and emergency management system. The framework of disaster social work interventions and the concepts of vulnerability, resilience and social capital are used in analyzing and conceptualizing the role. Preparedness plan documents and survey data of private services' preparedness in Finland form the empirical data of this study. This is compared to international research on disaster social work interventions. The results show that social work interventions of social and human investments, i.e. day-to-day roles, which enhance bonding social capital, were emphasized in disaster social work. Interventions of political empowerment and economic participation, which embrace bridging and linking with other disaster management actors were less common. Preparedness planning was completed only on a very general level in Finland, and the overall level of preparedness and understanding of bridging and linking with other disaster management actors was inadequate. Statistically significant differences were found between large and small social service areas and units in favor of the large ones. I conclude that enhancing social capital in client work, social work's own organization and in multiorganizational networking, should be central in disaster social work. The concepts of disaster vulnerability, resilience, and social capital are central in understanding the role of social work in disasters.

RAPONI, MARTINA* (*Noiserr*)

Noiserr: The Generative Capabilities of Epistemic Disruption

Noiserr is an interdisciplinary research group centered around explorations of Noise via deconstructed reading and listening sessions. Noiserr is an ongoing exploration of Noise instantiated via theory- and practice-led investigative actions. Since different conceptualizations of Noise are widespread, and many are mutually exclusive, our actions do not rely on an exhaustive definition of Noise, but instead try and harness its indefinable nature to examine the generative capabilities of epistemic disruption. We read works of art, performances, objects, sounds, images, videos, from the standpoint of Noise theories, organized in an ever growing reader that can be easily accessed and manipulated by participants, who navigate it and shape it through contributions and discussions. The non-academic free sharing of knowledge builds a fluid community around a topic which becomes filter and metaphor for the understanding of art, art making, art systems, as well as for understanding the socio-political conditions of our world. Noiserr is a parasite, as Michel Serres describes it. Noiserr is a parasitic art practice in the process of being built, while making use of other practices, experiences, traces, as reflecting and discursive points.

Noiserr will discuss Noise theories from an aesthetic perspective as well as a socio-political one, as unfolded, developed, and shaped during its reading and research sessions. Noiserr tries to resist the genreification of the word "noise" while building an un-constituted and cybernetic practice showing how the investigation of the Noise topic managed to condensate/connect people and thoughts, opening portals among compartmented sciences and practices, and infiltrating institutional and non-institutional environments.

RAPOSO, FERNANDA* (*Universidade de Brasília*)

Max Weber's Sociology of Religion and Its Limits: An Analysis of Brazilian Neo-Pentecostal Asceticism

According to Weber (1974) Sociology of Religion is a sociology of rationality, as it was responsible for the passage of a magical vision of the world to a defeat of magic through its disenchantment. His sociology of religion seeks to understand modern man with the help of ideas of life orientation, disenchantment and ethics. The aim of this article is to understand the Brazilian Neopentecostal movement taking into account the category of asceticism and rejection of the world, taking into account Max Weber's writings on religions and asceticism. Therefore, this paper aims to discuss Weber's Sociology of Religions and the Neopentecostal turn, especially regarding the Universal Church of the Kingdom of God (IURD) and its tendency to affirm the world.

In this way, I intend to elaborate an analysis that, although simple and synthetic, seeks to raise this discussion and propose new dialogues. To reach this, my first step is to briefly describe Max Weber's theory of religion, especially in his writings on *Religious Rejections of the World and Their Directions*, *The Social Psychology of World Religions*, and finally *The Protestant Ethic and the Spirit of Capitalism* and how the intellectual defines the concept of asceticism, the hallmark of the Protestant Christian religion. In a second moment, I will explain the genesis of Pentecostalism, in order to present, in a more historical way, its unfoldings. And, in a third moment, I will return to understand the birth of Neopentecostalism, issue that interests me in this work. Finally, I will try to discuss how the concepts discussed by Weber are perceived by modern Neopentecostal sects, anchoring especially in the case of the Universal Church of the Kingdom of God (IURD).

Looking Back on Life in Military Families: Lessons from Those with Troubled Civilian Outcomes

This paper presents the results of my ongoing doctoral study that longitudinally examines the lives of UK military personnel and their families. Individual, in-depth qualitative interviews have been undertaken, inviting military veterans, and the families of military veterans, to reflect on their experiences of life as part of a military family. It is interested in understanding intimate relationships over time, both whilst serving and following transition to the civilian realm. From a sociological lens the analysis considers the nature of familial support needs in a relatively unique, and rarely researched, context. The families taking part in the research are those connected to military veterans who have been involved in the UK criminal justice system since their military service ended. Whilst veteran offenders have been the subjects of some research, as are other military veterans with readily identifiable problematic civilian outcomes (eg homelessness, substance misuse etc) research to understand the experiences of their families in this limited context is noteworthy by its absence. This is a significant oversight. Families and the military are both regarded as 'greedy institutions' that make excessive and often competing demands on those within them (see Segal, M.W., 1986) With the benefit of hindsight, family members in this study reflect on the ways in which support has been structured, sought and assembled during military service, and the impact of this on their lives in and also beyond military service. Given the problematic civilian outcome, aspects of military family support are thrown into relief and there are lessons for Defence and support organisations in this. Further, the impact of social class (often related to service), is shown to be significant.

Utilising Bourdieu's concepts of both habitus and capitals, the study reveals how transformation in individual and familial resourcing over time, influence success in identifying and accessing appropriate support needs.

RATECKA, ANNA* (*Jagiellonian University*)

The Struggles over Representation of Female Sex Workers in Polish Feminist Movement

The prostitution/sex work debate is one of the most controversial issues within contemporary feminism. In the heart of this debate lies the conflict over the understanding of commercial sex, but also the legitimacy to represent women selling sexual services and the place of sex workers in the feminist movement. Viewed by the abolitionist feminist either as victims or "agents of patriarchy" or "pimp's lobby", sex workers are continuously delegitimized and excluded from the feminist movement.

This controversy refers to one of the key democratic issues within social movement – the representation, the right to voice and the way disputes within the movement are solved. Hence in my presentation I will investigate the power struggle between various actors within feminist movement in Poland over the right to represent women selling sexual services.

First, I will briefly discuss the political opportunity structure for the mobilization for the rights of women selling sexual services in Poland: the characteristics of Polish feminist movement; earlier mobilization for the rights of women selling sexual services in Poland; recent development in the sex work politics in Europe.

Second, I will present the actors (NGOs, informal initiatives, activists) taking part in this debate, their claims for being legitimate to represent women selling sexual services, the transnational connections of each actor with the wider feminist/anti-prostitution/sex workers movement.

Third, I will explore the dynamics of the prostitution/sex work debate in Poland, the discourse of various actors in this debate and their stance on the place of sex workers within the feminist movement. Special attention will be given to the role of social media and its influence on the dynamics of the debate.

RAU, VANESSA* (*University of Cambridge*)

Home, Burden or Desire? the Multiple Meanings of Hebrew in Individual Biographies.

"My house is in the language" says Inbal in reference to Hebrew. Despite five years as an Israeli migrant in Berlin, the German language cannot provide what Hebrew signifies for her. Inbal is a member of a Hebrew Choir in Berlin, where Israelis, Jews and non-Jewish Germans sing Hebrew Choral music. The group is part of my on-going PhD research, which seeks to unravel the interwoven relations and dynamics of belonging, religion, secularity, conversion and community building in a new Jewish scene in Berlin. While Inbal exemplifies a case of unease with the German language, other Israelis are diligently seeking to obtain fluency in German eager to lose their "Hebrew accent". Indicating the place of origin, the accent is seen as a marker of difference. At the same time, the Hebrew language and represents something exotic and very much desired for non-Jewish Germans. Their biographies reveal that it was through Hebrew, that they developed an interest in Judaism. In my paper, I will take the example of the diversity of the Hebrew choir and show the differing significations, which a language (Hebrew) can take. Relating it to the biographies of Jewish Israelis and non-Jews with a desire for things Jewish, I will show how Hebrew can attain multiple significations within a single group. As a bonding tie of a multi-national and multi-ethnic group, Hebrew equally becomes "home", marker of difference and object of desire and representation of 'the exotic'. Contrasting collected biographies, I will demonstrate how language (Hebrew) has influenced biography and trajectories on a personal and political level. Hereby, I will argue that language should not only be understood in its interpersonal function, but also as symbol with context-specific significations. By means of Hebrew, my paper discusses biographic trajectories (Routes and Roots) of individual and collective belonging.

Designing Paid Family Leave Policies to Support Low-Income Workers: Evidence from across OECD Countries

Paid family leave is a critical policy for supporting workers' ability to balance their dual roles as caregivers and earners. Paid parental leave benefits women's economic opportunities, including increased labor force participation for women, smaller gender wage gaps, and an increased likelihood that women will return to work with their previous employers. Paid parental leave is also associated with improved maternal and infant health, including higher breastfeeding rates, increased vaccination rates, and lower infant mortality rates. Beyond infancy, paid

family medical leave allows workers to meet their family members' health needs without job or income loss. Yet, policy design decisions may limit access to paid family leave for some workers, particularly low-income workers who may need it the most. Using data from the WORLD Policy Analysis Center on 34 OECD countries, this paper explores three critical aspects of policy that disproportionately impact low-income families: payment, eligibility criteria, and differences in leave generosity across family types. For payment rates, we examine how lower wage replacement rates, flat-rate payments, or caps on benefits may result in payment levels that are too low for minimum wage earners or even average wage earners to remain above the poverty line, making leavetaking unaffordable. For eligibility criteria, we examine how tenure and contribution requirements meant to fund parental leave systems may exclude a variety of workers, including those who have: changed jobs or fields, lost a job when a company had layoffs or an industry was downsizing labor forces, been seasonally or intermittently employed due to reduced opportunities in an economic downturn, or recently finished a period of education. We also look at how policy designs meant to encourage gender equality in leavetaking may inadvertently disadvantage single parents. Throughout, the economic feasibility of designing policies to be inclusive of low-income families is discussed.

RAUCH, ANGELA* (*Institute for Employment Research*)

KONLE-SEIDL, REGINA (*Institute for Employment Research*)

Activating the 'Inactive'. Employment Policy for Disabled People in Germany in a Comparative View

Across the OECD on average 14 per cent of the working-age population classify themselves as disabled. People with disabilities are often considered as particularly disadvantaged especially in the labour market. The majority of people with disability are non-employed or 'inactive' regarding their labour market participation. In consequence, there was a substantial rise in disability benefit rolls in many countries. In recent years a greater awareness arose that people with disabilities are able and willing to work together. In this context it was increasingly recognized that protecting the economic security of people with disabilities might best be done by keeping them in the labour market and changed the form of public protection to working-age individuals with disabilities in recent years. This is also reflected in the 2008 UN Convention on the Rights of Persons with Disabilities. The countries having ratified the convention are committed to enable people with disabilities to work in an open, inclusive and accessible labour market that will ensure sustainable and secure livelihoods. In comparison to other welfare states, we describe the evolution of the German disability programmes. Germany has been an exception to the international trend as the rates of disability benefit recipients have been low over decades. We discuss how policy choices played a role and analyse the pathways into employment, unemployment or invalidity benefit of people with health problems. In our descriptive and comparative paper we analyse the factors explaining the divergent trend in Germany and discuss whether policymakers in other countries might benefit from German policies to transform disability benefit schemes into activating labour market programmes.

RC15-288.16

RAUCH, ANGELA* (*Institute for Employment Research*)

TOPHOVEN, SILKE (*Institute for Employment Research*)

Single-Minded or Stuck in the Middle of Nowhere. Experiences in Vocational Rehabilitation Measures from Adults with Disabilities.

In Germany, a wide range of labour market policy measures are available within the framework of vocational rehabilitation to support people with disabilities in re-entering the labor market. In our analyses, we are exploring the pitfalls and challenges in vocational rehabilitation of adults, presenting findings of our qualitative study 'Evaluation of the participation of disabled persons in working life'. The empirical material consists of semi-structured individual interviews of 50 rehabilitants in vocational rehabilitation in responsibility of the Federal Employment Agency (FEA). The analyses are based on a life-course perspective and the capability approach. Amongst other differences, the persons differ in their type of disability, their social background and environmental context. We identify two contrasting groups differing in the type of disability and their social context which lead to differences in their occupational orientation. On the one hand, there are people with mostly physical disabilities or disabilities of the internal organs, who usually have a very target-oriented curriculum vitae, often do an apprenticeship for commercial staff and have concrete job positions after the end of rehabilitation. However, even if they did not find a job immediately, they would still regard the qualification received during rehabilitation as an important investment in their future career. On the other hand, there are people mostly with psychological disabilities also in a vocational rehabilitation for the commercial sector, but only in training measures. They often fail to complete their measures and are still uncertain, whether the training and the professional direction are appropriate for them. The allocation in measures by the FEA placement officers somehow reflects the assumed capacities of rehabilitants. Since the professional orientation and integration of people with psychological disabilities seems rather

difficult, one should consider supporting them in other ways to re-enter the labour market.

The Sectors of Activity and Occupations of Gay and Lesbian People. Evidence from a French Survey

Despite an increase in research on homosexuality in recent decades in France, it is still difficult to characterize gay and lesbian populations using general population surveys. It is rarely possible to obtain a sample of sufficient size that is representative of the general population, along with appropriate indicators of homosexuality that are required by such analysis. This communication proposes a novel approach based on data from the Family and Housing (Famille et logements) survey conducted in 2011 (n = 379 770) in association with the French census. This survey enabled us to study the sectors of activity and occupations of gay and lesbians who report being in union (including LAT people). Our analysis highlights the high levels of education among women and men in same-sex unions and upward mobility, as well as the specific features of their occupational profiles. Gay and lesbians are over-represented in sectors characterized by equal number of men and women and are less present in highly genre-segregated categories that are numerically dominated by their own sex. In this regard, the gender divide is smaller. This survey also enables to study geographical mobility. The individual situations observed also reveal strong geographical mobility characterized by a pronounced distancing from family origins and a frequent attraction to large towns and cities, among men more than women. Social mobility and geographical mobility combine differently, depending on the individuals' social origins. Social mobility is especially characteristic of men and women from the middle and working classes, and goes hand in hand with geographical mobility. Gay men from the upper classes are no different from other men from the upper classes in terms of educational trajectories, but are more frequently attracted to the Paris region, and even more so Paris itself.

RAUPP, MARIANA* (*Université Laval*)

Resisting to Penal Populism By Which Means? Discursive Strategies to Barrier Conservative's Criminal Law Reform in Canada

Several observers of criminal law have diagnosed the phenomenon of "punitive turn" or "penal populism" in contemporary western societies (Garland, 2001; Pratt, 2002) including Canada (Dumont, 1998; Doob et Webster, 2006; O'Malley, 2006; Landreville, 2007; Doob, 2012). This communication aims to discuss how opposition parties in Canada (NPD, Liberal, Green and Bloc Québécois) positioned themselves when facing conservative party's criminal law reform (2006-2015). From a case study of parliament debates of two criminal law project (Bill S-6: "Serious time for the most serious crime act" and Bill C-9: "conditional sentence of imprisonment"), we analyze the vocabulary of motives (Wright Mills, 1940) mobilized by the actors of political system and identifies the divergences and convergences from the strategies of different parties. We argue that despite their political differences, in terms of criminal law, their different discursive strategies rejoin. They immunize their main argument about social reintegration and its values to counter a punitive criminal law. Without a qualitatively different cognitive resource, they reinforce conservative arguments besides formally being an opposition to their criminal law projects. By doing so, this paper aims to contribute to understanding punishment transformation and persistence from a penal policy perspective.

Social Characteristics of Popular and Modern Painting's Audiences in Iran

This article is based on findings of research in the field of audiences of Iranian modern and popular paintings which examines the problem of difference or indifference of the personal and social characteristics of Iranian modern and popular paintings' audiences and their artistic taste. Moreover, factors effective on shaping these differences are examined.

The theoretical framework of the study is based on Pierre Bourdieu's artistic fields and the research method is both qualitative and quantitative. In terms of qualitative research, in some selected galleries, audiences of paintings and their behavior were observed directly by the researcher. In terms of quantitative research, questionnaires were filled by all willing audiences of these galleries.

The general finding of the research showed that the audiences of modern and popular paintings were different in terms of cultural and social characteristics. They were also different not only in terms of their difference in the amount of capital they have gained in relation to the field, but also in terms of demographic characteristics such as their father's occupational status and their life style. Moreover, the main hypothesis of the research was accepted and showed that there exists a meaningful relationship between the audiences and their taste judgment in general.

Clashing Turkish Nationalisms through Gezi Movement: Reflections on Everyday Nationalism

Gezi protests, emerged as a reaction against the AKP government's authoritarian intervention into the urban space, turned into a country-wide social movement. Interestingly enough, the movement brought various components of the society together with the aim of more democratic and pluralistic governance even though they have different political/ ideological backgrounds. The nationalist discourse with its eclectic, flexible and nonhomogeneous structure articulated in different forms in the Gezi movement.

Unlike the primordialist approaches to nationalism which considers nations as preexisting structures, modernist perspective embraces it as an invented and imagined product of social engineering. Modernist approach, which focuses on political institutions, overlooks the role of everyday life and individuals, as the real carriers of nationalism and national identity. However, the conceptualization of everyday nationalism focuses on how nationalist discourses and symbols are internalized and reproduced by ordinary people in daily experiences with a micro sociological perspective. Hence, this study, benefiting from the concepts of "everyday nationalism", aims to investigate how people, participated in the Gezi protests, subjectively constructed or reconstructed their national identity in their own discourses and narratives about their experiences in the Gezi Park. Is the perception of nationalism of these Gezi supporters compatible with the "Turkish" nationalist rhetoric?

The study will be based on qualitative data obtained from deep interviews with approximately 10 respondents who participated in the Gezi protests in the summer of 2013. The research findings will be analyzed by using discourse and narrative analysis. Participants' perception of nationalism and their discursive construction of national identity in their daily life will be traced through their experiences of Gezi movement.

Understanding the Health Inequality Paradox: A Meta-Analysis of the Effect of Study Design on Health Inequality Outcomes and Welfare Regime Patterns in Comparative Health Inequality Research.

Comparative research on social health inequalities focuses on the structural determinants, but results so far are inconclusive. Studies on the impact of welfare state arrangements on social health inequality either find that universal welfare states are beneficial for social health equity or the opposite – a health inequality paradox. Until now, this puzzle has not been evaluated systematically and comprehensively. To help resolve this, building upon various theoretical discussions and previous systematic reviews, I hypothesize that study design characteristics affects the measured extent of health inequalities and, thus, contribute to the appearance of a paradox.

In this meta-analysis, I used data from 39 publications identified through systematic searches of four literature databases (*PubMed, ASSIA, Web of Science, So-*

ciological Abstracts) and reference lists of four systematic reviews. Included publications consider individuals of any age in OECD countries with a cross-sectional and comparative study design examining educational, occupational, income and wealth inequalities in physical health. First, using a hierarchical mixed effects regression model, I estimate how much variance in effect sizes is explained by study design characteristics. Second, I calculate average effect sizes for each country accounting for study design characteristics.

Results to be presented at the conference will show that certain study design characteristics have effects on the extent of measured health inequalities. Therefore, my findings will highlight the impact of study design choice on the measurement and interpretation of results, especially in comparative studies. By taking study design characteristics into account, I can show the extent of health inequalities for each country, free of the obscuring effects of study design. In this way, I will contribute to solving the public health puzzle on the health inequality paradox.

RAWLS, ANNE* (*Bentley University*)

On Durkheim's Aphorism: Treating Social Facts As Moral Facts

Two decades before Weber penned the argument that became the anchor of the "value free" movement, Durkheim had begun making the important argument that all meaningful facts and objects are social facts and that all social facts are moral facts. Durkheim intended by this argument not only the idea that social facts depend on social cooperation to make them, but that the cooperation involved was an essentially moral enterprise because it created the ideas, identities and social relationships without which we would not be recognizable human. Durkheim considered the social commitments that this creation depended on to be "sacred" and therefore the underlying requirements of the social process to be moral. This was not a functional argument. It was a constitutive argument. If Durkheim is right about this there is no possibility of value free science. Durkheim's argument will be fleshed out with reference to ethnomethodology and research about race relations.

Aesthetic Animals: The Self-Presentation of Trudeau, Trump, and Macron on Instagram

Digital mediums like Instagram have reduced the importance of media gatekeepers for the self-presentation of political figures, reshaping the aesthetic and symbolic dimensions of the political. These transformations upend stable categories of aesthetic representation to consecrate new and desirable ways of viewing political figures—often finding resonance in popular culture. The sociology of culture brings valuable tools to questions of consecration of political imagery through these new mediums: how have politicians reshaped the aesthetic dimensions of their self-presentations and rituals through online mediums like Instagram? and to what effect? This paper is a comparative and systematic analysis of the aesthetic and symbolic dimensions of the photographic representations of Justin Trudeau, Donald Trump, and Emmanuel Macron on their Instagram accounts across their political careers. Each image was coded according to the interaction rituals present in the interaction according to Goffman's scheme developed in *Gender in Advertisement* (1979). While Macron and Trump are exalted in their representations, in accord with Goffman's thesis that white males are depicted as ritually superior in photographic displays to people of colour and women, Trudeau is depicted as ritually subordinated to women, Indigenous peoples, and peoples of colour—subverting the ritual order to symbolic effect. Moreover, while Trump's representation have maintained the same ritual order across his political career, Trudeau and Macron seem to adjust the ritual order of their interaction chains to fit their political contexts and policy desires. Such changing self-presentations point to a highly aesthetic sensibility for Trudeau and Macron. These aesthetic self-presentations create and reinforce a type of social imaginary in popular culture that sustains and reinforces a misrecognition of stratification in the social order, absorbing the contradictions of both symbolic and material inequality.

Reproducing Inequalities or Promoting Upward Mobility? a Case of Transnational Asian-Indian Entrepreneurs

Immigrant and ethnic entrepreneurship in developed economies and the US has been the subject of extensive research exploring how ethnic cultural capital and networks act as mechanisms of assimilation in host societies, and how structural challenges arising from discrimination of race/ethnicity, gender, class, religion, and nationality/immigration status shape entrepreneurial performance. With the exception of a small but growing body of research on cross-border entrepreneurship, scholarship on entrepreneurship in immigrant-

receiving advanced economies has focused on individual nations. However, new perspectives are needed to understand transnational entrepreneurs and their cross-national businesses as they as they benefit from global resources, opportunities, and diasporas, and the changing nature of international migration.

My research studies how transnational Asian-Indian entrepreneurs' cultural resources affect the growth and performance of their cross-border enterprises. I analyze how the context of entrepreneurship, language competencies, bi-cultural literacy, and 'transnational habitus'—that is, shared perceptions, cognitions, and dual frames of reference—cultivated by Indian entrepreneurs enable the conversion of social, symbolic, financial, and cultural capital into desirable goods in diverse societies.

Using data collected through interviews with forty-six Indian immigrant, returnee, and non-migrant entrepreneurs in info-tech, service, and retail sectors in major metropolitan areas in India and the US, I explore a) entrepreneurs' asymmetrical possession of cultural capital (language competency, knowledge of the society and its ways of doing business), and b) the association of cultural capital with 'class' resources, defined as private property, wealth, investment capital, and human capital (Light & Karageorgis, 1994). Class and cultural capital together become significant markers for different types of transnational networking, including multidirectional networks spanning borders beyond those of host and home country, and diasporic and ethnic networks facilitating co-ethnics' assimilation and risk management in host/home countries. My research shows how these cross-border networks create paths for upward mobility for some while reinforcing inequalities for others.

Faking the Media Ecosystem

The processes of globalization and the advancement of the information and communication technologies are among the main milestones tracing the humankind's developments in the 21st century. They are fundamental factors of social transformations.

The ICTs also influence the media transformations - from linear to non-linear services, as well as the audiences' transformations - from passive consumers to active prosumers. And if the contemporary processes of politicization of the media and mediatization of politics are closely associated with the traditional media (print, radio and television), the online media space (social networks, blogs, vlogs, etc.) makes the audiences active participants in the communication process. Thus a new system, combining traditional offline and new online media, namely a media ecosystem, has been formed. Thus people can enter an unmediated, direct dialogue. However, while traditional media can rely on codes of ethics, self-regulation and co-regulation in compliance with professional principles, the content in the online environment can hardly be regulated and it is difficult to organize public correction of the delivered messages.

That is why such phenomena as distribution of alternative facts and fake news disrupt the professional journalism and can have long term negative impacts on society raising distrust of the audiences to media content.

The proposed paper has been developed within the framework of the academic projects DCOST 01/10-04.08.2017, DCOST 01-11/04.08.2017, DCOST 01-25/20.12.2017, and DN 05/11-14.12.2016 of the National Scientific Research Fund of Bulgaria. It examines the challenges of these new phenomena in the mediated ICT environment. The text leans methodologically on the PEST (political, economic, social and technological) analysis. It also presents the results of a social survey on the effects of fake news on media consumers of different demographic and social profiles. Results of a comparative analysis of in-depth interviews with media professionals on sustaining media ecology are also provided.

RAYCHEVA, LILIA* (*The St. Kliment Ohridski Sofia University*)

TOMOV, MARIYAN* (*The St. Kliment Ohridski Sofia University*)

The Image of Ageing Women in Contemporary Media Ecosystem

Contemporary societies are undergoing significant social, economic, cultural, and political changes, correlating with the dynamic developments of the ICT environment. Today, these transformations are being catalyzed by the intense developments of the media ecosystem, combining the traditional media with the potential of the blogosphere, the social networks, and the mobile communications. Situated in the context of the globalization processes, media themselves are undergoing multi-layered transformations; they change with the dynamic developments taking place in technologies, business models, regulatory policies, professional practices, and audiences' habits. However positive the impact of ICT applications and media developments on progress in all areas of life might be, it is no less true that they pose challenges to the social stratification of society.

The trend of population ageing determines the need for urgent prevention of digital divide, regarding the social exclusion of older people from the modern communication environment. Many detailed expert studies and public dis-

cussions have focused on the problem of overcoming prejudices and negative stereotypes towards generation differences as well as on the capacity of older people to take part in, and contribute to intercultural dialogue. The media portrayal of the ageing women, however, has not been sufficiently examined.

The proposed paper has been developed within the framework of the academic projects DCOST 01/10-04.08.2017, DCOST 01-11/04.08.2017, DCOST 01-25/20.12.2017 and DN 05/11-14.12.2016 of the National Scientific Research Fund of Bulgaria. It examines important general and specialized documents of the United Nations, the Council of Europe and the European Union on age discrimination. It also discusses significant studies and regulatory practices on media image of older people, including women, in enlarged Europe. The paper presents the results of a comparative study of ageing women's portrayal in Bulgarian media. Results of a social survey on sustaining women's rights as part of their human's rights are also provided.

REA RODRIGUEZ, CARLOS RAFAEL* (UNIVERSIDAD AUTÓNOMA DE NAYARIT)

EL Pueblo Náyeri EN Lucha: De La Defensa DEL Territorio a La Producción De Alterhegemonía Regional

Ante la amenaza que representaba el proyecto hidroeléctrico Las Cruces, impulsado por el gobierno federal en el Río San Pedro-Mezquitlan, las comunidades del pueblo Náyeri se articularon con comunidades mestizas para crear el Consejo para el Desarrollo Sustentable de la Cuenca del Río San Pedro. En poco tiempo, el componente indígena se volvió central en el movimiento, colocando en la mesa de discusión otras formas de concebir la relación entre ser humano y naturaleza, entre ser humano y lo sagrado, entre ser humano y bienestar colectivo.

En esta ponencia mostraremos, cómo esta centralidad simbólico-política se convirtió en potencial hegemónico al seno del movimiento, operando como centro gravitacional en la Cuenca, pero también en la relación con actores sociales y políticos del exterior. Analizaremos igualmente las variaciones de su discurso, que van de la defensa del río, a la defensa de los lugares sagrados y su territorio, a la articulación con luchas de los pueblos Wixaritari, Odam y Mexica.

Por último, analizaremos el ascenso en el nivel de generalidad de sus planteamientos, acompañado de la diversificación de las arenas y escalas de actuación. Con particular detenimiento analizaremos cómo y con qué consecuencias se han sumado a través de sus principales liderazgos a las labores del Congreso Nacional Indígena, acercándose a experiencias autonómicas como la de Cherán y, recientemente, sumándose a la campaña de la indígena María de Jesús Patricio, como candidata independiente a la Presidencia de la República en 2018. Pondremos a prueba la hipótesis de que la disputa simbólico-cultural del movimiento en la defensa de su territorio, avanza -no sin riesgos de cooptación, desarticulación, partidización, radicalización- hacia el desarrollo de un potencial alter-hegemónico, centrado en la articulación, defensa y puesta en práctica de un modelo de bienestar colectivo propio y autónomo de alcance regional.

Critical Patterns in the Construction of Contemporary Social Movements

Social movements have been considered as the main actors of social change the more visible agents of a critical attitude in front of 'what exists' and the promoters of practices of 'what it could be'. Yet, such critical attitude of social movements is not explicitly theorized since a very long time and social movements around the world have been mainly empirically and descriptively investigated across the issues of democracy, human rights and inclusive citizenship. Indeed, globalization, digitalization, transnational communications, networking activities among mobilizations differentiated in terms of culture, history and politics have fostered a common framing based on empirical observations, rather than on epistemic questioning. Accordingly, central stakes for social movements such as the possibility of 'critique' have become problematic and almost abandoned by theorization. In this presentation, I would like take into account both the epistemological and the ontological issues of this situation. On the one hand, there is the question of how we know, we represent, we construct as a theoretical object a social movement, in front of a situation where 'modern' and 'western' idea of critique and emancipation have been radically deconstructed. On the other hand, there is the question of what we can ontologically include in the practices of a critical mobilization, when digital technology, artefacts and other kind of entities increasingly interact with subjective action.

Spatial Inequalities: The Space-Set Approach. Measuring and Explaining Individual Differences of Geographical Mobility in France, Italy and Germany

Globalization entails a rise in cross-border movements – of goods, services, information and persons. With diverse motives and modalities, the size of international travels has escalated uninterruptedly in the last decades (Deutschmann 2016). While we have data on the volume of international mobility, however, there is a lack of information on the social composition of the mobile population. Who moves around the world? Is the 'mobility revolution' of the last half-century opening up larger opportunities for all or is it, in fact, creating a new layer of social inequalities? In other words, are there 'winners and losers' of increased global mobility?

This paper introduces a concept – the 'space-set' – to answer such questions through survey research. A space-set is formed by all meaningful places that individuals experience over their lifecourse (Recchi 2015, 150-153). I examine two significant objective (size and range) and one subjective characteristic (emotional focus or centralization) of space-sets in three comparative surveys (France: ELIPSS panel, 2016; Italy: Doxa Mobilità survey, 2015; Germany: GESIS Panel, forthcoming) through a mixed map-and-questions instrument.

Preliminary results for France and Italy show that international mobility is stratified along class, education, age and, more surprisingly, gender lines in both countries. However, international travelling is a stronger correlate of higher education in France, presumably qualifying it as an additional instrument of social distinction. Correspondingly, a larger proportion of the French have polycentric and uprooted space-sets, which in turn may facilitate more globalized life choices.

Interrogating Intersectionality in the Caribbean Context: Feminist, Anti-Racist and Decolonial Thought and Politics

This paper engages with the concept of intersectionality at a time of great debate around its use, its politics and its relationship to feminist scholarship and praxis. It acknowledges that although a relatively new concept, it builds on a scholarship and grassroots theorizing of anti-racist, radical and feminist scholars and activists that preceded it. Using this frame, the specific and diverse experiences of the Caribbean are examined in the context of these debates, critically examining historical intellectual and political antecedents as well the contemporary context.

Globalization a Boon or Bane – a Study in Indian Context

In the late 20th century, the process of "globalization" has become one of the hotly debated politico-economic issues in International economics. Globalization integrated international market across the geographic and political boundary without any barrier and restriction to move freely goods, services, capital and technical know-how. India opened up the economy in the early 90's. In a globalized economy, the MNCs operate in many countries and exploit local conditions for their own advantage. A good lot of discussion and debate is going on regarding the differential roles, dimensions and effects of the process of globalization. Some defend the process on the grounds that, the process of globalization increases the wealth, cooperation between nations, advantages of the healthy competition, accelerates the process of Industrial growth, transfer of technical know-how, free flow of goods and services. While a few others criticize the same considering that the process of globalization widens the gap between the rich and poor, exerting the pressure to open the national market, but at the same time, the rich countries reluctant in open their own domestic markets for international trade. This unwillingness or indifference of the developed countries has created problems. Hence, some nations have started rethinking about their decision of actively participating in the process of globalization. In this context, this paper tries to explore the contours of the process of globalization.

Inclusive Growth in India Dream or Reality?

The subject of inclusive growth has been in the spotlight recently for obvious reasons. After three centuries of relative and often absolute poverty, India has in recent decades begun to return to its previous position as a global economic power. The Parliamentary election campaign of 2004, with its 'India shining' vs

'Aam Admi' slogan campaign highlighted an apparently widespread perception that the benefits of economic growth were simply passing to many people. While many challenges remain, the challenge of making India's economic growth more inclusive by reducing entrenched poverty i.e., to the marginalized groups is a principle challenge. It is well known that the poor and the under-privileged sections of Indian society including the OBCs, SCs and STs are lagging behind in education. Literacy is arguably the most significant factor in poverty reduction as it enhances employability. India as an emerging economy wedded to the policy of Welfare State has been adopting and harnessing ICT for inclusive growth through diverse policies and programmes. However, the inherent socio-cultural milieu and demographic constraints that have been the bane of development process in India, is assumed to have come in the way of successful implementation of these ameliorative schemes. The so called 'digital divide' that get accentuated by the preponderance of "haves" and "have-nots", lack of ICT infrastructure in far flung and remote rural areas, hesitation among the masses in adoption of new technology coupled with aspiration deficit, have rendered these schemes exclusive, rather than inclusive. This paper seeks to examine India's record on inclusive growth.

Creating Opportunities through the Inclusion of Workers with Special Needs in Worker Cooperatives

Research on cooperativism is at the core of some of the most recent advancements in the analysis of alternative forms of organisation of the economy. This work presents the results of an in depth analysis of the features underpinning a concrete case study of a cooperative that provides employment opportunities to workers with special needs. The cooperative Mol Matric located in Spain was created in 1982 to dedicate their activity to the manufacture of dies and tools for the automobile industry. Taking into account the previous developments in qualitative research on cooperativism, this work identifies the ways in which Mol Matric contributes to improve the inclusion of workers with special needs in the labour market. The qualitative fieldwork was developed on the basis of the communicative methodology, which has been published in two special issues of the ranked journal Qualitative Inquiry. As a result, this work provides evidence of the barriers faced by the cooperative in times of crisis and how to overcome such difficulties facilitating change and promoting the inclusion of workers with special needs. The investigation of this cooperative is framed in the line of research of competitive cooperativism and the study of successful cooperativist actions (Springer, 2017), which has achieved social impact in diverse contexts providing effective solutions to current societal challenges.

Becoming a Custody Nurse: The Ways That the Police Custody Nurse Identity Is Produced through Boundary Blurring

Nurses have been able to provide healthcare in police stations in England and Wales since the Police and Criminal Evidence Act 2003, which allowed 'healthcare providers' to offer their services in police stations. Originally 'police doctors' were used, but a substitution has taken place over the following decade with a large proportion of constabularies now running a predominantly 'nurse-led service', often with the assistance of a doctor via telephone when necessary. This transition has taken place against a backdrop of increasing privatisation of healthcare provision in criminal justice with most constabularies contracting out to private companies. As a result, nurses working in police stations find themselves at the centre of a range of professional and contractual relationships that have the potential to challenge their nursing identity. In this paper I will demonstrate the ways that nurses negotiate these challenges to their professional autonomy and identity, and the ways that these challenges are actually constitutive to the custody nurse identity.

Drawing upon Carmel's (2006) idea of 'boundary-blurring', I will show that the embedding of nurses within the police station and their regular work with the police has served to shape the professional identity of the custody nurse, in particular enabling them to balance the aims of criminal justice with the caring responsibilities of the nurse. At the same time, guidelines for custody nurse work, for instance Patient Group Directives designed by the employers, allow nurses a degree of autonomy, but in so doing also align the nurses' interests with those of the company. To this end, this paper will show that the professional identity of the custody nurse is regularly produced in this liminal space between professional and contractual relationships, and rather than medico-legal professionals needing to emphasise one 'role' over another, such tensions are actually generative of their professional identity.

Marhabaan 'ana Min 'anat (ﷲ ﷲ ﷲ ﷲ): The Intersection between Gender, Ethnic and Religious Identity Among LGBTQ Muslim Filipino Youth

There is a dearth of literature on the experiences of LGBTQ Muslims in the Philippines with transecting sexual orientation with their religious and ethnic affiliations. The rapidly growing literature on the intersection of sexual orientation, religion and ethnic affiliation suggests their socio-cultural and religious incompatibility which exposes an individual at a higher risk of stigma, discrimination, normalization and socially acceptable forms of gender-based violence. This study investigates the personal, ethnic, religious and socio-cultural dimensions of self-understanding among LGBTQ Muslim youth in the Philippines. Key informant interviews (KIs) with selected LGBTQ Muslim Filipino participants from Mindanao and Metro Manila were conducted to determine their affiliation to religious and ethnic identities, sexual orientation and relationship with family, peers, community, workplace and ummah (religious community). Additionally, this study explores their experiences of stigma, discrimination and socially acceptable forms of gender-based violence. This paper intends to explore the different mechanisms the participants employ to face these challenges of exclusion towards inclusion. This study aims to contribute to the understanding of the intersectionality between gender, religious and ethnic identities in the everyday life among Muslim-Filipino LGBTQ.

REGATIERI, RICARDO* (*Federal University of Bahia*)

Max Horkheimer and the Unbridled Capitalism

In the late 1930s and early 1940s, Max Horkheimer was striving to offer a proper explanation for the capitalism of his time. Texts such as "The Jews and Europe" (1939) and "Authoritarian State" (1942) were important milestones of a work in progress which resulted in the *Dialectic of Enlightenment* (concluded in 1944). The discussions within the Institute of Social Research in exile, especially embodied in a debate on National Socialism organized by the Institute at Columbia University in 1941 – which was attended by Friedrich Pollock, Franz Neumann, Otto Kirchheimer, Arcadius R. L. Gurland and Herbert Marcuse –, as well as the collaboration with Adorno, were two key elements for Horkheimer's theoretical positioning by the mid-1940s. In this paper I will draw on Horkheimer's claim, which first appeared in "The Jews and Europe", according to which authoritarian social formations should be interpreted as capitalism's loss of inhibitions (*Hemmungen*) to make use of force and violence in order to reach its goals – valorization and expanded reproduction of capital. After introducing this proposition put forth by Horkheimer in the late 1930s, I will suggest that his approach is useful to discuss contemporary capitalism marked by a broad backlash worldwide – populist, authoritarian and seemingly "antisystem" leaders, setbacks in democratic institutions, retreat of rights. Whereas approaches like Habermas' to a great extent idealize intersubjectivity within Welfare State capitalism, Horkheimer highlights authoritarian tendencies which are intrinsic to capitalism itself and which (re)emerge in periods of crises. I shall place this insight by Horkheimer in dialogue with contemporary approaches developed in both central and (semi)peripheral countries, such as the ideas of deconsolidation of democracy (Foa and Mounk, 2016), crony capitalism (Krugman, 2016), mafioso state (Oh and Varcin, 2002) and the elite of backwardness (Souza, 2017).

See, Read the City through the Prism of Urban Art: Reflections on Some Methodological Challenges

This paper aims to present some reflections and results of a visitor research (CNPq), entitled "The city as an arena of opportunity: Ethnography of the city's margins, aesthetics and political sharing of the sensitive". The project was built by a set of steps. The first one, completed in 2015, organized the ethnographic research, questioning the margins in the north of the state of Rio de Janeiro, Campos dos Goytacazes and revealing several practices of the city that count on diverse cultural and artistic initiatives. In the second stage of the research, an ethnography of the moving margins was observed, observing spaces of the city, walking along with graffiti artists. And finally, the opportunity to observe and analyze the process of building two squares (one in Rio de Janeiro, and the other one in Campos) with artists and actors of planning, education and architecture, allowed a reading of the city from various artistic expressions. This paper aims to exemplify reflections that point to some methodological challenges from classical procedures of survey, such as interviews, for example, that may be inappropriate to take care of the aesthetic part of the city. Considering that the

artistic manifestations, which take place in public space, resignify space forms, permanently or temporary.

Blood Boundaries? Contesting the Racial and National Identities of the Mixed-Race Philippine Men's National Soccer Team Players within Media and Public Debates

The increasingly global dispersion of elite athletes pursuing sporting careers is an important aspect of the global flow of sport-capital. International sport has enhanced this dispersion characterized by a growing tendency for sportspeople to represent a country other than the one in which they were born. Within this social sphere, questions about an athlete's attachment to place, particularly in relation to citizenship, identity and nationalism. This has been made manifest in the Philippine context where questions have been raised, mostly through media and resultant public debates, on the identities of mixed race members of the Philippine men's national soccer team, the Azkals. This paper is grounded on the case of the 'mixed-race' Azkals in the discourse on sports, media and globalization, in highlighting a theoretical discussion on the concept of transnationalism vis-à-vis the use of 'blood' and 'color' as figurative metaphors in imagining the 'nation' and 'citizenship'. In conclusion, the paper calls for a shift from employing color and blood as metaphors of race, nation, citizenship and culture and argues for instead for a massive remetaphorization of constructed ideologies which in effect challenges the idea that a national community and its identity are necessarily bounded by geographic border and its 'indigeness'. Doing this would lend itself to sociologically relevant theorizing that consciously questions attachment to place, particularly in relation of sports to citizenship, identity and nationalism within a Global South context.

Cosmopolitan Micropublics: Refugees, Education, and LOCAL/Global Interdependence

Institutional contexts can be micropublics. Amin terms these "micropublics of everyday social contact and encounter" (2002: 959). Schools, tertiary institutions and informal sites of learning require daily navigation of a range of differences. This paper considers the contemporary context of refugee mobilities drawing on a research project focussed on Syrian conflict refugees in Australia to examine how micropublics can be supported by policy. The project under discussion is also an international comparative project with Canada, Finland, Sweden, Germany, New Zealand, and the UK. This comparative dimension reveals similarities and differences where the language of integration features strongly in policy. The meanings in this integrationist discourse will be examined to consider the ways in which cosmopolitan theory, particularly banal cosmopolitanism, might provide an alternative analytical frame that works with the cultural cartographies (Ros i Solé, 2013) of refugees as well as potentially supporting the dynamic nature of cosmopolitan micropublics such as schools.

Perspectives in and from Institutional Ethnography

This presentation highlights the debates and issues raised in a new book *Perspectives in and From Institutional Ethnography* published by Emerald Publishing (December 2017) in their book series 'Studies in Qualitative Methodology'. The presenter is co-editor and contributor to the volume and the presentation explores recent developments in Institutional Ethnography (IE) and offers reflective accounts on how IE is being utilised and understood in social research. As an approach, IE is growing in significance across the globe, particularly in Canada, USA, Australia and UK and the contributors to the book, drawn from each of these countries, have discussed how they have engaged appreciatively and critically with other analytical approaches, or ways of making meaning. This includes: The Dialogic Production of Informant Specific Maps; Institutional Ethnography and Actor-Network-Theory; Standpoint: Using Bourdieu to Understand IE and the Researcher's Relation with Knowledge Generation; Institutional Ethnography, Critical Discourse Analysis and the Discursive Coordination of Organizational Activity; Community-Based and Participatory Approaches in Institutional Ethnography; and Using Institutional Ethnography to Explore the Everyday Work of Learning Mentors in an English State Secondary School. This collection includes contributions from those involved in the early development of IE alongside Smith as well as early career researchers, new to the sociology, theory and method of IE. There is focus on IE as a sociological theory and qualitative research method; the relationship between data generation and analysis in IE; implications from its findings for policy; and IE as a significant methodological approach. This involves

explication of the theoretical, the operationalization of IE, and links between the theoretical and the empirical. Significantly, it illuminates the relationship between data generation and analysis and includes consideration of its own textual relations of ruling.

REID, JAMES* (*University of Huddersfield*)

The Institutional Silencing of Care and Teachers As Care Receivers.

This presentation reports on the findings of an institutional ethnography (Smith 2005) of a primary school in the north of England during a period of regulatory scrutiny when the school was judged by government inspectors as 'performing less well than it might in all the circumstances reasonably be expected to perform'. Consideration is given to use of a narrative method, the Listening Guide including 'I' poems, and how these were utilised in revealing and analysing the co-ordination of social relations. Findings reveal complex, relational, ethical and political context in which the teachers' work is organized by powerful texts and intertextual processes. Specifically teachers are scrutinized by inspectors as needing to care about targets and desired outcomes and are silenced as care receivers. Consequently inspection work influences the process whereby social differences become anchored in the teachers bodies and they talk of stress, anxiety and depression. The presentation involves a reading of data, an 'I' poem through which attendees can gain insight into the everyday, embodied experience of teachers in a performative system of education. We will also attend to our own emotional and embodied responses to the poem and reflect on the potential of poems and performance for explicating the discipline of emotions.

REINHART, MARTIN* (*German Centre for Higher Education Research and Science Studies*)

The Unintended Consequences of Unanticipated Consequences: A Mertonian View on How Merton Has Been Treated By Sociology

This contribution will use the concept of „unanticipated consequences of purposive social action“, from Robert Merton's early paper with the same title, for two purposes: First, based on a citation analysis of the paper, the impact of the concept will be tracked quantitatively across the sociological subdisciplines and across time, up to the present. Special attention will be paid to the issue of "obliteration by incorporation" (another Mertonian concept) by comparing the sociological literature that cites the Merton paper explicitly and that which uses the concept without citing. This quantitative analysis will be extended by analyzing qualitatively how usage of the concept has changed over time. Second, the usage of Merton's concept will be used to discuss how a sociology of science that takes theoretical work in the social sciences as its object of study could look like. The neopragmatist sociology of critique will be used to elaborate on the premise that the social sciences have less control over their vocabulary and their theoretical concepts than is usually acknowledged.

RC02-JS-44.1

REIS, ELISA* (*Federal University of Rio de Janeiro*)

Looking at Changes and Continuities in the Perceptions of Brazilian Elites

Poverty and inequality are distinctive but entangled notions that sociological approaches to culture contribute to illuminate. It is at the cultural level that poverty and inequality are related, and that notions of fairness and justice define what is or is not acceptable with regards to the collective distribution of social and economic goods. While political theory has provided important clues to understand the normative issues involved, it is to sociological analysis that we must look to grasp how social actors actually conceive of such notions both in cognitive and normative terms. How do they define poverty and relate it to inequality? How do they distinguish between "them" and "us"? What policy strategies to reduce poverty are perceived as legitimate? Having researched elite perceptions in Brazil in the 1990s and again in the 2010s, I discuss changes and continuities in the ways those at the top view poverty and inequality, and explore their possible implications for social policy.

REISSIG, BIRGIT* (*German Youth Institute*)

SCHLIMBACH, TABEA* (*German Youth Institute*)

Peer Influence on School-to-Work Transitions: An Agency-Guided Perspective

Transitions from school to employment are biographical key passages that decisively shape further life courses. However, today's youth lack a

stable orientation system with predictable pathways and clear educational requirements when undergoing these transitions (Furlong/Cartmel 1997). Against this backdrop, social networks outside the family setting gain importance, among them especially peers as symmetrical socialization agents (Youniss 1994, Fend 1998) and as reference points for vocational orientation (Allensbach survey 2014). While peer influences in adolescence are a long standing matter of research, little is known on how young people approach peers in the context of vocational transitions.

Starting from a dynamic agency understanding which suggests that the role of accompanying actors is crucially influenced by the way these actors are used by individuals (Walther 2013, Pohl 2011), this work examines how young people embed peers in their transitional acting, which functions they ascribe to them in these periods and how peer roles change over time. Moreover, starting from Putnam's concept, we look at peers as bridging and bonding capital (Putnam 1995). This work builds on the empirical basis of interviews with secondary school leavers which were conducted in three waves between 2011 and 2014 (n=92, 55 and 33) within the frame of a qualitative longitudinal study funded by the German Federal Ministry of Education and Research.

Results show that school leavers assign a complex set of roles to their peers in school-to-work transitions. They rely on friends as arenas of comfort (Simmons et al. 1987) in times that produce increased insecurity and anxiety. Moreover, assuming a similar positioning, they make use of peer transitions as orientation systems for their own career related decisions. However, longitudinal analysis reveals that with increased transitional competency, but also when the adopted strategies fail, they tend to refrain from them in favor of more proactive approaches.

Class Narratives in Postindustrial Urban Development Debate. a Case Study from Poland

The paper will be based on the ongoing case study aimed at reconstructing class narratives emerging in Łódź, the third largest city in Poland which grew rapidly in the second half on the XIXth century as a centre of textile industry and island of modernization in a rural society. With polarized social structure and strong labour movement, it gained labels of "Manchester of the East" and "red" city. Under communist rule, despite the establishment of academic and cultural institutions, Łódź remained distinct, with relatively big share of unskilled workers and low quality of life. It was heavily hit by socio-economic transformation after 1989, gaining the nickname of "Polish Detroit". Since then, it has been in constant and desperate search of new identity. The reshaping of the social structure has become a core aim of strategic projects implemented by municipal authorities within the last decades.

The paper will focus on the understanding of the social class expressed in the debates about the future of the city. It will be based on the analysis of documents and media content and on in-depth interviews with political/policy and academic actors. The particular attention will be paid to the way various concepts of class penetrate the discourse. The way they are applied, understood and (re)constructed locally seem important for the design and implementation of policies.

The argumentation will be grounded in two assumptions. Firstly, social classes engage in stratification processes by everyday practices, participating in struggles over redistribution and/or by the attempts to set frameworks for debates on citizenship, representation etc. These activities can be analyzed as "class politics". Secondly, while the social structure is generally constructed on the macro level, processes occurring locally seem to play a key role in shaping living conditions and opportunities for the citizens. These local contexts seem particularly under-studied.

Culture Difference As a Strength: An Autoethnography Writing on Saving the Marriage

This is an autoethnography applied case study to address how with the culture difference between China and America, in which lie in psychological and institutional resources, a visiting scholar couple has rebuilt their marriage. When in China, with the male-dominated culture, the husband unconsciously tried to control his wife and the whole family life which arose the fight of the high-educated wife who values the respect from spouse. With no reflection of the husband, also logically rooting in the maleism, the wife had never achieved the gender equality in family. While in America, with the advantage of language, the wife took charge of the family which gave husband opportunity to understand her former situation as a dependent and cooperated to adjust the relationship. Also the gender equality and love family culture exposed through the scaring culture and legal crisis made the husband learned passively, which worked as the great source to promote the migration family change. The paper revealed how the wife actively and consciously explored all culture differences to save her marriage as well.

The Key to Success of Technology Application: An Explanation from the Intra-Organizational Legitimacy Perspective

This paper constructs an intra-organizational legitimacy analysis framework to reveal the conditional mechanism of technology application at the organization level. The retrospection of a nine-year application process of ERP in a state-owned enterprise shows how a new technology's performance fluctuation correlates with its intra-organizational legitimacy changes, composed of performance legitimacy, task legitimacy and value legitimacy. This research indicates that gaining sufficient legitimacy is one necessity for the success of technology application. Basically, performance legitimacy determines how far technologies can be transferred into the corporate sector. When a new technology application starts with performance uncertainty, it is the task legitimacy that ensures the organizational resource supplies, which serve to initiate and accelerate the technology application. Value legitimacy, on the other hand, ensures the informal resources input, which preserves the technology in crisis for future possible reuse and advance the application.

The D.O. of Mezcal in Mexico: A Tool of Exclusion for Small Producers.

The mezcal is a Mexican traditional distilled beverage, with centuries long historical roots; it is a craft production still elaborated in a traditional way mostly by small producers in several states of the country, which makes the difference with the tequila –also a mezcal– produced by industrials and distributed by large corporations. Since 1994, the Mexican State, through the Mexican Institute of Industrial Property, granted the mezcal a Denomination of Origin, in such a way that instead of being a tool of democratic development, it has produced exclusion: it does not take into account the territorial –biological and cultural– specificities of different mezcals (a generic name as "wine"), neither does it distinguish cultural and regional differences. It is designed following administrative delimitations that exclude a large numbers of traditional small producers, now forbidden to use the name mezcal for their drinks. The D.O. throws those small producers into illegality. The case shows how the definitions of D.Os. are a representation of political power since the mezcal producers included in the D.O. do not allow it to be enlarged in order to include all the genuine mezcal producers. At the contrary, supported by the State institutions and going further in the politics of exclusion, they have tried to forbid to the producers not included in the D.O. the use of the name "distilled from agave" or to oblige them to use a totally unknown name, "komil". The paper would explore alternatives of recognition of the quality of the mezcal not included in the D.O. Those alternatives depend on the organizational capacity of small producers, the negotiation they engage with the institutions of the Mexican State and the social relationship they acquire with others actors in the beverage chain.

Chronically Sociological: Sérgio Luiz Bianchi Cinematography

This abstract proposes a sociological study of contemporary Brazilian cinema, especially the cinematography of director Sérgio Luiz Bianchi (1945). His main cinematographic productions are Omnibus (1972), A Segunda Besta (1977), Maldita Coincidência (1979), the documentary Mato Eles? (1982), Divina Providência (1983), Romance (1987), A Causa Secreta (1994), Cronicamente Inviável [Chronically Unfeasible] (2000), Quanto vale ou é por quilo? (2006), Os Inquilinos [The Tenants] (2009) and Jogo das Decapitações (2013).

The Sociology of Cinema intends to locate in specifics works in cinema to understanding the social constructions by the analysis of documentaries or fictional films. In the present abstract, the sociological method chosen to interpret film productions is based on the reading of the images, examining cuts and planes of sequences (Jullier; Marie, 2012). However, in Pierre Sorlin's (1982) thought this kind of examination could assist in the sociological study of cinema, considering that the cinematographic productions apprehend specific social phenomena, from certain values. In this way, the films may be understood as narrative constructions that are based on the social imaginary and the speeches of the agents in the society. Furthermore, the film presents an end result of the creation process that reconstructs reality. Otherwise, the author observes that the work is a retranslation of a set of dominant ideas at a period time.

The research aims to study the complete Sérgio Bianchi's filmography, discussing with the social theories, special features of his ideology noted in the

movies, such as economic crisis, poverty, exploitation, social classes, etc. These subjects are interpreted by the filmmaker in his movies. Thereby, there would be the possibility of thinking national quests from his interpretations on the social reality.

Hearts and Minds: The Experience of the War and Speeches.

Hearts and Minds (1974), directed by Peter Frank Davis (1937) has as its theme the Vietnam War. The work approaches of social institutions in the United States and Vietnam, interacting with government officials, religious leaders, and the public sectors in order to sketch the historical context that promoted the invasion of US troops in Southeast Asia. The film also discusses the historical background of the discourses that shape the American society and formed the national culture. The instrumental sought in film criticism provided the observation of language features and aesthetics of which director Peter Davis put his hand in his filmic production to design a framework to recover the details of projection: scenarios, framing, sequence effects, use of soundtrack, etc; devices that are inserted in the documentary. It was also found that the film can be examined in thematic blocks that show the relationships addressed by interviews with panoramas described by the narrative construction. The research enabled the more accurate understanding of American and Vietnamese ethos, as there is a real construction given by narrators who guide the direction and way of life of every society, there is a clash ideologically and counterpoints being inserted in the development of movie. The culture of each nation presented by the discourses can be understood by the ethical issues that address the social representations and questions that may occur, in order to conduct expressed by the director and the treatment given by the interpretation of social reality. The documentary shows the US belief in being able to control the fate of the world. The film shows a nation stuck in his "iron cage".

Retirement Migration: A Way to Evade Social Exclusion?

Retirement Migration: A way to evade social exclusion?

In the Global North, age intersect with class such that those of higher classes might be able to stave off the designation of "old" longer than members of lower classes. While members of higher classes might be able to engage in high levels of consumption that mark them as privileged members of society, old people from the middle and low class are generally seen as a burden for society because of their presumed dependence on social policies. Such ageist representations are widespread and partly responsible for the exclusion old people experience.

At the same time, increasing numbers of retirees are migrating to Southern countries. While such migration may constitute a search for a better life, it may also be a way for middle and lower class members to avoid a loss of social status, especially for non-wealthy retirees.

In this paper, our aim is to contribute to a better understanding of why retirees migrate to Southern countries and to assess the extent to which it may constitute a way for some of them to challenge their social exclusion. To do so, we use qualitative interviews that were conducted in Spain among retirement migrants coming from diverse European countries, and who have mid-range or low incomes. An in-depth analysis of their discourses about their lives in Spain and the reasons why they left their previous country reveals that they feel that they occupy a social place in Spain that they would not have if they had stayed in their home country. For them, the negative representations of aged people that exist in their previous locations marginalized them. By contrast, in Spain, they perceive themselves to be valuable, especially because of the economic contribution that they bring to the region where they live.

Women, Mothers, Soldiers: Protest in the Israeli Context

The reality of a long-standing intractable Israeli-Palestinian conflict, requires both a strong army ready and able to cope with the enemy's challenges and a 'patriotic' civil population that identifies with society's goals and its 'existential threats and needs'. When this is the definition of the reality a national ethos arises that attempts to rally all (or most) society's members around a functional narrative: We are right (and 'they' are wrong); We are good, just and moral (and 'they' are bad, unjust and immoral), and the like.

Women and especially mothers of the fighting soldiers are put in an emotionally contradictory situation: As mothers, or virtual mothers, they tend to protect their children/soldiers from any risk; But as a patriotic, loyal, devoted member of their society they are supposed to encourage and back the soldiers to fulfil their military duty: fight for their country and even be ready to sacrifice their life. In that

sense women/mothers role is socially critical, although they usually are not the actual participant in the fighting.

In this paper I will discuss the periodical change in Israeli women/mothers attitude along time on the background of societal-ideological cracks that gave rise to various forms of women protest.

P.S. MachsoWatch, the largest women protest organization, will serve as a case in point to contextualize my discussion.

Assessing the Quality of Nonprobability Online Panels. the Italian Case.

Online panels are increasingly used in social research. The advantages of online panels are undisputed (i.e., fast data collection, lower costs). However, online panels – and in particular the nonprobability ones – have a number of limitations, due to coverage error and self-selection into the panel. The key issue is the quality of the estimates produced using nonprobability online panels that result not to be representative of the population they intend to represent (AAPOR, 2010; Callegaro *et al.*, 2014). Despite the relevance of this issue, there are few studies that addressed this topic; these studies have found strong evidence for bias and have shown that adjustments strategies may not be effective in compensating for bias. The overall aim of the work is to assess the quality of the estimates produced using an Italian nonprobability online panel and investigate the effectiveness of different post-survey adjustment strategies (i.e., post-stratification, propensity score adjustments) in reducing the bias.

We compare estimates from the online panel and two "gold standards", computing percentage differences and appropriate statistical tests. When appropriate, we use regression analysis. We then weight the data implementing different post-survey adjustment strategies. As gold standards we use the Multipurpose Survey "Aspects of Everyday Living", that is a probability-based survey that collects a wealth of information on the socio-economic characteristics and opinions of the Italian population (N=44.974; RR: 78.9%), and administrative data from the Italian Registry Offices. We also use data from the Italian online panel Opinione.net, that is a nonprobability online panel, established in 2011 (see also <http://opinione.net/>).

Civic Engagement As the Moral Duty to Help: Beyond the 'Conflict over Family' in Slovakia

The European policy on the recognition of LGBTQ rights has been encountering a backlash in the post-communist EU member states. In Slovakia, the national referendum about same-sex marriages and child adoption was organized by advocates of the 'traditional family' in 2015. Massively protested by LGBTQ rights activists, the referendum triggered so called 'conflict over family'. This paper studies how people engaged in this conflict make sense of their activism. I explore the civic engagement surrounding these issues by analyzing the interviews with representatives of both sides of this conflict. I investigate the meaning-making process of the activists utilizing the perspective of the strong program in cultural sociology. Whereas other scholars and media often depict the 'conflict over family' as a battle between irreconcilable value systems or polarized worldviews, I argue that the civic representatives of both opinion groups draw on the same moral and conceptual meaning structure – the engaged activists see their work as a form of helping others. They make sense of their engagement through the narrative of helping, articulate their feelings of moral duty to help, and, ultimately, perceive their work as a way to moral self-fulfillment. The consensus of activists on the commonsense moral principles can be a fruitful starting point for debates on the topic of same-sex partnerships and LGBTQ rights by providing strategic discursive devices to mediate the discussions of such conflicting issues. Nevertheless, this finding also makes us question: If civilly engaged individuals share the same moral reasoning of their work, at what point, or on which layer of meanings, does their reasoning diverge? And how does the shared eagerness to help integrate with the specific narratives and traditions of concrete social movements?

REUSCHLEIN, ROBERT* (*Real Economy Institute*)

Sources and Causes of the Kondratieff Wave

It is a mistake to consider the Kondratieff Wave a socioeconomic cycle instead of a natural cycle with profound socioeconomic implications. The principal cause of the cycle is found in a long term energy balance tradeoff between the Earth's lands and oceans. The cause of this energy imbalance is the differential rate of evaporation of water over land and ocean. This imbalance tends to leave the land warming three times as fast as the ocean. Extensive evidence for this planetary

system is found throughout the Earth system. The author has sought to find three or more proofs of each major feature of this system in an effort to triangulate each major feature. Alternative theories have been tried and found wanting in some cases, but the basics are clear except that further work on details is definitely needed. Known socioeconomic dynamics tend to reinforce and smooth out the natural forcing of the system. Human choices seem to be guided by natural forces in the case of the political cycle, but otherwise the natural cycle tends to drive the economic cycle and both tend to drive the political and war cycle. Imbalances buildup and eventually release throughout the combined cycles, with human factors often exacerbating situations along the way. Over a long period of studying and following the news, it turns out many extraordinary situations have historical similar precedents with most cycles about 54 years with repetitions sometimes on the double cycle or half cycle length, often tied to the underlying natural cycle. The author has accumulated about 60 major events that tend to show accuracy higher for longer term comparisons over shorter term events. Peak to peak is the best way to compare an event with historical precedents. Starting year is the best way to measure a war.

Music Deserts: How Social Inequality Affects Accessibility to Music Resources Important to Actively Participating in Music

Recent findings in the cognitive neuroscience of music suggest that active participation in music has benefits such as increasing reading comprehension, soothing babies, and helping increase synapses beneficial in differentiating music and speech from noise. However, these benefits are not accessible to all communities. Research done by Basmat Parsad and Maura Spiegelman for the U.S. Department of Education (2012) revealed that elementary and secondary schools with a higher rate of poverty have fewer music teachers, music courses, dedicated rooms for music, and proper music equipment. The purpose of this research was to examine whether social inequality in the U.S. correlated with a lack of music instrument stores (MIS) in certain geographical regions. These areas can be thought of as Music Deserts. To examine if social inequality correlated with access to MIS, I quantified the number of MIS registered with U.S. Census data within zip codes of New York City and Chicago. I also utilized U.S. Census data to identify characteristics of each zip code such as population size and median household income. After importing data into SPSS, I analyzed correlations between music stores per square mile and factors such as education, income, and race. Linear regression suggests significant correlation between Music Deserts and percentage of the population with a bachelor's degree or higher. Music Deserts are important to recognize because they identify areas where a lack of resources deprive lower income communities from benefits associated with active music participation.

Causal Mechanisms of the Socio-Ethnic Conflicts within Academe of Russia, Ukraine, Canada, and the USA: Comparative Analysis

The paper we proposed for presentation at the XIX ISA Congress Session "Education at the Margins: Towards Liberation or Subordination?" deals with the causal mechanisms that produce and reproduce discontent, conflicts, and protest behavior within academe in Russia, Ukraine, Canada, and the USA. It is oriented toward comparative analysis of the everyday life practices and inter-ethnic interactions between the faculty members, administration, staff, and students in the respective countries.

The basic research questions are:

1) What are the causal social mechanisms that determine a likelihood of the ethnic/racial tensions and conflicts in the academe?

2) Is it possible to prevent, to control and/or to normalize such conflicts? What are the routines and techniques of the prevention and control?

The problem of the interethnic and international relations in the academic milieu cannot be treated only in the context of the clash of cultures (and associated meanings, value orientations, aesthetic judgements, etc.) connected to the national identity. It is required to highlight at least several possible sources of conflict: class, cultural, rural/urban, local /foreign. Each of these conflict-creating dynamics has a distinct structure and causal mechanisms.

In terms of methodology the paper is oriented towards: a) comparative perspective centering two strategies – qualitative and quantitative and using mixed methods research; b) methodological approaches progressed in Visual Sociology; c) computational social sciences converging most recent tactics of using computers' and software's potential as well as computational methods for studying social processes.

The paper is based on specific on data and empirical materials that have been obtained during three years of the field work organized and conducted by the

International Research Laboratory TANDEM at St Petersburg State University in 2014-2017.

Clinical Sociology in Quebec, USA Pragmatism and European Critical School

Theories and practices related to clinical sociology in Quebec were much influenced by United States contributions. Let us mention approaches such as the Group dynamic, the Planning of Change, Organizational Development, and theoretical developments from the Chicago School, the existential and humanistic psychology, the pragmatics in philosophy. But researchers and practitioners in Quebec were also influenced by European contributions: post-marxist critical sociology, psychoanalysis, the socio institutional school...A rare combination has occurred that permits a confrontation of those contributions, showing for example how some basic theories and practices in United States depend also on European contributions and the reverse. To illustrate how Quebec researchers are dealing with this double influence, we present some works in the field of the clinical posture in group and organizational interventions, in the areas of community development and the practice of life histories or narratives.

\$15 or a Union? Dilemmas of Workers' Power in the Fight for \$15 Movement in the United States

One of the more prominent recent labor mobilizations in the U.S. is the "Fight for \$15" campaign, sponsored by the Service Employees International Union (SEIU) and sparked by a series of highly-publicized strike actions by workers in the notoriously hard-to-organize fast food industry. Since 2012 the campaign has conducted more than a dozen nationally coordinated one-day strikes with participation by thousands of workers, and it has won local legislation boosting the minimum wage to \$15 (more than twice the federal minimum) in several major cities and the states of New York and California.

In this paper, I use a power resources framework to analyze the Fight for \$15 campaign. In fast food, the structure of the fissured workplace undermines traditional forms of workers' power. Instead, organizers have pursued a dual strategy: In the industry, SEIU has led a corporate campaign targeting McDonald's in particular, while politically the campaign has built local coalitions to win regulatory reforms on wages and working conditions. In both, the strike actions have been crucial not for their structural but their symbolic power, as the public drama of protests in the archetypal sector of low-wage, precarious work has helped galvanize popular support for reform.

As it moves between the industrial and political spheres, however, the movement encounters varying institutional conditions affecting the position of actors and the rules, resources, and strategies for action. Notwithstanding its achievements, the campaign now faces a crisis of sustainability as it has yet to win collective bargaining rights and new union members in fast food while the SEIU faces grave threats to its own resources from legal challenges before the US Supreme Court. The result recalls a classic dilemma of labor political action: policy gains may benefit both union and non-union members, but also need to strengthen workers' associational power.

Does Income and Education of Working-Women Transform Social Values: An Evidence from Pakistan

Women's socio-economic empowerment is instrumental in transforming the societal values particularly in developing countries. However, this transition from traditional to modern social values is linked to women's income and education levels. This paper investigates this phenomenon in the context of working women in Pakistan. To this extent, three hundred and six working-women were interviewed in urban vicinity of Lahore city. By employing Multinomial logit model our study confirms that socio-economic status of working-women plays a significant role in transforming their social values. Both income and education levels of working-women tend to display similar association to values, although differences persist in some important dimensions. Women's empowerment through higher education and rising income leads to more bargaining power in household decision making, increasing political participation, and valuing gender equality. However, modernization as result of increased income levels and education has led to a decline in importance of religion in women from upper class unlike the lower class.

Work Ability in the Digitized World: Organizing Work to Support Learning and Development

The digital transformation requires new forms of work organization that help employees preserving their ability to act in an uncertain environment. Healthy and capable workers are considered to be essential for organizational success and innovations. However, the digital transformation causes harmful consequences for workers if demands and individual resources are no longer balanced. Thus, jobholders need to be prepared for meeting new demands by a job design that enables workplace learning and permanent development of vocational competencies, including digital expertise, methodological skills, social skills and self-competence. Our presentation reports current findings from Germany relating to the preservation of work ability in the digitized world. For our analysis we use both quantitative and qualitative data from a representative survey of employees and from different case studies in financial, insurance and civil service sectors. The importance of workplace learning is demonstrated as well as opportunities for employees, supervisors and organizations to enhance work ability in a rapid changing world of work through work organization and an organizational learning culture.

Capacity of Program Second Half (Programa Segundo Tempo - PST): Cultural Matrix of Educational Sport

In Brazil sports intercalate with society through the different sectors, however in the last 14 years the development of the Ministry of Sports influenced the country with actions of decentralized sports. These actions, shared among educational sport, leisure and performance, are policies meant to help the population from three different sports. The educational sport has a program named Program Second Half (PST) that discloses and produces a collection of information to organize the types of use of sport for the involved professionals. This information is named the cultural matrix of educational sport, because it systematizes a professional formation so the Nucleus Coordinators who perform with the population can be capable of applying this sport format. The objective of the research is understanding how the educational sport matrix produces information about leisure and how the Nucleus Coordinators apply leisure with the participants. As methodology we performed a documented research about PST and analyzed the data. We noticed that PST is formed by a very distinct group of people and that is not convinced of the inclusion of leisure in its principles and guidelines. Even without this clarification the PST uses a strategy to act through leisure which is the special program Recess of Vacation. The form that leisure affects the Nucleus Coordinators in the capacity of PST is in the contents transmitted via the EaD Capacity and on the books and Recess on Vacation. The leisure theme is discussed in the EaD Capacity and in the book in a specific chapter which discusses the theme proposing ways of implementing it on the groups. This abstract reports on research funded by FAPEMIG (Fundação de apoio a pesquisa em Minas Gerais - Research Support Foundation of MG, Brasil).

Law, Sexuality and Subjectivity: A Critical Contribution

The relationship between legal field and sexuality is a particularly challenging object of inquiry for a critical sociology of law. It has been included in a research agenda that has gained an unprecedented force in academic work, due to the increase of media attention, political activism pressure and legal reform projects. The lineage of feminist and queer sociolegal epistemologies, in their synchronies and contradictions, has been seen as a privileged intellectual angle to address the modes of production of sexual truth and justice, enabling the deconstruction of different expressions of patriarchal rationality both in social interactions and legal reasoning. However, much of these political or analytical perspectives are based in specific semantics of sexuality whose origins, presumptions, paradoxes and further consequences are far from being clarified. The aim of this communication is to put in evidence some of these underlying dimensions focusing "sexual orientation" as a cultural category that claims for a deeper sociological discussion not only around umbrellas like identity, discrimination, deviance, dangerousness and normality, but also on what is – and what is not – sexual in the legal uses

and imagination of "sexual orientation". Through a sample of Portuguese case law and legal controversies, this communication will try to map some points of tension within the forensic approach to sexuality, exposing some dilemmas and misunderstandings that characterize the coalition between law and psychiatry in the task of framing, meaning and governing sexuality as a source of power, constraint and subjectivity.

Unequal Society and Negotiated State: Post-War Plural Policing in Abidjan

After 20 years of neither war nor peace, Ivory Coast's economic boom in the « post-conflict » era is hailed as a peacebuilding success story, as the country's GDP doubled since 2011. However, almost half of Ivoirians survive with less than \$2 per day. Abidjan symbolises this contrast of a non-inclusive economic development, while the fragmented security sector inherited from decades of crises is a routine concern.

This paper is part of an on-going 6-month ethnographic study of shifting interrelations among segments of actors which police Abidjan: public police, mixed elite police/army units, international/private security firms, vigilante groups, traditional hunters. Without assuming pre-defined categories or relationships of power between actors, this study aims at understanding the hegemonic quest of the state for the monopoly of violence in light of the negotiation for power of plural policing actors. To undertake this, we chose to compare through thick-descriptions place-specific relations of power in 3 economically and socially contrasting *communes* of Abidjan, through interviews and observations with policing actors and citizens of targeted *communes*.

Thus, this paper seeks to explain for whom, for what, and how policing is delivered, and how it intersects with political economy and political domination. This is a contribution to studies of what is government in contemporary Africa in a context of an increasing "securitization" of "development" in urban settings, at the intersection of different traditions in social sciences. This paper will be presented as the field research is still on-going, therefore presenting preliminary results of the study.

RICCIONI, ILARIA* (*Free University of Bozen,*)

Avant-Garde Art and Politics: A Lost Chance?

Art is always political, for avantgarde art the relation is even more visible and ambiguous at the same time. The artistic breakdown of the Futurist avant-garde, for example, was a cultural break born from a situation of social and intellectual stagnation. The basic terrain had been laid by the revolutionary thinking that had developed since the second half of the nineteenth century from the revolutionary crisis of 1848. In this, Italy was unquestionably the tail end of an intellectual ferment that had formed around ideals of social liberation, especially in France, as the central territorial space of the European continent.

On the role of the Fascist party in relation to the spread of Futurism, Teige took a precise stance, influenced by reading Prezzolini who, in his criticism of Marinetti's book *Futurism and Fascism* stated that links between Fascism and Futurism essentially dated back to Marinetti's personal friendship with Mussolini: "However, in reality, Fascism was the antithesis to and a reaction against Futurism rather than an analogy of it. In other words, the exact opposite of Futurism." In this paper I will inquire the relation between arts and politics especially by the first Twentieth century avant-garde, taking into account Baudrillard's and Badiou positions on art critique and art implication to power.

RICCIONI, ILARIA* (*Free University of Bozen,*)

Simmel and the Issue of Autonomy in Modern Societies

According to Georg Simmel historical change is basically a change of social forms, as well as the subject can be seen as a changing entity that define itself in the relationship. In this paper three main issues of Simmel still of great contemporaneity will be taken into consideration: The naissance of individuality in modern society in connection with the change of forms of relationships; the spatial issue as the order of an interconnected society to relational nets; the influence of money on the construction of social relationship. According to Simmel, differently from Marxian and Durkheimian analyses, modern society is a chance for individual to develop autonomy and reach for an own path to social and personal realization. In this paper these issues will be analyzed in order to highlight the high potential of sociological perspective still exerted by Simmel's acute work on our contemporaneity.

RC13-255.3RICH, KYLE* (*Brock University*)MISENER, LAURA (*Western University*)*Resisting, Reproducing, and Recreation Rurality through Leisure: Insights from Rural Canada*

Despite the persistent imagery of rural communities as homogenous, wholesome, and static, rurality in Canada is a diverse and dynamic concept. Rural citizens and communities are often required to navigate fluctuating economies, the outmigration of youth, and difficulties in accessing basic services such as health care, transportation, and other social supports. Further, following the increased professionalization of public services and leisure industries, rural citizens face issues of capacity accessing resources and designing or delivering leisure opportunities that align with the expectations and restrictions of public, private, and non-profit organizations. Conversely, rural communities are also often characterized by a relative abundance of leisure space (e.g., parks, forests, community centres, sports facilities, etc.) and rural sport and recreation are often praised as some of the most important (and in some cases the only) social activities. In this chapter, we will explore identity politics in the context of contemporary rural Canada. We do so by drawing from extensive fieldwork conducted as part of a participatory action research project with a rural community in the Almaguin Highlands Region of Northern/Central Ontario. We will discuss the role of leisure as a way of expressing and negotiating the tensions inherent in rural identities in contemporary social contexts characterized by rationality and connectivity. Our discussion will highlight the way that leisure allows rural citizens to reproduce traditional ideas of rurality associated with the physical environment and close family relationships, but also as a space to resist traditional discourses and create new spaces for redefining rurality. This chapter will contribute to the scholarly understandings of rural leisure as third spaces and the politics of leisure in changing social contexts.

RC25-481.3RICHARDSON, PETER* (*Hokkaido University*)NAGASHIMA, MIORI (*Hokkaido University*)WADA, MASAKO (*Hokkaido University*)WATANABE, MAKOTO (*Hokkaido Bunkyo University*)PIHLAJA, STEPHEN (*Newman University*)KHEOVICHAI, BARAMEE (*Silpakorn University*)*Debating Blasphemy: Positioning and Power Dynamics in Emotive Face-to-Face Interaction*

In May 2017 Basuki Tjahaja Purnama, popularly known as Ahok, the former Christian governor of Jakarta, Indonesia, was found guilty of blasphemy and sentenced to two years in prison. The highly publicized trial and its result highlight the very sensitive and contentious issues surrounding the notion and enforcement of blasphemy and its relationship to social power. This paper focuses on a discussion about the blasphemy laws and the trial between an Indonesian Muslim in favor of the blasphemy charge and an Indonesian Christian opposed to it. It investigates how two participants with diametrically opposing viewpoints position each other in pre-discussion essays and during face-to-face interaction. We approach the discussion from the perspective of positioning theory (De Fina & Georgakopoulou 2012; Harre & Langenhove 1999: 10; Moita-Lopes 2006) and specifically Bamberg's (1997) framework of narrative positioning. This allows us to explore how particular frames, discourse strategies and storylines reflect multiple, fluid power relationships within unfolding positioning choices. The analysis also focuses on how the participants draw on a range of sometimes explicit and sometimes implicit dominant and contested discourses (Fina, Schiffrin & Bamberg 2006: 255-256) connected to national, religious and gender-based identities. We found that, while the pre-discussion essays contain a range of positioning choices that connect to dynamics of power and dominance, the effects of many of these factors and the chemical reactions between them became more complex and intensified during the face-to-face discussion. This leads us to conclude that face-to-face interaction can open up or further intensify positioning pressures and strategies. These can in turn lead to greater convergence and equilibrium, but also increased levels of emotion, domination, and acquiescence.

RC49-829.4RICHAUD, LISA* (*Fudan University*)*Rural Migrant Mental Health in Shanghai: Urban Transformations, Stress, and the Management of Subjectivity*

Drawing on recent ethnographic data on rural migrant lives in both suburban and central neighborhoods of Shanghai, this paper challenges conventional sociological understandings of the relationships between the urban environment and migrant mental (ill) health. It explores the mediations that operate dialogically

between, on the one hand, the city as lived by migrants through particular places and situations, and, on the other hand, distress, ill-being, and mental disorder. Rather than trying to ascertain or argue against the prevalence of mental illnesses among migrants, it emphasizes the active role of individuals in the management of their own subjectivity, that is, the everyday acts of preserving, through varied bodily, affective, and mental practices and adjustments, an enduring orientation toward the present and its undecidable futures. The city is thus apprehended through the habits of dwelling and the resonances of lived habitat, which filter the mental experience of migrants. This perspective enables to move beyond linear explanations where commonly identified urban stressors (poor-quality housing, hard working conditions, social exclusion and the like) directly impact migrant mental health.

RC11-217.1RICHTER, ANNA* (*University Kassel*)*Analogy or Co-Construction? Intersectional Perspectives on "Doing Age" and "Doing Gender"*

The concept of "doing age" has been developed in analogy to "doing gender". From an intersectional perspective it becomes apparent, that age and gender have not only similarities (and maybe differences) in the mode they are constructed on the level of everyday practices, they are also constructed simultaneously and interact in a dynamic and complex way. In this regard they can be understood as inseparably interwoven.

In my recently finished qualitative research project, I focus on the intersection of old age, gender and East German belonging, using biographic narrations to examine the modes of constructing differences and the ways of their intersection. In narrative practices people do not only construct differences but also do re- and devaluations of these different positions, in regard to social norms and structures. According to theories of recognition, this valuations can be understood as powerful structures, generating social esteem and integration on the one hand, devaluation and exclusion on the other.

In my presentation I will first ask, how far the analogy of doing age and doing gender reaches and which differences must be considered. Using the results of my research, I will show how the modes of "doing age" and "doing gender" differ in narrative practices. This should help to clear the potentials and limits of the analogy between age and gender. Second, I will show how the interaction of old age and gender as well as the co-construction of old age and East German belonging appear in the biographic narrations, how this affect the doing of age and what it means to the valuations given to the different positions.

RC38-JS-3.2RICHTER, ANNA* (*University Kassel*)*Devaluation of Biographies: Life-Stories of Older Women from Eastern Germany*

The characteristics of age and ageing are rarely considered in theory or empirical research of intersectionality. The difference and inequality between East- and West Germany neither. In my recently finished research project, I focused on the intersection of gender, old age and East German belonging, using biographic narrations to examine the subjective appropriation of different socially structured and devaluated positions.

Empirically, the research is based on a sample of four narrative biographic and eight structured biographic interviews with retired women from Eastern Germany at the age of 61 to 86 years. To conceptualize the relation between the different intersectional categories, I used the "both/and-strategy" suggested by Lena Gunnarsson (2017) and Ina Kerner (2009), asking for analogies and differences between the categories as well as for their intersections. Furthermore, I used recognition as an analytical tool to investigate different forms of social appreciation and integration on the one hand, social degradation, stigmatization and exclusion on the other hand.

In my presentation I will discuss this methodological considerations as well as my central results: First, the structural devaluation of East German biographies is highly important for the interviewees identity-constructions. Second, the intersections have differentiated effects, which is a) the interweaving of different positions of inequality can lead to new discrete forms of subjectivation, b) intersectional structured positions are not necessarily linked in the subjective appropriation and c) the coupling of positions of inequality can increase experiences of difference and lead to a higher degree of vulnerability.

RC49-830.3RICHTER, DIRK* (*Bern University, Center for Psychiatric Rehabilitation*)*Between Natural Kinds and Non-Kinds: A Review of Current Psychiatric Stakeholders' Views on Mental Illness and Treatment*

Historical and current mental health practice show a variety of illness concept being utilized by users, professionals and other people involved (e.g., carers). For

several decades, a dominant concept such as psychoanalysis, social psychiatry or biomedicine has shaped the view on mental health and illness. While biomedicine currently remains a strong perspective predominantly in academia, a diversity of new illness concepts have evolved.

This contribution seeks to identify current theoretical and practical perspectives that inform today's discussions. The concepts that are being reviewed range from 'Natural kinds – biomedicine' over 'Harmful dysfunction', 'Practical kinds – biopsychosocial psychiatry', 'Recovery', 'Neurodiversity' to 'Non kinds – denial of illness existence'. For each perspective, the leading stakeholder groups will be identified. By identifying relevant stakeholders, it will become clearer that the current diversity of illness concepts is one of the main causes of conflicts that we can see within the mental health care system. While these conflicts traditionally have happened mainly between users and professionals, today we see further splits of perspectives within mental health professionals or within the user community.

Finally, this contribution will explore the consequences of this 'postmodern' state of illness concepts. A strong unified and universally acknowledged mental illness concept seems to be out of reach. On the contrary, we can expect the treatment institutions to be confronted with an increasing diversity of views, enriched, for example, by non-western cultural attitudes on mental health and illness.

RICHTER, DIRK* (Bern University, Center for Psychiatric Rehabilitation)

Social Exclusion of People with Severe Mental Illness in Switzerland: Results from a Nationwide Representative Health Survey

Aims: People with severe mental illness (SMI) have a high risk of living socially excluded from the mainstream society. Policy initiatives and health systems aim to improve the social situation of people who suffer from mental health disabilities. The aim of this study was to explore the extent of social exclusion of people with SMI in Switzerland.

Methods: Data from the Swiss Health Survey (SHS) 2012 was used to compare the social exclusion magnitude of people with SMI with those suffering from severe physical illness, common mental illness and the general population. Variables from the SHS question set and from the indices set were used to represent several dimensions of social exclusion (employment and income, social network and social activities, health problems). Logistic regression was used to analyse exclusion differences between the above named groups. Analyses were adjusted for age and gender.

Results: With the exception of Instrumental Activities of Daily Living, we found a gradient of social exclusion that showed people with SMI to be more excluded than the comparison groups. Loneliness and poverty were widespread among people with SMI. Logistic regression analyses on each individual exclusion indicator revealed that people with SMI and people with severe physical illness were similarly excluded on many indicators, whereas people with common mental illness and the general population were much more socially included.

Conclusions: In contrast to political and health system goals, many people with SMI suffer from social exclusion. Social policy and clinical support should increase the efforts to counter exclusionary trends, especially in terms of loneliness and poverty.

RICHTER, RALPH* (Leibniz Institute for Research on Society and Space (IRS))

Social Innovation and Collective Action in Rural Communities

Rural regions are said to be areas where people are rather conservative and backward-looking than innovative and open-minded. Rural communities seem to maintain a traditional lifestyle and to be reluctant to change. Of course, these stereotypes ignore the many initiatives and new developments existing in these areas. Like in other places, in the countryside innovation and inventions come into being every day. People in villages and small towns constantly search for new ways of dealing with challenges and opportunities. This is also reflected by recent studies which direct attention to social innovation in rural regions. (Dax et al. 2013, Bock 2016, Neumeier 2016) However, innovative solutions and new developments remain still underrepresented in research in a time when demographic change and dying villages dominate the debates (Christmann 2017).

By means of two qualitative case studies and by applying social innovation theory (Rammert 2010) I will show how communities in a village and a small town proceed to deal with challenging situations in innovative ways. Even though the circumstances in both places differ (the investigated community in East Germany jointly constructed a wastewater treatment system, the observed community in Mid-West Ireland established a civic and sports centre which made the town an attractive place for in-migrants) both developments have some characteristics in common: in both cases an innovative idea promised to solve a need in a better way than the solutions already at hand, in both places the local community actively supported the idea and in both places persons with specific expertise and shaping power were crucial for the success and the sustainability of the initiative. My presentation wishes to contribute to a new rural sociology by focussing on rural

innovation (instead merely on rural adaptation) and on collective action and community spirit (instead on villages as "mono-functional dormitory settlements").

RICHTER, RALPH* (Leibniz Institute for Research on Society and Space (IRS))

"like a Spider in the Web": Local Capacity Building By Interconnecting Rural Communities

Many rural regions in Europe face challenges such as a high out-migration and low in-migration of young and well-skilled people. From this follows a lack of people who have fresh ideas, who question the status quo and act as change makers. At the same time the level of qualifications is rather low. In this situation policy makers and scholars direct high expectations to social enterprises. Social enterprises are said to be innovative actors who are able to find new solutions to social challenges and to operate in areas where the state and the market withdraw (Pless 2012, Munoz et al. 2014). This makes them to promising actors and capacity builders in rural regions.

In the proposed presentation I will present and bring up for discussion results of four qualitative case studies, conducted in rural regions across Europe. By applying social network theories (Burt 2004, Obstfeld 2005, Vedres/Stark 2010) and the conception of embeddedness (Granovetter 1985) I will show that rural social enterprises operate as *intermediaries* who interconnect rural communities with supra-regional networks and organisations on other spatial scales. This enables them to mobilize knowledge, ideas, support of powerful decision makers and financial resources which would otherwise be hardly available in remote rural communities. The far-reaching network contacts turn out to be important sources for the development of innovative solutions which rely on the *recontextualisation* of ideas rather than on domestic inventions. Rural social enterprises contribute to capacity building by improving the access of rural communities to powerful networks and support structures and by fostering social innovation.

Power and Violence in ER: Analysis of Conflictual Interactions between Patients and Caregivers in the Emergency Room of a Local Hospital in Northern France

Emergency departments in public hospitals in France are open 24/7. During the night, the emergency room (ER) becomes the main point of admission to the hospital. Each patient arriving in the ER must be examined. The ER staff typically deal with organisational constraints and a variety of patients, whose conditions range from "life or death emergencies" to "routine consultations". In performing their duties, the ER staff are constantly confronted with individual patients' subjective perceptions of their own health. Analysing professional practices and caregivers' victimization, this proposal, based on ethnographic fieldwork (combining observations and interviews) conducted over a year in the ER of two local hospitals in northern France, will discuss the conflictual interactions caregivers face in their daily practice and the balance of power that takes place between patients and health professionals. Three situations experienced as potentially violent will be highlighted:

- Patients leaving against medical advice or refusing to take treatment despite medical advice, which can be experienced by healthcare professionals as a negation of their professional identity.
- Applying medical restraints during certain medical procedures to restrain patients and prevent them from injuring themselves is often considered by caregivers as a "dirty job", raising the question of individual rights and freedom.
- The use of patient flow management systems by nurses involves monitoring patients, who are asked to comply with the role of the "good patient".

These three examples highlight the balance of power in the ER which expression can be experienced as violent by caregivers and patients and that both parties experience forms of stress and discomfort in ER.

Mapuche People in Chilean History Textbooks: Producing Otherness from the Beginnings of the Nation State

Indigenous peoples have always occupied a special position in Latin American nations history, being subject of multiple representations linked to changing interests concerning national identity. This is true also for Chile, where mapuche people, the largest indigenous group of this country, have been oppressed through many different political decisions at least during the last 130 years. Inside of the school system, Chilean textbooks for public schools – which have been produced or distributed by the ministry of education since mid of the

19th century- have permanently reproduced negative stereotypes of mapuche people, thus contributing to their marginalization and the long lasting conflict between mapuche people, the Chilean state and forestry companies installed in ancient mapuche territories. The paper presents a long term analysis of a sample of history textbooks, produced from 1846 to 2016, based on critical discourse analysis. The main findings are three: first, during the second half of 19th century, public discourses about mapuche people – present in historiography, literature, parliament and press- were of much more influence than the guidelines suggested by the nascent curriculum. Second, the Chilean state's interest concerning mapuche territory evidently influenced the changing representations of mapuche people: the representations shifted from "brave warriors" (against the Spaniards) to "wild" and "barbarian"; later, when their land was occupied and the people "pacified", to "true Chilean race", and finally, to "indigenous peoples". Third, there is something that never changed: mapuche people were always included in the narration of Chilean history in a discontinuous way, thus failing to recognize them as historical subjects. Chilean history textbooks have been producing otherness for too many years, missing so far the chance to be a mediation and reconciliation tool.

Aesthetic Cosmopolitanism As a Means of Entry for Global Imaginaries: A Research with Brazilian Young People

The increased circulation of cultural goods, to the point that they are disseminated worldwide, develops a sense that a global common knowledge exists. Still, we ask: to what extent does globalization and modernity encourage cosmopolitanism? In order to understand this issue, we discuss the meanings of cultural globalization in young people's everyday lives, based both on its mechanical effects and on hybridization, which can build an aesthetic cosmopolitan socialization, as a means of entry for global imaginaries. Our research "Youth Cosmopolitanisms in Brazil" focuses on the cultural consumption as well as knowledge and preferences regarding global imaginaries of Brazilian young people (from 15 to 24), since this generation has lived in a context of access to global products and services, most prominently through digital media. The analysis will bring quantitative data from a survey (N=1000), as well as from two qualitative methodological tools, a card game that focuses on cultural consumption (N=410) and a cartography of global imaginaries (N=670). This data set is part of an international research project, awarded by the French Ministry of Culture and Communication and the GEMASS of the Université de Paris, with the support of Sesc in Brazil. The research results show us that it is not only through knowledge, but also preferences for diversity that Brazilian young people navigate in-between cultural codes. It is through the aesthetic socialization, with relevant value in their imaginaries, that they narrate the world and perceive their own local reality with its own plurality, and engage to elements of the world, building cosmopolitan dispositions.

RIEKER, PETER* (University of Zurich)

Social Participation in the Context of Peers

In regard to children and youths growing up, attention has been directed to the integration into peer contexts for some time. It can be shown that most adolescents report to be integrated into a clique or to maintain friendships and that relationships with peers are especially important to them. Against this background, peer relationships are considered to be a virtually indispensable element of growing up, which help children and youths to meet developmental challenges and to participate socially. Too often, insufficient attention is given to the fact that relationships among peers have entirely different qualities and that not all adolescents maintain sustainable relationships to their peers. Against this background, it needs to be clarified in what specific ways the relationships with peers are shaped and what consequences arise concerning the social participation of children and youths.

In the contribution outlined here, participating socially in the context of peers is going to be defined further. In doing so, the data of the study "Participation of Children and Youth in Switzerland" which was conducted at the University of Zurich from 2012 to 2014, serves as a base. Within the scope of the qualitative part of the study, instances of participation were observed ethnographically and interviews with 16 children aged ten to twelve were conducted, in which they reported on participation regarding various social contexts. According to this data, the integration into peer contexts is highly important, since youths are able to experience more distinct creative spaces and more instances of self- and co-determination here than usual. In the planned contribution, different forms of integration in peer contexts are presented in their specific arrangements. Within the framework of detailed analysis, different qualities of participation within in peer contexts can be reconstructed as well as their relevance for social integration within other contexts.

Migration As an Answer to What? Findings from a Biographical Study on the (recent) Spanish Migration to Germany and the UK

In this article, I present some of the preliminary results of an ongoing qualitative study (on the basis of autobiographical narrative interviews) on the lives of (recent) Spanish migrants to Germany and the UK. Instead of focusing exclusively on the migration experience, I am interested in the long-term processes in people's lives and how macro-phenomena like the economic crisis in Spain (and other developments such as "Brexit") and the life-course of individuals are interrelated. This paper focuses on a specific phase in interviewees' lives: the time in which migrating to another country became a topic and appeared as a solution to serious problems. It was possible to identify different biographical action schemes (Schütze 2007) that shed light on how people arrived at the decision to migrate. While all my interviewees recalled how the recession had an impact on their lives in Spain (and was one important factor underlying their decision to migrate), it is important to note that the "aftermath" of the economic crisis on their lives took on different shapes depending on their "generational locations" (cf. Mannheim 1928), academic and occupational training, (lack of) work experience, personal support structures and biographical circumstances in general. Especially in the context of contemporary Europe, which is experiencing different (yet overlapping) crises at the moment, I argue that biographical research offers unique advantages as it is a way to overcome what has been referred to as "methodological nationalism" (Wimmer and Glick-Schiller 2002) and a tool to close the gap between macro and micro-sociological concerns.

RIEMON-ZARFATY, NITZAN* (Department of Medical Ethics and History of Medicine, University Medical Center Göttingen (UMG))

Parochialism and Fertility Related Legislation – Insights From a Religion Sensitive Analysis of the Israeli Surrogacy and Egg-Donation Laws

The bioethical debate regarding the motivations of women donating their eggs or serving as surrogates generally contrasts commercialism and altruism. Based on literature review, this paper examines this debate using an analysis of the Israeli surrogacy and egg-donation laws. The analysis focuses on a dominant normative stance in Israeli bioethics- the Jewish orthodoxy, informed by the Jewish law. Jewish law has been identified as a cultural script explaining the Israeli pro-natalism and general acceptance of reproductive technologies. However, Jewish orthodoxy is also an active political actor. Many rabbinical authorities will support reproductive technologies as long as their usage meets the Jewish law and tradition. A detailed overview of the laws indicates a connection between the restrictions they include and the Jewish law. The laws instruct that the surrogate and/or egg-donor should be unmarried, not related to the prospective parents, and that both parties must belong to the same religion. Those specifications result from rabbinic concerns regarding illegitimacy, incest and the religious status of the resulting child respectively. The surrogacy law's limitation of the procedure to heterosexual, legally paired couples also reflects the Jewish religious perspective on family integrity and formation. Those restrictions further represent mechanisms of social and political power-relations. The so called 'same-religion' restriction highlights the concept of *religious affiliation* also strongly connected to nationalism. Categories of different Levels of *Religiosity* are further discussed in the context of the prioritization of "traditional" – religiously acceptable family models over other "secular" family forms. The current legislation thus represents biomedical fertility/reproductive segregation based on religion related categories. I conclude by discussing the legislation as reflecting a new type of motivations connected to specific social reciprocity and solidarity based on predetermined religion related collectivities. This brings to the fore the relevance of the concept of *parochialism* in understanding altruistic motivations.

RIEMON-ZARFATY, NITZAN* (Department of Medical Ethics and History of Medicine, University Medical Center Göttingen (UMG))

The Medicalisation of Reproduction, Reproductive Timing and the Labor Market - the Israeli Experts' Debate on Social Egg-Freezing

"Social egg freezing" (SEF) introduces healthy women with the possibility to prolong their fertility. The procedure may therefore be analyzed as a technological attempt to stop women's "biological clock" or "freeze time". Giant corporations such as Apple and Facebook offered funding of the procedure for their female employees; thus provoked ongoing debates on the social and ethical implications involved. One of the issues debated concerns the medicalisation of women's reproduction as a (de)legitimate mean for gender equality in the labor market. Israel is one of the first countries to officially regulate SEF. The recommendations of Israel's National Bioethics Council informing the regulation were analyzed

as reflecting a perception of age-related fertility decline in terms of a medical problem; and hence as positively relating to SEF as a form of preventive medicine. Relying on interviews with relevant Israeli experts, this paper analyzes the experts' debate regarding SEF, the related medicalisation processes and the Israeli health policy. Analysis revealed SEF to be highly controversial. Supporters legitimized SEF as potentially giving women new opportunities in the labor market while solving gendered time related (work-family, biological-social) conflicts. SEF was thus negotiated as a form of family/reproductive planning. The opposite position raised concerns from further medicalisation of women's reproduction defining the difficulties faced by women as "social" problems which should be provided with social, state established solutions (e.g. family friendly work environment). I further discuss the notion of reproductive planning and timing in the context of the theoretical field of labor-markets. I conclude by discussing the relevance of the concepts of "(re)productive" and "clinical labor" (Cooper and Waldbry, 2014) in the context of the gendered power relations reflected in male centered model of ideal participation in the labor force, gender stereotypes and the oppression of women's bodies.

RINALDI, DÉBORA* (*Universidade Pontifícia Católica do Rio Grande do Sul*)

From a Waste Collector to a Businessman: A Biographical Study in Southern Brazil

This study focuses on the formation process of private waste collection and separation companies, founded and managed by waste collectors in southern Brazil. Based on the biographical case reconstruction method, I analyze the institutionalizing process, starting from the practice of an individual waste collector, and culminating in the foundation of a small private collection and separation company. This life history study explores the way waste collectors in southern Brazil interpret their work, and how this interpretation is constituted. The case presented here represents a type of waste collector which stands out for its degree of professionalization, resulting in the foundation of a company. The study discusses the theme of work and income among the popular classes from the perspective of the sociology of knowledge as developed by Peter Berger and Thomas Luckmann, especially their concept of institutionalization. In this sense, the type presented here reflects how the labor experience of a collector, especially in the informal labor market, as well as other biographical experiences, contributed to the constitution and management of his waste collection and separation company. A discussion of the interrelations between biographical and organizational experiences is thus central to this study. Concerning the methods used, biographical case reconstruction is a method of data analysis developed by sociologist Gabriele Rosenthal, in Germany, from the perspective of interpretive sociology. In this way, the biographical approach used here allows both an analysis of the socialization processes experienced by my interviewee, as well as an understanding of the mechanisms of institutionalization and legitimation of waste collection practices in the reality in which this individual is inserted.

RINALDO, ANDREA* (*Military Academy at ETH Zurich, Switzerland*)

Perception of Inclusion and Experiences of Minority Groups in the Swiss Armed Forces

With the beginning of 2009, the Swiss Armed Forces (SAF) introduced measures for diversity management that are based on a command of the chief of the SAF from 2008. Implementing this management strategy can be considered as a response of the SAF to the more and more diverse society as well as increasingly complex and specific missions of the armed forces. However, various studies have shown that many diversity support programs do not conform social reality and that the chosen organizational measures are often inadequate and not expedient^[1]. And even though legal bases and policies exist, the practical implementations sometimes bring some challenges that have to be overcome in order to promote an effective diversity management.

One way to find out in what way these diversity measures affect the inclusion and equal treatment of minority groups is to ask the affected persons themselves. This study is based on qualitative interviews with individuals and focus-groups that evaluate the perspective of different minority groups in the SAF and pursues the following questions: What are their attitudes towards the existing HR-policies and military guidelines which regulate the cohabitation and collaboration in heterogeneous groups? What is their opinion towards the importance of diversity management as an educational element in their military education cycle? Do they feel integrated, included and given equal opportunities? Where do they see potential for improvement?

Systems Revolutionaries: Making a Transnational Expert Community during the Cold War

In this paper I analyze the origins of the concerns with global complexity and uncertainty among Soviet social and economic planners. While the failure of the Soviet planning system as well as the limitations of the idea of centralized control have been widely analyzed by historians, we know little about the role of the ways in which the idea of global systems influenced Soviet governmentality. Tracing the emergence of global modeling communities in the Soviet Union, I will discuss the discursive, institutional and social strategies mobilized to deal with uncertainty in the Soviet system from the 1960s to the late 1980s. Drawing on archival documents but also oral history this paper charts the hitherto neglected aspect of Soviet governance and puts it in a dialogue with the growing literature on governing complexity and uncertainty in the Global North. Particular focus is on the Soviet debates on systems analysis and computer-based global modelling that took place at the Academy of Science's Computer Centre, the All-Union Institute of Systems Research (VNIISI) and the International Institute of Applied Systems Analysis (IIASA) in Austria. In the main, this paper will assess the strength and limitations of ideas of global complexity and the long term in the modernization of the Soviet governance.

RINGEL, LEOPOLD* (*Bielefeld University*)

The Nexus of Transparency and Secrecy

Transparency has become a buzzword of our modern times, denoting the idea of making social actors – especially organizations – visible and thus accountable to external audiences, which, in turn, is supposed to increase their legitimacy and efficiency. While most research on transparency takes an affirmative stance and puts all the effort into refining existing concepts, critical studies focus on the performativity of transparency. My presentation I add to the latter by drawing attention to the nexus of transparency and secrecy. Conceptually, I use Erving Goffman's frontstage/backstage-theory according to which actors vie to maintain boundaries of visibility between these two types of social situations. Against this backdrop, the emergence of new types of secrecy in reaction to the implementation of transparency measures can be interpreted as efforts to create and/or resurrect boundaries of visibility between front- and backstage. This perspective is applied empirically to an extreme case: The Pirate Party of Germany, a political party that tries to render itself as open as possible to the public and vows to uphold such standard once elected. A qualitative case study on the parliamentary group in the federal state of North Rhine-Westphalia demonstrates that an organization deprived of boundaries of visibility between frontstage and backstage runs into problems and thus subsequently introduces such boundaries.

Exploring Ontological Models and Forms of Exclusion in the Field of Psychiatry

Exploring ontological models and forms of exclusion in the field of psychiatry

Pia Ringø, PhD, Assistant Professor. Department of Sociology and Social Work, Aalborg University

The presentation takes its starting point in an ongoing research project: "Views of Human Nature in Social Work – welfare policies, technologies, and knowledge of man, AAU" (www.menneskesyn.aau.dk). A part of the project deals with the historical development in the relation between welfare policies I Denmark, scientific knowledge and diagnostic tools and presents an analytical use of what I define as ontological models (Ringø et.al 2017). Ontological models, underpinned by the

prevailing forms of knowledge of the time, represents ideas and understandings of the generative mechanisms of vulnerability and mental illness, which through history has led to different welfare political efforts and restructurings of our understandings and explanations of mental illness and the dialectics between man and society.

The presentation discusses the concept of ontological models as an approach to understand and explain the historical development in our knowledge about generative mechanisms and social determinants of mental illness. An analytical focus on how ontological models can be used as an analytic tool to identify the social factors or determinants for mental illness also points towards broader discussions about how welfare policies (and solidarity) becomes dependent on integrative knowledge about the structural, collective, biological, psychological and social mechanisms that generate or produce vulnerability and mental illness. In a relation between man and society.

Representaciones Mediáticas De Las Fuerzas Militares En Colombia (1985-2017)

Después de más 50 años de conflicto armado, el gobierno colombiano y las FARC-EP, el grupo guerrillero más antiguo del continente, firmaron un acuerdo en el 2016 para la culminación del conflicto interno. El conflicto colombiano ha sido causa y efecto de profundas implicaciones sociales, políticas y económicas; afectando principalmente la gobernabilidad por parte del Estado colombiano en la totalidad del territorio nacional. Las Fuerzas Militares de Colombia han sido uno de los principales actores dentro del desarrollo del conflicto armado y su participación ha sido documentada en diferentes medios como: a) Prensa escrita, b) Noticieros de televisión y, c) Otros medios como novelas y películas. A partir de un enfoque de análisis de discurso mediático, este artículo explora las representaciones sociales acerca de las Fuerzas Militares elaboradas en Prensa y Noticieros, abordando tangencialmente otros medios. Hemos estructurado el objeto de análisis en tres periodos: (i) 1985-2001 - derrotas militares como consecuencia de acciones armadas de grupos guerrilleros, (ii) 2001-2012 - victorias militares y golpes críticos a las guerrillas y (iii) 2012 - Presente - inicio y culminación de las conversaciones de paz con las FARC en La Habana. En el transcurso de este tiempo los medios de comunicación han influenciado la opinión pública acerca de las Fuerzas Militares y el conflicto interno. Proponemos que el análisis de las representaciones mediáticas acerca de las Fuerzas Militares en Colombia, permite entender mejor las expresiones de militarismo y anti-militarismo que afectan las relaciones civiles - militares en el país.

Lifestyles and Performativity in the Experience of International Musicians Inspired By Victor Jara and the New Chilean Song

In this paper, I will reflect on the influence of Víctor Jara's music and New Chilean Song (NCS) in the life of amateur and professional musicians who have participated in El Sueño Existe Festival (ESEF) in Wales. ESEF is an illustrative case about the influence of Víctor Jara's music and the NCS outside Chile and Latin America. During the festival is possible to see and listen to a variety of international musicians who have been influenced by, and incorporated in their repertoires, the music of Víctor Jara and the NCS. In a methodological level, this paper focuses on the subliminal dimension of the ESEF. Following Bennet and Woodward's (2014) argument, festivals bring into existence a collection of elements such as texts, images, and sounds in order to create a sense of collective identity. Festivals are liminal events in where a group of individuals shared their lifestyle culture that is generally articulated in a subliminal, non-conscious level. I will include interviews with seven musicians from six different nationalities: Chile, Bolivia, Spain, Italy, New Zealand and the UK (x2). In a theoretical level, I will use the performative approach (Fortier 1999; Duffy 2001; Yúdice 2003; Butler 2011) to understand music as a discursive practice that contributes to identity formation processes; in dialogue with theories focus on everyday music practices (DeNora 2003; DeNora 2004). I argue that Víctor Jara's music and the NCS is experienced as a subversive modality of expression that challenges the values of mainstream music. The subversion of Víctor Jara music is lived as an act of attempting to overthrow the capitalist regime and its consequent way of living. I define mainstream music performativity as the regulatory frame in which the subject is constrained to quote a series of music practices oriented to achieve commercial success, fame, and entertainment.

Design of a Qualitative Study of Health Inequality in Madrid Neighborhoods. Hhh Project.

ABSTRACT

Objective: To build a qualitative methodological design for a rigorous study of the social differences related to cardiovascular health in Madrid neighborhoods.

Method: Three neighborhoods in Madrid with different socioeconomic levels were selected for the study using Semi-Structured Interviews (SSIs) and Focus Groups (FGs). The selection process for these three neighborhoods was as follows:

- Classification of all Madrid's neighborhoods (129) according to a high or low socioeconomic level. An ad hoc index was created for this classification, considering such criteria as level of education and unemployment.
- After arranging the classification according to this index, nine neighborhoods were short-listed. Each neighborhood was classified into different socioeconomic levels.
- A non-participant observation technique was used for the final selection of the three neighborhoods, judged by criteria such as social heterogeneity within the neighborhood, size, and gentrification process.

Results: After selecting the three neighborhoods (Nueva España -high level-, El Pilar -medium level-, and San Diego -low level-) thirty SSIs were held with residents and twenty-eight FGs were formed, and six SSIs were held with key informants.

Conclusions: The proper choice of neighborhoods is essential for the qualitative study of health inequalities in big cities.

Patienthood Today: Exploring Normative Injunctions and Resistance in Two Ontarian Psychiatric Services

Based on the results of my doctoral research, this presentation explores what it can mean to be a "patient" in two Ontario mental health institutions.

The shift towards deinstitutionalization of mental health services and socio-normative transformations towards a society based on ideals of autonomy, individual responsibility and personal initiative that occurred in the mid-late 20th century serves as a background for this study. In contrast with earlier, passive conceptions of the patient, patients nowadays are expected to play an active role not only in their own treatment, but in a broader sense within the system. These ideals are encouraged by approaches such as empowerment, recovery and patient participation. This shift towards a more "active" patient was the focus of this ethnographic research informed by Goffman's (1961) concept of the moral career and Foucault's (1975) works on social norms.

My research was conducted within two research sites: an inpatient acute mental health unit, and a "client advisory council" of a tertiary mental health institution. In the inpatient unit, patients must work towards becoming autonomous in regard to their mental health, while at the same time conforming to expectations of adherence and collaboration with the mental health team.

In the advisory council, a small number of past and current patients take on an emerging role representing patients' interests. While the council expressed that their contributions led to some changes in the institution, they also experienced situations in which institutional constraints prevented them for effecting larger changes. Council members were implicitly and explicitly expected to support institutional objectives and values, notably through the construction of a legitimizing narrative promoting the image of an "ideal" patient. These two sites will allow me to depict two possible "figures" of the contemporary patient which can be placed on a spectrum between individual activation and collective/systemic activation.

Balancing Human and Informational Development in Latin America

In this presentation the relationship between human development and informational development is analysed, in the understanding that this link can take several forms according to the development models or strategies assumed by societies. Based on an investigation of several Latin American countries in

the decade of 2005 - 2015, coordinated by Dr. Fernando Calderón, we analyse in depth the case of Uruguay. We integrate two concept discussion: human development (Amartya Sen, 1999) and; informational development (Castells, 2000). Informational human development (Castells and Himanen, 2014) was studied as different forms of balance between human development (which without informational development does not produce economic growth and generates fiscal deficits) and informational development (which without human development produces increasing inequalities and exclusion)

The Uruguayan model is analysed with a holistic approach including different dimensions of development (economic and productive, social, cultural and political) in the Latin American context. The research uses statistical and documentary data and 20 interviews with qualified informants (development actors). Our main findings describe a model of human informational development in which traditional production structure, based on the export of primary products, an economic growth based on "commodities comfort" is recorded. At the environmental level, a change from an energy matrix based on hydrocarbons to a sustainable one. Informational development through the universalization of new technologies but with a slow inclusion in the productive structure. Progress in human development and reduction of inequalities and exclusion but with deficit but also consumerism. Consolidation of social and political rights with cultural changes (legalization of marijuana, homosexual marriage, legalization of abortion) and the country emerges as a "social and political laboratory". The results stimulates new theoretical reflections about informational and human development.

Co-Constructing Identities through Digital Traces: Scrolling Back on Facebook with Young People

For many young people, entire lives are played out through, made visible on, and archived across social media. Platforms such as Facebook, Instagram, and Snapchat are not just channels of communication and connection, but they have also become important sites of memory, reflection, and nostalgia. These 'digital traces' of lives are often co-constructed by peers (through tags, comments, likes, erasures) and also through the algorithms that order news feeds, privilege certain posts, and shape disclosures. These socio-technical, collectively produced digital traces can reveal rich life histories. This paper draws on qualitative research with young people in their twenties who had been using Facebook for more than five years (n=34). Interviews involved 'scrolling back' with research participants through their Facebook Timelines to reveal changes in disclosure practices over time, to reflect on Facebook as a record of life, and crucially for this paper, to explore how the digital traces inscribed onto the Facebook Timeline are collectively constructed and shared. While Facebook is just one trace with limitations among other personal histories (such as curriculum vitae, photo albums, and diaries), and also exists within an increasingly complex 'polymedia' landscape (where audiences are segregated and disclosure practices differ across social media platforms), this study points to the enduring significance of Facebook as a site of collectively co-constructed memory and identity-work.

ROBERGE, JONATHAN* (INRS)

Structuring Artificial Intelligence: A Network Analysis of AI Development in Canada and France

"Geoffrey & Yann & Yoshua" is a label that can be seen on a fashionable new T-shirt. For those who get the joke, it refers to the rise of professors Hinton, LeCun and Bengio as iconic figures of the Artificial Intelligence community, a.k.a the "Deep Learning Conspiracy," a.k.a the "Canadian Mafia." The question we want to answer here relates to the conditions that have allowed this particular configuration of this particular field, somehow outside of the US. First, we seek to archeologically reconstruct the scientific ties among the actors (for instance, the fact that LeCun was Hinton's post-doctoral student in Toronto), as well as the network of institutional support provided in the 1990s-2000s, especially the critical contributions from CIFAR (Canadian Institute for Advanced Research). Second, and in line with the "triple helix" of universities intertwined with governments and corporations, we want to focus on the role of the latter by examining, for instance, how instrumental the Google-Hinton relationship has been in the sub-field of image recognition, or how LeCun's association with Facebook has greatly facilitated the emergence of Paris as a new AI powerhouse (FAIR Centre, Station F, Collège de France, etc.). Third, it is important to note that none of the above developments would be possible without cultural cues in the form of particular beliefs, hopes, and narratives. Specifically, we want to discuss the symbolic handling of the disruptive aspects of AI by major Canadian and French actors (research institutions, business, and government)—how, for example, the "Silicon Valley of the north" narrative is promising to create rather than threaten jobs in the Montreal Region—, and what is at stake in such a framing of the debate with regards to the ongoing overall structuration of AI.

ROBERT, PETER* (TARKI Social Research Institute)

At the Right Place, at the Right Time. Who Can Avoid Education-Occupation Mismatch? a Comparative Analysis.

Education – occupation mismatch is typically present at the labor market in the modern societies. Educational investments and occupational outcomes do not correspond; the school system is unable to provide the right skills, employers require; both over- and under-education is present. From the perspective of the job holders, under-employment (over-education) is the real problem which may hurt economic rationality as well as individual justice if proper returns to educational investments fail.

The paper investigates the match between education (in terms of ISCED categories) and job (in terms ISCO main groups) from a comparative perspective. For this purpose, European Social Survey data are used; seven rounds between 2002 and 2014 are merged together for 16 countries, which participated in all rounds (total N is around 200,000). The match is operationalized by the degree how education and job correspond, e.g. jobs with ISCO main category 3-9 are considered as under-employment for respondents with tertiary education. Since the linkage between the school system and the labor market varies in the different countries, the countries are grouped to five regimes based on the character of this relationship: Flexcurity: DK, FI, NO, SE, NL; Corporative: BE, CH, DE (West), FR; Liberal: UK, IE; Mediterranean: ES, PT; Post-communist: DE (East), HU, PL, SI.

In addition to the concrete job title, further features of employment are also considered, like type of contract, full- vs. part-time work, degree of autonomy, etc. in order to determine the degree of precariousness in the occupation. Probability of precarious employment is investigated in the light of the level of schooling.

The whole analysis put large emphasis on the variation by gender, age and ethnicity. The education – occupation mismatch is studied for men and women separately, by distinguishing age cohorts and majority and minority groups in terms of ethnicity.

RC04-101.2

ROBERT, PETER* (TARKI Social Research Institute)

Occupational Gains through Education in Comparative Perspective

Returns to human capital investments in terms of wage premium are typically investigated by economists. This paper takes a similar approach of sociological kind; it analyzes occupational gains achieved by having higher level of education. The dependent variable of the study, occupational gains, is measured by Treiman's prestige score. The basic assumption is that people with higher level of schooling end up in jobs with higher social prestige. A further postulation is that those in jobs with higher prestige accumulate other social benefits (better social circumstances, higher respect, stronger inclusion in the society, better position in networking, social contacts including partnership, etc.). Thus, the study regards occupational prestige as an indicator of the wide range of social gains. The paper applies multivariate analysis; the effect of education on occupation is measured by prestige gains from primary to secondary and from secondary to tertiary level of schooling, also by increase of classes completed. The models control for gender, age, urban-rural difference for the respondents.

European Social Survey data are used; seven rounds between 2002 and 2014 are merged for 16 countries, which participated in all rounds (total N is around 200,000). While the positive impact of education on occupational gains is not much debatable, the paper focuses on exploring the international variation in gains in the various regimes, the 16 countries form. Based on the regime differences in the contextual conditions for the links between the school system and the labor market (occupational structure), the following five groups will be distinguished: Flexcurity: DK, FI, NO, SE, NL; Corporative: BE, CH, DE (West), FR; Liberal: UK, IE; Mediterranean: ES, PT; Post-communist: DE (East), HU, PL, SI. The occupational (prestige) gains are expected to be higher in countries (regimes) where the link between education and occupation is stronger, structurally more determined.

ROBERTS, ADRIENNE* (University of Manchester)

Golden Credit: Pawning Gold Assets in Gendered (Productive-Reproductive-Financial) Economies

There has been growing interest among scholars about the ways in which relations of production traditionally associated with 'the formal economy' are integrally connected to relations of 'social reproduction', which range from domestic labour to welfare state provisioning. I argue here that there is a need to further connect production and social reproduction to a third set of social relations: the social relations of finance. Drawing on the work of Spike Peterson, Diane Elson and others, I suggest that a feminist analytical framework that considers the intersections of production, social reproduction and finance historically and in the present era of 'financialization' is needed to fully capture the complex totality of gendered, classes and racialized social relations that constitute the (global) political economy. Using this framework, I go on to

explore two examples of credit provisioning that serve to (1) elucidate the links between these three spheres of activity and (2) show how they work to reproduce inequitable gender relations. The first example focuses on the active engagement of women in pawnbroking in early modern England while the second example focuses on a recent trend whereby women in Pakistan are using their gold jewelry as collateral for microcredit. In both instances, the provisioning of credit is part of the attempt of women to support social reproduction in the context of limited alternatives in the 'productive' economy and weak state support. In the former case, an historical analysis reveals the gradual recasting of pawnbroking and other forms of household credit as 'informal', 'feminized', and not 'valuable' in the context of a formalizing global financial system. The latter case exemplifies how such forms of household credit are once again becoming important sites of accumulation as financial capital has immersed itself in reproductive economies in order to appropriate household earnings and highly gendered assets.

The Financial Wage Premium in Postindustrial Countries: A Comparative Distributional Analysis

A persistent finding in the emerging literature on financialization and income inequality is the growth and prominence of the financial industry exacerbates wage inequality by increasing the relative wages of the highest paid workers and managers in the financial sector. More recently, several studies have shown the impact of financialization on wage inequality varies according to institutional, political, and economic differences between these countries. This study extends on this new line of research by examining whether the structure of financial systems explains differences in the wage premium received by financial workers and managers in a representative sample of postindustrial countries. We argue wage differences across the earnings distribution is exacerbated in countries where financial activities are primarily coordinated through market mechanisms rather than through formal institutions. This study tests this theoretical argument by estimating the financial wage premium across the earnings distribution of 12 postindustrial countries using nationally-representative and harmonized data from the Luxembourg Income Study and re-centered influence function (RIF) regression. Estimates from RIF regression models of 19 wage percentiles show the size of the financial wage premium in the earnings distribution varies across countries, but is generally concentrated in the upper-end of the earnings distribution in most countries. More importantly, estimates show the financial wage premium in countries with market-centered financial systems is greater in the upper-end of the distribution compared to countries with bank-centered financial system where the financial wage premium gradually grows across the earnings distribution. The findings indicate cross-national differences in the financial wage premium is partially accounted for by the market coordination of financial systems and points towards how restructuring financial systems may alleviate growing wage inequality in postindustrial countries.

The Centrality of Class Analysis for Research on Youth Collectivities

Interest in collectivities has a long history in youth sociology. While collective experience was for a long time the core business of the sub-discipline, it is our contention that this focus has been disrupted by (until very recently) a lack of sustained focus on social class. In this presentation, we argue that this diminishing centrality of social class analysis arises from two trends in youth research, both of which undermine the possibility for a renewed focus on collectivity. First, we concur with the idea that youth sociology has in recent times often emphasized the individual, but this usually occurs at the expense of structural analysis rather than an omission of a discussion of peer interaction or intersubjectivity, per se. The absence of a focus on collectives that emerges from moves towards understanding the heterogeneity of young people's biographies and subjectivities is, however, augmented by its polar opposite – the homogenizing of youth experience. In recent years, calls to understand young people's lives through lenses like 'social generation', precarity, and even the political economy approach of understanding 'youth-as-class', have intersected with public discussion on inter-generational 'wars' in ways that inadvertently marginalize differences within and between young people, such that youth is painted as an inherently difficult phase of the life course at the collective level. Retaining a constant focus on shared conditions of existence (at the level of both the material and cultural) would, we argue, provide a better frame for understanding the existence of a *variety of collectivities* among the youth population. These collectivities differentially experience and negotiate *similar* but not identical realities in a contemporary hostile economic landscape marked by growing underemployment, unemployment and rising housing costs.

How a Global Network Integrates Asia into Offshore Economy and Is Responding to Tightening Global Rules on Tax

In a global financial system, financial processes assume a relatively common form across jurisdictions and are used by a diverse set of actors, not simply Western actors. During the last decade, these conditions have been met in the case of offshore finance and a very specific network has come together to manage offshore capital flows. This network now primarily operates to connect Asian demand for offshore services with financial products in investor-friendly jurisdictions. Following earlier Western practice, Asian firms and individuals are seeking to maximize the benefits of offshore companies and trusts. This global network now confronts a changing regulatory landscape. The most serious international steps ever taken to rein in offshore finance are being translated into national policy. This paper has two aims. First, I will document the network underpinning the offshore economy by asking how Asian actors have been able to reach the offshore economy and who holds power in this global network. I will demonstrate that the most powerful offshore practitioners are based onshore, rather than in well-known offshore locales, such as the British Virgin and Cayman Islands. Particular attention will be paid to offshore practitioners based in Hong Kong and Singapore that direct a network that includes participants in Mainland China and throughout offshore financial centres. Second, I will assess the extent to which this global network is threatened through an analysis of how emerging regulatory frameworks are being implemented within Asia. Research will be presented on whether changes are discernible within the offshore network, specifically the financial services demanded by and offered to Asian clients. Data will be drawn from elite interviews in Hong Kong, Shenzhen and Singapore, as well as attendance at industry gatherings, especially the China Offshore Summits. The findings will be relevant to the study of corporate power amid tightening global rules.

Cosmopolitisme Et Médiation Numérique De La Culture Chez Les Minorités Linguistiques Au Canada

Cette communication a pour objectif de présenter un cadre théorique s'appuyant sur le concept de « cosmopolitisme esthétique-culturel » (Cicchelli et Octobre, 2017) pour cerner le lien entre les pratiques culturelles et les compétences linguistiques chez les communautés de langue officielle en situation minoritaire au Canada. Ce concept permet de dégager une approche qui tient compte de la circulation des œuvres et des produits culturels à l'ère numérique, des préférences « nationales », « communautaires » ou « internationales » dans les modes d'appropriation de la culture chez les minorités linguistiques. La présentation de ce cadre théorique sera accompagnée d'une analyse des données quantitatives issues des enquêtes nationales au Canada (recensement, enquête postcensitaire, etc.) qui apportent des éléments de réponse sur la consommation culturelle en lien avec les variables linguistiques disponibles dans ces enquêtes (langue maternelle, première langue officielle parlée, langue parlée à la maison, etc.). Dans un premier temps, le but de cette présentation est de mieux cerner les limites des cadres conceptuels actuels (y compris statistiques) qui servent à dresser un portrait des pratiques culturelles pour des populations en situation linguistique minoritaire. Dans un deuxième temps, nous chercherons à établir un cadre conceptuel plus pertinent pour expliquer la transformation des pratiques culturelles en lien avec la diversification de l'offre culturelle et linguistique dans un contexte d'« insécurité linguistique » observée chez certaines minorités, notamment celles francophones au Canada.

Overcoming 'Uncertain Futures': Regional Cooperation, Migration Policies and Socio-Spatial Justice in Disaster Risk Reduction in the Caribbean

The Caribbean Community, which comprises a third of the countries classified by the United Nations as Small Island Developing States (SIDS), is pummeled by earthquakes, volcanoes, hurricanes and the effects of global climate change. The recent passage of Hurricanes Irma, Jose, and Maria testify to the devastating effects of national disasters on the livelihoods and survival of these islands. These risks are exacerbated by their small sizes, fragile ecosystems, limited internal markets and limited abilities to experience economics of scale (UWI, 2002:1). The IMF's "Vulnerability and Debt in Small States" report proclaimed "many [SIDS] face an uncertain future" (CMC, 2017). As in other parts of the world, when disaster strikes, Caribbean people use migration as a strategic tool of coping with uncertainties. Under the Caribbean Single Market and Economy (CSME) project,

the Caribbean has been harmonizing migration policies. However, the CSME is economically driven (Boxill, 2010), and better response systems are needed in disaster planning, mitigation, risk assessment and reduction. This paper draws on official and trend data to elucidate migration and other responses to disasters in the Caribbean, and uses the theoretical frame of spatial justice to make two arguments. First, at the regional level, anticipation of social dislocation arising from disasters must be met with proactive coordinated responses to provide people with options to relocate to safe spaces. Spatial justice calls for special attention to vulnerable groups such as the poor, elderly, women, children and rural people, who are often marginalized in policy, research and disaster planning. Second, SIDS need to mobilize in the global arena to demand recognition of their spatial vulnerabilities, and demand actions to support capacity-building and effective pre-and post-disaster response. We therefore propose a global project of cooperation utilizing research and action to address the intersections of disasters, social justice, mobility, and space.

Savage Global Inequalities and the Transnational Capitalist Class

Social polarization is internal to the dynamic of capital accumulation. At the system-wide level the contradictions of overaccumulation and wealth polarization were historically attenuated by mass worker struggles and the intervention of states at the national level in the circuit of accumulation to capture and redistribute surpluses downward. But the liberation of transnational capital from the nation-state has increasingly undermined the ability of individual states to redirect surpluses. The result has been unprecedented inequalities worldwide and spiraling crises of state legitimacy. More enlightened transnational elites have become increasingly alarmed that extreme levels of inequality will undermine the prospects for continued growth and generate revolt from below. Yet the transnational capitalist class, in its blind pursuit of profit, has to date been able to use its structural power - especially in global financial markets - to veto attempts at bringing about a global neo-Keynesian measures that could mitigate global social polarization.

ROBINSON, WILLIAM* (University of California at Santa Barbara)

Trumpism, the Crisis of Global Capitalism, and 21st Century Fascism

Part I of this paper will summarize the theory of global capitalism based on the rise of a globalized production and financial system, a transnational capitalist class, transnational state apparatuses, and new modalities of transnational social control and domination. Part II will analyze the crisis of global capitalism, focusing on two dimensions in particular: economic/structural and legitimacy/ hegemony. Part III, building on my earlier work in this area, will discuss the notion of 21st century fascism and its distinction from 20th century fascist experiences. It will argue that there is no legitimate social scientific reason to assume that fascist projects in the 21st century must be made in the image of those of the 20th century. Both 20th and 21st century fascist projects need to be seen as right-wing responses to crises of capitalism involving an element of populism, and both involve fascist forms of social organization as well as fascist ideology in civil society. However, among other distinctions two will be highlighted: 1) 20th century fascism involved a fusion of reactionary and repressive state power with national capital, whereas 21st century fascism involves a fusion of this state power with transnational capital; 2) 21st century technologies of surveillance and repression allow for the reorganization of space and social control processes in new ways that may involve more selective as opposed to generalized coercion and the continuity of formal constitutional order. Part III will also examine Trumpism in the United States as a case study in the rise of 21st century fascist currents (although the argument is not made that the United States is fascist as of 2017), with special attention given to the role of spatial control rather than generalized repression.

ROCHA FRANCO, SÉRGIO H.* (University of Barcelona)

Favelas, Townships, and the Postracial

My aim with this paper is to engage with the notion of the postracial informed by two urban settings discernible by their relationship with race issues: Rio de Janeiro's favelas and Johannesburg's townships. The post-racial discourse became visible in the U.S. in the context of the presidential election of Barack Obama in 2008. The notion has been shaping public policies and rendering debates around race outdated. Even if the recent post-racial rhetoric has only barely echoed in Brazil and South Africa, both countries have bent comparable understandings - albeit differently configured -. Despite the existence of alternative views that do take racial discrimination and racism into account in both countries, Brazil and South Africa share, in their own ways, the project of a society where the

perception of race is somehow eliminated. In fact, the idea that Brazil is a 'racial democracy' dates back to the first half of the twentieth century, what perhaps makes it the utmost example that by merely avoiding racial categories we do not create a society free from racism. In South Africa, Nelson Mandela's election in the mid-1990s and the move away from apartheid's oppressive racial regime propelled a new national self-understanding, that one of the 'rainbow nation.' Based on my fieldworks in Rio's favelas and Joburg's townships between 2013 and 2015, I put these two discourses in relation to the experiences of favelas' and townships' inhabitants in order to signpost the significant discrepancy between postracial rhetoric and racialized everyday life in marginalized urban areas.

RODNEY, ALEXANDRA* (University of Guelph)

I Get Knocked Down, but I Get up Again: Calibration As Gendered Authenticity Work on Women's Healthy Living Blogs

Authenticity is considered an important personal trait and feminized cultural spaces offer opportunities to understand how authenticity construction is a gendered process. This study asks how authenticity is produced on women's healthy living blogs and involves a discourse analysis of 533 blog posts from six prototypical American blogs. Drawing from cultural and feminist theory, I argue that the process of producing authenticity on healthy living blogs is performed through calibration, a gendered form of self-presentation (Cairns and Johnston 2015). This calibration process on healthy living blogs involves ongoing self-positioning away from the dialectical extremes of failure and success in order to portray an authentic, healthy femininity. In order to develop their online persona, healthy living bloggers use coupled rhetorical strategies: confession/redemption and congratulation/self-deprecation. I argue that this authenticity work is shaped by historically-specific socio-cultural conditions relating to femininity, neoliberal ideology, selfhood and class. Key contributions of this paper include: 1) developing an understanding of authenticity as a gendered process; 2) identifying how calibration is used to construct an authentic healthy femininity; 3) extending understanding of how the performance of successful femininity involves the avoidance of extremes; 4) developing empirical understanding of authenticity construction in online spaces.

Critical Discourse Approaches and Modernity: Some Reflection

This work brings reflections on the methodology of Critical Discourse Analysis applied in a sociological work that has an anchor different from the approaches to modernity. With a theory based on critical sociological perspectives, as well as critical perspectives on linguistics, the Critical Discourse Analysis is built on a number of concepts stemming from a modern tradition. Is Critical Discourse Analysis, as it is constituted, capable of absorbing perspectives such as those of multiple modernities, coloniality and postmodernity?

The speeches analyzed as example are from the Chamber of Deputies in the 54th legislature and their themes were egalitarian marriage; the speeches are related to the decision of the Federal Supreme Court and National Council of Justice on same-sex marriage. I make an analysis from the Systemic-Functional Linguistics, with the observation of the Appraisal System, which focuses on the observation of the attitude of the speakers to what is being said, as of the engagement and graduation of them with what they say.

In conclusion, this work provides a view of possible developments of Critical Discourse Analysis as an analytical tool to sociological investigation, reaffirming its possibilities inter and transdisciplinary. In a changing world, Critical Discourse Analysis is able to cover many sociological approaches, being a strong ally in order to comprehend the liquidity of the social and theoretical changes of contemporaneity.

RODRIGUES, EMMANUEL H.* (Universidade de Brasília)

Parliamentary Discourses on Same-Sex Marriage: A Brazilian Case

This presentation brings a reflection on the religion in the public sphere in the Brazilian reality. The corpus presented and analysis presents here are developments of my mastering research. The speeches analyzed on this paper are from the Chamber of Deputies in the 54th legislature, specifically between 2011 and 2013, and their themes were egalitarian marriage. It is interesting to say that the three deputies that compose the corpus of this presentation have the religious title of pastor and composed the so-called Evangelical Bench; the speeches are related to the decision of the Federal Supreme Court and National Council of Justice on same-sex marriage.

In theory and methodology, there is a double anchorage: in linguistics and in sociology. I make use of a linguistic approach as a tool for a sociological analysis. I use Systemic-Functional Linguistics and Critical Discourse Analysis, with the observation of the Appraisal System, which focuses on the observation of the atti-

tude of the speakers to what is being said, as of the engagement and graduation of them with what they say.

From the linguistic analysis, it is possible to observe the religious behavior presented in the Brazilian political reality. I use, in order to investigate that, the approach of multiple modernities, that presents a vision of the world being modern but having diverse possibilities of modernities and its inner relations.

As a work affiliated in a critical perspective, with one of the purposes the reflection that help to deepen democracy in Brazil, this work observes how a religion under a fundamentalist scope effectively behaves in the Brazilian reality. The deprivatization of religion in Brazil is, then, one of the key points of the presentation of this investigation. This observation is intended to equip the academy and social movements for a more just society.

Brazilian Social Scientists in the United States of America: Conversion Paths (1970-1990).

Brazilian social scientists in the United States of America: conversion paths.

Lidiane Soares Rodrigues
Universidade Federal de São Carlos/Brazil

In the global sphere, economic and political inequalities structure the geopolitical order as well as the cultural and symbolic exchanges, although in this scope, the latter take specific forms and dynamics. The cultural experience and scientific production of the countries that became independent after the three centuries of modern-time colonization (XV-XVIII), are structured on the basis of an asymmetric relationship with foreign matrices of symbolic domains, which political elites desire to give their societies. Concerning social sciences, it could not be different.

Johan Heilbron suggests that a transnational history of sciences should focus on the structuring mechanisms of a "global field". The present paper adopts this point of view and is divided into three parts. Firstly, it presents two different types of "peripheral internationalization" of Brazilian social scientists. Secondly, it addresses the convergence of interests of the three main agents of the Political Science genesis. They were: the American patronage (the Ford Foundation); the elites (who negotiated the political license for institutional enterprises, since it could not be done otherwise due to the fact that the country was ruled by a military dictatorship); and the creators of the new academic subject (young militants of radical left-oriented organizations that resisted the military dictatorship of the 1960's). Thirdly, the analytical focus shifts to the topics and issues related to the research conducted by them. We want to emphasize the selective principles that drove this import process, characterized, at a given moment in time, by the reconversion of militant activity into scientific life (while they were in the USA) and, at a later stage, by coming back to Brazil, which favored some innovation and posed barriers to others.

Cross-Border Reproductive Care: The Impact of the Opinion and the Attitudes of the Society Toward Surrogacy in Women's Reproductive Rights

Gestational surrogacy is an assisted reproductive technique through which one woman (*surrogate mother*) will bears and gives birth to a child for another person or couple (intentional mother, intentional father, intentional parents) (IFFS, 2016: 70). In Spain, the *Law on Assisted Human Reproductive Technologies* (14/2006) expressly prohibits the contract of surrogate gestation agreement. However, it is estimated that around 1,000 children are born abroad every year through this method, which not only demonstrating their use, mainly to treat infertility of women by uterine factors, but also the emergence of the so-called phenomenon of cross-border reproductive care, considered today as a global industry (Lindheim, et al., 2014: 229-230). Research has emphasized that, in general terms, society disapproves of this practice and that surrogacy is perceived as the option less accepted among non-coital reproduction alternatives. It has been suggested that this social sanction is based on the fact that surrogate motherhood truncates the Western hegemonic and ideological models about family and motherhood. In this paper we present the results of a meta-analysis conducted in 22 studies, between 1988 and 2016, which have evaluated the opinion and attitudes of society regarding, specifically, surrogacy as a new reproductive practice. The purpose is to synthesize available scientific information in order to identify areas of uncertainty and processes of social construction, as these are key in the decision making process regarding women's reproductive rights and maternal health. The search of scientific literature was carried out in the databases WOS, SCOPUS and ProQuest, without temporal and geographical restrictions. This search was complemented by references cited in primary sources, in articles' reviews and in specialized manual search journals.

GONZÁLEZ-RÍO, MARÍA JOSÉ (*University of Alicante*)

What and How Do We Measure the Population Attitude about Surrogacy? Process of Operationalization of the Scale of "Attitudes Against Gestational Surrogacy".

La subrogación es uno de los tratamientos de infertilidad más controvertidos entre la opinión pública, a pesar de que se haya convertido en una industria global (Lindheim et al., 2014: 229-230) y de que existan resultados positivos evidenciados, tanto en las revisiones sistemáticas (Söderström-Anttila et al., 2015) como en estudios longitudinales (Jadva et al., 2015) en torno a los factores médicos y psicológicos evaluados en las mujeres gestantes, madres-padres-parejas intencionales e hijos nacidos a través de arreglos de subrogación. Las encuestas que recaban las actitudes de la población ofrecen información relevante tanto en los procesos legislativos en curso como en su construcción social (fuertemente estigmatizada a pesar de que la subrogación se erija como una técnica de atención reproductiva transfronteriza). El objetivo de esta comunicación es presentar la "Escala de Actitudes frente a la Subrogación Gestacional" (ASG) que se ha aplicado en el estudio "Actitudes, motivaciones y disponibilidad de la población española hacia la adopción, el acogimiento y la maternidad subrogada" (I+D+i, CSO2015-64551-C3-R). El desarrollo de la escala ASG se realizó sobre la base de un estudio descriptivo transversal que incluyó: un meta-análisis de 22 estudios realizados entre 1988-2016 en 10 países; un pre-test con 15 personas; una consulta a panel de expertos/as; la medición de su validez (cualitativa y cuantitativa); y, la evaluación de su confiabilidad. A su vez, los ítems de la escala ASG se insertan en cinco sub-escalas que miden la opinión frente a: las cuestiones legales y religiosas de la subrogación; las condiciones en las que se acepta su uso; los niños/as nacidos por subrogación; las madres subrogantes; y, la tendencia al uso de la subrogación. La escala ASG permite avanzar en un área en la que la investigación realizada es sustancialmente exploratoria y con fines no sociológicos.

Intimate Partner Violence in European Countries

In this communication, we will present the results of a research on violence against women based on data from the Violence Against Women Survey of the European Union Agency for Fundamental Rights (FRA, 2015). One of the most striking results from this survey is that in northern countries (such as Sweden) women report that they suffer more intimate partner violence than in the countries of the south (eg Spain). Our analysis will try to corroborate if in these countries the likelihood of women suffering intimate partner violence is similar if we consider other variables such as age, social status, level of education, suffering or not disabilities, immigration status, and sexual choice. We believe that deepening the sociodemographic profile of women who claim to have suffered violence may allow us to understand the extent to which the situation of women in the countries of northern and southern Europe resembles. And, as a consequence, the extent to which the same type of social policies can be used to combat such violence.

Arts-Led Urban Regeneration in the Iberoamerican Space

Processes of urban regeneration through culture and the arts have become a key strategy for the economic and social revitalization of many cities around the world. Driven by the public sector or public-private partnerships, these processes have pursued the economic, social and urban viability of obsolete industrial cities. In this kind of interventions, it is understood that culture and the arts can be used as a catalyst for economic development, urban improvement and social inclusion.

There is a standard narrative in academic literature that depicts these processes as inevitably producing negative effects like gentrification and displacement of lower income households or alienation of residents. On the contrary, an alternative literature conceives them in a very positive way as promoting economic development or urban renovation. Both interpretations use to be exclusively based on Anglo-Saxon cases and both tend to be rather simplistic.

Here we will try to offer a more nuanced perspective on the base of considering a different kind of evidence: the one accumulated in the Iberoamerican world. Actually, the Iberoamerican experience suggests the importance of a plurality of contexts and the processes dynamics in determining the influence that the arts

can exert on the urban space. In this presentation, we will examine a series of cases of urban regeneration based on the arts in the Iberoamerican space that will allow us to show this new theoretical perspective.

SERRADELL, OLGA (*Department of Sociology, Universitat Autònoma de Barcelona*)

Scientific Evidences and Social Transformation in Deprived Contexts: Impact and Transferability of the Successful Educational Actions (SEAs) to Spanish and Mexican Educational Centres

The scientific literature identifies a close relationship between low levels of education and greater risk of poverty and social exclusion. The Integrated Project of the 6th Framework Programme of the European Commission "INCLUD-ED: Strategies for inclusion and social cohesion in Europe from Education" (FP6 2006-2011) systematized and defined as Successful Educational Actions (SEAs) scientific evidence that contributed most to improve educational results and coexistence in the schools.

Therefore, SEAs focus both on improving the equity and efficiency of learning, contributing to overcome school failure and social exclusion wherever they are correctly implemented. This transformation is especially visible in schools and neighborhoods located in deprived areas. Such is the case of the two case studies from Spain and Mexico presented in this paper, which show how all the student body, particularly this in a disadvantaged situation, improve their learning outcomes at school and the necessary instrumental tools and knowledge to achieve success in our current societies.

This scientific knowledge has been implemented in different contexts and countries for more than 20 years. However, nowadays we have new evidences that allow not only to improve the social and political impact of SEAs, but also to transfer the success from educational to other important domains of human development (Sen, 1999) such as housing, work, health services or social participation, improving people's lives. The case studies and evidences presented in this paper show the relationship between the educational improvement and its impact on other social dimensions, and how SEAs are contributing to transform environments of exclusion and overcome poverty.

Public Opinion, Social Policies and Poverty in Latin American Countries

Latin America is considered to be the most successful region in the fight against poverty during the present century. However, those achievements have not been uniform and whilst some countries effectively register considerable reductions of poverty rates, in other countries no significant changes can be observed. Variations in real wages, re-configuration of labour markets and expansion of social policies, among others, have been pointed out as possible causes for reductions in poverty levels in the region, but the effects of public opinion in the development of public policies and their outcomes continues to be a scantily researched topic. This article explores the relation between public opinion, social policies and poverty in Latin American countries. The research uses the *Latinobarómetro* database and data from ECLAC to understand the association between the priority that public opinion gives to the issue of poverty and levels of social spending, social policy architectures and variations in poverty rates in 18 Latin American countries during the period 2000-2015. Variables of public opinion on poverty and anti-poverty policy are correlated with variables of the redistributive potential of public policies, public social spending and poverty levels, and Brazil and Mexico are analysed as case studies. Findings show that whilst there may be an association between the priority given to poverty and the formulation of policies with a potential for poverty reduction, political factors like the role of policy entrepreneurs during processes of policy change may have a stronger influence on the surpassing of the normalisation of poverty as a social problem. One pending task is to identify the mechanisms that may enhance the potential of public opinion to open windows of opportunity during agenda-setting and policy formulation processes, for reforms that may increase governments' capacity to deal with the still severe problem of poverty in Latin America.

Analysing and Validating Area-Based Policies' Design. the Case of Urban Regeneration Policies in Spain

The literature on public policies sustain that 'policy design' is a critical issue in order to analyse and evaluate them. Nevertheless, the analysis of urban policies normally pays little attention to this aspect. The aim of this paper is to introduce this important issue in the analysis and evaluation of urban policies. In this sense, we present a proposal to analyse the design of urban policies oriented to improve socioeconomic profile of neighbourhoods and reduce their imbalance regarding other neighbourhoods. First, different indexes are proposed and validated in order to measure three main aspects of policies: diagnosis, objectives, and policy tools designed to accomplish objectives. Second, these indexes are used to analyse two main aspects of policies design that normally help to explain their implementation, results, and impact: 'rationality' and 'coherence'. The analysis is applied by using content-analysis of documentation from projects of urban generation projects in Spain, in the frame of EU regeneration and social cohesion program. Results show the variability in the level of quality in the design of urban regeneration project that could affect the quality of their implementation, results and impacts.

ROELSGAARD OBLING, ANNE* (*Copenhagen Business School*)

The Training of a Comprehensive Self in Military Education and Culture

In light of the last two decades' war operations and future challenges, it is often said that what the army needs is leaders or commanders who are agile, innovative, creative and adaptive to be able to operate in what is understood as an increasingly complex and uncertain world. To fashion these commander dispositions and renew military organizations, the argument goes, military education and culture must reinvent its pedagogical methods and programmes. Through an empirical study of a newly reformed educational program for general staff officers in the Danish army, the paper describes the complex array of practices, interactions and knowledge that makes up the program, including critical reflexion methods and role performance in various war games. The paper illustrates the kind of reality that is produced and reproduced to the officers through the set of pedagogical techniques that characterise the education, and how the engagement in this particular setting configures the military personae. By doing so, it basically explores how the programs' methods and techniques come with the fashioning of specific types of personality and it asks: What kind of self is being cultivated through these practices? Decisively, the paper expands on Huntington's and Janowitz's original work on military professionals to argue that when new dispositions (e.g., agility, creativity, innovativeness) are added to the traditional curriculum of techniques it brings in new sorts of spiritual exercises of the self, which challenges the distinctiveness of the military mind.

ROGENHOFER, JULIUS* (*University of Cambridge*)

Antidemocratic Populism in Turkey after the July 2016 Coup Attempt

Under the leadership of President Recep Tayyip Erdogan Turkey's right wing, conservative Justice and Development Party (AKP) fundamentally transformed both itself and the Turkish political realm: The AKP acceded to power in 2002 on promises of economic liberalisation and accession to the European Union. Over the course of one and a half decades the AKP steered Turkey from being the Middle East's "model" of western-style democracy, via competitive authoritarianism, to autocracy. Instrumental for this transformation was Erdogan's use of a new form of right wing, religious populism that systematically undermined the institutions of Turkish democracy by polarising society, capturing the public discourse and disregarding constitutional principles.

This paper examines the emergence of the AKP's right wing, religious populism through three different analytical lenses: First, the historical development of democracy in Turkey and its shortcomings; second, an international comparison between the AKP's brand of populism with political strategies employed by the Bharatiya Janata Party in India, the Law and Justice Party in Poland and Putin's Russia; third, a study of the role of President Erdogan within the AKP and the corrupting effects of political power.

In undertaking this analysis, this paper sheds new light on the consistencies across right wing political movements throughout the world, particularly in their ability to instrumentalise religious conservatism, to challenge existing political institutions and to dominate the public discourse.

RC15-286.3ROGERS, ANNE* (*University of Southampton*)VASSILEV, IVAYLO (*University of Southampton*)*The Contribution of Sociology to Theorising Patient Systems of Implementation*

Patient systems of health care are compared to formal health care systems under analysed and to date lacked sociological analysis informed by robust sociological theorising. We will show the contribution of sociological theory to the study of patient systems of health care drawing on capabilities theory and theories included under the sociology of everyday life (including social interactionism). Sociological theory has a major contribution to make to this nascent field by bringing a social relational network perspective to bear on **the broader set of contributions that contribute to patient system of implementation**. More distal elements that are not connected to formal health care systems relate to social relationships and the availability of social capital at the community level which are key to the mobilisation of resources needed to take self-management action and to act as providers of care. We will draw on two examples of the role of pets in the illness work and connectivity to social resources in illuminating how the following constructs are relevant to defining the contribution of sociological theory to patient systems of health care.

- **Social Wellbeing**, -social integration, coherence, actualisation, acceptance contribution
- **Capabilities (Sen)** promoting managing adequately through focus on people realising their capabilities and engaging in practices of subjective value.
- **Mobilising resources through relational work** undertaken in people's surrounding personal communities of support.
- **Ontological security** which sustains people's confidence in self-identity through dependability of proximate social material environments made up of possession of everyday routines, social interactions and relational interdependence with others.

We will discuss the future theoretical work that needs to be considered in this sub-field

RC14-267.1ROGERS, PETER* (*Macquarie University*)*Appreciating Surveillance Cultures*

This paper is a reflection on the importance of the electronic eye and the subsequent work in surveillance studies as a discipline growing from that book. It offers a mapping of one scholar's encounter with surveillance studies, from exploring the implications of surveillance cultures embedded in the physical fabric of urban space to engaging with the surveillance imaginaries being constructed and experienced via emergent forms of citizenship, enmeshed in a distrustful world.

The work of David Lyon is of vital importance to this story, helping contextualise these encounters - for the author, for the discipline, and for surveillance as a subject, object and field of enquiry. How this work has helped shaped this emergent discipline for the author (personally), but also for sociology as a whole is addressed; suggesting that the field of surveillance studies has contributed to a kind of 'open ended pragmatism' in social sciences. By asking important questions at macro, meso and micro levels this has opened up a more nuanced understanding of surveillance in all its forms - though this paper emphasises surveillance culture and surveillance imaginaries. The contribution seeks to better illustrate how important this approach is to the development, experience and research output of a generation of scholars, and seeks to explore and discuss how the study of surveillance advances sociology as a whole.

RC57-921.3ROGOWSKI, ŁUKASZ* (*Adam Mickiewicz University, Poznan*)*Visual Diaries As a Form of Evaluating the Research Process and Creating the Self-Reflexivity of the Researcher*

Self-reflexivity of the researchers is becoming important aspect of social science research. It is fundamental in international projects, especially those, where researcher conducts research in many different countries. In my presentation I would like to discuss the visual diaries research technique as a form of building and sustaining the self-reflexivity of the researcher and thus evaluating the research process. I will refer to research project „RurAction. Social Entrepreneurship in Structurally Weak Rural Regions: Analysing Innovative Troubleshooters in Action“. This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No 721999.

Visual diaries are one three most important areas of visual data in RurAction Project, along with photo and video documentation. It is important that the diaries will be provided not by participants, but by Early-Stage Researchers. They will be created during the research secondments as well as in everyday scientific

work of ESRs. Basing on the primary results of the project, I will discuss such aspects of visual diaries as a form of self-reflexivity, as for example: everyday (scientific and non-scientific) routines of the researcher, relations in multinational research team, relations with participants of the research and other inhabitants of researched territories. I will also underline selected ethical issues of such visual diaries, as well as participatory forms of creating the diary tool during workshops with ESRs.

Thus the visual diaries will be described in three ways. Firstly, as a form of gaining knowledge on local visual and material culture, which will help in later stage of the research, while creating photo documentation and documentary film. Secondly, as a way of learning and integrating into unknown culture by the researchers. Thirdly, as tool helping to understand and renegotiate the assumptions and goals of the whole research process.

TG08-1013.3ROJAS MORENO, KARLA* (*Universidad Nacional Autónoma de México*)CAMARENA, MARGARITA* (*Universidad Nacional Autónoma de México*)*Effective Access to Health Services, a Professional Perception in Chimalhuacán, México*

The study of effective access to health services and equity by socioeconomic level like space of justice takes importance because, the poor population has been exposed in major proportion to structural factors that are injurious for them health. This situation provoke a poverty cycle, in addition the Health has been considered constitutional right in Mexico. The Chimalhuacán municipality located in the México state, shows 261,496 poor people (a proportion 62.7% of all municipality) and 201,935 hab. have any kind of absent in them health service according to the Social Politics National Evaluation Council (CONEVAL). In this way, the current research was done with the participation of a student group of bachelor's degree in medicine and a group of urban administration and promotion work in Chimalhuacán. We have used the Encuentros Creativos Expresivos (ECE) methodology with the objective of expand the knowledge about the problems in the access to health services and its possible solution, through the use of footprint search about quotidian highlight indicators and variables. The study have took into consideration the perception of students that will be responsible of the health services distribution planation and that at the same time they are users in urban poor spaces; so they displayed the national and international parameters and standards; and the quality access that they perceives like users according with them experiences and expectative, which are in function of them framework reference, cultural, social and academic level, judges and prejudices, myths and rumors, etc. By this way, was captured the perception of health services distribution with the variables: service availability, physical access, provision capacity with quality and equity, with the use of techniques like a film, drawn, speech and collages to represent the feeling and background of the life framework.

RC52-868.7ROJEK-ADAMEK, PAULINA* (*Pedagogical University of Kraków*)*From Ethics to Social Responsibility in Designer's Profession. Polish Perspective*

„Design is after all a social activity carried out for social ends“ claim Clive Dilnot (Dilnot 1982:1). What this term nowadays means and how can be described the contemporary designer profession in terms of ethics and responsibility, are the main questions of this presentation. The world of everyday life is usually “designed” and better or worse refers to the specific expectations of individuals. In a substantive sense, significant in this process is the kind of value attitude that designers can manifest in their work. They contribute to the creation of a specific order in the material world, influence the new shape of social network and new meaning of specific elements in the designed reality. Designers, however, create quite diverse environment in the range of professions and specializations. As well as there could be included architects, designers - builders, installers or specialists in the field of industrial and graphic design. Perhaps, it is an abuse to claim that poorly designed object, device or visual information system will be as damaging as improperly granted medical advice, but it is hard not to see that designers work has an extremely large force of impact on the welfare of individuals and groups. In order to deal with, it will be showed some empirical data from own sociological research conducted among Polish professional designers. This presentation will attempt to systematize the issue of determinants for designer's ethic attitude and their professional responsibility by referring to theoretical interpretation of “design” concept and network nature of analysis (with ref. to Bruno Latour). To bring more clarity to the matter, there will be also presented the definition of design, differentiation of roles undertaken by contemporary designers and their influence on shaping the material environment of human life.

RC14-274.2ROJO, RAUL* (*Université fédérale de Rio Grande do Sul*)*Les Salauds De La Démocratie Et La Représentation Médiatique Du Crime Au Brésil De Nos Jours.*

La nouvelle et frêle démocratie brésilienne hésite à regarder ses crimes en face, car elle a prétendu tirer sa légitimité du citoyen, qui ne pouvait être que bon. Aux mieux, les délinquants seraient des révoltés, au pire, des malades. On peut dater ce discours de la *Constitution citoyenne* de 1988. Pourtant, ces dernières années, le crime a refait surface comme figure irréductible du mal. Scandales financiers, affaires de corruption, trafics d'influence, de stupéfiants et d'armes, faits divers sordides. Faute d'aborder frontalement la question du mal on essaye de la contourner en faisant du criminel un être d'exception dont les forfaits repoussent, mais dont l'audace, au même temps, séduit. L'intérêt pour le crime est coextensif à cet attrait pour les comportements exceptionnels. La représentation médiatique de la délinquance remplit ainsi une fonction anthropologique discriminante qui spécifie la limite entre l'anormal et le normal et une fonction sociale qui transforme des faits individuels exceptionnels en expérience socialement significative. Les médias contribuent à cristalliser l'inquiétude par rassemblement d'une masse atomisée de craintes sur des objets identiques : les violences emblématiques des *saouds* de la démocratie.

RC23-432.6ROMANOVICH, NELLY* (*The Russian Presidential Academy of National Economy and Public Administration (RANEPA)*)*Imperatives of the Scientific Ethos of Robert Merton and the Dichotomy of Their Implementation Variants.*

The paper is concerned with the stages of Robert Merton's life which the author connects with the conclusions about the place and role of a scientist and the correct use of the intellectual occupation results to which Merton came during his scientific work. The author presents a detailed study based on comparative historical and ethnographic methods and document analysis. The study deals with the problem of the options dichotomy for choosing alternatives which follow from the imperatives proposed by Merton. For example, it is shown that both opposite requirements are true: the need to be receptive to new ideas and at the same time the call to succumb to intellectual fashion. The dichotomy of these and other alternatives offered by Merton sets a difficult outline for the development of the ethical code for modern scientists. The author presents the most comprehensive analysis of Merton's imperatives, their reflection in the ICC/ESOMAR International Code as well as in the code of the Association of Russian sociological researchers "Group 789". The study examines the problem of a difficult choice between pairs of practically equivalent alternatives. It was found that the very fixation of ethical professional criteria has a positive effect on teams of researchers regardless of the sanctions application for violations of the code. On the one hand the study results promote the need for an ethical code in the work of a research scientist; on the other hand, they make obvious the challenge of the ethical imperatives implementation in connection with a given dichotomy of equivalent alternatives. The professional ethical code of a scientist, which Robert Merton contributed to, has a universal character not only relatively to a particular nation, but also regarding any specific scientific activity. This work is the most sensitive and topical search for sociology published to date.

RC44-738.4ROMBALDI, MAURICIO* (*Universidade Federal da Paraíba (UFPB)*)*Mega Sporting Events: Innovative Trade Union Strategies at the Construction Industry in Brazil*

This paper analyses international trade union campaigns in the construction industry for mega sporting events. It seeks to understand how the strategy developed by the Building and Wood Workers' International (BWI) during the preparations for the 2014 World Cup (WC) in Brazil achieved positive results in terms of mobilization and negotiations and its continuations in the actions performed for the 2016 Olympic Games in Rio de Janeiro. Based on a power resources approach, variegated achievements and results are identified for both campaigns. The BWI previous experience in negotiating with the WC organizers and a lack of national coordination among Brazilian unions contributed to the willingness of local unions to take part in the international campaign and strengthened ties with the international union federation. The main outcomes of the 2014 WC campaign included an unprecedented unified national bargaining agenda of the unions in the construction sector, which was supported by a series of strikes at the WC stadium construction sites and a massive move towards affiliation of Brazilian unions in the international trade union federation. The 2016 Olympic Games campaign achieved wage increases and had other positive outcomes such as the occupational safety protocol, which defines safety and security rules for construction work, and an agreement on the use of certified wood products. During the Rio preparations, however, there were significant

obstacles in developing coordination between the international and the national level as well as among unions at the local level, as local unions tried to enforce their local priorities.

RC07-157.5ROMERO RIVERA, EUNICE* (*Open University of Catalonia*)*"La República Que Farem" Emerging Imaginaries of Migrantness and Nationhood in the Catalan Independence Movement*

This paper presents the creative potential of the common future narratives within the Catalan pro independence movement; it focuses specifically on how the place for internal diversity is negotiated within Catalonia's nationalist narratives, along with the ongoing mobilizations. Catalonia combines a huge impact of immigration on its current demographic composition (70% of its population has a recent migrant background), and a national claim with growing domestic support. During the last five years, independence has centered the political discussion in Catalonia. Recent mobilizations and claims for independence have transformed the Catalan national narrative itself. Based on a long-term ethnography of the Catalan national movement, this presentation explores the potential of social movements for bringing about alternative imaginaries of solidarity in the interplay of nationalism and migration.

After Francoism, the Catalan national discourse was built upon a relatively homogeneous national imaginary, which did not reflect the diversity of its population at the time. The absence of immigration as a "place of memory" into Catalan national narratives left those who held a migrant background having to deal with their heritage, factoring it in their own way of living Catalan nationhood. Imagining an independent Catalonia stirs up deep passions among its population; fears and hopes for a new beginning are now at the forefront, showing the complexity that has been lived for the last half of a century and remained silent. Independence leaders -aware of the challenge that the absence of immigration and cultural diversity in Catalan national narrative poses to their political goal- have made a consistent effort to reshape their discourse to appeal those (in many cases) still considered immigrants. By stating their wishes and defining their strategies, (new and old) independence supporters are not only imagining a future Catalan Republic, but also shaping their current nation.

RC24-456.1ROMERO-LANKAO, PATRICIA* (*Climate Science and Applications Program*)DAVIDSON, DEBRA (*University of Alberta*)MCPHEARSON, TIMON (*New School New York*)*The Food-Energy-Water Nexus and Urban Complexity*

The Food-Water-Energy Nexus is an emerging paradigm that has received growing enthusiasm in the environmental science community, based on high expectations for improved integration of interdependent drivers associated with social and natural systems. As with all emerging scientific paradigms, it is important to consider carefully both the associated promises and the challenges. In this presentation, we discuss this paradigm and characterize the sources of optimism among its supporters. Then we go on to discuss three fundamental challenges that are sociological in origin: the feasibility of science-policy integration, cross-scale inequalities, and path-dependencies in infrastructure and socio-institutional practices. These challenges are illustrated with reference to recent research on two major urban systems in the Americas: Mexico City and Boulder, CO. While in Boulder, governance regimes fail only under low probability high impact risks, such as those unleashed by the September 2013 Boulder flood, for instance, Mexico City is vulnerable to high probability low impact risks, and faces huge challenges securing FEW infrastructures and services in sustainable and fair ways. Our exploration will serve as a basis to examine how, context specific conditions relate to differentiated capacities and options for sustainable responses to urban security challenges.

RC54-890.1ROMO GONZALEZ, PRISCA ICELA (*Universidad Autonoma de Nayarit*)VAZQUEZ SANCHEZ, SALVADOR (*Universidad Autonoma de Nayarit*)NAVARRO HERNANDEZ, MARÍA DEL REFUGIO* (*Universidad Autónoma de Nayarit*)HERNANDEZ CUETO, MARIA DEL CARMEN (*Universidad Autonoma de Nayarit*)*Body, Representation and Society*

The body is the support of the sign and at the same time is residence of the significant and by the way is the true that closes the arbitrariness of the sign and that establishes the necessary articulation among the elements of the reference of any representation; it means there is a logical relationship among the projection

of the body and its shadow (image), that constitutes the materiality of the sign inside of the context formed by the imaginary that gathers the productions of the social interactions that flings to the space of the signification in appoint norms and taxemes of the culture.

To work over the relationship body-representation is to establish a vector that is diffused through of the imaginary and that determined a structure that builds the modulations of the assembly of the subject reflection. The social interaction is a transposition of displacement of the body with the reference of the meaning that the subject defines since of the individual biography and the form of the semantic groups, that allow to establish the bridges among the bodies in general, and the object that are known such conviviality. Where is the voice of the body and when it talks? in the grain? (Barthes, 2013), simple texture or tissue of the inside (Jung, 1984)? Is the voice that betrays the cloak formalities of the body that are the basis of the representative processes of "herself" of the subject?

The analysis was done in a try to put on a level the three-dimensionality of the body, to unfold the scenography constitutive of the representation and the power of the communicative force that there is among the signac formation in the semantic horizon in which the showmanship of the displacement of the gestural of the body and the semantic horizon.

Cultural Political Economy of East European Capitalisms: A Preliminary Analysis

Three decades of development since the beginning of historic transformations in Eastern Europe resulted in quite distinct manifestations of East European capitalisms. Both the (geographical) scope and (temporal) perspective of these processes provides us with ample empirical evidence to study specific mechanisms and processes of their emergence and the ongoing continuous transformations. In this paper I employ the Cultural Political Economy (CPE) approach, focusing on semiotic mechanisms of their constitution and material reproduction. With that in mind, I define an instance of (national) capitalism as a successful materialization of a specific economic imaginary, a semiotic order of specific discourses and the resulting set of social practices. After reviewing the main typologies of East European capitalisms I analyze the emergence of specific types of capitalisms by focusing on semiotic evolutionary mechanisms of variation, selection, retention, reinforcement, and selective recruitment, inculcation and retention. In this analysis I recognize, firstly, that for most East European countries past three decades are not a single period; in some cases we can identify a rapid succession of relatively distinct phases, shaped by both geopolitical challenges and opportunities, and volatile internal processes. This implies, secondly, that the (trans)formations of East European capitalisms are not finished and will continue well into the future, with uncertain outcomes.

Sociology and Its Role in Post-Socialist Transformations: Towards a Critical Analysis

The role of sociology in the communist countries of Eastern Europe, its institutional development, specifics of national sociological traditions, its often controversial and ambiguous relationship with the political system, and (limited) debates with the international sociological community were the subject of extensive sociological research. We also have relatively good overview of the state of development of sociology and its institutional conditions in post-socialist Eastern Europe. However, the role of sociology in the processes of post-socialist transitions remains curiously under-researched, if not completely overlooked and we have relatively little structured and reliable information about the role of sociology in post-socialist transformations. Hence, we try to shed some light, analyzing both the role of sociology as a science and specific expertise, as well as the impact of individual sociologists through their different roles.

We adopt the Cultural Political Economy approach to post-socialist transformations and explore the role that sociology played in this process. First, we will explore the contribution of sociology to processes of variation of discourses and practices, which may lead to a variety of alternative paths. Second, we will scrutinize selection of particular discourses, a process in which sociology could play a role by privileging and interpreting some of them, e.g. by providing legitimization through interpretation of specific phenomena. Third, sociology can contribute to retention of specific resonant discourses, a process in which discourses and practices are included in individual and collective routines and identities, in widely accepted strategies, state projects and are even materialized in physical environment.

Analysis is based on 18 national case studies of Eastern European countries. Recent developments in Eastern Europe – notable shift towards nationalism and less democratic forms of governance – imply increased role that sociology may play in reflecting and moderating these processes, so the knowledge about specific mechanisms is of vital importance.

RONDINELLI, ELISABETH* (York University)

The Young Cosmopolitans: Silence and Speech in Cross-Cultural Encounters

Everyday or 'ordinary' cosmopolitanism is an important tool for examining the capacities people develop for living with difference. In education systems, cosmopolitan principles are making their way into the student profile, where students are called upon to practice openness to difference and to be curious and conscientious in the interaction. Drawing on fieldwork with young students ages 16-20 who are enrolled in an international school in Europe that accepts students from different ethnic and socio-economic backgrounds, I argue that students use speech and silence, attention and tactful inattention, to enact an ethos of openness. Using the literature in cultural sociology and interactionism, I track the ways in which silence and speech are resources and strategies students use in the everyday negotiation of three particular challenges of cross-cultural encounters: competency, accommodation, and avoiding offence. I further examine how inequalities manifest in the subtle decisions of when to speak or remain silent, revealing the complex realities that characterize the cosmopolitanism of the young.

Time-Banking and Health: Is It a Suitable and Sustainable Social Capital Building Model for Seniors?

Our community-academic partnership examined the relationship between time-banking and seniors' health. Time-banking is a social capital-building strategy (i.e., building trust and reciprocal relationships to facilitate neighbors helping neighbors) for seniors to age-in-community. We examined: 1) if time-banking is a suitable (i.e., members' socio-demographic characteristics and if/how they perceived participation benefits) and sustainable (i.e., members' perceived organizational assets versus barriers) model for seniors and 2) the association between time-banking and seniors' health. We surveyed national and international time-banks from TimeBanks USA and hOur World Exchange directories (n=33) by telephone and emails. We surveyed five Colorado time-banks' leaders and members aged 55+ (n=54), examining self-reported health, health service use, and the Lubben Social Network (LSNS)-6, Geriatric Depression-15, and Sense of Community Index-2 (SCI-2) scales. We used descriptive analysis to compare Colorado vs. the national and international and older vs. newer time-banks. For suitability, Colorado members were mostly women (78.4%), White (86.8%), in very good/excellent health (69.8%), aged 55-64 (37%) and 65-74 (40.7%), and college educated or higher (66.6%). The median SCI-2 score by time-banks was 38.44 (range 0-72). Colorado's vs. national and international time-banks were similar except for: the number of factors associated with success and perceptions that time-banking increased self-worth, contributed skills to benefit communities, and reduced dependence on the conventional monetary system. For sustainability, old vs. new national and international time-banks were significantly different on perceptions of: the nature of communities and a bad economy as assets and difficulties with the time-banking software and insufficient funding as barriers. The LSNS-6 was significantly different across Colorado time-banks by age, gender, and income. Our findings emphasize time-banking's potential to shift emphasis from aging-in-place to aging-in-community for seniors of varying socioeconomic statuses, potentially reducing seniors' social isolation, transportation difficulties, and healthcare use and costs.

Mapping out Innovation Practices in Knowledge Intensive Firms in Portugal: Is Failure an Indicator of Success?

For long, innovation has been understood as critical to generate competitive advantages for the companies that develop them. Still, being innovation processes future-oriented, and thus, inherently uncertain, they do not always lead to successful results. Despite this, literature has mostly focused on successful pathways, presenting innovative companies as the example others should follow, and innovation practices as linear, straightforward processes. According to these views, innovation failure is a severe setback to innovative practices, companies' financial performance and, eventually, survival. However, it has

been recognized that innovation is not a simple sum of success after success. Rather, it is a cumulative path in which failure to innovate, creating potential learning opportunities through trial and error processes, can be central for firm's innovative and financial performance. This paper will specifically 1) map successful and unsuccessful technological innovation activities; 2) characterize these trial and error paths and their firm and environmental underpinnings, and 3) assess the relevance of failure to innovation outputs and companies' turnovers. For this purpose, this paper focuses on Knowledge Intensive firms, mobilizing the Community Innovation Survey data for Portugal (2012-2014) (n=2718). Our data shows that 49.9% of firms developed successful technological innovation activities, while 7.4% presented unsuccessful practices. Moreover, innovation failure was associated with firms' R&D activities and expenses; cooperation partners; and employees' formal education. Most importantly, there is a high probability that companies that abandon the process of innovation to i) develop products that are new to the market; ii) present innovation outputs such as patents; models; design and copyrights; and iii) have higher turnovers.

This study characterizes innovation activities and presents a first map of abandoned innovation in Portugal. Our results suggest that learning with ineffective innovative activity might ultimately be critical for firms' innovative and financial success.

The Associations of Moldovan Immigrants in Paris Region: Social Elevators or Bridges of Transnational Solidarities?

Economic migration is a common phenomenon to many East-European countries, especially for Moldova. France represents one of the destinations of the Moldovan economic migration, hosting between 24,000 and 40,000 Moldovans. Most of them are concentrated in the Parisian region.

Following our research interest for the migrant's dynamics of life in the host country, as well as for the bridges built by migrants with the country of their origin, we carried out a qualitative survey among the Moldovan immigrants in France. This helped us to highlight the role played by the non-profit organizations created by Moldovan migrants, organizations which aimed to protect the immigrant rights and/or to respond to the need of solidarity among their community or between the host and the home countries.

In this context, we perceived that these associations do not fully correspond to the objective they have proposed. They rather represent social elevators, which ensure a dominant social position (within the Moldovan community from Paris region, as well as in the country of origin) for those Moldovan immigrants who create and manage them. Most of these "creators" of associations identify themselves as "leaders" of the community.

Graving around the Moldovan Embassy in France, these organizations are symbolically associated, in the social imaginary of Moldovan immigrants, with the delegates of the Moldovan state in France.

At the same time, these "leaders" maintain links with the structures of the state of origin, which provides them with the necessary resources to successfully implement their personal social mobility strategies in the home country.

Based on the results of the above-mentioned survey, we discuss in this paper about how these associations have taken away from the mission they have formally assumed (to respond to an imperative of solidarity) to transform themselves into social elevators for their "creators"/"leaders".

ROSENBERG, MICHAEL* (*Concordia University*)

Tradition, Authority and Change: The Interrelations Among Traditional, Charismatic, and Legal Types of Authority in Max Weber's Ancient Judaism.

In *Ancient Judaism* Weber identified three forms of traditional authority – the hierocratic authority of the priests, the patrimonial authority of the Kings, and the patriarchal authority of the clan leadership – in conflict with one another and with yet a fourth, the authoritative moral law of the Torah as understood by the peasants and other plebeian strata. This conflict was the wellspring out of which charismatic prophecy emerged, which was itself subordinated to the authority of the Torah. Later, with the destruction of Judea as a semi-independent state and of the Temple in Jerusalem, a new form of authority developed, the substantively legal authority of the rabbinate. But this latter authority, too, was understood to be an extension of the traditional law found in the Torah. We see, then, multiple forms of authority – traditional, charismatic and legal – all intertwined and in some ways each serving to underpin the other. Combined with historical contingencies imposed by outside forces, tradition in Israel was transformed into a processual force facilitating societal change. Contemporary scholars assert that Weber did

not succeed in getting all of the historical and theological details he provided in *Ancient Judaism* correct. Regardless, his comparative historical study serves as an illustration of how ideal types are applied to concrete historical circumstances. As Weber demonstrated, ideal types such as "charisma" and "tradition" only become useful for explanatory purposes when they are modified and extended to incorporate empirical societal variations and transformations.

ROSENKO, SVETLANA* (*Lesgaft National State University of Physical Education, Sport and Health, St. Petersburg*)

Comparative Characteristics of the Middle Class in Post-Soviet Russia rosenko1@mail.ru

There is an extensive body of sociological literature addressing how middle class was formed and developed in Western societies. However, relatively little research exists examining what are the avenues for middle class development in transitional societies that have appeared after the collapse of the USSR.

The paper tries to address this gap in existent social sciences literature. The study is based on the desk research, on the conceptual and theoretical analysis of data provided by the secondary sources: Russian state statistical agencies (Rossstat), public opinion polls, specific publications in professional journals.

The paper reveals that driven by contemporary increases in economic inequalities, there has been a recent renewal of a diverse series of approaches to the study of middle class and inequality. While these approaches, such as Bourdieusian class analysis, have made important contributions to understanding class formation, there is also a common baseline amongst these methodologies which our research finding problematizes. We propose to utilize the multi-criteria approach to definition of middle class structure and to analyze how inequalities are emerging from the ability of some groups to benefit from systemic mismatches in the process of market building in Russian society.

The paper consists of two distinct parts: the first deals with statistical data and information analysis regarding middle class formation in contemporary Russia, it debates assumptions and basic conclusions that stems from official reports concerning middle class expansion in RF. The second part provides open-ended explanations and the qualitative analysis as well as discussion of policies implication for decision makers and state officials.

Gendered Organizational Perspectives on Human Security of Refugees in Germany

This research analyses in how far the pressure on Germany's refugee regime affects the multilayered human security situation in refugee accommodations and its implications on gender. It closely examines the impact of factual, political and legal changes in Germany's refugee regime since 2015 upon the organizational field of public administrations and non-governmental organizations. Through empirical fieldwork in two municipalities including six organizational case studies, the research sheds light upon organizational perceptions and solutions for gender related security aspects along the human security dimensions economy, environment, food, health, personal, community and political rights. It argues that a thorough analysis of the interplay between organizational behavior and the institutionalization of political debates provides important insights on the attention given to specific needs of women, men, girls and boys as well as their intersection with other indicators creating vulnerability (such as health, age, sexual orientation, religion, and socio-economic status). The qualitative research project combines current debates in refugee studies with theoretical concepts from organizational sociology, gender studies and policy research.

Human Security Perspectives on Refugee Children in Germany

This research poses the question in how far the pressure on Germany's refugee regime affects the human security standards for refugee children. It is assumed that the awareness of the intersectional vulnerability of refugees – particularly women and children – has increased since 2015.

The research project identifies challenges and solutions for the situation of accompanied children in German refugee accommodations along the seven human security dimensions economy, environment, food, health, personal, community and political rights. Linking this to minimum standards, the research focuses on the organizational implementation of protection measures on the municipal level and identifies organizational perceptions and networks from an organizational sociological perspective. This involves a structural analysis of existing standards for protection of children and housing and their development since 2015. For instance, a cooperation between the German Federal Ministry for Family, Senior Citizens, Women and Youth (BMFSFJ), UNICEF, and non-governmental organizations involved in local refugee accommodation compiled non-binding minimum standards within their project "protection measures for women and children in refugee shelters".

While analyzing binding and non-binding standards, an in-depth understanding can be provided on the following questions: Which challenges do organizations face while guaranteeing refugee children's rights? Which value have children's rights in political debates? Which role do local organizational networks and circumstances as well as international organizations such as UNICEF play?

ROSENSTRAUCH, JEAN-LAURENT* (*Titulaire Master 2 Sociologie EHESS*)

Les Associations d'Aide Aux Victimes Et Le Féminicide Au Portugal (2004-2015)

Depuis dix ans, le *féminicide* est devenu un problème public au Portugal. Cent vingt-sept crimes d'homicides ont été perpétrés durant l'année 2014 contre des femmes selon l'enquête de l'Association portugaise d'aide aux victimes (APAV) : la moitié d'entre eux étant commis au sein de la sphère domestique. Cette enquête s'appuie sur des données récoltées à partir de l'exploitation de cas cités par la presse et les médias audiovisuels. À ce sujet, 40% des homicides conjugaux se déroulent dans un contexte de séparation (Institut national de médecine légale, 2005-2007).

Notre enquête se fonde sur une analyse secondaire des données traitées entre 2007 et 2015 par l'Observatoire des femmes assassinées créé en 2004 par l'UMAR (*União de Mulheres Alternativa e Resposta*). Cette analyse sera enrichie grâce au travail d'enquête mené par le réseau d'aide aux familles et aux proches des victimes d'homicide (2013-2015) soulignant les difficultés d'accompagnement des femmes survivantes (par la voie de l'accueil téléphonique ou en présence de la victime) qui se cristallisent par un taux important d'abandon de dossiers d'aide. Ce réseau d'aide montre qu'en 2013, 96,3% des personnes condamnées sont de sexe masculin. Ainsi, à propos du *féminicide*, il y a lieu de distinguer la « perspective genrée » liée à la domination masculine et la « perspective de violence », intégrée à un cadre indiscriminé de violence (Kivivuori, J., Lehti, M., 2012).

RC12-245.5

ROSENSTRAUCH, JEAN-LAURENT* (*Titulaire Master 2 Sociologie EHESS*)

Peut-on Faire Une Sociologie Législative Et Judiciaire Critique Des Lois Françaises Et Espagnoles Concernant Les Violences Au Sein Des Couples ?

Le droit est un champ de lutte pour l'exercice des droits des femmes comportant des spécificités : « l'institution d'un monopole, le pouvoir de nomination et la force de la forme » (Pierre Bourdieu, 1986).

Les lois de protection contre les violences conjugales ont davantage fait l'objet de critiques de la part des féministes espagnoles que françaises : celles-ci soulignant la fonction punitive de la loi (Maqueda, 2008) ou une défense ambiguë du droit pénal de la part du féminisme d'État. Tandis que d'autres féministes envisagent le droit comme « une ressource » (Laure Bereni et alii, 2010) susceptible de réduire les récidives en cas de condamnations judiciaires des hommes violents.

Aussi, le droit est-il au centre du conflit familial notamment pour l'attribution de la résidence séparée, de l'autorité familiale, ou de la garde des enfants. Le législateur français adopte d'ailleurs des mesures juridiques limitées avant l'instauration de la loi du 9 juillet 2010, cette situation continuant sensiblement postérieurement du fait que les juridictions n'accordent qu'un faible nombre d'ordonnances de protection aux femmes ayant saisi le juge aux affaires familiales : presque un vingtième de moins par rapport aux chiffres espagnols. Ce qui met en lumière les difficultés de porter plainte pour les femmes victimes (14% en France en 2014, 27,4 % en Espagne en 2011) : la présence de témoins dans le huis clos familial nuit à la divulgation des faits de violences (phénomène d'*underdisclosure*).

Nous tenterons d'ébaucher une synthèse comparée des données françaises et espagnoles mesurant les effets des lois protectrices durant la procédure judiciaire. Enfin, il s'agira de démontrer également que les victimes se heurtent dans ces deux pays non seulement au problème délicat de la preuve des actes de vio-

lence mais aussi aux juges enclins à promouvoir la médiation familiale pourtant légalement prohibée.

ROSENTHAL, GABRIELE* (*Georg-August University of Göttingen*)

Biographical Research in the Context of a Historical-Interpretative Sociology

In my paper I will first address the question whether the collection and analysis of narrated or written autobiographies is just one tool among others in sociological qualitative research – as was more or less the case at the beginning of biographical research. Often one gets the impression that claims regarding a diachronic or processual perspective and the interplay or mutual constitution of individuals and society as a specific theoretical foundation are neither recognized nor implemented on the methodological level in biographical research.

I will use this talk to show how combining social-constructivist biographical research with Elias's figurational sociology can help the researcher to overcome the strong tendency to focus on specific individuals, to look more closely at unequal power chances in different figurations within a particular social setting, and to consider the methodological implications of this approach.

RC38-673.4

ROSENTHAL, GABRIELE* (*Georg-August University of Göttingen*)

Creating a Good Balance between Detachment and Involvement in Biographical Research

How can we succeed in creating the necessary balance in biographical research between detachment and involvement (necessary not only for good *research*)? When conducting biographical interviews and during their subsequent analysis, we are constantly confronted with the problem of how to show sympathy and understanding in our interaction with the interviewees on the one hand, while at the same time maintaining the critical distance that is needed when reflecting on their individual and collective self-presentations, and formulating questions in the interview (or in the observation situation). We are faced with the same dilemma when analysing the interviews and when making a contrastive comparison with interviews conducted with a different grouping. Thus, in the case of returned child soldiers in northern Uganda, I was aware of a tendency to identify with them and their fate, and consequently failed to understand the attitude of their relatives, who often refused to let them live in their compounds or tried to exclude them from their local and social community of origin.

In very general terms, we can say that while empathy is important in our relationship with interviewees, this always involves the risk of accepting their presentations too quickly, and perhaps too naively, and of failing to ask important questions. By contrast, maintaining a critical distance makes it difficult to conduct a good interview and to establish a relationship of trust with the interviewee. This dilemma is particularly acute when conducting research on armed collective conflicts or intrafamilial violence.

ROSSANO, MARCO* (*Universidad de Barcelona*)

The Use of Video in Social Research: Young People and Emotional Distress.

This work paper describes the experience of a group of young university student of Barcelona making a documentary about the young people's emotional distress. The documentary is the result of a didactic project carried out at the University of Barcelona. The film follows the story of Maria, an Italian student during her Erasmus project in Barcelona, through the positive and negative aspects of the experience of the trip. At the same time, the story of the protagonist is inserted into a broader context of youth emotional. Then, this paper explains all the phases of the didactic project from the first meetings with the students to the presentation of the documentary in classroom.

In this paper we also provide an overview of the use of video methodology in education practice and social research. The work describes the use of video for data collection, the features and potentials of video as a research tool. The students, guided by the professor-filmmaker, use the video and change their way of observing and seeing the social reality. They verify in their environment the reason and the existence of emotional distress. Thus, the students become researchers and the camera becomes an actor in the research process. So the video and visual methodology offer different ways of practicing field research.

RC17-332.6ROSSI, PAOLO* (*University of Milano-Bicocca*)COLOMBO, MONICA (*University of Milano-Bicocca*)*When a Practice Becomes a Contract (and vice-versa): The Construction of Inter-Organizational Partnerships for the Co-Design of Welfare Services*

The aim of this paper is to analyse how a multi-faceted practice (the inter-organizational collaboration for the design and implementation of social welfare services) is transformed when it is inscribed within the norms of a formal contractual arrangement of inter-organizational cooperation. One of the implications of this shift is the rise of a set of organizational skills that transform the management of this cooperation into a new repertoire of practices.

These processes occur when the creation of a meta-organization (particularly in the case of the creation of project organization) is a requirement for applying to calls for the implementation of innovative welfare services funded by public or private actors. This is a growing trend in those countries, such as Italy, where austerity policies have sharply reduced the public funding of the social welfare system. The creation of project-organizations with the purpose of implementing innovative services is an opportunity for sharing resources and tackling emerging social needs more effectively and efficiently. A growing number of public institutions (Regions and Municipalities firstly) as well as private actors (such as private foundations) are encouraging this practice in order to overcome the limits that the traditional forms of design and provision of social welfare services are facing because of the socio-economic crisis.

From a theoretical point of view, our paper aims at joining the literature developed in the field of the practice-based studies with the studies on meta-organizations. The rationale of this framework is the idea that the management of a new meta-organization implies the development of new practices both at the administrative and at the managerial level. This reflection is supported by the analysis of three case studies of project-organizations created for the development of innovative social welfare services in Northern Italy.

RC51-856.2ROTH, STEFFEN* (*Yerevan State University*)VALENTINOV, VLADISLAV (*Leibniz Institute of Agricultural**Development in Central and Eastern Europe*)AUGUSTINAITIS, ARUNAS (*Kazimiero Simonavicius University*)MKRTICHYAN, ARTUR (*Yerevan State University*)*Was That Capitalism? a Culturomic Analysis of the English Language Area in 19th and 20th Century*

This article tests whether the English language area may be adequately described as secularised and capitalist between 1800 and 2000. We are using the Google Ngram Viewer to chart and interpret time series plots of combined frequencies of pertinent keywords in the largest Internet book corpus, the Google Books corpus. The results suggest that the English language area is a secularised, politicised, scientificised, and ultimately also mediated language area which has never been dominated by the economy. Thus, we turn social macro trend statements from assumptions into research questions and conclude that the sample period may not be characterised as capitalist if we associate capitalism with any form of over-average importance or even dominance of the economy.

RC37-663.4ROTHENBERG, JULIA* (*Queensborough Community College, CUNY*)*Theaster Gates: Chicago's Entrepreneurial Artist*

Theaster Gates stands at the crossroads of controversies surrounding arts and urban restructuring. These controversies include debates about the role of the creative sector and the "university industrial complex" in urban development, arts driven gentrification and the displacement of low-income community residents and the role of non-profits as partners with the urban growth machine. In addition, Gates' (who is himself African American) activities intersect with issues pertaining to race and culture in Chicago, one of the most segregated cities in the United States.

Gates, whose art engages the post-industrial fragment, racism, and the Black experience, is an international art star. He is also the director of Arts + Public Life at the University of Chicago, implementing the university's goal to create a thriving cultural life in Hyde Park, the Chicago South Side community which was once a center of black life and culture, but, due largely to the university's "Negro Removal Projects" throughout the 1950's and 1960's, developed a reputation as a staid academic outpost, surrounded by impoverished Black ghettos.

Gates has purchased properties with money from his art sales in the blighted, African American community of Woodlawn just south of the University's campus, converting them into studio and exhibition spaces and winning acclaim and funding for his "creative place-making" and community revitalization projects. Resi-

dents there continue to battle depopulation, gangs, violence and a steady drain of employment and social services.

My study of the "Gates Phenomenon" deploys participant observation and interviews with members of his organization, university representatives, artists, and other community members to shed light on how discourses concerning the arts, community, heritage, and culture are harnessed to legitimate and push forward economic development and at what costs and benefits to community members such agendas are put into place.

RC44-748.8ROUTRAY, SANJEEV* (*Northeastern University*)*Labouring Poor in Delhi: The Meanings, Relationships, and Politics of Accumulation*

The paper attempts to conceptualize informal and precarious labor markets through three overlapping analytical perspectives: a) hegemonic meaning constructions of work: 'dirty work', 'licit and illicit work', 'leisure work', 'time pass work' that reproduce forms of capital accumulation b) building and deployment of non-economic relationships in the accumulation processes, and c) modes of accumulation processes as a consequence of judicial interventions, political arrangements, and economic improvisations. Drawing on ethnographic research over two extended periods (between 2010 and 2011 and in 2017) in Delhi, I examine the gendered, caste, and working biographies over time and space. I will be attentive to the temporal and spatial logics by analyzing various forms of violence, cooption, and resistance improvisations inherent in the informal labor markets. Apart from caste and regional networks that shape labor market negotiations, I analyze the non-economic relationships with local actors and intermediaries that define accumulation through deployment of various forms of capital and the contours of working lives. In particular, I will explore how the poor survive precarity by a range of incremental accumulation practices. Further, I explore how judicial interventions (especially with respect to the overlapping concerns of industrial closures, pollution control, and street vendors), political involvement through mediations and rent seeking practices, and working improvisations operate within the sphere of informal and precarious work. My empirical findings will provide insights into the linkages between hegemonic meaning constructions of work, forging of social relationships, and political negotiations concerning informal and precarious work. I also explore the contingencies and the relative autonomy of various domains that interact and shape labor market, surplus accumulation, and the working lives of the poor.

RC37-656.3ROVAI, MAURO* (*Federal University of São Paulo*)*The Film As a "Warning Device". Sociological Notes*

The aim of this paper is to explore the notion of "warning device" (*dispositif d'alerte*), that appeared in an article written by Jean Cayrol in 1956 and whose subject was the film *Night and fog* (*Nuit et brouillard*, directed by Alain Resnais, France, 1956), a film for which Cayrol himself had written the text that has been read during the film. The intention is to discuss the possible connections between this notion mentioned above and *Muriel, or the time of return* (*Muriel ou le temps d'un retour*, France and Italy, 1963), a film in which both, Resnais and Cayrol, worked together again. The main methodological procedure is, first, viewing the films and, starting from them, to make a sociological analysis taking into account its expressive elements.

RC14-271.4ROVENTA-FRUMUSANI, DANIELA* (*Bucharest University*)IRIMESCU, ALEXANDRA (*Bucharest University*)*Gendered Discourse Strategies in Facebook Interaction during Electoral Campaigns*

Blumler and Kavanagh (1999) divided political communication in Western countries into three distinct historical phases, starting with the post World War II which has been called the 'golden age of the parties'; the second phase, starting in the 1960s, was the 'era of television'. The third, more generally termed the digital era, characterized by an intense personalization, privatization and populism is now followed (since 2010) by the era of social media (in the opinion of most researchers).

Since gender has become one of the first languages of politics we decided to analyze the construction of women leaders' *ethos* in presidential campaigns (Roventa-Frumusani 2015), as well as the intermediality of verbal-iconic signs on facebook pages. This socio-semiotic approach will be complemented by a pragmalinguistic one, concerned with the "dialogue" of (masculine vs. feminine) conversational styles in the last Romanian parliamentary campaign (2016) and will be focused on the speech acts and politeness/impoliteness strategies encountered in the followers' comments on public facebook pages of three prominent women candidates.

The main research questions, following Nancy Fraser's quest for women's legitimacy (identity and statute legitimacy), are: 1. How does the plasticity of the online public sphere function in order to create the 'networked self' of women political leaders in search of visibility and recognition? 2. How does the audience consolidate, attack, reward the affective rhetoric of women politicians on Facebook? (emotion contagion, emotion induction).

La Construction De l'Ethos Des Femmes Politiques Sur Les Pages Facebook En Campagne Électorale. Le Cas Des Élections Parlementaires Roumaines De 2016

La construction de l'identité digitale en tant que technique de production de soi avec son corollaire le tournant expressiviste demande une analyse du genre dans la double perspective du contenu disséminé ainsi que de la nature de la relation instituée.

Web 2.0 avec l'accent sur l'interaction et l'expression crée les conditions favorables pour le dialogue démocratique (Cardon 2012) tandis que la présentation de soi actuelle - *networked self*- (Papacharissi 2011) engage des formes nouvelles de visibilité et discursivité.

Concernant la communication politique dans les campagnes électorales, nous investiguons comment Facebook devient un instrument indispensable pour le marketing politique qui participe à la construction de l'*ethos* politique des candidat(e)s. Si dans la plupart des analyses réalisés jusqu'à présent les messages personnels et les engagements civiques ont mis en évidence l'*ethos* de l'acteur/actrice politique, il serait significatif pour la société de l'ère 2.0 le *feed back* de l'audience (amis, *followers*) sur les pages Facebook publiques, autrement dit le *paths* du public

A Critical Discussion of Participatory Research Projects with Young People Which Use Film: Stories, Narratives, Authorship and Ownership

This paper considers a series of issues that arise in participatory research (PR) projects with young people in which film is used for different reasons. We discuss three case examples, two from England and one from Canada. In each project film was used. In each film young people do a lot of the talking and their voices, stories and experiences are deliberately foregrounded in the final edits. After briefly introducing the three examples, we consider a series of questions which relate to the use of film in PR. Our focus is on exploring the reasons as well as unpicking the assumptions underlying the use of film in these projects. Drawing on Arthur W. Frank's (2010) work (which, in turn, draws on Anne Harrington's) regarding the distinction between narrative and stories, we consider two different possibilities about PR projects involving film. The first is that using film facilitates the involvement of young people, as well as publics beyond the academy, in discussions about a whole set of questions regarding issues such as recognition, youth identity and citizenship, by creating accessible modes of public storytelling. The second more uncomfortable possibility is that in such studies young people's contributions are edited (and, also, often screened) by adults, who provide the narrative frameworks into which young people's stories are inserted. If this is true, the public voicing of young people's experience generated in these PR projects might serve to ensure that the social problems and issues of inequality they face are rendered cosmetic, as they are used to serve other people's narratives and agendas. We finish by considering whether involvement in cultural production improves or worsens the already complex problems of involvement, ownership, authorship and ethics in PR.

Land Resource Conflicts in India with Its Implications for Food Security and Food Sovereignty

As farmland is diverted to other purposes in a fast-developing country such as India, the number of land-related conflicts is on a steady rise. The current model of land takeover—which depends on closed-door bureaucratic decisions taken without project-impacted persons' input—may not be sustainable for India. Recognizing the unsustainability of the current land acquisition model has prompted me to ask: how much land is absolutely required to feed, clothe, house, and provide a life of dignity to some 1300 million inhabitants of India? Acknowledging that food, fiber, and animal feed are basic needs, this paper

focuses on three issues related to land and food production in India. First, I will examine the extent of farmland and common land acquisition in India during the period 1947-2016. Second, I will analyze the impact of land acquisition on food production in India. Third, I will examine two contrasting models of meeting food needs for India—the top-down model of "food security" and the localized, "bottom-up" model of "food sovereignty"—and spell out the implications of following each model for meeting the total food requirements of Indians at present and in the next twenty years. This paper builds on Gadgil and Guha's model of classifying Indians into three social groups depending on their circle of resource use: ecosystem people, ecological refugees, and omnivores. I argue that while land takeover by the Indian government from 1947-2016 has had a substantial impact on creating hunger and food-related dependency among some groups of ecosystem people (e.g. Adivasis), the government sponsored-agricultural revolutions have had the opposite impact on other groups of ecosystem people and especially on omnivores. Further, I will argue that a mixed model (combining features of "food security" and "food sovereignty" models) is necessary to meet urban and rural India's food needs, given the adverse population: fertile land ratio.

Ebola Heroes. Power Dynamics and Heroization Discourse in Social Media Conversations.

This communication will analyze power dynamics in social media, by exploring online conversations on the topic of Ebola heroes. Traditionally, social media has been used by public and global health authorities in a unidirectional way: they propagate knowledge, but infrequently consider the lay public's reception of this information and their understanding of epidemics, which is increasingly publicly accessible on social media sites.

This communication aims to analyze the lay public's understanding and appreciation of the Ebola epidemic response, by exploring which actors were cast as heroes. We will also reflect on power dynamics circulating within social media conversations that may influence who is - and isn't - valued through heroization.

This analysis of Ebola heroes will use international social media conversations as raw material. Data was collected from Twitter and Facebook using key word extraction, and the collected comments were divided into two corpuses: opinion-based data (primary data) and news-based comments (escort discourse data), each of which was submitted to a qualitative and quantitative lexical and content analysis.

From this analysis, the core of the communication will explore the influence of traditional "dominating" news media within social media conversations, as well as the tensions between "local heroes" (actors from west African communities) and "foreign heroes" (American and European individuals), and between "marginalized heroes" and "mainstream heroes". In doing so, we will discuss social media's role in molding and transmitting representation, and consider how historical and cultural power dynamics are (re)produced within heroization discourse.

As such, this communication will highlight how the analysis of online conversations in times of epidemics can allow health authorities to adjust their communication campaigns to foster a sense of agency in local actors, address ongoing tensions and conflicts, and encourage wider public engagement in fighting the epidemic.

ROY, MELISSA* (University of Ottawa)

Online Blame and Ebola. Exploring the Lay Public's Understanding of National and Global Health Authorities' Accountability in Times of Epidemics.

This communication aims to analyze the tensions between national and global health authorities during the recent (2014-2016) Ebola outbreak, from the lay public's perspective. To do so, we will explore the main target of blame in social media conversations. We will use this accusatory discourse to explore which health authorities the lay public initially held accountable for the Ebola epidemic response (and subsequently accused of having failed their duty).

We will draw upon the analysis of data which was collected from Twitter and Facebook using key word extraction. The collected comments were divided into opinion-based data (primary data) and news-based comments (escort discourse data), each of which was submitted to a content analysis.

From this analysis of online conversations, we will discuss what we call a "proximal blame trend", that is a tendency for social media users to cast blame "locally" (on the national state and nearby groups), while omitting "far away" people, places and authorities (including global health authorities). Understanding blame as a reaction from the lay public that results from perceived failures from actors in which hope and accountability had been previously invested, we will discuss the importance of national health authorities in the eyes of the lay public, and problematize the near absence of global health authorities in accusatory discourse. This will be situated within preexisting social, cultural and historical relations and scripts.

As such, this communication will show how national and global health authorities can benefit from social media analyses on the topic of blame to gain greater insight into the lay public's expectations relating to epidemic responses. Drawing on our results, we will conclude by showing how such an insight can allow for better adjusted communication and management strategies in times of epidemic, in order to foster deeper collaborations between national and global health authorities.
