This paper compares the effect of family background and parental involvement on children's high school attainment in two different educational selection systems in Taiwan. I choose to examine Taiwan because the country is a natural experiment: Taiwanese government changed high school entrance policies from exam-based selection to taking into account multiple dimensions of student performance. Data for this paper comes from the Taiwan Youth Project, a longitudinal study of two cohorts of middle school students and parents in northern Taiwan. I find that, compared to students in the exam-based system, high socioeconomic family backgrounds and parental involvement are more important for students in the new system than the exam system. The results suggest that educational equality, measured by limited parental influences, is perhaps greater in exam-based systems than in systems that account for multiple types of student characteristics.

Most countries seek to minimum privileges from family background when selecting students. While this study uses the example of Taiwanese students, findings from a natural experiment carry implications for other societies. By examining high school admission and the influence of family background in different educational systems in Taiwan, this paper joins the debate over fairness in stu-

dent selection and contributes to the sociological understandings of educational inequality.

Are the Childlessness More Likely to Report Loneliness in Early Adulthood?

Mental health problems have long been recognized as a strong association with loneliness, defined as 'a discrepancy between one's desired and achieved levels of social relations'. Gerontological research in 1980s suggested that childlessness was related to significantly higher risks of social isolation, but there has little empirical evidence about whether childlessness is associated with loneliness in young adults. This issue yet becomes particularly important in the low fertility countries such as Taiwan. We thus assess whether social and emotional loneliness cluster and have conceptual meaning, especially with respect to whether the social and emotional loneliness are complementary or in competition with one another for young adults. We then further explore how remaining childlessness is associated with the likelihood of being in specific clusters of loneliness for the two genders.

Using the longitudinal panel surveys of Taiwan Youth Project (2000-2014), we compare young men and women with respect to their marital and childless status on loneliness (n=2,726, aged 27-32). Loneliness was assessed by six questions of the De Jong-Gierveld short scale with two distinct dimensions: social and emotional loneliness. Among the participants, one-fifth are married; 28% of these married people are childless. Preliminary results from multivariate regression models indicate a significant lower level of emotional loneliness observed among married women and men either with or without a child, compared to never-married single counterparts. In contrast, a significant lower level of social loneliness is observed among childless married men ($\beta = -0.35, p < 0.5$), not among childless married women, compared to never-married single counterparts.

The preliminary findings underscore gender differences in the association between marital status and childless status in social loneliness. Further investigations will conduct cluster analysis on two distinct domains in loneliness, model its relationships with marital and childless status, and explore the social network characteristics as covariates on loneliness clusters.

Exploring Associations between Family Building Behaviors and Loneliness in Early Adulthood

Family-building behaviors are conducive to the development of family relationships in young adulthood. In these days, young people yet seem to have trouble seeking companionship in the family and household spheres as a significant increase in mental health issue around the world. Depression has well been recognized as a strong association with loneliness, defined as 'a discrepancy between one's desired and achieved levels of social relations'. We thus assess whether loneliness cluster and have conceptual meaning socially and emotionally. We then further explore how various categories in marriage, cohabitation, and having a child are associated with the likelihood of being in specific clusters of loneliness for the two genders.

Data from the longitudinal panel surveys of Taiwan Youth Project (2000-2014, n=2,726, aged 27-32) are used to assess a series of categories of entry into marriage, entry into cohabitation, and stay single as well as having a child on loneliness among Taiwanese young men and women. Loneliness was assessed by six questions of the De Jong-Gierveld short scale with two distinct dimensions: social and emotional loneliness. Among the participants, more than half remained single and not in romantic relationship (51%); 8% cohabitated; and, one-fifth married. Among these married 72% had a child. Preliminary results from multivariate regression models indicate young adults who remain single without a romantic relationship had a significant lower level of emotional loneliness, compared to other marital categories for both genders. A similar association is also found for men on social loneliness. However, for women a significant lower level of social loneliness is only observed among the married who had a child ($\beta = -0.27, p < 0.5$).

Further investigations will conduct cluster analysis on two distinct loneliness domains, model its relationships with various marital groups, and explore the social network characteristics as covariates on loneliness clusters.

Economic Crisis and the Coping Strategies of Women in the Informal Sector of Western, Nigeria.

This study took a look at how women in the informal sector in the Western part of Nigeria cope with the economic crisis currently going on in the country. Quantitative and secondary data from relevant literature were used in measuring the impact of the crisis on women's financial, human, and social lives. These women employed both negative and positive ways of coping with the crisis. Borrowing increased, and most of it went into financing household expenditure rather than in productive activities. The effects of the economic crisis on families revealed that women became increasingly, the main income earners within their families. Children's education and feeding were adversely affected. Some were withdrawn from school to assist with their family's income-generating activities, by engaging in street hawking. Some women have had to sell their belongings, in some instances, their children in exchange for money or bags of food stuffs. They also engage in other risky activities that have long-term effects on their lives and families. Since economic activities in the informal sector are very sensitive to change, the crisis that Nigeria is going through currently has had very severe effects on the living standards of families. This has exacerbated the poverty among them. In order to ensure a more inclusive social and economic recovery for these most vulnerable ones, deliberate policies must be planned and provided for, to cushion the effects of the economic crisis they are going through. This is critical in preventing the crisis from causing permanent harm to children (by harming their future capabilities), and pushing families deeper into poverty and weakening their resilience.

Long-Term Care and Migrant Labour: Comparing Migrant Care Worker Policies in Taiwan and South Korea

Care turns into a site of "crisis" with the ageing population, increasing women participation in the labour market, changes in family and gender relationships, and the restructuring of welfare states. As outsourcing of care is happening in tandem with the expansion of the global care labour market, international migration has become the solution to the "crisis of care". East Asia is no exception to this global phenomenon. As East Asia welfare states expand social care provision, the increasing demands for care workers have led to reforms of immigration policies. The deeply intertwined policy mechanisms also highlight the critical roles that government plays in providing rights and protection for immigrants while providing essential care to those in need.

In this paper, I compare Taiwan and South Korea to examine how East Asian states negotiate their elderly care provision and border control. I explore how migrant care labour has become central to the provision of elder care in East Asia and how state's long-term care provision and immigration controls would shape its migrant care worker policies. Also, I investigate how migrant care worker's status as both "migrant" and "care worker" are shaped by the political and institutional framework of the state.

With the qualitative data I collected over seventeen months of fieldwork, I argue the institutional arrangements of elder care provision and development of immigration policies shape the diverging paths of migrant care worker policies. State's social policy arrangements, policy sequences and migration legacies have not only shaped how elder care is organised but also affected how labour and membership rights of migrant care workers are negotiated and contested. The timing and policy sequence of elder care policy and immigration policy shape the composition of migrant care worker force, and the labour protections and access to membership rights for migrant care workers.

Not Migrant, Not Worker? The Mobilisation of Joseonjok Migrant Care Workers in South Korea

As of June 2017, there are 1.2 million registered foreign residents in South Korea, and more than half of them are *Joseonjok*. The *Joseonjok* are Chinese citizens who are ethnically Korean, living in North-eastern China near the China-North Korea border. Since China and South Korea diplomatic ties were normalised in 1992, *Joseonjok* has been "return migrants" with South Korean kinship lineage, "marriage migrants" who married South Koreans (mostly men), and "co-ethnic labour migrants" in the Korean labour market.

In this paper, we investigate the mobilisation strategies of Korean-Chinese (*Joseonjok*) co-ethnic migrant workers in South Korea. We pay special attention to the *Joseonjok* care workers because care and service-related work is the job category exclusive to *Joseonjok* migrants. Their exclusive access to the Korean care market and the special status as co-ethnic migrants have put *Joseonjok* care worker into an in-between status: on the one hand, migrant workers unions are reluctant to include *Joseonjok* care workers as they do not work in the same industries, nor do they share the same concerns as other foreign workers from Southeast Asia and the Middle East; on the other hand, local care worker organizations tend to exclude *Joseonjok* care workers due to their temporary migrant worker status.

With thirty-five in-depth interviews with *Joseonjok* care workers, local care workers, migrant worker unions and local care worker organisations, we tackle the question of why and how *Joseonjok* care workers are situated in the isolated vacuum of the civil society without representation to advocate for their labour and membership rights. We demonstrate that *Joseonjok* migrant workers' capabilities to navigate the local labour market ironically contribute to their isolation in the Korean civil society. We argue that the broader social and political contexts have significant influences on the strategies of *Joseonjok* migrant care workers to mobilise for claims-making.

Confronting Greenhouse Gas Emissions from Agriculture: Epistemological, Ethical, Political, and Practical Challenges

The agricultural sector is a large and growing contributor to global anthropogenic climate change. There nonetheless remains a great deal of confusion among policymakers, the general public, and even scientists when it comes to the topic of GHG emissions from agriculture, particularly livestock agriculture.

The purpose of this paper is to provide further clarity to the technical and policy difficulties associated with mitigating greenhouse gas emissions from agriculture by identifying and distilling the core tensions which propagate and animate them. We argue that these complexities exist across four critical dimensions: the epistemological, the ethical, the political, and the practical. Adequately confronting the challenge of agricultural emissions will require improved transparency in emissions measurement, increased science communication, enhanced public participatory mechanisms, and the integration of ethical deliberation in scientific and policy discussions.

Impact of Globalization on Organizational Commitment and Job Satisfaction: A Study Among Information Technology Professionals in India

Although much has been lamented and debated upon organizational commitment and job satisfaction for almost four decades, few studies have involved information technology professionals. The sociology of society, science and technology deals with how social and cultural values affect scientific development and technological advancement and how these in turn affect society and culture. In the Indian Society the process of globalization has induced the economic opportunity and employment potentiality in the field of information technology industry. However, the impact of globalization may be both positive and negative; it provides a pathway to continuous technological upgradation but at the same time it appears to threaten the information technology professionals on the basis of their involvement and satisfaction in performing the job. A study in India reveals the impact of globalization on organizational commitment and job satisfaction among information technology professionals. It also focuses on the determinants and indices of commitment of Information Technology professionals and their satisfaction on the job. The present research seeks to probe into the intricate realities confronting the Information Technology professionals in the Indian setting. The geographical universe of the study is restricted to IT professionals based out of Bangalore city. The researcher has analysed the primary data collected from two categories of respondents, namely, IT professionals and Information Technology consultants for the purpose, to ensure that the findings are as accurate and as unbiased as possible. The researcher concludes that job satisfaction tends to be rather high in Information Technology professionals in the higher age bracket. Job satisfaction tends to be lower in the case of IT professionals in the lower age bracket. Upon analyzing the collated primary data furnished by the IT professionals and the consultants, the researcher concludes that the work experience of the IT professionals has a bearing on their job satisfaction levels.

Tracing the Meritocratic Promise: A Study of Socio-Economically Disadvantaged Families in a 'Meritocratic' State

Singapore is a 'strong' developmental state (Castells, 1992) that exercises ideological leadership over economy and society. Paradoxically, however, the KOF Globalization Index 2016 ranked Singapore as 6th most globalised country, of 207 countries – using indicators such as participation in international organisations and trade. As with other developed economies, aspects of neoliberal logic are foregrounded in the Singapore education system that potentially amplify parental involvement: increased school choice, competition and the state's subscription to a self-responsibilising meritocratic ethos.

This paper examines these seeming policy paradoxes, through the views and voices of low-income, ethnic minority families. As such, this paper attempts to map the complex relationships between neoliberal logics, state logics and the parenting approaches of disadvantaged families. Conceptually, possibilities for these relationships in descriptive literature outline how a near-nationwide belief in the power of education credentials in acquiring prestige, social mobility and global competitiveness, has generated an intensification in competition – which in turn precipitated an effective shift from ‘meritocracy’ to ‘parentocracy’ (The Straits Times, 2014). Within a ‘parentocracy’, a child’s educational outcomes are contingent upon parents’ capacities (or difficulties in this respect) to invest and strategise to enhance their child’s competitiveness.

Drawing on in-depth and focus group interviews, two key patterns of deviation from Western neoliberalism are explored: (1) Despite growing possibilities for parent agency, within a state that strongly advocates the ‘meritocracy’ doxa, profound trust in the government co-exists alongside an internalisation of a meritocratic, self-responsibilising ethos – and material and ideational reasons for this are offered; (2) However, parents are not devoid of agency, but engage with intensified competition through close family relationships that include components of control, surveillance, mutual support and emotional appeals to their children regarding the value of credentials. Empirical particularities are used to re-theorise a ‘Singaporean neoliberalism’ and to draw out equity implications.

The Role of Faculty in Reducing Academic Dishonesty Among Students

University faculty are frequently tasked with promoting academic honesty among students. Academic dishonesty is, however, rampant among university students worldwide, and there is little actual evidence about whether faculty actions can prevent it. Studies that address the role of institutional factors in mitigating student dishonesty such as faculty behavior draw on non-representative data and therefore lack generalizability (Pulvers & Diekhoff, 1999; McCabe et al., 2012). Furthermore, few studies explore the role of faculty behavior in preventing student academic dishonesty. This is a serious omission as faculty members may be important agents that can contribute to students’ moral development (Mayhew et al., 2016). The purpose of this study is to examine whether faculty actions can reduce academic dishonesty among students. Analyzing nationally representative, matched data on 1000 STEM undergraduates and 500 of their faculty from 33 universities in Russia, we first document extremely high (88.3%) rates of dishonest academic attitudes among first year students. The rates significantly increase among third year students with the increases being driven by a worsening of dishonest academic attitudes among the highest-achieving tercile of students. Second, we observe that the variation in dishonest academic attitudes among students is, by in large, explained by factors at the class rather than the university level. We then show that stricter faculty actions against academic dishonesty have large effects on student attitudes towards academic dishonesty. Taken together, the findings emphasize the importance of strengthening the role of faculty to promote academic honesty among students.

Pursuing Ecological Democracy: The Role of Taiwan’s Anti-Nuclear Groups in Energy Transition

The revitalized anti-nuclear movement in Taiwan has gained its unprecedented momentum after the 2011 Fukushima Nuclear Disaster. Through massive social mobilization, the movement have resulted in the termination of the construction of the Fourth Nuclear Power Plant in April 2014. In 2016, the new elected President from the DPP has promised to carry out the ‘nuclear go zero’ policy appealed by the environmental groups and to increase the proportion of renewable energy to 20% by 2025. Against this background, one can observe that the focus of the anti-nuclear movement has significantly shifted from ‘against-’ nuclear power to ‘pro-’ energy transition. As political opportunities appeared and some institutional channels opened, the leading anti-nuclear groups do not only have their members participating in various governmental commissions but also seek to collaborate with the government and the economic actors in order to influence the country’s energy policy and to advocate the citizens’ version of energy transition. The research explores the efforts the anti-nuclear groups and activists have made since 2014. It finds that some groups and activists have participated in the formulation of new energy policy and promoted of the democratic form

of energy governance. Some activists have converted themselves to be energy prosumers, such as collectively establishing citizen power Co-op. Overall, the leading anti-nuclear groups and activists have made great efforts in pursuing a more democratic, decentralized and justice form of energy transition. How to form a democratic governance framework is an issue. Although the DPP has clearer stand on anti-nuclear power in compared with the KMT and its central and local government have opened some institutional channels for the anti-nuclear activists and scholars, the DPP is still a party generally favoring the interests of industry. The challenges of pursuing ecological democracy in energy transition is still tremendous.

Union Organizing Strategies for Workers in Irregular Employment in Taiwan: The Possibilities and Obstacles

In the era of neo-liberal globalization, Taiwanese society has witnessed a significant increase of the use of irregular employment in past two decades. The soar of irregular employees, including part-timers, day workers, contract workers, and newly emerging labour dispatch workers, has left a substantial impact on the working conditions in general. The development has raised the concerns from the society and government and also attracted research interests in the Taiwan’s academic community from the perspective of business management, labour regulation, labour flexibility, working proficiency, labour market, and so on. However, there is too little effort made by the students of labour studies in Taiwan to the understanding of unionization and collective actions of the irregular employees, while there have been some innovative experiments and reforms growing from the grassroots union movements to tackle the organizing difficulty in the irregular employment in recent years. This research focuses on the possibilities and obstacles to organizing Taiwan’s workers in the irregular employment relations. Three dimensions will be employed to analyze the unionization of irregular employees: the legal framework of trade unions, the mindset of organizing of union leadership, and the characteristics of irregular employment in modern service industry. By in-depth interviews with union leaders, union organisers, and irregular employees and participatory observations on union activities, the research will explore the possibility of unionization in irregular employment sector. Finally, the institutional constraints of development of the organizing activities of irregular employment workers will be reviewed.

Global Trends in Socio-Economic Segregation between Schools, 1964-2015

Recent research shows that socio-economic segregation between schools (“school SES segregation”) is increasing in the United States, Chile and Sweden, raising concerns about declining equality of opportunity and social cohesion. It is unknown whether similar trends may be occurring in other countries. On the one hand, de-tracking reforms (delaying the age of selection into academically- and vocationally-tracked schools) in many European countries may have reduced school SES segregation. On the other hand, recent global trends such as rising school choice and privatization and rising residential segregation tied to income inequality, urbanization and migration may be increasing school SES segregation. This paper draws on 30 different international large-scale assessments to examine long-term international trends in school SES segregation and the possible causes of those trends. The assessments represent 100 countries and about 5.8 million primary and secondary school students. Socio-economic status (SES) is measured in terms of parental education, parental occupation and/or the number of books in the household. Results indicate that school SES segregation has been remarkably persistent over the past 50 years. Despite de-tracking reforms, the international average level of school segregation by parent education and by parent occupation was about the same in 2015 as in 1964, and school segregation by household books was nearly as high in 2015 as 1964. Fixed effects models show that de-tracking reforms are indeed associated with declining school SES segregation. However, increasing educational access is associated with increasing segregation. In addition, declining fertility rates and declining school size are associated with increasing segregation. This suggests that smaller families with more time and money per child, coupled with the fragmentation of the school-age population into smaller schools, may be intensifying processes of school and neighbourhood choice.

Rationality in Practice Theory: Implications on Qing and Li Theory of Social Organization

The social theory of rationality general enough to be equally applicable to both Asian and Western experiences is now possible through the efforts by many pragmatically oriented philosophers and social scientists during the last century and recent developments in cognitive science, neuroscience, AI, robotics, evolutionary psychology, and behavioral economics. This theory of rationality based on practice theory culminates more than a century-long attempts to escape from the conceptual constraints of representational epistemology in philosophy and the tradition of sociological research on rationality initiated by Weber and, later, Habermas.

I will first briefly present a preliminary theory of social practices as symbolic complex adaptive systems able to maintain both stability and adaptability relying solely on each agent's ability of normative judgment on actions and judgmental criteria. Coupled with a theory of human agency based embodied-embedded cognitive science, this theory of social practices offers a most promising social theory of rationality not only consistent with the current scientific researches but also compatible with the long tradition of Western sociological and philosophical researches.

Then I will offer persuasive arguments for the claim that thus constructed theory of rationality is free from cultural biases possibly originating from its Western intellectual origin just as has been theories of modern natural sciences previously. This fact, in turn, implies that the social theory of rationality presented in this paper offers a common theoretical ground to analyze and compare roles of rationality and empathy in social practices including social organizations, institutions, and norms in Western and Asian societies. This will allow us a chance to view the issue of balance between emotion and reason as emphasized in Asian philosophical tradition from a new perspective. The remaining part of my paper will focus on the topic of the elements of rationality that can be discerned in Asian social traditions.

Grandparenting in Korea and England: Patterns of Engagement and Their Institutional Context

Social investment is about fostering human and social capital which reminds us that social policy is an integral part of the economic and social functioning that brings returns to the society. The policy areas typically include early childhood education and care; education and higher education and, more recently, some studies comprise active ageing as part of the social investment strategies. Although the active-ageing discourse addresses the ongoing participation of older adults in society, however, some criticised its sense of social utility and impulses towards independence. Critics argue that the active ageing notion is often described as a paradigm obsessed with work, appealing a simplistic vision of productivity rather than the well-being of the older adults. This paper examines the enabling and imposing aspect of active ageing by analysing grandparenting experiences in a comparative perspective through the cases of South Korea and England. Grandparenting has been regarded as a domain of active ageing, and many studies indicate that grandparenting experience is a rewarding part of grandparents' lives and, at the same time, it can be perceived a burden in certain institutional context. In the respect, this paper analyses the similarities and differences in the grandparenting experience using comparable data set of ELSA and KLoSA and interprets the results by making linkage with their institutional contexts.

Paths of Rapid Dietary Transformation: Disaster, Military Occupation, and Migration of the Marshall Islanders

In just a few decades, population-wide weight gain, obesity and associated negative health impacts have characterized many of the developed countries and increasingly the global South as well. While several factors are believed to underlie this phenomenon, adoption of the industrial diet is foremost among them. This case study focuses on Marshallese Islanders (one of Pacific Islanders) who have unusually high rates of chronic disease (e.g., diabetes, hypertension, and obesity). We uncover the pathways of dramatic dietary transition and identify their contributing factors among Marshall Islanders who have experienced U.S. nuclear bomb testing, military occupation and destructive storms in their homeland and domestic and international migration. In-depth interviews were conducted with a sample of 40 Marshallese elderly living in the mainland U.S. and in Hawaii who were born and spent at least their childhood in the Marshall Islands. Regardless of their experiences, they gave up their healthy traditional diet and developed a dependency on highly processed industrial foods. We discuss the circumstances that undermined traditional diets and created a dependence on highly processed industrial foods, and the complex ways in which dramatic dietary changes occur among populations in the global South. In particular, we highlight the largely ignored role that military occupation and nuclear testing, as well as natural disasters have played in dietary transformation and the serious negative health outcomes this has implied.

Health of Biracial Children

Context

This year marks the 50th year anniversary of *Loving vs. Virginia*, the landmark Supreme Court case that declared anti-miscegenation laws unconstitutional in the United States. During this fifty-year period, the share of newlyweds in interracial unions in the United States increased more than five times and the number of multiracial individuals increased by more than ten times. Despite the growing demographic salience of multiracial individuals, little is known about their health. The rare exceptions focus on the birth outcomes of biracial children (see Srinivas-jais et al. 2012) or the psychological wellbeing of multiracial adolescents (Campbell and Eggerling-Boeck 2006). To date, no studies have examined the overall physical health of biracial children.

Objectives

Using data from the 1998-2012 National Health Interview Surveys, we compare the general health of biracial children born to White and Black parents with that of single-race White and Black children. We also explore the extent to which group differences can be explained by socio-demographic correlates of health. Finally, we investigate regional variations in the relationship between children's racial background and their overall health.

Contributions

Our study contributes important insights about racial inequalities in health. First, given the increasing demographic salience of multiracial individuals, information about the physical health of the multiracial children has implications for the health of future populations. Second, most studies of children's health disparities define children's race/ethnicity based solely on the mother's race/ethnicity. Our study focuses on children's health disparities according to maternal and paternal race/ethnicity, which leads to a more refined understanding about race/ethnic disparities in children's health. Finally, rising numbers of biracial children have been celebrated for its ability to race/ethnic distinctions and inequality (Qian and Lichter 2007). A comparison of the health of biracial children can empirically test whether the rising share of biracial children reduces race/ethnic inequalities in health.

Neighborhood Context and Health: Highlighting the Role of a Neighborhood's Physical Environment

Motivation for our study

How neighborhood contexts influence individual health has long been of interest to social scientists. A rich literature has established the links between neighborhood characteristics and a variety of health outcomes, such as cardiovascular disease, obesity, chronic conditions, overall health, and psychological wellbeing (e.g., Aneshensel and Sucoff 1996; Kimbro and Denney 2013; Pickett and Pearl 2001; Sampson 2003). These studies have found that living in poor neighbor-

hoods increases the risk for poor health. Partly because they rely on census data to measure neighborhood characteristics, existing work on this topic usually describes how the socio-demographic characteristics of residents or the spatial distribution of residents influence health (Aneshensel and Sucoff 1996; Kimbro and Denney 2013; Sampson 2003). In doing so, these studies frequently ignore whether and how a neighborhood's physical environment (e.g., walkability, places to be physically active, food environments) shapes individual health.

Study objectives

Using pooled data collected from Google Street View, the 2011 National Household Survey, and the 2015 Canadian Community Health Survey, we examine the association between a neighborhood's physical environment and the risk for obesity, cardiovascular disease, and diabetes for residents of the Greater Toronto Area. Next, we identify individual factors that buffers (or exacerbate) the adverse consequences of living in neighborhoods with poor physical environments. Finally, we determine whether and how residential segregation and neighborhood SES shape the relationship between a neighborhood's physical environment and individual health.

Contributions

We will provide a more comprehensive account of how neighborhood contexts influence individual wellbeing and health by pooling innovative data from Google Street View with traditional survey data from the 2011 National Household Survey and the census. It will also provide valuable insights to policy interventions aimed at building socio-cultural facilities and altering the physical environments of a neighborhood as a way to improve the wellbeing of its residents.

Hypermedia Knowledge Representation and the Production of Ethnographic Knowledge on Hong Kong Home Culture

Although there is a lot of literature on the potential of film and photography as effective vehicles to narrate realist and experimental ethnographic tales, the use of hypermedia in creating reflexive ethnographic narratives remains under-discussed. The presentation is a discussion of the design rationale behind a website titled "Making Home: Tai Hang" (<http://taihang.scm.cityu.edu.hk/#en>), that I argue that hypermedia affords the production of reflexive ethnographic knowledge. The website is the result of a visual-ethnographic research on Hong Kong home cultures: the domestic ideals that participants embrace, their everyday domestic practices, and how objects in their homes constitute their home-making practices. The website represents participants' homes through four layers of interpretation: animated splash and introductory pages, panoramic photography, audio vignettes of participants-researcher interaction, as well as database. It also employs specific media in different layers and utilize multiple interconnections among media via hypermedia application to produce ethnographic knowledge on Hong Kong home culture. I argue that the meanings generated from particular media (graphics, images, sound, texts) and their interactions are multiple instead of monolithic. Hypermedia affords scholars to create complex, ambiguous, and constructed nature of ethnographic tales. The interaction of images, sound, and text also problematizes modern domestic ideal.

Deep Strike: Playing Gender in the World of Overwatch a Case Study of Geguri in Esport

Electronic sport or "eSport" has grown to a global-sport entertainment industry with a projected growth of 1.5 billion dollars (USD) by 2020 (Dunn, 2017). Despite its development and considerable attention from scholars within several disciplines, sport academics have largely focused on a philosophical question of whether this activity can be defined as sport (Funk, 2017). Scholarly interests and debates on the importance of eSport as a cultural space where diverse identities and representations traverse have been neglected within sociology of sport literature. The number of females entering the eSport community-- both as gamers and spectators-- is growing, yet the eSport arena remains overwhelmingly male dominated, and female gamers face online abuse and harassment in the form of sexism and/or racism ("Very few women", 2016). For this presentation, we provide a case study of the South Korean female gamer, Kim Se-yeon, also known as Geguri, to discuss issues around gender in eSports. Drawing from feminist cultural scholarship, in particular, Judith Butler's theory of gender performativity, we conducted a textual analysis to address the androcentric and misogynistic nature of the contemporary gaming culture of eSport. It is further suggested that eSport has a subversive potential to de/reconstruct the inflexible categories regarding sex and gender in sport.

To be White Korean: Race, Masculinities, and Nationalism in Global Korean Ice Hockey

Transnational sport migration constructs an imagined national community driven by flexibly attuned citizenship (Ong, 1999). In addition to sporting individuals' aspiration to move across borders, governments play a crucial role in the process of recruitment and placement of the sport professionals to strengthen their national power. Since 2011, the South Korean government has been allowing outstanding athletes to attain Korean citizenship. By implementing policy called 'Special Naturalization,' more than twenty athletes were naturalized in Korea, many of whom will represent Team Korea at the upcoming 2018 Winter Olympics in PyeongChang, South Korea. However, given the historical racial and ethnic homogeneity within Korean society (Lee, Jackson, & Lee, 2007), this new flexible citizenship is controversial, as it challenges hegemonic discourses of nationalism, neoliberalism, and global Koreanness. For this presentation, I focus on the Korean national ice hockey team, which comprises the greatest number of naturalized athletes, to explore the newly imagined white Korean subjectivities. In doing so, I investigate discursively constructed immigrant citizenship of hockey player migrants in relation to socio-cultural contexts of gender, race, class, and sexuality through analyzing media coverage and political documents.

CHOU, JEAN TZUYIN* (University of Oxford)

From Taihoku Imperial University to National Taiwan University: The Spector of Colonialism in the Higher Education Taiwan in Taiwan

This paper focuses on the institutional and academic development and in National Taiwan University, which was once *Taihoku* Imperial University constructed as an educational institute for Japanese Southern Expansion Doctrine/ *Nanshin-ron*. The time span of this paper will be dated back to 1920s, when *Taihoku* Imperial University was founded, and continue from the period of KMT government to today.

I enquire into two perspectives: first: Southeast Asian studies in Taiwan between Japanese colonization and today; second, the related historical archives which bought and collected during Japan's colonization and preserved after KMT took the office. From these two dimensions and with the case in National Taiwan University, we enable to discuss the theoretical, conceptual and methodological structures embedded in the higher education. Ultimately, I argue that taking Southeast Asian studies as example, the dual-colonization by Japanese and KMT in higher education institute evidently exists. The specter begins by coming back--the de-colonization of KMT from Japanese regime has produced another educational colonization. During the process, it had ignored the precious archives collected during Japanese colonization to create new and different institutions as well as intellectual ideologies in National Taiwan University.

Thus, it presents three paradoxes of de-colonization in postcolonial period in Taiwan. First is that "the specter begins by coming back": the specter of colonization never disappears, but oppositely reinforced while the changes of political authority in a pre-colony along with the political establishment. Second, the academic freedom can never genuinely exist in the places once been colonized. Third, the process of de-colonization in Taiwanese education has stagnated and kidnapped by the political agencies after the Japanese colonization, which could be so-called as intellectual colonialism by both KMT government and American influences and investments in Taiwan higher educational institutes after the mid twentieth century.

Left out? Forgotten Struggle Histories, Perspectives on Old and New Approaches to Migrant Worker Organizing

Much of the literature about contemporary migrant worker organizing, such as studies on workers centres and community-based approaches to asserting labour rights (largely, though not exclusively outside of trade unions), celebrates the apparent novelty of their forms and strategies. But how 'new' are these approaches to organizing precarious workers?

This paper discusses innovative organizing strategies and dilemmas in contemporary migrant worker organizing in Montreal by relating them to earlier, forgotten or less well-known struggles of precarious workers in Quebec/Canada. It explores the implications of recovering historical knowledge from struggles of migrant workers that are not part of dominant narratives about labour movements in Canada, in union education, the political education in community-based labour organizations, or in academic research. We contend that this forgetting/erasure impacts our understandings of the possibilities of working class organizing in-

clusive of migrant workers, obscuring the longstanding role that marginalized migrant workers have played in Canada's labour movements, and the extent to which they have long challenged unions and society through innovative strategies addressing broader issues of social justice.

The paper draws on critical ethnographic research on contemporary migrant worker organizing through the Immigrant Workers Centre, the Temporary Foreign Workers Association, the Temporary Agency Workers Association and broader coalitions in which these organizations have played a leading role, including their relationships with trade unions, and puts these experiences into dialogue with critical historical scholarship and archival resources from earlier migrant and immigrant workers struggles (Creese, 1987; Leah, 1999; Mills, 2014; Ramirez and Chun, 2016). We ask how recovery of this historical knowledge might inform understandings of apparently new forms of contemporary migrant worker struggles, and what lessons can be learnt for organizing among migrant and other precarious workers in today's political and economic climate.

New Home and Foreign Land: Post-Secondary Students' Interactions with and Perceptions of Immigrants and Refugees in a Canadian Prairie Province

Canada has a long tradition of welcoming newcomers from around the world. According to Statistics Canada (2013), the National Household Survey reveals that Canada was home to about 6,775,800 foreign-born individuals in 2011, representing 20.6% of the total population. The Canadian Government has recently established 300,000 as a new baseline for the annual admission of permanent residents, with the majority of those allowed into the country to be selected as economic immigrants. Canada's immigration and refugee resettlement programs, similar to its multicultural approach to inclusion, are designed to bring benefits to Canadian society as well as an offer of a better life to newcomers. Doubtlessly, the country's immigrant population, the ethnic backgrounds of its people, its visible minority population, and its linguistic and religious diversity show that Canada is truly an ethnocultural mosaic.

In Saskatchewan, the unprecedented influx of immigrants and refugees to the province over the past decade is a direct result of the provincial nominee and refugee resettlement programs. The large number of new arrivals of diverse cultural, linguistic, ethnic or religious backgrounds poses a variety of challenges to the province. Drawing on (1) the integrated threat theory (Stephan & Stephan, 2000) which brings together a variety of theoretical perspectives that have been employed to understand the role of threats (i.e., realistic threats, symbolic threats, threats stemming from intergroup anxiety, and threats arising from negative stereotypes) in causing intergroup attitudes and (2) the self-categorization theory (Turner et al., 1987) which posits that the social categorization of people into out-groups and an in-group stimulates a motivation to perceive or achieve a sense of positive group distinctiveness, this paper explores the interactions with and perceptions of immigrants and refugees in a sample of post-secondary students in Saskatchewan (Chow, 2018; Chow & Wang, forthcoming).

Towards a Sociology of Digital Controversies: Climate Change and the Cultural Narratives of Evidence

As the political discourse of climate change moved online it raised important questions about the value of scientific knowledge when it must compete with "alternative facts" in a sea of informational noise. In recent years, it has become clear that the propositional knowledge of scientific experts (i.e. assertions about atmospheric warming) can be challenged effectively by individuals and organizations decrying the "controversial" assertions of climate scientists and environmentalists by appealing to a supposedly universal principle of reasoned "skepticism." While the consensus among climate scientists regarding the anthropogenic sources of climate change remains overwhelming, I argue that the cultural narratives emerging from this digital controversy have had an outsized influence on climate change policy, especially in countries like the United States. To understand the digital discourse around climate change, this study combines formal topic modeling, field analysis and discourse analysis. One of the key findings of this study is that participants in this debate rely on multiple moral grammars to frame and justify arguments about how or whether issues climate change should be addressed in public policy. Such a finding has important implications for the ways that we understand the power of digital controversies.

Gendered Career Inequality (1000-Present) Implications for Women and Society in Past and Future

This paper explores the long-standing and intransigent problem of gender inequality and careers, using a macro-feminist and holistic analytic strategy. It builds on diverse women's and social movement research and mainly on a decade-long team project, coordinated by Immanuel Wallerstein (2015) on polarization trends of the World System from 1500 to the present. With responsibility on that project for the women and gendered structures domain, my early data from 1500 led to requests for an earlier starting date. Eventually 1000 provided historical and comparative understandings about Women's Space and an historically-created Patriarchal System. Analytic help came from strong, diverse methodological training at Columbia University (accuracy, healthy skepticism, triangulation) and feminist grounded theory principles (theoretic sampling, comparative method) applied to macro level analysis while remaining grounded by data of specific actions and relationships within time/space processes.

The paper for this presentation begins with brief descriptions of women's careers in both the church and secular realms of Europe around 1000 in comparison to men. It then briefly analyzes career inequality over time in two occupations. That analysis draws attention to an often un-noticed historical event – the establishment of institutions of higher education that totally exclude women. I briefly point to early and contemporary ramifications and consequences. This example of the patriarchal embedding of women's exclusion into new and growing institutions of higher education enables us to better understand the historical persistence of continuing career inequalities and other unintended consequences. For example, the social relational deficit resulting from the lack of women intellectuals, scientists, public thinkers and leaders over centuries and the exclusion of a women's standpoint from scholarship and knowledge production has become more widespread but still often unnoticed in this new millennium, despite developing social, environmental and equalitarian democratic ideals. My conclusion suggests alternative likely future scenarios and methodological lessons

CHRISTOU, MIRANDA* (*University of Cyprus*)

Solidarity and Reverse Racism: How Right Wing Groups Educate the 'Oppressed Majority'

This paper presents results from a study of the right-wing, nationalist party "ELAM" in Cyprus. ELAM is closely associated with Golden Dawn in Greece and has gained parliamentary presence for the first time in 2016. The study is located within larger debates about citizenship, solidarity and the fostering of social movements, especially through the use of new media (della Porta and Tarrow 2005; Adams and Roscigno, 2005). At the same time, I argue that the field of Sociology of Education must account for how youth are educated, galvanized and mobilized through the use of new media that has become a very successful tool in the spreading of xenophobia and neo-nationalism as well as the recruitment of youth in right-wing organizations. The paper combines analysis of multimedia material available on the group's internet site and as well as semi-structured interviews with ELAM's leadership and youth members. In this presentation I focus on ELAM's rhetorical tactics in convincing the "oppressed majority" that their identity and mere existence is at stake. I employ a Critical Discourse Analysis approach (de Cillia et al. 1999; Wodak et al., 2000) and focus particularly on the group's use of justification strategies to defend their practice of "solidarity" that is designated "only for Greeks". I point out that the discursive maneuvers used to defend their limited meaning of "solidarity", "need" or "hardship" are central aspects of a strategy in which a "suspension of disbelief" is employed to justify a contradictory logic. I conclude that their use of "reverse racism" is an effective persuasion technique that appeals both on the negative aspects of racism as well as the valorization of victimhood. The paper explains how these results are connected to findings in other contexts and raise questions about the globalized nature of neo-nationalism.

Experimental and Explorative Dialectics in Conducting and Analyzing Focus Groups: Identifying Social and Cultural Capitals As the Main Resources for Young People Coping with Precariousness

This research highlights social and cultural characteristics of young people in Greece key to understanding how they cope in an age of strict austerity measures. While avoiding certain established concepts that lead to the political "construction" of youth, as official statistics or government employment programs imply, our combined empirical research and theoretical effort leads to a new understanding of the social concept of youth. The study demonstrates methods for identifying

documenting young people through qualitative interview techniques, primarily Focus Groups (FGs). In this way, it is possible to better identify their original social and cultural identity, as well as the important contemporary social phenomena that define young people as a specific generation. Through the elaboration of important theoretical models that explain the concept of youth, and different models for the transition from education to work, the case study proposes a new theoretical approach for youth that derives mainly from the In4Youth survey and qualitative data analysis centering on unemployment, poverty, employment prospects and welfare. Through the research experience acquired, a new model for qualitative research using a certain dialectics methodology is also proposed for focus groups and group interviews.

Beyond Black and White : Cosmopolitan Experiences As Identity Ressource for the Second Generation Chinese Youth in Europe

Based on a series interviews of young second generation Chinese living in European cities (Paris and Budapest), this paper will analyze how these youth's cosmopolitan experiences linked with China's transformation in the last thirty years shape their narrative of belonging and citizenship. The first part of the paper presents their common trajectories. Growing up in migrant entrepreneurial families, they tend to consider travelling, studying or even working in China as a necessary passage. Without necessarily considering China as their own "home", their positive experiences render the country a desirable place and thus a sense of pride as being a Chinese overseas. The second part of the paper will then analyze how these cosmopolitan experiences contribute to their claims of "double identity" or "double belonging". By illustrating various practices of citizenship or collective actions - anti-discrimination campagne, cultural production, protests, etc., I argue that their positive perception of being "Chinese" encourages them to challenge conventional citizenship paradigm in their respective countries. I'll conclude my presentation by pointing out their personal struggles of belonging, especially the trade-off between the ideology of development and democracy value, which usually manifests in their negotiation between familial expectation and desire of individual freedom in various personal choices. Whereas their cosmopolitan experiences allow them to subvert the seemingly exclusive citizenship paradigm in their country of residence, the value of individual liberty inherent to European education also pushes them to quest the norms in Chinese society and what China's economic growth implies to personal life.

The New Chinatowns in Europe : Chinese Wholesalers As Urban Economic and Political Actors

This paper aims at presenting how capital flows from China reshapes the Chinese market place in European cities. Based on qualitative study in Aubervilliers (France) and in Budapest (Hungary), the research finds that in both cities, Chinese wholesale markets have revitalized the urban economy and transformed the former industrial neighborhoods into global trading hubs. Four consequences are found in both cities : first of all, migrant entrepreneurs integrate into the local growth coalition by adapting their investment strategy to the local governments' vision of urban development. Second, besides their economic influence, they also participate in trans-local city diplomacy and participate in exchange with Chinese municipalities. Third, the investment-led regeneration has created cultural-led regeneration as local government and real-estate actors seek to attract Chinese residents and create residential enclave. Finally, the growth of China's purchasing power and new transport channels such as "the New Silk Road" have urged young generation to innovate their business model (e-commerce and exportation into Chinese market) ; as a result, "Made in Europe, sold in China" becomes the new tendency. To conclude, the evolving dynamics within the Chinese ethnic economy has not only increased the importance of Chinatown in urban politics, but also produced a cultural hierarchy transmitting new image of China as cultural and economy hegemony in the urban diversity politics.

The Role of Families in Inclusion of Persons with Schizophrenia in Chile

Full inclusion for an adult person means the capacity to have a fruitful work, to be capable of originate an own family, and a degree of participation in community life. When a person develops an schizophrenic crisis, usually lost his job, lost many friends, and he is segregated. He develops a profound dependence of his family. Because of this reason the role of family in recompose social bonds is crucial.

Research conducted in Chile about family perceptions shows that they are deeply overprotective, that they are afraid of eventual crisis, and, because of this,

they favor protected works in rehabilitation institutions, not "normal" or competitive works, they think that they cannot live independently, and to have a beloved stable partner.

This questions public policies based exclusively in reinforce family bonds without introducing family changes oriented to the development of the patient as an empowered person that guides his own goals. The problem is more complex that constate social stigma in general, because the dimensions of stigma permeates also families and in many cases the own person. These prejudices are in many cases are shared by health professionals.

We propose a multidimensional approach that, without discarding family support, redirects the efforts toward a true full and empowered inclusion.

Negotiating Care and the Boundaries of Unionism: Chinese and Korean Immigrant Home Care Workers in California

This paper examines how immigrant women enter and experience the care labor market in two urban ethnic communities: Oakland's Chinatown and Los Angeles's Koreatown. We draw upon semi-structured interviews and focus groups conducted with Chinese and Korean immigrant women to better understand how gender, kinship, and status hierarchies shape the experience of paid care work, including for one's own parents and family members, as well as how unions and community organizations mediate the informal and intimate dimensions of home-based care. We find that the growth of the homecare sector through California's In-Home Supportive Services (IHSS) system, which subsidizes home-based care for low-income, disabled seniors, has created a vibrant occupational niche for immigrant women workers who face limited job prospects due to aging, language ability, gender discrimination, and economic restructuring, yet the ambiguities of paid home care work as both public and private, paid and unpaid, and informal and formal exacerbate the conditions of both low-paid, precarious work and racialized gendered servitude. Some workers are able to turn to the union for newfound sources of social and organizational support, yet unions, which remain ensconced in the model of industrial trade unionism, have limited ability to influence the conditions of hybrid forms of care work. We draw upon workers' experiences of the complexities of paid care to discuss the potential of unions to address to the changing world of world of work, care and unionism, particularly for immigrant women who have long been neglected by formal labor movements and who work in urban ethnic enclaves with long histories of co-ethnic exploitation.

The Governance of Social Investment Policies in Comparative Perspective: Long-Term Care in the UK, Japan, and Korea

Given the demographic shift coupled with the transition toward a service economy, care services have become a key social investment policy in lately industrialised societies in East Asia, as well as the Western advanced industrial democracies. The recent debates about how to improve social care services highlight co-governance in welfare mix – or 'care diamond' – and multi-level governance in the shape of a better balance between hierarchical decision-making and principles of decentralisation (Evers, Lewis & Riedel 2005). What are the distinctive features of welfare mix and multi-level governance in social care services in three different welfare states (the UK, Japan, and Korea) that share the common ideas and practices, namely the prominent welfare role of the private sector? The effective governance of social investment policies, including care services, relies on not merely the programmatic characteristics of policy, but also the organisation, administration and delivery of policy (Carmel and Papadopoulos, 2003; Borghi and van Berkel, 2007). Nonetheless, the existing literature on social investment policies has concentrated primarily on the content of policy (e.g., coverage and finance) and its decision-making dimension, often ignoring or downplaying the implementation arena where policy content is put into effect. Therefore, this chapter attempts to investigate a mode of governance in the implementation arena with a specific focus on long-term care for the elderly in the three countries. The mode of governance does not occur in a social vacuum, but is placed within a historically specific set of political and institutional dimensions. Particular attention will be paid to how the legacies of political and administrative institutions (e.g., vertical and horizontal integration) differentiate the actual operation of the governance, which is the cornerstone for understanding and comparing care regimes, but under-discussed issues in the studies of social investment reforms and their effects.

Transnational Fields of Cultural Production

Pierre Bourdieu's model of cultural production has been used to study a wide variety of cultural phenomena—including art, literature, and music. Most empirical studies of cultural production employing a Bourdieusian methodology still focus on nationally-based fields at the expense of a more dynamic and accurate transnational field. Understanding cultural production in a transnational field requires an adaptation of Bourdieu's theory. This paper will reframe national fields within a transnational context while simultaneously illustrating the transnational components of national fields. This adaptation will thus reveal the nationalist roots and transnational routes of cultural production. We will examine literature and music as transnational fields of cultural production: fin-de-siècle avant-garde artists who were the focus of Bourdieu's own research, and a set of contemporary musicians and music-makers. Using qualitative and historical methods, we argue that the ways in which transnational fields operate cannot be reduced to a single blueprint, but must be induced from the grounded reality of the intellectuals and artists themselves.

Excellence and Gender Inequality in Science - Comparative Perspective

Since the 1990s promoting excellence became an explicit goal in both US and European research systems. Currently "(t)he standard of excellence serves as a benchmark for academic evaluation and promotion" (van den Brink, Benschop 2011: 509).

The standards of excellence, based on Western norms of meritocracy and understood as a synonym of the highest achievement, may appear to be measured by objective, neutral indicators. This belief is also based on the Mertonian norm of universalism, according to which "the acceptance or rejection of claims entering the lists of science is not to depend on the personal or social attributes of their protagonist; his race, nationality, religion, class, and personal qualities are as such irrelevant" (Merton 1973: 270). However, a number of studies on the elements of academic excellence – such as journal rankings, citation indexes, peer review systems and grant applications revealed that an idea of excellence as a universal and neutral standard of merit is a myth: it reproduces structures of inequality, including those based on gender.

In this context our article focuses on specificity of defining excellence in physics and its implications for underrepresentation of women in this particular discipline. By comparing qualitative data from different cultural contexts (Poland, Spain, Germany, Italy, France, Netherlands, Austria, Switzerland, Romania), we will aim at answering three basic questions: how is excellence defined in physics? How different ideals of "an excellent researcher" affect women's career in physics? What actions should be undertaken to overcome gender inequalities connected with measures that define excellence?

The data used are 87 semi-structured interviews conducted in twelve institutions in nine countries with both female and male physicists occupying various academic positions (from postdoctoral researchers and research assistants to full professors in physics) and specializing in many sub-disciplines of physics.

CICCIA, ROSSELLA* (Queen's University Belfast)

Gender, Social Rights and Multiple Inequalities: A Normative Framework for the Analysis of Long-Term Care Policies

Long-term care policies addresses issues of growing concern – population ageing and gender inequality – and are one of the most rapidly developing area of intervention in mature welfare states. These policies reflect differences in social policy approaches to age, disability, class and gender divisions and, thus, offer a privileged standpoint to understand the dynamic interaction between multiple inequalities, their relative prevalence across contexts and the extent to which they are institutionalised as antagonistic or reconcilable. This article proposes a normative framework to analyse the multidimensionality of long-term care policies and reforms based on four types of social rights: the right to perform care (R1); the right to opt-out of caring (R2); 3) the right to be cared (R3); the rights of care workers (R4). There are historical differences in the extent that women's groups have fought for R1 and/or R2, groups of the elderly and disabled have mostly advanced claims concerning R3 and the political mobilization of care workers (including migrant associations) around R4 is a recent phenomenon in many countries. While these rights are often portrayed in opposition, only LTC policies promoting all four types of rights realize inclusive forms of equality. This

normative ideal is then translated into a policy blueprint to reconcile the needs of multiple social groups (women, family carers, formal carers, care receivers), and is used to assess policy developments in a range of European countries. This framework has broader application and is particularly suited to investigate discursive and institutional dynamics, including resistances and alliances between social movements and political actors, around the reform of care policies. This article adds to existing gender welfare state scholarship by developing an analytical tool sensitive to multiple inequalities and contributing to normative discussions around desirable policies, instruments and goals from a gender perspective.

Making Sense of Unexpected Life-Courses – Autobiographical Narratives of Polish Post-World War II Resettlements

In the aftermath of the World War II, Poland's boundary-changes resulted in one of the greatest state-sponsored resettlement programs in the history of Europe. Following the expulsion of Germans from the newly annexed Western and Northern Territories (the pre-1939 population comprised over 8 million predominantly German inhabitants), more than 4 million Polish settlers arrived from: 1) Eastern Territories annexed by the USSR, 2) regions of central Poland, 3) foreign displacements. Thus, accidental communities were formed by uprooted individuals, who had to manage the social and economic upheavals of newly imposed communist rule on top of their unforeseen relocation to emptied places they had few prior ideas about. While contemporaneous sociological research on those newly forming communities was limited due to practical and political constraints, one notable exception came in the form of open competitions for authors of personal journals organized by the researchers of the Institute for Western Affairs in the period 1945 – 1970. The available 1141 journals were composed in periods of profound political change, such as the post-Stalinist thaw, which seemed to have enticed the authors to exercise more freedom of expression, divulging information hitherto kept secret as well as of memories from the early moments of settlement. However, political sensitivity of the material ensured that only perfunctory analyses could be attempted at the time, and only recently the material came to be fully digitized, which opened the corpus of personal journals to exhaustive inquiry. The proposed paper would focus on the findings of a research project "New society on the Polish Western Territories. Personal journals of settlers from an autobiographical perspective", which combines textual analysis with qualitative research with selected descendants of the journal-authors. Our focus would be on the narrative strategies of dealing with the trauma of life-course disruption through war, resettlement and regime change.

Changes of Social Situation and the Conditions of Life in the City: The Case of the City of Poznan

The main aim of the paper is the attempt to explore relationships between the trends involving the improvements in the social situation in the city (incomes, affluence, level of unemployment) and the subjective indicators of life-quality in selected areas: housing conditions, safety in public space, social security. The study is going to be based on a longitudinal project of monitoring life quality "Quality of life indicators of the citizens of Poznan" conducted by the Quality of Life Centre of Adam Mickiewicz University in Poznan together with the Poznan City Council since 2002. In this period, 9 general measurements utilising uniform methodology were conducted as well as 3 monographic research-projects focusing on the issues of safety, civic engagement, and on social exclusion. The research program comprises twelve areas of city life, each of which is based on two sets of indicators: a. indicators derived from public statistics and b. indicators based on quantitative surveys of a representative sample of citizens. The systematic nature of the project (it has been running for 15 years), as well as its large scale – both in terms of desk research, and in the survey effort, allows for accessing large amounts of data. As the period of conducting the research involved vast improvements in the social conditions in the city: dynamic increase in the per capita GDP, significant decrease of unemployment, large improvement in the level of household affluence, hence, those changes would seem to constitute important factors modifying the subjective quality of life perceptions among the citizens of Poznan.

Young workers and trade unions in Brazil today: Creative tension and tactical innovations

The paper analyzes the experiences of workers collective action in Brazil. Focusing on the 2012-2015 period, we draw attention to the relationship of a young generation politically engaged and its impacts in the experiences of renewal and tactical innovation in the trade union movement. Based on data produced by official institutions, union organizations, newspapers and interviews with activists and leaderships we verified the results of the creative tensions between union organizations and precarious young workers and how they are building or not a set of renewed practices and strategies of labor resistance.

The chosen period is interesting as it is marked by the return of policies addressing economic and social development. It is also characterized by reduction of unemployment, resumption of formal employment, different forms of State-union relations and reconfiguration of social classes. One main characteristic of the period is the rise of a young generation as an important political actor, which had in the massive street demonstrations of June 2013 its greater icon. In terms of its profile, this youth is the most educated generation to date. However, representing 20% of the economically active population, it is hit by twice the unemployment rates and occupies mostly more vulnerable and more precarious jobs. Asking for alternative ways of action and organizing the young workers have put their leadership under strong pressure. The conflicts between youth and the traditional organizations have given rise to interesting initiatives such as the strikes of Jirau and Belo Monte (2012), of call centers attendants (2014) and the June Rebellions (2013). As we shall see sometimes these actions were put forward without the Unions support and even against it. In other cases, the leadership was able to deal with the youth demands staying closer to its movements.

Child Labor: Between Family and Contextual Determinants

This article aims to reinforce the debates on the determinants of child labor, focusing on the duality between family choices and structural forces. As the theme has been explored in the literature, the objective is to present a new look at the phenomenon using a multilevel econometric model. The article uses information from Brazilian Census (2010). The findings point to a multicausality to explain the phenomenon.

Home Economics Theory, based on classical approaches as Becker's time allocation theory (1965), focuses on economic variables to explain this phenomenon, especially family income. The decision of children's work is understood as maximizing family well-being. On the other hand, Life-Course theory assumes that individuals are in a historical and social context (Dewilde, 2003). So, the individual is shaped by his context and the values that characterize his time.

Economic Sociology has as presuppositions: 1) the relativization of rationality that guides economic action and 2) the relationship between social representations and patterns of behavior and social organization. Therefore, it can concatenate the conception of the influence of individual and family rational choices and how these choices are embedded in contextual social relations.

This article proposes an innovation: the multilevel model (Goldstein, 1995), which takes into account the data grouping structure. This is a possibility to convergence Macro and Micro Level Sociology, allowing a new reflection on child labor. The model allows an overlapping analysis between intrafamilial variables - family income, labor market insertion, family size, schooling of those responsible - and contextual variables of the municipality - estimation of poor families,

informality rate, dropout rate, coverage of social programs, percentage of rural population.

The Role of Courts in the Global South in Criminal Justice Matters

This paper applies a Gramscian analytical framework to the analysis of the role of courts in the Global South dealing with criminal matters under neoliberalism. Despite the moral and political leadership that courts have gained under what has been called 'the judicialization of politics', judges dealing with criminal matters have lost that leadership in detriment of other agencies of the criminal justice system, particularly law enforcement agencies. In this way, judges can increasingly become identified as part of the bureaucratic machinery of the state, as 'technicians of repression'. The paper argues this loss of leadership can be understood as a result of 'politicisation of crime', partially a consequence of the raising crime rate in societies of the Global South, that have paved the way to the emergence of a popular punitivism on one side, and a managerialism on the other. The paper analyses how the specific conditions of peripheral and semi peripheral societies amplify the most negative aspects of these two phenomena. Considering these differences, the paper argues that there is a need for comparative studies that provide a better understanding on how criminal courts operate and the role they play in societies in the Global South. This paper explores the potential for that comparative studies by looking into two case studies: Argentina and Philippines.

Social Mobility and Spatial Mobility in the EU

A long-standing presupposition in social mobility studies is that spatial mobility is an opportunity for both career advancement and intra-generational mobility. Relocation to 'escalator regions' can enhance job promotion and, at the same time, disentangles the tie between the social class which one was born into and the social position she strives to acquire. Migration and mobility research show that, however, the prospects of migrants' upward mobility is many times contingent upon their origin and destination. Although the freedom of movement regime should not be subject to such contingencies, the evidence is that EU mobility can be conducive to downward mobility and to amplifying existing opportunities for upper class closure and upward mobility for lower middle classes. For lower classes, the linkage between origin and destination remains untied despite the promise of equal opportunities for European citizens. This paper takes a step further in examining the link between spatial mobility in the EU and social mobility and assumes that spatial mobility, in all of its manifestations, constitutes a form of capital that contributes to social mobility and, in particular, to inter-generational upward mobility. We inquire how the time span of mobility experiences (long-term, short-term), types of mobility (for work, education, leisure) and range (few counties, many countries, EU-non-EU) are associated with upward mobility and social fluidity. We also pay attention how gender stratifies spatial mobility and ultimately impacts on post-mobility social mobility. We use the EUCROSS survey conducted with resident population in six European countries in 2012.

RECCHI, ETTORE (*Sciences Po, Paris*)

The Land of All Opportunity? Migration and Social Mobility in the EU

Within the international migration system, European citizens are often regarded as 'privileged' migrants due to the generous package of social and political rights they are entitled to once they move to another member state territory (Fox 2005). Yet, existing research shows that intra-EU migration has limited pay-off in terms of social class mobility for Western movers and most likely negative returns for Eastern movers (Recchi 2009 and 2015, ch. 4). This paper inquires into the individual *and* contextual determinants of intra-generational social mobility in the EU. Social mobility research has insufficiently dealt with the role of contextual factors (at both the country and regional level) in shaping the opportunities for social mobility in Europe, despite observed variation between countries (Breen 2004) and has mostly focused on individual characteristics, such as education, gender and age. In discussing selective social mobility in the EU we propose to test, besides the role of individual determinants, how the economic (GDP per capita, economic globalisation), institutional (welfare typology, union density and type, educational system, migrant integration policies) and political contexts (strength of left/right in the past decade, strength of the radical right, Euroscepticism levels) in the country and region of residence influence the social mobility of EU movers. We use a pooled dataset of the standard LFS and the 2014

LFS ad-hoc survey on the labour market situation of migrants and multi-level regression models to compare 'stayers' and 'movers' intragenerational mobility in the 28 EU member states.

Diffused Religion Theory

Modern diffused religion is not very different from that of the past. Indeed it is precisely its persistence that gives it its peculiar characteristic which Claude Lévi-Strauss would have understood as a hard core not easily touched by time but subject, nevertheless, to variations that may not be easily perceived. If anything has changed, it has done so at a secondary level that regards details rather than substance. Diffused religion is the result of a vast process of religious socialization that continues to pervade cultural reality and not only that. The pervasive character of religion arises from the religion itself and is heavily imbued with religious connotations.

Religion of diffused values embraces central categories of religious behavior. In particular the area that can be ascribed to the religion of values runs from the category defined as *religious (church) critical* to that described as *religious (distancing self from church) critical*, and thus includes both a part of church religion and the whole gamut of diffused religion, along with all forms of critical religion. Thus the framework of non-institutional religion appears much broader, being based on shared values which are represented by choices in terms of guiding principles of life. It is reasonable to maintain that we are faced not only with a religion based on values largely shared, since they have been diffused chiefly through primary and, later, secondary socialization, but these very values can be seen in themselves as a kind of religion. This religion has lay, profane, secular threads.

The City of Haifa As Religious Kaleidoscope

The city of Haifa presents a number of significant traits that may help us test Tönnies's idea (1963) of a dichotomy between community (*Gemeinschaft*) and society (*Gesellschaft*). In different moments of city life, we find features typical of community, in certain others, characteristics typical of society. At residential level, some houses are built in such a way as not to favour interaction between social actors, while others favour it so much as it appears to be something taken, practically, for granted.

It is one thing to live in large, multi-storey condominiums, another to reside in one/two-storey houses that favour a continuous, even specular, encounter of glances, voices, modes of behaviour. But there are also situations where given contextual conditions are nullified by the will of individuals who gather for mutually shared moments of convivium, celebration, ritual, entertainment, leisure. This is true of Jews, Muslims, Melkites, Maronites, Ahmadyya, Baha'i, Catholics and Protestants alike. In this sense, it is quite clear what strategic role an occasion like the *Holiday of Holidays*, held in Haifa every year in December, can play.

The everyday life of Haifa undergoes a series of interactions involving people, one might say completely, and impacting on every sphere of their lives. This can be seen at neighbourhood, condominium, district and city level, depending on the contingencies of the moment, on local, regional, national, foreign or domestic socio-political events and on whether open or surreptitious conflict is taking place.

CLADIS, MARK* (*Brown University*)

Emile Durkheim in the Age of Diversity, Inclusion, and Nationalism: Or, Why the Need for Durkheimian Solidarity Is Greater Than Ever

I explore the nature and place of human rights, global ethics, and social solidarity in the work of Emile Durkheim and, more generally, its relevance in the face of such contemporary challenges as the rise of nationalism, climate change, economic exploitation, and oppressive racism and xenophobia. I will argue that, from a Durkheimian point of view, the concept of "solidarity" is neither quaint nor irrelevant for societies marked by religious, cultural, ethnic and racial diversity. Indeed, I will maintain that for progressive democracies to survive and thrive, solidarity is required; and that diversity and inclusion, and the human rights and global ethics associated with these goods, does not lessen but increases the need for solidarity.

After presenting Durkheim's claim that at the micro, epistemological level and at the macro, social level, forms of solidarity are already in place in modern democracies, I will explore the more pressing, normative question "What kinds of solidarity do we already have, and what kinds *should* we have?" This normative question will entail addressing Durkheim's approach to such fundamental issues as the relation between individual rights and global justice as well as the relation between solidarity at the local, national, and global spheres.

CLARKE, ANDREW* (*Institute for Social Science Research, University of Queensland*)

The Function(s) of Public Place Surveillance in Responding to Visible Homelessness in Brisbane, Australia

Public place surveillance is identified as a key infrastructure shaping power relationships in contemporary cities. In most accounts, surveillance is characterised as an indispensable feature of systems of urban social control that aim to secure prime urban areas for a narrow set of economic and consumerist functions, namely business, shopping, entertainment and tourism. This is particularly true of homelessness research, where studies have shown how surveillance practices, such as CCTV and security patrols, are deployed alongside defensive architecture and legislation criminalising conduct specific to homelessness (e.g. public sleeping, begging, etc.) to exclude people who are homeless from urban areas where their presence is deemed to disrupt the aesthetic order and intended (commercial) uses of those spaces. However, a number of recent studies have shown that these social control systems are not the only game in town when it comes to responding to homelessness in cities. Instead, a range of more supportive objectives and practices exist alongside of, and often in coordination with, control oriented responses. In this paper, I explore what the existence of these more supportive objectives and practices means for the function of surveillance in governmental responses to visible homelessness. I do this through a case study of the city of Brisbane, Australia, wherein I investigate the different objectives and strategies to which surveillance practices are harnessed, and the different power relationships in which surveillance is implicated, including the relationship between agencies who deploy surveillance for security purposes (police, city councils, etc.) and social services who provide support to people who are homeless. Drawing on Foucault's insight that power relationships are always open and dynamic, I argue that surveillance practices can in fact be deployed to support people who are homeless by augmenting outreach and support services and mitigating the insecurities of street life.

CLARKE, CHRIS* (*University of Warwick*)

Locating the Social in Social Lending: A Relational Approach to Platform Lending

The emergence of online platform lending – once called 'social lending' – is commonly thought to present a challenge to dominant banking institutions around the world. Since its inception, platform lending has been closely associated with a set of financial and digital technological innovations, resulting in striking developments in terms of how people engage in lending and borrowing around the world. Conceptually, the paper engages with debates about how emerging practices of valuation and credit assessment in platform lending can be understood using a relational approach. Empirically, the paper explores the novel means through which new sources of digital data are being harnessed in the Global South, with a particular focus on lending in India. Emphasis is placed on the character of the social relations that make up and are constituted by these innovations. In particular, the paper investigates how digital and mobile technologies allow online lending platforms to harness new digital data sources. In turn, it examines how these technologies are underpinned by particular sets of social relations (including gendered and racialised sets of relations), as well as how they are further productive of such social relations. The paper explores the following arguments: (1) platforms facilitating new forms of lending can be best understood through a relational lens; (2) despite the discourse of 'digital disruption' surrounding the sector, the practices of valuation involved in platform lending tend to reproduce the relations of finance found in more conventional lending; and (3) the rise of platform lending in India ought to be contextualised within broader political developments associated with 'fintech' and demonetisation.

CLAROS, HUGO* (*Independent*)

Small Data, Big Data and the Ethical Challenges for the Internally Unequal Developing World

The global North observe with attention the advancements and promises related to the use of big volumes of data and their availability for the increasingly refined elements of artificial intelligence. Many agents see with enthusiasm the

potential of generating those capabilities in developing countries, as innovation could help to answer old and new problems, give a chance to "catch up".

Nevertheless, the success of these kind of elements in developing countries needs, before anything else, to deal with clear deficiencies and already existent challenges related to less complex elements (small data). It is imperative to generate public discussion about the current conditions to generate and manage data with a challenging level of volume, velocity and variety (big data) and, more importantly, the priority given to it versus solving more traditional problems.

To be truly successful, that public discussion will need to address topics that evaluate the possibilities and limits of the adoption and promotion of new information practices and technologies in dialogue with preexisting internal inequalities.

Among others, the discussion would need to include topics concerning: 1) how legitimate is to bet on a strategy based on the formation and impulse of an intellectual elite, 2) how the differences in resources available for different agents could generate a difference in how useful the adoption of these technologies will be (will simply the rich get richer?), 3) how the adoption of these technologies could exacerbate inequality between sub-national territories as a consequence of the difference of access and skilled labor availability, etc.

This discussion about these new technological elements will need not only data-aware public managers and authorities, but also awareness about the specific ethical challenges and dilemmas derived of its adoption in developing countries.

Association between Long-Term Stressors and Mental Health Distress Following the Moore, 2013 Tornadoes: A Pilot Study

Resource loss is a common outcome of disasters among affected households, contributing to stress and negatively impacting human health. Research in this area, however, focuses heavily on clinical mental health impacts of disaster experience, with less research on cumulative stress during long-term recovery. This study uses COR theory to examine the influence of stressors including resource loss, debt, and social support on mental health in a sample of households in Moore, OK, impacted by an EF5 tornado in 2013. Questionnaires were mailed to 750 households residing along the track of the May 2013 tornado in Moore, Oklahoma, 71 surveys were completed and returned. Descriptive statistics were performed to describe sample characteristics and disaster experience, unadjusted logistic regression models computed, and odd ratios are reported. In general, respondents were heavily impacted by the tornado, 56.24 percent reported that their homes were destroyed or sustained major damage. Consistent with COR theory, resource loss, debt, personal characteristics, energies, and conditions losses were all risk factors for mental health distress in this sample. There was no significant relationship found between objects lost and mental health distress. Additionally, this study added measures of social support and household constraint that are not covered by COR but prior studies suggest contribute to mental health distress. Findings suggest that low social support and reporting at least one constraint meeting household basic needs (food, transportation, rent, or utilities) are significantly related to mental health distress. These findings highlight a need for broader types of services to respond to mental health following disasters such as services that aid families in navigating new financial situations or for managing debt or public health interventions that target bolstering social support or other types of resources lost to mitigate mental health distress.

Models of Governance in the Local Health Districts. Real Actors and Processes of Some Italian Regions

The evolution of several well known factors is at the basis of the transformation of the welfare models and health systems in many countries. A structural change has involved the continuity of care between hospital and territory and the primary care system.

The keywords of this new change are: greater relevance of the territorial organizational models of health services (Districts); greater integration between health and social services; care focused on the person and the role of the caregiver; integration and co-ordination of professionals (case-management) work with and within the community (community welfare).

Aims

1) analysis of the occurred change in some selected Italian regions as for the innovation of care processes at the territorial level with a focus on the primary and intermediate care system (role of districts) and personalized treatment processes of patients with specific chronicity; 2) focus on a territorial level aimed at the reconstruction of both documents and phenomena of the organizational aspects and of the relevant processes put in place and of territorial governance.

Methodology

1) literature review on the subject; 2) Use of following Indicators: financing the systems; the providers; the processes and forms of regulation in the socio-sanitary system; 3) Building a 6-macro analysis grid with over 200 indicators to investigate both the regulatory level and the phenomenal level on: System Mix (Public/Private/Citizenship) and Production Process of the Social-Health Performance System; 4) Interviews on the processes of taking in charge of autonomous chronic patients.

Results

1) Assessment of the necessary re-balance of resources and activities between hospital and territory; 2) centrality of the district and territory compared to the hospital; 3) participation and programming of services in an integrated governance logics; 4) implementation of enabling goals; 5) focusing on the cultural and social features of chronic patients; 6) organizational and professional resilience to change.

Actuación De Peacekeepers Argentinos En Escenarios Devastados Por Desastres Naturales –Caso Terremoto Haití 2010

Si bien la actuación Contingentes argentinos en misiones de paz tiene como objetivo el mantenimiento de la seguridad y la paz en escenarios de conflicto, en numerosas ocasiones las tropas de paz han tenido que afrontar situaciones derivadas de desastres naturales, sin haber estado específicamente preparadas para ello.

El presente trabajo presenta un análisis de la actuación de peacekeepers argentinos frente a las consecuencias del terremoto acontecido en Haití, en enero de 2010, cuando faltaban pocos días para terminar su misión de paz. El análisis se basa en la percepción de la actuación del contingente argentino a través de entrevistas realizadas a una muestra representativa de la Plana Mayor del Batallón Conjunto Argentino XI, presente en oportunidad de ocurrir el desastre natural y teniendo que posponer su regreso, al país para ocuparse de la asistencia humanitaria de los damnificados. Por otra parte, se realiza un estudio del material de entrenamiento de contingentes, Core Predeployment Training Materials –CPTM – establecido por Naciones Unidas para determinar si se tienen en cuenta contenidos relacionados con la capacitación para el afrontamiento de desastres naturales.

El objetivo del trabajo de investigación es determinar si existe, en el programa de capacitación de peacekeepers argentinos, un entrenamiento dirigido a preparar a los contingentes para el afrontamiento de desastres naturales y sus consecuencias. Los resultados del trabajo permitirán optimizar los proyectos curriculares relacionados con el entrenamiento de contingentes.

Decolonizing Sociology?: Indigenous Scholarship and Sociological Theorizing in an Era of 'Reconciliation'

Indigenous scholars have been theorizing in the colonial academy for over half a century, after many centuries of theorizing outside of it. Yet, sociological theorizing has not typically taken these scholarly contributions seriously. This is partly for reasons of ongoing colonial racism and partly a consequence of (related) institutional divisions of labour which mean that sociologically-relevant Indigenous theorizing has often developed in other disciplines, notably Native and now Indigenous Studies. Especially in the current historical moment within Canada, in the aftermath of the Truth and Reconciliation Committee, now is timely historical moment to examine the erasure of Indigenous theorizing from within the sociological canon. From the standpoint of a non-Indigenous sociologist, I document suggestive evidence of the near-total absence of Indigenous scholarship from sociological theorizing. I then briefly describe wide-ranging sociologically relevant Indigenous scholarship, before considering what transformations might be necessary for decolonized sociological theorizing in the future. I contend that advancing knowledge is not just a matter of reconstructing classical sociological works, but recognizing that adequate theorizing of the realities and challenges of the 21st century will necessarily require critical engagement with diverse historical and existing Indigenous scholarly theoretical contributions.

Trickle-Down Gender at the International Monetary Fund: The Scope and Limits of Mainstreaming Gender in Financial Governance

As feminist scholars have long documented, both International Monetary Fund (IMF or the Fund) and World Bank policies have differentially affected men and women. Yet, if the Bank has engaged in significant gender analysis for several

decades, at the IMF, policy analysis informed by gender has been remarkable mostly for its absence. The near-total silence by the Fund on gender and women was broken, however, in a 2013 working paper on "Women, Work and the Economy: Macroeconomic Gains from Gender Equity". Since then, the IMF has launched a major campaign around gender and the economy, asserting that gender equity is both a good in itself and necessary to economic growth and so economic well-being. As of September 2017, the Fund has published more than 1900 documents and videos specifically concerned about gender, while alerting the public to its sustained concerns for gender equity via its hashtag #IMFGender. Yet, this new, public commitment to foregrounding gender in economic analyses co-exists with ongoing, remarkable silences. Women and gender are almost totally absent from "flagship" Fund publications like the biannual World Economic Outlook reports, for instance, that describe the global economy and offer macroeconomic policy advice. This paper draws on a wide-ranging textual analysis of IMF publications to examine, first, the emergence of the IMF's recent discourse "mainstreaming" concerns of gender and gender equity and second, the contradictions and limits of the IMF's mainstreaming efforts within the Fund. Finally, I consider the specificities and more general lessons that this study suggests about efforts to centre gender in neoliberal financial governance institutions.

Academic Spin-Offs in Italy: New Opportunities for Research Professionals

The paper investigates university spin-offs in Italy from two different perspectives. Firstly, the growing number of spin-offs as an opportunity for younger academics to be employed. An aspect related to the current condition of Italian academic workers, increasingly affected by budget constraints and university policies in the last twenty years. Secondly, the academic actors involved in the spin-offs creation process, in the light of their identity and self-perception. In the first part of the paper we use a quantitative method based on the analysis of data from official statistical sources (Anvur, Netval, Cineca); afterwards, a qualitative section, starts from the analysis of interviews of four case studies. We show that the growing number of spin-offs can (also) be explained as a result of the decline of stable positions in Italian universities and we explore four possible identity-working configurations of academic actors involved. We stress the role of university spin-offs as a tool for allow young scientific researchers to get a job and pursue their research activity. The "entrepreneurial environment" introduced by the university spin-offs forces the academic identities to be exposed to a so far unexperienced strain. If the university spin-offs are a valuable tool for enhancing research results, the new configuration of higher education that results seems to push the Italian universities towards a deep identity change, associated with the dilation of its missions, its boundaries and its disciplinary fields with the other spheres of society, such as the business or the financial sectors. We propose a new tool, called "matrix of trends", addressed to describe spin-off actors following their orientation (academic or entrepreneurial). The "matrix of trends" presents all the possible configurations of a particular feature related to a subject or an event, in its crossing with an additional property, that is also divided between two extremes.

Reclaiming Youth Culture to Create the Safe City: Young People's Activism As Collective Caring in Sweden

In this paper, we explore how young people's activism reclaims youth culture regarding the safe city. Although adult elites rarely involve young people in addressing urban safety, they frequently draw upon youth culture for this purpose. Youth culture is represented as a cornerstone of the safe city by generating fun and excitement linked to nightlife, shopping, music festivals and sporting events. Alternatively, youth culture is depicted as a threat to the safe city by displaying anger and rebellion connected to pub brawls, sexual harassment, vandalism or graffiti.

We draw upon a qualitative study in two Swedish cities that investigated the understandings and practices of young people's activism for creating the safe city. Our findings captured three processes. First, young people's activism entailed getting to know first-hand how young people feel unsafe in relation to a variety of social situations, ranging from interpersonal violence (i.e. bullying) and achievement pressure in school to sexism, racism and homophobia in society more broadly. Second, their activism addressed young people's unsafety by moving where young people are and when, thereby developing youth-to-youth strategies. Third, their activism created safety by being there for young people so that young people feel seen and heard.

We refer to these processes as *collective caring*, and contend that through them, young activists reclaim youth culture regarding the safe city. Collective caring involves re-negotiating feeling rules (Hochschild 1979) as young activists reject depictions of youth culture merely in terms of fun and anger regarding urban safety. Moreover, collective caring entails relational activism as young activists use the relationships they have formed in their communities as catalyst for social change (O'Shaughnessy and Kennedy 2010). Collective caring constitutes a form of resistance to precarization as young activists refuse governing through a permanent state of insecurity (Lorey 2015).

Class Politics By Any Other Name: The Drift of the Center-Left in the Advanced Capitalist Economies

Within the neoliberal drift of the past several decades, it is striking that the established parties of the center-left in the advanced capitalist economies have almost nowhere and almost never represented a credible alternative. The Democratic Party in the United States and the various Labour, Socialist, and Social Democratic Parties of Europe have often been the authors of neoliberal policies, and when not, they have offered little effective resistance. Since 2008, with the exception of the recent resurgence of the British Labor Party, it has been these center-left parties that have suffered the worst at the polls, often to the benefit of parties of the far right. Meanwhile, again outside the U.K., attempts to pull the established center-left parties to the left or to found new parties to outflank them have met with only limited success. Together, these facts represent a puzzle that has received too little attention in accounts of the neoliberal era. Why is it that the established center-left parties have *neither* taken up the banner of a genuine "countermovement" to neoliberalism *nor* been supplanted by political forces that can do so? We argue that answering this question requires a new analysis of the class politics of the "progressive" branch of neoliberalism. The more socially inclusive neoliberalism peddled by the established center-left parties cannot be understood merely as an ideological cover, but instead it is necessary to explain which social groups they have managed to cultivate as an electoral base, including a significant number of those who have borne the brunt of the neoliberal economy. We offer an account that clarifies the shared economic and political dynamics that have given rise to, *together*, the center-left's drift and the far right's rise, linking both to the underlying conditions of competition and capitalist accumulation in the global economy.

COHEN, HADAS* (Hebrew University of Jerusalem)

Gendering Treason - the Making of a Loyal Israeli Citizen

In this paper I analyze the case of a Jewish-Israeli woman, Tali Fahima, a Jewish Israeli woman who during the Second Intifada publically volunteered to be the human shield of Zacharia Zubeidi, the head of the Al Aqsa Martyr Brigades in Jenin who organized suicide bombing attacks against Israeli civilians. A few months following her public declaration, an Israeli military operation took place in the West Bank, in which a top-secret military document was lost by an Israeli soldier, and reached the hands of Zubeidi when Fahima was with him and his men. As a result, for the first time in Israeli history, Fahima, a Jewish Israeli woman, was placed in administrative detention for an indefinite amount of time, with no charges against her, and with no access to the state's evidence. Four months later, Fahima was charged with treason and with aiding an enemy agent, and following a plea bargain she initiated, served a three-year jail sentence.

I use Fahima's case to understand the ways in which the image of a "loyal citizen," and more specifically, that of a loyal Jewish Israeli woman, is produced and regulated through the discursive circulation of certain notions of citizenship, gender, ethnicity, and sexuality, and the violence that this normalization requires. I demonstrate how the intersectionality of these categories worked to depoliticize political dissent. As such, Fahima's case serves as a lens in which the national, the intimate and the sexual refract, exposing the multiple loyalties and allegiances a citizen must negotiate, the contradictions that exist within the seemingly monolithic national unit of "Israel," as well as the dynamics enacted to unify the nation against an internal dissident.

Wealth and Preferences for Redistribution

How does wealth affect policy preferences? While the wealthy have been shown to have disproportionate influence in shaping policies in many societies, we know little about how wealth itself shapes policy preferences. Although wealth

provides a range of important social and economic advantages above and beyond those of income, including political influence, and inequalities in wealth are even more extreme in many societies than those of income, social scientists have largely neglected wealth in studies of stratification and inequality. In this study, the relationship between wealth and support for redistributive social policies is examined in cross-national perspective using data on 31 countries from the 2009 wave of the International Social Survey Programme (ISSP), the first wave of that study to include measures of wealth. We present and argue for an alternative to a convention in quantitative cross-national research of pooling multiple country-level surveys into a single regression model, and introduce an alternative approach that blends the quantitative meta-analysis of country-level regressions with a more qualitative comparative-historical analytical approach. The findings presented herein demonstrate that wealth is among the most important determinants of policy preferences.

French Configurations of the Promotion and Practices of Fasting: Emerging Tools of Reflexivity and Ongoing Blurring Boundaries between Conventional and Unconventional Medicine

This communication offers a theoretical interpretation of the current promotion of fasting in France. We articulated different methodological tools as, an analysis of sixty books promoting fasting and published in France since the beginning of the 20th century, an analysis of sources available on the Internet and in the media, an ethnographic fieldwork within fasting centres in France.

A particular social configuration of fasting revolves around the development of its dietetic form since the 1990s and a large diversification of its models since the end of the 2000s. We outlined two major turning points:

- an international scientific one since the mid-2000 and first evidence of the therapeutic effects on animals;
- an national one since the beginning of the 2010s originating from media after a large dissemination of documentaries and books promoting fasting and its therapeutic effects

We consider fasting as a control over both the body and the food practices integrated into new reflexivities in the era of nutritionalisation. Media coverage has reversed the negative image of fasting towards a positive one. Fasting appears now as a response for people willing reflexively control food habits and nutritional balance, health and weight, to balance way and quality of life, or to enhance religious, spiritual or sportive practices. It brings also new hopes for preventing and curing diseases (cancer in particular).

Confined to natural medicine followers, the therapeutic and medical purposes of fasting (promoted by hygienists and naturopaths) are not integrated into conventional medicine in France, contrary to Germany or Russia. The success of dietetic fasting could be interpreted as a French adaptive modality in the context of a strong control of medicine legitimacy in France. However, the germinating scientific evidence and media dissemination bring into question new blurring boundaries of legitimization at stake when dietetic fasting is concerned.

Social Democratic Models of Development: Can Social Equality Make Whole Nations Richer? Evidence from the Brazil and the Global South Post 1989

This paper draws from the social democratic models of Sydney and Beatrice Webb and Dieter Senghaas to argue that social equality can increase the rate of economic development. Most sociologists study the relationship between economic development and stratification. It is less common to study reverse causation; however the gutting of the income of the popular classes and the concentration of income in elite hands can significantly slow the rate of economic growth by reducing consumption, lowering overall demand, reducing the rate of new firm formation and retarding the rate of technological growth.

We address the question of the relationship between economic inequality and social transformation as measured by development by using what would be for sociologists an unusual statistical methodology. We consider the Leontieff input-output matrices that have been calculated for nations in the Global South since 1989. These measure the interindustry transfers of income that come from sales between vendors and suppliers - and are used to measure the multiplier effects of different industries. One little-known property of such matrices is that the contribution of wages to growth is often measured. The magnitudes of wage effects are frequently un-reported in the economics literature. Sociologists ignore these analyses altogether.

The data allow for a calculation of the effect of raising wages on overall development and allow apples-to-apples comparisons of how improving social welfare

would affect the economy as compared to stimulating the industries that traditionally receive government stimulation such as automobiles, steel or computers. Higher wages increase the purchases of consumer goods which leads to all sorts of backward linkages to the industries that supply the raw materials and equipment that produce consumer goods.

Human Welfare is "an industry" that can produce real growth.

Diseño Gráfico, Una Apuesta Creativa Para Crear Ambiente Amables En Las Organizaciones

Durante la última década, el diseño gráfico ha planteado generar ambientes sociolaborales amables que procuren el bienestar de los individuos en las organizaciones y así luchar contra el conflicto innato y no siempre manifiesto, todo ello enmarcado en el paradigma de la sostenibilidad.

En esta investigación se presentarán algunas propuestas creativas enmarcadas en el denominado diseño gráfico social y que se plantea desde una doble vertiente teórica: por un lado, la apuesta que hace el diseño gráfico como medio de expresión y canalización de emociones y sentimientos de la gente, por otro, un nuevo reto se abre tanto para los diseñadores como para los científicos sociales y consiste en proponer utilizar el diseño para contar la realidad social y, a través de dicha apuesta alcanzar el cambio social o al menos, ser generadores de reflexión y autoreflexión crítica y constructiva.

Así entendido el diseño gráfico y, siguiendo a diferentes autores como Leonard y Ambrose (2017), éste se convierte en un instrumento básico para la comunicación organizacional, la mejora de los procesos internos y el clima sociolaboral. Además, se abre un campo de estudio indispensable para los diseñadores que promueven soluciones creativas en las que incluso los diferentes miembros de las organizaciones pueden participar generando ideas, soluciones y propuestas que ayuden a promover el entendimiento y la eficacia.

La presentación se hará con modelos reales aplicados y aplicables a diferentes organizaciones siempre desde la responsabilidad social y medioambiental.

A Comparative Analysis of Housing Subsidy Programs: Market Positions and Housing Outcomes

When governments provide demand-side benefits such as housing subsidies, recipients must enter the private housing market to use their benefits. Therefore, the outcomes of these subsidy programs are heavily influenced by the private market context in which those subsidies are used. This paper presents the concept of a *market position* as a tool to help analyze the experiences of housing subsidy recipients in the private market. In the context of housing, one's market position will be influenced by personal identity, the policy and regulatory context, prevailing market conditions, and the behavior of landlords. The conjunction of these factors endows a market actor with advantages or disadvantages relative to other market participants. This paper analyzes the market positions of housing subsidy recipients in the U.S., the U.K., and the Netherlands. Because the rules and conditions of subsidy programs help to define the market position of subsidy recipients, the variation in subsidy programs across countries provides the analytical leverage needed for a rich cross-national comparison of market positions. The analysis demonstrates that households in the U.S. and the U.K. face numerous challenges in the private housing market given their disadvantaged market positions, whereas assisted households in the Netherlands enjoy a far stronger market position. To test the utility of the market position concept, the study uses national housing datasets to test the relationship between market positions and housing outcomes. The quantitative results suggest a positive relationship in which stronger market positions are associated with more favorable housing outcomes. This initial finding underscores the importance of the market position concept as a tool to understand housing subsidy programs and the outcomes achieved by their recipients.

Tourism, Water, Gender and Injustice in Indonesia

The interconnect between environmental injustice and gender have been highlighted with reference to tourism (Cole 2016). Inequalities in terms of access to resources, greater vulnerabilities and the disproportionate negative impacts women suffer are all too common consequences of tourism developments. Bearing the burden of tourism's negative impacts, those in marginal communities at the fringes of social power, with little bargaining strength at the market and little force in the political process, are most affected.

Based on intensive fieldwork in Labuan Bajo, Flores, Indonesia including over 100 interviews in April and July 2015 this paper explores how the development of tourism far from being sustainable and empowering, delivers the reverse for

many of the women in Labuan Bajo. Environmental injustice compounded by patriarchy results in powerlessness, shame and disempowerment for many of Labuan's women.

Tourism development is competing for water supplies with the local residents. Water is diverted away from local domestic needs and agriculture to hotels who can afford to pay far higher rates. The cost of living has increased dramatically and the cost of water in particular. The wages from tourism jobs do not cover the cost of living when water has to be purchased. For some women, water procurement prevents them for participating in work outside the home reinforcing gendered divisions. Other women are driven into exploitative paid work while they remain responsible for all domestic and water work, thus doubling their burdens.

Labuan Bajo is not an exceptional example of where tourism has been promoted as a growth strategy, without consideration of local livelihoods or environments, or as in this and other cases, the availability of water. This study highlights how global tourism, based on capitalist relations, and putting profit before natural resource conservation, coupled with neoliberal water policies, increases injustice for the women of Labuan Bajo.

"Contingency-Based Expertise" in the Case of Olive Quick Decline Syndrome in Apulia

Beginning in 2013, the Apulia region (Italy) experienced the first signs of Olive Quick Decline Syndrome (OQDS). Since then, a scientific dispute about pathologization and medicalization of this plant pathology has taken place, involving regional laboratories which have expressed divergent positions regarding the causal role of *Xylella Fastidiosa subsp. pauca*, a plant pathogen that requires urgent eradication and containment measures in the EPPO region. The EU-mandated requirement to cut down thousands of centuries-old and culturally important trees, as the only possible containment measure (according to EFSA risk evaluations and EU precautionary principles), has encountered significant opposition among environmental groups and social movements advocating an expansion of research efforts (the so-called "360° approach") in order to find less drastic solutions. In this paper, we analyze this phenomenon in a three-dimensional space (cultural, political and epistemological) in order to develop a complex perspective toward public engagement and activism for citizen science. We focus our attention on the social dynamics that have brought civic activism and social movements to a new form of "lay-expertise". Our aim is to outline a new category of expertise generated by specific socio-cultural variables, highlighting its contingent nature, especially the way it stimulates the processes of knowledge production, scientific communication, and policy making structure. Moving towards a theoretical and methodological integration of Studies of Expertise and Experience (SEE) and Social Movement Studies (SMS), we suggest to enrich the theoretical framework with the new interstitial category of "Contingency-Based Expertise".

Freedom of Information: Reflections, Limitations, and Opportunities in Social Research

The UK Freedom of Information Act (FOIA) enables public access to information held by public authorities. Regarded by a small, multi-disciplinary group of social researchers as an 'overlooked' method, FOIA presents innovative opportunities for unparalleled access to, and scrutiny of, government departments. This paper reflects upon research conducted into the police use and governance of unmanned aerial vehicles in England and Wales, though UK FOIA's international counterparts will be relevant to the wider audience. Due in part to the institutional culture of secrecy and suspicion of outsiders, empirical police research is challenging. The initial project was designed according to the methodological opportunities afforded by FOIA over other methods: 1) bypassed ethical issues – consent, privacy, harm, deception – due to the legislation; 2) less resource-intensive so enabled national-scale cross-sectional research design; 3) dislocated the researcher from the institutional culture.

During the course of the project, however, *methodological misconceptions* emerged. Recurrent barriers to access were encountered, such as non-compliance and applications of 'exemptions' (legal justifications for not providing information due to it, in this case, intersecting national security and law enforcement efforts). Limiting the quantity and quality of the data collected, these misconceptions became pertinent to the project. *Anticipated* opportunities of FOIA-facilitated research gave way to the *unanticipated* scale of police curating the information they shared. Whilst this project did not 'fail' on the whole, significant, unforeseen challenges developed extemporaneously. The disconnect between FOIA legislation and FOIA in practice highlighted familiar challenges in empirical research: access; appropriate theories for interpreting data; methods seemingly incompatible with the research problem. This paper aims to introduce FOIA-facilitated research to the international sociological community, with the author's experiences serving

as guidance for future best practice. It also invites reflections upon how 'failures' can stimulate opportunities for re-acquainting ourselves with our methods and research problems.

Intergenerational Transmission of Indigenous Languages and Schooling Inequalities in Peru

Traditionally there is a perception of indigenous people as economic, social, and culturally homogeneous. However, the intra-group analysis of these populations reveals significant disparities within.

This paper aims to determine how differences in the linguistic legacy of parents with native language in Peru, influence the production of schooling inequalities among their children.

Using National Household Survey 2007 data on children whose parents have an indigenous language as mother tongue, first, we **describe** how parents transmit their native mother tongue to their children, finding that: more than half of the children did not inherit the native language of their parents; about half of the children belong to brotherhoods that are entirely native speakers of Spanish, and that there is a greater tendency to inherit the language of parents in poor households and in rural areas.

Then, we build four **logistic regression models** to determine the influence of the mother tongue on: the probability of pass the school year, assisting with delay of grade and delay of level to primary school; and to achieve basic school, controlling by socio-demographic and educational policies variables. We find that: children who inherited indigenous language are more likely to attend with delay of grade at primary school and do not achieve basic education. However, we not find a significant influence of this language on attended with delay of level the primary school, probably linked to a "selection effect" of continuing in school while child have the formal age for the level which is attending (well documented in literature). Also, we have not find significant influence of having Spanish mother tongue on the pass school year, probably linked to a dilution of its effect by variables like: age, condition of poverty and of migration of their parents.

Labor Platform Gig Workers & Collective Action: An Empirical Analysis from Uber Drivers in the U.S.

The expansion of the service economy in the U.S. has coincided with the growth of business models that rely on independent contractor labor. More recently, this "gig work"—unprotected by traditional employment and labor laws—has proliferated via labor platforms that cyber-coordinate and match tasks with workers. While this platform-enabled growth may offer more flexibility for workers, it can also be seen as creating a precarious workforce, which lacks both economic security and the ability to collectively organize and mobilize. Despite the ubiquity of an academic debate over the tradeoffs posed by gig work, little is known about who gig workers are, how they view their work, and how—if at all—they mobilize to achieve change. Using original empirical data on Uber drivers (as paradigmatic gig workers on labor platforms), we address a series of related questions about this atomized and dispersed workforce. In Part I, we analyze an original survey of Uber drivers in San Francisco—which was Uber's first market and one of its most lucrative—to understand who these gig workers are as well as their preferences, grievances, and efforts to address everyday work problems. We then supplement this survey data with a database we collected of national collective action attempts by Uber drivers to explore how these gig workers organize collectively, what issues spark grassroots mobilization, and how successful such attempts have been. Our data and analysis thus provide both micro and macro perspectives on labor platform-enabled "gig work," shedding light on worker perspectives and collective efforts in this new world of gig work.

The Refugee Entrepreneurship Paradox in Australia: Regional and Rural Experiences

Refugees are the most disadvantaged cohort of immigrant arrivals and face the greatest settlement difficulties in Australia. Refugees face severe difficulties in entering the Australian labour market, with unemployment rates exceeded only by Indigenous Australians. Regional and rural labour markets are even more

constrained, hence the great difficulties faced by refugees in regional and rural Australia in getting a job.

One strategy adopted by refugees over many decades in Australia and other countries to overcome this blocked labour market mobility (Collins, 2003) and engage with the economy is to create their own jobs through refugee entrepreneurship. This paper presents the data gathered from interviews with more than 100 refugee entrepreneurs in regional and rural Australia as part of a national research project on Refugee Entrepreneurs in Australia funded by the Australian Research Council. It investigates the reasons why refugees started-up their own business in regional and rural Australia, their strategies for overcoming the massive obstacles they faced setting up the business and the extent to which their businesses are embedded in their family and community. The paper also reflects on the experience of formal and informal discrimination, the extent to which the racialization of refugees in Australia has shaped their lives, blocked their access to the labor market, influenced moving into specific ethnic niche industries and the contradictions embedded in the refugee entrepreneurship paradox in Australia.

The paper also examines the ways in which boundaries of exclusion are created and maintained by the institutional frameworks and local communities. More specifically how some institutional barriers create boundaries of exclusion such as the lack of recognition of overseas qualifications, and what are the implications for social and economic mobility of refugee entrepreneurs within a non-metropolitan context.

Finally the paper considers the theoretical relationship between refugee entrepreneurship, immigrant entrepreneurship and diasporic entrepreneurship.

Labour Internationalism and Political Change in South America

What has come to be known as the "Pink Tide" in Latin America has had a variety of political, economic and social consequences. The rise to power of several progressive governments in the region has offered a particularly favourable environment for labour internationalism. Organizations such as the Coordinadora de Centrales Sindicales del Cono Sur (CCSCS) and the Trade Union Confederation of the Americas (TUCA) have largely benefited from this context, putting forward ambitious positions while finding open, if not friendly, interlocutors in their national governments.

Starting in 2015, the demise of several left-leaning governments in the region (in Argentina and Brazil) and the crisis facing others (such as in Venezuela, Bolivia or Ecuador) have opened an era of uncertainty and a return to power of openly anti-union forces. This represents a considerable challenge for labour internationalism organizations such as the CCSCS and the TUCA, that are now confronted not only to attacks on workers rights but also to renewed internal tensions among themselves and within them, due to divergent analyses and positions toward this new situation.

This paper, based on fieldwork conducted in South America in 2016 and 2017, aims at taking stock of those changes, understanding their dynamics and offering analytical perspectives in these challenging times for labour internationalism in the region.

COLLOMBAT, THOMAS* (*Université du Québec en Outaouais*)

Regionalizing Ilmos: The Trade Union Confederation of the Americas at 10.

For most of their history, International Labour Movement Organisations (ILMOs) have been split between those representing unions from the same industry and those gathering multi-sectoral union centres. Today, the former are known as Global Union Federations (GUFs) whereas the International Trade Union Confederation (ITUC) remains the only significant incarnation of the latter. Although not formally affiliated with each other, it is difficult to think about GUFs without taking into consideration the ITUC, and vice-versa. Together, they represent most of what can be considered today as the institutional international labour movement.

Both the ITUC and GUFs have found ways to structure their regional presence across the world. In the Americas, the Trade Union Confederation of the Americas (TUCA) is the regional arm of the ITUC. Founded one year after the 2006 merger between the ICFTU and the WCL, the TUCA both inherited the conflicted past of the Organización Regional Interamericana de Trabajadores (ORIT, ICFTU's regional branch) and embodied the hopes of Latin American trade unions to be recognized internationally and to have their voice heard.

This paper will aim at taking stock of the first decade of existence of the TUCA by looking more specifically at 3 dimensions: (1) the internal balance of power between its affiliates and the political identity it led to; (2) the strategies the TUCA has been using to influence economic governance in the region, in particular by transferring the ITUC repertoires of action at the regional level; (3) the ways it tried to influence the ITUC itself by putting forward its distinctive agenda at the global level.

LEWIS, SOPHIE* (*University of New South Wales*)

Bourdieu and Field: Theory and Method in the Australian Healthcare Sector

Bourdieu's concepts of habitus and capital have become popular theoretical choices for sociologists of health, while the field has been of lesser interest. In this paper, we draw on a study of the Australian healthcare system to argue for the applicability of Bourdieu's concept of the field, particularly when used in conjunction with his unique methodological approach. Bourdieu's concept enables a focus on the key discourses, practices, actors and relationships that comprise the healthcare sector, while his method, that of 'mapping the field', guide analysis of the relations of power which structure the healthcare system. Our study involved a discourse analysis of the print media, 78 qualitative in-depth interviews with citizens, and 41 with gatekeepers (including doctors, health service managers and policy-makers). Applying the method and concepts of Bourdieu, the healthcare field is shown to be dominated by media messages promoting private sector medicine and discrediting public medicine. These messages, which have been strategically constructed through the policy agendas of governments since the late 1990s, are in alignment with the hierarchical arrangement of the field, where the dominant actors are from the private sector (particularly the health insurance industry and the private hospitals). Despite the continuance of Australia's world-class health system and universal national insurance system (Medicare), these discourses have contributed to a significant change in the practices and relations of power in the field. Citizens have come to believe in the necessity of purchasing private insurance and increasingly lost confidence in public sector medicine; healthworkers (particularly specialists) have increasingly taken up opportunities in the private sector, thus lessening the capacity of the public sector to provide for public patients; and private entities (e.g., insurance agencies, diagnostic imaging companies) have extended and consolidated their influence (and profitability) within the field.

Planning, Regeneration, Area-Based Urban Policies and the Management of Ethnic 'Diversity' in London and Paris

Paris and London are 'super-diverse' cities in ethnic, cultural, religious and demographic terms as a result of successive waves of international migrations. They are the capital cities of two nation-states often perceived as opposed with regard to the recognition of 'difference' in public action: France is viewed as epitomizing a civic 'republican' model, the UK a 'multicultural' or 'pluralist' model. While there is a solid body of work in political science and sociology comparing national 'models of integration' and policies on citizenship, migrant integration and the way 'difference' – in particular race and ethnicity – is taken into account in state action, there is less scholarship looking at how the local level of policy-making is addressing those issues. Yet there has been, in recent years, mounting signs pointing to more progressive and inclusive municipal political agendas in national contexts which are veering towards increasingly conservative, nationalist, xenophobic, anti-migrants agendas in Europe and the USA. Both Paris and London are led by vocal mayors who have become prominent political figures, often carving out a political discourse explicitly different from, or even in opposition to, that of their national governments on a number of issues. In this paper we compare whether and how the concept of 'diversity' has been mobilized in city-wide planning, regeneration and area-based urban policies over the past 15 years. Two hypotheses will be tested through the comparison: (i) Do city governments articulate a different discourse and policy agenda on diversity 'against' or 'around' that of the national government? (ii) In spite of these cities being rooted in very different national 'models of integration' and philosophies of recognition of difference, is there a convergence between policy discourses and practices between the two city governments? The paper draws on the results from an EU-funded project (DIVERCITIES) completed in 2017 (www.urbandiversitycities.eu).

Connecting Individualizations: Towards New Generational Collective Actions

The presentation analyses how two different groups of young adults face the current difficulties in finding a job in Italy through emerging forms of cooperation, sharing of information, and mutual help. Based on a recent qualitative research

(ethnography and interviews in Milan from March 2017 to April 2018), the paper focuses on two very different groups of young people. The first one is composed by high cultural capital young adults who squatted in an empty building in the center of Milan to carry on their individual small jobs – often connected with the use of new technologies – sharing each other skills and information. The second one is composed by low socio-economical capital young people living in a degraded suburb of Milan who created dynamic forms of mutual support to face the uncertainties, precariat and lack of resources in their daily life. The presentation will show how youth preferences and motivations in respect to the present and the future continue to be influenced by gender, education and family origins, but it highlights the specificity of a new generational experience characterised by an ambivalent attitude: on the one hand, a radicalization of individualized and de-standardized forms of actions trying to solve individually systemic problems (Beck); on the other hand, new forms of cooperation and solidarity that explore innovative ways of collaboration and belonging. From a theoretical point of view, the presentation shows the importance of combining a generational perspective with an intersectional analysis, rather than assuming the existence of a transition normative processes or accredited patterns of collective action.

"Stories Mirror Our Society Here": Connecting People Real Life to Motivations for Change in an Education-Entertainment Radio-Drama in Mozambique

Rooted in cultural traditions knowledge, attitudes and practices, unequal gender relations and poor access to information are pointed out as key factors that influence children rights and well-being in Mozambique (UNICEF, 2014). In this context, it is relevant to use effectively communication in order to produce inclusive and sustainable socio-cultural changes. After an initial pilot phase, in 2014, UNICEF partnered with PCI Media Impact to produce and broadcast the Entertainment Education (EE) radio drama *Ouro Negro* (Black Gold). It is the story of the village of Jambolane, a traditional community in Mozambique. When the residents of the village are confronted with the arrival of a foreign mining company they must negotiate the resettlement of the community and their ancestral spirits in order to extract coal from their land. The setting includes rural and urban residents, adults and adolescents, in order to communicate key messages on health and children rights to diverse target audiences.

In 2017, an exploratory study, through phone in-depth interviews, was conducted in order to assess *Ouro Negro* listeners opinions and practices related to radio-drama and to evaluate the effectiveness of the programme. Quantitative data from other M&E tools were also explored.

Results show that listeners follow regularly the radio-drama and talk about it with family members and friends and the audience satisfaction is very high. Looking at inner motivations for change, strong linkages were identified between findings inputs from formative research, content analysis of stories and findings of audience research. Conclusions point out that *Ouro Negro* has been successful in reaching the target audience, reinforcing interpersonal communication, and achieving behavior and social change contributing to promote children rights. Key findings circle around the inner motivation of the target audiences and enabling them to make choices that allow them to live their lives as they wish.

Thinking with Seeds and Seed Dealers: Exploring the Techno-Political Relations of Big-Ag Seed Sales in Rural Kansas and Missouri

This paper explores the material and techno-political relations which connect top-five agrochemical and seed-production corporations with the large-acreage, conventional farmers who plant their seed. I draw upon data collected during 12 on-site, qualitative interviews with Northeast Kansas and Northwest Missouri regional seed salespeople and agronomists who often act as gate keepers to the specialized, technical knowledge-scape of large seed production corporations. This research explores the material relations and conditions of seed salespeople and the flows between sellers and the humans/non-humans with whom they interact. Findings from this research suggest that NE Kansas and NW Missouri seed salespeople are uniquely positioned, mobile actants which interpret technical knowledge of ever-proliferating catalogues of hybrid, genetically engineered (GE) seed. While they often participate in the laboratory-ization of conventional farms, seed dealers also tend to be long-term members of rural communities who experience the declining population of farmers as a deep loss. Seed dealers locate this decline not with the large agro-chemical and seed production companies that design and produce social technologies (i.e. GE seeds), but with the technologies themselves as they materially and relationally constrain and enable certain agricultural practices (i.e. *you must plant more to break even these days because the equipment is so expensive*). In this paper, I think with seeds

and seed dealers, joining in their material discourse, mobilizing a new materialist, assemblage-thinking approach (Latour 1999, Bennet 2010, DeLanda 2016) to re-examine often-overlooked actants in conventional agricultural practice: seeds and seed dealers. The paper participates in the trend towards generative, democratic research in agri-food studies (Carolan 2012, Lewis et al 2016, Dwiartama et al 2016) by thinking with research participants to open up a conversation about what conventional agriculture is, and what it could become.

Stigma Reduction and Empowerment Building through HIV Peer Education Programs in Eastern Africa

As HIV/AIDS continues to dominate health discussions across the globe, unique, community-based responses to combat its spread have been generated through local initiatives. Programs designed to promote education, dialogue, and reduce stigma surrounding HIV testing, status, prevention, and treatment have been implemented. "Reach A Hand, Uganda" has worked with community and international partners to create the "I Know" concert series and the Peer Education Academy. In South Africa, the "Know Your Status" campaign has promoted HIV testing, treatment options, and prevention. In Mozambique and Malawi, local coordinating committees have created educational skits about transmission and prevention strategies, as well as unique responses to the growing numbers of AIDS orphans. These locally generated initiatives provide culturally appropriate vehicles to reach broader population bases, resulting in effective programmatic responses and social challenges to risky cultural traditions. This presentation will review components of these local initiatives and present evidence of their impacts, including increases in testing, individual and community empowerment, and the reduction of stigma. Drawing on "best practices" models, recommendations will be made for expansion and refinement of central elements of these approaches for broader implementation in a variety of global contexts.

CONESA CARPINTERO, ESTER* (*Universitat Oberta de Catalunya*)

A Defence of an Ethics of Care in Academia.

Changes in academic institutions under new managerial values and practices (Deem, 1998) have shifted the conditions under which academics work. Intensification of demands, pressures to achieve standard indicators in an international environment and competing for funding in austerity times are some of the features of this new regime. Some scholars have brought to the forefront of the debate the increasingly long hours culture and pressured and competitive working environments that harm academics well-being (Gill, 2009; Mountz et al., 2015).

This model remits to an academic ideal that has unlimited time and no other priorities than work (Bailyn, 2003) - what undermines the necessary time to care for oneself and others - and perpetuates the masculine breadwinner model. It is also focused in the image of the successful worker embodied in the academic "entrepreneurial self" that works under business models and self-maximization promoting individualism (Scharff, 2016; Morley, 2016; Müller, 2014).

This work studies how these changes have affected academics based in Spanish institutions under the ethics of care lens. The ethics of care places care in the centre of political life supporting ideas of interdependency, responsibility, equality and justice (Tronto, 1993). In this sense, it appears useful to study the competitiveness ethos and working-time regimes in the academic world. Working on semi-structured interviews, the results show when and how care (or a care culture) is denied or supported in current academic lives. The presence of a caring environment supports women (and all academics) careers and its absence penalises women and those men committed at the familiar and social level. Thus it stops the possibilities for gender equality in science. The paper finishes with a defence of an ethics of care (or a care culture) to be applied in academia as a clear advancement for equality and justice in organizations.

New Managerialism and Austerity in Academia: Risks on Gender Equality

Changes in academic institutions towards neo-liberal logics are increasingly being applied either at public, semi-private or private Higher Education Institutions. In order to achieve greater efficiency, efficacy and excellence, new managerialism (Deem, 1998) has implied more pressures and intensification of demands in academics in order to compete in an international level for high impact publications and for funding, as well as the high mobility. Moreover,

austerity measures due to the crisis have affected the conditions under which academics work as well as increased labour uncertainty and high competition for funding.

In this study we have examined formal documents (laws, human resources policies, expert reports) and analysed semi-structured interviews in Spanish academic institutions, under a gender perspective. We have analysed, as well, the evolution of the faculty in Spanish public universities in the last ten years.

The results show that labour rights fulfilled in a collective way in organizations are becoming reduced under new-managerial human resources strategies, which translate private managerial practices into public institutions. Universities rationalize costs and do not take responsibility on the careers and promotion. According to international mobility dynamics and meritocratic focus, institutions 'expulse' science and technology workers. This creates great pressures on academics searching for high research productivity which unbalances teaching commitments. Austerity measures exacerbate this tendency because stable positions have been frozen during many years.

The academic entrepreneurial model do not support the advancement of women researchers. It intensifies a competitive environment that reproduces hegemonic masculine values and dispels some women from academia (at least, make progression harder to them). Thus, our questions contemplate not only the risks for knowledge and education of students but also risks for women inclusion due to neo-liberal HEI model, what questions the role of social responsibility of academic institutions.

CONNELL, DAVID* (*University of Northern British Columbia*)

The Culture of "Community": A Systems Theory Perspective

The disparity between the increasing use and rising importance of community and an apparent inability to explain this cultural phenomenon presents a dilemma regarding the meaning of community. This disparity appears in the form of closure. Community theorists presume that community is too elusive to define and too complex to understand. Consequently, ambiguity is accepted as a normal condition of inquiry. When we ask about the meaning of community, this closure (i.e., community is ambiguous because it is ambiguous) becomes problematic: community theorists cannot see beyond the limitations of their approaches. Thus, whereas one might examine the "culture" of a community, I ask, what underpins the cultural transmissions and transformations of "community." To examine this question I take leave of the normal assumptions, methods, definitions, and approaches of community studies and adopt a systems-based inquiry by replacing a presupposition of an orderly existence with a presupposition of complexity. I work from the philosophical implications of complexity and reach forward to the possibility of community. The purpose of this presentation is to address the limitations of the normal science of community theory and, in so doing, propose a comprehensive foundation for a theory of community as a social system. The theoretical framework is based on Niklas Luhmann's general theory of society.

Gender Revolutions: Women Making Lives and Solidarities in Post-Colonial Worlds

To understand the situation of women and the formation of gender in post-colonial societies, theories of gender role, discourse, habitus and identity derived from the experience of the global North are of limited relevance. In what terms can we theorise gender on a world scale? As Amina Mama and others emphasise, the postcolonial world was created by centuries of violence in which no gender order remained stable. Populations were devastated, land occupied, economies re-made, authority shattered, states built, race created as a principle of division. Southern feminist classics, including the work of Teresita de Barbieri, Heleieth Saffioti and Bina Agarwal, emphasise the relational dynamics of gender in post-colonial spaces. Women confront new forms of masculinized power - domestic, local (e.g. in developmental states), transnational, and distributed (e.g. in new media). Anticolonial struggle, and complex local traditions, permit more democratic gender relations - but don't guarantee them. Growing up female, a particular concern of Cynthia Joseph's research, is a project with contradictions at both personal and collective levels. Pressure on young women to define themselves by marriage and fertility comes from patriarchal attempts to preserve gender orders that are not in fact stable. Economic and cultural demands challenge these definitions where they depend on women as workers and consumers, but may produce other forms of subordination. The patterns of agency and solidarity emerging from these processes are crucial for the future of gender relations, and should be at the heart of sociological research on gender.

Re-Framing the 'Paradox of Embedded Agency': Figurational Dynamics, Habitus Formation and Advertising Practice at Arthur Guinness & Sons Ltd

New institutionalism is now one of the most dominant theoretical frames for the study of organizations. Despite this, it remains conflicted by the problem often termed 'the paradox of embedded agency'. Using Elias's concept of social habitus and the wider theoretical lens informing it, we contend that this approach helps reframe and dissolve the dualisms that have been implicit within institutional theory. Our empirical case concerns the brewer Arthur Guinness & Sons Ltd and the decision in 1927 to sanction an official direct advertising campaign in Britain for the first time. We explain how this was connected with the emergence of more equal power relations between the bourgeoisie and the aristocracy, which facilitated a change in the social habitus of those in favour and those previously opposed to advertising at Guinness. Furthermore, we illustrate how the social tensions generated by this structure of society were channelled into the social habitus of individuals. We conclude that changing social interdependences at connected levels of integration - organizational to international - reframe emotional relations thereby enabling strategic innovations.

Relationship between Sociology and Psychology at the L'Année Sociologique

The journal *L'Année Sociologique* was founded by Émile Durkheim in 1898 and since then it became the scene of some important debates and strong divergences between several approaches related to the explanation of social facts. The main agents involved were: Durkheim, his collaborators and the authors whose works were reviewed by them.

The main objective is to analyse the way the conflicts between sociology and psychology appear inside the pages of the journal - emphasising three main moments: during the foundation period, structured around the debate between Tarde and Durkheim; during the 1920s, when Mauss and the new collaborators to the journal look again to this question through their reviews of recent books; and, finally, in the 1930s, when the collaborators of the *Annales Sociologiques*, linked to Célestin Bouglé, returned once more to the debate after new works were published.

The proposal, firstly, is to treat each one of these periods in its specificity, focusing on the agents' positions and their works within the corresponding intellectual fields. Secondly, the aim is to compare these three moments and analyse their differences - regarding the composition of the group of collaborators to the journal and the relationship they developed with the authors whose works they reviewed.

Riding the Local Foods Wave: Tennessee Whiskey As Terroir?

The concepts of terroir, denominations of origin and geographic indications have emerged in the sociology of agrifood literature as ways to designate and legally protect the special climatological and cultural aspects of regional foods and drinks. Champagne, Parmesan Cheese, and Tequila are notable examples. These official designations are now central dimensions of the local foods phenomenon around the world and in agrifood studies. In Spring 2013 a controversy emerged in Tennessee over laws passed with the support of Jack Daniels to create an official definition of Tennessee Whiskey, a special form of American bourbon whiskey. Small distillers in Tennessee and the major distilled spirits transnational corporation Diageo of the UK challenged the new laws as an unfair action to restrict entry and protect market share. Jack Daniels defended the law as necessary to protect the integrity and quality of whiskey. The controversy between Jack Daniels (owned by Brown Forman) and George Dickel (owned by Diageo) continued in the courts for four years. We employ the case of the contested definition of Tennessee Whiskey to inform discussions on the role of geographic indications in local foods and the sociology of agrifood studies.

The Image of the "Other" in the Contemporary TV Discourse

Taking into consideration the big importance of the communication issues (especially nowadays), this paper aims to give a research example on how the

"refugee problem" is diffused by different media. More specifically (and because on one hand the image of the "other" is central on the identification level -who we are, with whom do we feel partners and whom we consider as "enemy"- and because on the other hand we live in a period of reclassifications -of borders and identities), we think important to give specific examples from television discourse on the "others", including the rhetoric of hatred and racism. We thought it important (as an introduction to the works of this session) to capture the "everyday discourse" diffused in "cozy emissions" (in the TV magazines) where (like in social media) the mentalities and current ideas are shown more easily and (which is more interesting) because they coincide with "given as correct -dominant- ideas" their xenophobic and excluding characteristics are not easily remarked by the public. We will emphasize on examples of media of countries "at the borders" (such as Greece) fighting to conserve their place in the "security zones" (such as the European Citadel).

Inclusion and Excellence in Post-Conflict Colombian Higher Education: Views from the Leadership

The broader meeting of the International Sociological Association (ISA) World Congress seeks understandings of power, violence, and justice. We narrow these global struggles to the plane of Colombian higher education. Propelled to international spotlight, only one year ago the Colombian government signed an agreement of peace with the Revolutionary Armed Forces of Colombia (FARC). The higher education sector is tasked, by the Ministry of National Education and ourselves, with playing a crucial role in the journey toward becoming a post-conflict society. Emerging from a half century of devastating civil conflict, we pursue social justice through peace: responsive, inclusive, sustainable, life-changing peace that centers the marginalized. Educational equity through peace requires engaging our students, administrators, faculty, broader community, and peers, on this collective journey. We propose a Rectors' panel, a critical dialogue about the unique context of Colombian higher education moving into this new era, through sharing our various institutional histories, perspectives, challenges, and forward trajectories. As leaders of higher education institutions across Colombia, we are uniquely positioned to offer insights on this pressing topic. Participating Rectors and their institutional affiliations include:

- 1) Jaime Leal, Rector Universidad Pública Abierta y a Distancia (UNAD)
- 2) Maritza Rendon, Rector Universidad Cooperativa de Colombia
- 3) Jose Consuegra, Rector Universidad Simón Bolívar of Barranquilla and Founder RED NEXUS
- 4) Edgar Parra, Rector University of Cartagena and Vice President of the State University System of the Colombian Caribbean (SUE-Caribe)
- 5) Harold Castilla, Rector Corporación Universitaria Minuto de Dios (UNIMINUTO)

These institutions collectively represent the various regions of Colombia, both public and private spheres, enroll hundreds of thousands of students, and together, can actively shape the future of Colombian higher education.

The Socio-Technical Transition to Renewable Energy and Its Implications for the Maintenance and Dismantling of Inequalities: A Comparative Case Study of "Transition Towns"

This paper illuminates the obstacles facing the labor and environmental movements in their fight for a just transition to a renewable energy economy at the local level through a comparative case study of two New England "transition towns": one that has since replaced its decommissioned coal plant with a solar farm, and the other that is still in the midst of its decommissioning and reuse planning. Drawing on participant observation, content analysis of public planning documents, as well as interviews with grassroots environmental activists, local and regional government officials, union members, and private industry, I explore and compare 1) the mechanisms by which local labor, community, and environmental organizations are included/excluded from corporate and municipal planning decisions regarding the decommissioning and replacement of coal plants, 2) the discourse employed by private entities, government institutions, and community organizations to shape and mobilize support for transition initiatives, and 3) the

varying conceptualizations of energy justice held by different stakeholders. I ground my discussion in existing theories environmental justice, and use a post-structural approach to examine the role that neoliberal development ideology/discourse plays in shaping the political solutions deemed feasible or necessary during reuse planning. This project is one piece of my ongoing dissertation research, which seeks to bridge the applied policy literature on socio-technical transitions with the environmental justice and political ecology traditions, laying the foundation for an interdisciplinary public sociology of climate change mitigation that is theoretically robust and critically informed. Such research can be used to inform policymakers and activists alike as to how social, economic, and environmental inequalities can avoid reproduction in the political transition to a low-carbon society.

Sporting Bodies That Protest: Nation, Sport, Media, and Bio-Politics

Sport has often been viewed as an apolitical social sphere. This paper seeks a historically and sociologically informed perspective on sporting athletes who use their bodies not only as tools in the arena of athletics, but use their bodies to protest social injustice, or to move social agendas. How is the sporting body both constitutive of power in athletics, but also in the realm of politics? At the same time, how are protesting sporting bodies subject to the power of the state, corporation, and the media? How are sporting bodies fashioned into sites of resistance by cultural agents? A review of past, present, and emerging forms of corporeal sporting protest will be addressed. Further, this paper is informed by Michel Foucault's work on the body, specifying bio-power techniques as exerted on the corporeal body from the nation-state, the corporation, and the media. Sporting bodies that protest then become a site over contested meanings of social justice regarding groups, race, and nation. What meanings have emerged historically from these protesting sporting bodies? Do these meanings remain at the symbolic level or are they used to transform structures of unequal power in society? How does human agency interact with social structure as sporting bodies emerge on the social sporting scene? Socio-historical content analysis will be employed to study this ongoing social phenomenon.

The More Things Change the More They Stay the Same: A Longitudinal Analysis of Educational Inequalities for Australian Youth

Longitudinal panel studies provide a unique opportunity to analyse the lives of young people over time. This paper examines the construction of patterns of inequality in youth transitions over two decades for two generations of young Australians, focusing particularly on patterns of inequality arising from the dramatic increase in rates of participation in tertiary education in the last four decades. I argue that although many groups which were underrepresented in tertiary education in the 1970s (for instance women, rural youth) both new and existing forms of inequality nevertheless continue to arise from this educational participatory process. In order to illustrate these patterns of inequality I draw on a longitudinal cohort panel mixed-methods research program that has followed one generation of youth since they left school in 1991 (loosely known as Generation X) and another generation since they left school in 2006 (loosely known as Generation Y). Focusing particularly on the experiences of women and rural youth, this paper finds that the multifaceted nature of the new and existing inequalities faced by each group are most visible when their experiences are tracked over time. The findings are used to contend that, contrary to studies that focus on a single point in time, longitudinal studies provide necessary platforms for researchers interested in examining entrenched assumptions about inequality and youth transitions, particularly in times of rapid social change.

Inequalities in Fathers' Access to Work Flexibility: Evidence from the UK

Flexible working time arrangements (FWTAs) enable employees to alter the schedule or location of work. FWTAs can help parents to manage conflicts between work and family life, and to share caring responsibilities more equally. In the UK, all employees have a legal right to request FWTAs, but there is growing concern that some parents, particularly fathers, may have limited access to FWTAs in practice. Sociological theory and research suggests that the management of family and working life is the outcome of a combination of constraints and enabling factors at both the individual, household, and structural levels (Hobson,

2011), and that time flexibility is both a gendered and a classed phenomenon (Gerstel and Clawson, 2014). Utilising this perspective, and focusing on fathers who are commonly overlooked in discussions of work flexibility, the paper analyses inequalities in fathers' access to FWTAs, concentrating on variations by occupation and economic sector. This focus is important in the UK context, where austerity policies since the 2008 recession have led to concern about receding employee rights, particularly among the so-called 'precariat' class (Standing, 2016).

The paper uses cross-sectional data from Wave 6 of Understanding Society, the UK's household longitudinal study, collected in 2015. This provides recent, nationally representative employee-reported data on availability and use of FWTAs. The analysis considers a subsample of employee fathers (N= 4500). The dependent variables are fathers' reports of availability and use of FWTAs. The independent variables are fathers' occupation, economic sector, as well as the gender composition of employees' job and other important control variables such as partner's economic status, children's characteristics, and earnings.

The paper identifies socio-economic and sector barriers to fathers accessing FWTAs. With a focus on inequality between fathers, it highlights limitations in 'work-life balance' policies, which claim to provide equal access to FWTAs for all employees.

Power Dynamics at Play in Graphic Elicitation Interviews with Children

Researchers, practitioners and policy makers are increasingly concerned with identifying children's perspectives on matters that affect them. Yet studies have highlighted that power imbalances are pervasive in research with children, largely due to adult-centric consent, research design, and data interpretation (Khoja, 2016). Acknowledging these imbalances, recent studies assert that knowledge is co-constructed by adult researcher/s and child participant/s, and argue for the need for reflexivity (Tay-Lim & Lim, 2013). Underpinned by a child-centric methodology, graphic elicitation interviews aim to address power imbalances; however, few studies have examined the shifts in power dynamics that occur during interviews with children and consider the implications for the co-construction of knowledge. We address this gap by analysing graphic elicitation interviews with children aged four to 15 years. We find interviews contained continual shifts in power dynamics, with adult interviewers actively seeking to empower children while at times inadvertently reinforcing inequitable power relations. Concurrently, children sought to gain power and also sometimes appeared disempowered. Interviewers empowered children by encouraging responses to their visual diaries, commentary and interests, and reinforced power dynamics by interacting in an authoritarian manner and expressing approval or disapproval of children's behaviour. Children sought more power in the interviews by asking questions about the interviewer and why certain discussion topics mattered. However, children seemed disempowered when they considered that they had completed the visual diaries incorrectly. We argue that some of these interactions were important for building rapport, hence, power relations are neither entirely problematic nor beneficial to the co-construction of knowledge.

COOPER, ADAM* (*Stellenbosch University*)

Race, Gender and Low Quality Schooling in South Africa: A Critique of Research from Economics

Youth unemployment is South Africa's biggest challenge, with conservative estimates suggesting that 45% of 16-34-year-old South Africans are unable to find work. Most young South Africans who are unemployed are Black, a result of the country's legacy of racialised inequality. Far more opportunities exist for young men to find work than for young women, due to the nature of menial labour, the unequal distribution of child rearing responsibilities and societal biases regarding what constitutes desirable employees. Despite the clear existence of raced and gendered stratification mechanisms, local economists almost exclusively argue that high rates of unemployment and low wages of Black youth are the result of low quality education. The overwhelming finding from this body of work is that low school quality and attainment, associated with schools formerly reserved for Black students, result in reduced chances of employment and of earning a high wage. A systematic review of studies from the discipline of economics shows that the evidence for a causal relationship between low quality education and high wages relies on a problematic set of assumptions and silences, with different criteria applied to White and Black youth in assessing why they are or are not able to find employment. I argue that the success of knowledge produced by Economists lies in its political utility, as it is easily applied to short term interventions that may produce small but relatively immediate positive effects. Instead of bemoaning what could be interpreted as Economists' nefarious intentions, I challenge Sociologists of education, youth and work to demonstrate similar usefulness and commitment to engage with and ameliorate societal problems, such as those bound up in youth unemployment and education. A number of possible research paths are suggested that may be fertile for this purpose.

COOPER, CHRISTOPHER* (*University of Toronto*)

Virtual Ethnography: An Analysis of the Social Benefits of Video Game Communities and Networks

Video games are often depicted promoting violence, misogyny and anti-social behaviours (Borchard 2015, Carnagey et al. 2006, Paassen et al. 2017), but social benefits of video games have not been extensively researched or analyzed. Online gaming has been studied from a behavioural science perspective primarily, and has relied on outside observations of gamers (Kowert et al. 2014). Few researchers have attempted an insider approach to discovering social phenomenon within video games (Acevedo et al. 2016, Fusaro & Bonenfant 2010). This paper uses an ethnographic approach to analyze the positive network effects found in video game communities. Data includes long conversations with players, formal and informal interviews, and screenshot and video analysis, used to discover how video gamers interact, build networks and gain social support. There is an interesting tension, in that negative behaviours may be reinforced through online social support in the same way networks provide social benefits. This paper analyzes how video games are used to find like-minded groups and whether they provide helpful or harmful social support. Video gamers are a growing population. Learning how they make meaning of online socialization helps us understand how online community formation can be beneficial to people who struggle with socializing in everyday life, or harmful in connecting people who reinforce negative behaviours.

COPPOLA, NICOLAMARIA* (*Sapienza Università di Roma*)

Migrant Bodies As Social Icons

Within a migration system, the body of migrants is one of the most important "spatial units" that contribute not only to their physical connotation but also to define how they are connected to the world. (Bernardie-Tahir & Schmoll 2014). The physical body of migrants and its interactions with the surroundings and other bodies becomes a "focus of meditation, dissection, and investigation" to understand the role that it plays in the migratory experience: it can be seen as the "place of condensation" (Sayad 2004) of the migratory experience itself. In the destination countries, the bodies of migrants acquire a symbolic and iconic role: on one hand, well-being, wellness and wealth while on the other strangeness, obstruction, invasion. Clothing, such as Western-style garments and/or Islamic veil and headscarf, technologies, like smart-phones and IT products, and certain body modifications such as piercings, tattoos and non-traditional hair colors and styles mark the inclusion, the exclusion and/or the rejection of bodies. The A. seeks to analyze the symbolic image of the body of migrants in a migration system, pointing out how the identity construction, the identity perception and the level of integration due to the social representation of his/her body interplay and interact. The A. draws the attention on the gender dimension (Shekhawat & Del Re, 2018), wondering how the body representation affects men, women, heterosexuals, and homosexuals at a social level. Furthermore, the A. focuses on the body of

the LGBT migrants, analyzing the role that sexuality plays in understanding the identity of migrants.

CORCORAN, THOMAS* (*University of Massachusetts-Amherst*)

Rupture, Reformation, and Redemption: Urban Casinos and the Construction of the Social Good

Recent scholarship on taxation has offered novel ways of conceptualizing how revisions to state fiscal policy shape patterns of public trust and social cleavage (see Martin, Mehrotra, and Prasad 2009). When applying this thesis to institutions including work and leisure, or the family and public health, we can anticipate changes in symbolic relationships among and between groups, in addition to the formation of new political coalitions and ties. This paper locates the role of urban casinos in restructuring fiscal policy towards change in social, economic, and cultural institutions among mid-sized deindustrialized cities in the United States. As many mid-sized cities continue to stagnate, often stigmatized from outsiders for disproportionate levels of unemployment and urban violence, local policymakers and residents are faced with the challenge of adopting economic and cultural strategies to create conditions for inclusive urban citizenship. By focusing on a single case—a northeastern city with a population of roughly 160,000 residents—I examine how the construction of a downtown casino brings together a network of actors working to create living wage jobs, enhance initiatives for community health, and promote cultural amenities for residents and visitors alike. Whereas the casino corporation has promised the community a unique partnership in sponsoring many of these initiatives across the city, stakeholders involved in collaborative projects are confronted with overcoming strong ties to neighborhood and loyalties to community-based organizations. Drawing on narratives from in-depth interviews conducted with residents, community leaders, small business owners, artists, commercial developers, labor unions, and social justice advocates, I demonstrate how these groups traverse the fuzziness of boundaries between cooperation and competition. Ultimately, this empirical case intends to contribute to literature on the influence of corporate governance in processes of urban redevelopment, while assessing the possibilities for social agents operating in liminal spaces to negotiate positive change.

CORDELIER, BENOIT* (*Université du Québec à Montréal (UQAM)*)

Confrontation Et Associations De Discours Dans Les Processus Organisationnels

Foucault (1969) a établi les bases d'une approche discursive du pouvoir en expliquant que ce dernier s'appuie sur des règles d'énonciation historiquement construites. Elles définissent qui a le droit de parler, ce qui peut être dit et comment le dire. Plus encore, ces règles précisent comment les énoncés peuvent être combinés stratégiquement pour s'imposer. Elles n'ont pourtant pas une existence indépendante puisqu'elles sont intégrées dans les formes mêmes du discours. Saussure (1908) déjà, quoique sur un plan linguistique, expliquait que pour être cohérents les énoncés devaient s'inscrire à la fois dans un registre paradigmatique (où l'analogie des signifiés délimite le champ qui est évoqué) et syntagmatique (qui porte sur les séquences et combinaisons possibles). Ces éléments permettent la production du sens de l'énoncé.

Pourtant dans les organisations, des discours peuvent à la fois converger et s'opposer en prenant racine dans des valeurs, des idéologies ou, plus simplement, des principes différents (que nous associons à la dimension paradigmatique). Après tout, l'entente sur le sens donné peut être locale grâce à l'opération d'un signifiant flottant (Hall, 1985, 1997 ; Lévi-Strauss, 1949) qui permet de passer d'un caractère universel à une autre plus local ou particulier (Laclau, 2005 ; Lowrie, 2007 ; Mumby, 2016) à travers une logique d'équivalence et différence (Laclau et Mouffe, 1985).

Si au niveau de la société, la notion d'hégémonie sert à établir la domination d'un groupe sur un autre à travers une idéologie générale. Sur le plan local, organisationnel, les relations de pouvoir peuvent être renversées. Nous postulons que cela se joue dans la connexion d'énoncés syntagmatiques relevant de paradigmes différents. Celle-ci est rendue possible par l'investissement du signifiant flottant dont l'ambiguïté permet le maintien des échanges organisationnels. Nous illustrerons cette proposition par des exemples relevant de milieux organisationnels différents (établissement industriel, organisation de santé, institution d'éducation).

RC25-476.2

CORDELIER, BENOIT* (*Université du Québec à Montréal (UQAM)*)

What Performativity for a Subsidiary Discourse

In what Chia and Langley (2004) or Langley and Tsoukas (2010) may call a weak process approach, we consider that the organizational change process is articulated with artifacts (Groleau, 2008) that reflexively embed social practices (Orlikowski, 1992, 2000) and ideologies or discourses (Gee, 2014; Mumby, 1988,

2015), even if they are transitory and linked to the length of the project. As ephemeral as those practices are, they create tensions, even more when they correspond to *concrete action systems* (Crozier & Friedberg, 1977) that are used to resolve discursive antinomies. We study this tensions through the dialectic the actors raised between the weaknesses of the implementation of Electronic Medical Record in a health organization. The tentative of resistance from some employees led us to identify two modalities of *Discourse* that we offer to call *dominant* and *subsidiary*. As a matter of fact, even if the *dominant Discourse* among employees is to complain about the imperfection of and the problems caused by the new system, it is their *subsidiary Discourse* that actually reflects the best their engagement and converges with the main orientation of the organization and the announced aim of the project. Organizations grow through contradictions (Engeström, 1987, 2013) or controversies (Callon, 1986, 2006) that help actors make sense of their actions (Weick, 1979; Sutcliffe & Obstfeld, 2005). But they also need to agree on some of their actions. The collective *sensemaking* allows then the actors to share a same narrative that accounts for the organizational conflicts as well as for the build up of a social cohesion. But it does so through the development of a collective memory without homogenizing the individual points of view. In this case, the employees' *subsidiary Discourse* about the project was a way for them to lessen the inner dissonances they may feel and perceive.

CORMACK, PATRICIA* (*St. Francis Xavier University*)

Anglo-Canadian Identity, State Mediation and Symbolic Violence

This paper picks up on the Congress themes of power, violence, and justice and explores the construction of (Anglo-) Canadian identity in the context of state mediation – especially state communication organs that seek to manage Canadian identity and heritage. Canadian identity has long been posited as one of “crisis” in that it purportedly stands against the dominant cultural influences of the US and gains identity by way of holding off American popular culture. State intervention in cultural production has, since at least the 1920s, been justified as the insulation against this apparently overwhelming influence and cultural “other”. This negative justification has been used to support the existence of both cultural content providers like the Canadian Broadcasting Corporation and content regulators like the Canadian Radio Television Telecommunications Commission. Ironically, the threat ultimately lies within, as Canadian audiences show a strong desire for such “foreign” content, and become the object of constant disciplining by way of state cultural apparatuses.

This paper argues that the Canadian state, understood as a benevolent protector of heritage and identity, has managed its own symbolic violence and hidden its real historical and colonial violence as the “content” of media is the sheer mediation of state itself. This “contentless” appearance of the state allows the state to appear and disappear at the same time in the seemingly benign administration of culture.

CORONA, VICTOR* (*Universitat de Lleida-ESQ7550001G*)

Becoming a Mechanic: An Ethnographic Study of Communication in Vocational Education in France.

This paper is based on a sociolinguistic ethnography carried out over a period of 18 months in an automobile maintenance and repair class in a vocational school in a large city in France. During this time, I followed a group of nine young students aged sixteen and seventeen in an attempt to capture their linguistic practices in interaction, their understandings of vocational training and how their life trajectories had led them to this training. As is the case in many ethnographic studies, I kept field notes and recorded the activities of informants using a video camera. In previous studies in similar contexts, researchers have shown the importance of discourse practices not only for communication in the workplace, but also as preparation for the world of work. (Boutet 2001, Fillietaz 2012). For this reason, the research questions that guided my approach were focused on the language practices of young student apprentices and the construction of their identities as “mechanics”. Identity here is understood as the professional identities that the students projected drawing on a range of semiotic resources, including language. I was interested not only in the students’ “professional linguistic practices”, as technical or specific vocabulary, but also in the informal conversations in which my young informants, through jokes, projected an image of “hyper-masculinity” (Tetreault 2008). I consider their performances of masculinity as central to the more general construction of a professional mechanic identity.

RC25-471.1CORONA, VICTOR* (*Universitat de Lleida-ESQ7550001G*)BLOCK, DAVID (*Universitat de Lleida*)*Constructing Latino Identity in Barcelona.*

This paper draws on definitions of *latinidad* developed in North America (e.g. San Miguel, 2011; Negrón, 2014), which see it as indexing particular language-specific nationally backgrounds (Spanish-speaking North America, Central America, South America and the Caribbean) and certain emergent sociocultural practices (around language, music, food and so on). However, it recontextualizes these definitions, focussing as it does on Catalonia, and the city of Barcelona, and not, for example, the United States. More specifically, it examines how being a young Latino in Catalonia is not a casual occurrence; it is shaped and conditioned simultaneously by a series of conditions. These include the political economic backdrop of Catalonia; ongoing discursive activity related to language and culture that intersect with Catalan/Spanish bilingualism; Latinos' symbolic self-positioning, that is, their repertoire of behaviours and semiotic activity; and finally, how Latinos are positioned by others, that is how young latinos are invented and invested with meaning by non-Latinos in Catalan society. We believe it is important to focus on the topic of *latinidad* in Catalonia, and to do so in this specific way, because it allows us to question various aspects of the bilingual dynamics of Catalonia as well as the kind of multicultural society that it is. It also provides us with a window on inequalities in Catalan society, based, above all, on class, race, nationality and gender.

CORRADI, LAURA* (*Università della Calabria, Dipartimento Scienze Politiche e Sociali - Gender Studies and Intersectional Methodology - Feminist/Queer Lab*)

Indigenous Feminist Theories and 'Fourth World' Feminisms: Commonalities in the Art of Decolonizing/Disassembling Power Structures and Relations

During the last decades, Indigenous feminists and feminists from former colonies criticized white supremacy in mainstream feminist and women's movements, and in academic knowledge production. Globally, feminists of color, Aborigines, Dalit/Adivasi feminists, Kurdish jineology in Rojava, Maori and Gypsy feminists made clear how general theories reflect standpoints of the global north (Talpade Mohanty 1984; Moreton-Robinson 2006; Green 2007; Suzack, Huhndorf, Perreault and Barman 2010; Meyer 2015; Castillo, González 2008; Corradi 2014, 2017).

White privileges and power dynamics have been challenged within feminism itself. Social scientists and activists were exposed to self-reflexive methodologies and invited to examine critically how, as researchers, they embody the power structures in terms of gender, race/color, class, status/caste, age, sexual orientation, religion. Maori Feminist Linda Tuhiwai Smith (1999) taught us how to decolonize research methodology; others highlighted how to decolonize feminism itself (Lugones, Lucena 2008; Bidaseca, Laba 2011); Vietnamese feminist Trinh Minh-ha pointed out how the colonizers encouraged jealousy among women and how "decolonization of relations" is necessary too. As Romani feminist Alexandra Oprea (2004) argued: "It is only through recognizing our privilege, whether it be white privilege, male privilege, class privilege, light skinned privilege, or heterosexual privilege, that we can challenge hierarchical relationships."

Indigenous feminist theories (IFTs) teach about the intersections of power structures and geopolitical differences in gender subalternity in the North-Atlantic context, in its margins and in the global south: in other spaces that are beyond the state/nation, often referred to as Fourth World (Castells 2000). IFTs do not easily offer 'complementary' sociological analyses, since they tend to subvert dominant discourses in social sciences, opting for epistemic change and transnational counter-hegemonic knowledge (Carroll 2015, Keim 2011). IFTs can be seen as a therapy for the detoxification of both social sciences and feminist theory, still deep-rooted in western colonial concepts and categories.

CORRADI, LAURA* (*Università della Calabria, Dipartimento Scienze Politiche e Sociali - Gender Studies and Intersectional Methodology - Feminist/Queer Lab*)

Laura Corradi, Gypsy Feminism. Intersectional Politics, Alliances, Gender and Queer Activism, Routledge (forthcoming) <https://www.Routledge.Com/Gypsy-Feminism-Intersectional-Politics-Alliances-Gender-and-Queer-Activism/Corradi/p/Book/9781138300330>

Clumsy stereotypes of the Romani and Travellers communities abound, not only culturally in programmes such as Big Fat Gypsy Weddings, but also amongst educators, social workers, administrators and the medical profession. Gypsy

cultures are invariably presented as ruled by tradition and machismo. Women are presented as helpless victims, especially when it comes to gendered forms of violence. The reality, however, is much more complicated.

In Gypsy Feminism, Laura Corradi demonstrates how Romaphobia – racist and anti-Gypsy rhetoric and prejudice, pervading every level of society – has led to a situation where Romani communities face multiple discrimination. In this context, the empowerment of women and girls becomes still more difficult: until recently, for example, women have largely remained silent about domestic violence in order to protect their communities, which are already under attack. Examining feminist research and action within Romani communities, Corradi demonstrates the importance of an intersectional approach in order to make visible the combination of racism and sexism that Gypsy women face every day.

This concise and authoritative book will appeal to scholars and students in the areas of Sociology, Cultural Studies, Women's and Gender Studies and Anthropology, as well as Politics, Media Studies, Social Policy, and Social Work. It is also an invaluable resource for activists, community and social service workers, and policymakers.

RC37-654.2CORREA, AMELIA* (*University of Copenhagen*)*Postcolonial Art and Critical Discourses at the São Paulo Biennial*

For many critics, mega-events like Biennials are little more than a neoliberal platform, a space corrupted by big capital. Nonetheless, my point here is quite another: I am interested in looking at how the most important contemporary art event of the *Global South* allows us to think of new power configurations, bringing feminist and post-colonial debates to a wider audience. In fact, one of the most prominent aspects of media treatment of the 2016 São Paulo Bienal was that for the first time in its history, the number of women artists selected was higher than that of men; it has also featured the highest number of black artists ever selected. I have carried out an extensive survey of the profile of the participants, which enables me to analyse questions of artistic representation within the event by taking a close empirical look at artists' nationality and place of work, as well as their gender and race. This data also allows me to approach issues related to a notion of a *post-colonial* world of art. The interviews I have done with the curating team lead me to believe that a certain *moral geography* has partially guided their selection. The space – symbolic and within the geography of the exhibition – given to artists and debates from the *South* can be read as a position assumed by the institution, as a place from which redefinitions of the center and periphery take hold within the art world. Finally, I analyze some of the works that engage in a direct dialogue with the issues discussed above, focusing on Grada Kilomba and Maria Tereza Alves. Through their work, we are able to see that contemporary art is not a mere repertoire of possible answers, but a place where questions and doubts are translated and re-translated.

Youth Pathways: The Schooling and Work Processes of Young People from the Metropolitan Area of Belo Horizonte - Brazil

In recent periods, Brazil, as well as other Latin American countries, has experienced an increase on the access to rights in many fields, including the right to a "decent work", as well as an increase in public policies for the youth which have already been interrupted by the economic, political and social crisis of the country. In that perspective, this article intends to contribute to the understanding on the schooling and work pathways of young people who had participated in a widely disseminated government program – the Young Apprentice Program. By a quantitative and qualitative perspective, with different collect of data instruments – questionnaires, interviews and research in social networks – the work and education experiences of 112 young people from the metropolitan area of Belo Horizonte were mapped in a period of four years. Based on the theoretical background of the sociology of the youth, sociology of work and sociology of individual, the primary results reveal that, in this group of young people, a precarious entry in the job market has persisted even in the period of labor formalization, which evidences the necessary articulation between the analysis of young people labor's insertion and other inequality determinants, such as gender, race and territory.

The Effectiveness of Retelling One's Life Story to Increase Quality of Life - the Participants' Perspective

The efficiency of illness narratives to stimulate coping processes has been already shown in the field of narrative based medicine. In persons with aphasia, a neurological language disorder, limited efficacy data is available (e.g. Bronken

et al., 2012). However, especially these persons experience reduced social participation and Quality of Life (QoL). Although life story work can support processes of sense-making, people with aphasia are mostly excluded from narrative approaches because of the impaired language abilities. Therefore, we conceptualized a modified biographic-narrative intervention targeting identity renegotiation. Quantitative data showed an improvement in QoL. To gain a deeper understanding of the approach we now look at the perspective of the participants.

The study was set in a pre- and post-test-design with a follow-up assessment three months after the intervention. Five face-to-face biographic-narrative interviews and seven group sessions were conducted over ten weeks with a sample of 27 participants with chronic but different types of aphasia.

According to our hypotheses, we found a significant and stable improvement in health-related QoL. Also self-reported states of mood, e.g. "happiness", grew significantly. Semi-structured interviews revealed four main themes regarding identity issues: agency, control, disease concept and doing things. The results show the efficiency of the approach as a supplementary method for improving QoL associated with an enhanced sense of competence and positive self-attribution. As this intervention increased the traditional task of speech and language therapists, we have to discuss, the role of the professionals, and the patient-professional relationship. The transferability of this intervention to other patients is an open question for discussion and further research.

Neighborhood Cohesion and Generalized Exchange in the Sharing Economy

In the burgeoning sharing economy, *trust* is often cited as the main problem to be solved by sharing economy platforms. Consequently, sharing economy platforms have developed a multitude of mechanisms and tools aimed at promoting trust in the interactions that they facilitate, in particular reputation systems. The ubiquity of formalized reputation systems on sharing economy platforms begs the question whether such systems are a necessary condition for the emergence of trust, or whether trust is also possible without them. We study an exception to the rule: a Dutch sharing platform where users borrow items from other users in their local neighborhood. From a theoretical point of view, this platform constitutes a particularly clear case of a generalized exchange system. Interestingly, it does not feature a reputation system. In this paper, we study the relation between neighborhood cohesion and the success of sharing economy interactions on this platform.

Building on theories on generalized exchange, trust, and networks, we hypothesize that 1) the *demand* for interactions on the platform, in terms of memberships, is smaller in more cohesive neighborhoods, while 2) the *supply* in terms of the likelihood of a positive response to a request, is higher in more cohesive neighborhoods.

To test these hypotheses, we combine data on social cohesion in a random sample of 180 Dutch neighborhoods with data on over 1000 interactions on the platform in these neighborhoods. Our results provide insight into the viability of large-scale generalized exchange in the context of local embeddedness.

Youth Policies in Brics Countries: Towards the Construction of a Typology

Drawing upon several researches, this article attempts to classify youth policies in the Brics Countries according to a variety of dimensions: the views about the youth in the discourse of political leaders, the definitions of youth and the main purposes of youth policies organisation of the youth sector in government, the target groups for youth policies. Youth policies are highly diverse between the five countries, but they are also diverse within countries, being either centralized or decentralised towards the regional/local level and the voluntary sector. Inspired in the Wallace and Bendit study on youth policies in Europe, the paper highlights convergencies and contrasts between countries.

The Theoretical Construction of Pobladores and Favelados As Social Movements in Latin America

How social sciences had contributed to produce theoretically the Movement of Chilean pobladores and Brazilian favelados during the twentieth century? Through the critical review of the main theories and perspectives that sought to understand the political action of the urban poor in Santiago de Chile and Rio de Janeiro, I intend to show the close relationship between these movements and the production of social sciences, in which operates a double hermeneutic, i.e. a mutually influential reflexivity process that would eventually incurs on the constitution and recognition of the movements as such. This paper aims to analyze how social sciences perform the same social struggles that they attempt to describe. In other words, how certain academic contexts interact positively or negatively with the political and social disputes generated from the movements in question. Therefore, it reviewed the main perspectives who had studied the urban social issue: the theory of marginality; the urbanization dependent theory; the theory of urban social movements; the utilitarian readings and the theory of new social movements, showing how these interpretations had alternated between the requiem, the rediscovery and the denial of favelados and pobladores as social movements.

Food Sovereignty and 'buen Vivir' in Ecuador

The study of Ecuador's reality is particularly interesting because the concept of food and nourishment is closely related to a specific idea of wellness pertaining to the indigenous population, *sumak kawsay*, which in Spanish translates as "buen vivir" or in English as "good living". Here we find a conception of food and lifestyle different from the current Western model. Daily routines in the Andes, such as cooking or farming, have an epistemological character since they are spaces of common interaction, *Pachamanka*, the Andean method of cooking food by covering it with earth, is closely related to food sovereignty. The methods for preparing and consuming food are reflections of culture and environment within a certain context. The food system represents a relationship both self-centred and related to the others, as a strategy for survival and individual and collective wellness. Ecuador's new Constitution (2008) includes the *sumak kawsay* or *buen vivir* as a main principle. It declares a new relationship with nature and states that nature is a subject of rights and respect. It also declares a new horizon of coexistence within a plurinational democracy, a new model of economy based on solidarity and equity and a new democracy based on reinforced citizens' participation. In this framework food sovereignty, that is, the right to make decisions regarding one's food, becomes a multidisciplinary strategic objective, a platform for developing public policies aimed at overturning the destructive logic of the dominant agro-industrial model and at reaching the *sumak kawsay*.

Late Modern Scenes of Action

This discussion will explore and seek to extend the conception of "action," particularly in terms of the ways in which late modern social conditions institute new scenes of action, in the economic sphere and in other dimensions of everyday life. While Goffman sought to explore the social-interactional significance of action, the voluntaristic framing of Goffman's analysis can be supplemented with a consideration of the social structuring of risks and "imposed" forms of risk-taking. For Goffman, gambling was the "prototype of action," and Goffman himself was an enthusiastic gambler. Relevant to the discussion then will be the example of the expansion of legalized gambling, understood as a cultural phenomenon and voluntary social action orientation on the one hand, and economic-policy orientation and revenue producer on the other. Other examples to be considered (if time permits) include housing, investing, and retirement/planning.

COSSI, GIANUGO* (*University of Udine*)

Luhmann's Sceptical Approach to the Globalisation Cultural Processes

GIANUGO M. COSSI

Luhmann's sceptical approach to the globalisation cultural processes

Luhmann developed his thinking in the work *Global Theory*. In this sense, he believed that functional-structuralism had universal relevance, and was therefore global. *Global Theory* meant, and means, taking into account the entire social complex and not only fragments. Luhmann therefore treats the overall phenomenon

of globalisation in his theory, or better, a series of narratives that were contemporary in his days, centred on the combination of processes that define that series.

According to Luhmann, around 1995, it was possible to speak about globalisation when moving towards the affirmation of a single sub-system for each functional environment on a planetary scale. If the definition, *sui generis*, suggests that there is a single (complex) economic sub-system on a planetary scale, this does not imply for the master of Bielefeld (as one might think in common sense) a simplification of the codes utilised. In other terms, the unification of economic organisations does not constitute a decisive central element of socio-cultural simplification.

In conclusion, for Luhmann, globalisation achieves something completely different than the mere domination of markets; given that the process of unification of functional codes presents other aspects. The processes of globalisation, while projecting onto a planetary scale, are reinforced through specialisation, which implies the inter-dependence (even if relative) of single codes. In the framework presented thusly, the mass media, which might be considered other systems, increased the functional autonomy of their codes during the 1990s. Through these, the social function of the global world media does not serve to direct the self-observation of the social system (said differently, self-description) but rather to divide still more than in the past the global world into sub-systems of communication and environments.

COSU, ANDREA* (*University of Trento*)

The Sins of the Fathers? Clifford Geertz, Intellectual Autonomy, and the Concept of "Cultural System"

This paper aims to contribute to an intellectual history of the "cultural turn" by looking at how anthropologist Clifford Geertz made his steps toward interpretive social science in the period that went from the late 1950s to the publication of *The Interpretation of Cultures*. I reconstruct, with the aid of precious archival resources from a series of archives (including Geertz's personal papers), two strategies of positioning and differentiation that Geertz pursued: one within his close network of scholars, an intellectual coalition of functionalists and modernization theorists whose center had been the Department of Social Relations; and one *from that network* when Geertz tried to provide the Institute of Advanced Studies at Princeton not only with an organizational, but also with an autonomous intellectual base.

I show how Geertz first attempted to rework the concept of "cultural system" since the late 1950s as a means to address some inconsistencies of the application of the four-function scheme (AGIL) at the level of the cultural system. This led to a rift with Parsons that involved a different positioning on issues like formalism and interpretivism, and on the social scientific or humanistic character of the social sciences. This project was abandoned briefly in the early years of the IAS, which saw the explicit attempt to produce a more radical move toward intellectual autonomy, and was completed in the mid-1970s, when Geertz, now secure in his position as a superstar of interpretive social science, returned to the concept of "cultural system".

In the conclusions, I question current interpretations of Geertz that detach his work from the institutional conditions of its production, and connect the findings of this paper to some more general aspects that deal with the mobilization of ideas and the process through which scholars reach their intellectual autonomy from strong, powerful, intellectual networks.

Fear of Crime, Disorders, Incivilities and Social Cohesion in Brazil

This article analyzes the fear of crime among residents of the Brazil Federal District using data from a victimization Survey conducted by the Public Security Secretariat of the Federal District in 2015. We have found three factors that proved to be central to the explanation of fear: Noise of shooting, people being assaulted, and distrust among neighbors. In all situations, the presence of incivilities was found to be more important than disorders and quality of public services. The presence of car keepers showed to be responsible for the constitution of an alternative social order that leads to the reduction of fear. Finally, sexual violence has been shown to be a key factor for the increasing of fear at home and the existence of areas of drug use in the neighborhood has been shown to be important to increase fear at night.

COSTA, SERGIO* (*Freie Universität Berlin*)

Persistent Inequalities, Mutable Classes? Social Structure and Political Crisis in Brazil

The paper first draws on contemporary contributions that combine Marxist and Weberian traditions of social structure analysis (especially R. Kreckel

and G. Therborn) for constructing a conceptual framework able to study recent transformations observed in class positions in Brazil. Starting from this framework, the paper discusses contemporary Brazilian crisis as a distributive conflict involving four classes or strata (the poor, newcomers, established, millionaires), defined using five vectors of inequality: wealth, position, knowledge, selective association and existential rights. The class alliance led by the Workers' Party PT brought between 2003 and 2013 an improvement in terms of wealth, knowledge and existential rights for all four strata or classes. However, the established lost social position as their power to exclude newcomers diminished. Starting in 2014, the picture has changed: Due to the economic crisis, all strata have lost wealth. Additionally, the millionaires lost part of their selective associations as the investigations into corruption advanced. In this context, the existing arrangement between capital, state and wage labor lost support leading to Rousseff's impeachment. Her successor, Temer, has systematically readjusted the distributive arrangement in favor of capital

RC35-636.1

COSTA, SERGIO* (*Freie Universität Berlin*)

Relational Turn in Inequality Research

Inequality research – in contrast to poverty research – is by definition relational. However, conventional scholarship uses to concentrate on inequalities between classes or strata within national contexts ignoring the multiplicity of relevant unequal relations. Recent contributions have searched for filling this gap at both: the analytical and the methodological level. Analytically, the focus on classes or strata has been expanded in order to integrate gender, race and ethnic relations, not only within national borders but also globally. Methodologically, spatial units of reference (municipalities, national states, regions, etc.) have been substituted by relational units such as regime, figuration, and chain (care chain, commodity chain) which encompass not a previous territory but a changing web of relations.

The first section of the paper presents the main developments associated with this "relational turn" in inequality research. In the second section, the paper uses the example of "regimes of inequalities" involving Afro-descendants in Latin America to highlight the advantages of relational approaches in inequality research.

COSTA, SUSANA* (*Centre for Social Studies*)

The Social Life of Forensic Evidence in Portugal - Travelling between Epistemic Cultures

In ST&S studies forensic evidence is seen as material and social. Part of an *apparatus*, forensic evidence combines bodies, traces, technologies, legal, scientific and administrative practices. If the use of technologies and scientific knowledge can provide a more robust and credible character to forensic evidence it is also dependent on social and legal practices of the actors that compose the chain of custody.

The documents that police agents produce mediate the understanding between the crime scene and the court. The police give visibility to the narrative and assigns legitimacy and credibility to its performance. However, dealing with *impure objects*, this activity is liable to *improvised practices*. The decision to give to "see" certain aspects of the narrative, leaving others invisible may have repercussions in the production of robust evidence or a verdict.

This presentation is based in a qualitative analysis of an homicide case judged in a Portuguese court. It will be explored how the narrative constructed by the police, based on what they see and what is unseen, travels between epistemic cultures.

Starting from Appadurai's concept of "the social life of things" and rescued by Corinne Kruse with "the social life of forensic evidence", both allow objects or their trajectories to be followed. I will try to follow the trajectory of traces on this particular case and analyze how these objects travel between different epistemic cultures.

I argue that travelling from the crime scene, to the lab, to the court and also to the appeal court, the production of a narrative with legal value acquires different weight and relevance according to the understandings made from the same objects by different epistemic cultures. The way different actors and different epistemic cultures see and interpret the evidence determines the social life of forensic evidence.

COTE, DENYSE* (*Université du Québec en Outaouais*)

Shared Physical Custody : A Feminist Analysis of Regime Change in Family Institutions

In practically all known societies, childcare work have been entrusted to women. Diverse family mythologies have maintained this sexual segregation within a range of socio-economic conditions. Shared physical custody is increasingly being presented today in Western societies as the ideal model for post-separation custody of children in heterosexual families. It is also being exported to areas of

the world where gender symmetry is not part of the fabric of the family. Such is the case of Brazil, where compulsory shared physical custody in conflictual cases has become law. In this society of highly segregated parental roles, shared physical custody has become a new patriarchal regulatory tool opening the door for divorced fathers to delegate childcare to their female family members and new spouses, while maintaining control over their ex-spouses. Of course, this is not always the case: voluntary shared custody in non conflictual situations is quite different. Based upon two decades of empirical research on shared custody (Côté 2000, 2002, 2006, 2012, 2015, 2016), this paper will analyze how a new mythology of shared custody sets the stage for new gender regimes regarding family policy. Based on a principle of gender symmetry, it paradoxically paves the way for new forms of individual and collective violence against women while incorporating flexibility of gender roles, diversity and mobility of marital and family experiences. Re-reading Walby's analysis on the varieties of gender regimes (2004), this paper will examine how imposing shared custody by law or via the courts has generated for women new types of constraints and inequalities while responding to the demands of fathers' rights groups to « provide remedies » to maternal custody. These new legal regulations are constructed on political discourses framed by the notions of equal and human rights but constitute a pushback to feminist politics.

Between Redefinition of Professional Identity and Resistance: The Case of Family Physicians in the Political Context of Reforms and Public Administration

The context in which family physicians practise has changed considerably in recent decades. These professionals are more likely to be confronted by new forms of managerial rationalization that redefine efficiency standards, which in turn complicates work, redraws the boundaries of professional autonomy and leads to the negotiation of new forms of professionalism. The medical profession is, more than in the past, required to function within various administrative and bureaucratic constraints that guide physicians' practice and limit their professional choices. To this has been added a new relationship between the professional and the beneficiary, revealed by a questioning of traditional forms of professional authority and a strengthening of the market relationship. The figure of the "professional" no longer refers only to the skilled, the expert, the self-employed, driven by values of commitment and responsibility, but also to a set of externally imposed imperatives that are not without consequence on practitioners' relationship to work and their daily practices. The objective of this presentation is to present the results of a qualitative investigation that was carried out in the province of Quebec (Canada) regarding the evolution of family physicians' work relationship. We conducted 35 individual semi-directed interviews with physicians from three labor market integration cohorts (early, mid and late career). The findings revealed that the current healthcare context (reforms, laws and regulatory frameworks, new public management, etc.) places strong pressure on family physicians to adapt their practice to the requirements of efficiency and effectiveness that are defined by a managerial logic that contributes to a redefinition of their professional identity. However, our findings also revealed that family physicians resist these pressures in a variety of ways, defend a highly focused professional identity, and a humanistic vision of care.

JEAN, EMMANUELLE (Université du Québec à Rimouski)

Evolution of the Role of Family Physicians in the Context of Their Interprofessional Collaboration with Advanced Nurse Practitioners

Physicians practise within complex health care environments in which governments are endeavouring to ensure citizens' access to quality primary care services while simultaneously controlling costs. Within this context, the development and implementation of advanced practice nursing (APN) roles is one of the important initiatives of recent decades. A growing number of physicians have therefore had to determine how best to exercise their role relative to that of these health professionals. Much has been written about the development and implementation of the APN role, including some discussion within Medicine. However, little information exists about how physicians' view their role relative to that of these health professionals. Physicians experience a number of well-documented pressures (e.g., large caseloads, increasingly complex cases) as they endeavour to provide the best possible services while also maintaining a satisfying professional life, these pressures potentially having negative consequences (e.g., burnout, moral distress). In this context, it is important to understand physicians' perspectives regarding this evolution in the organization of practice. The purpose of this talk is to present the findings from an investigation conducted in the province of Quebec (Canada) regarding family physicians' perspectives about

their role relative to that of primary care ANPs. We conducted nine in-depth semi-directed individual interviews and two focus groups with ten physicians. Physicians reported three areas in which their practice was influenced : 1) client composition and scope of practice; 2) the type of follow-up; and 3) teamwork. The physicians' perceptions about the transformation of their role include both losses and gains; they seem to experience a certain ambivalence about a redefinition of their role, which in turn is linked with the meaning that they gain in their work.

Forms of Capital in the Resistance, Renewal and Retention of Indigenous Communities: A Cross-National Exploration of Urban Indigenous Entrepreneurs

Scholars often talk and write about urban Indigenous Peoples as a perpetual underclass – under-educated, unemployed, reliant on social services and assimilated into the mainstream culture of the centers in which they live. This ignores not only a growing urban business community and expanding middle class, but the mechanisms through which it is happening and its impact on connection to community. Past work suggests that over and above accessing needed financial and human capital, social and cultural capital are valuable in business success – having diverse connections and cultural knowledge specific to a marketplace help in accessing opportunities and growing businesses. Using data from a mixed-methods study of 220 urban Indigenous entrepreneurs across three countries, this paper explores the role of Indigenous and non-Indigenous social and cultural capitals on business success in urban markets. Findings show that entrepreneurs build social and cultural capital needed to succeed as entrepreneurs in an urban marketplace and use their position and businesses to: (1) reinforce and strengthen their connection to Indigenous community networks and culture, and (2) provide support back to communities. A consistent theme shows that success is about more than profit – entrepreneurs consider promoting strong, positive images of Indigenous Peoples and helping community in a variety of ways as more important. Other cross-national similarities and differences are also discussed.

COUSINEAU, LUC* (University of Waterloo)

JOHNSON, COREY (University of Waterloo)

Manning up and Manning on: Masculinities, Hegemonic Masculinity, and Leisure Studies

For better or for worse our leisure is steeped in the social and cultural influences which also inform our politics, positionality, and performativity. Kivel (1996) argued that "leisure contexts contribute to a hegemonic process which creates "insiders" and "outsiders" (p. 204), and gendered ideology is an important pivot for those processes. Both in participation and consumption of leisure pursuits, gender and gendered norms – particularly masculinity – shape the way we engage with leisure. Whether this influence is pro-masculine (e.g. the reverence for the "hard" man represented in full-contact sport) or anti-feminine (e.g. only "sissies" and girls sew), masculinized ideology and the spectre of hegemonic masculine ideals serve to police our leisure choices, and our willingness to accept the leisure choices of others. This set of attitudes persists in Canada and the U.S. through decades of North American feminist action, which in spite of having leveraged significant social developments against oppression, now seems under near-constant attack.

It is in this landscape where we situate our theoretical argument for a refocusing of efforts on the study of masculinities in leisure theory and practice. As men who also identify as feminists, our goals are to understand our masculinities, the positive kinds and the toxic kinds (Ferber, 2000; O'Neil, 2010), and decide what we can do about them as activists, researchers, teachers, sons, husbands, brothers, friends, and social justice oriented humans. In so doing, we will detail the historical and disciplinary roots of the study of masculinity, followed by the tensions and challenges we've encountered deploying these projects into the emerging fourth wave. Finally, we end with a call to others; to consider how masculinity, as well as critical research on men and the masculinized socialization of leisure spaces, can offer a part of the solution for creating a more gender equitable world.

COUTINHO, ALINE* (University of Ottawa)

High-Impact Entrepreneurship and Development: Shifts in Governance of Emerging Economies

It has been a long time since entrepreneurship is seen as a motor for economic development and, as such, entrepreneurship policies have been designed to build entrepreneurial ecosystems and boost attitudes towards entrepreneurship. In this article, I discuss recent practices of entrepreneurship-building in the Global South carried out by Endeavor, a nongovernmental organization headquartered

in New York that seeks to promote entrepreneurship in emerging economies. Taking the efforts of the Brazilian affiliate as a qualitative case study, I argue that Endeavor is carrying out a form of entrepreneurship-building that entails the assemblage of networks to promote high-impact entrepreneurship and changes in governance of institutions such as the city, the academia, and culture. The networked efforts weaved and carried out by Endeavor are different from traditional top-down entrepreneurship policies and programs designed by governments and international financial institutions to foster small businesses and economic rationality. The data gathered in this investigation suggest the emergence of a type of socioeconomic development project that promotes and establishes an ecosystem appropriate to the founding of business enterprises. This type of development ultimately encompasses an indirect neoliberal societal reengineering and constitutes a specific economic subject, the *homo auctus*, whose rationality builds on and radicalizes the axioms of *homo economicus*.

Leisure in Youth University Lifestyle. Prospects and Trends Among Audiences Brazilian, Portuguese and South African

Leisure is a human activity, which represents the need to enjoy, ludically the social practices constituted culturally (Gomes, 2014). It is developed without commitment with predetermined tasks being understood as one free of social obligations. The lifestyle is the set of practices influenced by the position of social classes, literacy, values, economic power, gender, age, profession and address, being the leisure a component of people's lifestyle, constituted by individual habits. The youth constitute their own lifestyle, culturally established or assimilated (Pais, 1996). It also seeks to reflect their habits, their customs, and interests in everyday actions. Our objective was to know the youth's lifestyle in their leisure, according to their conceptions. We used electronic questionnaires with university students (36% from Lisbon-Portugal, 57% from Belo Horizonte-Brazil, 8% from Cape Town-South Africa). 705 from 1220 questionnaires were answered. We analyzed profile, leisure conceptions and lifestyle using the software SPSS. There are common among young people of the three countries go out with friends and surf the internet. On the understanding of lifestyle as an action determined by the social knowledge, which alternate as desires and manifest themselves in various fields. Young people have styles of their own and peculiar life in every country and every culture, use is made of public spaces and reframe according to their interests and availability. The lifestyle can be turned on and endorsed by the cultural capital versus financial capital to meet the determination of practices. Even in so distant and different cultures, we see similar interest in young people, showing that globalization and the cultural industry, especially the entertainment is of great value and influence in contemporary human formation. While we understand leisure as self-determined practice, we recognize that is the result of society, thus underlining the differences initially shown in this study.

From Acupuncture to Ozone Therapy: Exploring Uses of Complementary and Alternative Medicines in Elite Sport

Participation in sport, especially at the elite level, places athletes at a significant risk of musculoskeletal injury. Athletes face extreme pressures to consistently perform at the top of their game, strive to improve their performance 'naturally' and return to play quickly after sustaining injury. There is a broad range of therapeutic options available to elite athletes, from novel cutting edge biomedical therapies and more established biomedical, surgical techniques and physiotherapy to a wide range of other non-orthodox therapies. However, little is known about how these different treatment options are selected and evaluated and their uses negotiated in practice.

We draw on data from interviews with 27 leading sports medicine physicians (including doctors, physiotherapists and orthopaedic surgeons) working in elite football and cycling in the UK. During interviews we asked specifically about the incidence and management of musculoskeletal injuries and considered factors influencing decision-making including both formal treatment protocols and pathways and informal healing practices that they were engaged in.

Our aims in this paper are to examine (i) when non-orthodox therapies are considered as a therapeutic option in elite sport (ii) why elite athletes (and/or their medical teams) turn to these therapies in the management of sports injuries, and (iii) how they are positioned in relation to orthodox biomedical therapies. We end

by reflecting on whether current CAM/biomedicine theories adequately account for the use of non-orthodox therapies in the context of elite sport medicine.

Social Movements Studies Beyond the Core: Theories and Research in Post-Colonial and Post-Socialist Societies

We will present the core argument of Interface special issue dedicated to "Social movement studies beyond the core".

In much of the core, social movement studies are understood as relatively marginal to the central concerns of the social sciences. In much of the postcolonial world in particular, intellectuals and academics have at times had particular concerns with social movements and revolutions – arguably in far deeper ways than in the West, given the impact of anti-colonial movements and the centrality of postcolonial movement struggles in many societies, but also in terms of expectations of intellectuals around social change. In postcolonial India, it is in history and literature that many of the key debates about popular struggles have taken place, and social movement studies' limited engagement with these fields is its own loss – a gap often made up by postcolonial theorising.

There are both activist and academic traditions of thinking about movements which have fundamentally different histories. Articulating these is a way of challenging the intellectual power relations that automatically place Northwestern thought at the centre, and contributes to the creation of a genuinely global dialogue about social movement experiences and learning.

Actors, intellectuals, ideas, experiences and epistemologies from the South provide insights into their own reality, but also the challenges for democracy and possible emancipation paths in the Global North. We aim at developing research and analyses beyond borders and to fully include sociologists from all regions of the world.

Looking Forward, Looking Back: Adult Survivors Colonize Children's Abuse.

Beginning in the early 1970s, a series of public inquiries into child fatalities began in the U.K. and later found its way to Canada. In general, these inquiries focused on individual children known to child protective systems. By the early 1990s however, these inquiries were augmented by inquiries into abuse within institutions. Mt. Cashel may have been the first, but it was soon joined by others.

These inquiries were concerned with recent abuse to children. However, in the new millennium, inquiries into historical child abuse began to proliferate in Europe, Australia, and Canada. These inquiries no longer concerned themselves with children, but with adults who were children when they were abused. Thus, though an important rhetorical device used by inquirers into contemporary abuse was to 'speak for' children – especially those that had died – these later inquiries are dominated by the rhetoric of adult 'survivors' demanding recognition for past abuses.

This paper will argue that the discursive shift from abused child to adult survivor has had two major consequences. First, the purpose of inquiries has shifted from preventing the further abuse of children toward providing compensation to adults for historical harms. Second, the proliferation of adult voices has tended to drown out the voices of children. In other words, an unintended consequence of enlarging attention to adult survivors has been to place child abuse in the past, and reconceive victims as adults rather than children. Effectively, child abuse has been colonized by adults. Thus, while a generation of adult migrants in Australia is arguing for compensation, present-day child migrants are tortured in Australian transit camps. And, while Canada's Truth and Reconciliation Commission has drawn unprecedented attention to survivors of the residential schools, indigenous children's right to adequate child welfare provision continues to be denied.

The Composition of Grandparental Childcare: Gendered Patterns in Cross-National Perspective

Grandparents are important providers of childcare while their adult children participate in work and other activities. The literature suggests that grandmothers are more likely than grandfathers to provide care for their grandchildren, and also that the prevalence of childcare provision among grandparents, and the intensity of care provided, varies by country, with patterns of care loosely associated with types of policy constellations. But research is lacking on the *composition*

of grandparent childcare time, and whether this varies across countries. What patterns do we see in the gendered distribution of childcare tasks among grandparents? To what extent does this vary across countries with different family policy regimes and norms of familial obligation? Using Time Use Surveys of Australia, Korea, Italy and France we explore *how* grandparents are spending their time with grandchildren. We focus on the activities of child care including physical care, talking, reading and playing, supervising children or accompanying them to day care, school or sports. We reveal cross-national similarities and differences in the gendered distribution and relative composition of care and discuss the implications for grandmothers and grandfathers in the four different welfare regimes.

Human Resources for Health Policies and Power Dynamics: Perspectives of Policy Makers, Professional Associations and of Researchers in Portugal and Brazil

In a globalized and changing world, it is crucial to analyze the dynamics underlying public policies design and implementation vis-à-vis the different interests. This reality is particularly important to know when studying human resources for health policies and health systems, which by nature are complex and facing competing interests, namely of different professions.

Understanding the politics of the utilization of research evidence in relation to human resources for health according to health professional associations representatives, decision-makers and researchers provides insights into the dominant political culture, and in the power dynamics in the Portuguese and Brazilian health care systems. We report on perceptions of these three groups regarding the use, or non-use, of research evidence by policy makers and reasons to do so in designing and implementing HRH policies, particularly understanding the underlying dynamics of the education and management health workers' policies.

We designed a comparative case study of semi-structured interviews with Portuguese and Brazilian health professional associations representatives, decision-makers and researchers (N=28). Interviews were audio recorded, transcribed, anonymized and analyzed thematically.

We report on the following: who sets the research agenda? which power dynamics emerges and what facilitates or is an obstacle to the use of evidence in the definition of health policies related to health professions? A discussion on the advantages and challenges of perform country comparative analysis will be integrated.

Gender, Radicalization and Precarious Belongings: The 'new' African Diaspora in Vancouver across Two Generations

Unlike earlier cohorts of immigrants to Canada, it has been well documented that the majority of those migrating since the 1980s are more highly educated than other Canadians but experience long-term downward social and economic mobility. Those who migrate to Vancouver from sub-Saharan Africa – the 'new African diaspora' – provide a good example of this trend. African immigrants express disappointment at local employers' failure to recognize their educational credentials, credit their overseas work experience, or accept their African English accents, and encounter gendered forms of everyday racism, resilience and community building. However hard migration to Canada has been, however, most parents have dreams of a better future for their children. Indeed, their own sacrifices may be considered worthwhile if their Canadian-raised children have better opportunities and do not experience the marginalization that has marked their parents' lives. This begs the question: are the first generations' dreams of better opportunities and belonging for their offspring born out for the second generation of African-Canadians in Vancouver? This paper addresses this critical question of long-term migrant integration, taking a multi-generational, gendered and anti-racist lens to assess whether or not optimistic expectations for the second generation are fulfilled.

All the World's a Stage: The Geodemography of Political Contention.

All the World's a Stage: The Geodemography of Political Contention. Edward Crenshaw*, Kristopher Robison** and J. Craig Jenkins*.

Abstract

David Kilcullen recently theorized that violent political contention around the globe is (and will increasingly be) driven by geodemographic forces that he sums up with the pithy phrase "crowded, connected and coastal." That is, he suggests that coastal, media-connected megacities are the battlefields of the future, and so we should expect this new human geography to strongly predict political contention. Using pooled cross-sectional time-series analyses on cross-national samples that average over 100 nations (1976-2012), we examine the effects of these geodemographic factors pitted against a more general globalization model we augment with structural control variables typically found in such studies (e.g., GDP/c, government repression). Using this standard model, we predict three forms of political contention: (1) non-violent anti-governmental protest; (2) terrorist attacks; and (3) guerrilla/insurgent attacks. In order to empirically test Kilcullen's concept, we create a (country-year level) four-variable index that includes population size, the coastal population distribution, the size of the largest city, and foreign press bureaus (the latter representing "connectedness"). Net of our standard model, our results strongly validate Kilcullen's theory; geodemography positively predicts protest, terrorism and insurgency and does so consistently and robustly (as do democracy [Polity IV] and government repression). We conclude that Kilcullen's theory is a breakthrough in the human ecology of political contention, greatly aiding international organizations and policy-makers in predicting and anticipating conflicts and humanitarian crises around the globe.

From Grassroots Mobilization to Professional Protest: How 'Ordinary Folk' Become 'Organized Folk'

Social movements are usually characterised as collective social action, ranging from local 'grassroots' groupings to global networks. Interest in the mobilisation of social movements suggests the construction of a movement narrative is influenced by a range of resources, including those associated with the individuals that participate in collective action. For example, activists may bring specialist skills and resources to the movement that facilitate mobilisation, from rhetorical skills and political acuity, to technical competencies or social networks. Although many studies look at the mobilisation process, few have examined the specialist skills and competencies of key actors in the evolution of movements, including how individuals help a movement transition from 'grassroots' to 'national' political engagement. Developing new theoretical insight, we draw on ideas within the sociology of professions to analyse how activists draw on their professional background to influence the formation and development of grassroots movement, in relation to other actors both within the movement and the wider field. Our empirical case is the mobilization of grassroots protest against high-speed rail in the UK. The study shows that activists' perceived professional background became integral to their positioning within the movement, as technical specialists, movement leaders, and representatives in political forums. In part, this reflected recognised professional attributes, such as the ability to command expertise or mobilise social networks, but in other ways reflected a particular 'style' or notion of professionalism that promoted the social legitimacy of the movement. As such, the internal dynamics and external representation of the movement was increasingly characterised as a 'professional protest' with actors establishing their position according to their past occupational experience, but also their ability to project a particular style of protest.

CROTHERS, CHARLES* (*AUT University*)

Interstitial Sociologies and Their Associations

Interstitial Sociologies and their Associations

Alongside (and sometimes interpenetrating with) mainstream sociological activity are special-focus sociologists whose work draws on sociology but whose activities and identities tend to be quite separate. Mainstream sociologists are seen as those teaching (researching) in mainstream sociology departments while those conducting sociology teaching or research outside this organisational setting may be trained as sociologists or explicitly drawing on sociological frameworks and methods. Their identities are partial and they often do not engage with mainstream sociologists or their associations in part because of exclusionary formal disciplinary boundary-setting and partly because they are more committed to other scholarly establishments. Such 'other sociologists' can be identified by data on social scientists more generally and their existence is pointed to by separate interstitial associations. The paper examines the apparent extent of the various fields of interstitial sociologists and presents information on their associations – which tend to be one of the more visible signs of their existence. Such

associations have particularly arisen in the Global North but equal attention will be focused on those from the Global South.

The Relationship between Merton's Sociology of Science and His General Sociology

Merton saw sociology of science as his main sociological interest which had two quite distinct phases: the earlier comparative/historical work on external factors on the development of science institutions and their operation, and a later phase drilling down into more detailed operational details, alongside a Columbia University team. Work in both phases has been limited in its impact on sociology in general, since comparative history has side-lined his earlier work while the latter was overshadowed by the rise of the sociology of scientific knowledge. On the other hand, Merton's work on deviance and structural analysis is central to ongoing sociological interests. This paper shows the links between Merton's specialist sociology of science and his general sociology and argues for the continuing importance of both for the continued development of sociology.

CROWHURST, ISABEL* (*University of Essex*)

Taxpayer Citizenship and Prostitution

Far from being innocuous bureaucratic procedures, taxes are central markers of civil belonging and of what is referred to as taxpayer citizenship, i.e. the enjoyment of political legitimacy through taxpayer status (Walsh 2017; Hackell 2013). This paper explores the under-studied and under-theorized nexus between taxation and prostitution, and sheds light on the role of fiscal policies in shaping the relationship between the state and sex workers.

The discussion of these dynamics draws on the Italian case. Here, the stigma associated with prostitution, and the institutional and social violence that this begets, is compounded also by the inequality and ambiguity of fiscal measures on the treatment of commercial sex. Taxation arrangements that penalize and exclude sex workers from the enjoyment of full taxpayer citizenship contribute to fuelling a rhetoric of demonization towards them as individuals who exploit the fiscal system at the expense of law abiding 'good citizens'. However, recent shifts in the body of values, norms and beliefs that inform the regulation and taxation of prostitution in the context of austerity measures suggest a move towards a re-articulation of this marked distinction between good and bad citizens. An increasing number of prostitution policy proposals and public and political debates now support the introduction of regulationist systems aimed primarily at the taxation of commercial sex activities. In this context, sex workers, outcast and marginalised for decades, are now called upon to make a contribution towards the collective effort to fight the current economic crisis and join the ranks of 'good citizenship' by paying income tax on their sex work-related earnings. The paper interrogates the significance of these changes, the forces that underpin them, and their potential implications for the notion of citizenship.

CRUZ, KEVIN* (*Universidad Nacional Autónoma de Honduras*)

Juventud y Medios De Comunicación En Honduras

El objetivo del presente trabajo es analizar las representaciones sociales sobre la juventud en la prensa hondureña en el año 2017. Durante este año se ha logrado identificar en la prensa, una serie de noticias en donde persisten las opiniones, estereotipos y demás discursos estigmatizadores acerca de la juventud más vulnerable del país, noticias que contribuyen a fomentar la imagen de que son estos jóvenes el problema que provoca la crisis de violencia generalizada y otros problemas que atraviesa Honduras.

Dichos discursos manifiestan la violencia simbólica detrás de ellos al ser contrastados con otro tipo de imágenes que proliferan en las páginas publicitarias de la prensa, en donde se muestran a jóvenes que consumen, modelan o recomiendan los productos de las empresas que pagan por un espacio. Sin embargo, no son los mismos jóvenes de las noticias anteriores, sino un tipo de joven socialmente aceptado, perteneciente a estratos más elevados, con capacidad de consumo y que refleja los valores culturales dominantes (Margulis, 2009).

Para poder estudiar este fenómeno, se hará uso del enfoque nominalista de la juventud (Brunet & Pizzi, 2013), apoyado de la teoría de las representaciones sociales de Jodelet y Branchs (Rodríguez Salazar (coords) & García Curiel, 2007). El enfoque metodológico es cualitativo, siendo que este es un trabajo documental, el cual se apoya en la técnica de análisis de discursos.

CSANADY, MARTON* (*Karoli Gaspar University of the Reformed Church in Hungary*)

Religion, the Churches, and Political Power in Hungary

Hungary is one of the traditionally multi-religious European countries. While more than 90% of the population in the Hungarian Kingdom had belonged to a Protestant church in the seventeenth century, the Counter-Reformation under Habsburg rule made Catholicism the religion of the overwhelming majority. Fully free practice of religion has become possible only after 1990.

The Reformation subverted the traditional conception of worldly political power and the differences among the churches in this respect have not disappeared. Attitudes to political power can be assessed by measuring trust in the institutions that represent it. (Offe 2000.)

Studies of religion generally classify countries by their majority religions. (Inglehart 1999.) The first question of the research conducted at Károli University of the Reformed Church in Budapest since 2014 asks whether there are significant differences among the major Christian denominations within a country in the attitudes of their members to state power. If that be the case, then the second question is directed at the source of such differences either in the original doctrines or rather in the local history and present social standing of the various churches.

Three large-sample surveys (of 1000 persons each) have been conducted using and complementing the questionnaire of the European Value Survey. The paper presents the survey results and uses them for the discussion of the specific political cultures of the different denominations, analysing their respective conceptions of state power and democracy in relation to the depth of church membership in the major denominations.

Being a Cop: Perceptions of Police Officers in Sao Paulo

In Brazil, the return to democracy (mid-1980s) did not break with the police model adopted during the dictatorship. Two police forces divide the activities, one of them being militarized: the Civil Police responsible for registering crimes and investigation; and the Military Police responsible for patrolling the streets. This paper presents an analysis of a survey of military and civil police officers conducted in 2016 in São Paulo, comparing the perceptions of officers from these two institutions. The survey explored officers' view of their self-legitimacy - the level of confidence that a public official has about his or her own legitimacy, feeling worthy or not worthy of his or her authority. In this regards, we examined issues such internal relations, between superiors and subordinates, between peers, and between subordinates and the institution as a whole; and aspects related to their relationship with the public, compliance with the law, democracy and human rights. We could perceive that as police forces the two institutions are quite similar. In general, in both police forces they feel confident in using their authority as police officers, and also feel that they occupy a position of special importance to society. What differs them are the attitudes, norms, and values derived from being a member of a militarized or civil organization. Compared with civil police officers, the view of military police officers about their superiors are less positive. There seems to be greater submission to coercion on the part of military police, because they tend to being more afraid of punishment should they question their superiors. It is also possible to identify that the military police officers tend to present more conservative positions than the civil police. The implications of this results and police practice are discussed.

Control Judges in Mexico. a New Legal Body

Control Judges in Mexico. A new legal body

Control judges in Mexico are a new legal body within the system of justice in Mexico. The creation of these operators comes from the implementation of the oral accusatory system by means of the Constitutional Reform in Criminal Matter in 2008. This system is divided into different stages, and for every stage there is a judge.

The first stage refers to everything that concerns the investigation process, the detection and accreditation of the felony. In this stage, a control judge intervenes. He/she is in charge of invigilating and making sure that due process is carried out. The investigation stage is crucial for the process, for it is when the Public Prosecutor's office along with the crime experts, policemen and witnesses put together the investigation file and the job of control judges is to ensure that the investigation abides by the regulations. That is to say, making sure that neither

impunity nor corruption affects the victim or the accused party. The second and third stages concern the oral trial judges and the execution judges.

This text comes from an investigation carried out in the state of Morelos, Mexico. Throughout the investigation, semi-structured interviews were made to control judges and other operators aiming at observing their perceptions of the new justice model in the country. In order to achieve this analysis, we resorted to coding as a qualitative tool. From this, categories and subcategories of analysis were constructed, which allowed to understand the perspectives and practices that control judges incorporate in the oral accusatory system.

Marginal, Liminal and Traditional Employment: A Longitudinal Analysis of How Young Australians Fare in a Precarious Labour Market.

Recent debates surrounding the concepts of precarious work, the gig economy and the rise of the precariat as a distinct social class bring into focus the effects that contemporary changes in the labour market are having on young people's lives. It has been established, for example, that the transition from education to employment can no longer be regarded as linear and that young people struggle to gain a permanent job after completing their education, whether that be at the secondary school level or at the higher education level. In this paper, we examine the relevance of Andy Furlong and colleagues' three zones of employment: traditional, liminal and marginal in the Australian context. We draw on a mixed-methods longitudinal panel study, the Life Patterns project, which follows a cohort of young Australians who left secondary school in 2006. These young people experienced pressure to gain tertiary education qualifications to equip them for an increasingly precarious labour market. Following Furlong and colleagues' analysis, we examine three important aspects of this cohort's post-secondary school trajectories. Firstly, we examine whether their high level of investment in tertiary education has been rewarded in the labour market. Secondly, we analyse their struggle to secure traditional, full-time permanent, employment. Finally, we illustrate the impact that falling into the liminal zone of employment can have on other spheres of their lives.

Perceptions on Intercultural Competence Development in PhD Programs

International policy maker agencies have transformed education around the world over the past two decades. From Delors's competences as a start point and all the way through Deardoff's intercultural competence. This latter appeared when the process of globalization forced international educational organisms to make changes emphasizing new requirements related to the internationalization process.

Internationalization requires global citizens to join knowledge societies with people from different cultures, for which they have to be prepared with a competence that allows them to interact in an effective and appropriate way in order to avoid cultural shock or differences, under the very basis the UN was founded. Nevertheless, internationalization of Higher Education Institutions in Mexico is a work still in progress. HEI have implemented different strategies, such as: mobility, second language acquisition and the use of technology, leaving aside necessary abilities when interacting with people from other cultures.

This cross sectional qualitative exploratory study presents the findings of a dissertation carried out in a Mexican southern university. Participants involved were coordinators, faculty members as well as PhD students from 3 PNPC PhD programs. The findings show that internationalization attempts are being made with the resources they have at hand, there is no presence of foreign students nor professors in their programs, lessons are not bilingual, little literature in a second language is being handed in, as students are expected to do international stays and join international research networks for future collaboration and co-operation, they are not being prepared in order to perform appropriately nor effectively in an intercultural situation. The findings also show that internationalization at home is required followed by the inclusion of a subject on intercultural competence in the curricula, and as the literature and the state of the art suggest, a four-axis internationalization model and a taxonomy were designed.

TISDALL, KAY (*University of Edinburgh*)

Child-Led Research: Questioning Knowledge?

Over the last twenty years, childhood scholars have created a significant 'turn' in childhood research, to undertaking research *with* rather than *on* children. While in the past adults were often treated as informants on behalf of children, researchers increasingly respect that children can respond and participate on their own behalf and provide meaningful contributions to address the research questions. Research itself is no longer the sole preserve of adults; children themselves are increasingly taking on different roles within research processes, from advising research studies as consultants, to peer researchers collecting and analysing data, to research collaborators. For those who promote the participation of children and young people, there is considerable enthusiasm to involve them in all research stages – from research planning, fieldwork, analysis to dissemination -- leading to the growth in what is often called 'child-led research'.

The paper draws upon empirical evidence from such projects, undertaken in both the Global South and the Global North, for a critical examination of the meanings and implications of 'child-led' research. In particular, the paper explores what counts as knowledge in research within contexts of generational difference and power. This leads into discussions of ethics and methodologies, alongside questions of research legitimacy and impact. This paper concludes by considering the theoretical boundaries and epistemological frameworks that either support or undermine children and young people's competencies to conduct research, across the diversity of cultural contexts and of children and young people themselves.

Neoliberalism and National Minority Universities: The Paradoxes of Hungarian Language Higher Education in Romania

My paper examines the formation of the Hungarian higher education 'complex' in Romania after the fall of the communist regime in 1989. It traces the political struggles for the establishment of a separate Hungarian state university, ended with the 1999 revised Law of Education. Multicultural universities became the default framework for minority language instruction, while minority institutions of higher education were relegated to private initiative. Using mixed methodology, the paper documents the restructuring of Hungarian higher education set off by the foundation of the private Hungarian university Sapientia, and shows how, in the context of demographic decline, neoliberalization of education, and divisive involvement of kin-state Hungary, it lost its political edge and ethno-national focus. It transformed into a weak, disjointed, and dependent 'complex' structured around two competing parts: the Hungarian line of study at the well-established multicultural public Babes-Bolyai University, vastly autonomous but increasingly impaired and made dependent on the Romanian line, by the scarcity of students and falling state subsidies for higher education; and the new private university Sapientia, reliant on Hungarian government's financial support, part of its policy regarding national kin abroad, asserting itself within the Romanian higher education regulatory framework. The analysis of how the Hungarian higher education 'complex' functions highlights the drastic impact of neoliberalization over minority education. The whole Romanian education system yielded gradually to market values and turned firmly towards privatization, commodification and financialization. This had a particularly adverse impact over the Hungarian 'complex', due to the structural asymmetry between majority and minority in terms of power, population, and institutions. This points to the fact that, in the field of higher education, a commitment to give equal public recognition to Hungarians requires a stronger financial support from the Romanian state and a different institutional arrangement.

CUNHA, MARIA JOAO* (*CIEG/ISCSP - Ulisboa 5161800401*)

Female Bodies in Consumption Societies: Subjection or Agency

In consumption societies, the body in its appearance and ability to construct identities has been a gendered issue as pressures on women to comply with a certain body type are stronger than on men.

Since the 1990's the study of body image has developed the idea that lifestyles and body planning have become a part of everyday life. In this communication, we intend to discuss two different interpretations for female body projects. In the one hand, body projects imply an active control through certain lifestyle options, which may imply that reflexivity and agency are main individual features that could even translate the idea of empowered women through body awareness. On the other hand, and drawing upon feminist theories, this supposed agency capacity must comply with ideal images that have been conveyed in different media showing a stereotyped female image of youth, beauty, health and thinness which hence leads us to female bodies as objects of men's consumption – therefore with a subjection that annihilates any agency capacity.

We depart from discussing the concept of agency applied to female body projects to then cross analyze studies results from diverse cultures, comparing western and eastern societies. This approach enables the analysis of globalization effects as well as the comparison of defiance and compliance strategies in the living female body.

RC05-119.1CURINGTON, CELESTE* (*North Carolina State University*)*"We Speak Back!": African Women's Racialized Citizenship Acts in Portugal*

Based on 32 interviews and 1 year of participant observation in the Lisbon metropolitan area, I focus on African migrant women who possess legality and use the framework of "citizenship acts" to illustrate how these women experience and contest social exclusion on the day to day. I look for moments in which African women report other's claims to citizenship, and highlight how this process casts African women outside of Portuguese citizenry. These moments include women's firsthand exposure to racist verbal street harassment enacted by White Portuguese citizens, such as being told to go back to their country. I illustrate throughout how these women's counter narratives to these incidents reflect how they engage in everyday resistance and in the process perform the very same citizenship that other seek to exclude from them. Importantly, I illustrate how these citizenship acts are in fact *racialized acts* and reflect how minority communities challenge the ideology of racelessness that places them outside of European citizenry.

RC29-529.2CURLLEW, ABIGAIL* (*Carleton University*)*Platform Governmentality: Content Moderation in Anonymous Social Media*

Social media platforms and online communities have become a locus of various forms of e-bile, vitriol, trolling, flaming, and harassment. Though such behaviour can be said to exist across a wide array of different platforms (including Facebook and Twitter) it is especially intensified in platforms that are organized around anonymity or pseudonymity. This paper will explore the concept of platform governmentality to understand how social media companies regulate and shape flows of content so to dampen the intensity of toxic behaviour. The anonymous social media platform Yik Yak serves as a good case study of the successes and failures of digital modes of governmentality in anonymous cyberspaces. To mediate issues of toxic behaviour, Yik Yak enlisted the support of nonhuman algorithms and human users, as well as strategies of hierarchal and lateral forms of surveillance, to shape how users were able to interact over the platform's interface. Drawing from the results of a digital ethnography on Yik Yak and twelve semi-structured interviews with invested Yik Yak users, I will empirically trace the various semiotic and material practices deployed under Yik Yak's mode of governmentality. This project will combine material semiotics with Foucauldian insights in order to explore how discipline and social control is practiced in (un)disciplined, anonymous communities.

RC14-269.5CURLLEW, ABIGAIL* (*Carleton University*)*Surveillance Strategies from the Antifa Underground: Lateral Surveillance, Obfuscation, and DIY Community Policing*

Our current socio-political climate has hit a crescendo as far-right groups become more visible and brazen in pushing a white nationalist political agenda further into the public realm. As these groups take to the streets, the far-right are often met by masked anti-fascist (Antifa) protestors who purportedly claim to defend communities from the growing threat of fascism. These protests and counter-protests have been a major source of public controversy, as activists, political pundits, and academics debate about the use of violence as a legitimate form of resistance. Antifa is not an organization, it is a set of social movement strategies that have been deployed to challenge the threat of Fascism in whatever form it takes. These strategies have been taken up by a wide variety of groups on the radical left. Many of these groups have developed digital sanctuaries, where they communicate, strategize, and organize. This paper will look at Antifa deployment of lateral or peer-to-peer surveillance to resist, obstruct, and police the white nationalist movement in North America. This includes practices of intelligence gathering, doxing, and taking to the streets to physically "shut down" white nationalist rallies. This paper will also look at Antifa techniques of maintaining anonymity and obfuscating state and far-right surveillance. I will accomplish this project through a review of Antifa websites, zines, and online communities that explicitly discuss surveillance and obfuscation strategies. My goal is ethnographic—to understand the deployment of tactics from the social movement's own cultural logics. This project will position Antifa tactics within the larger scope of critical criminology and surveillance studies to make sense of the current public controversies and the very real threat of the rise of white nationalism.

RC16-303.4CURRAN, DEAN* (*University of Calgary*)*Between Marx and Foucault: Organized Irresponsibility As a Systematic Power Relation*

In an age of indeterminate, but powerfully growing environmental challenges, of increasing inequalities, and of reinvigorated neoliberalism – despite neoliberalism's apparent failure of its *experimentum crucis* following the disastrous consequences of financial liberalization – there is clearly an exigent need to understand contemporary transformations in power at both a theoretical and empirical level. Marxist macro-level analyses of power relations continue to be relevant in a context in which the rich are better mobilized than any other group in society to solidify and intensify their classed advantages. On the other hand, Foucauldian approaches, emphasizing key micro-power relations associated with individual 'responsibilization', also illuminate important aspects of contemporary power inequalities. However, between the domains of macro 'hegemonic' control and a 'microphysics' of power there exists an important level of power relations not addressed on a systematic level by either of these approaches. This paper aims to identify key elements of this dimension of power through a rethinking of Ulrich Beck's concept of 'organized irresponsibility.' *Organized irresponsibility* – where agents can pursue harm-creating, but self-beneficial actions, and avoid being held individually responsible because the resulting damages emerge only from the collective interactions of these actions – has proven itself to be immensely beneficial to owners and elite workers in finance and other corporations. Functioning in a space of power between complete control, where the powerful cannot disavow responsibility for overall outcomes, and a lack of control, where powerful groups cannot intervene for their own benefit, 'organized irresponsibility' is an effective and systematic social power that exists between the micro and macro-levels. Identifying the impacts of this social relation shows, in turn, how through a dialectic of control and loss of control, key groups are able to achieve systemic gains from an increasingly complex and interdependent world.

TG04-969.2CURRAN, DEAN* (*University of Calgary*)*Culture of Fear or Risk Society? Beyond a False Opposition*

Sociological studies of risk have become increasingly polarized between a risk society perspective emphasizing the global, catastrophic nature of contemporary risk and those approaches that emphasize the excessive fear manifested by groups in society and how social policies and practices based on these excessive fears are having counterproductive effects. This paper argues that risk society or culture of fear is a false dilemma and that it is not only possible, but necessary to emphasize the importance of both of these perspectives. Specifically, Giddens' embedding of the study of risk within the dynamics of contemporary capitalist modernity can illuminate how, *a la* Beck we are facing increasingly important global systemic side-effects of the production of goods, while also experiencing, in many aspects of life, intensified fear that is not mirrored by the intensification of underlying conditions of risk. For the latter though, rather than solely developing an ideological critique of the fear, this paper follows Giddens in his social-materialist understanding of increasing fear in terms of accelerated and more individualized conditions of modernity which tend to increase ontological insecurity and replace psychological satisfying forms of trust with trust in distant abstract systems.

RC09-191.3CURRY, MARK* (*National University of Ireland in Galway*)*Conditional Cash Transfers in Brazil and the Philippines: Reducing or Masking Economic, Political and Social Inequalities?*

This paper employs a comparative-historical analysis of Conditional Cash Transfers in Brazil and the Philippines to consider problems of economic, political and social exclusion for the most marginalized sectors. CCTs aimed to conditionally match redistribution measures with human capital development, especially in health and education. Introduced in Mexico and Brazil in the mid-1990s, CCTs enabled Latin American states to address entrenched economic inequality on constitutional and rights bases, and thus to attempt reducing social and political inequalities. Brazil's Workers' Party implemented *Programa Bolsa Família* (BFP) in 2003, which helped institutionalise its transition to election-winning political party. Moreover, by 2015 some 64 countries had implemented CCTs. However, feminist and leftist scholars of social protection have pointed out that CCTs impair opportunities for women beneficiaries, add unpaid labour responsibilities, and retrench rights as a basis for social protection. Since all beneficiary data is recorded and non-compliance is punished with competitive exclusion from the system's benefits, CCTs thus appear as a relatively cost-effective sorting system for behaviour modification of the poor. From this perspective, CCTs do not reduce real economic inequalities but perpetuate political fragmentation, enlarge the space for market penetration of social protection, and generate a data-driven dragnet over the lives, livelihoods and behaviours of the poorest sectors. How

has this adverse re-incorporation of a recent social protection innovation into neoliberal structures of domination taken place and what are the prospects for marginalized social and political groups? This comparative study of the world's largest and third largest CCTs provides insights into three important factors: bottom up versus top down programme implementation, the degree and timing of IFI lender involvement, and positioning of the middle classes in relation to the 2016 political transitions. Prospectively, CCTs may be relevant to future Brazilian electoral contests but become subsumed into clientelistic market-state relations in the Philippines.

CURRY, MARK* (National University of Ireland in Galway)

Progressive Social Policy Demands Vs Market-State Pragmatism: A Comparative-Historical Analysis of Conditional Cash Transfer Programs in Brazil and the Philippines

This paper undertakes a comparative/historical analysis of two Conditional Cash Transfer (CCT) programmes, Brazil's *Programa Bolsa Família* (BFP) and the Philippines' *4Ps/Pantawid* to assess social movement demands in relation to market-state priorities. CCTs emerged in Brazil and Mexico in the mid-1990s in response to deleterious structural adjustment policy implementation. CCTs target the poorest families to provide them with regular subsistence cash payments on compliance with specified health and education conditionalities. How well do CCTs institutionalise progressive social policy stipulations as opposed to cost-effectively assuaging them while increasing the role and space for market-oriented domination of social protection? A comparative case study analysis of these large scale CCTs is compelling because the social movement-based Workers Party in Brazil won electoral power and implemented BFP nation-wide in 2003 on constitutional, rights-based grounds, which consolidated its power. By contrast, the Philippines' centre-right Lakas CMD party of Gloria Arroyo introduced the *4Ps/Pantawid* CCT project in 2007 as a top down, elite-driven project for political ends, including Millennium Development Goal compliance. Benigno Aquino's Liberal Party expanded *Pantawid* partly to reconstitute radical social movement demands as a function of state-market pragmatism. Political change in each institutional setting halted these very different approaches in 2016. The paper sets out the comparative conditions of economic and social inequality in each case up to the respective introduction of CCTs. It then maps the respective strategies, phases and junctures in CCT implementation in relation to radical social movement demands and reciprocal state responses. The comparative-historical approach thus generates insights into how progressive social demands are subject to varieties of recapture and reformulation within neoliberal dynamics. Comparing these CCTs enables inquiry into real versus managed inequalities and poverty reduction in each case and the scope for future social movement engagement.

Parental Joblessness and the School-to-Work Transition in Australia and the United States

As young adults transition from education into the labor market, they are at risk of periods of non-employment, which can affect their subsequent labor market outcomes. We test whether the proportion of time that children spend in households with jobless parents is associated with a lengthened first job search following educational exit in Australia and the U.S. using Cox proportional hazards models run on longitudinal household survey data. We also examine whether effects of parental joblessness differ according to the respondent's highest level of educational attainment. We find that parental joblessness is associated with longer initial spells of joblessness upon exiting education on average in both the U.S. and Australia, though this relationship is stronger in Australia. We also find that bachelor's degree attainment mitigates much of this negative relationship in Australia, suggesting that parental joblessness is most harmful for Australians who leave school before earning a university degree. However, there was no evidence for a similar interaction in the U.S., suggesting that the relationship between education, parental joblessness, and the school-to-work transition may depend on contextual factors such as the welfare regime or other policies affecting young adults' employment.

Worldview Education in Canadian Public Schools: Demographics, Dilemmas and Directions

Worldview education plays an essential role in shaping students' understanding about the challenges and opportunities of living in a diverse society. Just as national conversations over religion, non-religion, and belief in the public sphere continue to unfold in numerous plural democracies, the role of worldview

education in public classrooms is likewise under scrutiny. Across Canada, the academic literature shows little to no consensus on approaches to worldview education, broadly speaking. The province of Quebec, however, implemented an obligatory Ethics and Religious Culture Program in all of its primary and secondary schools nearly a decade ago. This program stands in contrast to other provincial education curriculum where worldview literacy is integrated into other academic subjects or not offered at all. At this juncture, the Ethics and Religious Culture Program—once considered an innovative pedagogical approach to the shifting societal landscape of diversity—has recently come under review by the provincial government. Taking into consideration rising trends of religious 'nones,' calls for changes to education policy by the Truth and Reconciliation Commission and the evolution of the definition of *creed* in provincial human rights codes, this paper examines the directions, dilemmas and demographics which intersect with educational imperatives for worldview literacy.

In the Countries of the Old: Population Ageing and the Future of Social Change

That population ageing is occurring throughout the world is indisputable. More problematic are the social consequences of this demographic phenomenon. Some see population ageing as an accomplishment (due, for example, to declining mortality and increasing control over reproduction), and others see an opportunity or demographic dividend. Most commentators, however, point to the problems and challenges associated with population ageing, sometimes speaking in demographically apocalyptic terms. In this presentation, we examine two presumed consequences of population ageing: tendencies toward attitudinal rigidity and sociopolitical conservatism, both hypothesized to lead to a slowdown and even cessation of social change. Data are drawn from 42 years (1972 to 2004) of the NORC General Social Surveys and 10 years (2002 to 2012) of the European Social Surveys. Using various analytic approaches, we describe and decompose trends into various demographic mechanisms, such as intracohort ageing, cohort replacement, and period shifts, with adjustments for compositional differences. The results support three general conclusions: (1) sociopolitical attitude change occurs among all observed cohorts; (2) changes are more likely to be in a liberal than a conservative direction; and (3) attitude change in the older cohorts often occurs in the same direction and at a similar rate as in younger cohorts, and sometimes at a rate sufficient to narrow the generational gap. In other words, changes in sociopolitical attitudes appear to be dominated by period effects. We also examine indicators of social change occurring during this 40-year period. We conclude that the population ageing that occurred in recent decades was not inimical to the occurrence of social change.

Young People and Mobility: Furlong's Work As a Basis for Critical Explorations in This Field

This presentation seeks to reflect on the work of Andy Furlong and its actual and possible developments for new generations of youth sociologists around the globe paying particular attention to issues of geographical mobility in the study of young people.

I discuss, in the first place, the widely known idea of the 'epistemological fallacy' (Furlong & Cartmel, 1997) as an interpretative category in youth studies with special regards to how it may illustrate the contradictions that are generated when young people engage in constructing a mobile and/or more generally transnational career, in line with the so-called 'mobility dream' (Cairns et al 2017). I then proceed to revisit and update Furlong's work on such metaphors as niches, pathways, trajectories and navigations (see Evans & Furlong 1997), again in the light of an existing debate on (geographical) mobility and young people. Should mobility be systematically integrated in these ways of looking at youth transitions? and if so, how?

Through these themes, this presentation overall pays a tribute to Furlong's work for offering powerful grounds for further research that, while rooted in classical categories such as class, structure vs agency, is also ready to engage with emerging demands in the lives of young people, thus keeping a focus on *actual* struggles.

CVAJNER, MARTINA* (University of Trento)

Performing Sexual Emancipation the Emmanuelle Narratives (1959-2012)

In current sociological folklore, the sixties are associated to a radical «Sexual Revolution» that seemingly changed the meaning of sexual life. The analysis of its behavioural consequences is currently at the center of an ample variety of social research programs. Across Western countries, and increasingly also outside the western world, there is a growing output of academic literature documenting the changes in sexual practices, roles and identities unleashed by such revolution.

At the same time, until now there has been very little work carried out on the cultural sociology of such revolution. Few studies analyzed how sexual emancipation has been framed, described and narrated for its several audiences. This is surprising, as one of the most outstanding outcomes of this alleged revolution has been the birth and growth of a *legitimate* market of erotic literature, movies and paraphernalia devoted to portray how an emancipated sexual life looks like.

The paper analyzes the changes in the character of Emmanuelle, one of the most important and long-lived icons of erotic emancipation. It chronicles the changes in the portrayal of the character of Emmanuelle, a young woman entering a voyage of erotic self-discovery. It starts with the 1959 underground text, bound to quickly become a classic of French and international erotic literature. It follows it through its incarnations in several differentiated strings of erotic movies in the '70s and '80s, as well as its appearance in graphic novels, magazines, videogames and even pieces of furniture. It continues the analyses with its reboot through various TV-series from the early 90s to 2012. Through the semantic analysis of the codes employed to portray the very same character (and her relations and practices) along several decades and media, the paper is able to address issues of stability and change in the cultural narratives of sexual life.

Diabetes, Social Cohesion and Subjective Well-Being Among Diabetes Persons in Mexico.

On the one hand, social cohesion analyzes the strength of networks of person within the group relations like friends, family, neighborhood, etc. On the other, the subjective well-being reflects the individual satisfaction from welfare services provided by state: health, education, labour, among others. We are particularly interested in social cohesion and subjective well-being among diabetes persons.

We report evidence of health inequalities that are shaping contemporary Mexico. Using a Structural Equation Model that includes data from two Mexican states: Chiapas and Nuevo Leon, we show that women with diabetes have more disadvantages than men, as well as they are victims of violence caused by their partners. A study in Tuxtla Gutierrez and Monterrey will tell how social cohesion has a strong impact on families and what is a perception of well-being among women and men with diabetes and without in these two Mexican cities.

Spatial Analysis of Labour Market Inequality in Mexico, 2005-2015

The main purpose of this paper is to analyze the spatial changes in labour market inequality for the Mexican regions, using the data from national occupation and employment survey (ENOE, for its acronym in Spanish) from 2005 to 2015. We report evidence of spatial variation in gender employment shares provided by the different productive structures of the regions. We show that inequalities and poverty are shaping contemporary Mexico. Since inequalities conform a system of accumulative disadvantages, the same occurs with labour. Birth place, education as well as access to health services shape the future labour. Using a spatial panel data, we show that women are in more disadvantages than men inside the different regions, even in regions with more development.

Union Strategies Towards Young Precarious Workers: The Case of Poland

Trade unions worldwide struggle to halt de-unionisation process. Poland is no exception. The traditional clientele of trade unions, predominantly male workers with steady jobs in manufacturing, as well as in the public sector has shrunk. Despite variety of revitalization strategies put into action since 1990s, the effects appear to be meagre in terms of effectively attracting new groups within the working population to unions. Should the young precarious workers become the new target group for Polish unions? Considering the growing extent of precarious employment in general, and among the youngest participants in the labour market, in particular, the stakes are high for trade unions. However, three crucial

questions arise: 1) do young precarious workers need trade unions, 2) do trade unions need young precarious workers?, and 3) provided, trade unions assume they actually need young precarious workers, are they capable to effectively recruit such people? In the context of the debates on the nature of union (structural, institutional, associational and discursive) power resources in semi-peripheral, dependent variety of capitalism in Poland, the paper seeks answers to those questions based on the results of the ongoing comparative research project PREWORK (funded by NCN-DFG), and draws from 60 biographical narrative interviews with young precarious workers (aged 18-30), in particular a subsample of young activists of unions and political organizations struggling against precarity, as well as representative CATI (n=1000) and PAPI (n=1000) surveys conducted in Poland in 2016-2017. It is argued that the key challenges for unions in Poland are: (1) the tendency to "normalize" precarity as an expected part of individual careers by a large part of young workers studied; (2) the tendency to hijack union agenda by right-wing populist parties and movements which encourages a part of young people to support them instead of supporting the organized labour.

Human Capital Revolution or Educational Inflation? about the Losses in the Return on Educational Investment for Younger Cohorts in Old Age

In Germany debates in the 1960s led to extensive educational reforms. Unquestionable, these quantitative and qualitative changes in educational participation reduced inequalities. However, individual outcomes of an increasing educational participation are an ongoing touchstone for investigation: Assuming a limited number of qualified positions on the labour market, the expansion of high skilled workers should lead to a growing competition for these positions. Thus, one can expect a relative devaluation of the economic value of these qualifications (educational inflation). In contrast, the driving force for investments in human capital was the demand for labour in high skilled positions.

I compare four cohorts in the pre- and post-educational era to observe differences in the return on investment during career start (a five-year period starting with job search or first employment subject to social security contributions). The indicator for the educational outcome is the entitlements in later pension income. This is innovative and appropriate since pension entitlements in a contribution-based system highly depend on wages and employment biographies. For my multivariate modelling, I used unique data called BASiD (biographical data of selected social insurance agencies in Germany). The longitudinal data includes biographies of 568.468 persons e.g. with day-to-day information on pension entitlements.

Results show that younger cohorts continuously lose pension entitlements. Even though, they were generally lower educated, older cohorts benefited of the economic miracle after World War II. In contrast, younger cohorts experienced longer periods of unemployment gaining fewer entitlements for later pension income. Women gained the most profits of human capital investments. However, part-time work and periods of home caring limit their return on investment already during career start. Later birth cohorts of high skilled worker had shorter periods of unemployment but still lower pension entitlements: This result strongly supports the theory of queuing for higher positions in growing labour competition.

CZEPEK, JUDITH* (Georg-August-University Goettingen)

Opportunities and Challenges of Multiple Administrative Data at the Intersection of Education, Labour Market, and Pension Research

The advantages of administrative data for social research are obvious: Administrative data are mostly a representative selection limited by administrative tasks but with high numbers of cases. Since losses of answers and failures in one's memory are impossible, the data quality is quite high – objectivity and reliability is granted. However, systemic missing data in the registration of key variables for social research limit data quality. The limitation is caused by the fact that there is neither a need nor a benefit from correctly reporting or updating this information towards the administrative bodies. Furthermore, the lack of these data on e.g. qualification makes complex procedures of imputations necessary.

By referring to my studies at the intersection of education, labour market, and pension research, I present some of the benefits and challenges associated with the use of multiple administrative data and possible solutions.

To analyse the individual outcome of an increasing educational participation in Germany, I observed four cohorts in the pre- and post-educational era during career start. The indicator for the educational outcome was the entitlements for later pension income. This is innovative and appropriate since pension entitlements in a contribution-based system highly depend on lifetime earnings.

For my multivariate modelling, I used a unique data set called BASiD (biographical data of selected social insurance agencies in Germany), provided by the German National Pension Insurance and the Federal Employment Agency. The linked

micro data set includes employment biographies of 568.468 persons with day-to-day information e.g. on pension entitlements. Additionally, firm's data such as wage level and number of employees are included.

My contributions aims to discuss the applied frame of analysis of BASiD with regard to their opportunities and limitations for research in social inequality.

Analyse Des Relations De Pouvoir Dans La Sous-Traitance Dans Les Réseaux d'Entreprise

Face aux injonctions contemporaines du capitalisme financier, et dans le contexte de mondialisation des systèmes productifs, on assiste au déploiement de stratégies d'externalisation de diverses fonctions, centrales ou périphériques, qui se traduisent par des configurations de la relation d'emploi très éloignées de la relation binaire classique : sous-traitance, travail en intérim, franchisage, travail indépendant.

Ces configurations organisationnelles ont pour effet d'accroître la division du travail, mais aussi de transformer le cadre de la relation d'emploi, en l'encastrant dans une relation de type commercial. En conséquence, les travailleurs concernés subissent les effets du contrôle d'organisations qui n'ont pas à leur égard le statut juridique ni les responsabilités d'un employeur, et leurs conditions de travail et d'emploi ne dépendant plus uniquement des stratégies de l'entreprise employeuse, mais, de plus en plus, de la nature des relations inter-entreprises (Flecker et Meil, 2010). La littérature scientifique révèle par ailleurs que ces impacts varient selon les dimensions analysées, selon les ressources des groupes de travailleurs et selon les arrangements institutionnels nationaux, sectoriels et locaux.

En prenant appui sur deux études de cas au Québec - industrie de la volaille et services en technologie de l'information -, cette communication identifie dans un premier temps les rapports sociaux auxquels prennent part des travailleurs impliqués dans des relations de sous-traitance, ainsi que les ressources sur lesquelles ils prennent appui pour développer leur rapport de forces. Les rapports et les ressources sont ensuite analysés à la lumière de l'organisation de la chaîne de valeur ou du secteur de l'industrie, de l'état du marché du travail, des choix stratégiques des entreprises et des modes de gestion privilégiés dans chacune des industries. En guise de conclusion, la communication explore les formes possibles de la protection et de la représentation collective des travailleurs dans le contexte de ces nouvelles configurations.

D'ANDREA, FABIO* (*University of Perugia*)

For an Aesthetic Ecology. the Need of a New Framework to Cope with Environmental Risks.

The recurrent appearance of the term "ecology" in widespread discourses marks the advent of a form of understanding different from the one Modernity got us used to. Ecology stresses the importance of the dimensions of interdependence and connectedness among spheres of existence, thus diverging from the competitive attitude of economism. The idea of ecosystem highlights the multiple links that bond the different species together and to the environment that constitutes their primordial prerequisite and mitigates Modern demands for a systematic order. It also hints at a shift towards Oriental holistic *Weltanschauungen* where the whole planet is thought of as a living organism. This image, often mistaken for a naive organicism, aims instead at underlining the actual impossibility of interpreting environmental balance according to the mechanical rules of the paradigm of simplification (Morin).

The increasing success of ecological viewpoints can be read as the beginning of the emancipation from Modern cognitive frames. Getting rid of such a cumbersome ideological apparatus is not an easy task and should be undertaken with courage and energy. As a first step, this paper aims at sketching a complex, ecological vision of Man. This can be achieved by integrating into Simmel's *Wechselwirkung* the emotional, symbolic and aesthetic dimensions that constitute a crucial part of humanity, but have been – and still largely are – rendered invisible by Western rationalism and utilitarianism. They play a fundamental role in recovering the qualitative side of interaction, the feeling of being-together that makes it possible to care for others and for the world in which one lives and whose disappearance is at the root of contemporary *Angst* and uncertainty.

D'AVOLIO, MARIA SILVIA* (*University of Sussex*)

Professional Performances in Architecture: A Cross-National Study

The lack of women in architecture is a phenomenon that has been extensively analysed during the last 20 years, but the focus has been mainly placed on the gendered aspects that historically characterised the profession.

In order to offer a different approach to the problem I am conducting a comparative study between Italy and the UK aimed at understanding whether architecture is more organised around a gendered or a contextual professionalism. Is the difference among both architecture actors and practices more relevant

between Italy and the UK or between women and men, despite their country of employment?

From the preliminary results obtained so far from the analysis of original empirical data sourced through individual interviews and focus groups, the concept that I am developing is that architecture is a profession characterised by various sites of performativity. Therefore, it requires its actors to conduct different performances of professionalism. For example, architects are required to act differently in the studio, on the construction site or with clients. Neither of these performances are specifically perceived as feminine or masculine, therefore it could be argued that architects seem to perform what is expected from the profession itself rather than what is expected from their gender. The current definition of architect seems to embody a "one size fits all" idea of professional identity, here the contrast encountered in particular by women and other minorities (i.e. ethnicity, age, ability, economic background, etc.), which for decades tried to fit in the current definition rather than offering new practices and identities.

Moreover, this approach could be implemented in actions for change aimed at challenging the gender imbalance in the construction industry.

Autodisciplinamiento, Realización y Enajenación. Sensibilidad y Transformaciones En El Mundo Del Trabajo Corporal

En la etapa actual del capital, el mundo del trabajo está atravesado por la desestructuración y la lógica destructiva, afectando a la fuerza de trabajo y al medio ambiente. Repensar las dinámicas laborales es central para comprender las maneras en las que el sistema capitalista se redefine, reforzando los mecanismos control y adaptación de las subjetividades a sus tiempos y demandas. En el presente escrito analizamos específicamente el trabajo "freelance", relacionadas con prácticas corporales. Siendo atravesados por la precarización y auto-explotación como trabajadores "independientes", es necesario tener en cuenta la contracara del trabajo corporal desde el autodisciplinamiento y exigencia de rendimiento para poder alcanzar la meta de vivir bailando/de bailar.

Partimos de que "no me estoy refiriendo al *trabajo asalariado, fetichizado y extrañado (labour)*, sino al trabajo como creador de valores de uso, el trabajo en su dimensión *concreta*, en tanto actividad vital (*work*), como 'necesidad natural y eterna de efectuar el intercambio entre hombre y la naturaleza', según las conocidas palabras de Marx (Marx, 1973: 36)." (Antunes R, Los sentidos del trabajo, EdHerramienta, BsAs, pág161). Si consideramos que la creación de plusvalía es proporcional a la alienación del trabajo, donde la realización del objeto y su apropiación por parte del mercado es enajenación del trabajador, ¿qué consideraciones podemos hacer sobre prácticas ligadas a autonomización y control de sí, cuando devienen sostén cotidiano? ¿Dónde está el límite entre realización y enajenación?

Primero, enmarcamos la investigación y sus consideraciones básicas; a partir de entrevistas realizadas en la investigación "Cuerpo, trabajo y energías corporales. Las nuevas técnicas de entrenamiento corporales y las transformaciones del mundo del trabajo", UNVM, Villa María/Córdoba, Argentina- y desde la experiencia de los sujetos rastreamos narrativas de autonomización y sus tensiones con dinámicas de atenuación del conflicto social, finalizando con una posible agenda de indagación.

D'HERS, VICTORIA* (CONICET-IIGG)

Sociology, Environment and the Senses: Environmental Perception in the Xxist Century.

From the 1960's, the environmental issue has gained both a field of study and a space in the political world. The global green agenda is being discussed over and over, in various contexts. At the same time, both global and local movements are arising central questions to the actual socio-economic system, and the present growth model. It is commonplace to hear we would need many Earths to keep up with the current consumption level. In this scenario, what is the place of social sciences? Assuming that there is an "environmental issue", in which ways are societies changing or reinforcing their patterns of development? Is more information really serving its purpose, or is it only making societies to be in a permanent alert over issues such as climate change –and its phenomena- and possible lack of water? Are we getting used to being in an environmental crisis?

Here is where a central sociological question emerges: what is the *social perception* of the environment. Do people understand the environment to be related to their everyday life, or only present in the countryside? How are the ever growing cities being perceived? Once we pass through these obvious questions, we are urged to make some more complex reflections on how we are approaching perception studies. Crossing the environmental with the sociological epistemologic turn to bodies and emotions, it is possible to come closer to a new understanding. *In what ways* our bodies and sensibilities not only interact but construct the so called environment? Which is the boundary between the skin and the environment, the air and water with the perception of certain landscape? How are these connections and disconnections, socially elaborated? We aim at revising Matura-

na and Varela's perspective, to analyze the enactive approach, among other conceptual tools new to the environmental sociology field.

Class, Class Identity and Musical Omnivorousness: Plurivores or Diversivores

Research on musical consumption laid out a pattern of musical omnivores in the higher social classes, i.e. having an open attitude, contrasted by univores in the lower social classes. We look at the role of subjective class identity, since a majority of the American population does not identify as part of their material social class. In addition, we challenge the traditional measurement of musical omnivorousness, with a focus on the volume of musical tastes, and pay attention to musical omnivorousness as defined by the breadth of musical preferences by accounting for the cultural distance between musical preferences. We look into this by using the General Social Survey 1993, one of the prime sources of detailed musical consumption, and employ a material and subjective class scheme consisting of the working class, middle class and higher class. Our results show that material social class is indeed important when it comes to the traditional measurement of omnivorousness, but when focusing on the cultural distance between musical taste a different pattern emerges with subjective class identity having more discriminatory power. Referring to musical omnivorousness measured by volume of musical taste as musical plurivorousness, we argue that this is related to material class because of the cultural capital and resources of people and consequently does not measure an open musical attitude. Omnivorousness measured by the breadth of musical taste, referred to as musical diversivorousness and seen as a more accurate measurement of the concept, is predicted by class identity because this is a conscious process of musical choices in order to gain acceptance within the social group while excluding others belonging to different social groups.

Transnational Industrial Democracy? Labor Movements, Multinational Companies and Trade Agreements

In an increasingly globalized world and digital economy is employee participation and the regulation of employment relations going to remain at the national level or is a form of industrial and representative democracy possible beyond national borders?

This presentation proposes to contribute to the debate about what kind of voice, democracy or participation employees have when they work for a global company, by addressing the issue at the transnational level, i.e. by analyzing the representation of workers/employees at the level of transnational companies and thus the consequences of globalization in terms of the democratization, or lack of democracy, of employment relations.

The presentation will first focus on the history and current configuration of transnational labor organizations. It will then map strategies and outcomes regarding employee representation at the transnational company level as well as the negotiation of collective agreements with transnational companies. It will further analyze labor strategies regarding the introduction of labor clauses in international trade agreements as well as the articulation of strategies between the national and transnational levels.

The conclusion intends to further the reflection about industrial democracy by identifying the implications, challenges and obstacles of taking the notion from the national to the transnational level.

The Daily Life of Viticulture Female Workers in the Valley of the São Francisco River, Northeast of Brazil

This study presents the strategies and tactics used by the viticulture female workers in the valley of the *São Francisco* River, in the Northeast of Brazil, and the singularities of their daily lives revealed in the narrative of the images about their working activities in the grape farms. For that, as a theoretical basis, were used the studies by José de Souza Martins, Michel de Certeau, Karl Marx, Heleith Saffioti, and Joan Scott. The research is based on the photoethnographic method, anchored in the approaches of qualitative research of ethnographic inspiration, built upon the studies of Luiz Eduardo Achutti, as well as the studies by Philippe Dubois and Roland Barthes, that expand on the correlation between

photography, ethnography, and anthropology. For the analysis and interpretation of the data, the work is based on the method of Discourse Analysis (DA), of French inspiration, whose data were collected by means of semi-structured interviews with the working women of a grape farm in the region and with other social actors. The results show that the work of the women in the viticulture of the Valley has a significant representation, although it is not revealed in the statistics of the grape production system. The data also reveal the empowerment of fruit female workers as they specialize in delicate fruit management, as required by international production protocols. This constitutes a space of power in the labor market in which the women manage to establish themselves in positions, sometimes of leadership, also disputed by men, resulting in frequent competition to remain in the activity.

DA SILVA, FLAVIA* (EHESS/IIAC)

Expériences De Mobilisation Et d'Engagement Politique à São Paulo

L'actuelle crise politique brésilienne annonce des échecs de la démocratie représentative dont l'exercice, étranger à la réalité quotidienne sociale, met en péril le jeune processus de redémocratisation brésilienne. Cette conjonction intensifie le sentiment de méfiance de la population envers les partis politiques et les institutions telles que le Congrès, les Conseils Municipaux, les Syndicats, les Tribunaux, etc., Dans ce contexte, de jeunes militants se mobilisent pour dénoncer le modèle de la « professionnalisation de la politique » et pour revendiquer l'occupation de la politique par des personnes « communes ».

Dans l'environnement des mouvements sociaux contemporains, des collectifs politiques « transpartisans et autonomes » s'identifient comme une voie non corporatiste de mobilisation et d'engagement citoyen. Les membres et les militants de collectifs tels que la Bancada Ativista, la Virada Política, le Vamos!, la Rede Nossa São Paulo et la Nova Democracia, parmi d'autres, promeuvent des activités de débat, d'écoute et de participation politique, sans pour autant adhérer à un parti politique quelconque.

Pourquoi parle-t-on d'initiatives citoyennes de processus de politisation et d'engagement dans un pays démocratique, où le peuple est censé exercer ses devoirs et jouir de ses droits? Nous soutenons par la suite que dans le processus de redémocratisation brésilienne, les mécanismes de centralisation et de « participation régulée » (Santos, 1979) ont constitué une base très vulnérable de représentativité et de citoyenneté au Brésil. Une démocratie fortement caractérisée par des phénomènes de « coronélisme » et de « clientélisme » (Leal, 1976) constitue la pratique de la citoyenneté corporatiste.

Ainsi, notre problématique est la suivante : dans quelle mesure ces collectifs politiques qui ne constituent pas un parti sont-ils à même de promouvoir la transformation d'un modèle uniquement de délégation vers un mécanisme d'expérimentation d'instruments et de méthodes de démocratie participative ?

Feminism and the Legitimisation of Austerity's Moral Project

This paper focuses on how young middle-class women talk about feminism within the context of austerity, drawing on interviews with women in Leeds, London and Brighton during 2014 and 2015. Exploring austerity as a moral project, I argue that the way in which these women identify with, understand and discuss whom feminism is important for, converges with a range of values present in the UK austerity discourse. I call this particular type of feminism, 'austerity-bourgeois feminism'. For these middle-class women - adopting certain characteristics of neoliberalism - 'austerity-bourgeois feminism' is taken up as a positive subject position, characterised by individualism, self-love and self-care. However, this feminism is distinctive since it is seen as necessary for other women who are at the receiving end of the austerity cuts to take on. Emphasising the need for self-care and self-responsibility to deal with forms of inequality, 'austerity-bourgeois feminism' helps to displace the current forces producing inequality by placing individual's misfortunes into their own hands. Such feminism also serves as a way to create and reinforce distance and distinctions between those suffering within the current context and those who are not. This type of feminism therefore results in a perverse confluence with austerity discourses, reproducing and legitimising its principles.

Gender Based Violence - Impact Evaluation of an Initiative Among the Waste-Collector Community in Ghaziabad (UP) India.

The study carried out in Vijaynagar, Sihani and Bhopura of Ghaziabad District indicate a prevalence of the Gender based Violence (GBV) such as Domestic Violence, Eve-teasing, Denial of Healthcare & proper Nutrition, Denial of Education etc among the extreme poor and marginalized waste picking community. Due to

Lack of financial resources, alcoholism among males, the rate of GBV is rising with time. A majority of female does not have proper access to the healthcare due to their poor economic conditions or their dependence on their husbands, who are reluctant to provide them with proper healthcare. The women living in abusive and violent relationships prefer to stay silent on GBV. Lack of awareness about their rights makes women habitual to the domestic violence.

The study also reveals not only the wide experience of victims but also the types of perpetrators responsible for GBV against them such as Intimate Partners, husbands, family members, neighbors and unknown strangers etc. Most of the GBV happens at homes. Only the pervasive existence of cultural, economic, and social systems that subordinate women can explain the overall pattern of GBV.

The impact of GBV influence the emotional, physical and sexual health of the victims. The consequences of the GBV range from Psychological to physical. Psychological problems include frustration, fear, depression, tension, anger etc. Many women do not have access to the nutritional food and healthcare facilities due to their economic status or utter negligence on the part of their partners. Some of them are surviving on one meal a day.

Factors contributing to violence are dependency on the perpetrator, perception about men's superiority, lack of education, awareness and employment opportunities. Women living in the waste pickers' community tend to adapt themselves to this situation and accept these incidents as an integral part of their life.

DAFNOS, TIA* (University of New Brunswick)

The Pacification Logics of Critical Infrastructure Resilience

This paper situates Canada's contemporary national security framework of critical infrastructure (CI) resilience as encompassing pacification strategies that work to produce social, political and economic forms based on accumulation and dispossession. While new to the realm of national security and CI protection, the pre-emptive anticipatory risk logic of resilience has a longer genealogy as a feature of capitalist logics of accumulation, and of settler colonialism's 'anticipatory' and 'imaginative' geographies (Verancini, 2010). Infrastructure projects have been essential technologies of realizing these visions. As 85% of critical infrastructure in Canada is privately owned and operated, the federal Canadian government has taken measures to integrate owner-operators and industry stakeholders as national security partners. At the same time, the objective of *resilience* hinges on ensuring *increased* private investments in CI. These activities are reorganizing bio- and necro- political governance around the circulatory 'life' of the supply chains of capital as 'critical infrastructures'. Focusing on the energy sector, I consider implications for Indigenous nations on whose territories physical supply chains/infrastructures flow, as the resilience of settler-colonial sovereignty depends on containing Indigenous jurisdiction.

Challenging the Bad Masters: Teachers As Gatekeepers in Implementing the Inter-Religious Dialogue Against Radicalization of Youth

The increasing number of terrorist attacks, in and outside Europe, requires new strategies for prevention and construction of a new "sense of being in the world." Nevertheless, there is only one tool capable of defeating the radicalization before it takes place: the dialogue, particularly between religions, whose diversities, real or perceived, are often a justification for the radicalization and extreme forms of behaviour. The EU report on prevention of radicalization and recruitment of European citizens by terrorist organizations (CE A8-0316/2015) pointed out the important role should be played by schools and education in preventing radicalization observing that enabling teachers to take an active role against all forms of discrimination and racism is crucial for this purpose.

The aim of this work is to present a comparative mixed-method action-research design conducted in 5 European Countries (Belgium, France, Italy, Poland and Romania). The research outcomes provide an alternative empirical basis in designing/informing innovative anti-radicalization OER (open educational resources), and media products (e.g. anti-radicalization Educational Cartoons) based on narratives for dialogue among different religions. These will be proposed as support to the teachers of pre-adolescent and adolescent pupils in order to contrast social media influences in the construction of radical behaviours.

RC48-801.5DAHER, LIANA MARIA* (*University of Catania*)NICOLosi, DAVIDE (*University of Catania*)MAVICA, GIORGIA (*University of Catania*)CAMPANELLA, FEDERICA (*University of Catania*)*Migrant Descendants Protests in Italy: A Challenge to the Issue of "National Citizenship"*

The paper aims to give a broad outline of migrant descendant associations in Italy, and the reasons for their protests; it also aims at understanding their status in society and the sources of the choice of their mobilisation as movements. This will be examined through direct and indirect narrations (narrative interviews and website forums), and analysed on a comparative basis. The methodological goal is to analyse the "who, when, how and why" of the claims concerning the issue of citizenship in order to examine the influences of these groups on social policies and to observe them as forms of "active citizenship from below."

The above protests will be also analysed as a challenge to the issue of "national citizenship." Where the citizenship does not represent only a juridical status, but it is deeply related to the construction of the modern welfare systems. Also, it is played through belongings, and concerns all the processes of socialization of new generations, providing the younger of a sense of membership linked to a multi-cultural and/or intercultural idea of citizenship.

RC06-147.2DALES, LAURA* (*The University of Western Australia*)*Meshwork: Friendships and Marriage in Contemporary Urban Japan*

Shifts in demography and the social landscape in Japan indicate that while marriage continues to feature in the life course of most Japanese women and men, singlehood is an increasingly common, and increasingly long-term experience for Japanese adults. Accordingly, the relationships that individuals form outside marriage warrant further scholarly attention as significant sites of intimacy and meaning-making, and as sources of satisfaction and well-being.

Scholarly work on friendship in the west suggests gendered differences in expectations, perceptions and processes in forming relationships (eg McRobbie 1977; Allan 1996; Redman et al 2002). In the Japanese context, hierarchy-based relationships (*senpai / kôhai*) and work-centred social interactions have been identified as significant sites of homosociality for men, and housewife and hobby groups for women (eg Dasgupta 2004: 270; Rosenberger 2001).

Friendship, being more than just a dyadic relationship, is constituted around, between and through other social engagements, and binds individuals together in what Ingold terms meshwork: "entangled lines of life, growth and movement" (2011:63). In meshwork, the lines of friendship knot with those of other intimate (and non-intimate) relations. While these knots may be structurally supportive – so that particular relations might enable others – they also hold tensions in relation to the marital and kin (inter alia) relationships of both individuals. Thus the perception and performance of friendship is inextricable from gendered norms and ideals of life course that may challenge or reinscribe the centrality of marriage and reproduction.

In this paper I draw on interviews and recent ethnographic fieldwork in urban Japan to examine the connections between friendship and other relations as perceived by Japanese women and men. In doing so, I aim to sketch the effect of shifts in marriage trends on the discursive, affective and practical functions of friendship for both women and men, within and beyond marriage.

RC34-611.4DALLAIRE, CHRISTINE* (*University of Ottawa*)*Current Research on 'Youth' in the Sociology of Sports in Canada*

This presentation provides an overview of the current research in the sociology of sports in Canada focusing on the social factors that modulate youth participation and on the variety of social issues related to gender, identities, injuries, abuse, positive development and other considerations that influence youth involvement in sports. While few sociologists of sports problematize 'youths' as a specific social category, these studies provide valuable empirical data on youth experiences of inclusion and/or marginalization in sports and outline relevant policy issues to enhance youth participation.

RC19-362.5DALLAIRE-FORTIER, CLARA* (*Economic Policies in the Age of Globalization (EPOG Master)*)*The Closure of Emerald Mine: A Case-Study on Retrenched Workers from the Coal Sector in United-States*

A pervasive narrative about poverty in Appalachia, United-States, has been recently strengthened by the republican plan to stimulate coal mining. Historical poverty and the reliance on the coal sector in Appalachia underline some of the vulnerabilities, and capabilities, of the workers. This research presents a portrait of Appalachian coal workers facing the decline of the coal sector by focusing on the closure of Emerald Mine in 2015, a case study situated in Greene County, Pennsylvania. The broad research question is: how has the closure affected the workers who were retrenched, and what factors are relevant in accounting for differences in workers' experiences? A series of interviews with miners, miner's spouses, and public and private stakeholders bring texture to the multi-faceted reality of coal communities in Appalachia. Identifying a failure of the neoclassical economics framework in facing such complexity, the research suggests an interdisciplinary approach interested in elements like skill profiles, access to national programs, family dynamics, health coverage, and mobility. The fact that the experiences of the workers are intertwined with the transition and decline of the coal sector raises necessary questions on the tension between micro realities and macroeconomics elements such as the natural resource price cycles and the reconfiguration of the energy sector. While being focused on the micro level, this study interrogates the dichotomy between coal workers and energetic transition by opposing employment to environmental policies.

TG06-988.2DALMER, NICOLE* (*The University of Western Ontario*)*Explicating the Social Organization of Family Caregivers' Information Work***Objectives**

Seeking, interpreting, managing and sharing information (examples of activities considered as information work) are key components of care provision. Information work saturates every facet of caregiving, providing tools for coping, problem solving and dealing with uncertainty through knowledge and support. Family caregivers' information work is increasing in quantity and intensity given the prevailing assumption that information provision is sufficient to produce improved care outcomes and the trend towards the informatization of care, that is, the provision of information used as a means to gradually marginalize care.

To begin to map the social organization (and invisibility) of family caregivers' information work, interviews with family caregivers and paid senior service providers made visible the ways in which aging in place policies and administration invisibly coordinate caregivers' access to and use of information needed to provide care.

Method

Guided by Dorothy Smith's institutional ethnography method of inquiry, thirteen family caregivers of community-dwelling older adults living with dementia were interviewed. Embedded in the interviewing process, building on Sonnenwald's information horizons (1999), caregivers drew maps of their information worlds while speaking to their everyday information work, including those they interact with and are influenced by to get their information work done. Another set of interviews with senior service providers were used to question how senior service organizations determine how, when and in what format to deliver information to family care providers.

Results & Conclusions

Interviews and maps of caregivers' information work combined with interviews with paid senior service providers made visible the complex ways the institutional complex surrounding aging in place policies and administration enter into and coordinate caregivers' information work. This study signifies an innovative shift in the ways the complexities of searching for and using information on behalf of another are understood as a means to more responsively support the information needs of family caregivers.

RC31-565.1DAMASCO, VALERIE* (*University of Toronto*)*The Transnational Labour Migration of Filipina Nurses to Canada during the 1950s and 1960s*

In this paper, I discuss the transnational labour migration of Filipina nurses who immigrated to Canada during the 1950s and 1960s when the country faced a labour shortage of nurses. I conducted oral history interviews with two cohorts of retired Filipina nurses: (i) nurses who were recruited from the Philippines and worked in hospitals across Canada; (ii) former exchange visitor nurses who were provisionally employed in American hospitals through the U.S. Exchange Visitor Program (EVP) prior to relocating to Canada. All of my participants were hired as staff nurses and subsequently as registered nurses after obtaining licensure from provincial nursing regulatory institutions. Notably, half moved into supervisory positions such as director of nursing, nursing coordinator, or head nurse. I argue that various forms of historical, structural, and social influences prefigured the mobility of Filipina nurses to and within Canada during the mid-twentieth century. The nurses completed training at elite private nursing schools established by the U.S. colonial government during the annexation of the Philippines and hence was founded according to an American model of nursing curriculum and practice.

Further, they were trained by Filipina professors who completed postgraduate education at distinguished American universities during the 1940s (e.g., Columbia University School of Nursing, University of Michigan School of Nursing, University of Pennsylvania School of Nursing). On their return to the Philippines, they were appointed as educational administrators of the nursing schools my participants attended. My participants also maintained connections with earlier waves of Filipina nurses who immigrated to the United States and Canada and who are also graduates of the nursing schools they attended. Through these networks, my participants learned about employment opportunities in the United States and Canada as well as how to navigate the labour migration process which contributed to their mobility in the Canadian nursing profession.

VIVIANI, LORENZO* (University of Pisa)

The Threat to the Political Establishment By the New Populist Parties: A Comparison between Podemos and Five Stars Movement

From the nineties on, the crisis of traditional political families has become particularly intense in the democracies of southern Europe, with an increase in electoral volatility, the contraction of membership and crises of confidence as well as of electoral consensus. In these realities, alongside the traditional parties of the twentieth century, a generation of new political parties was born that reject the right / left division, proposing a new fracture between the low and the high of society, or - better - between the people and the elite. In Spain and Italy, the anti-establishment political offer is marked by the birth of Podemos and the Five Star Movement. This article focuses on the comparison between these two new political parties, highlighting differences and analogies in terms of policy, identity, and organization. The research hypothesis developed in this paper refers to the different form and identity in which populism is expressed in the two national cases. From the methodological point of view, the comparison between the two parties will be conducted through the analysis of the text of the electoral programs of the two different political forces. In order to have a full definition of national and supranational issues that characterize the two political groups, we will consider the official electoral programs presented in the national political elections and in the European elections in the period running from 2014 to 2017.

Hatred Politics and Public Intellectuals: Different Perspectives | Divided Narratives Towards the "Other"

Since the attacks of September 11, 2001, the people of the planet have been preoccupied by issues of violence and terrorism. If Afghanistan, Syria, and Iraq have been the scenes of substantial warfare, Darfur, Lebanon, Sudan, France, Germany, Belgium, England and Spain have not been trouble free. Today Isis has almost certainly bypassed Al Qaeda in its brutalities while Trump and rightist colleagues like Le Pen and the rising of the German political party AfD seem to have learned precious little from the brutalities of the immediate post-September 11 world. This paper tries to understand how public intellectuals, from different ideological and political frames, show different positions and divided narratives towards the growth of jingoistic nationalism, demagoguery and hatred towards the "Other".

The Oude Molen Ecovillage As Community of Ad-Balls: Navigating between Efficiency and Solidarity

'You never change the existing reality by fighting it. Instead, create a new model that makes the old one obsolete.' With this quotation of the architect and designer Buckminster Fuller *Oude Molen* ecovillage describes his vision for an alternative and sustainable future. The ecovillage *Oude Molen* was initiated in 1997 by social entrepreneurs who transformed the abandoned hospital complex in Cape Town's area Pinelands into a micro-enterprise ecovillage which also hosts non-profit-organizations and community development programs. *Oude Molen* ecovillage is a vibrant and diverse community that provides jobs, food security and youth development to the local, neighborhood and outlying communities in the region. Many tenants experienced poverty and/or marginalization due to their life style in the post-apartheid area or due to the recent economic decline. At *Oude Molen* they got the possibility to start their own business, gain independence but also to contribute to the surrounding community. *Oude Molen* can be described by the emic term used – as a 'community of ad-balls' which highlights the contradiction between solidarity and individualized economic behavior. Community of ad-balls describes a group of isolated entrepreneurs, living at the margins of society but still have the ability to interlink and to contribute to community development.

Thus, the paper discusses on the basis of *Oude Molen* ecovillage the contradiction between the individualized and efficiency based behavior of entrepreneurship and solidarity and therewith highlights how people organized themselves, how they practice solidarity, aspire for a sustainable change without sharing a world view or common interest.

The Business Model of Trafficking in Human Beings. the Case of Trafficking for Sexual Exploitation in India.

The Business Model of Trafficking in Human beings. The case of Trafficking for Sexual Exploitation of Women and Children in India.

Over the last two decades, the fight against sexual exploitation has been receiving increased attention from different scholars throughout the world. The literature analysis shows that, due to the level of complexity of the phenomenon, there seems to be a general tendency for studies in this field to focus only on some dimensions, addressing either the particularities of the trafficking process or the socio-demographic characteristics of its victims.

This study aims to go a little beyond that framework and focus on the business models used by sex traffickers in India. Using a mixed methods approach, the business model framework, common in the management field, will be taken as a reference and combined with criminological and sociological concepts and the analyses of data from 292 traffickers and 84 cases of victims of sexual exploitation collected by the NGO STOP Trafficking and Oppression of Women and Children.

Do We Need Development Sociology or Is a New Framework for Knowledge Production Needed? Some Reflections on Transdisciplinary Research

Being a development sociologist the aim of the presentation is not specifically on sociological thinking and knowledge production but I will argue in this presentation that a 'new' framework of organizing knowledge and modes of thinking is needed in face of the global 'development' challenges and issues. Starting from the assumption that science and knowledge is inherently social and thus cultural and contextual the question raised and discussed in this paper is whether transdisciplinary research defined as collaborative spaces between science and civil actors in order to integrate different values, perspectives, and experiences can lead to knowledge production on issues which cannot longer be analyzed from one disciplinary perspective only. Thus the aim of this presentation is not to present new work or advancements in sociological thinking and knowledge but rather to discuss what the role of development sociologists can be in such a 'new' knowledge framework giving their long lasting experiences with different theories, methodologies, reflexivity as well as the awareness that power and power-relations on different levels influence and structure knowledge, research and the development of theories.

Based on experiences in and with a transdisciplinary research and teaching project between different academic as well as non-academic actors from Europe and Asia this presentation will be more a reflection about knowledge production in such a setting, the role development sociologists can play and what such a new framework of knowledge production means for theorizing development. Most importantly the question will be raised whether such an approach is able to put scientific knowledge back into „culture“ and not treating it as a „separated“ entity detached from social or to put it differently whether the role of knowledge production in such a framework can lead to a mutual learning process instead of 'just' informing the public.

DANNECKER, PETRA* (University of Vienna)

Female Migrants Entrepreneurs and Their Social Mobility

In this paper the connection between spatial and social mobility will be discussed and analyzed. Drawing upon phenomenological concepts (Schütz 1971, Schütz and Luckmann 1979) it will be shown how female 'migrant' entrepreneurs in Vienna experience, rationalise and 'use' their spatial mobility not only as a resource and a marker of difference but as an important qualification and a means for social mobility, structuring their everyday practices, economic activities, social interactions and subjectivities. The interface between the 'moving out' (spatial mobility) and the 'moving up' (social mobility) is experienced and derives meaning from the special embeddedness of the female migrant entrepreneurs within the society and has, as the empirical data consisting of qualitative interviews with female migrant entrepreneurs shows, to be permanently negotiated. Thereby

especially the gendered meaning of social mobility will be focused on showing that the costs and benefits of their social mobility can only be understood by taking the different social fields and the complex social configurations they are confronted with into account. The chosen actor oriented approach allows not only scrutinizing how the female migrant entrepreneurs define and experience their social mobility but also how their social mobility through their economic activities is perceived by different actors, like the families, the 'ethnic' community or the so-called local society, as a challenge to the constructed images or perceived social positions of female migrants.

Overcoming the Divide between Redistributive and Cultural Protest? – the Protests Against Ttip in Germany 2015

In how far does the distinction between 'old' redistributive and 'new' cultural protests still make sense? Latest research on anti-austerity protests found that a 'mixed' category in protest mobilization has gained prominence where social movements jointly mobilize with trade unions. This article examines the role trade unions actually play in such joint collective actions. Classically associated with more redistributive protests, existing research about trade unions suggests that their involvement changes the character of protests – towards more membership based mobilization and redistributive claims. Analyzing the case of the anti-TTIP mobilizations in Germany in Berlin 2015, we show that this is not necessarily the case. Based on protest survey data, we show that while many participants of the protest were members of trade unions, they were largely mobilized by other groups, in particular social movement networks such as Campact or Attac. Furthermore, we show that trade unions members do not differ significantly from other protest participants with regards to trust in political and economic institutions and the perception of political influence. However, we do find significant differences in central concerns with trade union members giving more priority to issues such as welfare state protection and fair redistribution in society. Overall, this indicates a much greater 'mix' of redistributive and cultural protest than previously measured and expected. (co-author: Sabrina Zajack)

Two Worlds of Solidarity Activism? Comparing Engagement in Solidarity with Refugees in Italy and Germany

In the last few years, an increasing number of migrants sought asylum in Europe. This phenomenon triggered a broad range of collective actions including grassroots activities and initiatives in solidarity with refugees, self-organised protests led by refugees at the borders and in camps, and transnational campaigns demanding changes in European policies. This paper compares engagement in solidarity with refugees in two European countries, Italy and Germany, with different roles within the so-called European refugee crisis: While Italy constitutes the second "country of first arrival" (after Greece) for refugees that come to Europe by sea, Germany next to other Northern European countries represents for many the place of destination. Based on qualitative interviews and on survey data we observe similarities with regards to the forms of action, with the prevalence of localised, solidarity-oriented direct social actions in both countries. The two countries however differ in two respects: first, claim-oriented protest action is more prominent in the Italian case than in the German. Second, while direct social actions in Italy remains largely focused on covering the basic needs, the focus in Germany has shifted since 2016 from basic needs to addressing longer term issues such as achieving asylum and access to education and work.

Critical Insights into the Political Economy of Sport for Development and Peace

In this presentation, I draw on the findings of a recently completed major research study into the Sport for Development and Peace (SDP) sector, funded by the UK's Economic and Social Research Council. Over a period of more than two years, our team conducted research in Jamaica, Kosovo, Rwanda, Sri Lanka, and Zambia; further research was carried out at SDP events and conferences in Europe and North America and through interviews with major international SDP stakeholders. These diverse locations were selected to ensure the capture of current SDP activity, and to maximize the diversity of geographies and cultures included within the fieldwork. Most data were collected through qualitative research involving mixtures of participant observation, ethnography, and semi-

structured interviews. From this research, I advance three main arguments. First, despite rhetorical and political commitment to the use of sport to pursue grassroots, participatory and 'bottom up' development, I suggest that the SDP sector as currently organized still proceeds in a heavily top-down fashion, with corporations, international non-governmental organizations, funders, and inter-governmental bodies holding significant influence on the sector. Second, the marrying of sport to international development has resulted in a range of political tensions within the SDP sector, such as whether sport organizations should be focused on sport first and development second, and whether the commercialization and professionalization of SDP practices has yielded positive results. Third, while SDP programs have demonstrated important benefits, the top-down structure of the global SDP sector clearly has effects on local initiatives, some unexpected, and not always positive. The implications of these arguments are discussed.

Islamic State in the Viewpoints of Two Leaders (Sayyid Qutb and Ayatollah Khomeini): Similarities and Differences

Islamic State in the viewpoints of two leaders (Sayyid Qutb and Ayatollah Khomeini): Similarities and differences

The argument over succession after the Prophet Muhammad's demise has been one of the central differences between Shiism and Sunnis, two significant Islamic religions, over the span of fourteen centuries, which still is the case. Shiites have the conviction that the succession of the Prophet to be the right of Ali ibn Abi Talib and they assume the rule to have divine legitimacy, whereas the Sunnis consider Abu Bakr as the Prophet's successor.

After the Muslims confrontation with the West in the previous century and despite the schism between Sunnis and Shi'ism, the Islamic government has been the primary demands of the both religions leaders.

Sayyid Qutb (1906-1966) one of the leaders of Ekhnawol-Moslemin (the Muslim Fraternity) in Egypt and Ayatollah Khomeini, the leader of the Islamic Revolution of Iran (1902-1989), both believe in the Islamic regime.

After dealing briefly with Sayyid Qutb and Ayatollah Khomeini's lives and their positions in the political thoughts of the contemporary Islamic world, the present article examines the essence of the Islamic state, its characteristics, and the similarities and differences between the two leaders' points of view regarding the Islamic state.

Sayyid Qutb's most prominent work, through which one can learn about his views on Islamic rule, is *The Road Signs*, which has had a profound impact on the Islamist militants of the twentieth century.

As for Ayatollah Khomeini's views on the Islamic state, one should refer to the book called "*Velayat-e faqih*", the basis of legislating in the Islamic Republic, after the 1979 Islamic Revolution.

Thus, In order to answer the research question on the comparative study of Sayyid Qutb and Ayatollah Khomeini's views on the Islamic state, the documentary and library methods have been applied.

Leisure and Gender Dynamics: A Sociological Appraisal

LEISURE AND GENDER DYNAMICS: A SOCIOLOGICAL APPRAISAL

Binoyjyoti Das

Doctoral candidate
C.S.S./J.N.U

Leisure is a commonsensical term that refers to in everyday parlance, the time left over after work and non-work obligations- often called as free time and the way people spend that time. The universe of leisure encompasses activities such as sports, tourism, watching movies, playing games, internet browsing and other entertainment activities. The present study was triggered by a conversation of a group of working youth the researcher overheard in the city of Guwahati, in which majority of them preferred "sleeping" as their first preference in the weekend for their non-work obligation i.e. their leisure time activity. This incident inspired to take up a sociological study on leisure preferences of male and female in Guwahati city. According to the census of India 2011, population wise Guwahati's rank is 48 among the cities of India with a 91.47% of literacy rate and a per capita income of \$4000. The objective of the study is to explore the presence of different leisure activities available in the city and attitude of male and female towards those. It also tries to explore the meaning of leisure as viewed by both the gender and their preferences. A structured questionnaire prepared to explore such objectives of the study and administered on as many as 200 people between the age group of 25 to 55. After data analysis we can say that inherent inequality of the gender in our social system got reflected in choices of their leisure pursuits. Women's leisure has been constraints due to their social obligation, time and male power to central over her activities. No independence travelling, quality time with family. While male youth has choices in leisure time.

Key words - Leisure, stereotype image, social obligation

Rural Communities and Climate Change: A Study of Fishing Communities in Chilika, India

It is being increasingly recognized that climate change is the most pressing environmental issue of this century with unprecedented social and economic impact on the poor. This is especially so in the case of rural communities who are already economically disadvantaged and are often dependent directly on the natural environment for their livelihood. In this paper I explore the challenges of climate change faced by one such vulnerable group, the small-scale fishing communities in the ecologically fragile Chilika coastal lagoon of Odisha province, India. Unlike other a-historical studies that focus on local experiences of climate change, this paper offers a historical analysis of climate change experienced by the fishing community. Methodologically, the paper combines analysis of unpublished archival material and published sources with oral histories.

Marx's Capital, Class Theory, and the Global Periphery

In this paper, I begin with a critical discussion of the ways in which certain Marxist writers conceptualize capitalism. I then deploy dialectical philosophy, and especially the form-content analysis, to present an alternative framework for understanding capitalism, a framework that emphasizes the relation between capital and labour at the point of production. In doing so, I build on Marx's often-neglected, and often-misunderstood, discussion in *Capital* volume 1 on hybrid, formal and real subsumptions of labor as forms of the capitalist class relation. Capitalism as a class relation exists even if there is only formal subsumption, and even if instruments of production have not been systematically revolutionized. The transition from formal to real subsumption with associated technological change is not automatic. A protracted process, it is mediated by class struggle, which occurs in the context of a whole host of geographically-specific factors, including capitalist state interventions. Under the pressure to cut costs, property-owners can respond to class struggle against formal subsumption in multiple ways. Real subsumption, which is expressed as the advanced level of development of productive forces, is only one. Property owners can also respond by reinforcing formal subsumption, deploying a gender and a spatial fix, and/or introducing hybrid subsumption (which includes mercantile-usury-based exploitation of direct producers). The nature of capitalism is further complicated by imperialism, which impedes the transition to real subsumption, while selectively facilitating it. So I briefly discuss imperialism in terms of its internal relation to forms of subsumption, both in the context of advanced capitalism and peripheral capitalism. There are several theoretical implications of the subsumption perspective of capitalism as a class relation in an international context, for understanding such issues as the class character of the global periphery and geographically uneven development. It also has interesting political implications for class struggle against capitalism and imperialism.

Abuse Against Elderly in India

With the increase in the life expectancy, India is experiencing a considerable rise in the proportion of elderly population. Earlier Old age was never been considered as a problem in India. Caring and respecting the elderly are instilled in the Indian culture but now due to changes in the life styles and social values, attitude towards care giving responsibility also changing. As a result there is a growing crime against elderly in India. According to the surveys conducted by Helpage India (2014), 50 percent of the elderly are experiencing abuse; Abuse can be verbal, physical and emotional, in the form of isolating and talking rudely to them, physical harassment, denial of basic needs, mental torture, neglect, disrespect and abandonment, ill treatment and restricting their social contacts. This issue of violation of human right has to be look and understand by the elderly, service provider's and care giver's perspective.

The main objectives of the study are: to know the causes and consequences for the abuse, to examine perception and the level of awareness about the rights of elderly and to suggest the strategies to prevent violence against elderly. The study is conducted in Belgaum (Belagavi) city of Karnataka state, India. The empirical data were collected by 200 respondents through interview. A simple descriptive statistical method is applied to analyze the data. The study concludes that majority of the elders irrespective of their financial and social status is abused by their family members. Older women were more affected and prone to suffer from

abuse due to gender discrimination, poor financial condition, longer life span of widowhood and social norms. The study emphasises the need to create awareness about the rights of elderly and to ensure implementation of policies pertaining the protection of old persons.

Les Trajectoires De Douleur Des Personnes Utilisatrices De Drogues [Pain Trajectories Among People Who Use Drugs]

Alors que les enquêtes épidémiologiques insistent sur la forte prévalence des douleurs chroniques chez les personnes utilisatrices de drogues, les autorités sanitaires nord-américaines renforcent régulièrement les restrictions autour de la prescription d'antalgiques à cette population, d'autant plus dans le contexte actuel de la « crise des opioïdes » qui touche le Canada et les États-Unis. À partir du concept de trajectoire de douleur (*pain trajectory*) issu de la sociologie de S. Fagerhaugh et A. Strauss, cette présentation s'intéresse à l'expérience et à la gestion de la douleur chez les personnes consommant des drogues. Les analyses se basent sur une étude qualitative en cours par entrevues auprès d'usager-e-s de cocaïne et d'opioïdes de la ville de Montréal (Canada) déclarant souffrir de douleurs chroniques ou récurrentes. Comment les consommations de drogues s'inscrivent-elles dans les trajectoires de gestion de la douleur de ces personnes ? Comment le contact avec les mondes sociaux organisés autour de la consommation et de la vente de drogues influence-t-il l'expérience de la douleur et sa gestion ? Nous analyserons les trajectoires de douleur des personnes utilisatrices de drogues à la croisée du monde du soin et du monde des drogues : il s'agira de comprendre leur expérience de la prise en charge médicale de la douleur, mais aussi leurs pratiques de gestion de la douleur en dehors du système de santé, notamment l'automédication avec des substances antalgiques obtenues dans la rue. Le constat d'un entrelacement entre la gestion de la douleur et les consommations récréatives permettra une réflexion sur l'ambiguïté de la frontière entre drogue et médicament, et un questionnement sur les conditions d'accès au soulagement de la douleur pour les personnes consommatrices de drogues.

Power Structures in the Tourism Industry in the Context of the Israeli-Palestinian Conflict

With reference to war theorist Clausewitz' (1832) considerations, Thurot stated that "tourism is a simple continuation of politics by other means" (quoted in Edgell 1978: 171). Cohen-Hattab (2004: 62) confirmed this position by arguing that "tourism may be, and often is, exploited in order to create and export images that both correspond to and advance distinctive political and ideological goals". He examined the Zionist utilization of the Arab dominated tourism industry in Mandatory Palestine to promote Jewish national ambitions and to alter the world opinion in their favour. He showed how Zionist organisations influenced the oral, visual and written tourist media by launching guidebooks, tourist maps and films which focused on their Jewish state's vision. Furthermore, he emphasised the role of the tour guides whom he considered "a key element in the complex interaction between ideology and tourism" (2004: 71) as they can influence the tourists and use them as multiplier of their perspective in their home countries.

Now, nearly 100 years after the beginning of the mandatory era, the power relations have reversed and the once struggling Zionist minority turned into the ruling majority.

Against this backdrop, I will analyse which tools are used – and how they are used – by the conflict partners to instrumentalise the tourism industry for ideological and political purposes in the context of the Israeli-Palestinian conflict?

This concept paper aims to illustrate the current power structures in the tourism industry within the context of the mentioned conflict by a two-level approach: Firstly, a media analysis will help identify the images created by both conflict partners in order to shape the perception of the region abroad. Secondly, participatory observations of conducted tours in the region will provide detailed insights on the transmitted ideological perspectives.

The Relational Sociology of Technological Survival: The Exemplifying Case of Eco-Innovation

While sociology often adopts a capacity-oriented perspective when looking at innovation, our paper intends to provide a relational perspective on innovation

relying on the figurational process sociology of Norbert Elias. Taking the example of a German scrap metal recycling network which promotes recycling technologies as eco-innovations, our paper strives to conceptually re-embed phenomena of change in their socio-historical contexts. We will show that relational sociology is a good theoretical conception for aiding the understanding of complex societal phenomena of change as presented by our case study on an emerging eco-innovation. We notably focus on what Norbert Elias called "survival units". These can be regarded an important momentum of society persisting in the course of time and potential cause for radical societal change. We will show that the innovation looked at in our case study is constructed by what we call a technological survival unit. The technological survival unit reacts with the promotion of progressive technological novelty when it is faced with discontinuities of its existential bases which in our case is mineral mining in the oldest mining area of Germany. In our view, relational sociology re-links the local view on technology development and innovation with its embedding social context and by so doing overcomes the classical structure-agency dilemma.

Body Politics, Sexual Violence and Trauma: Tattoos to 'Re-Member'

Scrutinized, sanctioned, and regulated in both theory and practice, women's bodies are undeniably political. Gender based violence occurs as a result of normative role expectations and an unequal distribution of power (Bloom 2008). Sexual violence against women, as one type of gender based violence, most proximately perpetrated by individuals is, arguably, a form of violence countenanced by the state through its institutions. In the case of sexual assault, the violence and trauma experienced by its victims are reinforced and intensified by the legal system. Our work has shown that tattoos work to reclaim and rename traumatic experience. Tattooing, as trauma by choice, allows one to remake meaning and reclaim experience, and to integrate trauma into one's life in a way that demonstrates "the choice of what happens to [one's] body (Inckle, 2016, citing Jeffreys 2000, p. 423)." In this presentation, we discuss proximate and distal causes of trauma as a consequence of sexual assault, and consider tattoos as commemorative, restorative, and empowering artifacts that make visible the invisibility of trauma, remake its meaning, and function to help survivors 're-member' integrity and reconstruct identity.

Can Farmers be Climate Leaders? Seeking Climate Change Innovation in Unlikely Places.

As environmental sociologists, we often look to a handful of key structural sources of positive environmental change: environmental social movements, environmental states and governance, and technology. But perhaps we are not looking everywhere innovation is taking place? In this presentation, we explore the potential role of farmers as climate leaders. Farmers are not a likely place to look for climate leadership. To the contrary, a number of studies have highlighted the prevalence of climate skepticism among some farming populations. As well, given their economic dependence on agricultural production, farmers would be expected to resist the burden of additional costs that may be associated with climate change innovations. In our research, however, we find it is not quite so simple. Based on the findings of a discursive analysis of several local media sources targeting the agricultural producer population in Alberta, combined with a survey of a sample of grain and beef producers, we discuss how inter-relations among identity, emotion, information and practice can encourage different forms of farmer engagement in climate change mitigation.

Hockey Arenas, the 'Public Good' and Reconciliatory Indigenous Art: The Case of Edmonton

This paper will consider how development of sporting venues in Edmonton, Alberta, Canada has functioned as a technology of settler colonialism. The occasion for this dialogue is the building of a new sports arena and entertainment district in the downtown core of this mid-sized prairie city that yet again displaces and removes Indigenous peoples. The (attempted) historical and ongoing elimination and removal of the Indigenous peoples of this place (primarily the Nehiyawak Plains Cree, the Stoney Nakota Sioux, and the Metis), means that the pre-contact history of Amiskwacis, or Beaver Hills, arbitrarily named Edmonton

by British fur traders, is yet again disregarded by celebratory stories of settler civilization – and often those triumphant tales are centered around sport. Drawing on fieldwork, media accounts, and policy analysis, the paper thinks through the multiple meanings and effects of a publically commissioned art installation in the new Rogers Place arena, created by renowned artist Alex Janvier of the Cold Lake First Nation. In post-TRC (Truth and Reconciliation Commission) Canada, how do investments in public art in public-private partnerships both further celebrate ongoing Indigenous culture and resurgence, and concomitantly, continue to exacerbate the genocidal conditions under which the settler nation of Canada was created and continues to function?

Gender for Sale: Regulating Sexist Online Behavioural Advertising

SMART Law? Law in the Age of Blockchain, Legal Metrics, Algorithms and Big Data

Abstract

Gender for sale: Regulating sexist online behavioural advertising

As online behavioural advertising (OBA) – or targeted advertising – becomes more ubiquitous in daily life, the question for lawyers has been, how to regulate discriminatory forms of advertising that feature sexualisation, objectification or gender stereotypes? Often, governments, legislators and regulatory bodies struggle to keep up to speed with the rapidly changing technology and forms of advertisement. Thus far, tackling sexist forms of advertising has only been approached through traditional formats, such as regulating TV, radio, newspaper and online content. Self-regulation and legislation has developed rigorously in the EU over the last decade with certain member states such as Spain spearheading the issue. However, such regulation has ultimately proven too weak to capture the personalised or online behavioural advertisement. Therefore the legal 'problem' is how to regulate such adverts that rely on data collection and algorithms that (re)produce gender stereotypes in advertising? From my research data collected across three EU member states, teens and pre-teens reported that not only does personalised and targeted advertising play a big part in their everyday lives it also produces harmful stereotypes, body image norms and gendered sexualisation. Targeted advertising also has negative impact on mental and physical health of their audiences. In all three case studies, the focus group's 'visual diaries' centred on personalised advertisements that 'followed' participants around the internet. This paper argues that these processes of targeting sexist advertising reproduce gender inequality and become unlawful in their denial of the right to privacy and freedom from discrimination. As targeted advertising becomes ever more omnipresent in our everyday lives, further legislation is required to regulate online behavioural adverts that produce and reproduce sexist advertising.

Researching Participation: Dimensions of Time and Space in Methodological Perspective

In a three-year study of participation in local civil society in two localities in Wales, the authors set out to explain how volunteering, collective action and participation in local associational life are embedded in place and how they are changing over time. The rich tradition of community studies and other place-based ethnographies has typically generated data from a variety of sources, including elements of life stories and narratives. The present project made a deliberate choice to use autobiographical narrative interviews and narrative ethnography to capture temporal aspects of participation, including social and spatial mobility, occupational trajectories, and variations in engagement across life stages. These interviews took place alongside participant observation of local events and meetings, informal conversations, a local survey, and analysis of local media and archive materials. The paper reflects on the experience of using this research design and the interactions between the different forms of data, comparing examples from autobiographical narratives with examples from the ethnographic data. The research reveals significant complexity in patterns of participation and belonging both in the present and over the life course. Biographical data is particularly appropriate for understanding the social embeddedness or dis-embeddedness of participation and its salience in actors' lives. Ethnographic data is essential for understanding institutional contexts and their meanings. The paper explores questions of method and interpretation including the relationship between ethnographic time and biographical time, types of biographical interview, and the complementarities (or dissimilarities) between ethnographic and biographical data concerning sites of participation, actors, organisations and events.

RC01-35.2DAVIS, KAREN* (*Department of National Defence*)FEBBRARO, ANGELA (*Department of National Defence*)HACHEY, KRYSTAL (*Department of National Defence*)*Unscr 1325 and Canadian Military Culture in Transition: Gender Integration or New Roles for Women?*

In recent decades, the Canadian military has transitioned to satisfy human rights and national security agendas, and despite significant disruption to masculine military culture, the integration of women into all environments and roles has made a significant contribution. Today, women in the Canadian Armed Forces (CAF) serve as combatants, and in operational leadership, command, and critical support roles. As a result, the CAF has considered itself to be "fully gender integrated" for over two decades. However, Canada's response to the United Nations Security Council Resolution, and subsequent Women, Peace and Security resolutions (UNSCR 1325+), challenges assumptions regarding gender integration. Efforts to increase the participation of women in peacekeeping operations, and to integrate gender mainstreaming and gender perspectives, represents potential for further disruption to military culture, as it demands that women and men include gender considerations in the repertoire of knowledge, skills and competencies that they apply to operational planning, decision-making and operational activity. What are the characteristics of a military culture with the capacity to effectively integrate gender perspectives into operations? How will we know when the military has achieved those objectives? Furthermore, what are the implications of a strategy that has the potential to isolate women in gender segregated roles in volatile security environments? Based on a preliminary analysis of CAF initiatives and stakeholder analysis, as well as lessons learned from an international Gender, Peace and Security Workshop, this paper presents a research proposal to inform research questions and to evaluate CAF capacity to integrate gender perspectives into operations. Reflections will be offered on how the cultural character of military forces, in some instances, have transitioned to more inclusively address UNSCR 1325+, including efforts to eliminate sexual violence, and on the role of today's military leaders in facilitating an inclusive culture and the operational effectiveness of mixed gender teams.

RC38-673.2DAVIS, KATHY* (*VU University*)*Neglected Feelings. Analyzing Resesearcher Emotions in Biographical Research.*

Most biographical researchers attend to the body language of their interview partners in order to facilitate the interview and help them tell their stories. Researchers may also pay attention to their own emotional responses during the interview, but usually this occurs only in their field notes. Rarely do their feelings of shock, irritation, boredom or, for that matter, amusement, excitement and delight find their way into the analysis itself. In this presentation, I will discuss some of the reasons for this neglect as well as the negative consequences it may have for biographical analysis. I will argue that biographical researchers should draw more explicitly and more reflexively on their own emotions as an analytic resource which is necessary for making sense of their informants' stories.

RC01-39.6DAWES, ANTONIA* (*London School of Economics*)EDMUNDS, TIM (*University of Bristol*)HIGATE, PAUL (*University of Bath*)WOODWARD, RACHEL (*Newcastle University, UK*)JENKINGS, K. (*Newcastle University*)*Taking the Middle Ground: UK Reservists As Depoliticised Ideological Actors*

Over the last decade, political campaigns for greater public valorisation of the UK military have happened against a backdrop of significant defence cutbacks. One of the key aspects of UK Army 2020, the Army's response to the government's 2010 Strategic Defence and Security Review, has been to promise a large-scale reduction of the regular personnel that are to be replaced by an increased and fully-integrated reservist force. Beyond this being a cost-cutting measure it has also been the hope that reservists might play an important role as positive mediators between civilian and military experiences and perspectives (Edmunds et al. 2014). This aspiration is reflected by the scholarly literature on reservist identities which describes them as 'trans-migrants' (Lomsky-Feder 2007), or people who are both particular citizens and particular soldiers (Griffith 2009), and whose lives continually cross between their different occupations. We conducted in-depth, longitudinal interviews and focus groups with military reservists over a 2 year period. This paper makes use of data where interviewees reflect upon their political awareness, motivations and commitments in the light of their

experiences crossing military and civilian divides. Whilst there is some literature about regular soldiers as ideologically-informed actors (Guttman and Lutz 2010; Weiss 2014; Gibson and Abell), there is less understanding about the ideological positioning of reservists. The paper argues that reservists often view themselves as having a more informed and open perspective about contemporary social, political, economic and military conflicts than the regular forces or other civilians. However, their commentary often jars with an individualised and generally apolitical motivation for joining the reserves. Whilst also opening up possibilities for dissent and critique, this disconnect blurs the distinction between the spaces and actors involved in war and peace, resulting in the depoliticising and obfuscating of war's effects (Higate et al. forthcoming).

RC20-374.1DAWSON, ANDREW* (*York University*)*Are Democratic States Perceived As More Legitimate By Their Citizens? a Cross-National Analysis of Democracy and Subjective Legitimacy*

Although democratic polities are often considered a normatively legitimate form of government, do their citizens actually regard their states as more legitimate than do citizens of less democratic countries? Drawing upon the World Values Survey and other data sources, I conduct a cross-national statistical test of this question. The analysis suggests that they do not, and aside from all but the strongest democracies, citizens in more democratic countries tend, on average, to view their state as less legitimate. This finding holds across different measures of democracy, across country GDP categories and in the presence of a variety of controls, including a measure of democratic transitions. Moreover, with the exception of strong democracies, level of democracy is among the most influential cross-national predictors of perceived state legitimacy, surpassing the importance of other variables such as ethno-political exclusion, GDP per capita and income inequality. The results suggest that, while democracies may be an inherently desirable form of government (i.e. they may be considered to enjoy relatively higher levels of normative legitimacy), more democratic states do not necessarily enjoy comparatively higher levels of subjective legitimacy.

RC47-797.3DAWSON, MARCELLE* (*Centre for Social Change, University of Johannesburg*)*Insurgent Scholarship and Cognitive Justice: Exploring Knowledge Production within and Beyond the Academy*

Increasing pressure to quantify and commodify knowledge has narrowed the scope of what counts as knowledge. Indeed, knowledge production within the university relies largely on methodological tools and theoretical premises developed and entrenched by European and American scholars. Consequently, many 'knowledges' that do not conform to the standards of Western epistemology have been dismissed as 'anecdotal', 'trivial' or 'quaint'. Despite the neocolonial, neoliberal context within which it operates, the twenty-first-century university—both as agent of socialisation and site of knowledge production—remains a vital site for creating alternative futures. However, to preserve its crucial role as 'critic and conscience of society', knowledge production within the university must be decolonised and decommodified to make room for other ways of knowing. Prompted by Santos' notion of global cognitive justice, this paper explores the idea of insurgent scholarship as a project of everyday resistance from within the academy aimed at transforming the ways in which knowledge is created, disseminated and valued. Insurgent scholarship aims to unveil the distorted history of knowledge and incorporate alternative ways of knowing and seeing into every aspect of academic labour. As such, insurgent scholarship entails reclaiming the university as a site of resistance.

RC16-299.1DAYÉ, CHRISTIAN* (*Alpen-Adria-Universität Klagenfurt*)*How the History of Sociology Can Inform Contemporary Theorizing in Sociology: A Framework*

The main objective of this paper is to propose a scheme that systematizes ways in which the history of sociology can be useful for the current theorizing. It thus so by first discerning the objective to inform theorizing from other potential uses of the history of sociology, e.g. in teaching or in the construction of the discipline's identity. Relying on historical epistemology, it discusses how two distinct, but interrelated movements of thought can be used to writing histories of our discipline that are informative to contemporary theorizing. The one, *historization*, consists in following the historical trajectories of epistemologies, concepts, theories, methodologies, methods, and techniques in order to demonstrate their variability as a function of their social and cultural embeddedness. Hence, current theorists would be equipped with a richer understanding of the prior life of the

ideas they work with, with a better “working memory,” as Richard Swedberg once put it.

The second movement of thought, the *epistemologization* of the history, attempts to revisit the history of sociology in order to identify which factors informed earlier science, both its confirmed and its obsolete elements. This, in turn, should increase the level of self-reflexivity with which current theorists approach their task. While contemporary studies on the history of sociology focus on social factors of knowledge production, dissemination, and evaluation, I finally argue that one direction less intensely followed consists in seeking for psychological, or perhaps even psychoanalytical factors in a way proposed by one of the early luminaries of historical epistemology, French philosopher Gaston Bachelard.

Individual and Institutional Factors in the Choice of the Educational Track after Completing Compulsory Secondary Education in the City of Barcelona: An Approach through Multilevel Analysis

Educational inequalities has been a central theme in Sociology of Education, within the context of industrialised countries and especially with the important expansion developed in the last decades of the educational system. It is not only it is focused on the influence of social origin on the academic results obtained (primary effects), but also it is analysed the choice of educational track, which has become popular as the secondary effects (Boudon, and Breen & Goldthorpe, 1997, Mayer, Müller & Pollak, 2007, Breen et al., 2009 and Jackson, 2013). Focusing on the latter, the factors involved in the decision to make at each intersection of education are key to understanding the inequalities in the educational tracks of young people, adopting either an academic option or more professional or dropping out the system.

The purpose of this paper is to explore the impact of the individual characteristics along with the family characteristics and institutional factors associated with the school center in the decision of the educational track after completing compulsory secondary education. For this, the multilevel analysis is used, under the approach of a model with two levels of variables, level 1 corresponding to the students who finished compulsory secondary school, and level 2 corresponding to the schools where they studied. Variables included in the model belong to several areas: personal characteristics; family characteristics (related to socio-cultural and economic background); and school characteristics (related to its users and the educational processes taking place in it). The sample, which come from an international longitudinal study of 10th Grade students in thirteen cities of the world (Cities Project)[1], consists of a total of 2056 students who were enrolled in secondary school in the academic year 2013-14 - or who were born in 1998 - from 27 centers of the city of Barcelona.

DE ALCANTARA, GUILHERME* (*Universidade Federal do Rio de Janeiro*)

School, Sweat and Tears: The Reconfiguration of Emotional Order and Mobilizations for Justice in School.

This paper analyzes the constitution, work and effects of a particular emotional order in a public primary school recognized as “good and democratic”, even if situated in a poor and violent neighborhood on the outskirts of Rio de Janeiro. This school has been trying to produce distinctive education for disadvantaged students for 30 years. Drawing on 600 hours of observations, 10 in-depth interviews with school actors and documental research, I argue that this work was linked with a reorientation of the meanings of school organization and the constitution of a “state of engagement”, sustained by a particular form of regulating emotions related to: (a) the reconfiguration of pedagogic work, of professionals identities and ethics; (b) the reorientation of relations between neighbors, parents, students and educational professionals; and (c) the way emotions are understood, legitimized and used in mobilizations for resources, against injustice cases produced by the education system or the external environment. The reconfiguration of a constantly negotiated micro-politics of emotions influenced the development of a particular sense of justice. Furthermore, professionals developed strategies of visibility, recognition, valuation and sharing of the intensive emotional labor and care demands, constituting a way of regulating the interactions that are attentive to the expressions of affection, authorizing, for example, crying as a legitimate expression of awareness and as data in meetings and decision making processes. The normalization of this emotional micro-politics regulates actions, contributes to the development of a collective ethic, to the change of pedagogical work, to address institutional processes of indifference production, to redirect responsibilities and commitments, and to the engagement

in the struggle for resources and rights. However, it enhances the emotional charge of the teaching work, which can cause conflicts, stress and illness.

DE ARMENTERAS CABOT, MARCOS* (*University Rovira i Virgili*)

Environmental Justice for Future Generations: An Alternative Discourse to the Sustainable Development.

The idea of Sustainable Development enshrined in most international environmental instruments of soft law and most western constitutions has framed the body of environmental law. The relation and interactions between environment and society has been guided by the idea that the economic social reproduction could still being unchanged if the hegemonic idea of development was “sustainable”. However, while the economic benefit and development, which understands nature as an asset in hands of the human, still in the centre of the public policies, the sustainability cannot be understood as any alternative to face the current environmental crisis. The present contribution seeks to critically map the role of sustainable development in the idea and further development of the meaning of environmental justice, taking into consideration the physical limitations of the earth in the continuous exchange between the society and its biophysical base; the obstinate faith to technical advances in facing the increasing environmental damages; and the responsibility in terms of justice from an intergenerational and global perspective, taking into special consideration the climate crisis in terms of justice with generations to come. This approach seeks to understand other burdens of environmental justice, beyond the conceptual framework developed during the 80s, seeing it as the alternative to the sustainable development discourse.

Interreligious Dialogue As a Tool to Manage Public Space and to Reduce Social Conflict

This paper presents some outputs of the research “Multicultural laicism and the management of religious diversity within educational spaces” aimed to identify those conditions under which the educational community are able to develop interactions that would decrease prejudice and foster coexistence. We are facing in Europe an increasing of racism and intolerance especially towards religious minorities. Interreligious dialogue can be an important tool in a society to reduce, deactivate and prevent these conflicts. However there is a gap in the scientific literature about the elements required to develop a successful interreligious dialogue and to prevent social conflict. So we focus part of this research to find out which were these elements. We analyzed two schools within a rich multicultural context that implement Successful Educative Actions (SEAs) and we analyzed how this SEAs had a social impact in the wellbeing of the community reducing prejudices related to religion. The analysis revealed that conditions as **egalitarian dialogue** where **solidarity**, **equality of differences** and the **arguments validity** prevail allow the development of friendship ties among students, teachers, families and volunteers that are clue in reducing prejudices and as a way to prevent violence.

Sex Work or Prostitution? Implications of Dominant Social Problems Vs. Activist Movements Discourses on Men Selling Sex to Men

In the current global order, most countries consider commercial sex as a (trans)national social problem, rather than a platform for social movements. This approach is embedded in policies governing sex for sale, concerning – among other – migration, mobility and exclusion (within and across countries), as well as shifting sexual and gender norms. In 1999, Sweden became the first country in the world to criminalize the client, but not the person offering sexual services. Central to this official stance is the conceptualisation of, firstly, sex workers as women, and secondly ‘women as victims in need of protection’, thus making concepts such as ‘sex workers’ highly controversial. More, this shift in legislation meant a displacement from the social to judicial domain in shaping the “problem” of commercial sex. Since then countries across Europe have adopted similar legislation. The victim-discourse clearly dominates the social problems debate in Sweden, while discourses emphasising sex workers’ agency and rights has gained less (official) attention. However, the conceptualization of commercial sex as a global social problem, or as a platform for activism, is under constant negotiation.

In this paper, “the language of social problems” concerning commercial sex is put under scrutiny. The data of the study is qualitative: transcribed interviews with men selling sex to men. The analysis indicates that dominant discourses on commercial sex – whether centered on ‘victims’ or ‘agents’ – tends to be reduction-

ist approaches, shaping the micro-practices of the actors involved. In conclusion, I argue that the 'social problem discourse' reflects a reaction among the interviewees to avoid the feminized 'whore-stigma' as contagious to their self-representation. Moreover, the 'sex workers'-discourse appears as quite ambiguous, since participants almost unanimously depart from the pro-work feminist stance claiming to combat stigmatization for those involved in commercial sex.

Low School Attendance in Developing Communities: A Case Study of the Socioeconomic Risks of Low-Value Mineral Mining

In 2015, the European Union partnered with the United Nations Development Program (UNDP) to launch an initiative promoting and investing in low-value mineral mining in African, Caribbean and Pacific (ACP) states. Low value mineral mining possesses three unique characteristics which make it an ideal vehicle for development. Firstly, these mines are labour intensive and have the capacity to generate significant employment for low and medium skilled workers. Secondly, low-value mineral mining is not capital intensive and is therefore suited for underdeveloped communities. Finally, low-value mineral mining produces materials that significantly contribute to local-level development. Notoriously, mining resources typically bypass local-level development; hitting international markets while consequently neglecting community infrastructure.

The purpose of our case study is to explore some of the economic, social and political risks associated with low-value mineral mining. We have decided to focus on the low school attendance of young males, a historical development trap, as a potential risk. Given that these mines are labour intensive, our data suggests that they might negatively affect the school attendance of young males in some regions. It is therefore essential for the United Nations to acknowledge the undesirable effects of this project and take adequate measures to prevent them.

The history of development programs and aid work has shown that understanding the social and political climate is key to the success of the programs. Ultimately, the low-value mineral mining initiative launched by the UNDP has the potential to develop post-conflict communities, strengthen democratic institutions and alleviate civil strife. This case study serves to equip the United Nations' project with local-level knowledge of a social dynamic such as school attendance that has long been a developmental trap for ACP states.

Transforming Clients into Experts-By-Experience: Health Risk Governance and Client Participation in Dutch Long Term Care.

To deepen their insights into the risks and uncertainties of long term care delivery, and under pressure of societal debate, the Dutch Health Care Inspectorate (IGZ) experiments with the use of experiential knowledge in the regulation of care for the elderly. As experts-by-experience, clients are thought to give additional information for, and legitimacy to, the IGZ's work. Empirically, this paper tracks an IGZ pilot project with experts-by-experience through a mixed-method qualitative inquiry that involves the ethnographic observation of the pilot project-team, site-visits, and repeated interviews. Theoretically, we argue for the need for an interpretive and dialectical approach to understanding health risk governance. We examine the dynamic feedback loops between institutionalized and individualized risks, by showing how the project transforms selected clients into experts-by-experience through training and site visits as 'mediator' of the client-perspective, 'source of data' in themselves, and as 'ambassador' of the IGZ. In this transformation clients struggle, and fail, to bring to the fore their own definitions of quality and safety. This happens in part because of the project-team's felt need to ensure a safeguard from institutional risks. Paradoxically, in their attempt to open-up valid new perspectives on the risks of long term care delivery, the project 'makes-up' (Hacking) the experts-by-experience in such a fashion that these perspectives are least likely to emerge. Concurrently, we find how in their attempt to produce valid (objective, rational) knowledge experts-by-experience devalue their own experiential knowledge. These findings underscore the dialectics of health risk governance. We show how dominating, legitimate, interpretations of health and risk resonate in experimental institutional practices that try to move beyond them, and how both regulators and clients face risks in taking experiential knowledge on risk and uncertainty on board.

Who Is Going Public? Ethical Perspectives through a Decolonizing Framework

Who is Going Public? Ethical Perspectives Through a Decolonizing Framework

Ndlovu-Gatsheni (2017, line 106), in the context of decolonising research, argues that researchers should reposition "those who have been objects of research into questioners, critics, theorists, knowers, and communicators" in the research. Participatory visual researchers have been contributing to such a repositioning through close scrutiny of and sensitivity to the underlying ontological, epistemological, methodological, and axiological philosophical underpinnings and practice of participatory visual research, endeavouring to work with participants in co-producing knowledge, co-analysing knowledge produced, and co-presenting the findings emanating from their own insider knowledge to not only other researchers, but also to policy makers and members of their own communities. As such participatory visual research intends to open up spaces for dialogue towards deepening an understanding of the issue under study and enabling action for social change. As researchers have come a long way in persuading university ethics boards to 'allow' us to do participatory visual research, a further challenge arises when the participants who are the co-producers and owners of the knowledge want to represent themselves and share the knowledge they produced publicly.

In this paper I ask, "who is going public?", "who is allowed to go public?" and who "allows the going public?" It is at this "going public" juncture that ethics seem to place boundaries on participants' sharing their work publicly, drawing on constructs such as consent, anonymity and confidentiality in gatekeeping the participants from sharing their work. I argue that the philosophical underpinning and practice of research ethics have not yet transformed sufficiently to address the issue of ethics in participatory visual research. In this presentation I explore the concepts of consent, anonymity and confidentiality - through using examples from our participatory visual work with youth in South Africa.

DE LANNOY, ARIANE* (*University of Cape Town*)

GRAHAM, LAUREN (*University of Johannesburg*)

Re-Engaging Youth Agency and Resilience in Youth Research

Much of the academic, public and policy discourses on youth development in South Africa tend to give primacy to constraints and risk factors that impact on young people's wellbeing. The many statistics available on the lives of South African youth indeed indicate that large proportions of youth find themselves in dire situations, faced with severe structural constraints. Nonetheless, an overemphasis on the range of constraints in young people's lives can lead to the creation of 'moral panics', which inadvertently leads to problematising youth from low socio-economic groups as at best victims and at worst deviant. Perceiving youth as mostly, or only, vulnerable may further reinforce a sense of passivity and obscure the understanding of young people as active agents with the power to transform and intervene in their life circumstances. Drawing on empirical data collected through a long history of qualitative research in various parts of the country, this paper illustrates extensively that young people can mitigate the often dire consequences of their risky and constrained environments by tapping into and strengthening their remarkable resilience. The article thus challenges existing literature that assumes young people growing up in poverty, to be only vulnerable or 'dysfunctional' and highlights in various ways the resilience and agency that young people continually display. It argues therefore that approaches to youth development should be comprehensive enough to simultaneously address 'deficiencies' that need to be rectified and support youth in their resilience and agency. It points to the need for a solid evidence-base that provides a comprehensive and correct understanding of both the structural constraints and individual agency and argues that a lack thereof could have important implications for the success rates of policy and practice aimed at supporting youth development.

Youth Well-Being and Social Exclusion in South Africa

This paper interrogates the concept of youth well-being in post-apartheid South Africa as applied in the country's youth development policies. Concerns around large groups of 'socially excluded' youth dominate the public and policy discourses in South Africa. Since the 1990s, a string of national and provincial youth-oriented policies has attempted to respond to this 'exclusion'. However, a growing body of longitudinal survey data indicate little or no change in the dominant measures of youth exclusion. This paper presents a brief overview of the concepts of 'well-being' and 'social exclusion', followed by an examination of these notions in the context of policy efforts to address youth deprivation. The 2015 National Youth Development Policy is used as a case study. The paper then draws on qualitative data on the lived experiences of youth in South Africa to highlight gaps and inconsistencies in the policy's dominant interpretation of 'well-being' and 'exclusion'. It indicates that youth well-being and exclusion seem to be understood mainly in terms of deficiencies in the individual fields of educational attainment and employment, or, at the levels of the family and community, as 'dysfunctions'. The paper argues that it is exactly these inconsistencies that continue to drive the symbolic and experienced exclusion of South African youth.

RC02-JS-8.4DE LARA, JUAN* (*University of Southern California*)*Contesting Contingency: Racialized Labor and the Logistics of Global Capital*

This paper argues that precarious workers can provide insightful organizing strategies and theoretical challenges to the global circulatory apparatus of racial capitalism. It uses Southern California's logistics economy to show how the production of immigrant workers as precarious labor was critical to the development of flexible production and distribution systems. Southern California's port complexes are an example of these systems and provide a window into the machinations of state actors and business interests; who strengthened their position within the global commodity network by developing extensive and intensive distribution systems they believed would attract a highly mobile and flexible 21st century capitalism. More specifically, the paper examines how contingent warehouse workers produced a counter-narrative that challenged the dominant discourse of logistics-based regional entrepreneurialism by questioning public policies that placed growth and profit before economic and social justice.

The paper begins by outlining how the Change To Win labor federation launched a regional organizing campaign that extended the scale of warehouse work by moving beyond the usual confines of shop floor complaints to make a broader argument about economic justice, regional development and globalization. Warehouse workers and their allies argued that the unmitigated flow of global capital - underwritten by corporations like Walmart and Amazon - regularly subjected local communities to poverty level wages, precarious employment and deadly levels of diesel pollution. What unfolded during the Warehouse Workers United organizing campaign will show how labor and immigrant social movement organizations crafted spatial narratives that connected global logistics to regional struggles for racial and economic justice.

RC05-122.1DE LIMA, PHILOMENA* (*University of the Highlands and Islands*)*Bridging the 'Migration-Development Nexus'-Addressing the 'wellbeing' of Migrants in Rural Areas*

The last decades have witnessed an increase in the range and scope of literature on international migration, including to so called 'non-traditional locales' - i.e. rural regions, towns within some large metropolitan regions and countries with little or no previous experience of international migration. The debate on migration in the EU including the UK has privileged two parallel discourses reinforcing an instrumental view of migrants: the role of migration and migrants in contributing to 'development' and poverty alleviation in their countries of origin; and their contribution to economic growth and addressing skills shortages/gaps in the context of demographic changes, identified as being more severe in some rural areas in the Global North. These discourses underpin two contrasting and persistent tropes of migrants in rural areas: as essential to plugging labor shortages/ skills or as taking jobs and resources from 'locals', resulting in an obsessive interest in how best to 'integrate' migrants largely from destination country perspectives and at the expense of social justice considerations related to their wellbeing and human rights. Rurality in this context is not a neutral space but rather is conceptualized as relational embodying varied notions related to race, nationhood, gender, age and so on which impact on migrants lives in rural communities. Drawing on empirical research undertaken on EU mobile citizens and international migrants in rural areas of the UK and Scotland and a synthesis of a literature review of rural migrants in the EU the paper will outline a critical approach to understanding and researching rural migrant experiences that places their wellbeing and human rights at the forefront.

RC27-492.2DE LISIO, AMANDA* (*Bournemouth University*)SILK, MICHAEL (*Bournemouth University*)DE ALMEIDA, BÁRBARA S. (*Universidade Federal do Paraná*)*(Re)Presenting, Embodying & Consuming Rio De Janeiro: Narratives of Nation and the 2016 Olympic Games*

As one of the most visited cities in the Southern Hemisphere, sandwiched between world-renowned beaches and mountainous terrain, Rio has forever been in the midst of urban renewal—the literal city of the future. More recently, the entrepreneurial mode of governance pioneered in Barcelona, prior to the 1992 Summer Olympic event, influenced a wave of urban (re)development strategies enacted across 2016 Olympic host communities. The Strategic Plan of the City of Rio de Janeiro (Plano Estratégico da Cidade de Rio de Janeiro) named the (sport) mega-event as a desirable chance to restore tourism and attract foreign, as well as domestic investment (Torres Ribeiro, 2006). In this way, the mega-event offered an alternative avenue to “civilizing” the public sphere—e.g., whereas health and sanitation policies in the late 19th century were intended to “civilize” (those included in) the populace, the current planning approach has

allowed foreign capital to dictate the terms of renewal (Caulfield, 2000; Meade, 2010). More than a mere catalyst, the hosting of an internationally-recognized mega-event—in this case Rio 2106—served as a crucial vehicle in urban image (re)construction (see also Broudehoux, 2017; Silk, 2002). Within this paper, we examine the manner in which Rio de Janeiro was (re)presented within national media and “official” Olympic documentation, and discuss how preferred, selected, local narratives were embodied, appropriated and mobilized in, and through, Olympic spectacle.

RC04-88.5DE MOLL, FREDERICK* (*Goethe University Frankfurt am Main*)*Educational Strategies and Self-Beliefs of Lower Class Parents in Germany in the Face of Current Notions of Good Parenting*

In recent years, public and political debates on educational inequality have increasingly focused on parents' influence on children's academic development. Social and education policies throughout Western societies aim to promote meritocratic competition by increasing socioeconomically disadvantaged parents' abilities to cultivate their children's talents (Gillies, 2005): *Good parenting* is often characterized by typical middle class practices such as reading daily to children and enrolling them in organized activities. However, it remains unknown how lower class parents respond to such expectations. Their own perspective on the link between childrearing and educational success has rarely been studied. The present study aims to help fill this gap. Drawing on Bourdieu's contention that social class is linked to cultural practices and people's habitus, the study first examines differences in parents' childrearing practices and family life among the lower class in Germany. Second, the study asks under what conditions parents believe in their capacity to improve their children's education.

The analyses draw on primary data of $N = 1069$ parents with elementary school children (9–12 years old) in Germany. Disadvantaged parents are identified based on income, education, and employment status. The results show that two distinct types of childrearing practices are prevalent among lower class parents: the first type can be called *Active Cultivation* (Siraj-Blatchford et al., 2011), which is a lower-class childrearing strategy aimed at upward social mobility; the second type is characterized by children's media use and low parental involvement in children's academic lives. Parents who try to promote their children's school success put high value on performance and believe in meritocracy, whereas parents who belong to the second type consider their child's home learning opportunities to be deficient. Thus, lower class parents seem to be largely influenced by publicly held beliefs about their responsibilities and limitations in providing their children with educational experiences.

RC47-JS-76.3DE MOOR, JOOST* (*Keele University*)CATNEY, PHILIP (*Keele University*)DOHERTY, BRIAN (*Keele University*)*What Hampers Contention in Practice-Based Movements? a Comparative Study Resistance and Alternatives in Two British Cities*

Various scholars describe the proliferation of practice-based movements, including those working around community energy and local food. Some have celebrated this trend in the context of decreasing electoral and institutional political participation: rather than political disengagement, we witness a *shift* of political participation to the arena of everyday life. Others point out that practice-based movements and participation makes for a poor replacement because they tend to be 'apolitical' and fail to challenge the status quo. However, both these interpretations seem to overlook that participants in practice-based movements often have a radical background in contentious politics that are clearly reflected in the 'political' motivations that still drive these collectives. Practice-based activism is here often seen as the alternative 'yes' that *accompanies, rather than replaces*, the 'no' expressed through contentious politics.

Nonetheless, our previous research has questioned how compatible contentious and practice-based repertoires really are. Activists often have clear motivations for challenging the status-quo, yet in practice, it can be difficult to turn those motivations into contentious actions whilst simultaneously promoting the diffusion of grassroots innovations. The latter namely relies on cooperation, which can be compromised by contentious relations. This finding stresses the importance of a division of labor in social movements. If movements effectively want to promote both alternatives and resistance, it appears that there is a need for distinct organizations to push for each of them.

However, such a division of labor seems more common in some cities than others. We therefore present an in-depth comparative analysis of environmental activism in two British cities – Manchester and Bristol – which explores several contextual explanations for such variations. We thus aim to answer the question: Why are some urban contexts more conducive to a coordinated division of labor between resistance- and alternatives-oriented environmental movement organizations than others?

RC08-177.1DE NANTEUIL, MATTHIEU* (*University of Louvain*)*DID Sociology Favor Social Injustice to the Detriment of Violence (S) ? European Sociology Facing Colonialism at the End of the 19th Century.*

This paper wishes to critically look at the conditions under which European Sociology was born at the end of the 19th century. If the latter was crucially innovative in the field of social injustice within capitalist societies ("the social question"), it was terribly silent on forms of violence generated by colonialism ("the colonial question"), i.e. forms of violence which were not produced by - and limited to - social inequalities. Embracing Marx's contributions and contradictions on this issue, this communication will critically examine Durkheim's text on *Division of Social Labour* (1893) and Weber's conferences on *Science and Politics as Vocations* (1919). It will show that the "Fonding Fathers" of sociology were unable to set up epistemic categories to analyse structural violence in European modernity and, therefore, to open adequate routes to overcome them. For European sociology - esp. for critical sociology -, this has generated a situation whereby social injustice has progressively become "a rule" - injustice are never legitimate: it's possible and necessary to combat them in a radical way - and violence "an exception" - a certain level of legitimate violence has to be accepted: violence can be regulated but not eradicated. Oppositely to such a vision, which also roots in Montesquieu and Elias' legacy, this communication will end with some proposals to combat structural violence in contemporary societies facing economic and political globalization. "Non-violence" is one of them.

RC16-316.6DE NIEVES GUTIERREZ DE RUBALCAVA, ARTURO* (*Universidade da Coruña*)*Formalizing Bourdieu. Formulating the Law of Capital Attraction.*

During the last decades we have seen an impressive progress of rational action theory (RAT) in the social sciences, which produced models with high explanatory and predictive power for different instances of human behavior. RAT, however, presents serious limitations when it comes to integrate the influence of social structure on its models, as it sees human behavior merely as the outcome of utility maximization equations rationally calculated by individuals. Departing from Bourdieu's view of social structure as a force that orients practice, this paper introduces a new mathematical model designed to measure that force; we called it the law of capital attraction.

RC45-763.5DE QUINTANA-MEDINA, JÚLIA* (*Universitat Autònoma de Barcelona*)*Bounded Rationality and Public Policy: The Nudge and Boost Approaches.*

Research on human behaviour and decision making points out the limitations of rational choice theory to explain how individuals behave. Many of this insight on human behaviour fall under the general category of 'bounded rationality' (BR). The term, accounts for an alternative approximation to human behaviour that emphasizes how in most real-life choices subjects do not behave in the way predicted by utility theory. Two different research programs build on the notion of BR: the *heuristics and biases* program and the *fast-and-frugal heuristics* program. Both focus on studying the cognitive processes that bring about behaviour in realistic situations. However, they present different normative and positive accounts of rationality. Following the current trend of applying behavioural insights to policy making, these two programs have proposed behavioural change strategies: the nudge and the boost approach, respectively. In the literature, their theoretical and applied views are said to be opposite interpretations of decision-making. However, it is not that clear. Although developed under apparently opposite interpretations of human behaviour the nudge and boost approach tend to share interest in similar phenomena, and prescribe similar interventions to change behaviour. This paper theoretically explores the research programs around BR and their prescriptive dimension. Rather than addressing which of the programs constitutes a better theoretical foundation for behavioural public policy, the goal of the paper is to explore the main points of agreement and identify insights that might be useful for policy making. Recently, insights of human behaviour and decision-making have become an important benchmark in policymaking. This has placed more interest in the theoretical debate on behaviour. The paper aims to clarify the debate on BR and public policy and address the role that behavioural theories should play in policy making.

RC01-44.4DE ROSA, STEFANO* (*Swiss Military Academy*)*Nutrition in the Swiss Armed Forces*

A satisfying supply of food and an adequate nutrition of the soldiers are fundamental for every armed force. Thus, the Swiss Military Academy starts a research project about "nutrition in the armed forces". The scope of this study is to gain more precise insights and more profound knowledge about the particularities of military food and nutrition.

In particular, this sociological study aims to show how the Swiss Armed Forces deal with the considerable variety of food preferences and alimentation habits of their conscripts. Contrasting the wide range of food available in our modern society with the restricted choice of meals during military service, it becomes evident that some adjustments are needed to bring these two worlds together. The presentation will therefore display the implemented measures of the Swiss Armed Forces to meet day-to-day the different expectations of the soldiers. What are the key organizational aspects of an adequate food supply for the troops? Is it possible to satisfy a broad range of necessities or do we face restrictions in the food offer?

To answer these questions, the first task is to describe the current diversity of food necessities and preferences among young Swiss adults. Multiple reasons are brought forward for very different alimentation habits: religious views, ethical claims, environmental concerns, food allergies, health beliefs, etc. The second task is to assess - through the analysis of regulations and guidelines as well as through interviews with responsible personnel - whether the Swiss Armed Forces take into consideration these different food habits. Finally, it will be shown towards what alimentation necessities the Swiss Armed Forces are geared and where the limitations of diversity management of food preferences are.

RC47-783.1DE SOUSA SANTOS, BOAVENTURA* (*University of Coimbra*)*Epistemological and Practical Challenges for Social Movements in the Global South in 2018*

Social and epistemic justice in the late 2010s.

RC44-740.5DE SPIEGELAERE, STAN* (*ETUI*)*European Works Councils, an Embryo for Transnational Solidarity*

As companies operate increasingly on an international scale, meaningful employee participation needs a form of transnationalism. In Europe, this took shape in the form of European Works Councils (EWCs) with a EU Directive on the matter published in 1994. It was hoped that through transnational information and consultation of employees, a form of transnational solidarity would be created. Case study research identified multiple obstacles and limits to the development of this transnational solidarity.

In this paper, we study the development of transnational solidarity in EWCs based on large scale survey results. A survey of over 2.000 EWC representatives of over 200 different EWCs gives insight in how EWC representatives experience transnational solidarity, how this changes according to the EWC, but also how the experience varies inside various EWCs, depending on the position and country of origin of the representative.

This multi-level research is the first of its kind that looks in to these themes using a representative sample of EWCs and EWC representatives and provides crucial in the problems and prospects of going towards true transnational solidarity.

RC43-735.3DE VOS, ESTHER* (*Royal Roads University*)SEVERSON, MERYN* (*Capital Region Housing*)*Conceptualizing Social Sustainability in the Canadian Affordable Housing Sector*

The three dimensions of sustainability - environmental, economic, and social - have been well established. However, while economic and environmental sustainability are more easily understood and measured, social sustainability remains less understood. Researchers have begun to study social sustainability in earnest, particularly exploring its connections to urban sustainability, urban form, mixed density and use, and community development. However, the context of social and affordable housing remains an untouched area. Situated in Edmonton, Canada, Capital Region Housing is one of the largest providers of social and affordable housing in the country. We recognize that the current model of social and affordable housing is unsustainable - financially, environmentally, and socially. We are moving towards recognizing that social sustainability is an important concept for the support of our tenants and communities.

We thus conceptualize social sustainability within the context of social and affordable housing. How does a housing provider define social sustainability? What does social sustainability look like for the people that live in social and affordable housing and within the broader community? We understand social sustainability to be multi-scalar and multi-dimensional, and linked to four key themes: equity, inclusion, security, and resiliency. Connected to these themes, we elaborate on

new policy innovations to increase opportunities and stability for tenants of social and affordable housing. This paper integrates research on affordable housing, regeneration and revitalization, community resiliency, and social sustainability.

DE WET, KATINKA* (*University of the Free State*)

Reversing Re-Engineering: The Failure of the Community Health Worker Program in the Free State Province, South Africa

There is a tremendous array of proof as to the benefits that the deployment of community health workers (CHW) potentially hold. Evidence-based improvements in multi-faceted health outcomes are often found in the literature. Ironically, some countries with much lower per capita spending on health, are witnessing substantially more concrete outcomes than compared to a relatively affluent country like South Africa. This is noteworthy given the South African state's intention to create a large cadre of standardized CHWs as essential components of the Ward Outreach Team initiative under the Primary Health Care re-engineering process that is tentatively emerging in South Africa. One of the most troubling absences in the extensive range of knowledge related to CHW and their activities, is the fact that little evidence is available to direct and forewarn as to the management of CHW programs at scale, under the auspices of the existing health system. Equally worrying in the case of South Africa's move towards a universal CHW program are the associated challenges of re-orientating a range of eclectic community-based services that literally sprung up overnight to respond to disease specific requirements notably related to HIV and AIDS and to TB, to the creation of a standardized and regulated CHW program. CHW are supposedly a response to more inclusive, participatory, equitable and relevant responses related to health care needs in a world where inequalities (especially in relation to health) are constantly soaring. However, the history of community-based health care activities, as can be witnessed by the 2014 incident in the Free State province by the peremptory dismissal of a group of CHWs, is replete with the duplication of errors and falling prey to the pitfalls of the past.

DE WET, KATINKA* (*University of the Free State*)

Through the Lens of Bourdieu: The Evolution of Responses to HIV and AIDS in South Africa

The field of HIV and AIDS has transformed significantly over the last couple of years, especially with the introduction of life-saving antiretroviral treatment (ART) that has manifestly changed the course of this epidemic. The field of HIV and AIDS has witnessed interesting shifts since the full-scale availability of ART and the concomitant medicalization of responses to the scourge (through initiatives such as "treatment as prevention" and "pre-exposure prophylaxis"). These changes in the field constantly call for new forms of capital to be mustered in order to ensure continued legitimacy in this evolving field. In a variety of responses to the illness – from funding, to human resources for health, to activism, and in relation to the field of ethics – constant re-negotiations and reflections are vital in order to adapt to the new realities in the field of HIV and AIDS. The disease's initial exceptionalism has framed the field to a large extent but in light of its normalization (through its medicalization), those in the so-called "AIDS industry" have to reposition themselves in order to maintain the capital and material advantages such as funding, recognition, and legitimacy, in order to remain authoritative figures in the field of HIV and AIDS. This is even more apparent in research on HIV and AIDS in the humanities and the social sciences. Whereas these disciplines were deemed invaluable during the "glory days" of HIV and AIDS enquiry marked by its uniqueness and exceptionalism (and ample resources through the deeply problematic mechanisms of global funding), these disciplines are now struggling to find their erstwhile legitimacy and influence compared to their biomedical counterparts.

Critical Artists and Urban Development - Theoretical Foundations and Proposed Explanations

This presentation and paper will deal with an essential issue of the ISA Research Council "Sociology of the Arts", entitled "Potency or Impotence of Artists in Society". The "potency" or "impotence" studied here, is a characteristic of the artist, and her political value orientation and political behavior in urban settings, e.g., against urban development policies. In a comparison of four cities (Jerusalem, Tel Aviv, Hamburg, Hanover), our interdisciplinary and international team studies if and how artists critically contribute to the shaping of the city, and

how much these critical artistic interventions are regarded as political, from a spectrum of reconciliatory and strategic cooperation with local municipalities to outspoken antagonistic opposition and protest. The presentation and paper in Toronto would concentrate on our discussion of theoretical foundations, based on first empirical findings in the four cities. We look at a triangle that symbolizes the causes, structures, and consequences of critical urban interventions of artists. The three overlapping fields (or corners) of this triangle are "art", "politics", and "city". The field of "art" (or art world and fields of culture) intersects with the field of the "city" (changing urban spaces), and both intersect with the field of "politics" (understood as the engagement in shaping the collective). The focus of our research is the "urban political activist" who is positioned in the intersection of all three fields. Other types to be considered for comparative reasons are the "urban activist" (in the intersection of "politics" and "city"), the "political artist" (in the intersection of "art" and "politics") and the social artist (in the intersection of "art" and "city"). There is also the "exclusionary artist" who refrains from political and urban issues but is still inspired by the city for her work. This research tests the typology of artists in the four cities.

Mass Shootings, Heroic Actors, and the Competitive Construction of Concealed Firearms on University Campuses

The United States is unique among developed countries in its cultural valorization of firearms ownership as a fundamental right. While most other Western countries have sought to restrict gun ownership and the carrying of firearms, there has been a significant legislative momentum in the United States toward the liberalization of gun laws. Within that larger trend, there has been a movement toward allowing individuals to carry concealed firearms in previously protected spaces, including hospitals, churches, and university campuses. The state of Idaho, for example, has been at the forefront of this trend. In 2014 the state legislature passed SB 1254, a law which allowed licensed individuals to begin carrying carry concealed firearms on the campuses of state colleges and universities. Not surprisingly, there has been robust public debate over the expansion of concealed carry. On the one hand, supporters of these new laws have argued that allowing individuals to carry firearms on campus will deter potential mass shooters, terrorists and enhance the security of students, faculty, and staff. Those who oppose campus carry have contended that universities have low crime rates and that allowing firearms to be carried on campus will increase the number of accidental discharges, suicides, and violent crimes. Given these trends, this paper traces out the discursive struggle over firearms on college campuses in the state of Idaho. By conducting a qualitative thematic analysis of newspaper articles, social media posts, and transcripts of legislative debates, this paper traces the evolution of the campus carry debate. Particular attention is paid to how supporters of campus carry constructed the role the concealed firearms could play in deterring and thwarting mass shootings and terrorist attacks on U.S. college campuses.

Minefield Montage: Juxtapositions of Materials, Stories, and Sensoria from Cambodia

This presentation will depict the use of montage as a sensory ethnographic method in a Cambodian minefield among deminers who were training to detect landmines with mine detection rats. Montage allowed unexpected relationships to emerge, from uncertainty's relationship to love to human relationships with spirits. The paper draws from juxtapositions of multiple fieldwork materials from visuals, narratives, and sensorial sources (such as audio and touch). I focus on exemplary moments of montage from the field: 1) contemporary art by Cambodian artists with filmed fieldwork scenes; 2) narratives of love deminers have for the rats with narratives of suspicions they have for coworkers; and 3) the homage the deminers give to a dead rat with the homage they give to spirits. The senses bridge across these juxtapositions, revealing unnoticed parallels and exciting connections. Considering that the minefield threatened potential violence in the form of explosives in the ground, by the state which surveilled the deminers, and the former combatants-turned-deminers themselves, montage offered a useful method for allowing what was unsaid but also expressed more apparent to an outsider. Moreover, because the fieldwork entailed understanding spirits and nonhumans like mine detection rats, montage formulated ways of knowing that went beyond words. Key for this presentation is utilizing associative logic to understanding the minefield's milieu with all its actors: humans, rats, spirits, and ethnographer. Unnoticed, and sometimes unspeakable, connections and patterns emerged through the relationship between the materials, stories, and sensoria of the minefield. This presentation will make use of the montage mentioned above by showing them directly as part of the presentation including soundscapes, video, and narrative.

RC32-595.1DEB, ISHANI* (*University of Calcutta*)*Legitimization of Surveillance and Discipline in Schools in Kolkata: A Study of Students' Lived Experiences of Discursive Practice*

Schools as an institution have utilized surveillance in numerous ways: through televised monitoring of the students, by creating students' profile in the website that amount to creating students' database and through gender normative behaviour. Deeply pronounced cultural values and language define such apparently gender neutral disciplinary mechanism (Gregory and Fergus, 2017; Monahan, 2011). The analysis on subjugation and subordination has been contributed by the feminists and by the theorists of power (Lukes, 1974/2005). The research contributions regarding this issue have been multifaceted. Feminists like Nancy Fraser (2013) and Paula England (1999) have invoked the philosophy of knowledge on the politics of representation and body construction. Also several works have been towards the pedagogy of teaching, etching out of how the hierarchy between the students and the school management has been maintained (Chanana, 2002). Finally the conventional utilization is that of Foucauldian notion of surveillance. The underlying implication is that CCTVs are not the only determining factor in body control and surveillance. Different schools respond with varied experiences. Uniform strictures of students based on gender, obsession with IDs and compulsory prayer service of the students monitored by the principal are also the factors of discipline. Meenakshi Thapan (2014) pointed out, it is required to decode the classroom experiences in the words of the students themselves and that the scholars move beyond the scope of analyzing the macro structures of discipline and surveillance. This paper therefore presents the narratives of the students of both the gender segregated schools as well as of the Coeducational institutions (schools) in Kolkata. The respondents are both male and female students of the ninth and tenth grade from the middle and from the upper middle class background. The paper also talks of how the students understand these discursive practices and comply with the rules without fail.

RC02-JS-53.2DECIEUX, FABIENNE* (*Johannes Kepler University*)*The Economic Shift and Beyond: Care As a Contested Terrain in Contemporary Capitalism (co-authored by Brigitte Aulenbacher, Fabienne Décieux, Birgit Riegraf)*

This paper argues that we are witnessing a fundamental transformation of capitalism in the Global North. Under the auspices of an economic shift, social reproduction and constituent care and care work are undergoing a process of reorganization. The first part draws on Polanyi's analysis of the relation between market and society and on contemporary revisions of his approach. Referring to core arguments from his perspective on the "market society" it identifies processes of commodification, marketization, and quasi-marketization, which we can understand as an economic shift driving the development in the field of care and care work. The second part refers to empirical studies in Austria and Germany and reflects in terms of a Polanyian "double movement" on how far care and care work - in the case of elder and child care and, more precisely, home care agencies, residential care communities and the social investment state - have become a contested terrain. The third part points out how local and global tendencies are interrelated and shows the societal relevance of the reorganization of care and care work.

TG04-984.5DECIEUX, JEAN PHILIPPE* (*University of Luxembourg*)*Bargaining for Evidence in a Hybrid Forum? the Case of an Expert Group Chaired By the European Commission.*

In the area of policymaking, we observe that decisions are increasingly based on knowledge/evidence gained through debates in hybrid advisory organisations. This knowledge is used to ideally fade risks and uncertainties by calculating the risks involved in the final decision and by this to legitimize political decisions by delivering hard-facts in the argumentation (e.g. as "evidence-based-policy-making"). A consequence of these decision-making processes is the authoritative implementation of knowledge and direct application into the context of everyday-life. Such a political-decision-context often is a very specific situation, in which traditional mono-disciplinary scientific knowledge commonly is not precise enough, because usually it is produced to be universally valid and bases on certain assumptions. What is needed in such a context of real life application is socially robust knowledge.

As a response to that demand, the mode of knowledge production is changing. Instead of linear-ordered knowledge-production, hybrid forums of heterogeneous actors are becoming important. These actors are debating and bargaining solutions to a problem and are co-constructing contextualized knowledge as decision-making-base for the specific context of application. This discursive process of knowledge production is not only affected by different forms of knowledge from

heterogeneous actors, it is also influenced by heterogeneous world of relevancies of the actors (interests, targets, practices, experiences...).

This study assesses and analyses with a multiple triangulation how an Expert Group of the European Commission develops knowledge within a transdisciplinary- and transnational expert-discourse. Based on multiple data sources my study is offering information on how evidence is produced in decision-making within such hybrid forums, e.g. important factors, processes and structures influencing political knowledge-systems.

RC22-412.3DEEGALLA DURAGE, ANTON PIYARATHNE* (*The Open University of Sri Lanka*)*Religious Rituals As a Way of Living with Conflicting Ethnoreligious Nationalisms in Sri Lanka*

To many it is hard to imagine that conflicting ethno-religious groups in Sri Lanka actually unite in everyday interactions. In this presentation I will explain why and how this happens in a context where essentialisations of ethnic and religious labels prevail and relations between groups are still tense following years of conflict. My recent fieldwork in the rural village of Panama shows that people belonging to three different ethnic groups, Sinhala, Tamil and Muslim, tend to overcome their differences in the context of rituals that blend Hindu and Popular Buddhist traditions. I will discuss the ways in which religion provides an environment for conflicting groups to unite building on Victor Turner's idea of communitas (1969) as recently applied to the lived religion of pilgrimages (Hermkens, Willy Jansen, and Notermans 2009). In the Sri Lankan context communities is established through the power of rituals which unites people according to their concerns: security and safety. The two main religious performances are the yearly worshiping of the Hindu goddess Pattini and the annual pilgrimage to the shrine of the Hindu god Murugan (or Kataragama). Both rituals start with a three to six days walk of around 105 kilometres to the Murugan Temple located at Kataragama in the month of July, followed by rituals called ankeliya ('horn pulling') for paying respect to the goddess Pattini, in the following month. Sinhala and Tamil villagers join with the outsiders (sami) to walk through Panama and the Yala National Forest to do the pilgrimage. During ankeliya the entire village is divided into two: udupila ('upper side') and yatipila ('lower side'). Both the low caste and high caste Tamil people join hands with the fellow Sinhala villagers according to a traditional belief system, which says that the festival will profit the whole community.

RC05-117.3DEEGALLA DURAGE, ANTON PIYARATHNE* (*The Open University of Sri Lanka*)*Struggling to Construct "Home" in Ethno-Nationally Divided Sri Lanka*

This paper will discuss the everyday struggle of multi-ethnic Sri Lankans to construct "home", and is based on ethnographic research that was conducted for my PhD work. In this discussion, the "home" refers to a concept I used in my research as "commongrounds", a process in which people belonging to conflicting ethno-national groups continuously struggle to create a social space favourable for (peaceful) living. The everyday life of the members of the multi-ethnic community in the country became uncertain and insecure in post-independent Sri Lanka. This was a result of the politicization of ethnic and religious groups, in post-independence party politics, which were established under the Westminster democratic model by British colonisers. This situation was further reinforced by the strengthening of ethno-religious identities during the 500 years of colonial administration in the country. The peak of these divisions was experienced by all Sri Lankans - Sinhalas, Tamils, and Muslims - during the internal war that continued for nearly three decades. In the post-conflict context, the Sri Lankan state has not satisfactorily addressed the ethno-national conflict. My paper will explain ways and means through which local people of multi-ethno-national backgrounds construct and maintain a harmonious relationship and create a peaceful environment, a social space that can be identified as "home", within this context.

RC51-853.1DEGUCHI, HIROSHI* (*Tokyo Institute of Technology*)*Constructive Social Systems Theory - As Sciences of the Techno-Social Artificial -*

The first Internet revolution has caused the deep change on the B2C based industrial structure and related life worlds. The second Internet revolution which is characterized by IoT based technology & management will change B2B based industrial structure and our life world where we are embedded in functionally and semantically through division of labor. New distributed organization and related work style depend on new division of labor which will be created by IoT based management. This is one possible scenario of a reality shift. There is another reality

shift scenario where B2B platform will be locked-in and the labor market will be divided into "high value added & high capability creative class" & "low value added & low capability worker class".

We are living not on stable traditional life world but on fluid & continuously constructed & reconstructed world. Where we are confronted by continuous reality shift.

The process of modernization is characterized not only by a disembedded & personalizing process from traditional reality. There exists a new embedded process in a new constructed reality.

How we can analyze the embedded and disembedded process?

Natural sciences and some social sciences focus on the universal law. But it is impossible to find the universal social law for a society because a reality of a society is a constructed reality. Some social sciences focus on construction of a reality for a limited context. They do not focus on the techno-social system where both functional and semantic aspects are required. On the contrary, there exists a commensurability gap between functional and semantic aspects.

We have to bridge the commensurability gap between functional and semantic aspects and have to construct a new methodology and modeling method to manage the reality shift process as "Constructive Social Systems Theory".

DEL RE, EMANUELA C.* (Univ. Niccolò Cusano of Rome)

Minorities, Conflicts and National Identity. the Yazidis: A Case in Point.

The persecution by ISIS of the scarcely studied Yazidi community (A. Birgül, 2014) has raised questions about the destiny and role of all minorities in the new Middle Eastern asset and about the strategies and normative to protect them and preserve their presence in the region (M. Ma'oz, G. Sheffer, 2002; W. Kymlicka, E. Pfössl E. 2014). The A., who has carried out extensive research on and with the Yazidis since 2013, analyzes their actions and conditions at local, regional and international level, enhancing their transformation from being a vulnerable group virtually unable to react, to being a credible interlocutor for the Muslims in the fight against a common enemy such as ISIS. A transformation due to changes occurred in the recent years in the community such as more openness, political recognition and other, in line with globalization and with the media exposure following the persecution (E. C. Del Re, 2015, 2017). Moreover, their ethnicity has become an important element in their social and political role and position in the Iraqi-Kurdish society that has become even more significant in the referendum for the independence of Iraqi-Kurdistan in September 2017, where their national identity emerged as a key element. The relationship with the consistent diasporic communities in Europe and in the USA is also a relevant element of the new phase in their history. Their appeal for the recognition of their persecution as Genocide, promotes them as bearers of fundamental global values, and makes them a case in point for all minorities.

"Gendered Borders": Migrants and Refugees Shaping the Policy Making Process

The gender dimension of borders crossing has been scarcely studied (K. Ohmae, 1990; A. Paasi, 2009; T. Wilson, H. Donnan, 1998, 2012). The A. has studied the process of "gendering" the European Union Borders and its effects on policy making, analyzing critical issues such as the concept of borders and boundaries, as constructed lines of differences, and the process of policy making in the EU. The presence of vulnerable groups amongst refugees and migrants in the flows since 2014, has obliged the Council of Europe to recommend to the member states to take into account gender-based violence and gender-related persecution in their asylum systems. The Istanbul Convention of the Council of Europe 2014, for the protection of refugee women against violence, focuses on the reception procedures and support for asylum seekers. According to the interviews and materials gathered in long field researches by the A. amongst refugees in Iraq, Jordan and Syria, amongst diasporas in EU – Yazidi and Christian – the experience of men and women (according to age class) are different with specific vulnerabilities in various stages (according to the phases of their journey) and in various forms (for instance violence suffered by women in the country of origin, when they become the victim of abuses during their journey, when they are trafficked). When crossing the borders, their vulnerability emerges more because of loss of points of orientation, lack of know how, risk to be blackmailed to access resources, risk of sexual abuse etc. (Amnesty International, 2017). Not only women: also single men and children suffer types of violence and have become the object of a specific normative in EU countries. The concept of "Gendered Borders" offers a new perspective in policy making, in prevention and resolution of conflicts and violence (S. Shekhawat, E. C. Del Re, 2018).

The Effect of "Migrant Women's Capital" Working in Domestic Service in Spain

Recent decades have witnessed considerable dynamism and change in domestic service in Spain. Social, economic and demographic developments in society have led to both the massive incorporation of women into paid jobs and a rapid ageing of the Spanish population, which has increased the demand for domestic workers. This demand has been covered largely by migrant workers.

The aim here is to analyse the job trajectories of migrant women that are working, or have worked, in domestic service in Spain, paying special attention to the effects of the economic crisis. It should be noted that domestic service in Spain, both from a legal perspective and in practical terms, encompasses both housework and the care of dependent persons in private homes, generally combining both these tasks. We consider three decisive factors in these women's labour trajectories: human capital upon arrival (job experience and level of education), social networks, and family circumstances, which we refer to as "migrant capital".

This study has involved 34 in-depth interviews with migrant women that are working or have worked in domestic service. The fieldwork conducted between November 2015 and November 2016 was based on a theoretical sampling of an intentional nature. In other words, the aim was to achieve a heterogeneity of profiles according to the women's provenance (Latin America, Africa and Eastern Europe), legal status (regular or irregular), family circumstances upon arrival (with/without partner; with/without children), and level of education.

The study reveals a major heterogeneity of situations due largely to the sector's poor regulation and each woman's different conditions upon arrival. Initial insertion, labour trajectory and the effects of the crisis are highly influenced by these two aspects. For migrant women, working in domestic service is indeed a good opportunity for finding work, but at the same time it presents numerous pitfalls.

DELANEY, HELEN* (The University of Auckland)

Social Inequality and Crises of Democracy: The Role of Workplace Participation

In a climate of increasing economic and social inequalities, this paper considers the potential for more participatory and democratic ways of working to address such inequalities. The academic debates about social inequality provide a thorough understanding of the macro-economic causes of, and solutions to, inequalities. However, these discussions insufficiently consider the changes in work, employment relations and organizational practices in recent decades. The erosion and dismantlement of former institutions that protected workers and helped to foster democratic sensibilities has brought a considerable social toll. In order to more fully understand social inequalities, we must examine the social relations of production within workplaces, especially with regard to worker voice and influence.

Contemporary academic debates about the function and value of employee participation and involvement rarely connect with concerns about political and social justice. In this paper, we argue that contemporary expressions of organizational democracy are vital resources for redressing workplace and economic inequalities.

We provide evidence from two longitudinal qualitative case studies of companies based in New Zealand, both of which are engaged in a strategic partnership with trade unions to improve employment relations, organizational culture and firm performance. Both partnerships entailed extensive changes to the structure and processes of ER, and required significant training in collaborative decision-making and conflict negotiation. In both organizational sites, employees are more actively involved in identifying, solving and implementing solutions to substantial problems relating to the quality of work life and economic performance.

We identify the main effects and outcomes of the strategic partnerships for management, unions, and employees. Our interest is to capture the contested and delicate nature of the ongoing efforts to accomplish a more progressive form of workplace relations. Ultimately, we offer evidence of socio-cultural innovations that give rise to economic and social benefits both within and beyond the workplace.

Gendered Violence Regimes: Context, Policy and Practice in Intimate Partner Violence in France and Sweden

This paper argues for more complex analyses of welfare state gender regimes by focusing on a key element frequently forgotten in cross-national comparisons: intimate partner violence (IPV) and responses thereto, especially criminal justice system (CJS) responses. We return to the notions of gender regime and welfare regimes, and critically elaborate them through the notion of gendered violence regime, to analyse gendered socio-political and judicial institutions and practices. According to Haney (2004), welfare state regimes, gender regimes and judicial regimes tend to match together in how policies are named, debated and implemented. However, many comparative welfare analyses do not attend to violence; moreover, violence and responses thereto are rooted in institutions and inequality regimes (Walby 2008).

Building on earlier work (Hearn, Strid et al. 2016), we use comparative methods to address discursive dynamics and judicial practices in France and Sweden in the light of transformations in gender regimes, illustrative of broader contextualizing and theoretical concerns. First, we review relevant laws and policy, inspired by the Critical Frame Analysis (Verloo 2007), noting differences, similarities and convergences in welfare and judicial systems. Second, we focus on judicial practices in two countries, particularly in CJS treatment of IPV. In Sweden, more explicitly gendered structural policy is accompanied by cases being constructed and treated more individually by professionals with real expertise on domestic violence; while in more corporatist regime France, only very serious cases are so treated, and less individual, more proceduralised assessment of cases by workdays lost is used. CJS procedure impact the construction and definition of the problem, especially regarding how professionals consider the gendering and seriousness of the violence in making a case.

Finally, we critically interrogate how useful "regime" typologies are, including in providing avenues for intersectional analyses combining sociological theories of change (Muller 2005) and transformation (Felstiner et al. 1980).

KOBANDA, DIEUDONNE (*University of Strasbourg, research center Dynamiques Europeennes*)

Access of Immigrant Roma Families to Strasbourg's Integration Policies, in Particular French-Language-Teaching Policy. an Example of Biographical Policy Evaluation.

We have been working on the comparative "biographical policy evaluation" of social policies concerning migrants in Strasbourg and Frankfurt, e.g. local programs for teaching to new migrants the language of the host country, hence French in Strasbourg. The method of "biographically evaluating" social policies takes note of the fact that social policies relevant to different domains (such as housing, healthcare, vocational (re)training and access to local labour markets, childhood, language programs for migrants...) are most of the times developed and implemented by different public agencies (or private subcontractors), mostly separately; while the combination of their decisions on the conditions of life of given individuals or families necessarily interact and may engender unforeseen and unwanted effects. Hence the idea of evaluating policies "from below", through in-depth case studies and case histories of small samples of recipients. This is an approach to evaluation that also has the advantage of allowing to observe how recipients receive, perceive, and react (or even proact) tactically and strategically to make the best possible use of policies oriented towards them. In doing so - and without necessarily being aware of it - they "join the game", which if they are for instance migrants, does contribute powerfully to their integration. We will present here the case of Roma families coming from Eastern European countries to settle in Strasbourg, and of their reactions to municipal policies aiming at teaching them French to foster their access labour markets.

DELGADO, JUAN* (*University of California, Sociology*)

The Religious Life of Ethno-Racial Mobilization of Blackness in Colombia

After the Second Vatican Council (1962-1965), important sectors of the Colombian Catholic Church were "opting for the poor" at a time when Latin America was going through exclusionary processes of economic development and political authoritarianism. The emergence of liberation theology not only sensitized priests to socio-economic inequalities but also to ethno-racial demands by Indigenous peoples and Afrodescendent populations. However, during the same period, the Colombian Catholic Church has been described as one of the most conservative catholic ministers in Latin America. How to understand the emergence and differentiated impacts of liberation theology on ethno-racial mobilization processes in Colombia? Using a field-theoretic approach, this paper argues that liberation theology was more likely to incubate ethno-racial process of mobilization in marginal but committed sectors within the Catholic Religious Field. Non-diocesan priests from Missionary Catholic Orders were particularly prone to put liberation theology in practice. Through in-depth interviews and archival data, this paper reconstructs pastoral practices of Claretian Missionaries in rural areas

of the Northern Pacific Coast that were conducive to the mobilization and legal recognition of ethno-racial demands of Afrodescendent populations in Colombia.

DELLA RAGIONE, LINDA* (*University of the Basque Country UPV/EHU*)

Advertising and Female Body: Evolution and Social Issues

In order to create consumers, *ad men* had to develop universal notions in co-operation with social psychologists that have demonstrated the effectiveness of links between "instinct" and mass sales. The methodologies followed to create ads have evolved and changed deeply, jointly with the evolution of economy. Both the industrial revolution - before - and the rise of consumerism - later - had a determinant impact upon the characters of advertisements, whose content moved gradually from mere information to more or less subtle persuasion, to be achieved through the stimulation of a consumer's emotional and psychic sphere. Nowadays, commercials manipulate people's strongest desires and greatest fears to convince them to buy their preferred products and, doing so, they also uphold stereotypes regarding class, gender and race. The aim of this paper is to show the historical evolution of the use of the female image in advertising during the last decades and the social issues related to this topic.

RC25-478.5

DELLA RAGIONE, LINDA* (*University of the Basque Country UPV/EHU*)

Free Speech and Sexism: The Role of Social Media

Since advertisement started to arise, women have been increasingly used as protagonists in order to advertise and sell products devoid of any connection with the female body. Their image has been undressed, fragmented, up to decapitated. We came to speak about the 'commodification' of the female body. That gender representation in advertising is not neutral, and that this has a deep impact on society, is proved by the attention that high-ranking researchers have devoted to the ethical questions directly emerging from these matters. Erving Goffman in 1976 expressed his opinion about the contribution that the role models proposed by the media and by advertising gave to the meaning of "gender identity" since they strongly pervaded society, due to their public diffusion. For any legal system, an especially difficult problem consists in putting limits to the freedom of speech. In the advertising industry, it is possible to find an example of the "third way" proposed by R. Abel in his *Speech and Respect*, in order to solve the conflicts caused by a speech, namely a (semi)-informal process through which it is possible to regulate the speech itself, besides solving a conflict. The aim envisaged by Abel is an institutionalized but informal conversation between the victim and the offender where the offender should offer an explanation, an alternative interpretation of his own ambiguous words and impenetrable motives. The victim, in turn, could accept this explanation and his injury might heal. There are some examples of public excuses presented in a "communitarian" way from ads companies. Nowadays, the easiest and more practical manner to express a public apologize is through social medias. The aim of this paper is to prove the effectiveness of Abel's third way in the advertising field, in order to redress the status equality between men and women.

RC22-415.4

DELLAPERGOLA, SERGIO* (*Hebrew University of Jerusalem*)

Antisemitism: National or European Constellation?

What are the fundamentals of contemporary antisemitism? Jewish excessive power, Holocaust denial, and Israel demonization are the three main strands of antisemitism. A fourth type stressing the Jew as a physical and moral degenerate was important historically but is less central today. There have been and there are different ideological foundations - pagan, Muslim, Christian, left-wing, right-wing, and liberal-centrist. Christians and Muslims view the Jew as enemy, but also as possible neophyte. Political antisemitism condemns the Jew for different and specular reasons: the Capitalist, the Bolshevik. For liberals, the main theme is assimilation of the Jews. Fundamental research needs include: noting the number of events and the number of perpetrators; looking at the number of people exposed to the event, or the multiplier of events and people exposed to them; a comparative framework, time-oriented and in association with external events - economic conjuncture for example; and understanding differential geographic, demographic, socio-cultural characteristics of perpetrators and victims alike. Finally, one needs to look at the frequency and patterns of Jewish response. Looking at past research experience, we detect studies of antisemitic acts, perceptions, and discourse. We need to start creating a coherent mapping sentence toward more integrated studies in the future. We must outline who is the active and passive actor; who pursues action after the initial antisemitic event; and what are the main diffusion channels. Longitudinal studies have been quite absent from the scene. How to react to antisemitism? Through educating people to Jewish values and history, doing good deeds and providing good behavioral examples, being politically active, bringing people to directly know Jewish and

Israeli realities, and – last resort – knowing how to practice self-defense. Data illustrative of these topics will be presented based on recent research in Europe.

DELLO BUONO, RICARDO* (*Manhattan College*)

Crisis Neoliberalism and the Global Retrenchment of Social Welfare: A Second 'end of History'?

Just as the social welfare state arose to reproduce and mediate the contradictions of an ascendant phase of capitalist expansion, the ongoing retrenchment of the social welfare state forms part of an epic struggle to maintain profits within the contradictory limits imposed by a deepening structural crisis. Political opposition to social spending cutbacks was initially weak as neoliberalism proved adept at fragmenting the traditional bases of popular resistance, leading democratic/social democratic parties to succumb to the dictates of global capital and opting for "softer, gentler" neoliberal reforms as the "only alternative" to savage austerity and neoliberal restructuring. In the 1990s, an earlier phase of ascendant neoliberalism yielded the triumphant proclamation of an "end of history" which subsequently came crashing down in the throes of a deep and persistent recession. In more recent years, a deeply dimensioned political trend to the right has refueled and accelerated the tendency towards establishing an ever lower common denominator for recalibrated social welfare regimes, taking on proportions of a new "realism" in policy making that amounts to a second "end of history." This paper explores the future prospects of the embattled social welfare state, using comparative observations from its peak paradigmatic expression in the Nordic countries of prior decades as well as from its most minimalist form under US "exceptionalism." The precarious social consensus that sustains this trend contains its own fissures that underlines the contradictory character of neoliberal crises. Social democratic parties that once championed the universalization of comprehensive social welfare policies but have since embraced acquiescence to neoliberal retrenchment, presage the emergence of new oppositional forces that reject these parties. What remains to be seen is whether an upsurge of popular mobilization can successfully disrupt and detain the hardening policy regimes of neoliberal retrenchment.

The Feminization of an Established Profession: The Case of Notaries in France.

Ten thousand notaries appointed by the Ministry of Justice are working now in France with a status inherited from the former venality of offices. The traditional way of entering into this liberal profession was for the aspiring notary to be presented to the supervisory entities by the assigning notary, who receives a price corresponding to this right of access. As a result, the labor market for notaries is not very open and is dominated by a patrimonial conception of the trade. Women have suffered in particular from a weak access to the profession that has long been male oriented. Nevertheless, the advancement of the wage-earning system favored their entry into the notarial profession. By 2014, nearly 34% of notaries are women, yet they only constitute 30% of the notaries who are partners but 65% of the salaried or wage labor notaries. However, the increase in women in the notary profession still faces a glass ceiling and even resistance. I will discuss during my presentation the entry of women into wage labor; the fact that the notaries "corps" is now feminized; the existence of a glass ceiling. The effects of the current reform of the profession by the "Macron" law of 6 August 2015 have also to be called into questioned. If the introduction of a retirement age could accelerate the departure of mainly male populations, and if the increase in the number of offices and notaries is expected to increase the flow of entry into the notary profession, several obstacles remain, however. Finally, the reform reinforces the competitive logic and promotes liberalization that can just as easily promote female entrepreneurship as generating gendered segregation logics. It also provokes resistance in the profession and reform projects which are liable to promote as to limit the feminization of the profession...

However, the increase in women in the notary profession still faces a glass ceiling and even resistance. I will discuss during my presentation the entry of women into wage labor; the fact that the notaries "corps" is now feminized; the existence of a glass ceiling. The effects of the current reform of the profession by the "Macron" law of 6 August 2015 have also to be called into questioned. If the introduction of a retirement age could accelerate the departure of mainly male populations, and if the increase in the number of offices and notaries is expected to increase the flow of entry into the notary profession, several obstacles remain, however. Finally, the reform reinforces the competitive logic and promotes liberalization that can just as easily promote female entrepreneurship as generating gendered segregation logics. It also provokes resistance in the profession and reform projects which are liable to promote as to limit the feminization of the profession...

Narratives of Immigrants: A Comparative Analysis of Generations

A comparative analysis of successive generations of families is relevant to the understanding of international migration processes and the experiences of the subjects. This paper analyses oral narratives obtained under the form of histories of life in a study carried out on dislocations occurred between Africa and Brazil in the 1970's decades 2000. We focus the memories who came for Sao Paulo when powders-independence are escaping of the colonial war and of the difficult situations in Angola and Mozambique. We interview Portuguese, Luso-Africans and Africans whose trajectories were very varied, having in common the fact that they all went out from Africa at the same moment – from political questions and the war. When interviewing different generations of each family, we could get different representations of the same facts and experiences, as well as from one generation over another. The family histories may also be considered. The nature of the questions to research had led us on a historical incursion, taking into account the fact that talk of second and third generation involved, in the case of these migration processes, in talking about children and young people. This aspect is usually not considered in most studies: that large proportion of children and young people carry on their life experiences in different socio-economic and cultural realities. Tried to verify that implications displacements during this period of their lives and experiences established during the checkout process and entry into new contexts can lead to the experiences, cultures and identities of children and young people and that the analysis of these elements could highlight issues. Urges us to question how each generation represents its history, the history of its family, and the history of the nation of origin of the first generation.

Relationalizing Contact Theory: The Dynamics of Contact and Contention

Contact theory argues that groups of people become less prone to conflict with each other the more they are in contact with each other, holding that contact reduces stereotyping, prejudice, and hostility. While empirical evidence for and against the theory exists in the literature, we argue that the flaws of the theory relate more to its conceptual and methodological underpinnings than to its empirical correspondence.

The theory pays attention to relations among groups primarily in terms of hierarchy, competitiveness, and interdependence. While this is a promising, it is neither sufficiently relational nor dynamic. Above all, the theory pays little attention to the role mechanisms play in the generation of conflict-prone and non-conflict-prone contact. Relaying on the analysis of variable covariance, it hints, at best, at the presence and consequentiality of mechanisms but does not investigate actual mechanism operation.

In order to better explain why *sometimes* contact leads to violence, we reconstruct contact theory conceptually and methodologically. Rather than conceptualizing groups as pre-given units, we conceptualize social formations resultant from boundary relations. Methodologically, we analyze mechanism operation, rather than treating mechanisms as intervening variables. Particularly, we analyze the interplay among mechanisms and reverse mechanisms. This allows analysis of the key process whereby contact becomes politicized, hence no longer contained in the private realm but rather consumed by the public realm, where the state is implicated.

We apply mechanism analysis in a comparison of two settings: colonial Cyprus (1945-1959), where members of the Greek and Turkish populations were in contact; and West Bank (1967-2001), where members of the Israeli Jewish and Palestinian populations were in contact. Each of the two settings featured, respectively, historical periods of politicized contact promoting violence and depoliticized contact impeding violence.

RC26-484.3DEMIDOVA, YULIA* (*Moscow State University of Lomonosov*)*De-Urbanization in Central Russia: Socio-Cultural Transformations in the Life Practices of Modern Rural Communities***De-urbanization in Central Russia: socio-cultural transformations in the life practices of modern rural communities.**

The aim of my study is to find out whether de-urbanization in Central Russia can be explained as a form of escapism. The last to be interpreted as the way of overcoming one's individual and social problems, meeting the aspiration to get rid of political ideology and employment relationships and find peace, solitude and tranquility.

Or, otherwise, is it still an ordinary form of urban-rural life, when a city dweller live in «two homes» of city apartment and holiday village (dacha) in suburb and do not realize his lifestyle as something opposing commonly accepted standards.

The long-term observation and inquiry into the life of eco-villages and dachas enable us to say, that the life in the Russian countryside encourages the inhabitants to become more sensitive to their state of dependence on social system in different spheres of life, such as:

- Physical self-maintenance
- Informational autonomy and independence from the official media
- being beyond the biopolitics (cultivation)

We can also state the situation of cultural divergence between dachas and eco-villages

- dachas – deal with the soviet legacy, common urban culture, self-actualization practices.
- eco villages – are inclined to invent their own traditions and generate original ideology. In this way we come across with neopaganism and nationalism.

Such a research is inevitably linked with socio-psychological issues. The concept of de-urbanization for the eco-villagers therefore implies that when you leave the city and move to rural area you take responsibility for your life and escape from the influence of social manipulation and biopolitics.

RC32-589.6DEMOS, VICKY* (*University of Minnesota, Morris*)*Domestic Violence and the Twentieth Century Greek Family in Greece, the United States, and Australia*

Gender inequality is most critically evidenced in violence against women. It is estimated that one in four women in Greece has or will be the victim of violence sometime in her life. Domestic violence has been shown to have increased there since the onset of austerity. In addition, it has been argued that it occurs among the poor and the uneducated.

Greeks are known for their strong family system, a system that has provided personal safety and security throughout Greece's tumultuous history. At the same time, the sacredness of this institution has until recent decades meant that family violence has existed in secret and with impunity.

Based on my research of Greeks in Greece and the diaspora of Australia and the United States during the twentieth century I will identify ways in which domestic violence was largely unrecognized as a social issue. In addition, using sources such as the United Nations CEDAW report on Greece, WIN HELLAS, an NGO founded in Greece in 2006 to empower women and fight domestic violence, the Daughters of Penelope, an organization established to maintain and continue the Greek culture and now engaged in domestic violence projects, and family studies, I will explain how 21st century institutions outside of and within Greece have provided support for the elimination of domestic violence during its heightened visibility currently as austerity has been implemented.

Overt violence will be covered as well as symbolic violence manifested by the idea of the traditional or patriarchal family. While discussion of actual statistics will be limited to Greece, discussion of violence in the Greek family in Australia and the United States will be based on qualitative research. The sociological recognition/non-recognition of the issue will be compared to the psychological and anthropological.

RC06-126.2DEMPSEY, DEBORAH* (*Swinburne University*)PARKINSON, SHARON (*Swinburne University*)ANDREWS, CAL (*University of Melbourne*)MCNAIR, RUTH (*University of Melbourne*)*Family Conflict and Violence As Pathways into Lgbtiq Homelessness in Australia*

Homelessness for LGBTIQ people is a product of personal vulnerabilities and structural stigma that embeds heteronormative, queerphobic, and transphobic prejudices in everyday experience. Rejection by family of origin is well-documented in international literature, and greater reliance on families of choice

including friendship and community networks is known to be supportive in the face of conflict within family of origin. To date, less is known about how family violence and conflict contribute to first homelessness among LGBTIQ Australians. There is a great need to understand their distinctive experience of family violence, conflict and homelessness in order to resolve early home leaving and the ongoing cycle of housing instability.

This paper presents the findings on family conflict and violence from a mixed methods research study of Australian LGBTIQ homelessness. We conducted a secondary data analysis of two national surveys of homelessness that contained responses from heterosexual, lesbian, gay and bisexual people of all ages. We combined these with 19 qualitative interviews with homelessness service providers and 17 LGBTIQ service users.

Reported reasons for first homelessness differed significantly according to sexual orientation. LGB survey respondents were more likely to report relationship breakdown, family conflict and family violence than heterosexual respondents. Higher levels of childhood sexual assault and out of home care experiences for LGB people indicated that conflictual issues in families of origin arise much earlier than adolescence for some. While family support was lower for LGB respondents than for heterosexual, support from friends and a greater reliance on community groups rather than family for support was potentially a protective factor in pathways out of homelessness. We discuss the implications of these findings for policy and service provision, and with regard to future LGBTIQ research agendas related to family conflict or violence and homelessness.

RC41-710.3DENIER, NICOLE* (*Colby College*)WAITE, SEAN (*University of Western Ontario*)*Who Gets Hitched?: Documenting Selectivity into Partnership Among LGB and Heterosexual Canadians*

Mounting evidence suggests that sexual orientation matters in the labor market. Nonetheless, existing research remains limited by available data. Censuses and labor force surveys, which have high quality, detailed earnings and employment information, often do not have measures of sexual orientation, leaving researchers to identify sexual orientation through conjugal partnership with someone of the same self-identified sex. Health surveys increasingly ask questions about sexual identity and practices but do not offer large sample sizes nor quality measures of labor market outcomes. Thus it remains to be seen how understandings of economic inequality between heterosexual and non-heterosexual populations change based on the type of data used. In particular, a key question is whether LGB and heterosexual singles and couples are similar in terms of characteristics that impact labor market outcomes. In this paper, we draw on the 2003 to 2014 Canadian Community Health Surveys (CCHS) to document how selectivity into partnership varies for heterosexual and lesbian, gay, and bisexual individuals. Specifically, we focus in on how single versus partnered individuals vary in terms of age, educational attainment, occupational status, labor force engagement, and health.

RC23-426.7DENIS, ANN* (*Université d'Ottawa*)HEAP, RUBY (*University of Ottawa*)*Using a Feminist Interdisciplinary Lens to Research Gender and Canadian Engineering Education: Processes, Challenges, and Potentials*

Despite their increasing participation in Canadian higher education since the 1970s, women remain underrepresented among undergraduate students in engineering. To explore why this is, our interdisciplinary research team has undertaken a complex mixed methods study of selected faculties of engineering in which women, though still a minority, constitute an atypically large percentage of the undergraduate student population. The study included questionnaires and interviews, completed by women and men engineering students, professors and administrators within engineering, along with direct observation and the collection of documentary material. This paper reports on the various processes and challenges we encountered, linked to the development and use of multiple methodologies within an interdisciplinary research team, including the mutual education of team members about theory, research techniques, engineering cultures and practices, and the building of a consensus over the rationale for our eventual research design. To date, little Canadian research on gender and engineering education has been conducted with the basic goal of bridging perspectives across social sciences, education and engineering, while this was identified from the start as a key objective of our team of feminist professors and graduate students. We conclude by discussing how the resulting research experience confirms our conviction that such interdisciplinary research offers great potential for generating new knowledge that can help improve the situation of women in engineering education.

RC52-857.5DENT, MIKE* (*Staffordshire University*)CARTER, PAM (*University of Leicester*)MARTIN, GRAHAM (*University of Leicester*)***Challenging Medical Power? Citizen and User Involvement within the English NHS***

The profession of medicine in England has been variously challenged and changed by the growth of Public and Patient Involvement (PPI) in its various forms. Initially, and especially at the turn of millennium the emphasis was on a *deliberative* democratic model of citizen and user involvement. With the neo-liberal turn of *New Public Management* (NPM) in the following decade the emphasis switched to a consumerist approach (patient *choice*). This version challenged the power of the profession more immediately and directly. Currently, the emphasis has again changed, this time to *co-production*. This reflects an attempt at more consensual approach to managerial-professional power relations and a move away from (but not a rejection of) consumerism and NPM and the emergence of a *New Public Governance* (NPG). This, perhaps idealistically, seeks the hybridisation of doctors, patients and maybe even managers too.

The paper will review the extent of citizen involvement across the NHS and the professional bodies in service delivery and health research governance. In examining the power play involved, I will be assessing whether the involvement reflects an empowerment or manipulation the parties involved. For while not the only factor, citizen and more especially user involvement has played a crucial part in the reconfiguration of the power relations between the medical profession, managers and the state, as well as the public. In this paper I will draw on a Foucauldian analysis of power informed by an Actor Network Theory analysis.

RC33-609.6DERBAS, ALEXIA* (*Western Sydney University*)MAPEDZAHAMA, VIRGINIA (*Western Sydney University*)***Women Researching Violent Extremism: Gendered and Racialized Experiences***

Researching "radicalization" in a government funded study is a difficult process as the field work tends to reinforce ambivalence towards government practice. The difficulty is further compounded when the researchers are two women: a black woman racialized as black, and an Arab woman racialized as white. The paper is a critical, reflexive reflection on being in the field engaged in "Countering Violent Extremism" (CVE) research in Sydney, Australia. Eighteen youth service providers were interviewed to understand their attitudes and experiences towards "violent extremism" and young people at risk of "radicalizing" to violence. Participants shared traumatic stories of young people impacted by the Australian Federal Government's strict new laws for children seen to be involved in terrorist related activity. They also showed frustration for what they saw to be misplaced funding as they were dealing with other issues impacting young people more profoundly, such as domestic violence, drug and alcohol abuse and homelessness. The paper will explore how the two researchers navigated such challenging and often emotional topics. The researchers experienced the interviews differently, with power manifesting differently in different spaces, and so the paper will reflect on how these experiences were highly racialized. This, as well as being impacted by the different ages and career stages of the researchers.

RC22-420.6DERBAS, ALEXIA* (*Western Sydney University*)***Young Muslim Women's Politics of Everyday Living: Australia and the Digital Social***

Digital technologies have transformed the possibilities for religion and how it is experienced today. They have also magnified racist and sexist encounters, while simultaneously providing spaces of resilience and community. This paper explores young Muslim women's embodied practices of social networking in an Australian context. Contrary to the clash of civilizations thesis, young Muslims in Australia are not tasked with a distinct choice between tradition and modernity. Nowhere is this more evident than in the hybrid performances they engage in on mainstream social media sites. Platforms such as Facebook, Instagram and Snapchat require different performances of the self, foregrounding different identities at different times. The study shows that for young women, Islam is constituted in new ways through digital media and cultures, and this includes an interaction with "offline", "traditional" religion and religious practices. Connections with other Muslims, with non-Muslims and with political events impacting global Muslim communities are also constantly negotiated in ways that sometimes enforce traditional power structures, but also allow for a performance of the self that reconfigures power to centralize the individual's everyday practices. Digital media practices are here shaped by the gender and cultural expectations of different communities, impacted by a difference between online and "offline" selves, and

the consequences of presenting as a woman in both types of spaces. But social media also impacts on young Muslim women's different selves. The research makes a case for small samples in order to focus on situated knowledges and the notion of polyvocality within categories of people and within people themselves. In-depth mixed-methods research with twelve participants has allowed a better understanding of the intersectional identities of young Australian Muslim women and their online performances.

RC47-783.5DERMAN, OZGE* (*Ecole des Hautes Etudes en Sciences Sociales - Paris (CRAL)*)***Reflections on the Future of Turkey: Looking at the Two-Way Mirror of Gezi and 15 July***

Turkey has been navigating through turbulent waters since Gezi Protests in 2013. As a part of the post-2010 Occupy movements around the world, Gezi, characterized by its anti-governmental features, was giving the cues to build the idea of an alternative future through its non-organized forms of resistance. Following the very spontaneous yet tactical and performative resistance during Gezi Protests, counterpublic spheres and counterdiscourses proliferated in Turkey along with a strong belief in the transformation in society.

Nonetheless, the country is going through a process of increasing authoritarianism since then in which violence and the silence resulting from the violence reigns, not to mention the erosion of democratic principles. The coup attempt on 15 July 2016 and the people taking the streets against heavily armed soldiers to protect their president after his call for an immediate resistance becomes the second point of reference through which the present paper investigates the "meaning" of alternative futures. The ongoing state of emergency in conjunction with the restrictions on freedom of speech and media might not necessarily concern the multiple public(s) in the same way. The present paper aims to explore that the sense of future could easily differentiate according to those public(s).

The main question concerns thus how the subjects of both of the social movements become the actors through their bodily presences and repertoire of actions on the one hand, and on the other, in accordance with their values and visions on the future. Moreover, this comparison involves the questioning of the correlation between the imagining and the shaping of those subjects' future prospects.

This paper adopts a qualitative methodology based on hermeneutics as the process of understanding. The data is provided by semi-structured interviews with the participants of the protests, hashtag ethnography on Twitter as well as an analysis of visual materials.

RC57-JS-28.5DERMAN, OZGE* (*Ecole des Hautes Etudes en Sciences Sociales - Paris (CRAL)*)***Remembering the Victim(s): "You'Re Not a Fish after All".***

The assassination of the Armenian-Turkish journalist Hrant Dink in Istanbul in 2007 by a Turkish nationalist is a drastic incident in Turkey that remained engraved in people's memory. He was not the first or the last intellectual assassinated and those repetitive forms of death constitute a very strong image of Turkish history. His assassination brings into light once again the political crimes against humanity and subsequently the dynamic relationship between art and politics.

In 2010, Mihran Tomasyan, a member of Ciplak Ayaklar Dance Company, creates his performance called "You're not a fish after all" in memory of Hrant Dink. The performance is introduced in a fragmented mode like dreams, however it articulately addresses a collective memory shaped by continuous violence and injustices. It represents an individual recollection of a certain event through which the artist interferes with the remembering of a large group of people like a big family. That so-called family is concerned by and follows closely multiple comparable killings of intellectuals and journalists in Turkey. In fact after 2015, the assassination of Tahir Elçi, a Kurdish lawyer specialized in human rights issues, could become the subject matter of the same performance. The performance thus unwittingly stages instances and images from historically repetitive periods.

This paper focuses on the reconstruction of the collective memory through that artwork and it adopts a qualitative methodology, introducing hermeneutics as a process of understanding. The data will be provided by semi-structured interviews with Tomasyan and the spectators of the performance in several occasions, taking into account the place and date of the performances.

RC32-581.1DESAI, MANISHA* (*University of Connecticut*)***Beyond the Global North South Divide: Contemporary Feminist Debates in South Asia***

While there have been tensions at the governmental level between countries in South Asia, feminists and women's rights activists have always collaborated across those differences. Following a brief history of those collaborations, in

this presentation I will focus on how neoliberal globalization, the emergence of religious fundamentalisms, and militarization and wars in the region have shaped feminist debates. In particular, I will focus on the work of SANGAT, South Asian Network for Gender Transformation that emerged in 1998 to bring together gender activists and trainers. Following its changing directions over the last twenty-one years provides insights into the innovative ways in which feminists in the Global South work across differences but also the ways in which their epistemologies and pedagogies are influenced and limited by those of feminists in the Global North, emphasizing the need for decolonizing feminist practices in the Global North and South.

RC20-378.1

DESHMUKH, YASHWANT* (CVoter Foundation)

Justifying Aspects of Power, Violence & Justice in API (Absolute Poverty Index) of Transitional Societies

The ideas on studying Poverty or "Extreme" poverty by mapping "Development" have been challenged by looking "Beyond GDP". Particularly when the research colleagues are trying to map give objectively what is considered subjective. Particularly aspects "Power, Violence & Justice", where the "Objective" numbers are limited to counting "Number of Incidences" in these critical areas. Covering these aspects in the "Framework" of Poverty become more critical, particularly when the "framework" of Poverty is created by those who are looking at extreme poverty from a distance, rather than by those who are "living" the extreme poverty. This took us on a journey across poorest of the poor regions in India and meeting those who were not only observing the extreme poverty, but also those who were living in extreme poverty.

Most of our interaction with the people living in extreme poverty challenged the basic definition of the very concept of poverty to start with. The framework excludes "Power, Violence & Justice". We realized that while the World is trying to map the Poverty in concrete objective numbers, the concept of poverty goes beyond those numbers into a subjective territory which defies the textbook learning of Poverty. Going beyond the "Objective Indicators" there was a series of "Subjective Indicators" which is generally never mapped, more so because it's never considered as quantifiable empirical data. Even the construct of "Objective Indicators" to define Poverty falls flat when working on Extreme Poverty. Based on 2016 findings from the Pilot 'Globescan/CVoter Survey of Extreme Poverty' in India, we developed an Absolute Poverty Index using subjective and objective measures of well-being, including the critical aspects of Power, Violence & Justice. These themes are compared and analyzed in the composite constructs of Safety, Dignity & Self-esteem, Gender equation, Equal opportunity and last but not the least, Optimism.

DESJARDINS, BRIDGETTE* (Carleton University)

"Hockey Is for Everyone": Racism, Homophobia, and Inequality in Canada's Game

Hockey is undergoing a public relations face-lift. The National Hockey League's (NHL) "Hockey is for everyone" initiative and brand new 'Declaration of Principles' affirm the league's commitment to equality regardless of race, sexual orientation, socio-economic status, etc. The NHL is also partnered with external organizations focused on improving race relations and LGBTQ inclusion. Additionally, Hockey Canada's Ontario branch introduced mandatory transgender education for coaches and trainers. Yet recent events show this commitment to equality is little more than lip service. The reigning championship team committed to visiting the White House on the same day football players (inspired by President Trump's incendiary comments) protested anti-black police brutality. When team captain Ryan Getzlaf uttered a homophobic slur during the 2017 playoffs, the NHL leveled a pitiful reprimand, and Getzlaf offered an equally pitiful apology. When black player Joel Ward scored a game winning goal in the 2012 playoffs, fans unleashed a twitter storm of racist hate, showing the bigoted underbelly of 'hockey culture'. These events are the tip of a racist and homophobic iceberg. Using discourse analysis and queer theory I address the following questions: How does a sport predominantly played by white athletes perpetuate white privilege? How does homophobia manifest in the only professional sports league without an 'out' athlete? What structures exist within hockey organizations that nurture a racist and homophobic status quo? What sites of resistance exist within hockey institutions and/or culture? I analyze documents published by Hockey Canada (such as the limited trans inclusive dressing room policy created after a human rights complaint) and the NHL (primarily the Declaration of Principles), and compare the rhetoric espoused in these policies with the on-the-ice/ground action of both groups. Additionally, I look at player and fan social media commentary to connect the dark side of hockey culture with institutional practices.

MCCULLOCH, TIARA (Medicine Hat College)

When Homelessness Is Resolved: Understanding the Hard to House and Their Needs

Medicine Hat, Alberta, has attained and maintained a functional zero level of homelessness. This means that individuals experiencing homelessness are quickly transitioned into housing, effectively solving chronic homelessness as a social problem. However, a small portion of the population, the "Hard-to-House," has found the housing options unsuitable for their needs and have returned to homelessness. The authors endeavored to assess the needs of this group by conducting seven qualitative, semi-structured interviews that explored the overall quality of the emergency shelter, the needs and priorities of the populace, and individuals' feelings about the shelter and future programming. A line by line analysis of the participants' responses yielded four major themes within data. (1) All participants felt they lacked freedom, due to their inability to practice individuality or make choices both in the shelter as well as their community; (2) all participants felt a lack of dignity, emphasizing dehumanizing interactions each experienced in both the shelter and society. (3) Affordability was the main barrier to obtaining suitable housing. (4) Shelter programming could be enhanced through, proximity to transportation and services, and a sense of community and belonging. In an effort to address these needs, permanent supportive housing, which works to address the highly individualistic needs of each resident, was suggested. By offering affordable, supportive housing that works to increase the freedom and dignity of its residents, the program may increase the suitability of housing and quality of life for each individual.

Alienation and Emancipation in the Biographical Temporality of Underprivileged Young Montrealers/ Aliénation Et Émancipation Dans La Temporalité Biographique De Jeunes Montréalais Défavorisés En Modernité Tardive

In accordance with several authors preoccupied by the importance of the structures of temporality within human development (Rosa, 2010; Sève, 1975; 1987; 2008; Castel, 2004), this communication will investigate the role of alienation and the potential for emancipation in the present day experience of 28 young adults (20 years old on average) spending time in Community based Organizations in the greater Montreal area. Deprived of resources in their childhood and adolescence, what meanings emerge from how these youth describe their past? How does the acquisition of personal and social resources in the present open possibilities for the development of their autonomy and how do these possibilities open a path towards emancipation? Risking exclusion, these youth must define the sequencing of their investment in diverse social spheres and synchronize them. How do these youth articulate their daily routines, their life expectations and what seems convenient in this Late Modernity, in order for them to enter the adult age?

Avec plusieurs théoriciens critiques préoccupés par l'importance des structures temporelles dans le développement humain en modernité avancée (Rosa, 2010; Sève, 1975; 1987; 2008; Castel, 2004), nous nous intéressons à la part d'aliénation et au potentiel d'émancipation de 28 jeunes en difficulté, provenant de milieux défavorisés, dans leur fréquentation d'organismes communautaires autonomes de la grande région de Montréal au printemps 2016. Privés de ressources durant l'enfance et l'adolescence, quelles significations ces jeunes accordent-ils à leur passé? L'acquisition dans le présent de ressources sociales et culturelles leur permet-elle de développer leur autonomie pour l'avenir et de s'émanciper? Au risque de l'exclusion, ces jeunes doivent définir à la fois les séquences de leur engagement dans chacune des sphères sociales et leur synchronisation. Comment articulent-ils leurs routines quotidiennes, leurs perspectives de vie et ce qui semble opportun dans l'époque actuelle pour s'inscrire dans l'âge adulte.

Child Labor in the Informal Weaving Sector. a Study in Addis Ababa, Shiro-Meda Area

Title of Research Paper: Child Labor in the informal weaving sector. A study in Addis Ababa, Shiro-meda area

Abstract

Child labor is a widespread and growing phenomenon in today's world. Though child labor exists in all parts of the world, the extent of the problem is very high in developing countries. Ethiopia is one of the countries where child labor exists in an extensive scale. The main objective of the study was to investigate the

causes of child labor and its impact on children engaged in the weaving sector in Shiro-Meda area, Addis Ababa. I used qualitative research approach in order to generate relevant data as exhaustively as possible on the issue under study. I gathered information pertinent to the study through semi-structured interviews, focus group discussion, and observation. The finding of the study indicated that poverty (child trafficking and migration), family breakdown and peer influence, are identified as the major factors that push children to enter in the weaving sector. The study also found out that child labor has negative impact on the children's health, physical well-being, psycho-social development, and education. The study recommends that the prime cause that forces children to work in their early age is the widespread poverty of families. Thus, there is a need to educate parents, employers, the community on the methods they need to solve their socio-economic problems.

Keywords: child labor, child trafficking, poverty, education, peer influence, migration, Shiro-meda, Gamo/Dorze

DEUSDAD, BLANCA* (*Dep. Anthropology, Philosophy and Social Work. Rovira i Virgili University*)

LONG-TERM Care in Spain: The IMPACT of the Economic Crisis on Social Policies and Its Effects on Older Adults with Care NEEDS

Demographic change is bringing about the need of long-term care policies and specific services and benefits for older people. Nevertheless, austerity measures resulting from the economic crisis have deeply affected these social policies and retrenchments in Southern European countries. Additionally, high unemployment rates have affected indirectly the quality of life of older adults and the amount of caring services and caring support received. The economic crisis has affected indirectly older adults increasing intergenerational transfers and solidarity to the extent of changing their way of life and independence. Therefore, caring support has changed for older people as a consequence of the economic crisis, fewer public services and a *false deinstitutionalization* based on family care and support. The context of deep economic crisis has brought about processes of re-familiarization, where older adults are handing up their pensions to their relatives, offsetting high unemployment rates and homeowner evictions. Furthermore, there are processes of marketization through co-payment of care services, which forces a dependence on family care by women. This study was part of a European project on social services (COST Action IS1102) and is been published in the Journal of Social Service Research in January, 2016. The study was based mainly on a qualitative methodology, although some statistical data from Eurostat and Spanish National Statistics Institute were included. In particular, we drew on discussion groups and interviews with social workers and care workers, politicians and older adults.

DEVETTER, FRANÇOIS-XAVIER* (*IMT LILLE DOUAI - CLERSE*)

Clients Et Bénéficiaires Du Service : Quels Impacts Sur l'Organisation Et Les Conditions d'Emplois Dans Des Activités De Nettoyage (propreté et services à la personne) ?

Les conditions de travail et d'emploi des salariés des services à la personne et des agents de propreté sont connues pour être particulièrement médiocres : faible rémunération, précarité, isolement, absence de reconnaissance des compétences mobilisées, pénibilités physiques et psychologiques, etc. Ces deux métiers partagent également le fait de relever de rapports salariaux atypiques (situation de multi-employeur, travail à temps partiel, ...) et plus encore d'être « coincés » dans des rapports sociaux de service marqués par des inégalités de revenu, de statut, de genre.... Mais, alors que de nombreux travaux insistent sur l'instrumentalisation de la contrainte client, il semble que, dans ces deux professions, le « bénéficiaire » du service puisse apparaître comme un soutien partiel pour les salariés.

L'objectif de cette communication est de présenter, à partir de deux terrains distincts (l'un sur les services à la personne - en cours -, l'autre à partir d'une étude sur l'externalisation du nettoyage de 19 collèges - 41 entretiens réalisés) la façon dont certains salariés parviennent à s'appuyer sur d'autres acteurs (clients, bénéficiaires, salariés des structures clientes) tant pour tenter de construire leur identité professionnelle que pour défendre leurs conditions de travail et d'emploi.

Dans un premier temps l'accent sera mis sur la diversité des configurations d'alliances entre bénéficiaires du service et salariés. Dans un second temps nous essaierons de saisir les formes par lesquelles ces configurations d'alliances peuvent influencer tant sur les conditions d'emplois (rémunération, stabilité de l'emploi, temps de travail, rythme, ...) que sur les modes d'organisations et de revendications des salariés.

Women As Teachers and Researchers : Which Strategies to Stay in the Race ?

Ten years after the implementation of the law « Loi Responsabilité Universités » (2007), the report is the one of the deep reorganization of the higher education and the risk of an increasing of the activities for the teachers- researchers (Musselin, 2008).

In this new model of the work in the higher education, it is the time witch appears as the rarest element and which everyone seem to run after. A difficulty which is doubled in the case of the women, in particularly when it is about young women mothers of very young children (Azizi, 2014). They confront with the dilemma to choose between formation and research works.

The study analyses the working conditions for the women teachers-researchers in France, and focus the way they find a balance and not give up the career. We analyses, moreover, how they organize their time between work and family and how that produces dissatisfaction, mostly for women researchers, and how that impacts their career.

The methodology favors the joint of quantitative and qualitative approaches through the exploitation of 1409 questionnaires from a national investigation and through biographic narratives.

Online Hate and Offline Action: Tracing Right-Wing Populism and Virtuous Violence in Internet Communities

American populism in the form of the Alt-Right increasingly resembles the culture of certain online worlds. Participants of Alt-Right affiliated groups rally around "anti-political correctness" – fighting against what many online define as elitist, corrupt liberal enemies. In investigating how online culture becomes actualized ideology, I outline the development of anonymous "Chan culture" and its notions of "virtuous transgression" as it emerged on 4chan.org and grew through the comparable site Reddit.com. Specifically, I dissect the collective action carried out by these communities in the form of violent anti-feminist and racialized abuse, as was seen in high profile cases such as the #Gamergate controversy and the expulsion of Reddit CEO Ellen Pao. I argue that these events laid the groundwork for spaces like R/The_Donald, Reddit's community of young Trump enthusiasts who vilify progressives and find virtue in the transgressive politics of the far-right. Alongside these case studies, I present a theoretical tracing of reflexive online practices which shape narratives of collective-self, and the ethical permissions that follow. Ultimately, the features of these online publics produce new ethical subjectivities which determine how one should live in terms of actual-world politics, reformatting American right-wing populism in the process.

Muslim Women As a Home-Maker and an Earner in West Bengal, India

: A family is a unit, regarded as the cornerstone of a healthy and balanced society. In India the women used to engage themselves just in home management earlier, but the scenario has been changed. Now women play a vital role as an earner being educationally backward or sometimes uneducated also (earns in informal sectors). The Muslim women are not out of this purview. Generally Muslim law (Shari'ah) is a bit conservative and being a part of this society Muslim women face a lot of restrictions. But now-a-days they are quiet desperate of managing both the outer activities along with the management of home as well. The aim of the research is to highlight this dual role of Muslim women of West Bengal forced to involve in earning for their families and at the same time playing a role of a perfect home-maker.

Asurvey on 100 Muslim families in Murshidabad District of West Bengal has been made to gather information on Muslim women involved in earning along with their household work. The families were specially from poor and lower middle class and since the basic needs of these families are to manage their food and shelter along with the education of their children, the question of balancing the both together comes in. The purpose of the study is to observe how they are (Muslim women) balancing with their poverty, and social restrictions with their urge to earn for nurturing their family and making their world a better place to live in.

Caring Citizens or Unpaid Care Work – a Case of Self Help Groups in Kerala

Unpaid care work can take place in various forms, one of which is the work done by women who are a part of Self Help Groups (SHG) involved in thrift and credit activities. In this paper I examine the aspect of community labour work performed by the SHG women as an extension to the tasks done by them in the domestic sphere. The State Poverty Eradication Mission of Kerala was established in 1997 and comprised of a federation of Self Help Groups (SHGs) of women. The cornerstone of the movement was the microfinance activities conducted by members of the SHGs. Over a period of time, in addition to microfinance activities, SHG women were encouraged to perform voluntary work as service towards the community. However, it has been pointed out by feminist scholars, that these kinds of engagements led the women to being considered as a source of readily available cheap labour, as remuneration paid to them was much lesser than market standards. Also, the SHG women who participate in community volunteer work end up performing what is known as the third shift of labour, the first two being work done in the household or that done for remuneration. Despite several governmental programmes for women's empowerment and microcredit aimed at enhancing the efficiency of women, there has been no change in the sexual division of labour either in the domestic arena or in paid work. This is because there has been no system to account for the unpaid and unaccounted labour within the home. Additionally, the programmes established by the welfare state see women's work in the public sphere as an extension of housework which will be demonstrated in the paper through relevant case studies. The paper aims to examine this impact of unpaid care work in the lives of women.

Work and Family Balance: Challenges Faced By Rural Women from Microfinance Groups

Microfinance is a burgeoning area across the globe creating complex relations between Global North and South, not least in terms of financial relations but also impacting the micro realities of women in the form of 'unintended consequences'. A major impact has been on the work being done by the women who are a part of the Self Help Groups involved in microfinance activities. The State Poverty Eradication Mission of Kerala, was established in 1997 and comprised of a federation of Self Help Groups (SHGs) of women. The cornerstone of the movement was the microfinance activities conducted by members of the SHGs. Besides providing opportunities for entrepreneurship, the State established organization encouraged the women to volunteer in flagship programs (also instituted by the State) for the destitute, elderly and differently abled people in the community. This resulted in the SHG women performing what is known as the third shift of labour, the first two being work done in the household or that done for remuneration. The opportunities of work created a flow of capital, not just economic but also in the form of social and cultural capital as espoused by Pierre Bourdieu. However, it also impacted their role in the family as the work done by the SHG women was not restricted to a specific part of the day but was influential in shaping them as agents in the community and spilled over into what could be perceived as "family time". Through this paper, I am will be exploring the complex web of relationship that the SHG women share with the State (as citizens) and the market (as consumers and entrepreneurs) and its impact on the family as the project is helmed by the State but has its roots in the neo-liberal political economy of development.

DHAOUADI, MAHMOUD* (*University of Tunis*)

Postcolonial Bilingualism in Tunisia

Tunisians hardly have normal relationship with Arabic, their native/national language. **Normal** means here the use only of Arabic in speaking and writing. Plain and participant observations show that Tunisians use mainly two languages: Arabic and French, the colonial language. This creates **two types of bilingualism**: A- a bilingualism which accepts the use of French instead of Arabic among Tunisians. This is the most widespread linguistic Tunisian behavior today. One example makes the point: more than 90% of Tunisians write their bank cheques in French. B- a bilingualism that uses Arabic and avoids French among Tunisians. This is practiced only by a very tiny minority. Bilingualisms A and B are associated with two forms of the so-called "Arabization": 1- the wide social use of Arabic in the various sectors of the Tunisian society. 2- "Psychological Arabization": having close relationship with Arabic. Research has not found a positive relation between type A of bilingualism and forms 1+2 of "Arabization". In contrast, bilingualism B is strongly in favor of the promotion of the two forms of "Arabization". Analysis of the Tunisian linguistic behaviors show that bilingualism A's continuing heavy presence is the outcome of three major factors: 1- the spread use of French during the French colonization (1881-1956). 2- Many Tunisians went or go to schools where French had/has dominant use in high schools and university levels. 3- After independence, most graduates of these educational institutions have had the upper hand on governing the country. Theoretically, Bourdieu's concept of **Reproduction** fits well to explain the Tunisian postcolonial bilingualism which may be called: Conspiring Bilingualism, because it often prefers the use of French instead of Arabic: the Tunisian national language. As such, Tunisian bilingualism illustrates the unbalance of **power** between the colonizer and the colonized, as Memmi would put it.

Through the Eyes of the Natives: Watching the White Sails of FIFA and IOC Approach the Urban Indigenous Occupation of Rio De Janeiro

As the world awaited the 2014 FIFA World Cup and the 2016 Rio Olympic Games with anticipation, few were aware of the unfolding battle that took place in its shadow. An indigenous community was living on a piece of land located right next to the world-famous Maracanã sports stadium in Rio de Janeiro. The land, of great ancestral value for the Brazilian indigenous community, had been occupied by indigenous groups since 2006. Seeking a juridical and physical place for the indigenous people in the city, 35 representatives of 17 different indigenous groups then claimed the land as theirs with the aim of revitalising and reusing the abandoned mansion on the site. Their plans to develop an indigenous cultural centre dedicated to the preservation of indigenous memory and identity, as well as the first indigenous university of South America, were, however, attacked in the lead up to the World Cup and the Olympic Games. As the sports events got closer, authorities moved away from their role as social caretaker and instead adopted a sharper money-driven tactic where the indigenous community was placed under attack. Facing eviction, the indigenous suffered both discursive and physical threats, with politicians striving to support their eviction by discrediting the movement. On 22 March 2013, the indigenous community was evicted in a turbulent operation by the urban military troops with guns, gasbombs, fight dogs, helicopters and a supersonic weapon meant for anti-terrorist attacks during the World Cup and Olympic Games. In this paper, we discuss the events leading up to that eviction and present an alternative story of the international sports events. Based on film recordings and a participatory method this paper considers the indigenous voice in this clash and, drawing on postcolonial and neocolonial scholarship, explores how the case represents an example of continuous colonial hierarchies.

Institutional Drivers for the Fourth Industrial Revolution. Comparative Analysis of Impacts on Quality of Employment and of Work Explained in Three Regimes

In contrary to the predictions of Brynjolfsson e.a. (2014)/ Frey e.a. (2013), the 4th Industrial Revolution has not lead to mass unemployment and major changes

in work practices. In fact, we can see major differences in impacts between countries, when looking at how industrial sectors have reacted to the new technological change. In Western-Europe, we can see three trajectories of the manufacturing industries. In Germany, high wages and strong unions have led to a new growth in the manufacturing industries. In the Netherlands, trade unions have lost their grip on labour conditions and relationships. The manufacturing industry has shown new growth, but at the expense of employment levels, quality of work and of employment relations. In other Western-European countries, the manufacturing industry has continued to diminish in importance (Tshidimba e.a., 2015). These conflicting trends are not understood. We want to look at the cooperation between employers and trade unions, the reaction of policy makers, and the development of support systems for industrial sectors, and see how they impact the integration of new technologies into work. We want to explore the main differences in quality of work in manufacturing industries, the degree into which different work organisations allow for more process and product innovation. For this purpose, we will look into the outcomes of major surveys on technology, employment and quality of work for these three contexts (German BIBB/BAuA-survey: Pfeiffer, 2016; Dutch Skills Survey: Akçomak e.a., 2011; IOA Survey: Delagrange, 2016). We want to see how these institutional contexts are important to explain the impacts on employment conditions and quality of work, but also on the competitive performance of companies. We will assess how 4th Industrial Revolution technologies show different impacts, according to these institutional impacts. We explain why the predictions about new technology need to take these conditions into account.

Big Data and Social Indicators: Actual Trends and New Perspectives

Big Data are a top subject in international research articles and a vast debate is taking place on their actual capability of being used to complement or even substitute official statistics surveys and social indicators in particular. In this paper we analyse the metadata of the Scopus database of academic articles on Big Data and we show that most of the existing and intensively growing literature is focused on software and computational issues whilst articles that are specifically focused on statistical issues and on the procedures to build social indicators from Big Data are a much smaller share of this vast production. Nevertheless the works that focus on these topics show promising results because in developed countries Big Data seem to be a good information base to create reliable proxies of social indicators, whereas in developing countries their use (for instance using satellite images) may be a viable alternative to traditional surveys. However, Big Data based social indicators deeply suffer of a number of open issues that affect their actual use: they do not correspond to any sampling scheme and they are often representative of particular segments of the population; they generally are private process-produced data whose access by national statistical offices is rarely possible although the intrinsic value of the information contained in Big Data has a social importance that should be shared with the whole community; Big Data lack the socio-economic background on which social indicators have been founded and their help to policy makers in their decision process is a fully open point. Therefore Big Data may be a big opportunity for the definition of traditional or new social indicators but their statistical reliability should be further investigated and their availability and use should be internationally coordinated.

Collective Actions Against the Exploitation of Migrant Workers in Italy: The Relationship between Trade Unionism and Social Movements

In social sciences the relationship between trade unionism and social movements has been deeply analysed considering several aspects, as: workers' collective actions in opposition to forms of domination with the aim to control the historicity of society and the general transformation of social life (Touraine 1992); varieties of trade unions models, as membership-based unionism and social movement unionism (Turner & Hurd 2001); varieties of strategies of revitalization and organizing approaches to favourite alliances with other actors, as community unionism (Phelan ed. 2007; Gumbrell-McCormick & Hyman 2013). In Italy, trade unionism is characterized by the persistence of a continuous tension between the logic of consolidated organization and the logic of movement (Regalia 2012) and trade unions have several limits in their capacity to strength relations with social movements in wide networks, as in the experience of the alter-global movement (Farro 2008).

The paper is focused on the relations between trade unionism and social movements in Italy considering a specific case study: collective actions to affirm migrants' rights, with a focus on the farm workers. During the recent years, Italian

trade unions participated to many collective actions against forced labour and exploitation of migrant workers in the agriculture sector, at national and international level. The paper aims to underlines main features and tensions in the relationship between labour and other social movements, considering several dimensions: meaning of action and cultural orientations (towards the affirmation of individual subjectivity of migrants, their dignity as worker and citizen, universal rights); networks (considering trade unions, associations, self-organized groups, institutions and their more or less cooperative interactions); participative methods and organizing approaches (in a scenario characterized by a strong workforce fragmentation, limits of the traditional organizing models, varieties of participatory logics). Research methodology adopted a qualitative approach with in-depth interviews with migrants, trade unionists, activists.

High Skilled Self-Employed Professionals in Italy: Working Conditions, Expectations, Networks.

The paper presents the main results of a long-term research focused on high skilled self-employed professionals' working conditions, needs and expectations. The research has been realised using different methodologies: online survey based on a sample of 2150 respondents; focus groups; in-depth interviews to professionals and experts. The sample includes a great variety of occupations (with or without a professional body and a specific certification system) considering a large spectrum of sectors, such as healthcare professions, lawyers, engineers, journalists, financial advisors, consultants, sales and estates agents, researchers, actors and artists, etc.

The paper analyses the main findings focusing on: changings occurred in the professionals' identity and their position in the labour market, the gap between the high level of qualification and their working conditions, the tensions between autonomy and subordination, the forms of precarity, gender and generational segmentation and specificities. The paper will also present their expectations and proposals, as well as the challenges for organizing network, collective action and representation of free lances, considering the role of self-organized groups, associations and trade unions. Finally, the paper will focus on the professionals' reaction to work fragmentation and isolation due to the autonomous form of employment and to the contemporary trends in the work organization.

BARN, RAVINDER (*Royal Holloway University of London*)

Unaccompanied Migrant Minors: Conceptualizations of Childhood, Child Rights and Well-Being

The importance of protecting children is broadly recognised in mainstream public policy. However, in dealing with the protection needs of unaccompanied migrant minors, governments face the challenge of how to comply with their international and humanitarian obligations at a time when their overall concerns have shifted towards tougher immigration policies and stricter border control to curb unauthorised immigration (Drammeh, 2010; UKBA 2010). By drawing upon a qualitative study, this paper explores unaccompanied migrant minors' conceptualizations of the notions of childhood, child rights, child well-being and risk. A total of 15 unaccompanied migrant minors in Sicily contributed to rich insights. A thematic analysis sheds light on key findings to identify the tensions which exist between international law and the protection of vulnerable migrant minors and immigration control and governmentality. Young people's narratives also attest to child agency and competence, within a framework of risk and vulnerability, and the contested nature of the notion of childhood.

New Organization of Work in a Multinational Car Company: Job Satisfaction and Working Condition in Comparative Perspective

The research discusses the characteristics of *World Class Manufacturing* and interprets it as a variant of the *lean production model*, analyzing strengths and criticalities in its application in the most important automotive company in Italy. In particular, the study takes into consideration four factories of the multinational company, two located in the north of Italy and two located in the south, highlighting the differences that emerge in the *working conditions* and in the *job satisfaction* with regard to the fundamental pillars of the organizational model of work. Sixteen variables are considered (workload, team leader, innovation, cleanliness, temperature, autonomy, trade union, security, collaboration, tools, bonuses, clear guidelines, feel comfortable, work life balance, individual valorization, salary) and

for each of them it is noticed the expected satisfaction, the real satisfaction and past satisfaction. The emerging differences are important both in the comparison between the four plants and in the comparison over time. The findings of the research seem to be significant as the theoretical hypotheses are confirmed for some model pillars (innovation, autonomy, cleanliness), whereas the theories are being scrapped for other pillars (workload, collaboration, team leader). The results appear to be coincidental both in the North and the South, so regardless of the territorial context taken into account.

The New Frontiers of Collective Bargaining in Europe

The research discusses the current theme of shifting the legal regulation of work to "sources of proximity" and, in particular, to the corporate and territorial scope, with the possibility of derogating from legal discipline and collective bargaining, highlighting its ability to ensure a proper account of the company's reasons in today's globalized economy, both in terms of the general and the special interests of labor law. The study is focused on identifying the lines and dynamics of evolution of the theme, placing inevitably the emphasis also on the economic and labor organization, with the peculiar conclusion that the global character of economic competition calls for the need for progressive globalization of regulation rather than its fragmentation in the business sense. The guarantee of rights in a globalized world can only be achieved if there is the right mix between local development and new European protagonism.

RC02-JS-52.6

DIACHUK, OLHA* (*Ivan Franko National University of Lviv*)

Felicitous Approach to Global Researches of Well-Being and Social Inequality: The Search for a Universal Model of Future Fair Society

The idea of universalism presupposes development of an effective social policy of the state, redistribution of resources in society to achieve equality in the access of citizens to all public goods, building a fair society in the future.

An important indicator of a fair society is the high level of well-being of all its members. In this aspect, indicators of economic well-being that can be measured statistically (for example, GDP per capita) correlate with the indicators of subjective well-being only up to a certain level of people's material wealth.

We understand subjective well-being as a feeling of happiness and satisfaction with life of a certain person. The study of happiness has developed in the new science of felicitology, and measurements of the level and indicators of happiness have spread from the national to the global level. Thus, Happy Planet Index since 2006 explores the progress of most countries of the world on their path to happy and sustainable life, and in 2012 the UN launched a unique global study World Happiness Report, which covered more than 150 countries.

Global sociological researches using modern information technologies allow identifying the most urgent problems of social development and create opportunities for cross-national and cross-temporal analysis of the level of social well-being and ways to improve it in all countries without exception. An example of such a research is the United Nations Global Internet Survey "My World", in which 9.7 million people from all over the world took part (since 2012).

Consequently, integration of universalism and felicitous approach in conducting of global researches will help in effective search of a universal model of the future fair society, as well as in determining the best ways to achieve it.

RC32-586.9

DIACHUK, OLHA* (*Ivan Franko National University of Lviv*)

Global-Local Approach to the Study of Gender Inequality

To study gender inequality in the world, certain methodological tools were developed, such as the Gender Inequality Index and the Global Gender Gap Index. These indices, including the largest possible number of countries for research, are based on such indicators as access of men and women to education, life expectancy, economic opportunities, political representation, etc. However, along with demonstration of global and national manifestations of gender inequality in main spheres of life these researches have local specificity, the study of which requires the improvement of their methodology.

The problem of gender indices is that they are based predominantly on statistical indicators. Sociological data is important for increasing and deepening the empirical base for analysis of gender situation in the countries. Difficulties in conducting sociological surveys on the global-local level can be overcome due to the use of modern IT. For example, online surveys using LimeSurvey application are possible wherever there is access to the Internet.

To be able to compile information and compare data from the global to the local levels, it is necessary to develop a common program with a unified system of gender indicators. The advantage of global-local gender studies is that they can take into account local specificity of gender relations and gender culture. For

example, the Global Gender Gap Index shows that gender inequality in Ukraine in political representation is overcome only by 9.8%. But this indicator takes into account only representation of women in supreme authority bodies of the state. At the same time the fact that representation of women in local authorities is much higher wasn't taken into account.

Thus, global-local studies with a certain periodicity give rise to new opportunities for cross-cultural and cross-temporal analysis of the problems of gender inequality and gender development in all countries of the world, their local communities.

Building National Unity after a Fratricidal War. Transitional Justice Mechanisms As Operators of Truth for National Reconciliation

Through a detailed analysis of the National Truth and Reconciliation Commission (1990-1991) set up in Chile after seventeen years of dictatorship, I propose to show in this paper, how this mechanism transformed the claim of truth for justice, which was demanded by the relatives of the disappeared, into truth for reconciliation, which was required in order to construct a democratic nation.

At the end of Pinochet's dictatorship in 1990, the problem of truth regarding crimes committed during the dictatorship was institutionalized, and the newly elected President of the Republic (Patricio Aylwin 1990-1994) created the National Commission for "Truth and Reconciliation" (TRC, 1990-1991).

This "truth for reconciliation" had to be very general, without pointing a finger at those responsible or guilty of the crimes. Truth was supposed to function as a unifying mechanism. Normalization of political life and the preservation of unity were the official objectives, rather than justice (penal/criminal), which was seen by the government as a source of conflict.

The truth, which was a central value in the ethical-political struggle of the victim's relatives, was replaced with the objective of creating something "for the good of Chile" (President Aylwin). It was supposed to create a consensus, common ground and reconciliation as a political solution to a national problem.

My study of the TRC effects on the public status of truth is based on an analysis of the report of the TRC, a selection of press articles (1990-1991), decrees, orders and laws, and a detailed analysis of presidential speeches regarding human rights violations and the Commission.

Sustaining the Socialist Alternative in Cuba: Achievements and Challenges

Since 1959, Cuba has pursued an alternative vision of development rooted in revolutionary measures aimed at eradicating the prerevolutionary system of social class inequalities and underdevelopment. For nearly six decades, the Cuban revolution has symbolized defiance to capitalist hegemony across the global South and to the present day, it continues to inspire social movement resistance throughout Latin America and beyond. The proliferation of neoliberal, market fundamentalism throughout the region has placed powerful constraints upon ways in which societies pursuing alternative vision of development can

viably integrate into the global economy. In sustaining its socialist alternative in this context, Cuba has continually adopted new policies designed to maintain its universal social policies that made possible its historic gains in social development while seeking to avoid social polarization and exclusion produced by the strategic introduction of market reforms and a growing reliance upon the tourist industry. This process can be further observed in the confrontation of two opposing sets of values in which revolutionary solidarity, internationalism and egalitarianism become challenged by individualism, consumerism and corruption. The paper focuses on the new generation of social policies being implemented to meet this formidable array of challenges and to sustain an alternative system of development in the face of persistent external hostility and a need to confront recurrent natural disasters largely on its own.

DIAZ RIOS, CLAUDIA* (University of Toronto)

The Role of Public-Subsidized Private Schools in Colombia: How Do They Work, in What Contexts, and Who Benefits from Them?

Despite the increase of public funding for private education on a global scale, empirical evaluation of these initiatives has been sparse. These few studies have provided inconclusive results on the effectiveness, quality, and inequality of public-subsidized private schools (PSPS). Yet, little work has addressed the question of why and how this type of schooling succeeds or fails in different contexts. My paper argues that the idea that students in PSPS achieve more than students in public schools may not hold true when implemented in real contexts. In developing economies, this type of private provision can be affected by principal-agent problems: governments may lack capacity to choose or control subsidized schools, and private schools can be scarce or lack capabilities and/or incentives to provide sufficient and good service. In turn, these problems create opportunities for actors in the government, private schools, or families to re-interpret the ideas underlying publicly subsidized private schools and take advantage from the policy for their own benefit and at expense of an even distribution of resources.

This study employs a within comparison of Colombia, a country with a long-standing but understudied tradition of publicly subsidized private schools. Since education delivery in this country is a responsibility of provinces, this paper compares PSPS in the subnational jurisdictions with the highest and the lowest proportion of enrolled students in private subsidized institutions. I use statistical matching techniques to assess the results of publicly subsidized private education at the national level, and to select cases (schools) in the two jurisdictions for the qualitative comparative analysis of the implementation process. With this methodological strategy, this study unravels the relationship between the social and political contexts in which PSPS are employed, the actual way in which these schools operate, and the results associated with these contexts and types of operation.

The Unintended Consequences of the World Bank's Policy Recommendations on the Education Domestic Coalitions in Colombia

What happens when influential international organizations change their beliefs about social policy? Do they effectively use their power to transfer their learning and change domestic decisions? This paper answers these questions through the analysis of the learning process about vocational secondary education in the World Bank, and its influence on Colombian policy. In the 1960s, the World Bank widely supported the expansion of vocational schools in developing countries. The Colombian government in turn embraced enthusiastically the World Bank's assistance and recommendations. These schools however, did not provide the expected contributions to human capital. Employers considered them inadequate either because students were not properly trained or because such training raised salary expectations in an economy that deeply relied on low salaries. Nevertheless, Colombian vocational schools quickly nurtured new constituents: 1) teacher unions who regard vocational teachers as allies to increase their power, 2) low-income families whose demands for education were tracked into this type of schools, and 3) politicians who gained popular support from the implementation of public vocational schools. Therefore, in the 1980s, when the World Bank changed its ideas and assessed vocational schooling as inefficient, suspended associated loans and technical assistance, and actively disseminated the limitations of vocational education, the Colombian government was not able to adopt the new recommendations and faced a strong resistance from the coalition supporting vocational schools. This study ultimately shows that domestic coalitions that emerged from the implementation of past global norms will not easily embrace changes when international organizations radically change their policy ideas. In other words, while global ideas implemented in a particular country can actually shape domestic political coalitions, these coalitions may have later unintended consequences that affect the influence of powerful international actors and constrain policy change.

Bordering the Utopia: Work-Life Balance in Travel Agencies in Tijuana (Mexico)

Balance of life is regarded as vital for tourism due to its characteristics of a highly time-consuming sector. Several scholars have evidence the importance of addressing work-life balance strategies in hotels, restaurants as well as in other companies related to travel and tourism industry.

In Mexico work-life balance strategies have been largely neglected, but this can be changing during the last years. Public policies and personal demands might be playing a relevant role in demanding a balance between work and family life in the country.

Considered as a basic element in the travel and tourism sector and characterized as small businesses, travel agencies have been to adapt to the TICs challenge probably more than any other in the sector, but TICs have not being used to promoted balance.

In Latin America, travel agencies are considered a feminised business, in a region where women experience an important imbalance in daily life as a consequence of care work that remains predominantly performed by them, so the promotion of balance between job and family is crucial.

Located northern Mexico, Tijuana (Baja California. Mexico) has been considered as the main cross-border destination in the country. The city experienced a wave of violence about a decade ago, but tourism activity has been recovering during the last years and benefits are also reaching travel agencies.

In order to explore the perception of work-life balance and job satisfaction among employees in travel agencies in Tijuana we conducted a qualitative research.

Among our relevant findings are the importance of work-life balance in job satisfaction mainly among women, the presence of informal work-life balance arrangements, the importance of life-cycle as relevant for prioritizing the different strategies and, unless the increasing participation of men, the concentration on women as main care work providers.

The Gendered Tourists: Mexican Women and Bike Traveling.

Participation of women in active traveling, internationally and in Mexico, has been increasing during the last years. Regarded as a tourism activity that promotes physical activity, bike traveling has been revisited during the last years either as a sustainable way of transportation, as a social construction, as well as a product itself. The presence of women in tourism has been actively explored by Anglophone Academies; however in a region where scholars have mainly paid attention to gendered hosts, gendered tourists have been little examined; therefore bike traveling –as well as other tourists activities- and gender have remained a neglected field.

To minimize this gap this research has been designing to identify determinants that positively or negatively affected the engagement of Mexican women in this kind of tourism and excursionism either in national destinations or abroad.

A total of 36 in-depth interviews were conducted among Mexican women that have been practicing bike traveling actively. They were contacting using snow ball sampling contacting personal acquaintances, cycling groups and travel agencies that promote bike traveling.

Even though their presence of women as bike travelers has been increasing during the last decade, women still consider their presence as anecdotal, the combination of gender stereotypes and insecurity is regarded as a main limitation to solo or "only women" travels in a society where an important percentage considers women still need the presence of a man to be safe in public spaces.

United States, Canada, France, Germany or Spain are among the most frequently chosen abroad destinations, they are considered as more safe places and significantly less traditionally regarding gender stereotypes; but even though traveling to these countries can increase their safety perception, women used to travel with others and solo traveling is not a common choice yet.

De La Patrimonialización a La Territorialización: Apropiaciones Locales De Los Discursos Del Poder

Los espacios naturales protegidos implican una resignificación de los elementos que se seleccionan como dignos de constituirse como representativos de la naturalidad. La protección de estos espacios se ampara bajo el discurso global patrimonialista y de la sostenibilidad, como herramienta retórica para justificar diferentes intereses que pueden ir desde la conservación a los identitarios, económicos o turísticos.

Los habitantes de estos lugares, especialmente aquellos que encajan en mayor medida en una imagen de tradicionalidad acorde con los estereotipos que se trata de proyectar, frecuentemente reaccionan contra estas dinámicas de resimbolización. Estas no sólo implican una reformulación de los usos del territorio en función de los roles que desde las instituciones se otorgan a los diferentes usuarios del mismo, sino que además conllevan una nueva lectura sobre su entorno que en muchas ocasiones difiere de las formas de entendimiento y relación con el ambiente que estas personas mantienen.

En definitiva, estos procesos de patrimonialización legitiman las limitaciones y prohibiciones en base a esta nueva mirada sobre el territorio impuesta por las políticas de conservación.

El estudio de estos conflictos suele abordarse desde la contestación, sin embargo, también suceden dinámicas de asimilación de las nuevas lecturas ambientales que estos procesos traen consigo, así como de apropiación de los discursos institucionales, que son instrumentalizados por las poblaciones locales en su beneficio.

Mediante el análisis de dos contextos en España (uno en Murcia y otro en Canarias) se incide en las dinámicas de transformación y las estrategias de apropiación que suceden a raíz de procesos políticos y económicos globales.

Heterogeneous Groups Overcome the Diffusion of Responsibility Problem in the Volunteer's Dilemma

The evolution of cooperation in humans has been studied by means of linear, symmetric collective goods games played by homogenous actors. However, many cooperation problems human groups face are non-linear and asymmetric. These cooperation problems can be described with step-level collective goods games played by heterogeneous actors. The volunteer's dilemma (VOD) is a binary choice, n-person game in which a single actor's cooperation is necessary and sufficient to provide the collective good for the entire group. An interesting property of the symmetric VOD is that actors' probabilities to cooperate decrease with group size. This property is also known as "diffusion of responsibility" or "bystander" effect. In the asymmetric VOD, which differs from the symmetric version in one actor having lower costs of cooperation, groups coordinate on the "strongest" actor to provide the collective good alone, irrespective of group size. We study the diffusion of responsibility in social norm enforcement (i.e. second-order cooperation) by means of the VOD. In a computerized laboratory experiment we show how larger groups are less effective in sanctioning a norm breaker if the sanctioning situation is symmetric. In the asymmetric condition it is mostly the actor with the lowest costs who sanctions. As a consequence, the diffusion of responsibility effect is reduced in the asymmetric condition leading to more first-order cooperation than in the symmetric condition. Our results show that heterogeneous groups can be more successful in achieving cooperation than groups of all equals because they naturally evade diffusion of responsibility. More generally, our results show how the studying of non-linear, asymmetric cooperation problems can unveil hitherto unknown mechanisms by which human groups achieve cooperation.

Multifaceted Views on the Role of Language for Migrants' Social Positions

Research frequently emphasizes the important role of language for migrants' social integration into local and national communities, as well as their access and success on the labour market. Those findings highly relate on macro contextual conditions, for instance, the labour market situation or diverse evaluation of different languages as (dis-)advantageous for the labour market participation. In surveys 'language' is operationalized in different ways and relates to (self-evaluation of) oral, written, and reading abilities in a countries given language, a

mother tongue or other languages. However, research rarely uses this variety of measurements for social inequality analysis.

In our paper, we propose the analysis of many different dimensions of language abilities and practices and their impact on migrants' social position drawing upon a large scale panel survey, the German Socio-Economic Panel (GSOEP) Migration Sample (n=5.000). Germany is a favored receiving country of immigration; it has nearly full employment, indicating a strong integration of residing citizens and non-citizens into the labour market. Our data have the great advantage to measure language in various ways and dimensions (attendance in language class, language used in family, with friends and at the workplace, oral, written, and reading abilities in German and mother tongue, etc.). Our analyses will yield a multifaceted interpretation of the influence of language on migrants' social position. In this way, we are able to explore and discuss the characteristics of diverse language abilities for integration into the German labour market.

A Qualitative Study Exploring Relationships Among Infertile Couples in the Gambia

In low-and middle-income countries, the focus has been traditionally on family planning and maternal and child health services for women who do bear children. However, in 1994, the International Conference on Population and Development has put infertility on the international health agenda. Studies on involuntary childlessness in low-and middle income countries have indeed shown significant psychological and social consequences, which appears worse then in high-income countries. It appears that the main hardship that infertile women endure are extramarital affairs, polygamy and divorce. To explore this, we carried out qualitative research to understand how infertile Gambians experience polygamy.

Understanding Harmfulness and Socio-Cultural Aspects of Vaginal Practices across Cultures: A Systematic Review of Qualitative Research

The World Health Organization defines vaginal practices as 'a variety of behaviors that involve some modification to the labia, clitoris, or the vagina'. These practices have also been described as harmful cultural practices. Based on a systematic review of qualitative research, we aim to understand the relationship between the conceptualizations of harm and vaginal practices, and to identify those factors motivating vaginal practices across cultures. Eight databases were screened in order to find qualitative research on vaginal practices across different settings up until 8th August 2017. Studies were selected according to inclusion and exclusion criteria; subsequently the quality of the studies was assessed and data extracted. Findings were analyzed and synthesized along key themes using NVivo. In total, 43 articles were reviewed including a wide range of vaginal practices in 31 countries. Qualitative studies on vaginal practices are mainly carried out in low-and middle income countries particularly in Sub-Saharan Africa. Most studies described the negative health consequences of vaginal practices and women's awareness about these, with six studies describing psychological and social consequences. This focus on medical harm within literature fits within the current discourse on harmful cultural practices relying on notions of the integer body to support human and women's right claims. Several scholars warned against the victimization of women practicing vaginal practices and situate vaginal practices in a context of cultural beliefs and gender relationships which (in)directly influenced norms regarding the female body. In these contexts, vaginal practices can be tools for women to manage their health, hygiene and sexuality. A multidimensional approach taking into account all these aspects of women's lives, provides a more nuanced portrait to understand these practices instead of a focus on harm.

DIETRICH, HANS* (*Institute for Employment Research*)

School-to-Work-Transition and Well-Being in Australia",

The school-to-work- transition period is a demanding episode within the life course in all societies, as in the years of adolescence a sequence of severe and long-lasting decisions are to be made with respect to educational choice and getting integrated into the labour market (Ryan 2001). Failing within the educational process, becoming unemployed or starting the employment career in a precarious contract could take a negative impact on the future life-course. And that period of the life course is a sensitive time with regard to adolescences"

developments and social relations (Mayer 2009). Well-being and mental health are possible outcomes (Schulenberg 2004), which themselves take impact on individuals further educational, labour market related and social life (Western & Tomaszewski 2016).

The Australian Hilda-data are employed to explore the relation of the school-to-work-transition period and individuals (subjective) wellbeing. HILDA is well established panel-survey running since 2001, which a set of health and wellbeing related questions in all waves.

A model-specific sample is drawn out of the HILDA-participants including 3.201 individuals, interviewed firstly as new HILDA-persons in the age of 15/16 and attended at least two consecutive waves in the HILDA survey. Thus 22.745 records (7.1 records per individual in average) are included in the models. A set of model-specific selectivity checks are performed, controlling for effect of wellbeing on panel participation. Both models controlling for characteristics at the first interview and models controlling for life course events indicate effects of wellbeing on individuals' attrition rate, whilst well-known effects like educational attainment, experience of marginal employment drives attrition.

Specific attention is drawn on the relation of life satisfaction and the school to work transition, which is followed up to individuals age of 30. The results support an own standing effect of the school-to-work- transition on life satisfaction.

Work Commitment and Interview Effects in Cross-Cultural Studies

Germany has experienced a significant influx of refugees since summer 2015, especially from Syria. Surveying this special population, special attention has to be paid to the target groups' linguistic and cultural background as well as the specific situation of these refugees. Thus we expect effects of the modus of interview (CATI vs CAWI), gender effects of the interviewer and effects of social desirability regarding the receiving country.

To test this hypothesis we use data from two related surveys conducted in the year 2016, the IAB-study „Youth unemployment, mental health and labor market outcome“ and the IAB study “WELLCOME”. Both surveys sampled young people 18 to 25 years of age, who entered the German unemployment register for the first time shortly before the interview

The CATI and CAWI interviews of the WELLCOME study have been performed in Arabic language, the CATI interviews by native Arabic speaking interviewer. The interviewer population for the CATI interviews is gender balanced.

To identify social desirability we employ two scales, the work-commitment scale (Warr et al 1979) and the short form Hopkins Symptom Check List (HSCL10; Derogatis 1974). Whilst we anticipate a clear direction of social desirability with the Warr scale (work commitment is preferred by the receiving country), we assume a unclear profile for the HSCL10 scale (workability versus medical support).

The results indicate significant differences in respondents' work commitment (Warr scale) between Syrian refugees and German residents. Furthermore, we identified a significant mode-effect in answering behavior of work commitment.

We assume, part of the mode effect could be connected to the interaction between respondent and interviewer. Both male and female report a higher level of work commitment in case of a male interviewer compared to female interviewer.

We apply logit models to control for individual and migrant-specific covariates and additional interviewer characteristics.

Muerte Asistida y Gestión Del Morir En Chile

Durante los últimos años, en Chile se ha discutido públicamente sobre la legalización de la muerte asistida, a saber, la práctica de acelerar la muerte por solicitud del enfermo terminal debido a lo intolerable de su padecimiento. En este debate, en el ámbito legal (Ley 20.584) y médico, existe una aparente inconsistencia entre lo establecido como principio ético médico de autonomía del paciente y declaraciones que se enfocan en factores económicos, sociales, como también en la conservación de la vida humana, y que postergan a segundo plano la discusión ética en torno a la autonomía del enfermo terminal. En la presente investigación esta tensión es analizada desde el concepto de biopolítica de Michel Foucault, al considerarse la racionalidad ética de la muerte asistida incorporada dentro de la gestión del biopoder. Se plantea que el resguardo del principio ético médico de autonomía, al que alude la Ley 20.584, actuaría a favor de la noción de un individuo autónomo con respecto a la toma de decisiones en torno a las condiciones de su muerte, que serviría de sustento para el funcionamiento del biopoder.

Como antecedente empírico, se presentan los resultados de un análisis de discurso a información obtenida en entrevistas realizadas a pacientes con cáncer acerca de la gestión del morir, particularmente, del ejercicio de la autonomía en la toma de decisiones y las condiciones de muerte del enfermo terminal. En estos relatos es posible reconocer declaraciones que son reflejo del discurso médico dominante y, al mismo tiempo, identificar puntos de resistencia hacia el poder de regularización.

Responsabilidad Penal Juvenil En Chile

En Chile, en el año 2007 entró en vigencia la Ley 20.084 de Responsabilidad Penal Adolescente (RPA). Con esta normativa se establece en el país una nueva concepción de los jóvenes infractores de ley y, por tanto, una transformación en el tratamiento penal de los mismos. Estas transformaciones se deben a una nueva visión del Estado chileno, que pasa de una lógica tutelar de menores a una perspectiva garantista de derechos. Desde el punto de vista jurídico, la antigua Ley de Menores 16.618 entraba en contradicción con disposiciones constitucionales y la Convención Internacional sobre los Derechos de los Niños, Niñas y Adolescentes, en la que Chile suscribió en 1990. Bajo esta antigua ley los menores que cometían delitos eran considerados personas racionalmente inferiores.

De este modo, se establece por primera vez en Chile un sistema de responsabilidad penal especial para adolescentes -mayores de catorce y menores de dieciocho años- con un conjunto de sanciones, como tratamiento a un delito protagonizado por el joven infractor. Al implementarse la Ley RPA, se cierran las antiguas Secciones de Menores y se abren los módulos especiales para jóvenes condenados bajo esta nueva normativa. Desde entonces los módulos juveniles se encuentran dentro de complejos penitenciarios de adultos a cargo de Gendarmería de Chile, denominadas Secciones Juveniles. A partir de esto, se expondrá cómo los jóvenes infractores, con esta nueva visión de Estado expresada en la Ley 20.084, se constituyen en un producto del disciplinamiento y objeto de saber criminológico. Aun cuando el tratamiento de los adolescentes internos es diferenciado de la población penal adulta, las Secciones Juveniles en Chile cumplen con ciertas características que permiten definirlos como una prisión regular, teniendo como referencia lo planteado por Foucault en *Vigilar y castigar*.

MANUSHI, DR. (*Indian Institue of Mass Communication*)

Mgnrega: A Way to Meet RURAL Urban Divide

As majority of the poor in rural parts of the country depend mainly on daily wages as unskilled labour thus living on the threshold of subsistence and vulnerable to the possibility of sinking from transient to chronic poverty in the event of inadequate labour demand or in the face of unpredictable crises like natural disasters or personal like ill-health, all of which adversely impact their employment opportunities. This grave scenario demanded the need to evolve a mechanism to supplement existing livelihood sources in rural areas. The Government implemented wage employment programmes that offered wage employment on public works with minimum wages. In context of poverty & unemployment, wage employment programmes provide unskilled manual workers with short-term employment on public works such as irrigation infrastructure, reforestation, soil conservation, road construction etc. These programmes provide income transfers to poor households during critical times especially in slack agricultural seasons.. Durable assets created under these programmes have the potential to generate sustainable livelihood. Based on the experience of wage employment programmes Mahatma Gandhi National Rural Employment Guarantee Act (MGNREGA) was enacted to reinforce the commitment towards livelihood security in rural areas. The mandate of MGNREGA is to provide 100 days of guaranteed wage employment in a financial year (FY) to every rural household whose adult members volunteer to do unskilled manual work. MGNREGA aims to provide a steady source of income and livelihood security for the poor, vulnerable and marginalized sections of the society. The Act brings with it huge opportunities of making a difference in the lives of millions of rural household. The paper attempts to demonstrate the impact of MGNREGA with special reference to its impact in bridging the rural urban divide.

Television Consumption and Social Stratification: An Italian Case Study

The practices of cultural consumption have long been considered as tools that maintain high the boundaries between the classes. Cultural tastes and choices create people's lifestyles and cover every aspect of everyday life: from higher practices typical of the highest social classes (such as going to museums, listening to classical music, etc.), to those easily accessible by a wider and heterogeneous audience (such as going to the cinema or watching television). Considering the differences between the practices of cultural consumption, it has been assumed that cultural habits could reflect the social positions of individuals who adopt

them, becoming a differentiation tool between social classes and an homogeneity tool within them.

The purpose of this study is to investigate whether a particular type of cultural consumption, the television one, highlights a correspondence between the socio-economic position and the choice of the TV-program to see, or if the television can break down the borders between classes, reaching all individuals without distinction. We chose to investigate the relationship between the individual's education level (that defines the class position) and the television products selected, through a quantitative methodology. In addition, it was investigated whether the connections between social stratification and television consumption differ according to sex, estimating the probability of choosing to see a certain set of TV-programs not only in relation to the higher level of education, but also in relation to gender. Finally, a longitudinal analysis was carried out in order to investigate if there have been changes in the Italian TV consumption over a decade (1995-2005).

The study was carried out considering the main theories about tastes and cultural consumption and their relation to the socio-economic positions of individuals: the homology approach (Bourdieu 1979); the individualization approach (Beck 1986) and the omnivore-univore approach (Peterson 1992).

La Représentation Du Réfugié Syrien Dans Les Journaux Télévisés Français Et Turcs

Depuis le déclenchement des émeutes en Syrie, en mars 2011, le nombre des réfugiés syriens ne cesse d'augmenter en Turquie et, depuis peu, en Europe. Au-delà des conséquences de leur passage/présence sur les plans politique, social, culturel et économique, à mesure qu'il s'intensifie, l'afflux de ces réfugiés – le choix des termes est lourd de signification[1] – donne lieu à des débats de plus en plus enflammés dans les espaces publics et médiatiques. Ils sont à la fois l'objet de manifestations xénophobes, « de préjugés, de discriminations, de situations d'exploitation et de violences »[2] et de prises de conscience et/ou d'initiatives d'ordre humanitaire souvent personnalisées dans des figures-type.

L'objectif de ce travail est de repérer la présence de l'Autre (le réfugié syrien) dans les médias audiovisuels en France et en Turquie : Quelle place y occupe-t-il ? Quels sont les thèmes abordés ? Quels regards se dessinent ? Il propose une étude, à la fois quantitative et qualitative, de la couverture réservée aux réfugiés syriens dans les journaux télévisés de 20 heures dans trois chaînes nationales pour chacun des pays faisant l'objet de ce travail.

Migration, Poverty and Islamic Feminism(s) in Europe

I concentrate my research on the following questions raised by Islamic feminism:

- Within the paternalistic and liberal values' system of Europe, how does Islamic Feminism take its legitimacy?
- In a liberal order, does Islamic feminism have premises to orient societies' for struggling against social injustice?
- In a Europe with euro debt crisis, how far does Islamic feminism manage to elaborate an alternative order that extend its claim for dealing with poverty, where rights of the weak takes its legitimacy from the strong?
- Does this model constitute a system of values where everyone manages to live humanly? If so, what kind of roles does Islamic feminism give to women?
- While proposing a system based on the concept of "justice", at what rate and how does Islamic feminism confront us with a series of new paradigms in the current neo-liberal system?
- Does Islamic feminism propose an alternative path of thinking for people at the margins in general -women, poor people, migrants, ...- or does it limit itself to its own marginalised group?

The series of question regarding the patriarchal system are rather authentic and interesting. For instance, while focusing on people affected the most from poverty over the last decade in Europe, particularly after the Euro debt crisis (2009-2014), Islamic feminism binds this issue with the paternalistic and neo-liberal value systems.

Therefore, this research is built at the intersection of the counter-hegemonic, post-modern and post-colonial feminist theories.

The first part of this project relies on analyzing and interpreting theoretical data inside literature. In the field, this project adopts a descriptive research method : A data survey on "poverty, feminism and Islam in Europe" is conducted in three major Western European capitals where the Muslim population is relatively high and where different State systems operate.

Social Structure, Social Learning and the Severity of Physical Intimate Partner Violence Against Women in Nigeria.

Intimate Partner Violence (IPV) against women in Nigeria is a subject matter that has captured the interest of various researchers in family research and gender studies. Several empirical investigations have been undertaken to understand the prevalence, attitude towards, and predictors of IPV against women in Nigeria. However, most of what is known about IPV in Nigeria are from community samples. Also, there has been no study that has investigated the distinction between minor and severe physical IPV against women within the Nigeria context. Using the Nigerian Demographic and Health Survey of 2014, this study applies the social structure (feminist) and social learning perspective in understanding the severity of physical IPV against women in Nigeria. The study revealed that primary and secondary educational attainment, and being employed predicted severe physical IPV victimization. Alcohol consumption by the respondents' spouses, being a victim of childhood abuse, and witnessing IPV between parents predicted severe physical IPV. This study shows the significance of applying a feminist and social learning theoretical perspective in pointing to the socio-cultural context that shapes the abusive experiences of Nigerian women.

Village Base Stations (VBTS): The Promise of Community Cellular Networks As a Project for Public Sociology

The Village Base Station (VBTS) Project in the Philippines builds low-cost, low-power community cellular networks that enable remote and unserved localities to have access to communications services, which is envisioned to leverage more investment, and spur development and empowerment in these localities. It is an interdisciplinary research project funded by the Philippines' Commission on Higher Education through its Philippine-California Advanced Research Institute (PCARI) program, which brings together a collaborative team of researchers from the Philippines and the US as well as a multi-sectoral array of stakeholders as partners in project implementation.

This presentation examines the challenges that impede the diffusion of community cellular networks in the Philippines, such as a 'duopolistic' pattern of spectrum ownership, an outmoded policy environment for spectrum management, and the persistent tension between commercial viability and social service provision. It also identifies the disruptive and transformative potentials of community cellular networks as a human-centered technological innovation, such as highlighting the need to democratize the ownership and management of radio frequencies, its promotion of multi-stakeholder community participation and support to ensure viability and sustainability, and the various possible uses of the VBTS for efficient and innovative delivery of social services to marginalized communities.

This presentation argues that human-centered technologies such as the VBTS have to recognize the social infrastructural requirements of technological innovations. Community cellular networks would have to amplify voices from the 'last mile' through passionate policy advocacy, participatory approaches to technological research and development, and sustained reflexivity and dialogue that dissolve traditional barriers between disciplines, cultures, and social statuses. Human-centered technological innovations, such as the VBTS, are projects for public sociology.

Violences Basées Sur Le Genre Au Sénégal : Mécanismes De Prise En Charge Et De Prévention Par Les Institutions

Ce texte traite des mécanismes de prise en charge et de prévention des acteurs institutionnels engagés dans la lutte contre les VBG (Violences basées sur le genre) au Sénégal. Les résultats sont issus d'une enquête effectuée auprès de différentes organisations (police, gendarmerie, justice, Organismes internationaux, GPF, OSC, structures communautaires de bases, directions centrales de l'Etat, etc.) qui interviennent dans la prévention, la prise en charge la répression des VBG et la reddition des comptes. Les données aussi bien quantitatives que qualitatives ont permis de voir les types de VBG répertoriées par ces institutions mais aussi les mécanismes existants et les stratégies déployées pour faire face au phénomène. L'enquête auprès des acteurs institutionnels et l'analyse des documents et rapports d'activités ont permis de mettre en évidence diverses actions qui se déclinent en termes de prévention (70,3%), d'accompagnement et de suivi (24,6%) et de prise en charge (5,1%). En plus, les réponses nationales proposées par le Gouvernement sénégalais en partenariat avec les différents acteurs que sont les institutions techniques et financières, les ONG internationales et locales, qui constituent autant de dispositifs et d'actions pour lutter contre le phénomène de violences sont passées en revue.

Responses, Practices, and Processes of European Disaster Management and International Humanitarian Aid Operations in the European Refugee and Migrant Crisis

To understand the link between migration and disaster it is not only important to understand how disasters contribute to migration, but also how disaster management procedures shape migration and refugee contexts. Contributing to these issues our paper describes and analyses the responses, practices and processes of European disaster management and international humanitarian aid operations of the so called "refugee and migrant crises" from 2015/16 to date exemplified by Germany and Greece and their dynamic interconnectedness.

The influx of hundreds of thousands of refugees and migrants into Europe in 2015/16 overwhelmed the capacities of responsible services in several European countries, resulting in multiple humanitarian and political crises. Although it was not formally declared a disaster, disaster management procedures were deployed all over Europe. While Mediterranean countries were predominantly confronted with refugees and migrants arriving by boat and in need of first services, countries along the different routes (e.g. the Balkans, Greece, Austria) dealt with aspects of transit migration such as short-term sheltering and transport whereas the destination countries had to take care of organizing temporary and permanent accommodation and provisions (e.g. Germany, Sweden).

In 'non-crisis' times, the care of refugees, falls under the regular jurisdiction of government entities and/or social welfare organizations. While these organizations continued to provide support, additional civil protection and disaster management organizations carried out their largest operations in many European countries during the 2015/16 period. In some places operations were even carried out under the umbrella of international humanitarian aid, specifically regarding practices, standards, and funding (e.g., DG ECHO, UNHCR). It was the first time that international humanitarian aid and European Disaster Management measures came into place in European contexts. As a result, an unprecedented hybrid situation emerged that involved very different and heterogeneous actors with to some extent competing structures and manners of operation.

Social Media and Education in the Era of Globalization

Social media permeates today's society with millions of us engrossed, some would argue to the point of unhealthy addiction via apps such as Facebook and Twitter. The educational institutions have an increased use of social media marketing to showcase their courses and to attract students, but are they harnessing the full power of the medium to engage and interact with those same students once they begin their studies? Do social media have a place as a teaching tool or is it simply a distraction? It seems that some lecturers are indeed beginning to tap into the potential benefits of social media in education. But could social media play a more central role in university education? we can look at the lead taken by distance learning models which in some respects have got ahead of the game when compared to their campus-based counterparts. Learning management systems such as Moodle and Blackboard have become immensely popular. The role of social media in education has different meanings depending on which side of the house you sit on. The studies have concluded that the more you connect with your student population the better your retention rate. Social Media can be a great way to engage student population and to ensure that they are made aware of student-centered activities on campus. Another area, where

the role of social media in education is becoming apparent, is in the area of recruitment and admissions. The use of social media is growing and has almost become a utility in many cultures. Colleges tend to be behind the curve in the adoption of using social media in their educational strategy and have not put a lot of time how to overcome the obstacles. The paper is aimed to discuss these issues in the context of Indian Society.

Narratives of Illness and Offending: Mentally Disordered Offenders' Views on Their Offending.

Mentally disordered offenders pose a problem for the criminal justice system. Courts are tasked with deciding whether an individual has committed an offence and how far they should be held responsible. However, mental disorder may limit an individual's ability to understand or weigh up the consequences of their actions making notions of responsibility problematic. This paper is about how a group of individuals, identified by the courts as needing psychiatric treatment due to their level of risk toward others, viewed their offending behaviour.

Narratives have been used in both the sociology of health and illness and in criminology to examine how groups of people present themselves in moral terms. The purpose of this paper is to focus on the narratives of offenders' s subject to section 37 / 41 MHA 1983 as a means of highlighting how illness and offending are presented within talk to present a moral identity. I offer a new approach towards the study of offender narratives through drawing on theories from both the sociology of health and illness and criminology to identify how accounts of offending and illness intersect.

Participants presented illness in a variety of different ways indicating a range of moral positions towards offending. In line with previous research a first group used mental illness to excuse offending and saw themselves as achieving moral reform through treatment. A second group also used illness to excuse offending, but did so inconsistently, seeking to mitigate responsibility whilst distancing themselves from treatment obligations. A third group portrayed themselves as dishonourable both due to their category of offence and the type of illness experienced. A final group rejected both labels of illness and offending, seeking to portray themselves as consistently moral.

The Use of Mental Health Law By Relatives of Patients with Mental Health Problems: The Case of the Nearest Relative.

The concept of 'family burden' has been used by sociologists to explore the emotional strains and economic difficulties experienced by the families of psychiatric patients. Through drawing on published research, this paper considers the way in which subjective burdens experienced by families might impact on decisions relating to the compulsory admission of patients who have been diagnosed as being mentally unwell.

The paper focusses specifically on the role of the Nearest Relative under the Mental Health Act 1983 in England and Wales. Nearest Relatives are given powers to prevent an admission in hospital for treatment or to request an independent review of detention. Conversely, they are also empowered to apply for detention or to request that professionals consider this.

The paper highlights a number of tensions related to the Nearest Relative role. First, quantitative research has shown that family members view admission more positively than the users of mental health services. Second, studies have shown that patients and carers hold different perspectives on the degree to which compulsory admission may be justified. Third, users of mental health services may view the actions of Nearest Relatives as detrimental to their recovery. We conclude by considering ways in which the current system may be improved.

Environmental Education in the Sacred Woodlands of Korhogo (Ivory Coast) and Adoption of Environmental Behavior By the Insider : A Phenomenological Analysis of the Sustainability of Indigenous Community Ecological Innovations

In African traditional societies, the relationship with the Environment has constituted for a long time, a link of intimacy between the African and his environmental space. This report has its peculiarity in that, the environment is an integral part of the social organization and cultural practices. Now the spiritual question within the African traditional society is strongly related to the

elements of nature such as water, pebbles, trees As African traditional religion apprehends these elements as the place of habitation of deities and ancestors. This is why the Senoufo people practice in their wooded forests the initiatory rites called "Poro" which situates the social education of the young boy. Thus, in initiatory forests, these young people from 14 to 18 receive an environmental education aimed at health, agriculture and climate change concerns. However, at the exit of these initiatory sites, ecological behavioral differences are observed for some of them into community. This paper will therefore analyze the determinants of environmental education given to insiders; But also, it will observe the aged environmental perceptions' who are in charge of the training of these young people in the forests. At the end, this production will answer the question "What are the logics underlying the adoption of the environmental behavior by insiders of the sacred woods of Korhogo in the Northern of Côte d'Ivoire?" The challenge is to grasp the sustainability of adaptive innovations of indigenous communities in the face of drought and the transformation of ecological habits of insiders in contact with the urban city. It therefore analyzes 117 interviews conducted with the chiefs of the sacred woods, the insiders and the village chiefs. The data were analyzed under WeftQda and interpreted according to the sociological approaches of Riley Dunlap.

Comparing 16 Energy Living Labs across 8 Countries: Methodological Challenges, Limits and Hazards

Efforts to improve and reduce household energy consumption are on the rise across Europe, with everyday people increasingly seen as playing a key role in the energy transition. The EU Horizon 2020 ENERGISE research project aims to understand the social and cultural influences on energy consumption, based on a comparison of 16 Energy Living Labs (ELLs) across eight European countries. In order to achieve this goal, methodological developments include a consideration for the design, implementation and analysis of the ELLs, to understand "energy cultures" and social influences on the individual (household) and collective (community) level. The design of ELLs is based on the review, classification and analysis of household and community energy initiatives from 30 European countries. When it comes to comparing qualitative and quantitative data around the implementation of 16 ELLs, a specific methodology is needed to address the question of scale (household and community) and context (eight different countries). The aim of this paper is to question and discuss the challenges, limits and hazards of this type of comparison. Based on a literature review of comparative methods, we will propose and discuss our methodology and underline the associated challenges (e.g., different scale, cultures and sub-cultures; types of households; energy domains and sub-domains studied; as well as the amount and types of data that will be gathered, including visual data). We will also discuss the limits of this comparison, involving temporality issues for example. Finally, we will discuss the hazards of this comparison, such as the risks of result de-contextualization. This methodological discussion and analysis could interest colleagues with similar cross-national research project and challenges.

What Sort of « Innovation » Are We Talking about? a Review of Swiss Household Energy Initiatives

Efforts to improve the efficiency of household energy consumption are on the rise in Switzerland, with everyday people increasingly seen as playing a key role in the Swiss energy transition. These initiatives involve the promotion of new technologies and low-energy appliances, alternative ways of producing energy (e.g. local renewable energy production) or efforts to change energy-consuming practices (e.g., bike to work programs or sharing economy initiatives), among others. Different actors are leading these initiatives, ranging from institutions, governmental and no-governmental organisations, citizens, activists and researchers, with various modes of action: informative campaigns; monetary incentives; gaming, challenges and competition; Living Labs approaches and peer-to-peer cooperation are some of the many forms that such initiatives take on. Based on a review of more than forty energy initiatives in Switzerland, in the frame of the EU Horizon 2020 ENERGISE research project, this paper will question which forms of innovation they constitute and which aspects could be considered as "innovative" in relation to actors and their roles, modes of action, participative processes, forms of representation and changing practices. This contribution aims to uncover: 1) an overview of all energy initiatives in Switzerland in recent years that engage with household energy consumption, resulting in a typology of initiatives; 2) a focus on select initiatives (2-3 examples) that engage everyday people and change social practices related to energy consumption; and finally 3) implications for understanding in what way this initiatives around energy efficiency and sufficiency are innovative.

DOBNER, SUSANNE* (Institute for Sociology, University of Vienna)

Exergaming and the Construction of Age(s)

The use and development of digital movement games or exergames has become widespread in gerontological research particularly in the context of Active and Assisted Living (AAL). On the one hand, the games are specifically used to train and improve motoric and/or cognitive skills of older adults. On the other hand they partially replace common social board games or can serve as a social medium at family celebrations (De Schutter 2010, Allaire et al. 2013). This empirical contribution examines how age is constructed in the interaction with and development of the 'EnterTrain' exergaming platform, a gaming platform developed within an ongoing AAL research project.

During a test and evaluation phase of the gaming platform, participants aged 65 and older have the games installed in their homes over a period of 12 months. Empirical material used for the analysis consist of video footage capturing older adults playing the games as well as qualitative in-depth interviews at several points in time during the trial phase. Additionally, participant observations during the initial installations of the gaming platform contribute to a better understanding of the interaction and construction of age(s) between participants, technicians and the gaming platform itself.

The theoretical basis of this contribution is a materialistic-feminist development of Schroeter's concept of the "Doing Age" (2012), which captures the interplay of symbolizations and physical performances analytically. To consider the concrete manifestations of physical processes and changes is particularly important in gerontological research because they are a central expression of aging (cf. Abramson 2015). Materialistic-feminist research expands this approach by "de-limiting" the body as an ontological unit and working it out as reconfigurations of human-thing-technology-networks with other physical embodiments (see Barad, 2003).

Cross-Movement Mobilizing after the Left Governments. Unions and Social Movements Alliances in Latin American Regional Organizing

The experience of cross-movement collaboration in Latin America peaked during the struggles against the Free Trade Area of the Americas (FTAA). Trade unions and social movements brought an alliance that managed to mobilize, lobby and design a strategic platform focusing on an alternative development model to the neoliberal regime. That alliance weakened during the 'pink tide' of centre left governments. Unions focused on national contexts with little cross-movement collaboration. The end of the left cycle is bringing back former alliances.

This paper explores the challenges and potentials for the current alliance-building around issues of sustainable development and climate change that trade unions are creating with social movements in Latin America. Specifically, the paper looks into the regional trade union confederation and its positions on development during the past decade and in the present. The shift in governments has put unions and social movements on the same side again, and the possibilities for rebuilding relationships around issues of sustainable development are stronger. The challenges to that alliance today will also be addressed, together with a critique of the role unions have played in defending extractive development models.

A central issue in the paper is the role played by the association of unions around issues of energy democracy, and the relationship with trade unions in the US and Canada, where the debate sustainable development has taken a different, and more confrontational, form for the labour movement.

DOCENA, HERBERT* (University of the Philippines, Diliman)

'Passive Revolution' on the World Stage: How the Global Movement to Stop Climate Change Failed to Produce an Alternative Future

Beginning in the late 1960s, a new global movement pushing for more radical solutions to "global environmental problems" such as climate change unexpectedly burst onto the world stage. To the surprise of many, members of subaltern groups worldwide began converging and gaining more and more adherents behind their goal of radically reforming or transcending capitalism to stop or limit climate change—and it seemed for a time that they might yet succeed. And yet, today, nearly half a century since it first emerged, this global movement has all but failed to achieve its objectives: the world's governments have managed to pass only weak and ineffective international agreements and measures to address the climate crisis and the international community is now beginning to experience the impacts of catastrophic climate change. Why? How was this once promising and powerful global movement contained?

Drawing from interviews, participant observation, and historical sources, this paper analyzes the emergence and evolution of radical climate groups in the Philippines to argue that the radical global movement to stop climate change was

defeated as a result of a "passive revolution" on the world stage: Faced with a growing challenge to their hegemony, a particular fraction of the world's dominant classes came together and pushed for limited international reforms to address the crisis, thereby disorganizing the dominated classes and consequently weakening not just the dominated classes' but also even their own capacity to counter the more conservative elites blocking their proposed reforms. Building on Gramsci's concept of "passive revolution" and examining how it works at the global level, the paper presents an alternative framework for understanding transnational politics and, in so doing, examines how social movements can succeed in producing alternative futures.

DODDASIDDAIAH, NANJANASIDDAIAH* (*Karnataka State Open University*)

Globalization, Gender and Poverty: Women Workers in Garment Industry in Karnataka Region of India

Globalization in India and elsewhere has led to the emergence of number of industries in general and garment industry in particular. Besides having direct impact on the consumers in terms of manufacturing, in Indian industrial development, they are also seemed to be assisting the needs of the industries in terms of providing them with the packing material. It enables them to play an extremely larger role in the Indian economy and provide employment opportunities to much of the Indian women population. Since the introduction of liberalization policies introduced in India 1991, there has been considerable growth of export earnings through the garment industry in India. In Karnataka many textile policies were adopted since 1993 which has enabled growth of job opportunities for women in garment industry. The number of women employees in state wide is more than three lakhs out of which more than two and half lakhs women employees are located in Bangalore city units. An attempt is made in this paper to analyse the socio-economic status of women workers in garment industry and their working conditions. The garment industry in the state of Karnataka of India particularly Bangalore city employees bulk of the women working force. Based on empirical evidences this paper sheds a gender perspective on functioning of garment industry in Bangalore to point out the absurd effects on women workers by exploring the poverty implications of this new form of employment by analyzing the socio-economic backgrounds, working conditions and wage disparity in garment industry of India. With regard to the problems, sexual harassment of women workers was a rare phenomenon at the work place as there were no rape or molestation cases. In many cases extra marital relations were noticed with co-workers or supervisors. This could be in retaliation against the habit and poverty of families.

Power, Violence and Justice: Reflections & Responsibilities from the African Diaspora

This is a proposal to the XIX ISA Conference, RC56, to present a paper that explores the long forgotten African Diaspora regarding issues of "Power, Violence and Justice" as such an exploration can help global public intellectuals, policy makers, journalists activists and others re-contextualize their 21st century thinking toward justice. The paper proposes that historical facts of the African Diaspora, among human history's largest, longest, and most traumatic global phenomena, is inextricably embedded in modernity's capstone features of democracy, capitalism, globalism, and freedom. It is generally understudied, fully misunderstood, unknown and/or deemed insignificant to contemporary social life. Generally, the thinking is that the African Diaspora has little or no contributions to our modern world.

For example, institutionalized value premises and organizational arrangements upon which many criminal justice systems have evolved, and that gave substance to many global parameters about race, racism, and other topics that pervade our modern world, were initially designed, explored and refined in the social context of the African Diaspora. Such prison systems that do not train inmates to re-enter society upon "paying their debt" are based on experience with members and processes of the African Diaspora that never intended African people to ever be integral members of any euro-centric society. Rather, current public intellectuals, policy makers, journalists, activists and even academics tend to episodically engage contemporary social issues without the historical context that produced them.

This paper assumes an historical sociological approach to study and understand attitudes and practices of the this and other phenomena that have evolved from the African Diaspora as global experience. The paper focuses on the African Diaspora as analytical tool for reviewing the global phenomenon and its relation to historical and contemporary modernity.

DOERING, JAN* (*McGill University*)

The Socio-Political Experiences of United States Citizens Living Abroad in the Age of Donald Trump

This paper examines the socio-political experiences of United States citizens living abroad in the age of Donald J. Trump's populist presidency. The U.S.'s central role in world politics has always engendered not only admiration but also a certain degree of resentment and hostility. In many countries, however, the reputation of America and Americans has deteriorated in response to Donald Trump. What repercussions do these changes have for expatriates from the United States? Drawing on data collected through participant observation and 28 in-depth interviews with American expatriates living in Canada or Germany, this paper analyzes how Americans experience their nationality while living abroad. Specifically, the paper examines American nationality as a source of stigma that expatriates have to either conceal or manage. In doing so, the paper contributes to the literature on transnational politics in the sociology of migration but reverses the typical focus on the flow of people from less- into more developed nations. In this specific context, the findings illuminate how populist homeland politics affect the lives of (temporary) emigrants. The study also contributes to the literature on ethnicity and nationhood by analyzing the concrete experience of American nationality, a rarely examined but important social identity.

DOGRU, HAWVA EZGI* (*Independent Researcher*)

Between Rights-Based or Profit-Based Housing: An Examination of the Turkish State's Role in the Financialization of the 'Affordable' Housing Market

With the crash of the US mortgage market in 2007 the seriousness of the symbiotic and mutually (de)constructive relationship between the finance and real estate markets in the Global North became ineluctable. And when it comes to the Global South, late-comer states are argued to be in the process of building a 'transparent mortgage market' without prioritizing the disastrous results of transforming housing into an instrument subject to financial speculation. Based on a year-long field research on the Mass Housing Market in Turkey, the paper asks the following question: "How should we understand the Turkish State's role in the financializing the affordable housing market for the poor?"

The case of Turkish Mass Housing Administration (TMHA) brings interesting insights for understanding the nation state's role in the financialization of affordable housing for the lower income classes. On the one hand, Turkish state has maintained a 'rights-based' discourse as it argues that TMHA, as welfare state institution, prioritizes the demands of the 'targeted masses in need' with the promise of solving housing problem for the poor. On the other hand, TMHA created huge numbers of indebted poor through re-commodification of the shanty houses which are already owned by the poor. That is, urban regeneration is used as a main housing policy tool by TMHA to dispossess the poor and integrate them into the financial markets.

By looking at the relation between rights-based discourse and profit-based implementation of Turkish state's housing policies, this paper argues that right to housing, as the right to control the concreteness of our livelihood, should be prioritized over the new financialized visions of housing policies.

DOLATA, ULRICH* (*University of Stuttgart*)

Apple, Amazon, Google, Facebook. Market Concentration – Competition – Power

Based on a systematic review and evaluation of business reports, documents, statistics, literature and press releases, this paper analyzes the market concentration and the expansion and innovation strategies of the leading internet companies. The findings invalidate any claims that a decentralization of the market and a democratization of the internet is taking place, or that research, development and innovation processes are becoming more open and collaborative. The four examined companies, as the operators of the core infrastructures of the worldwide web, shape the overall products and services offer of the internet, determine access to the web, structure the communication possibilities for users, and are the main drivers of innovation in this field. Not decentralization, democratization and open innovation, but market concentration, control and power struggles are categories to adequately describe the fundamental dynamics of the commercial internet. The power of the internet companies manifests not only as an economic power, which is based on the superior economic resources of the companies—their financial strength, strong research capacity, market dominance. In addition, internet companies are gradually broadening their power over data, namely by interlinking their range of cross-divisional offerings and by systematically matching and evaluating the resulting user traces. Above all, the power of the internet companies is based on

their ability to, by means of numerous and coordinated offers, design and shape the framework conditions of essential social contexts, be they consumer worlds, information and communication patterns or social relationship networks. This means that they are not merely intermediaries, such as telephone companies, but are transformed into action-orienting and opinion-forming curators of public discourse. This can be described as an infrastructural and rule-setting power.

Social Movements and the Internet. the Sociotechnical Constitution of Collective Action in the Digital Age

For some years, the field of research on social movements has undergone fundamental changes with regard to its structure and orientation. More specifically, it has moved from conceptualizing and examining protest movements as purely social phenomena to taking into consideration the new technological foundations of collective action. Regardless of the degree of influence which the internet and its media platforms is deemed to have on social movements, most research contributions to this topic have one commonality: Despite the oft-made references to the action-enabling and -expanding character of the new technological connectivity, the technologies themselves with all their embedded rules and regulations remain a blind spot in much of the discussion. Against the backdrop of this discussion, this paper seeks to identify the role played by the internet and in particular social media today in the development and stabilization of political protest and social movements. For this, the paper pursues two tasks: One, to arrive at a more precise definition of the technical foundations of collective behavior and action, namely one that would reveal the internet and social media not only as enabling but also as regulating and action-guiding infrastructures and institutions that have a considerable degree of impact. And two, to assess the relationships between the technical and social conditions under which collective protest and social movements take shape in the digital age, referred to as "technically advanced sociality."

DOMARADZKA, ANNA* (University of Warsaw)

DIANI, MARIO (University of Trento)

Field Theories of Urban Collective Action: A Comparative Assessment

Over recent years several versions of field theory have been applied to the study of urban collective action. Reviewing weaknesses and indeterminacies of existing theoretical lines, Martin (John L. Martin, "What is Field Theory?" *American Journal of Sociology*, Vol. 109:1, 2003: 1-49) argued that each has an important contribution for the social sciences, giving us the possibility of joining the analytic insights given by field theory to a more grounded line of research.

In our own work we have drawn upon, with variable amounts of adaptation, classic neo-institutionalist arguments à la DiMaggio and Powell (Mario Diani, *The Cement of Civil Society: Studying Networks in Localities*. Cambridge/New York: Cambridge University Press, 2015) and Fligstein and McAdam's concept of "strategic action fields" (Anna Domaradzka and Filip Wijkström, "Game of the City Re-Negotiated: The Polish Urban Re-Generation Movements as an Emerging Actor in a Strategic Action Field," *Polish Sociological Review* 3, 2016: 291–308). In his own version of field theory, Nick Crossley (*Towards Relational Sociology*. London: Routledge, 2011; *Networks of Sound, Style and Subversion. The Punk and Post-punk Worlds of Manchester, London, Liverpool and Sheffield, 1975–80*. Manchester: Manchester University Press, 2015) has proposed a novel integration of Bourdieu's perspective on fields with the tools of social network analysis.

In our paper we contrast these approaches and discuss their comparative fruitfulness for the analysis of collective action in urban settings, drawing upon our empirical work on Poland, South Africa and the UK. We focus on "right to the city" frame used by civil society actors in local and international context, to better illustrate the explanatory capacity of field and network theories.

Why Grassroots Groups Result in Different Consequences of Contribution to Local Public Goods?: A Case Study of Maintenance of Public Squares in Japan

This research focuses on why grassroots groups result in different consequences of contribution to local public goods, though they participate in a public project which has a goal and is carried out by a municipal government. Although many researchers have shown that grassroots groups can be categorised from the perspective of the relationship between governments and NPOs, as far as I see it, reasons for them to result in these different consequences on the Japanese context are not clarified yet. Saitama City Office in Japan established an ordinance to use unused public lands as squares for ball games in 2010. Moreover, the Office has added a condition that it is necessary for grassroots groups to maintain the lands. There are 14 multi-purpose squares at present. Interviews with members of grassroots groups in each square have been conducted from 2014 to 2016. The conclusion is as following. Firstly, these squares are classified roughly into three types. The first type is *correspondence* that grassroots groups such as sports clubs use and maintain squares. The second type is *separation* that grassroots groups such as volunteer groups maintain squares and other people use them. The final type is *nest* that grassroots groups such as neighbourhood associations maintain squares and a group or some groups which use them are included in them. Secondly, it is easier for neighbourhood associations in the type of *nest* to maintain squares than for the others because they conventionally have a system which makes almost all new households members, so that they have enough members to maintain them. And finally, it is difficult for sports clubs in the type of *correspondence* to continue maintenance of squares because they lose their motivation to maintain them when they find another place that they enjoy ball games without the burden of maintenance.

E-Commerce from Regional Communities

E-COMMERCE FROM REGIONAL COMMUNITIES

Within the Societies of Knowledge and Welfare we are experiencing a social and economic phenomenon where the new businesses that are succeeding have one thing in common: the use of Information Technology, Communication and Knowledge. Commerce is one of the economic activities that has changed the way it operates with the injection of computer tools: hence the increase in electronic commerce. The opportunity of e-commerce and social computing, and the object of this work, is to create tools and strategies to incorporate this type of commerce in virtual communities, which are the technological platforms for regional communities and improve their welfare. The work not only requires the generation of a tool that is the most attractive, useful and generates the benefits that the sea used by the inhabitants of a region, also the communication and business strategies for the inclusive sea, grows constantly and consolidate as part of the technological infrastructure of a Regional Community. The challenge is to generate a comprehensive proposal that can solve the paradigms and the idiosyncrasy of regional communities in favor of growing e-commerce. With this work, we are looking to create an e-commerce service platform that can offer different lines of action to increase online commerce from regional communities to the global platform through mobile applications.

Work Tourism

WORK TOURISM

Today, we see in our Society of Knowledge and Welfare a great opportunity to consolidate their collaboration in solving problems faced by 21st century societies, one of which is the generation of employment and an increase in the economically active population. On the one hand, we are faced in the technological revolution where information and knowledge technologies are increasingly affecting more aspects of our lives, in aspects as daily as local communities, and on the other hand we have a great diversity of economic activities to generate the Labor Tourism. Labor Tourism is a network of communication, collaboration and technology that allows the creation of specialized economic zones to improve a country's regional growth: sources of employment, professionalization of more people, increase tourism and innovation, and generate global presence with the use of Virtual Communities. Not only is the fact of keeping a record of all the different economic activities, but also the opportunity to generate a "productive" communication, with which you can create pristine areas for different types of jobs and work, and that opportunity is offered to generate online courses, job offers, increase competition and offer a labor map within a country, and can be exploited internationally.

DOMINGUEZ, MARIO* (Dpt. Sociologia. Universitat de Barcelona)

Provisión De Cuidados y Desigualdad De Género. Propuesta De Indicadores Sociales En Europa y América Latina

Los cambios acaecidos en las sociedades occidentales contemporáneas a partir del cambio de ciclo económico de 2007 y el impacto de la crisis económica, han supuesto transformaciones en el modelo de organización social y, específicamente, en las formas de provisión de cuidados y la realización del trabajo familiar y doméstico. El debilitamiento del estado de bienestar, con políticas de ajuste estructural que afectan la oferta de servicios públicos, y la inaccesibilidad de las familias a los servicios que oferta el mercado en un contexto de caída de su poder adquisitivo, ha incrementado el tiempo de trabajo familiar doméstico y de cuidados por parte de las familias.

El objetivo de la comunicación es presentar la operativización de un sistema de indicadores sociales utilizados en los análisis del impacto de estas formas de organización social de los cuidados y del bienestar, que agudizan las desigualdades de género (al tiempo que emergen nuevas formas de desigualdad social por razones de clase, etnia o lugar de procedencia). La propuesta de indicadores sociales podrán ser utilizados en análisis comparativos entre diversos países teniendo cuenta las dinámicas sociales, la especificidad y la comparabilidad de contextos sociohistóricos y culturales.

A nivel empírico, los estudios sobre usos del tiempo ponen de relieve las fuentes de organización social de los cuidados y el bienestar, así como las diferencias en la adjudicación por sexo de los diferentes trabajos y de las actividades realizadas en cada ámbito (familiar y mercantil). Concretamente, se utilizan de forma comparativa las encuestas de uso del tiempo en países de Europa (España, Finlandia y Francia) y América Latina (Argentina, Chile y Uruguay) [1].

Between Economic Exile and Lifestyle Migration. US and Spanish Expats in Chile.

In this paper, I present the results of my research with "immigrants" from the United States and from Spain that are residing in Chile since 2000. I base my analysis on Castles' theory of social transformation applied to international migration within neoliberal globalization, in connection to Favell ideas on mobilities and the notion of life-style migration. Using virtual ethnographies on blogs and other virtual spaces, secondary statistical data, and more than 50 interviews, I explore the contexts that frame the US and Spanish migration process to Chile in the early 21st century to understand how these contexts narrated by these migrants and the construction of their migration decision. Based on the data analysis I argue that there is a dual construction of the migration process. On the one hand, these migrants frame their migration within the Great Recession of 2008 and this period inhabits their migration decision. On the other, they narrate their decision and stay in Chile from an agency based perspective that centers on how this migration is an opportunity created by a search for the "good life" and not externally influenced.

This research expands on the study of migration decisions by analyzing how global social transformation create context in which individual decisions takes place. Advances, as well, in migration studies by studying migration from the global north to a country in the global south (or at least in the periphery of the global north). Third, it advances life-style migration approaches by studying possible restrictions to this type of migration in context of social change and global crisis.

Political Participation of Migrants and the Question of Citizenship. the Case of Santiago, Chile

T.H. Marshall (1950) stated that citizenship is comprised of civil, political, and social components. Each of these would grant access to certain rights such as freedom of expression, right to vote; and the right to a fair salary, to name a few. This conception of citizenship has been put into question not only by social inequalities, but also by the conversion of citizens into customers as proposed by Somers (2008), but also by international migration to liberal democracies (Joppke 2010). With large variations, immigrant receiving states have provided migrants mostly with rights associated to social and economic rights. Political rights and political participation, however, has not been associated to immigrant status but to the process of those migrants' becoming citizens (Baubock 2002; Méndez Lago 2008; Modolo 2014).

The Chilean case is particular. Immigrants have had the constitutionally sanctioned right. According to the Chilean Constitution, immigrants with five or more years of living in the country, regardless of residency permit, have the right to vote in all elections. To access this right they do not need to become citizens, unlike most countries in the world. Recent changes to migration law, making voter registration automatic and voting voluntary, eased even more access to this right. Based on forty interviews of recent immigrants done in four locations in Chile in 2016, as well as an online survey, we discuss the effects of access to the right to vote in the construction of immigrant citizenship beyond the access to a Chilean citizenship. We argue that political participation in the home country influences political participation in the country of destination, thus "citizenship acts" are transferable beyond borders.

Elders' Quality of Life at Collective Dwelling Community

Canadian population is aging rapidly, and the long waiting time for a vacant senior accommodation unit shows that an increasing number of Canadian elders have chosen to reside in a collective living community for seniors. Of Canada's population of 36 million people, the great Toronto area has over 6 million (Statistics Canada, 2016). With many elders now residing in accommodations for seniors (i.e. retirement homes), an investigation on the desired living conditions for elders can help to find gaps in the status quo and the directions for future improvement. This study examines the elders' subjective wellbeing in their current accommodation at an elders' living community in the greater Toronto area.

Do Naturalised Immigrants Hold a Stronger Shared Sense of Belonging to the UK Than Their Non-Naturalised Counterparts?

One of the recent most disputed points of public and academic debate concerns the economic, cultural and social integration of settled immigrants. Governments across Europe have recently embraced policies and an overarching narrative of "good citizenship" as grounds for a common identity and, in turn, of social cohesion. This paper asks whether naturalised immigrants have a stronger shared sense of belonging to the UK than their non-naturalised counterparts. The analysis used wave six of the largescale, nationally representative, UK Household Longitudinal Study, employing latent trait modelling. Sense of belonging represents the subjective dimension of social cohesion and was therefore operationalised as a) national identity and b) trust in political representation to reflect its horizontal (intra residents) and vertical (intra resident and government) dimensions. Findings suggest that the acquisition of citizenship is associated with closeness to the host society for all immigrants, but especially for people born in the Middle East. Citizenship does not, however, necessarily correlate with trust and satisfaction with British democracy. Individuals originally from Eastern Europe/ex USSR or South East Asia are the only ones who show increased levels of trust towards public officials when holding citizenship status. Citizenship appears to therefore hold a meaning tied to individuals' sense of identity: immigrants with citizenship status feel more British. Nonetheless, citizenship is not generally associated with satisfaction with the functioning of British democracy. In an increasingly globalised world with flexible borders, these results prompt reflection on the role of citizenship as grounds for a common identity and social cohesion. These findings provide us with a first insight into the motivations for and meaning of naturalising, which might go beyond the mere practical benefits associated with the legal status.

The Relationship between Trust, Health and Housing in Australia

This paper examines the relationship between trust, health and housing in Australia. The research considers level of trust across a range of housing tenures, concentrating on tenants and home owner's level of interpersonal trust and confidence in a range of public institutions. Through multivariate analyses of national survey data the paper profiles the class, income and health levels of people in different housing tenures. Although public housing tenants have access to affordable, secure housing, they appear to be less trusting than private renters or homeowners, and exhibit less confidence in some public institutions.

These findings may reflect the residualized nature of public housing in Australia and suggest that public tenants are likely to become 'alienated' from certain aspects of mainstream culture. However, public tenants also have higher levels of confidence in certain institutions, such as banks, Australian companies, the Courts and legal system than private renters or homeowners. So public housing may 'build up' confidence in certain areas. The findings suggest that levels of trust and health would be lower if disadvantaged citizens did not have access to social housing.

Understanding Why LGB and/or T People Remain in or Return to Domestically Violent Relationships: An Ecological Analysis

Why do lesbian, gay, bisexual, and/or trans (LGB and/or T) people experience/enact domestic violence and abuse (DVA) in their intimate relationships? Theoretical responses to this question currently reflect the disciplines that have researched the phenomenon. Thus, there is a predominantly psychological approach focusing on the factors correlated with individual 'victim' and/or 'perpetrator' behaviours. This approach predominates in research and also in practice, primarily because it is in privatised and individualistic contexts – counselling, therapy – that LGB and/or T people experiencing/enacting DVA most often seek formal help. However, a more sociological approach, taken in this paper, considers the wider socio-economic and cultural contexts in which LGB and/or T people live out their relationships to focus on what the conditions are that might lead to DVA relationships being initiated, maintained and, indeed, returned to. In this analysis we analyse our data from British mixed-methods research and draw on Heise's ecology of violence framework to point to the ways that the (nested) individual, relational, community and societal layers constitutive of the socio-economic and cultural contexts in which LGB and/or T people live can develop more holistic understandings of their experiences of DVA. We particularly focus on help-seeking behaviours since, clearly, the existence of appropriate and timely support can make the difference between whether a DVA relationship continues or ends. We explore the ways in which, for those experiencing/enacting DVA behaviours, help-seeking is shaped by society (e.g. through the public story of domestic violence, lack of inclusive sex and relationships education), the community (e.g. through willingness or ability of friends and family to respond appropriately and homo/bi/transphobia from informal and formal potential help providers), the relationship (e.g. dynamics of power, love, care and responsibility in the relationship), and the individual (e.g. whether this is a first relationship as an LGB and/or T person).

Private Tutoring As Educational Strategy in Australia

This paper reports the second phase of a four-year study of Australian families' investments in private academic tutoring (or 'shadow education') for their primary school-aged children. Private tutoring is a burgeoning industry in Australia, although the phenomenon is far from the saturation point reached in the Asian regions from which the country draws much of its migrant intake. In the context of the marketisation and privatisation of Australian schooling, studies have provided insights into demand for private tutoring, suggesting that some migrant families invest in this educational service to assuage anxieties about their children's progress, and to secure prestigious placements for high achieving children and remediation for children who are struggling academically. That body of research speaks to ethnically charged tensions in public discourse about private tutoring and equity, the de facto ethnic segregation of socially 'desirable' schools, and the distribution of academic achievement in Australia's multi-ethnic society. However, other groups in Australian society are now making use of private tutoring as parents are responsibilised for their children's educational success (Doherty & Dooley, 2017). The first phase of this study identified a differentiated field of production (Bourdieu, 2005) of tutoring that made available services targeting both academic skills and knowledge and the engagement and commitment of children to learning. The phase reported here probes homologies with the field of

consumption of tutoring. It asks: Who is buying what tutoring products? Data are drawn from interviews with the parents of 10-11 year old children approaching transition into secondary school. The analyses describe families' educational strategies and the place of academic tutoring in these.

When Reactivity Fails: The Limited Effects of Hospital Rankings

Various lines of social research have put forward the idea that modern society is replete with numerous measuring activities that are often focused on evaluating the performance of individuals, organizations, or states. Frequently these measurements are taken by independent third-parties, which are supposed to guarantee the impartiality and trustworthiness of the process in contrast to the presumed self-interest of the actors performing the services in question. Both the application and the research of such measures suggest that the actors under scrutiny will internalize the expectations associated with these measures and adjust their behavior accordingly ("reactivity"). Usually these expectations are not just of a technical nature but involve a moral component of trying to improve the activities in question in a way such as to make them more beneficial, efficient, equitable and transparent for the consumer and society in general. While such measurement schemes are certainly ubiquitous, current research instantaneously equates their widespread presence with their efficacy, i.e. that their implied behavior-altering capacity is inevitably achieved. This argument overlooks that the coupling of measurement and behavioral change is mitigated by the interpretative processes of the actors under examination. Not the mere presence of the measurements but how the actors make sense of them grants relevance to measures and potentially induces behavioral modification. Using examples from the U.S. hospital sector, the proposed paper shows that patients, medical professionals, and hospitals do not simply conform to the expectations created by hospital rankings but rather show different forms of resistance, such as ignorance or rejection. Thereby the paper highlights that the conditions under which measures prove inescapable and substantially influence social fields need to be examined more closely.

Creative Methods of Data Collection in Music Therapy with Aggressive Adolescents

This multiparadigm inquiry sought to explore relationships between empathy and aggression with adolescents referred to group music therapy for aggressive behaviour. One group was conducted within a Husserlian phenomenological paradigm, and another through integrating theoretical perspectives by Deleuze and Gergen. Youth at-risk may often struggle to engage in verbal disclosure of thoughts and feelings. The arts create an inviting, playful and non-judgmental environment in which to express, explore and work with difficult (and resourceful) thoughts, feelings, and interactional patterns. This paper will present examples of two data collection methods from each group: a receptive music listening and imaging technique and a drumming circle (from the phenomenological group); song-writing and a vocal improvisation (from the group informed by the thinking of Deleuze and Gergen). The value and usefulness of these methods within each paradigm and for this group of participants, specifically, will be highlighted.

Mother Militant and Military Sons

Mother militant and military children

In Brazil, the current context of governmental instability is marked by the strong shift to the right-wing of political relations in the world. To retake some dynamics, as memories, may be interesting, as regards the understanding of internal emotional conflicts from a case study of a black family from the periphery in São Paulo, highlighting their counterpoints: on the one hand, the militant mother of social movements left-wing ecclesiastical and other, military sons who, in one way or another, participated in the most dense and persecutory moments of the military dictatorship, beginning in 1964. On the side of the sons, the great fear of a possible confrontation targeting the mother (and later the sister); the fear that

other elements in the service of the dictatorial force could reach his family, and also the tension if his superiors discovered that his family participated in the body of insurgent actions. This fear permeated relations and particularly pervaded the very existence of these people who found themselves in this dilemma. On her mother's side, she had no afraid, despite seeing many of her peers being arrested, tortured, raped or missing. She had a strong conviction that what they were doing was right, good and fair. This proposal of this case study seeks to reflect and find clues to the situations which, even today, can present themselves in the daily life of the participants of the social movements that now emerging. How do they coexist, make agreements and combinations and solve their impasses? For the development of this work, we will make interviews with the remnants of the family, leaders of that time and people who have experienced these moments and their struggles. It will also be developed a bibliographical research to anchor the work theoretically.

Possibilities for Libetration from Criticism of Modern Barbarism: Education, Emancipation and Radicalization of the Concept of History in Walter Benjamin and Theodor Adorno.

The alternatives for emancipation are examined by authors linked to the Critical Theory of society. The rise of fascism in expression in the most diverse forms of authoritarianism is part of the horizon analyzed by Walter Benjamin and Theodor Adorno. Nowadays, there is a resurgence of many movements that achieve more and more spaces in the environments of democracy. The rise of Fascism is present in various contexts, for example, in the neo-Nazi demonstrations in the United States that occurred at the time and the strengthening of the right-wing extremists after the Impeachment of President Dilma Rousseff.

Here it is aimed to highlight, from the dialogue between the writings of Benjamin and Adorno, the emancipatory potential of the concept of History in its mediation with the conception of critical education. It is intended to indicate how the dialogue between the two authors provides a critical formulation to modern barbarism.

The objective is to point how Education, especially from a critical referential, promotes an alternative to the totalitarianism that currently frightens contemporary democracies. In this sense, we use the concept of history outlined by Walter Benjamin in the *Theses on the concept of History* and the propositions on an emancipatory education of Adorno. From this set of essays, it is shown the role of history as a tool for enlightenment in the light of examples from Brazil's recent history.

Finally, we analyze the recent attempt to promote a history "task to brush history against the grain" through the experience of the victims of the Brazilian military dictatorship (1964-1985) and the importance of a critical reference for this type of alternative. Thus, we try to outline an alternative experience for the current scenario described here.

DOS SANTOS, WANDERSON* (*Wanderson Barbosa dos Santos*)

The Simmel's Sociological Analysis through the Methodological Construction of Social Types

The present work seeks to highlight the sociological reflection of Georg Simmel with regard to the construction of social types. Simmel promoted a reflection from a context of social transformation in which the advance of modernity modified the social landscape that the author was inserted. The emerging sociology in this context was confronted with this reality change, in that sense, the sociological reflection of Simmel inserts as an alternative way to the understanding of the social. Echoes of this sociological analysis methodology can be seen in large part from the first generation of the well-known Chicago School of Sociology.

The analysis of social types, for example, the stranger and the poor, are ways in which Simmel deals methodologically with the attempt to interpret society. In this sense, the present work reflects on this methodological alternative, especially for its innovative character in the sociological theory of its time. I emphasize the importance of the methodological construction of these social types, especially in their connection with the idea of social totality. An expression of the connection between social types and social totality can be seen in Simmel's *Money Philosophy*.

Finally, this paper proposes, from the analysis of the construction of social types mentioned by Simmel, the approach with the philosopher Walter Benjamin. Benjamin inherits from the sociology of Simmel the methodological perspective of analysis of society, especially with respect to the social construction of type that connects to a more comprehensive social organization. Thus, one of Benjamin's essays that mark this influence among the authors is *Das Passagen-Werk*, in which Benjamin analyzes the transformations of the city of Paris through these emerging social types in modernity.

Evaluating Spatial Inequality of Healthcare in Process of Rapid Urbanization in China By Using Remote Sensing and GIS

China is experiencing rapid urbanization with fast growing population migrating into major cities such as Beijing, Shanghai, etc. Spatial inequality of healthcare is amongst other explicit and distinct impacts of rapid urbanization. On the one hand, growing population in cities increased urban demand for healthcare and on the other hand, good physicians in surrounding regions are strongly attracted to major cities for higher salaries and other precious resources that could only be provided by major cities such as better education for kids, more convenient lifestyle and so on, and that exacerbated the spatial inequality of healthcare. In China, some people in small cities would rather to take a trip over 4 hours to seek treatment in the regional major city because they do not trust local physicians. Measuring spatial inequality of healthcare and pinpointing areas inter- and intra-cities is important in planning a sustainable city circle.

Although various methods exploiting GIS have been proposed, indicators calculated with zonal data based on administrative borders, leading to important intra- and inter-relational limitations. Two-step floating catchment area (2SFCA) method partly overcomes these limitations to determine catchment areas. However, more precise spatial distribution of population and some other spatial attributes/predictors are expected. Remote sensing could provide more profound information by analyzing land cover/land use type, or estimate population distribution and economy level through night-time light images, and so on. By using remotely sensed data, we could estimate spatial distribution of socio-economic phenomena more precisely.

As the formation of such spatial inequality is a combination of first-order and second-order process, traditional methods evaluating accessibility or other indicators are insufficient. Spatial analysis exploiting auto-correlation and multivariate analysis would greatly improve accuracy of spatial models. The result would help decision makers to understand the source of urban healthcare burden and how to alleviate spatial inequality of healthcare.

DOUGHERTY, BETH* (*Loyola University Chicago*)

A Sense of Belonging: Religious Ritual in Sensory Narrative

What roles do the senses play in participant understandings of experience? Beyer (2016), McGuire (2016), and notable others have called for a more thorough investigation of the senses in religious lives. Examining narratives from interviews, this paper investigates ways often inchoate moments of sensory experience impacted feelings of membership or solitude. Examining sound, sight, and the haptic moments where individuals talk about sensations that are "off" or "wrong" emerged as key clues to points where ritual and individual failed to connect. In this paper, I argue that sensory experiences are strongly shaped through experience and play a major role in the efficacy of ritual experience. I also examine the ways in which the physical and bodily engagement of the individual in co-production of these sensory moments impacts their efficacy. Additionally, I raise questions about the manner in which individuals address these sensory moments, and the role of the less addressed senses such as periorception in narratives of experience.

Examining Bureaucratic Capitalism and Social Stratification in the United States in the Post-Fordism Economy

Over the past forty years, the United States has reorganized the major economic drivers of its economy. This reorganization, international in scope, has significantly changed the stratification system along with it. While explicit racial and gender discrimination were key dimensions of the 20th century economy, the new world order depends significantly on a racial and gendered bodies to keep its engines humming. Some public institutions have receded while different ones assume prominence. Drawing on the works of economic historians Joel Mokyr and Robert Gordon; political scientists Jacob Hacker and Paul Pierson; and sociologist Geoffrey Ingham, to name a few, we detail the new stratification order in the United States dictated by finance capitalism and fueled by mass incarceration. Using the concept of bureaucratic capitalism developed by Gideon Sjoberg, we detail the parameters of the new stratification system and the redefined relationship between state, capital, labor and citizenry.

A Feminist Critical Discourse Analysis of the Representation of the Surrogate, Egg Provider and Intended Parent(s) on Canadian and International Medical Broker and Fertility Clinic Websites

Abstract

Reproductive tourism is often referred to the demand side of the phenomenon—to those who travel outside their jurisdiction or home country to access the kinds of medically assisted reproduction they desire. In Canada, payments for gametes and surrogacy are illegal; however, the non-altruistic markets for these services and gametes clearly exist in other countries under a variety of regulatory frameworks. Intended parents may search the internet for medical brokers who can connect them to a fertility clinic abroad or contact the fertility clinic directly through a website. Whether it is the intended parent, fertility specialist, medical broker, the surrogate, egg provider, and the health and non-health personnel that are separated thousands of miles are now thrust into close transactional relationships. Using a feminist critical discourse analysis, this paper explores how the intended parent, the surrogate and egg provider and the labour and care they preform are virtually represented on Canadian and International medical broker and fertility clinic websites. Many medical broker and fertility clinic websites project an imagery that provides an authentic identity of place, but at the same time, commodizes it for tourist consumption reflecting desirable experiences.

RC29-530.3DOYLE, AARON* (*Carleton University*)MCKENDY, LAURA (*Carleton University*)*Securitization and the Remand Population Explosion in Canada*

We examine the processes that have led to the tripling of the pretrial population preventively incarcerated in Canadian provincial jails and remand centres while the sentenced population has been shrinking, and the shift towards a majority of people in provincial penal institutions now being people on remand denied bail. We consider the role of a culture of risk aversion influencing the process (Webster, Doob and Myers 2014) so that those on bail are “set up to fail” (Canadian Civil Liberties Association 2014) resulting in the pre-trial incarceration of large numbers of often-marginalized people on minor administrative breaches, in conditions of extreme overcrowding. These developments are situated as part of a broader trend of the expansion of preventive governance described in various literature on securitization, risk, surveillance, precrime, and community control, although distinctive features of the remand population explosion are also evident. Alternative ways of theorizing the remand population are evaluated, and consequences and implications explored.

RC39-683.1DRABEK, THOMAS* (*University of Denver*)*Enhancing Student Understanding of Disaster/Hazards Research through Fiction Abstract*

While professors in other sub-fields of sociology occasionally have incorporated fictional works into their courses, rarely, if at all, has this been attempted in disaster and hazard studies. This paper is a summary of one such effort including both the rationale and approach. Following discussion of context, a case example of an original fictional story is described including its origins and method of analysis. The story is rooted in an actual disaster and based on data obtained shortly afterwards. This approach provides both links to the humanities and greater depth of student understanding of core concepts, like multiorganizational coordination which is used in this case example. Through this strategy students enhance their ability to emphasize with disaster responders and victims who too often are trapped in social structures that result in failure.

TG04-971.4DRAIS, ERIC* (*INRS*)LAPOIRE-CHASSET, MIREILLE (*INRS*)*Combining Sociology of Law and Sociology of Quantification: A Key Way for Risk Assessment and Empowerment?*

Risks studies often combines sociology of science and political sociology (Burgess, Alemanno, Zinn, 2016). Focusing as much on the mechanisms that produce knowledge as on those that produce ignorance, it shows how both contribute to risks agenda-setting process. In the field of health risks, we know that both selecting scientific work and also calling such work into question can contribute to limiting knowledge and to keeping populations exposed. Occupational health is also concerned. In France some recent works analyses

the biases relating to construction of the public problems and to the scientific knowledge that structures occupational risk prevention (Henry, 2017). In the fields of controversial risks how do occupational health specialists mobilise such highly debated knowledge in support of their intervention? This question is a concern in our research work at the French Research and Safety Institute for the Prevention of Occupational Accidents and Diseases (INRS). In this presentation, we propose to describe how, at the scale of the company or business, using sociology of law and sociology of quantification, make it possible to refresh knowledge and to transform collective assessment so as to lead to mobilisation and risk prevention. Our proposal is based on work analysing and comparing social uses of law (Drais, 2017; Lapoire-Chasset, 2017) and social uses of measurement (Lapoire-Chasset et alii, 2017), in contexts of controversies between multi-stakeholders related to distinct occupational exposures towards psychosocial risks and nanomaterials (40 cases). We will show how the construction of risks takes place with regard to the procedures for quantifying them and for attributing responsibilities. By combining these approaches, the sociologist develops knowledge that promotes a redistribution of capacities as regards risk prevention. Reducing the uncertainties as regards evaluation and legal norms contributes to reducing health inequalities and to a certain social justice with regard to occupational risks.

RC27-499.3DRAKE, CARLY* (*Haskayne School of Business, University of Calgary*)RADFORD, SCOTT (*Haskayne School of Business, University of Calgary*)*Here Is a Place for You/Know Your Place: Understanding Representations of the Female Body in Fitness Advertising*

The media landscape is one realm in which gender equality remains elusive. For example, images of women shared in fitness media negate women's athletics and sexualize female athletes, treating their [ideal] bodies as objects to be gazed upon (e.g., Hardin et al., 2005; Wasylkiw et al., 2009; Cranmer et al. 2014). Research typically considers editorial and advertising images in fitness media as a single unit. However, advertising merits separate inquiry because it educates consumers (Sandage, 1972) by shaping social norms and values (McCracken, 1986) using medium-specific objectives and tools (e.g., sales and sales pitches).

Given the apparent salience of the body in sport culture, and the way in which running media is said to present a gendered, aged, and classed version of reality (Abbas, 2004), this study asks: How might we understand how female bodies are represented in fitness advertisements in mainstream and women's running media? A critical reading of advertisements in the January/February 2017 issues of three running magazines reveals that the bodies and related messages advertising shares act as “biopedagogy” that provides implicit and explicit information and directives about how a body should look (Rail & Lafrance, 2009; Fullagar, 2009).

This biopedagogy creates a place in sport culture for female readers but reminds them they may only occupy a *certain* place. To this end, advertisements function in three ways. Specifically, they (1) prescribe and normalize a bodily obsession centred around nutrition and sport science; (2) highlight white, slim bodies without showing the effort that goes into shaping those bodies; and (3) infantilize women and trivialize their participation in sport. In reconciling these interrelated but often competing messages, this study argues that fitness advertisements in running media attempt to empower women to seek the benefits promised through athletics but withhold information that can help them safely reach their goals.

RC37-661.4DRAPEAU-BISSON, MARIE-LISE* (*University of Toronto*)*From a Novel to a Bookstore: The Memorialization of L'eugélonne in Québec*

Much like the *The Feminine Mystique's* effect in the United States, the publication of *L'eugélonne* in 1976 crystalized radical feminism in Québec, so much so that as to be called the feminist bible (Guillemette 2011 in Le Devoir, Saint-Martin 1990). Forty years after its publication, the novel can be found in bookstores in its 2012 re-edition, archived at the *Maison de la Littérature's* permeant exhibit in Québec city, or reinvented as the name of a new feminist cooperative bookstore in a Montréal neighbourhood. In doing so, various activists and cultural experts both crystalize the past, along with a certain version of “acceptable” feminism, while also opening up opportunities for new practices (see Reger 2017). This tension, I contend, is at the heart of memorialization but also of much feminist activism.

The question under study is thus how does the materiality of the novel, its written text, content and genre, affect conflictual processes of memorialization. To do so, I analyze three sites (the bookstore, the permanent exhibition and the mainstream media) where each site is understood as different cultural forms of memorialization. I deploy a set of data collection strategies in order to mine the data for the different “interpretive strategies” (Corse and Westervelt 2002) employed by actors in each of these sites. In doing so, I am to shed light on the multi-level, power-laden and continually evolving process of meaning making in the memorialization of cultural objects.

RC50-833.2DREDGE, DIANNE* (*Aalborg University-Copenhagen Campus*)*Hitchhiker's Guide to the Collaborative Economy: Knowledge, Power and Asymmetric Information*

From the 1970s, many governments started to link higher education policy with economic objectives. Over the last decades this link has been consolidated through the introduction of a wide-ranging marketisation agenda (e.g. user fees, demand-driven marketing, deregulation, etc.). Now, as governments are increasingly (and unwillingly in many cases) pushed to confront looming societal issues, universities have been given an additional "impact agenda". This impact agenda, largely driven by those systems pushing the marketisation of higher education, attempts to close the gap between higher education research and the solving of practical and applied societal problems. Criticisms aside, this impact agenda sits alongside another directive- the employability agenda- which demands that universities improve students' employability outcomes. Together, these agendas aim to unlock incremental social and economic innovation that facilitate the transition towards new economic-social futures beyond twentieth century industrial growth. But how achievable is this impact agenda? And what do researchers need to know about power, knowledge, and the machinations of capitalism if they are to address this agenda? Finally, how (and indeed should) they position themselves within this space?

Critiques of the impact agenda have been well canvassed elsewhere. In this paper I adopt a network perspective to excavate the network relations that embed and sustain the growth of the collaborative economy, and I illustrate the challenges of research in this climate. Through an exploration of the complexity of network knowledge-making interactions between diverse, heterogeneous, complementary and interdependent actors in collaborative economy accommodation sector, it is possible to gain insights into the different relational constellations, flows of power and knowledge that shape, reinforce and ensure the continued production of platform capitalism. I argue that researchers need to be knowledgeable about this landscape, to be reflexive of the power and knowledge flows, and the role of capitalism within this agenda.

RC50-833.4DREDGE, DIANNE* (*Aalborg University-Copenhagen Campus*)*Richard Florida Was Wrong! the Rise of the Creative Precariat in Inner City Tourism/Residential Development*

Globalisation and technological change have far-reaching consequences. Economic restructuring, challenges to (un)employment, rising individual debt, taxation shortfalls, the liquid and shifting of responsibility for the impacts and consequences of market failures, and a "productivity challenge" are engulfing many developed countries. Moreover, recent political events reveal that actions to mitigate impacts of uncontrolled and uncoordinated capitalism are of little interest to elected representatives. Our democratic systems are under attack from pay-for-access lobby groups, policy and research think tanks paid for by corporate interests which effectively use social media to create doubt or even turn public opinion. In this context, capitalism exploits this lack of co-ordination, it takes advantage of weaknesses in global governance systems where power is diffused, authority is weakened, information is asymmetric, and resources are shifted away from the public realm. These factors make it harder to engage with the crucial challenges of our time- climate change, poverty, inequality, resource exploitation and depletion, and sustainability. As a complex global phenomenon, tourism is part of the machinery of capitalism creating, reinforcing and contributing to inequality, marginalisation and a growing precariat class.

For some years, the hope on the horizon was Richard Florida, who convincingly argued that the creative class- hipsters, artists, researchers, and techies- would pave the way for a new economic revolution and a flourishing postindustrial urban economy. However, in his latest book, Florida issues a *mea culpa*, observing that the creative class has not delivered the mooted benefits. This paper takes up Florida's arguments examining the case of Carlsberg Byen, Copenhagen. Carlsberg Byen is an inner city megaproject with both tourism and residential elements. The competing logics underpinning tourism, historic conservation and land development are examined, and which illustrate that, despite the "creative class" branding, capitalist land development logics dominate that contribute to a creative precariat class.

RC16-321.3DREHER, JOCHEN* (*University of Konstanz*)*Social Theory of the Digital World – Construction and Constitution of the 'Digitally Augmented Life-World'*

The digital world is characterized by internet based communication with applications such as email, chats, mobile telephones, smartphones etc. Through digital communication spatial distances between humans shrink and the exchange of experience, knowledge and information is accelerated. The emergence of a multifaceted virtual space established a new reality dimension with specific social

relationships and forms of sociation as well as personal relationships. To capture the specificity of the digital world, a bridge will be established between digital sociology and sociological theory in offering a particular theoretical framework. Social theoretical reflections on the digital world part from a combination of a sociological with a phenomenological perspective dedicated to the analysis of the "construction" and the "constitution" of virtual reality. The sociological standpoint concentrates on the social "construction" (Berger/Luckmann) of the digital world in concrete socio-historical contexts that can be empirically reconstructed. From the phenomenological standpoint following Edmund Husserl and Alfred Schutz, the general principles of "constitution" of the (digitally augmented) life-world, e.g. based on consciousness activities, are in the focus of the argumentation. It will be demonstrated that the mediated, digitally augmented life-world massively extended the zone of the "there and now" as opposed to the "here and now," establishing new forms of communication. The digitally augmented life-world is characterized by "ontological insecurity" since third parties are involved in the process of data collection related to our individuality when individual fingerprints are created without our knowledge of it. Communication is no longer based on *authenticity*, *confidentiality* and *integrity*, since the digitally augmented life-world does not include a manipulatory area anymore that can totally be controlled by ourselves.

RC27-501.3DROMUNDO, ROLANDO* (*ISSA*)*The Geopolitical Role of Non-Recognized and Partially Recognized Polities in Sport*

Since its origins, the Olympic Games and several World Championships have been a significant showcase for participant countries. For a sovereign state, these events represent an opportunity to display itself in the international arena, while the results obtained could symbolize, among other issues, the success or failure of a regime. Instead, for several non-recognized or partially recognized polities, it is a chance to portray their struggle for a full recognized statehood, for autonomy or simply for recognition of a local identity.

To that extent, the International Olympic Committee (IOC) since its origins has argued that Sport geography may differ from political geography. Currently, the United Nations counts with 193 members and two observers, while the IOC includes 206 National Olympic Committees (NOC) plus 8 NOC's recognized continentally.

Different approaches can be found by the IOC and the International Sport Federations to accept or tolerate the participation of non-fully recognized polities generating also several controversies. Meanwhile, these polities, have been either able to compete as a recognized national representation or have been forced to participate under a different flag denying their chance to promote their own local struggles.

In that sense, without clearly defined criterion among International Sport Federations and the IOC, the whole ordeal is not exempt of the global geopolitical tendencies, where geopolitics impacts the position taken by sports authorities in favour or against different local struggles for recognition.

RC15-283.5DROVETTA, RAQUEL* (*National Scientific and Technical Research Council (CONICET)*)*Discourses Associated with Reproduction in Movements for a Humanized Birth in Argentina*

In the last few years in Argentina, it has become possible to observe mobilizations by organizations demanding for what is called a humanized birth. Women and/or heterosexual couples ("the pregnant couple"), from middle and urban sectors, frequently adhere to this way of thinking, and, more and more, women whose first delivery was by cesarean section.

Our hypothesis puts forward that the movements demanding a humanization of birth constitute themselves as dissidents against the predominant regulations, something which acts on disciplined sexuality. In this sense, these movements would advocate for the formulation of a counter proposal to the one that originates in, for example, hegemonic sectors within biomedicine. This resistance would include collective action work for the resignification of feminine reproductive events, thus removing such events from current cultural regulations, allowing women to reinterpret their symbolic construction of giving birth, caesarean section, pain, and even, maternity, and promoting substantial changes in women's subjective construction of aspects connected to reproduction.

The research design proposed is qualitative and presupposes the integration of different techniques to work with the data. In-depth interviews will be conducted with key informants and document collection will be carried out. The research questions are: how do they construct and articulate the network of practices and discourses associated with reproduction? which features does reproductive governance currently take on in Argentina?

We employ as an analytical tool what Morgan and Roberts (2012) define as reproductive governance, when referring to the mechanisms through which different historical configurations of actors, such as state institutions, churches,

donor agencies and non-governmental organizations [women and feminist organizations], use legislative controls, economic incentives, moral mandates, direct coercion, ethical incitement and/or principles in order to produce, supervise and control reproductive behaviors and practices.

Global Social Governance: Unfolding the Effects of Global Regulatory Complexes on Decent Work in Central Asia

The concept of decent work has been developed and communicated by the ILO as a strategic re-orientation, in which among others the Core Labour Standards have been developed as a complementary regulatory mode of labour questions. Nonetheless, a variety of indecent working incidents are documented for the Central Asian region, in which a specific nexus of state imposed and privately extracted forced labour that heavily draws on patterns of semi-legal migration, illegal migration and *trafficking* schemes can be identified. Even though, these developments can be traced back to the region's Soviet and transformation history, these historical explanations, the paper argues, are not sufficient. Not only, that this nexus of state-private-forced labour combined with specific recruiting strategies based on illegal migration or *trafficking* schemes pose specific challenges to the new labour regime as developed under the decent work agenda. It furthermore, illustrates the need to shed light on the specific relations between global, regional and national regulations and to unfold the nested and/or overlapping regulations of trade, migration and labour law in the Central Asian region. The paper therewith pays specific attention to the global governance constellations within global social regulations and their effects on the realities in decent work for migrant workers. The paper theoretically draws on conceptions of regime complexity and is going to analyse central legal and political documents as well as expert interviews applying content analysis.

Attitudes Toward Sex and Risky Sexual Behavior Among Caribbean Female Adolescents

This study explores the attitudes of adolescent Caribbean girls toward sex and whether they engage in risky sexual behavior. Singular studies of adolescent girls remain largely absent from empirical investigations on sex and sexuality, which in part reflects the cultural norms of which sex and reproductive health are not as openly discussed in the Caribbean as they are in North America (Archibald, 2007). Young women in the Caribbean often engage in sexual behaviors with minimal knowledge and many misconceptions about the consequences of intercourse. As a result of the limited and often fear-laden discussions adolescent girls receive from authority figures (e.g., parents, teachers, pastors) little is known about the attitudes of adolescent Caribbean girls toward sex and whether they engage in risky sexual behavior. In this study, a total of 2534 female adolescents in Trinidad and Tobago and 1365 female adolescents in Guyana, grades 10-12, were randomly selected to participate in two nationally representative surveys conducted in 2009 and 2012, respectively. Ordinary least squares regression analyses are utilized to compare how the attitudinal differences of female adolescents in Guyana and Trinidad and Tobago contribute to them engaging in risky sexual behaviors such as consuming alcohol or drugs before intercourse and failing to use pregnancy prevention method. Prevention efforts to reduce engagement in risky sexual behaviors among Caribbean adolescents will depend on gender sensitive and culturally appropriate intervention approaches.

Gender and Race Differences in Sexually Risky Behavior of Guyanese Adolescents

The past decade has seen decreased rates of HIV/AIDS in the Caribbean region yet the Caribbean continues to be second in prevalence of HIV/AIDS cases globally (UNAIDS, 2017). Increases made in education about sexually transmitted diseases have lowered overall numbers of deaths related to HIV and AIDS in the Caribbean, nonetheless, there is an increase in prevalence among women and girls in the region. Activities such as early age of sexual activity, sex with multiple partners, and engagement in risky sexual behaviors increases the chances of exposure to HIV/AIDS, especially for adolescents. This paper explores the differences between male and female adolescents' engagement in risky sexual behavior. The paper used data collected from 2,499 randomly selected Guyanese adolescents from grades 10-12 who were surveyed. Males and females are compared by age, race and religion on their likelihood of engaging in behaviors such as drinking before intercourse, taking drugs prior to engaging in sexual intercourse, and failure to use a form of birth control during sexual intercourse. Findings reveal that ... This

study contributes to the discussion of health and wellness among Caribbean adolescents. More specifically, it provides empirical baseline data that may be used to further the discussion of adolescent health and well-being in Guyana and the creation of Comprehensive national policy or strategy to address adolescent health and wellbeing. The findings may also be used to provide knowledge about the plight of women and girls so that specific intervention and prevention strategies may be discussed and enacted to improve their health outcomes.

Home Leaving and Housing Transitions in the Netherlands: Understanding Dependence and Independence between Generations during Early Adulthood

Using an original dataset of qualitative interviews with young adults and their parents living primarily in and around Amsterdam, this article investigates early adulthood housing transitions and the nature of intergenerational relations during this period. We find that while strong norms regarding early home leaving and young adult independence persist, the conditions of the housing system, and especially Amsterdam's housing market, prompt significant intergenerational support, financial and in kind, to sustain this 'independence'. Support for renting and homeownership play into different intergenerational dynamics, with the first being part of a process of easing into adulthood, while the latter solidifies a new set of relationships between fully adult generations supporting one another on equal terms. Despite a growing trend toward individualization in Western European societies, the analysis of housing trajectories of young adults shows that intergenerational dependencies emerge in specific housing markets, requiring creative ways of maintaining the apparent separation of generations. In the case of the Netherlands, these negotiations take form at times in quasi contractual or actually contractual agreements between parents and their young adult children. To conclude, we argue that the nature of housing systems and housing markets have profound influences on how generations of a family negotiate dependence and independence.

Pushing the Urban Frontiers: Infrastructure Funding and Local Growth Coalition in China's Relocation Programs

In the last decade, the Chinese state addressed the dilemma between economic growth and environmental protection by pushing further the urban frontiers on an unprecedented scale. It launched a master plan of mass peasant relocation: By moving peasants into high-rises and reclaiming their living spaces, new arable lands were created to counterbalance the farmland lost to urban sprawls. The central argument of this paper is that as the Chinese state encouraged private investment in state-oriented programs to avoid further accumulation of local debts, a fundamental change took place in local growth coalitions when private sectors gradually took over the land requisition and preparation from local government in relocation programs. By comparing relocation programs in two counties in Chengdu, Sichuan and Shangqiu, Henan, before and after the transition into private investment, the paper explores the changes in urban infrastructure funding model, the shifts in local growth coalition, and the profound influences upon the relocated peasant households. The paper reveals that instead of a smooth cooperation between local government and private sectors often assumed by the growth coalition literature, the particular funding model of the program had a profound influence upon the negotiation between actors within the coalition, as well as the actual effects of the programs. Specifically, the transition to private investment in relocation programs had resulted in local government compromises and consequently, the exacerbation of peasant conditions. The paper concludes by reflecting on the social consequences in the form of benefit encroachment and risk transfer in the transition to private investment in the state-oriented development programs.

Character and Organization

In recent years, questions of 'character' have become increasingly prominent in a range of policy contexts, from education to social welfare, and from business

to healthcare. They have also appeared in the field of organization studies, broadly defined, from Richard Sennett's critique of the 'corrosion of character' manifested in contemporary management and organizational cultures, through the invocation of the development of 'character' as an antidote to the wave of corporate scandals unfolding since the beginning of the millennium, up to and including the representation of 'character' as the 'critical success factor' in leadership development and a core dimension of an organization's 'talent acquisition strategy'. What unites the various contemporary paens is an assumption that building 'character' is a crucial component of ethics and that it holds the key to establishing and maintaining virtuous conduct; moreover, that the cultivation of 'character' is at best under-valued and at worst actively undermined and denigrated in any number of contemporary organizational practices. In this paper, we seek to interrogate key aspects of this 'turn' to character as it has been articulated in recent and on-going debates about the reform of organizational life. We argue that this 'turn' suffers precisely from an abstraction and lack of specificity - not simply in relation to questions of 'character formation', but also crucially in relation to questions of organization, and indeed of the relation of the one to the other - that severely curtails both its ethical reach and explanatory power.

DU GAY, PAUL* (CBS Copenhagen)

Disappearing 'Formal Organization': How Organization Theories Dissolved Their 'Core Object', and What Follows from This

Debates about the ('higher') purpose and usefulness of Organization Theory (OT) have periodically shadowed the field since its inception. In recent years, disquiet has mounted once again, not least concerning what has been variously described as the overly theoretical and often a-or anti-organizational state of OT, and its abstraction and lack of practical purchase in the light of pressing economic, social and political concerns that are often deemed profoundly organizational in nature.

At the same time as OT itself has been undergoing a process of intense self-examination and self-criticism, the world it ostensibly examines, describes, and seeks to intervene in – the world of actually existing organization and organizations – has itself been subject to considerable substantive and normative problematization. Aside from the organizational scandals and breakdowns at the beginning of the present millennium, and, more recently those attaching to and indeed constitutive of the Global Financial Crisis (GFC), most of the pressing matters of concern dominating public debate in a range of areas both raise and involve at their core fundamental practical and normative matters of formal organization. And yet, it is precisely the idea of 'formal organization' that seems increasingly defunct both in the practical world of management and organization, where substantive developments are deemed to presage an epochal shift to an era of 'organizing without organizations', and the arrival of 'a post-organizational society', and concurrently in OT itself, where we witness the emergence of a wide variety of theoretical vocabularies often widely at variance one with another, and yet nonetheless united by a shared (negative) capability, that of 'disappearing' the field's core object: formal organization. Consequently, while the term 'organization' continues to be used, it is stripped of any substantive meaning; . Increasingly, it would appear, formal organization is a problem, if not downright dysfunctional.

Industrial Relations and Adivasi Resistance in the Tea Plantation Sector in Assam

The present study, carried out in seven districts in Assam (India), examines how evolving dynamics of industrial relations both in its form and execution require historical sensibilities. The seven districts include Dibrugarh, Sibsagar, Jorhat, Golaghat, Sonitpur and Kamrup (rural). The domination of the owning classes over the tea workers is interwoven with class conflicts and gender discrimination. The tea industry in India was created to satisfy England's demand for higher quality black tea and hence the East India Company brought tea to India from China. Tea, as a commercial product, was first cultivated and expanded by the British. Indeed, it is the outcome of the toil and struggle of the *Adivasi* workers or indigenous people of central and east India who were made to migrate to Assam under extremely brutal conditions. Such oppressed communities have been waging struggles to protect their rights in the tea estates in Assam. The study examines the factors contributing to organised physical violence between management and tea workers, ineffective trade union practices, sexual division of labour and sexual abuses in the tea estates resulting in declining labour conditions. Declining labour conditions may be attributed to the withdrawal of the State from its basic responsibilities and commitment and social welfare activities. The study is based on in-depth personal interviews with plantation workers, trade union members, owners of the tea estates and management staff located in the seven districts in Assam mentioned above.

Healthcare Inequalities in Contemporary Clinical Encounters: The Lens of Cultural Health Capital

On average, the United States spends almost three times more on healthcare per capita than most developed countries, yet our health outcomes are generally no better. Systems of care continue to be plagued by social inequities in quality, patient satisfaction and service provision. In 2010, the landmark Patient Protection and Affordable Care Act (ACA) provided momentum in addressing these health disparities. It ushered in a number of fundamental changes to the US healthcare system including expanded access to insurance, mandating substance use and mental health treatment on par with other conditions, institutionalizing what has become known as patient-centered care, and focusing on socially and medically complex patients. However, with these recent organizational transformations in healthcare delivery, the demands being placed on patients and providers alike have intensified and heightened the degree to which cultural resources and skills matter in clinical interactions. The framework of "cultural health capital" (CHC) uses Bourdieusian concepts to help account for how patient-provider interactions unfold in ways that may generate and exacerbate inequalities in health care. CHC has been defined as a repertoire of cultural skills, verbal and non-verbal competencies, attitudes, behaviors, and interactional styles that are exchanged in clinical interactions by patients and providers alike. Using data from ongoing qualitative studies, we will explore several healthcare priorities that are emblematic of how structural inequalities are operationalized at the clinical-interactional level: 1) the recent focus on patient-centered care, 2) treatment of substance use, and 3) services for high-utilizing, complex patients. Through the lens of CHC, we will examine the ways in which both patients and providers leverage cultural resources to shape clinical interactions and how the social position and expectations of patients and providers facilitate or mitigate the care that is offered and received.

DUBEY, BIRENDRA NARAIN* (Babasaheb Bhimrao Ambedkar Central University, Lucknow)

LGBT Community and Their Human Rights in Neo-Liberal India: A Sociological Analysis

Like many of the third world countries India became neo-liberal economy after 1990s but tumultuous phase of change has least been influenced by so called universalistic liberal human values. Social system and institutional set up continue to produce and inculcate patriarchal mind set and Indian society still operates within 'Gender Box'. Disparity does exist in terms of social, economic, political, educational, religious and cultural development. Along with Lesbians, Gays, Bisexual and Transgender, LGBT community includes sexual minorities, trans-sexual, cross dressers, transvestites, gigolos, heterosexuals, heterosexuals, hijaras, kotis, queers and gender non-conformists. Individuals with such an identity are generally not treated as equal in the society or by State. Society based discrimination starts from the family, community, peer group and often gets extended to the cultural, educational and economic systems including employment to public and private enterprises. Transgender receives unequal, unfair and mala-fide treatment in all the existing medical systems in India. State sponsored discrimination is reflected remarkably in the Constitution and Indian Penal Code. It provides enough scope and space to discriminate them through the system of Criminal and Civil Law. Such individuals are treated as pathological, anti-social and anti people. This notion gets legitimized through provisions of Indian Penal Code Section 377, Army, Navy and Police Acts. In this context, it appears extremely important to mention that New Social Movements from all over the world have strengthened the emergence of new identity movements in neo-liberal India but is confined mainly to the metropolitans. The time has come for required changes in the Indian Constitution in general and IPC in particular. Equally crucial is to argue that the mind set of people in the society needs to be changed so that gender equality can be assured to millions of LGBT people who are creative, progressive, intelligent and good human beings.

DUBROFSKY, RACHEL* (University of South Florida)

Beyond Contexts of Surveillance: Surveillance in the Everyday

This presentation, based on a book project, moves the frame within surveillance studies: rather than seeing surveillance as technology, apparatus, object or procedure, or as a unique practice, or thing, I look at what occurs in a surveillance society, particularly, at aspects of our lives not directly under surveillance. Partial to Foucault's (1995) thinking about how discourses and ideas about surveillance have impacted us in mundane, everyday ways, I shift the perspective within sur-

veillance studies to attend to meaning-making in contexts where surveillance is not the most obvious mediating technology, highlighting how surveillance is seamlessly embedded into our culture. The project asks: What are the implications when ways of being under surveillance infuse our lives in contexts where surveillance may not be explicit?

With a focus on authenticity, Building on Banet-Weiser's (2012) work on authenticity and branding, and Gunn Enli's (2015) examination of mediated authenticity, the project insists on the significance of surveillance in understanding contemporary notions of authenticity. I look at popular culture—scripted television, social media, selfies, the popular press, and music videos—to explore how ideas about authenticity in contexts of surveillance have salience in contexts not under surveillance, pushing the discussion of surveillance beyond technologies and mechanisms of surveillance, to a focus on the cultural implications of surveillance. For instance, I examine how breaking expectations, central to affirming authenticity in the reality TV genre (a context of surveillance), is also how President Trump is framed as breaking conventions for the presidency in the news. Arguing that Trump's appearance of breaking convention for presidential behavior, and norms for middle-class whiteness, affirm his authenticity, I posit this as marker of white privilege (accessed only by a body appearing white), making whiteness visible at a moment of intense white fragility.

The Impact of Social Media on the Relationship between Patients and Health Professionals: The Use of Whatsapp in the Chronic Disease Management

The digital revolution, in particular the widespread use of social and participatory web (web 2.0), has led to a profound change in the health field. This change involves a review of traditional ways of thinking and managing the relationship between health organizations, health professionals and citizens -patients.

The birth of "e-patient" has created a citizen's empowerment towards managing his health due to the ability to acquire more information, to generate content and to exchange experiences in Internet, through the activity of social networking and the use of apps or digital devices enabling self-monitoring. This is a new condition in which people get benefits but take also serious risks (false informations, misleading relations, with problems of Health Literacy).

Health professionals also are using Internet and social media, and in particular the use of WhatsApp by doctors is growing rapidly, not only to communicate with organizations, but also to exchange information and to maintain a relationship with patients.

We therefore propose a critical reflection on the ambivalent implications that the use of this social network involves the relationship between health professional and patient, taking into consideration the case of the management of a chronic disease (diabetes): what is the impact on taking care of the patient and on disease management? What are the criteria, the level of awareness and the sense of responsibility with which health professionals use this means of digital communication and inhabit the current medial ecosystem? In this regard, we illustrate the results of a qualitative research, conducted by carrying out in-depth interviews with Italian diabetologists in the last quarter of 2016.

DUCHESNE, SIMON* (UQAM)

Les Identités Collectives Dans Un Contexte De Répression : Les Effets Des Sentiments

Au cours du printemps 2015, une mobilisation autour de luttes contre l'austérité et une autre contre les hydrocarbures a tenté de faire front commun en liant luttes syndicales, étudiantes et environnementalistes au Québec. Rétrospectivement, les militant.es soutiennent que leur échec est marqué par les limites personnelles de leurs actions, par l'angoisse et l'épuisement. Le discours autour de ces événements porte le poids de la militarisation de la police (Woods, 2015) et de la « proxy repression » de la direction de l'Université du Québec à Montréal, où avait lieu une part importante de la mobilisation (Chicoine, à paraître), de la stigmatisation médiatique et de la non-reconnaissance des groupes considérés initialement comme alliés. Pour sortir de l'échec, on constate une renégociation de l'identité du mouvement (Polletta et Jasper, 2001) entre groupes plus formels et les groupes affinitaires, notamment autour de la notion d'autonomie. De quelle manière cet événement a-t-il marqué l'identité du mouvement antiautoritaire montréalais? Quel lien peut-on faire entre le contexte et l'intériorisation des violences à travers des émotions vécues?

Cette présentation examinera comment les effets de l'épuisement et d'autres sentiments négatifs peuvent avoir des effets structurants sur l'identité collective d'un mouvement dans un contexte de répression. En s'appuyant sur une analyse interactionniste et la notion d'identité collective, nous tenterons de comprendre comment les acteur.rices surmontent ces événements et l'expérience négative de ceux-ci tout en continuant à militer.

Les données utilisées pour cette recherche découlent d'entrevues semi-dirigées ainsi que d'une recension des événements militants entre 2015 et 2017. Cette recension se base notamment sur les ateliers du salon du livre anarchiste et les sites web d'information liés aux groupes mobilisés durant le printemps 2015

DUDEK, MICHAŁ* (Department of Sociology of Law, Faculty of Law and Administration, Jagiellonian University in Krakow)

(Tardian) Monadology and Sociology (of Law)

Undoubtedly, Gabriel Tarde's metaphysics expressed in his *Monadology and Sociology* received recently great interest from a variety of thinkers. Even though this work can be considered as purely philosophical and its relation and compatibility with other threads in his oeuvre (socio-theoretical, criminological, economic, etc.) can be questioned, ideas for broadly understood social sciences are still drawn from it and discussed by contemporary commentators. However, it should be stressed that in most cases sociological conclusions drawn from *Monadology and Sociology* are general - they do not refer in a focused manner to any particular area of social life or subject of sociological inquiry (e.g. religion, politics, art, etc.), but instead they seem to concentrate on the social in general. Against this background, this paper attempts to make a one step further in contemporary revival and applications of Tardian metaphysics by discussing its possible implications for the contemporary socio-legal research (most notably, law's ontology and epistemology, including empirical research). This analysis is preceded by careful (statement after statement) reconstruction of Tarde's metaphysics, coupled with discussion on relevant theses expressed by its commentators. Even though the task of looking at the law through the Tardian monadology can be regarded as speculative and experimental, the paper in the end aims at addressing the following practical question: what can be borrowed from *Monadology and Sociology* that will allow to better grasp the law and its functioning?

Research on Power Distance in Courtroom As a Basis for Innovation in Courts – Preliminary Findings from Qualitative Research

Power distance (PD) in courtroom, more specifically, between judge and lay participant-defendant during hearings has not been comprehensively and holistically conceptualized, nor empirically researched. This paper aims at fulfilling this gap by preliminarily discussing findings from observation and attempt at measurement of actual PD in courts based in Krakow (Poland), started in autumn 2017. For the sake of this project, PD is defined as a pattern of realization of power relations, that can maintain or support the disproportion between those who are subjected to power and those who have the power (large PD) or *vice versa* – minimizes this difference (small PD). This concept is confronted with the relations between judge and lay participant-defendant during hearings, which leads to enumeration of variables constituting the discussed phenomenon, i.e.: spatio-architectural order; courtroom rituals; attire of judge and lay participant-defendant; eye contact between the judge and particular lay participant-defendant and facial expressions; communication accommodation/non-accommodation of judge towards lay participant-defendant and *vice versa*; or judge's critical remarks about lay participant's-defendant's behavior and her/his reaction. With the autumn 2017 a series of observations in Krakow courts began aiming at measurement of PD between judge and lay participant-defendant and assessment of the hypothetical relation between PD and lay participant's-defendant's satisfaction from hearings. This research generates a number of suggestions for innovations with respect to judges' behavior during hearings. Should PD be large or small and in what exact variable, in order to reach higher lay participant's-defendant's satisfaction levels, which in turn can cause increase in social trust in judiciary, or other positive consequences? What exactly should be changed, how and under what conditions implementation of given innovation is plausible? On the basis of conducted research, paper will discuss in detail the possible answers to these questions, which constitute a hypothetical innovation scenarios for courts and judges.

Sexual and Reproductive Health Needs of Female Labor Migrants from Central Asia in St. Petersburg, Russia

There is an increasing number of female labor migrants from Central Asia to Russia. They are often not eligible for health care services because they are not citizens of Russia and hard-to-reach with health promotion campaigns and outreach services. They are particularly vulnerable in regard to their sexual and reproductive health.

The objective of our study was to better understand the sexual and reproductive health needs of female labor migrants from Central Asia who are currently residing in St. Petersburg, Russia. We aimed to gather the perspectives of health and social service providers about the needs and gaps in current services and to learn about the needs directly from female labor migrants.

Methods: key informant interviews with members of civil society and government service providers, and in-depth interviews with female labor migrants in St. Petersburg. We purposively sampled women from Central Asia who had migrated to St. Petersburg for work and recruited women through nongovernmental organizations. Data were deductively and inductively coded in the qualitative software program Dedoose. Thematic analysis guided our process through coding the data and identifying themes around the salient issues related to migrant women's sexual and reproductive health.

The following topics were revealed: reflection on arrival to Russia, types of work women are involved in, general health and social service needs of female labor migrants, sexual and reproductive health needs, differences in needs and health care compared to country of origin and Russia, awareness of existing services, accessibility and any barriers to receiving care, gaps in services provided and/or linkages to care, interest in participating in interventions or programs, and recommendations for services. The longer-term goal of this research is to develop interventions to improve the sexual and reproductive health of female labor migrants in Russia.

Studying Stigmatized Populations through Online-Communities

Social media gives sociologists a new possibility for obtaining data by unobtrusive methods. For some research tasks the analysis of information produced by members of online-communities can replace collecting data by reactive methods, reducing a field phase of work, avoiding imposition of thematic structure to discussion and gaining time for deep analysis. Online-communities could be considered as a tool for sociologists to study hard-to-reach populations. The use of online-communities as a space for research allows one to collect data directly from communication between actors, not mediated by an interviewer and to find focused information given that communication in these internet spaces are organized around specific topics that participants choose themselves.

This presentation gives an example of the use of online-communities to conduct social research of people living with HIV (PLHIV) in Russia. In many countries, including Russia, PLHIV are subjected to high levels of stigma and discrimination. These high levels of stigma may make it difficult for researchers to recruit PLHIV and for participants to speak openly about their problems. PLHIV have created numerous online-communities within internet, including the Russian-language internet space to discuss their problems with others who are in similar situations.

Studying an online-community of PLHIV allowed us to gather perspectives directly from the community of PLHIV rather than introducing predetermined questions. We were able to learn information that was important to the community of PLHIV rather than introducing topics and asking them to reflect on situations that may or may not be applicable to their lives. Online-communities could be considered as a good tool for sociologists to study hard-to-reach populations and sensitive topics, but this tool have several limitations such as questionable generalization to populations not represented in internet, restricted possibility to ask clarifying or follow up questions and so on.

Social and Economic Costs of Digitalization of Democracy: E-Voting in Estonia

The remarkable development of information society in Estonia since 1991 placed this country in a privileged position in terms of digitalization of social life. One of the pioneering technological developments carried out in the country is connected with the creation of a successful system of electronic voting that had become a global reference.

As Krivonosova mentions (I. Krivonosova, "Total cost formula for e-voting implementation", The International Conference on Electronic Voting E-VOTE-ID 2017, 2017), there is no consensus on the impact of e-voting in the global cost of elections, whether it is reducing the final cost or its impact is not effective. In relation with its impact on the final turnout, there are also not conclusive positions in relation with its effect in the increase or decrease of voters, as Celeste, Thornburg and Lin put in (Celeste, R., Thornburg, D. i Lin, H. "Asking the right questions about Electronic Voting" The National Academy Press: Washington, 2006), the introduc-

tion of new technologies can both attract new voters or create new barriers, real or perceived, in the participation of voters.

With the aim of bringing new elements for the reflection on the debate of social impacts of technology, in this paper we are presenting an innovative approach to the calculation of costs of different types of election (electronic, paper or postal), analyzing the Estonian Municipal Elections (October 2017), and propose a reflection on the impacts of the different electoral channels in the global turnout.

The Transnational Invention of Endogenous Development

How was the notion of "endogenous development" born? Now often referred to in the perspective of economic development, the notion has seen its scientific dimension forgotten while it was part and parcel of its invention in the late 1960s. The presentation aims at describing the role played by the Unesco in the emergence of this notion in the mid-1970s within the framework of reworking the idea of development by articulating it to the promise of a New international economic order. Officially inscribed within the Unesco medium-term plan for 1977-1982, it also becomes a core notion in the programs of the United Nations University from 1975 onwards as part of the Human and Social Development axis. From 1976 to the early 1980s, two programs were developed under the direction of the Egyptian –working in France – economist and sociologist Anouar Abdel-Malek. He organized different workshops, mostly in Asia and in Central and Latin America about "endogenous creativity" in the late 1970s and early 1980s that created links between various scholars who had been thinking mostly independently about the evolution of sociology in their own countries in the first place. Even before the issue of indigenizing sociology came to the fore with the publication of some crucial articles in *International sociology* in the mid-1980s, it belonged to the intellectual imagination of social scientists from the non-Western world.

Relying on documents from the Unesco archives and from the United Nations University archives, the communication aims at throwing light on one of the most important South-South scientific programs of the 1970s-1980s.

The Politics of Aspiration: Digital Disruption and the Promise of the New in Australian Higher Education Policy

Young people's relationship to the digital information economy is a key site of popular and policy attention in the context of global shifts in labour market conditions. The massification of social and digital media, and the rapid growth of digital markets globally have brought significant challenges for policy makers in what counts as work, and how best to prepare young people to engage with it. As this paper explores, notions of futurity and the 'new' within the digital information economy have played a dominant role in popular and policy discourse in Australia, as it has in many other post-industrial countries.

This paper follows the deployment of notions of the digital, coding, and 'jobs of the future' by Australian Federal Ministers since the announcement of Opposition Leader Bill Shorten's 'coding in schools' policy in May 2015. It draws upon a critical policy analysis of parliamentary debates, media releases, and engagements by Government and Opposition Federal Ministers to consider how the re/articulation and embedding of 'STEM' in secondary and higher education takes up an idealised notion of 'the future' as tech-enabled and requiring a policy response to 'the new'.

The analysis highlights three lines of debate that have emerged in operationalising and responding educational policy in the wake of digital labour market disruption: first, the rise and reach of networked infrastructures into traditional modes of life and work; second, the future value of existing and proposed programmes of study; and third, the implications for resourcing in the wake of the Global Financial Crisis and uneven economic recovery. It suggests that a policy and popular emphasis on these three forms of 'newness' has come to inform what counts as 'success' for young people's lives in the future, and reorganize the orientation of their educational experiences in the present in new, commodified forms.

Patterns of Shaping Disciplines: The Trajectories of Seven Disciplines from the Social Sciences and Humanities in Seven European Countries Plus Argentina

Historians of science are seldom expanding their attention field beyond the 'hard sciences'. Sociologists studying their own or cognate fields seldom practice this self-reflexive habit in a comparative attitude. Instead of following an STS approach to the social sciences and humanities (SSH), such as Camici's, Gross's and Lamont's (2011) practice perspective, we propose a historical sociology of

the SSH, comparing several disciplines in several countries over a significant time span. This paper offers for the first time basic data on the institutionalization of a set of seven SSH disciplines (anthropology, economics, literature, philosophy, political science, psychology, and sociology) in seven European countries (UK, France, Netherlands, Sweden, Germany, Italy, Hungary) plus Argentina for the period from the immediate aftermath of World War II to the present. During these 70+ years all SSH disciplines studied here were established in the higher education systems of each country and experienced remarkable increases of the number of faculties, graduates and output. However, these growths were neither simultaneous nor linear but show quite different rhythms across countries and disciplines. Strong growth was often followed by slowdowns or even contractions, which we call de-institutionalization. While our comparative data identifies different processes of institutionalization and de-institutionalization, instances of the latter are especially in need of explanation. The highly different systems of governance, differences in the political regime can explain some of these movements, but others are embedded in the higher education system itself. We therefore offer an alternative to the traditional internalist-externalist explanation of scientific growth.

The Impact of the Ford Foundation's East European Program on the Social Sciences and Humanities in Real Socialist Europe

This paper analyzes the Ford Foundation's East European fellowship program and assesses the impact that these programs had on the social sciences and humanities in 'real socialist' countries. From 1956 and through most of the 1960s and beyond, hundreds of East European social scientists, humanities scholars and artists, above all from Poland and Yugoslavia, received fellowships to spend study and research stays up to two years in Western (mostly US) universities. Different from earlier programs such as the 1948 'Free Russia Fund' (since 1951 called 'East European Fund'), that had targeted émigré scholars from the Soviet Union, the new program's objectives were to stimulate the expansion of modern social sciences within the Communist 'satellite states' and to 'Westernize' their intellectuals. My paper consists of two parts. First, based on archival research in the Rockefeller Archive Center in Sleepy Hollow, NY, I outline the Ford Foundation's rationales and activities concerning its East European programs, including the Foundation officers' interactions with political and academic elites at home and abroad, as well as their evaluations of the program's success. Second, I address the question how the impact of the program can be historically assessed. To that end, the conflicting goals and expectations from Ford Foundation officers, the socialist governments and the academic intellectuals will be explicated and compared to different historical outcomes. In addition to archival material, I draw on a set of oral history interviews with selected former fellows from different countries and disciplines.

The Role of Metaorganizations in the Emergence of an Industry. the Case of Renewable Energy

Industry associations are meta-organizations (Ahrne & Brunsson, 2008; Berkowitz & Dumez, 2016), whose members are companies making business in the same industry. For example, the American Petroleum Institute includes all the oil companies operating in the US. The meta-organization allows firms to share information, in particular on best practices, to disseminate information on the sector in the public, to develop standards and to carry out common actions such as of lobbying. The functioning of these meta-organizations and their role in the constituted sectors have been studied within the framework of what Schmitter and Streeck (1985) called the « corporative-associative order ». These organizations develop standards and create private regulation alongside, and articulate with, public regulation (Brunsson & Jacobsson, 2000).

But how does an industry emerge and what role does the creation of an industry association play in this emergence, when the industry does not yet have definite boundaries? If one makes the hypothesis of an imprinting (Stinchcombe, 1965) or of a phenomenon of path dependency, does the way in which the meta-organization appears play a decisive role in the trajectory that the industry will follow later on?

To answer these questions, it is necessary to study a sector of recent emergence and to follow its trajectory since this emergence.

The study focuses on the renewable energy sector. This sector is recent and very heterogeneous (wind turbines, geothermy, solar panels, hydroelectricity, bio-energy, marine renewable energy, etc.). In France, one industry association - the Syndicat des Énergies Renouvelables (SER) - represents all these heterogeneous subindustries. Is it helping to build an institutional renewable energy sector that would otherwise not exist? In that case, the meta-organization would create the sector more than it would represent it.

The Integration into Labour Markets of Vulnerable Young People in Quebec: From a Social Policy Issue to Sustainable Linkages between Young People and Local Actors

Dans un contexte de transformations du marché du travail et des exigences attendues des jeunes en termes de flexibilité, compétences et performance, l'insertion professionnelle constitue un enjeu d'autant plus complexe pour les jeunes en situation de vulnérabilité. Alors qu'ils se trouvent éloignés du monde professionnel pour des raisons multiples, les structures institutionnelles et communautaires qui les suivent ont pour défi de mettre en œuvre des interventions prenant en compte cette réalité pour les accompagner dans un processus d'insertion socio-professionnelle.

Cette communication visera alors deux objectifs : comprendre comment, à travers la définition de priorités locales d'intervention sur des formes particulières de vulnérabilité, ces multiples acteurs tendent à favoriser l'insertion socio-professionnelle juvénile ; analyser les effets de ces modes de conception de l'action publique et des pratiques d'intervention sur les trajectoires juvéniles d'insertion.

Pour ce faire, la communication s'appuiera sur les résultats d'une recherche qualitative traitant des interventions publiques et communautaires déployées sur quatre terrains québécois dans le cadre des politiques de jeunesse. Les analyses présentées seront issues d'environ quatre-vingt entrevues semi-dirigées menées auprès de professionnels du champ de la jeunesse ainsi que de jeunes en situation de vulnérabilité entre 18 et 30 ans dans des contextes territoriaux distincts.

Le cœur de la communication portera alors sur la difficulté à établir un lien durable avec ces jeunes et questionnera, par extension, la capacité des diverses structures à soutenir leur insertion socio-professionnelle, objectif pourtant imposé par les politiques sociales auxquelles les acteurs concernés doivent se soumettre.

The Intentional "Deconstruction" of Scientific Expertise: Environmental Skepticism, Climate Change Denial, and the Post-Truth Era

Decades ago industry launched efforts to block government regulations on harmful products, from asbestos to tobacco smoke, by "manufacturing uncertainty" regarding scientific evidence supporting the need for regulating their use. Over time these efforts were extended to combatting evidence of a wide range of human and environmental threats, including DDT, acid rain, and ozone depletion, and eventually broadened to undermining environmental science writ large.

The use of contrarian scientists to attack mainstream scientists and their research, labelled "junk science," is central to manufacturing uncertainty and promoting environmental skepticism. This strategy has peaked with climate change denial, as industry has been joined by the conservative movement in an all-out assault on climate science. Contrarian scientists in league with conservative think tanks, media and political leaders have waged war on climate scientists, accusing them of falsifying data to exaggerate the threat of global warming to obtain funding and promote government regulations. This intentional deconstruction of scientific expertise (extended to environmental science of all types) has allowed politicians opposed to carbon reduction policies to argue that the science is too uncertain to impose allegedly costly regulations to limit climate change.

Some have argued that these efforts have been facilitated by earlier challenges to scientific expertise by post-modern philosophers and social science analysts of science and scientific knowledge. At a minimum, these scholars helped create fertile soil for such efforts. For example, lay climate change deniers portray themselves as "citizen scientists" and contrarian scientists cloak themselves as challengers to scientific orthodoxy, both claiming to "democratize" science. But in the process they are undermining legitimate scientific expertise in order to defend fossil fuels, neo-liberal ideology and the Western way of life, as increasingly recognized by those (e.g., Barry Collins) seeking to re-establish scientific expertise in our "post-truth" era of alternative facts and realities.

DUNNE, PETER* (*University of Bristol*)

Legal Recognition for Diverse Identities: Gender Equality Beyond the Binary

Across the Council of Europe, 41 State Parties now provide legal recognition for preferred gender. Yet, in all jurisdictions (with specific exceptions), individuals can only be acknowledged as having a 'male' or 'female' identity. In recent years, leading service providers – including Transgender Europe and the Scottish Trans Alliance – have documented an exponential growth in persons identifying outside 'man' and 'woman' categorisation. This paper considers the possibility of extending Europe's gender recognition frameworks to those who live beyond the gender binary, including persons who experience no gender whatsoever.

The paper is divided into four parts, Part I sets out the concept of non-binary identities. It introduces the numerous ways in which individuals experience their non-male and non-female genders, and explores how existing European laws erase gender diversity. Part II investigates public and intra-community hostility to non-binary identities. Dismissed as unreal, childish or political, non-binary individuals are rejected by both the general public, as well as some trans persons, who fear that non-binary advocacy undermines and delegitimises wider trans equality. The paper critically engages with these arguments, and considers whether they are consistent with non-binary lived-realities.

In Part III, the paper explores the difficulty in adopting a workable, generally-applicable framework to recognise persons who are neither male nor female. The fear of *othering* non-binary persons, an inability to adequately capture "infinite" identities and cultural resistance to de-gendering the law all present obstacles to reform. Finally, using the principle of "reasonable accommodation" as a guide, and critically assessing the on-going necessity of gender in specific areas of the law, Part IV suggests a compromise solution. Conceding the (the often important and positive) role that gender plays in Europe's legal system, Part IV nonetheless offers a blueprint for greater non-binary inclusion and respect.

Experiencias Laborales Contemporáneas y Nuevas Técnicas De Entrenamientos Corporales. Un Análisis Desde Las Sensibilidades Sociales

En este trabajo proponemos un abordaje acerca de las transformaciones recientes en nuestras sociedades; particularmente relacionado a la metamorfosis en las experiencias laborales de los sujetos. Fenómeno que se torna relevante para comprender la dinámica y las lógicas estructurales que se instancian en estos sujetos productivos. En esta dirección, se recuperan algunas líneas de indagación que iniciamos tiempo atrás en el marco del proyecto de investigación "Cuerpo, trabajo y energías corporales..." (Villa María 2016-2018), del cual formamos parte.

De esta manera, se destaca la centralidad del cuerpo en tanto territorio de relaciones en que los modos/procesos sociales son narrados y experimentados; es decir, enfatizado como sustrato donde se encarnan aquellas transformaciones sociales. Es, en este contexto, que una sociedad moldea a sus cuerpos productivos; tejiendo entramados entre patrones de movimiento e inercia, mediante técnicas y vectores biopolíticos de entrenamiento. De modo que re-pensar la noción de cuerpo/corporalidad en relación a los procesos sociales que conectan las transformaciones del entrenamiento y la metamorfosis del mundo del trabajo; y que definen las conexiones entre cuerpo-movimiento-entrenamiento-sociedad, se constituye como hilo conductor del presente trabajo.

Para ello, tomando como corpus de análisis una iniciativa novedosa de capacitación a distancia sobre alto riesgo: la "Universidad Extrema", junto con un relevamiento de datos secundarios (medios de comunicación gráfica, audio visual, internet, etc.), y el análisis de las experiencias de los "sujetos-trabajadores" referentes, los cuales participan de estas nuevas técnicas de entrenamientos corporales; lograremos reconocer de manera más precisa la forma en que se re-estructuran las relaciones entre Deporte-Tiempo Libre-Trabajo y cómo las mismas configuran, en cierta medida, las sensibilidades actuales.

Young French Women in Managerial Occupations: A Time Availability Perspective

As in EU, women are commonly under-represented in managerial positions in France despite their recent progression among young career beginners (di Paola et al., 2017). However, their overrepresentation in higher education since the end of the eighties, the reduction of segregation in education during the last two decades, gender ideologies more and more reflecting egalitarian disposition, are conditions that foster their high occupational achievement. In other words, young women should be more numerous than they really are in managerial positions.

Without excluding a self-selection process (Hakim, 2002; Corby and Stanworth, 2009), we would like to investigate a time availability perspective in relation to gender role attitudes within couples. In fact, most of managerial positions in the competitive sector are particularly time demanding and require a strong career commitment. For women in couple, these conditions depend on the division of

activities and career priorities between partners and in particular, the way each one contributes to care and domestic tasks in the private sphere.

The aim of this contribution is to assess the importance of time availability for holding supervisory positions in early careers, attempting to control for other dimensions likely to interfere.

Our empirical material consists in a longitudinal survey – "Generation 2010", Céreq - of about 9000 French individuals who left education in 2010 and were interviewed three times, in 2013, 2015 and 2017. The questionnaire of the third round includes two specific modules of questions that will be used to deal with the issue. The one informs the content and conditions of managerial occupations with specific questions on the time schedule and working hours. The second is addressed to all individuals being in couple and relates to the division of care and domestic work between partners and their priorities for career decisions.

DUPUIT, ELODIE* (*UMR CNRS EVS (RIVES), Université de Lyon (ENTPE)*)

Contesting Automobile Culture: The Case of the "Vélorution" in a French Semi-Rural Area

Environmental activists are adopting different postures in regard to public action. The literature identifies these as ranging from civil disobedience to counter-expertise strategies. In France, the 1970's anti-nuclear activists argued that ecology must be a social movement (Ollitrault, 2008). Since 1980, counter-expertise has brought some environmentalists to collaborate with local authorities. These now have access to political decision. In parallel, a new form of militancy, insensitive to pyramidal organization and mistrusting political discourses, has emerged (Inglehart, 1977). These new forms help the renewal of collective action (Tarrow, 1989).

My doctoral research focuses on a local mobilization, found in periurban, semi-rural France. This mobilization fits these new forms of militancy. It deals with an environmental organization, which struggles for the development of the bicycle, as a daily transport mode. The data is provided from an ethnographic study within this organization, through interviews with activists, local elected authorities and participative observation. The case studied is specific for two reasons. First, periurban areas are frequently associated with the *Nimby* phenomenon (Davis, 2006), but this mobilization shows another relationship with politics. Second, low density areas are associated with private cars. Therefore, the activist's claims may not be legitimate not only for members of local government but also for public opinion.

On the basis of this case study, I'll present a horizontal mode of organization and its forms of protest. Activists studied use the neologism "Vélorution", from "vélo" (bicycle) and "révolution" (revolution) to define the way they protest i.e. with demonstrations on bicycles. For some of them, the challenge is to start the debate on bicycle transportation within public space. But others would like to increase awareness and change society by encouraging eco-friendly attitudes.

Exploring periurban contexts helps us understand the activists' choice of a festive but also dissenting strategy to counteract the automobile culture.

Lifestyle in the Women Aging Process in Older Women: A Complex Systemic Interrelationship

The objective of the present study is to analyze the lifestyle of older women (40-60 years old) on their aging process, through the complex interaction of mental, physical, and relational health. A health process, understood as psychological, physical, social and spiritual wellbeing, goes beyond the traditional biomedical scheme; it comprehends the subjective sphere, and human behavior. It is not just about the absence of illnesses or health alterations, but a wider and integral concept that implies several levels of vitality and harmonic functionality.

Method: qualitative (complex systems) through case studies, with in-depth semi-structured interviews. The sample includes older women, between 40 and 60 years of age. The present study is still under development; it started in January of 2017 and it intendeds to end in 2019, with the first results expected by July of 2018.

Lessons from the Congreso Nacional Indígena (CNI)'s Transnational Community Solidarity

The main purpose of this paper is to contribute to the discussions on ethnicity, transnationalism and social change by mapping the forms of organization and struggle for autonomy and dignity of indigenous people across the Mexican-U.S. border. In October 2016, the *Congreso Nacional Indígena (CNI)* together with the Zapatistas launched a proposal of naming a Concejo Indígena de Gobierno (CIG)

and an indigenous woman presidential candidate (spokesperson) for the 2018 Mexican elections. The objective has not been to achieve power, rather to organize civil society from below for dignity, liberty, democracy, autonomy, and justice. This project is not being directed exclusively to the Mexican society, and might also help to deconstruct the ethnic and economic hierarchies on the rise since the electoral triumph of Donald Trump. By considering that large part of Mexican migrants in the U.S. have a rural or indigenous background, I demonstrate the possibilities, in the context of neoliberal governance and the global design of development and modernity, to organize, adapt and fight across frontiers against the regulation of life, spaces, and minds. In March 2017, the Zapatistas already disclosed an active international solidarity network as they launched the 'Fuck Trump' coffee project to help immigrants. However, their organization and proposal of social transformation can be taken further by the CIG through the support of their transnational communities.

The data discussed here is being collected through my participation as research-activist and contextualized by a research project held with the indigenous community of Mezcala since 2008. In this way, I propose to map the networks and structures of power and solidarity and provide a balance of the contradictions, problems, and achievements of CIG's project, to engage in a dialogue for the reconstruction of our realities, especially with the rise of racism and xenophobia around the globe.

How to Compare When Data Come from Diverse Sources: A 4-Level Model of Change in Institutional Trust over Time

Much effort has been invested by International Survey Programs to harmonize data *a priori*. However, different survey programs may take different decisions in this regard. And we may need to combine data coming from these different sources. This paper will show how to use multilevel modelling to analyze data collected on the same topic even when the question wordings, answer scales and other features vary between surveys. We use institutional trust as a "showcase". Most of the research published on this question has been carried out in Europe and North America in which comparable data are more easily available. Outside these regions, comparing trust between countries is challenging. The Global Barometers, the WVS and LAPOP are the main sources of data and since not much data are available, we need to use all that we have. These data are disparate: The answer scales differ (4 anchors for the Barometers and the WVS, 7 for LAPOP). More importantly, the institutions on which trust is assessed vary both between countries and over time. The paper compares change in institutional trust over 20 years in South and Central America, Africa, West Asia and North Africa, Asia and Eastern Europe. The data combine more than 800 surveys conducted in these countries by various Survey Programs. Instead of trying to harmonize these data *a priori*, the paper uses a 4-level model which allows to use all the data and control *a posteriori* for the differences between the surveys. Questions on trust for different institutions (level 1) are analyzed as nested within respondents (level 2), themselves nested within years (level 3) in which the surveys were conducted and within countries (level 4) where people live. The analysis allows for assessing whether the use of different scales has an impact of the level of trust.

Victim and Judicial Decision-Making in Protection Order Cases: Considering Institutional and Contextual Factors

This paper focuses on victim and judicial decision making in domestic violence civil protection order cases filed in Arizona. Arizona is an ideal place to examine victim decision-making as there are no residency requirements for protection order filings. Thus we can examine not only when protection orders are awarded, but also which courts victims choose to use to file for protection orders. We analyze victim and judicial decision making through a series of logistic regressions with two separate dependent variables: (1) whether the petitioner files for a protection order in a court that is not the nearest court and (2) whether the judge awards a protection order to the petitioner. Independent variables in the models include extra-legal factors (petitioner and respondent demographic characteristics), legally relevant factors (descriptions of violence and characteristics of the incident(s)), institutional factors (the resources provided by the court, measures of standard court operations, and filing procedures), and contextual factors (characteristics of the neighborhood in which the petitioner resides, including language fluency and socioeconomic measures). Results are discussed in the context of access to justice for victims of domestic violence, the feasibility of waiving jurisdictional residency requirements for protection order filings in other states/countries, and the need for greater support and outreach services for victims.

DURNOVA, ANNA* (*Institute for Advanced Studies*)

Understanding the Post-Factual World through Cultural Sociology of Emotions

"Post-Truth" was pronounced the word of the year in 2016. What followed was a vivid defence of truth by scientists, journalists, and politicians. It seems we are on our way to abandoning the notion of truth as we know it, if we consider the populist uprising and the raging against academic knowledge during Brexit debate or coming from the Trump administration. Scientists should raise their voices against the trend, and civil society should fight post-factualism.

Yet, exactly what should be said and done? Along current examples of the interplay of scientific knowledge with politics, the paper argues that we already lost the battle on truth a while ago. It examines truth as 'sound knowledge' - which once was seen as the cornerstone of modern government - through the lenses of emotions. The paper sets the stage by identifying the current post-factual politics as a result of the way emotions have been placed outside of truth production by modernity. Evidence-based political responsibility calling for the integration of scientific knowledge engendered the dichotomy of modern societies of civil rationality being threatened by uncivil emotionality. As a result, emotions have served as a way of delegitimizing both knowledge and the actors who harnessed emotions. Being consequently limited to tools of social movements, empowerment strategies and revolutions' trump cards, emotions have been raised to virtues for those who are against the establishment; against accepted truth. And these virtues gained even more importance through recent rise of citizen participation.

The paper proposes to solve this puzzle by offering a cultural sociological analysis of emotions in truth production. As "performances of values and beliefs", emotions enter evidence-making, they evaluate the range of actors and make them entitled to pronounce public concerns. As such, emotions have to be recognized as integral parts of political processes.

DURNOVA, ANNA* (*Institute for Advanced Studies*)

'It Is Not What You Think': Science and Popular Culture in the Context of 2017 March for Science

The March for Science has been by far and large the biggest public performance of the public value of science. In its political contextualization of the critique of the Trump presidency, the march has launched a key reflection momentum about the relationship between science and civil society. While the reflections about the role of science for and in the civil society are not new, as they hit recently the headlines of science and technology studies (STS) in terms of 'citizen science' and 'science slams' and manifold popularization programs, the 2017 March for Science provided a unique stage to bring in artefacts of popular culture; among them T-shirts, internet memes, and posters that have been previously outside the public presentation of scientific practices.

By presenting a comprehensive analysis of the artefacts that appeared in the context of the March for Science the paper uses Strong Program in Cultural Sociology to show how these artefacts - while calling for affirmative and citizen-near image of science - display the gap between the cultural ascendancy of science and its will to embrace civil society. The identity of science and scientists has been framed as being above society as their aim is to explain and to identify overarching rules of our everyday complexities. Yet science has been criticized for being detached from everyday life because of that. The straddling between these two views, apparent in the analysis, suggests that replacing science identity remains difficult unless we challenge to role of emotions in the public presentation of scientific practices. The paper uses the context of popular culture to demonstrate this.

DUROCHER, MYRIAM* (*Université de Montréal*)

Food Biomedicalization and Self-Tracking Technologies: How Is "Healthy Ageing Body" (re)Defined?

This communication draws from the emerging literature on self-tracking technologies (e.g., Katz and Marshall, forthcoming) and the biomedicalization of food (Kim, 2013), observable through the multiplication of food knowledge and the development of individualizing technologies (e.g. MyFitnessPal) that help individuals to exercise control and transform their bodies from the inside (Clarke et al. 2000), to critically questions: What forms of ageing bodies are produced at the intersection of these fields of research? In a context where seniors are enjoined to take responsibility for their own health (Powell and Wahidin, 2006), in order to avoid the "inevitabilities of aging" (Powell, 2006, p. x), how are healthy ageing bodies articulated?

Health enhancement and self-tracking are not new (Katz and Marshall, forthcoming), neither are they in relation to food (Crawford & al., 2015). Although, they now happen within a society permeated by healthism discourses (Crawford, 1980) that contribute to defining "successful ageing" (Katz, 2013) by the maintenance of a good health (Power and Polzner, 2016). Seniors are enjoined to "embrace the

potential of longevity through the daily acts of eating.” (Powell, 2006, p. x), by the consumption of “functional food”, namely food characterised by the causal relationship drawn between food’s biochemical properties and their alleged effects on bodies (e.g. medicalxpress.com, 2017, « Studies link healthy brain aging to omega-3 and omega-6 fatty acids in the blood »). Hence, through its biomedicalization, food becomes a new site of health governance “where the risks of chronic diseases should be managed” (Kim, 2013).

Following Katz and Marshall’s (2016) work over the “speculative futures of aging”, this paper critically examines how food biomedicalization and self-tracking technologies contribute to (re)defining “healthy” aging bodies and new normativities.

Imagining Culinary Nomadism: Intimate Food Exchanges Shaped By Global Mixed Race, Diasporic Belongings and Cosmopolitan Sensibilities

This paper grapples with the notion of “ingested nomadism” as an idealised motif for the modern state: a collective, sensory-based imaginary in which homes are portable, spaces are shared and technology provides freedom of movement – both actual and virtual – across the globe. This mood of wonder and optimism, however, might need to be positioned against Noyes’ (2004) “brute reality of the refugee”, especially in these troubling times of war, displacement, diaspora, xenophobia and increased national gatekeeping. Taking a microcosmic focus, the paper examines the productive possibilities and mounting tensions of nomadism through the lens of daily food exchanges, particularly the sensory content of these, within the intimate relations of “mixed marriage”. Seeking out resonant fragments from narratives of an Australian woman and a Chinese-Mexican man marrying and raising children in Mexico City, for example, or of a mixed-race couple becoming second-generation owners of an Ethiopian cafe in Adelaide, South Australia, the argument traces the significance of the “mix” for households’ culinary relations against a backdrop of politically challenging times. Drawing on the sensory complexities of foodscapes of belonging, yet not-belonging, the paper reflects on the extent to which meanings of nomadism pervade modern life and food (whether we move or not), and poses its central question: how much of global mixed marriage, with its “ingested nomadism”, involves “letting go”, “unlearning” oneself ... in the interests of a “multilateral modernity” (Chambers 2008)?

Alternative City: Possibilities and Limits of Prefiguration in Urban Mobilizations

This paper proposes a reflection on space-time where an alternative use of the environment emerges at a local scale.

The dynamic of gentrification in the neighborhood Pointe Saint-Charles (Montreal, Canada) led to different collective initiatives in the past ten years. Under the impulse of the collective La pointe libertaire and the autonomous social center of Pointe Saint-Charles, a mobilization emerged in the neighborhood for the collective re-appropriation of certain places, either on a transient or long-term scale. Moving from cinematographic projections on abandoned buildings to illegal occupations, from collective meals to popular plays, what meaning can be given to this series of initiatives? Is there a narrative framework supporting collective actions spreading over a decade? What are the potentialities and the civic limits of this type of mobilization?

Using a theoretical framework based on the notions of prefiguration (Breines, 1989; Kruzynski & Silvestro, 2013; Polletta, 2002) and right to the city (Lefebvre, 1968, 1974), we argue that formal organized collective groups channel the initiatives toward an alternative development of urbanity (1) and that creativity as a driving force of action is a mechanism guiding the alternative urban imagination (2).

This paper is based on semi-structured interviews and guided tours of the neighborhood with residents to reconstruct the meaning of urban space and its use as much in everyday life as in activist actions.

Children of Lone Parents in Nordic Welfare States: Left behind or Ensured Equal Opportunities?

Children frequently experience changes in family composition during their childhood and the variety of arrangement of care and economic responsibility

seems to be increasing. Such variety may go hand in hand with increasing differences in opportunities, living conditions and outcomes for children.

The paper analyses the situation of children living with one parent in Iceland and Sweden, two Nordic welfare states known for their extensive support to families, where both parents are encouraged to combine work outside the home and care for their children. The paper asks how this dual-earner model meets the needs of lone parent households and whether it ensures all children the same opportunities.

The family law in both countries emphasizes that all children are entitled to care from both parents regardless of their family situation or the nature of the parental relationship. The study will discuss whether this is attained and to what extent the social policies, e.g. family benefits and parental leave are supporting this goal. Here the residential situation, the contact with the other parent and how parental obligations are formulated and supported will be of interest. Attention will also be paid to children where only one parent exists, by choice or other circumstances.

Furthermore, as the poverty rate among lone parent families is high in both countries, it is necessary to scrutinize a variety of economic dimensions; lone parents’ employment rates, work hours and work conditions and how work-care balance is supported, for example by access to preschool and its opening hours. Furthermore an understanding of the fiscal support, including maintenance is important to gain understanding of the high poverty rates.

The paper will synthesize earlier research and draw upon data from policy documents, available statistics on description of the children’s situation, volumes of benefits and services, as well as outcomes of children.

Family Policy and Parents’ Division of Market Work in Sweden 1968-2012

Women’s earnings have over time increased, but still the transition to parenthood is a major turning point, when mothers cut back at work to accommodate new time demands at home, and earnings differentials between partners widen. However, policy developments influence how these choices are made.

In Sweden, women’s employment, in particular among mothers, expanded greatly since the end of the 1960s. With a combination of administrative income data and population registers, we analyze earnings developments of all Swedish mothers who enter parenthood between 1968 and 2012. We focus on the changes in legislation during this extensive period and whether it has influenced women’s employment and earnings. Our main interest lies in the 1971 tax reform from joint taxation of married couples to individual taxation for all men and women in Sweden. In a progressive tax system, this implies an incentive for households to have two earners rather than one high earner and one carer. We observe whether this legislative change altered women’s choice to work or care, and how this decision may be influenced by fathers’ earnings. The individual taxation will be put in context of other reforms at the time, such as the introduction of parental leave and an expansion of the public daycare system. The study will descriptively show time trends in women’s and men’s relative earnings and isolate the potential changes related to tax reform by treating it as a natural experiment, thus with difference in difference design comparing the situation before and after.

Have these reforms led to men’s and women’s employment responses to child-birth becoming more symmetrical over time? The study sheds light on how policy environments shape the distribution of work and family roles within a couple, and will contribute a historical perspective to understanding gendered work and family patterns in Sweden.

Transforming Urban Collective Memory: From Historical Red-Light District into ‘Cool’ Public Green Open-Space in Jakarta

This paper highlights the process of transforming collective memory of the people of Jakarta, on the city’s red-light district. Collective memory of the district as a notorious yet historical district of controlled by groups of local strong men, transformed into the image of ‘cool’ family-friendly public green open space, in less than two years. This paper questions: who takes what part and how in the making of the ‘new’ collective memory; who are in(ex)cluded by whom and how.

According to historical data, ‘Kali Jodo’ (‘match-making river’) district emerged as red-light district in early 19th century when Indonesia was still under the Dutch colonial rule. Occasionally the district witnessed its workers evolved from a sexual worker into courtesan and eventually mistress of the client. After the independence of Indonesia in 1945, the district image worsened, as the social class of its clients and workers deteriorated. ‘Kali Jodo’ was then known as hive of sexual transaction, illegal gambling, drug transaction and crimes, under the command of groups of strong men, with image as ‘untouchable’ by the formal authority.

Attempts to 'clean-out' the district by several governors of Jakarta since 1990s did not bring significant changes. However, in 2016 the city government carried-out a scrap-and-build urban renewal policy resulting in a drastic change. The district turned into public green open space. Though still bears the same name 'Kali Jodo', the district is now known as a 'cool' and family friendly public space.

This paper traces back and analyzes visual images (including historical pictures, drawings, visual appearances in media after the urban renewal policy in 2016) of the district. In addition, this paper also gathers personal experiences from people who were close to the district, to comprehend the contesting process of transforming urban collective memory.

Historicising Indonesia's Position within the Global Agriculture and Food Relations: A Sociological Narrative

The dynamics of Indonesia's agriculture and food sector cannot be separated from the global context in which it strives to develop. Employing a theoretical framework called the food regime theory, this article seeks to situate Indonesia's agricultural development, particularly rice and sugar industry, in accordance with the growth and crises occurring within the history of international food relations (1830 – present). Whereas rice has been amongst Indonesians (or at least Javanese people) for a very long time to the extent that political decisions and manoeuvres have most often circled around it, sugar was brought to fame during the Dutch colonial era and has since played a major part in the institutional making of agriculture, trade and industry in the country. This article therefore aims to address the extent to which the rice and sugar agrifood complex conforms to, or contradicts, the existing world structure as delineated by the food regime narrative. In analysing the relationships between Indonesia's rice and sugar industry and its global context, this article concludes with a remark that Indonesia should make a clear trajectory on how it should position itself amidst the global configuration of international agricultural trade and production.

Music Constructs Community: A Study of Transgender Community Living in Dehradun City of Uttarakhand (India)

Music is a moral law. It gives soul to the universe, wings to the mind, flight to the imagination, and charm and gaiety to life and to everything. - Plato

Music does not primarily crave public success, it invites human participation. Transgender communities historically exist in many cultural contexts, known as *Bakla* in the Philippines, *Xaniths* in Oman, *Serrers* among the Pokot people of Kenya and *Hijra, Jogappas, Kothis, Jogtas, Tirunangais or Shiv-Shaktis* in South Asia. The '*Hijra*', also called 'Third Gender' or Eunuch-Transvestites have existed for centuries in the Indian subcontinent. This paper is based on a qualitative research with both primary and secondary datas and a combination of snowball and purposive sampling is used which focuses on the **music culture of transgenders** living in the Dehradun city of Uttarakhand state in India. The objective is to study their relationship with music as a leisure activity and how their musical performances is thus concretely determined by leisure and by the capacity to conceive and work with leasured state of mind, body and spirit. Their musical performances have a great emphasis on our Indian culture. They only sing and dance on special occasions as they too become a part of somebody else's happiness and transgender is the only community in India which has a survival solely on music. Their musical attachments are so vibrant that wherever they perform, the crowd nearby feel the connect with their music too. This is the community which has music in their veins, music as their leisure, music as their livelihood, music as their only source and reason for their survival. For them music is not "what they do, it is what who they are".

Agency and Youth: Insights from the Brics

Over 40% of the world's youth live in the BRICS countries (Brazil Russia, India, China and South Africa). The construction of BRICS as a viable political entity capable of influencing **the future** involves not only institution-building, but massive 'sense-making' efforts, by politicians, intellectuals, diplomats, journalists, etc. and this paper aims to draw some insights from youth agency as documented and theorized about by different scholars and at different periods.

The overdue publication of the 'Handbook on the Sociology of Youth in BRICS countries' (2017) permits sociologists to incorporate new insights into the sociology of youth. It helps modify the supposed "Universality" of some Western concepts, e.g. Erikson's moratorium, school-to-work transition. Another contribution

of the book is to show that other Western concepts seem to work well e.g. theory of generations, age-class system. Also, new phenomena appear, sometimes with a great force. Some may have already been detected in the West (e.g. Aids/ HIV, NEETs...), whereas others are may not have Western equivalents (e.g. Hukou system, corruption, cybercrime, censorship, forced marriages, caste system, one-child policy...).

Against this background, this paper will examine how agency is seen and understood in youth studies in the BRICS countries, temporal and spatial dimensions will be provided as appropriate. Sociology's treatment of agency after the emergence of ICTs will provide a central focus of analysis. Social actors are to be found in all of the BRICS.

EACOTT, SCOTT* (UNSW Sydney)

Beyond Leadership: A Relational Approach to Understanding Organizations

Classic organizational theories build on substantialist assumptions and grant ontological status to organizations. Rarely do the underlying generative principles of scholarship get illuminated. With an inter-disciplinary and global scale, various networks of scholars, a volume of contributions in journals and books (e.g., the Palgrave Handbook of Relational Sociology), and an array of international meetings, Prandini (2015) argues there is a 'relational turn' in the social sciences. The label 'turn' indicates an epistemological breakthrough that has transformed an intellectual space, altering its constitution and 'providing a blueprint for new developments' (Gulson & Symes, 2017, p. 125). Drawing insights from the recently published *Beyond Leadership: A Relational Approach to Organizational Theory in Education* (Eacott, 2018), this paper offers a starting point for the relational approach I am advancing through the explicit articulation of a concept glossary. Paying attention to the core thrust of the relational program - the relational extensions - this paper demonstrates how the key concepts of *organizing activity*, *actor*, and *spatio-temporal conditions* are crucial to maintaining theoretical integrity and coherence. Creating distinctions from other 'relational' positions, such as the adjectival, co-determinist, and conflatory, I offer a nuanced, within the confines of a conference paper, account of how a relational approach and explanatory framing differs from hegemonic substantialist approaches. This paper is not about constructing a dense and inaccessible technical language rather, articulating and defending a vocabulary to discuss and understand the social world relationally. As a series of starting points, this paper contributes to bringing some clarity and coherence to shared principles of relational approaches for understanding and significantly, how these ideas and concepts can be mobilized for empirical work courtesy of insights from an ongoing project on principals experiences of temporality.

EBERHARD, VERENA* (Federal Institute for Vocational Education and Training)

Transition of Young Refugees to Vocational Education and Training in Germany: A Comparison between Refugees and Other Migrants

In 2015 and 2016 more than 1 Million asylum seekers entered Germany. Many of them are young but lack the professional and vocational qualifications necessary to be integrated into the German labour market. In Germany, more than 50 % of all young people receive such qualifications in the dual system of Vocational Education and Training (VET). Thus, for integrating refugees into the German labour market and society, the VET-system is highly relevant. However, young people's chances of starting a VET apprenticeship are influenced by the companies' voluntary provision of training places and their recruitment decisions. In this context, research has shown that migrants have lesser chances of getting an apprenticeship even if cultural and social capital are controlled for.

Against this background, the paper aims to answer two questions: 1) Do refugees seeking for an apprenticeship face the same disadvantages as other migrants (first and second generation)? 2) Which factors (cultural and social capital as well as sociodemographic factors like gender, age and length of stay in Germany) influence the transition to VET within the group of refugees and are there differences in these effects compared to the group of other migrants? Due to regional differences in training place supply and demand in Germany, the local institutional framework of the VET system is also taken into consideration.

Data from a representative survey of approximately 5,500 young people who were registered with the Federal Employment Agency as applicants for vocational training in Germany in 2016 is used. 1,436 training applicants are refugees and hold a citizenship of the major asylum countries of origin (Afghanistan, Eritrea, Iraq, Iran, Nigeria, Pakistan, Somalia, Syria). Applying logistic regression models, preliminary results indicate that different factors influence refugees' transition to VET compared to the group of other migrants.

Pathways to Violence Propensity: Results from a Two-Year Study of Young Males in Urban South Africa

This study followed 288 males aged 11-23 years-old from a general population sample in Khayelitsha, Cape Town, South Africa over a 12 month, two wave period to assess factors associated with risk for engagement in interpersonal violence and criminality. In Structural Equation Modelling, a pathway emerged through which an unstable home environment, influenced by deprivation and violence, affects the

quality and consistency of parenting perceived by young male subjects. In turn, early deviant associations and attitudes toward violence and gangs are cultivated and these may have a deleterious effect on schooling and, with this, a subject's orientation toward the future and the present value of investment (of schooling efforts) for delayed gratification. This violence potential and weak school attachment manifests in greater future substance abuse and, in turn, much greater exposure to and acceptance of instrumental violence and criminal associations. Policy implications and suggestions for further research are discussed.

Value of Children, Fertility Preferences and Reproductive Behaviour in Ogun State, Nigeria

This paper is based on a study carried out in three urban and two rural communities in Ogun State, Nigeria. The study was aimed at examining the value of children, fertility preferences and reproductive behaviour. A 73-item questionnaire was administered to randomly selected 1,302 ever married women ages 15-49 and 703 men 60 years or less. The results showed that the mean age of the respondents was 35.7 years (38.8 years for men and 34.1 years for women). Marriages were mostly monogamous and the mean age at first marriage was 26.5 years for men and 22.1 years for women. The respondents were mainly of the Christian and Islamic faiths. The mean stated ideal and desired family size was 5.5 and 4.5 respectively. Almost half of the women ensured pregnancy before marriage and the mean children ever born (CEB) and living children for women ages 15-49 years were 3.6 and 3.2 respectively (5.6 and 4.8 respectively for those ages 45-49 years). Unexpectedly, ideal and desired family size, CEB and living children were higher in urban areas than in rural areas. Ideal and desired family size was higher among men than among women. The perceived economic value of children was positively related to fertility ($p < .05$). Those who would expect financial help from children had higher ideal and desired family size, CEB and living children than those who would not. The desire for sons was positively related to fertility ($p < .001$). Socio-economic status and sex of respondent were significantly related to old-age security expectation from children ($p < .001$). Old-age security expectation from children was stronger among women than among men. Appropriate recommendations for policy were made.

Child's Family? Discursive Constructions By Finnish Childcare Administrators

The diversification of family forms in which children live has been argued to be a major global trend. For example, taking Finland as an example of a western society, children live in various family configurations, including LGBTIQ-parent families, single-parent families, adoption families and foster families, to mention just a few, in addition to families comprising two parents of different genders and their biological children. In addition, increased immigration has enhanced the diversity of Finnish family forms over the last two decades. Despite this diversity, it has been argued that Finnish family and childcare policies continue to be mainly targeted to native Finnish two-parent families (with different-gender parents) in which the mother has the role of primary caregiver. To address these issues, we report on and discuss how childcare administrators discursively construct 'family' in their accounts. The data, which comprise qualitative interviews with municipal childcare administrators ($n=47$) conducted in ten municipalities across Finland in 2016, are analyzed by applying a discourse analytic framework. Based on initial readings of the data, we hypothesize that while the diversity of the family forms children live in is recognized, two-hetero-parent native Finn families with biological children are often assumed when administrators are speaking about family. This could pose a major threat to the equality of children living in different family forms in, e.g., access to early childhood education and care services, and thus needs to be taken seriously.

Inspiring from "Frantz" for Peace: The Politics of Encounter and Forgiveness

This paper reviews and analyzes the film "Frantz", a French film created and directed by François Ozon in 2016 by relating the content of the film with the themes of forgiveness and the politics of encounter. Such two themes are also related to the understandings of positive peace as developed by Johan Galtung as well as important for feminist politics. The film narrates the story of Anna, a German woman whose fiancé is killed by Adrien, a French man during World War I. The film focuses on micro-processes of forgiveness and its potential contribution

to nurturing of culture of peace by touching the importance of the politics of encounter. As the film continues, Anna reconstructs herself as a more liberated woman. Although the film relies on Christianity for the idea of forgiveness, the theme of forgiveness is very important to be discussed as a critical element of ensuring peace and peaceful relations in a collective manner/sense. Forgiveness may be basically defined as "a deliberate process that transforms a vengeful, negative response into a positive one" (Maio et al, 2008: 307). Forgiveness does not only reflect that "the other" and "enemies" are artificial constructs but also open a space for questioning the structural issues behind violence. Such questioning is important for the reconstruction of values necessary for peace for all. Analyzing the film opens a space for further discussion about how forgiveness may be important as a tool for peace. To this end, this paper mainly aims to question and seek answers for the roles and meanings of forgiveness for feminist politics and peace studies.

Care Policy and Gender Equality: A New Contribution to the Theoretical Debate about Familialisation and De-Familialisation

The paper aims to contribute to the theoretical debate about the role of care policies for gender equality. It is often argued that welfare state policies support either extra-familial care work (= de-familialising policy) or family care work (= familialising policy), and that mainly only de-familialising policies support gender equality. The paper links its argument to more complex approaches which were recently introduced. It proposes to re-conceptualise the relationship between "de-familialisation and familialisation" and their role for gender equality. It argues that policies towards familial care and policies towards extra-familial care represent different types of policy that vary relatively autonomously. Welfare states combine them in different ways, depending on policy aims and main cultural ideals. Moreover, in a specific setting of care policy, also policies that support family care can contribute to gender equality.

On the basis of a comparative study for five European welfare states, which represent different types of welfare regimes, the paper investigates how welfare states combine their policies towards familial care with their policies related to extra-familial care with regard to their generosity, and it analyses the consequences for gender equality and the reasons for the differences, using document analysis of care policy legislation, MISSOC data and expert interviews.

The findings support the argument that de-familialising and familialising care policies vary relatively independently of each other. They indicate that welfare states can offer a similar generosity in both types of care policy, and that both are often part of a general care policy package that treats both types of care in a similar - more or a less generous - manner. More generous welfare states often pursue a strategy that offers generous support for both types of LTC policies, supporting the financial autonomy of family carers and thereby promoting gender equality.

Jóvenes, Violencias y Familias: Una Sociedad Que Oculta Sus Falta

Dra. Noemi Ehrenfeld Lenkiewicz

Jóvenes, violencias y familias: una sociedad que oculta sus faltas?

Resumen

Establecer un marco teórico fincado en las ciencias sociales, para entender mejor los fenómenos que vinculan las naturalezas de las violencias y sus articulaciones y permitiría paliar las diferencias metodológicas y empíricas de las investigaciones.

La pérdida de una comunidad que implica inseguridad individual abarcando todos los espacios de la vida y de una familia en la que también se experimentan las violencias más íntimas. Estos aspectos se exploraron en una encuesta (NEOTIS) aplicada a 5837 estudiantes; representativa por unidad, división y sexo, lo cual permite ver perfiles que pasan desapercibidos en otros estudios. Entre los resultados obtenidos, destacan: Los jóvenes perciben a las familias mexicanas como un ámbito de violencia, que abarca desde 76.1% hasta 95.8%, dependiendo de la relación y el tipo de violencia que refieren, así como del género. El 63.6% de los hombres y 61.7% de las mujeres perciben su comunidad como violenta. Sólo 18.3% del total, identifican violencia en su propia familia. Abuso sexual es declarado por 12% de los estudiantes y violación por 3.5% del total, siendo 17.7% de los agresores familiares cercanos.

La mayor parte de los actos violentos de cualquier carácter, no han sido denunciados (sólo 15% denunció) y la respuesta más frecuente es la falta de credibilidad en la impartición de justicia y en las instituciones responsables de la misma. Menos de la mitad percibe la universidad como un sitio seguro. Las evidencias

obligan a buscar alternativas de prevención y atención en el espacio universitario, reflejo y albergue de la violencia generalizada en México. La vinculación de estos conflictos entre jóvenes, familias, violencias y cultura, exige explorar instrumentos metodológicos mas precisos y u paradigma teórico que pueda contener y desafiar la complejidad del tema.

Gender and the Transition from Military to Civilian Life: Examining the Experiences of Canadian Female Veterans

Gender remains an underexplored area of inquiry into veterans' transition from military to civilian life – both in Canada and elsewhere – but one that is growing in importance in view of the changing gender make-up of militaries across the globe. That gender is a key variable affecting the success of veterans' reintegration into civilian society is increasingly evident in the literature. In part, female and male Veterans face similar challenges upon their return from a war zone and/or their release from the military. However, some aspects of the transition are gender-specific and related to societal gender norms and gendered military culture. A qualitative methodology was used to conduct interviews and a focus group with female Canadian Armed Forces Veterans regarding their experiences transitioning from military to civilian life. The themes of balancing work and family, gendered injuries, and insufficient supports emerged as salient. Across these themes the analysis revealed the core issue of a conflicted and unacknowledged *female veteran identity* shaped by military and civilian gender norms. It is important to recognize female veterans' unique experiences and needs, and how military and civilian gender norms as well as other factors may impact their military-to-civilian transition. Insights from this research will help inform guidelines for more gender-sensitive veterans policies and programs in Canada that go beyond the male veteran norm or alleged gender neutrality.

Does Democracy Pay? Determinants of Organizational Effectiveness in Labour Unions

Amidst concern about rising economic inequality, a growing body of research has identified declining union strength as a key contributing factor. This in turn has sparked a vibrant debate as to how best to revive labour's fortunes. Central to that debate has been the question of unions' organizational form and functioning. Some emphasize the need to increase members' commitment and willingness to fight by deepening unions' democratic functioning. Others counter that focusing on democracy is short-sighted, as it emphasizes the ever-narrowing group of already-unionized workers at the expense of the vast majority of non-union workers who have no voice at all. Additionally, studies of existing revitalization projects have suggested that more staff-driven, "top-down" approaches are often necessary for success. The crux of the debate is whether union democracy and union effectiveness are counterposed or complementary. This paper is an initial step in the most systematic examination to date of the relationship between union democracy and union effectiveness. We report on findings from a pilot study that we will expand into a representative survey of local unions in the U.S. and Canada. As the building blocks of union organization, local unions offer the primary avenue for member involvement, making them the best site for evaluating democratic practices. For our purposes, we adopt a narrow conception of union effectiveness, and focus on wage gains. As for democracy, we use metrics that are easily quantifiable and minimally subject to interpretation, such as contested leadership elections, the number of elected and appointed union staff, the ratio of union stewards to members, union meeting frequency and attendance, as well as participation in union-sponsored activities. Our question is simple: do more democratic unions negotiate higher wages for their members? We are currently conducting the pilot survey, and will report preliminary findings at the conference.

EIZAGUIRRE ANGLADA, SANTIAGO* (*Universitat de Barcelona*)

From Inclusive Cooperatives to the Promotion of "Maker's" Culture: Initiatives Aiming at Democratic Innovation and Co-Production of Social Policies in Bilbao.

Bilbao can be analysed as an example of bottom-linked governance in which the response to global challenges related with social inequality and economic democratisation is approached by a melting pot of citizen's initiatives organized around the defence of the common good. The observation of the history and governance mechanisms of a sample of entities in the field of employment, citizen's participation, and the exchange of resources that respond to social needs, offers us evidences of the commitment of this type of initiatives to the continuous improvement of the local welfare regime. This contribution against the failure of

social policies is combined with a search for organisational autonomy and the maintaining of a critical point of view with respect to public administrations. The leadership of the cooperative sector in the development of social and labour inclusion can be explained as a response to the deindustrialization experienced in the Biscayan context and is key to understand the commitment of Basque Administrations to the provision of welfare policies. Also the role of the neighbourhood movements empowering people in the most disadvantaged contexts, and a political culture that gives importance to citizen's participation at the local level, are key to understand the consolidation in the city of Bilbao, of a local socially innovative system with critical, creative and dynamic actors. Finally, considering the emergence of new actors in the context of the recent Great Recession, it should be pointed out that current networks between citizen's creative strategies are mainly structured around a collaborative provision and exchange of resources to respond to social needs, with a strong perspective on economic democratization that without succumbing to the dynamics of co-optation by public administrations are promoting democratic innovation and coproduction of public policies from a socially transformative perspective.

Revisiting the Cultural Processes of Agricultural LAND Appropriation in North Central Nigeria: Panacea for Preventing Violence between Farmers and Herdsmen

Farming communities in North Central Nigeria have experienced unprecedented violence in recent times. This dimension of violence has been precipitated by the unhealthy farmers-herdsmen inter-phase in the bid to gain advantage over one another with respect to access and usage of agricultural lands. Land appropriation historically, has followed a laid down cultural process of inheritance along family lines in North Central Nigeria or other special arrangements consented to by the custodians of their cultures. This way every member of the communities could clearly identify and use his portion of the land. However, violent conflicts have persisted in this region, thereby frustrating concerted efforts toward food security in Nigeria as a result of loss of lives and properties as well as societal instability. This paper addresses the possible ways of preventing these avoidable violent conflicts. The study adopted Focus Group Discussion (FGD) to elicit information from members of the communities in the study area. The results of the FGD show that (i) the herdsmen were invaders into the communities' farm lands, (ii) the herdsmen do not ask for portions of agricultural lands, (iii) compensations were usually not paid to victims (farmers) of these invasion, (iv) the farmers are not prepared to be forced out of their inherited lands, (v) the herdsmen have never complied with peace efforts. Based on these findings, it was concluded that the forceful land grabbing approach of the herdsmen was responsible for the incessant conflicts. It was therefore recommended that the cultural process of land appropriation be modified and adhered to such that everybody is made to comply with the process of acquiring land for guaranteed sustainable food production.

Language Learning As a Social Encounter with the "Other" – a Comparison between Families of Cameroonian Origin in France and Germany

This presentation will explore language practices departing from the case study of two different Cameroonian families who live in France and Germany among whom biographical interviews have been collected within the French-German research project "Migreval". It will reflect on the impact of colonial experience and power on language practices as well as on migration and language learning. While the family who migrated to France already spoke the language of the country of arrival – French being one of the official languages of Cameroon, this was not the case of the family who migrated to Germany. This contribution will reflect on differences and similarities between these case studies concerning multilingual practices in their country of origin and of arrival. Departing from interviews with members from different family generations, we will analyze the way the interviewees learned different languages in different contexts of life through time: in school, through Erasmus programs, work, or their neighborhood. We will pay special attention to biographical turning points (Hareven and Masaoka 1988) that have led to a change of perception and practice of multilingualism in the life course of our interviewees and the way these practices have been accompanied by processes of exclusion or inclusion. Thereby, the impact of language policies will be taken into consideration.

We will also reflect on the meaning the interviewees attribute to the learning of different languages, and the way this process becomes a social practice of encounters with the "Other". This presentation will address the way different languages become their "own" and how learning the mother tongue of the "Other" becomes a powerful means of creating rapprochements and blurring the frontier between the "Self" and the "Other".

Les Métiers Relationnels Au Maroc, Entre Dispositions Sociales Et Vision Du Métier : Cas - Les Métiers De Santé ; Étude Comparative Entre Les Médecins Et Les Infirmiers

L'origine de cette proposition intitulée « **Les métiers relationnels au Maroc, entre dispositions sociales et vision du métier : Cas des métiers hospitaliers** », est une recherche de terrain, faite entre 2013-2014 dans le centre hospitalier Ibn Sina de rabat Maroc. On a opté pour une approche mixte, quantitative et qualitative afin de cerner le rapport entre les dispositions sociales acquises et la vision du métier chez les acteurs hospitaliers (médecins et infirmiers).

Ces dispositions sociales sont le produit objectif de l'ensemble des déterminants sociaux tels que l'origine familiale, niveau d'études des parents, leurs professions, l'absence d'alternative, la rapidité d'accès au monde du travail et le statut social de la profession. Ils se sont considérés comme tels vu leur impact délimitant l'accès à telle carrière et non pas à d'autres (métiers de soins, métiers médicaux), c'est-à-dire, cet accès là devient un fait de reproduction sociale et d'inégalité des chances. Ce caractère objectif de cette reproduction sociale se véhicule par un système de vision et de division des choses comme disait P. Bourdieu suivant la possession de certains capitaux (capital culturel, capital économique). A cet effet, ces conditions sociales façonnent le rapport des travailleurs hospitaliers à leurs métiers et à leurs manières de tisser des liens et des rapports sociaux avec les autres acteurs (par exemples les collègues, les malades, les visiteurs).

Nous concluons par l'importance des déterminants sociaux et culturels dans la détermination de la nature du groupe social exerçant une profession dans le centre hospitalier. On est donc devant un phénomène de réglementation sociale et culturelle de choix et d'accès une profession. Par la suite, ce phénomène impacte le système de vision des individus lors de leurs exercices professionnels. Finalement, la socialisation professionnelle est relativement liée à ce système social de reproduction et d'inégalité des chances.

Post-Revolutionary Egypt: Agents of Transformation between Openness and Cloture of the Political Structure

Since 2010, countries in the Middle East and North Africa have been undergoing constant changes of political and social nature. Protests were directed by youth-led, non-ideological, horizontal, leaderless movements who benefited from the openness of political structure in the aftermath of the uprising. Despite, their participation in the overthrow of the old regimes, the revolutionary movements were almost excluded from the key decision-making positions during the political transformation processes.

In particular, and with emphasis on Egypt, the paper has two interrelated aims: First, it examines the openness and closure of political structure during the political transformation period that we split into three phases: 1) the military phase; 2) the Muslim Brotherhood phase and; 3) the actual polarization phase. The analysis focuses on the extent to which social movements benefited from political opening to increase their inclusion in the political sphere in post-revolutionary Egypt. As well as to the degree in which social movements succeeded or failed in challenging the repressive measures taken by the current regime to exclude them from the public space. The emphasis is on the change interaction between state-society relations on the one hand, and fragmented revolutionary movements relations, on the other hand, which were split into secular and Islamists coalitions. This focus may indicate how the different actors shaped the trajectory of each phase of the transformation process. The first aim of the paper will serve to: a) enhance our understanding of the strategies adopted by social movements either to sustain or suspend their mobilization in each phase of the transformational process and then; b) identify the response of the political structure to social movements mobilization in a shifting context.

Social Sciences in Palestine: Critical Reflexing

This paper aims to examine the practices and perceptions of Palestinians social scientists in an attempt to historicize the social sciences in Palestine and to clarify divergent visions and positions both normatively and epistemologically. The evidence shows that there are differences in perceptions and approaches among members of the Palestinian scientific community regarding conceptual issues, a fact that reflects diversity of the cognitive tendencies and visions on one

hand, and the effect of globalized international scientific groups on the other, in addition to the desire of the Palestinian scientific community to be engaged with the global academy.

The paper will also present different approaches of Palestinian researchers through an overview to their research and to its outputs, approaches and debates and the discussions problematizing their methodologies and references. And how to create a social knowledge that enables the study of the Palestinian social phenomena? and with what tools? and how to do we do with the results of such studies? And what is the role of researchers in the social sciences within their colonialized society, and how to adapt between the epistemological and societal commitment. And give a close reading of the approaches, various researchers use to liberate their discourse from the dominance of cultural centers, especially certain Western notions? the question here, is How to reconcile Al-Khaldouni notions of sociology with Western sociology? Presenting thus a broad overview of the debates on methodology, focusing on the debates about the methods used to "acclimatization" or "home-ization" of these sociological knowledge, all aligned to the local phenomena studied. Added to this, a view of other debates related to the research tools and the language its produced in will be problematized. In other words, do we produce Arabic knowledge of the Palestinian society with English?

EL-MAFAALANI, ALADIN* (*FH Münster - University of Applied Sciences*)

The Appeal of Salafism

How can it be that an ideology that has been around for centuries is suddenly experiencing such a resurgence among young people in Western Europe? Why are young men and women, either with or without a "migration background", longing for a return to the Middle Ages and thus coming together to form one of the most dynamic contemporary youth movements and protest cultures in Europe? On the basis of empirical findings and theoretical reflections (following Bourdieu's habitus concept), the attractiveness of the movement is reconstructed from the perspective of the young people..

Experiences of discrimination and exclusion in combination with national and international developments play a role here. But especially in times of individualism and „Retrotopia“ (Z. Bauman) Salafism offers a collective strategy, identity and belonging. The historically rare constellation in which young people can provoke with radical asceticism and nostalgia provides a sounding board for marginalised young people by making a virtue out of necessity. Those who feel excluded, unable to participate in society, don't have much to lose when they join a radical group. On the contrary: taking this step can turn a sense of powerlessness into one of autonomy and strength. In this respect it is much more a political movement than a religious movement. It follows that unequal opportunities to participate in society on the one hand and Islamophobia on the other increase the provocative potential of the movement, thereby contributing to its enduring appeal. How youth and provocation will blend into an ultra-conservative movement in the long term remains to be seen.

The Open Society and Its Enemies Revisited

Openness and liberalism have spread at an accelerated rate in the last decades, which in turn fuels counter-movements. These nationalist, populist and religious fundamentalist movements are promoting an exclusive identity and social closure. My thesis is: The problem is not the situation itself, but rather several paradox effects of the open society, or more precisely, the discrepancy between expectations and reality.

Openness within a society means that the opportunities for minorities and disadvantaged groups to participate in society are improving. At the same time more and more of these people talk about discrimination. And at an advanced stage openness means, that national identities and social privileges are re-negotiated. So the central effect of an inclusive society is a higher potential for conflicts, while the opposite is expected. The outward openness has a similar paradox effect: the symbolic west is becoming increasingly more and more important, and in the same time the western countries are losing their dominance and privileges. Especially nations or groups who historically seen themselves as having a right to a dominant global or national position seem to be prone to populism. Additionally, while income inequality between countries may have been reduced, inequality within countries has risen. This is only a selection of paradoxical consequences and counter-intuitive relations of the open society.

This paper presents the thesis that the unexpected consequences of openness leads to different kinds of an identity-based social closure as a central characteristic of our time. Based on the approaches of Zygmunt Bauman, Alan Coser and Karl Popper the social and global ambivalences are described, which founded the rise of populism.

How Collaboration Between Police and Other Services Guided a Victim/Survivor Centred Response to Sexual Violence in Victoria, Australia

Collaboration between a range of organisations is widely regarded as the basis of an effective response to victims/survivors of sexual assault. A collaborative and integrated whole-of-sector response is important to engaging with the diverse and complex needs of victims/survivors of sexual assault and supporting broader strategies to reduce violence against women, particularly given the often fragmented and dynamic nature of service systems. As part of government acknowledgement of this necessity, formalised working relationships were recommended as part of a sexual assault reform package in Victoria, Australia, during the early 2000s. Based on the Victorian Law Reform Commission's recommendations for the improvement of sexual offences legislation (2001-2004), Victoria Police and the feminist Centre Against Sexual Assault (CASA) began formal collaboration to support an effective response to sexual assault in the state.

Understanding the circumstances that allowed for strong policy action on a complex social issue is important to learning to replicate such strategies in other settings. In this paper, I investigate the ways in which a victim/survivor centred approach was incorporated into the punitive-based management of sexual assault in Victoria. I draw on my doctoral research into a time period that saw changes to criminal justice policy and practice brought about by discourses attached to feminism and the new public health framework. I apply a method of critical discourse analysis to key documents from Victoria Police (2005), particularly the *Code of Practice for the Investigation of Sexual Assault* and its accompanying Action Checklist, or *Ready Reckoner* – the products of collaboration between CASA staff and police. I also provide a glimpse into the informal side of collaborative relationships based on interviews with key informants associated with Victoria Police and CASA, and discuss the competing internal discourses about the role of police in addressing violence against women more broadly.

Fading Boundaries: Religion, Violence and Spatial Mapping of Nigeria's Jos North Urban Centre

This paper argued that the vulnerability of localities in Plateau State, Nigeria, to political manipulations and reoccurring conflicts is grounded more in primal spatial ideologies than economic and political aspirations, even though these factors are equally important. Historically, the exogenous agents of colonial expedition imposed a western spatial framework on the indigenous spatial forms. As a result, "native" lands were demystified and de-ethnicized within the context of globalisation to satisfy capitalist and hegemonic ambitions which in turn have led to the creation of identities devoid of cohesive communal qualities in the African sense. In the light of such reconfiguration, presently there seems to be an ongoing (re)ethnicization and de-ethnicization of geographical boundaries in ways that appear to sustain the practice of territorialisation and the capacity for religious othering in the city of Jos North. Also, such spatial transitioning combined with waves of ethnic migrations have given rise to renewed ethnic pride and ancestral affinities fused with religious loyalties in the face of growing local ethnic diasporic communities in the city. Thus, this study by exploring the spatiality of Jos North urban existence re-interrogate existing political worldviews that political leaders draw on as they experiment with democracy since the transition from military regimes to civilian rule in 1999. Such condition also begs the question about the extent that such worldview engenders integration as well as allow ethnic migrants (that are a minority) to cultivate a deep sense of belonging and spatial rootedness. By drawing on ethnographic data and with the aid of *ESRI ArcGIS* (Geographical Information System software) to represent the city's religious spatial formations and transitioning, the argument of this paper will be grounded in critical spatial theories.

Flip the Coin – Explaining the Synchronicity of Institution and Occupation Using the Example of the German Bundeswehr

The I/O model, first introduced by Moskos in 1977, has inspired research on the military with regard to its organizational setting as well as and to the attitudes of its personnel until today. Controversy on the I/O thesis enlarged the hitherto prevailing debate on the status of the military as a profession by introducing a

dynamic perspective on the soldier's job and its political, social and cultural framework.

In Germany, the I/O model has mainly been discussed according to the prevailing patterns of interpretation which focus on the normative postulation of democratic civil-military Relations. In this perspective, occupational trends or a de-professionalization of the German armed forces tend(ed) to be interpreted as positive signs of a successful democratization of the military. Irrespective of this particular debate, empirical research on military careers in Germany has shown concurrent developments for all ranks: Since the introduction of a combined military and academic training for officers in the 1970s, German officers possess a double qualification as a military professional and as a professional in an academic area; non-commissioned officers have to pass a vocational training with additional schooling, and warrant officers need a practical master training. Moreover, studies on military identity have revealed heterogeneous professional attitudes and orientations amongst the military personnel, thus displaying institutional and occupational features according to the original I/O model. Finally, taking into account that the majority of soldiers have to leave the military after a certain period the question arises how soldiers manage to develop and adjust professional identities over the years, i.e. during and after their military service.

Against this background we propose to take up the I/O thesis, reassess it in the light of current debates within the sociology of professions, and discuss it with regard to empirical data on recent developments concerning the German Bundeswehr.

'It's Our Moral Imperative As (White) Americans': The Classed Meanings of Whiteness and the Politics of Immigration in Arizona

Even when U.S. immigration policy does not directly affect them, American citizens still flock to the U.S.-Mexico borderlands to take the law into their own hands. Some activists stealthily work with the Border Patrol to stop border crossers. Others defy border agents by leaving out water to help migrants journeying across Arizona's Desert. What are the motivations of these different groups of Americans? I argue that the answer has to do with the meanings of whiteness vary across class. Although both groups in this study were overwhelmingly white, pro-immigrant activists were solidly middle class, while restrictionists were downwardly mobile, blue-collar men. Scholarship on U.S. immigration politics has ignored this class difference as well as its implications for participants' motivations and mobilization methods.

Specifically, I find that pro-immigrant activism attracted white participants who struggled with being politically progressive, on the one hand, and socioeconomically privileged on the other. Aware of the gulf separating their own experiences from the plight of disadvantaged groups, pro-immigrant biographies revealed failed attempts to be 'good white allies.' At the border, however, they realized that they could exploit their privilege. There, race and class privilege became a (possible) tool to weaken the state and help a vulnerable group. This rare opportunity is what made border activism appealing to pro-immigrant respondents.

Restrictionist activism, meanwhile, appealed to blue-collar men who grappled with being simultaneously privileged and marginalized. Restrictionists felt that they were *more* American and concomitantly, *more* entitled to a good life than ethnic minorities and immigrants. Yet, restrictionists' lives were characterized by the marginalization of downward mobility. Shoring up the state allowed restrictionists to manage this crisis of racial privilege and class marginalization. As civilian extension of Border Patrol, restrictionists felt powerful, active, and needed. Volunteer work in the borderlands helped them escape the disempowerment they otherwise felt.

Variations of the Sacred in Pop Culture Fandoms: A Survey of Comic-Con Conventioneers

This paper builds on Emile Durkheim's sociology of religion by investigating the world of fan communities, or fandoms, and the degree to which they involve beliefs and practices that are sacred. In the process, it also addresses broader questions about how "secular" activities can share important similarities (or elementary forms) with traditional religion. The sacred, Durkheim explained, is set apart by the community as something powerful, transcendent, and holy, and is clearly distinguished from the mundane world of everyday affairs via ritual activity. This conception obviously includes beliefs and practices about the gods or the supernatural, which is the typical focus of sociologists of religion, but it is not exclusive to them – other beliefs and practices can be sacred. Overall, this insight represents an underexplored legacy that has enjoyed only limited applications to non-religious or secular activities, despite pleas in the sociology of religion to further explore the varieties of sacred experiences.

While there is a long-standing literature about fan behavior that has described it in various ways – as psychologically dysfunctional, the result of cultural or corporate manipulation, a form of cultural agency and rebellion, or a modern quest

for personal identity and community – there is little systematic information about different fan beliefs and practices. To this end, I have designed a survey to be administered at comic book conventions in the United States, commonly known as Comic Cons. These particular conventions have expanded dramatically in the last decade and are attended by a variety of fans engaged in a variety of activities, such as costume play (or cos-play), celebrity panels and autographs, merchandise collecting, games, and job interviews. Therefore, these particular conventions are an ideal environment to survey fan beliefs and practices, and to test central Durkheimian claims about religion.

ELLISON, KIRSTEN* (University of Calgary)

"Hack Your Age": Anti-Aging Technology, Biohacking, and the Pursuit of the Optimal Self

In the realm of anti-aging medicine, cosmetics and supplementation, the machine metaphor of the body that has dominated the field in the past has been reworked into what Neilson (2012) has described as 'a kind of molecular software or reserve of information that can be read and re-written.' Popularized by DIY scientists and quantified-selfers, the language of 'biohacking' has become increasingly prevalent in anti-aging discourse. Drawing on recent examples from anti-aging promotional materials and popular science and technology print media, I examine how the language of biohacking is employed to construct, translate and quantify biomarkers of aging into of points of entry into the body as 'molecular software' via various techniques of intervention, ranging from stem cell serums and hormone optimization to nutritional supplements. Presented with speculative futures of *superhuman* health and longevity, consumers and patients are invited to 'hack' the aging process, reducing age to one of the many programs, or rather 'bugs' that can be re-written, removed, and rendered obsolete. The 'hacked' body is one that has been upgraded, boosted, or (re)programmed to 'run' with optimal performance, resilience, and functionality. And in this particular case, it is the perpetually youthful, ageless body. In the pursuit of moving *beyond* age, to be *more than*, it is a state that can never be fully achieved and yet must constantly be striven for, a continuous battle between the resurfacing of time/age and the (re)programming of its obsolescence.

Curious Choreographies of the Quantified Self: Breath and Biofeedback

It is still hard to collect real time data on the act of breathing in the wild, outside of medical facilities that utilize such tools as body plethysmography. Breathing is voluntary and involuntary; it consists of internal and external respiration; it can be diaphragmatic or costal and affect parts of the body located far from the trunk (Calais-Germain 2005). Proxies for breath include motion, emotion, displacement, moisture, and sound. In this sense, "data doubles" of the breath body are a prime examples for critiques of the quantified self that counter any narrative of seamless transition from "feeling to numbers," instead pointing out the mythic nature of such claims to accuracy and reliability (Crawford/Lingel/Karppi 2015).

This paper focuses on recent media and performance projects that use performers' or users' real-time breath data as biofeedback controllers. There is groundwork for the potential of such work, ranging from research that posits the role of the humanities in bridging epistemic gaps in medicine's clinical ability to account for experiences of breathing and breathlessness (Mcnaughton/Carel 2016), to scholarship that argues for the use of digital tools to heighten sensory awareness (Davidson 2016). On the other hand, critiques of the quantified self as well as the findings of critical code studies advocate for attention to the biases, symbolic nature, and cultural embeddedness of algorithmic processing (Marino 2006), rather than celebrating such biofeedback work as a black-box feat of hardware and/or software engineering. Balancing these perspectives, I am interested in approaching the impossibility of this collection that is nonetheless translated into interactive representations, and in what is asked of the bodies that interact with them. I ask how such inaccurate and partial data is built into feedback loops that may ultimately offer alternative experiences of embodied breath in the form of curious choreographies of the quantified self.

Privacy Attitudes and Concerns in the Digital Lives of Older Adults: Westin's Privacy Attitude Typology Revisited

There is a growing literature on younger users' attitudes toward online privacy, yet little is known about older adults. As older adults join the digital world in growing numbers--going online to connect with friends and family, accessing

services, and searching for information-- we need to understanding their privacy attitudes and concerns. This paper fills this research gap by examining 40 in-depth interviews with older adults (65+) living in East York, Toronto. Westin's typology of privacy attitudes informs our qualitative data analysis. Specifically, we examine to what extent the typology is useful in understanding privacy attitudes of older adults. Our East York older adults varied considerably in terms of their comfort with digital media and approach to privacy threats. We propose a typology of older adults that distinguishes this demographic into five categories: fundamentalist, intense pragmatist, relaxed pragmatist, marginally concerned, and cynical expert. We found that each category had a set of unique concerns, but some concerns were shared across several categories, the most common being surveillance, scams, spam, and unauthorized access to personal information. Fundamentalists had few concerns as a group, whereas intense pragmatists had many concerns. The marginally concerned group was more annoyed about potentially privacy breaches than concerned. We draw theoretical implications based on the findings for our understanding of privacy in the context of older adults and discuss implications for offering training geared toward enhancing privacy literacy in this age group.

Organizing the Commons: A Solution to Acting Collectively

This project proposes a new solution to problems of acting collectively. I propose to test that new solution by applying it to the standard public goods experimental paradigm where free riding is otherwise endemic. Whereas psychology, biology and economics look to factors within individuals to suppress free-riding, this study seeks to show that, by organizing relations external to the individual, the problem of free-riding can be circumvented allowing for successful joint action. In the proposed design, group members contribute to a collective good, and a group dealer determines the returns to self and others. A pilot study conducted using students in an introductory social psychology course suggests that dealers developed three distinct strategies for the distribution of returns: proportional, equal and favoritism. Of the three strategies, contributions for equal and favoritism groups showed declines in contributions over time while in proportional groups, contributions increased. Using z-tree, software developed specifically to investigate problems of collective action, the effect of organizing the commons on the success or failure of joint action will be tested under controlled conditions in the Social Research Lab at North Dakota State University.

EMBRICK, DAVID* (University of Connecticut)

Racism, Emotions, Alienation, and Racial Microaggressions

Racial Microaggressions have been the purview of disciplines such as psychology and educational psychology. While these fields have certainly left a mark in terms of pushing the boundaries of understanding how individuals belonging to certain racial and/or ethnic groups cope with, and are mentally, physically, or physiologically affected by racial microaggression, missing are meso and macro level understandings of how racial microaggressions affect folks. Further, what are the cumulative effects of racial microaggressions over both time, space, and with respect to the totality of each of these level (i.e., micro, meso, macro)? In this paper, I bring back sociology theory to better situate racial microaggressions to account for all of these factors. In doing so, I specifically highlight the ways in which differential health outcomes among racial groups are deeply shaped by racialized emotions. Further, racial microaggressions (i.e., seen as acts of racial domination) produce positive health outcomes for perpetrators who may find solace in understanding their positions at the top of the racial (white supremacy) hierarchy.

Sanctuaries of White Supremacy: Art Institutes and the Boundaries of White Spaces and Whiteness.

The recent battles, both overt and subtle, regarding the removal of confederate statues and other symbols of white supremacy, is often assumed as a necessary action if the US, as a nation, is to move forward in terms of its racist past. On the one hand, some scholars argue that these acts represent a good first step in reclaiming white spaces in both our physical and mental landscapes. Other scholars argue, however, that, like the tip of an iceberg, the battle over the removal of confederate statues is minuscule against the larger foundation of white supremacy. That is, we need to pay more attention to the racial mechanisms present in our institutions and even larger social structures that serve to perpetuate both over and subtle

racial discrimination. We side with the latter view, noting that US society is rife with various social institutions that serve the same purpose as the confederate statues that plague our parks, office, and other public spaces—to convey the message of white superiority. To that end, our project examines the elite “white spaces” of national art museums, specifically the Art Institute of Chicago; we interrogate the racial and class mechanisms that perpetuate racial emotions conveying who “belongs” and who should be “excluded” from general society. Museums, wittingly or unwittingly, are set up as physical monuments (i.e., white elite safe spaces) that attest to white superiority over other racial groups. Such racial expressions are not just conducted through the inclusion (and exclusion) of artifacts, but also through physical and mental barriers that promote or deny an authentic sense of belonging (e.g., frequent policing of the body, hostile/friendly attitudes, etc.).

50 Years of Labour Apartheid, Now What? Learning and Moving Forward in the Movement for Migrant Rights in Canada

The Seasonal Agricultural Workers Program (SAWP) which recruits workers for the agricultural industry in Canada turned 50 years in 2016. Grassroots community-labour activists have long held the analysis that this program structures labour and immigration apartheid among workers from the Caribbean and Mexico who perform grueling and dangerous work. For over 17 years, Justicia for Migrant Workers (J4MW), a political collective comprised of pro-bono organizers acting as organic intellectuals and activist academics, has been at the forefront of migrant farmworkers struggles in Canada and transnationally. Long before there were experts in the law dealing with migrant workers rights, J4MW undertook grassroots research to learn about migrant workers' lives in order to be more effective and accountable allies. In this paper, I recount the main learnings of my work as a transnational organizer, activist academic and co-founder of J4MW and formulate new directions for our work by taking cues from important movements and developments throughout North America. I detail the urgency of broadening our transnational work to global movements against neoliberal globalization and to the creation of alternatives and building the world we want in the here and now. My analysis takes into consideration our limitations in a critically reflexive manner. I bring to the fore the agency and struggles of not only migrant workers but also that of their families and communities impacted by the disciplining of neoliberal global capital. How do we step it up for the movement of migrant rights in Canada? How do we go beyond case work to tangibly effect structural change? How can we come together from our divergent positionalities to build an encompassing social justice project reflective of migrant workers' and their families' voices from all guest worker programs for agriculture including those without status?

ENCALADA GREZ, EVELYN* (OISE of the University of Toronto)

Managing El Corazon and Transnational Households Among Mexican Migrant Women

Neoliberal globalization has induced unprecedented shifts throughout the globe since its inception in the early 1970s. While there is a wealth of political and economic studies pertaining to the changes in governance, deregulation of markets and cuts to social spending, emotional aspects of this shift warrant further attention. In this paper, I situate the labour migration of Mexican migrant women to rural Canada within the context of emotional burdening and disciplining of neoliberal capital. I show how their labour entails not only working in Canadian agriculture but caring for their children and kin and managing households across borders. I start by discussing the literature on transnational families and gendered statelessness negotiated by migrant women as non-citizens from the Global South. I then explicate how the discourse of the Canadian family farm acts to obliterate migrant women, their families along with the arduous productive and reproductive work they all perform in order to supply labour and earn wages for household survival. Overall, the complex transnational homemaking practises produce a myriad of consequences, some of which I term “transnational casualties” that women contend with in order to secure survival, care, and well-being for themselves and their families. In their precarious labour migration and transnational livelihoods, Mexican migrant women have to constantly manage their *corazones* and migrate with broken hearts. Hence social justice projects have to consider not only the material quality of life of migrant women and their families but also the immaterial such as emotions and the structures that coerce and pain them.

ENGELBERG, ARI* (Hebrew University of Jerusalem)

Family and Inter marriage in a Radical Israeli Jewish Organization

This paper will discuss the radicalization, political and religious, of Israelis, most of whom hail from Mizrahi working class background. The focus of the article will

be an organization by the name of Lehave upon which I conducted ethnographic research. The official goal of Lehave is to prevent intermarriage in Israel between Jews and non-Jews; de facto, it expends most of its efforts on preventing Arab men from courting and dating Jewish women. Generally speaking, the Jewish family as an idealized concept plays an important role in current Jewish Orthodox worldview. It is seen as a site for holiness that enables the perpetuation of tradition in face of liberal secularism and feelings of rootlessness. Organizations like Lehave demonize the Arab and Muslim family as overly patriarchal and oppressive toward women. Interestingly they are co-opting liberal feminist discourse in order to make this argument. Given this world view, Jewish women who marry Arabs are seen as taking a step into the abyss. Lehave and similar organizations attempt to 'save' them even after marriage by encouraging them to leave their husbands. The family metaphor plays a role also in the discourse used within the organization. Many of the members, who are teenagers, are themselves coming from an endangered or in other cases disadvantaged family background. Others come from stable families, but like many teenagers are seeking meaning and a calling. The organization provides a close knit framework attempting to provide a substitute for the family. So family, as a concept informs Lehave on several levels, and since Lehave is an organization that justifies violence and power, we can see here how differing conceptions of family legitimate the use of power in the eyes of certain individuals.

ENGELHARDT, ANNE* (*Kassel University*)

Organizing labour at chokepoints: labour struggles against casualization at sea- and airport terminals in Portugal.

In the last four decades, logistics has become one of the most important sectors of the global economy. A growing velocity in this sector was made possible due to the intermodal function of the container and automatization. This decreased the costs of transport allowing for an ever-expanding division of labour and the globalisation of commodity flows to Just-in-Time-production and door to door transport. This process has created 'chokepoints' mainly in air and water transportation, i.e. spaces of the economy where the flow of commodities can most easily be interrupted on a large scale through labour struggles. At harbours and airports, the intermodal change of goods - from an airplane to a truck, from a ship to a train etc. - takes place through inter-functional processes between highly automatized harbours and airports and a centralised workforce on the one hand and individualized and often self-employed truck drivers on the other. Different scholars (Edna Bonacich, David Bensman, David Jaffee etc.) analyse chokepoints as a special field of 'logistical power' for workers to contest precarious labour conditions, union busting, and elevate unionising. However, exactly because chokepoints appear to be vulnerable places for the commodity flow, governments as much as companies in the logistic, security, and insurance sector impose ever new legislations, surveillance, and control to minimize the risk of interruption. Referring to these two antagonist discourses around chokepoints the following research questions are aimed to be answered: I) Is the thesis about logistical power still valid? II) Have there been successful struggles concerning the improvement of labour conditions and unionising in the port and airport sector? III) How could they succeed concerning increasing surveillance and securitization? The paper will be underpinned with examples of recent struggles of the IDC in Portugal/Lisbon and labour struggles in the airports against the privatization of the TAP.

Time for Fathers? the Politics of Paternity/Parental Leave Policy in Cross-National Comparative Perspective

When are fathers recognized as care-givers under leave law? Since the 1970s many affluent democracies have extended paid leave rights to fathers by adopting paternity and dual parental leave policies. Such policy change suggests a "path shift" from breadwinner to earner-carer family policy models. This shift is important, because social policies that grant time-off from work to care for new children affect public health and family economic well-being and matter to women's political and economic equality. Despite considerable cross-country differences in leave generosity and the timing of leave policy adoption, large-scale quantitative analyses on the sources of family policy are surprisingly rare. This paper reports new research estimating the impact of structural pressures, institutions, power resources and, to the extent that data allow, normative beliefs on the timing of paternity/parental leave policy adoption from 1976 to 2016 across 22 affluent democracies using discrete-time event history methods. The unique data set draws on multiple sources and the author's compilation of paid and unpaid paternity and parental leave policy histories.

Disrupting the Feminine Athletic: Whiteness, Heterosexuality and Women's Sport in Africa

On the African continent sport has, particularly in the last two decades, been hailed as a useful tool in the quest for nation building and social cohesion. A popular claim is that sport has a particularly powerful role to play in achieving gender equality and women's empowerment, and that the pride imbued in national teams and athletes can foster national unity and cohesion across historical divides. As a result, a variety of sport-for-development projects and programmes have emerged across the African continent in the last 20 years. Yet, what often remains uncontested in assertions about the benefits and potentials of sport, are the ways in which sport also produces and sustains processes of inclusion and exclusion, frequently along sex, gender and race lines. Sport has social and cultural significance precisely because it justifies and reproduces normativities around gender, race, sexuality and embodiment.

In this presentation, I will critically examine how sport development projects and public policy discourses on sport reproduce heteronormative and racialised ideas about women's sport and women athletes in South Africa. Firstly, I will highlight how the sport for development industry relies on conceptualisations of African women as under-developed, disempowered and physically inactive, so as to rationalise their own existence. In this, the normativity of whiteness and heterosexuality is also sustained. Secondly, I will illustrate how South African public policy and popular discourses on women and sport are complicit in these representational practices through silencing critical debates of sexuality and homophobia, and through domesticating and feminising black sportswomen's appearances and performances. In so doing, the presentation will raise critical concerns regarding the need to de-colonise academic and public engagements with sport, gender, sexualities and race on the African continent.

Mobility As Process: Migrant Agency, Gender, and Race in Sports Labour Migration

In this presentation I will draw on empirical material from a case study of the migrations of Nigerian women footballers, to pose arguments about how to approach athletic migrations from the Postcolonial South to the Global North, and the role that migrants themselves play in the production and maintenance of sport migrations. The presentation argues for the need for analytical approaches to sports labour migration that do not rely on linear models with narrow definitions of success and desirable destinations. What happens to analyses of sport labour mobilities if we start from the recognition that migrants do not have stable and fixed aspirations regarding their professional and migratory careers? In this presentation I will suggest that sports labour migration might be better analysed through paying attention to the processes through which mobility is produced, re-produced and sustained. In this, migrants are not inanimate objects or commodities that are moved by external forces alone. Rather, their performances, and the work they put into sustaining employment is crucial in producing particular trajectories and maintaining migratory careers. This work, however, happens within particular contexts, and is shaped by local and transnational regimes of gender, race and class. Hence, it is not just the desires and efforts of migrants that affect their for transnational careers, but also regimes and ideas, in the Global North, about the bodies, talents, and dreams of labour migrants from the Postcolonial South.

Critical-Creative Methods of Feminist Protest: (re) Embodying and Assembling Social Protest

Feminist critique and epistemologies (Irigaray, Braidotti, Haraway, Hayles, Grosz et al.) have situated the body at the center of the critique to dual, binary, dichotomic and essentialist gender and sexual models, and have connected these models to social inequality, hierarchy, and violence. Deleuzian epistemologies such as posthumanism stress the importance of thinking through 'assemblages' and relations, instead of essences and facts.

In this proposal, I mean to think about the (dis) connections between feminism and other claims for social justice among leftist activists in Spain. For some of these groups, ideologies, genders and bodies are closely bond. However, for others, equally situated in the left, feminism is not an issue at stake. The movements that have a clear gender awareness and define themselves as clearly feminist (and anticapitalist, ecologist, queer, etc.) situate the 'body', 'our bodies', as a 'battlefield'. This fact clearly distinguishes these groups from other groups, creates a continuity with the social movements of the 60-70s that made of bodies an element of and for 'political' claim, and has consequences for the political tactics and the social visibility of these groups. The feminist claim of one's body, of the control

over one's body and the defeat of all kinds of exclusion or discrimination based on the sex/gender system is a key distinguishing feature of these groups.

This proposal is based on an ethnographic analysis of LGBT activism in Spain and on an ethnographic analysis of radical leftist political groups in Catalonia. The division between an assimilationist LGBT activism and a 'radical' LGBTIQ activism relies, among other elements, on the explicit importance of feminism and bodies for radical activist claims and their absence from assimilationist claims. Catalan independentist groups such as Arran and Endavant have made of feminism, gender and bodies a core element in/for their (political) claims.

The Link between Trafficking and Sexual and Reproductive Health Rights - a Case Study of South Africa and Nigeria

THE LINK BETWEEN TRAFFICKING AND SEXUAL AND REPRODUCTIVE HEALTH RIGHTS – A CASE STUDY OF SOUTH AFRICA AND NIGERIA

Trafficking in persons is a global human rights challenge which preys upon the vulnerable for exploitation. Trafficked persons are exploited in different economic sectors and for various purposes, one of which is commercial sexual exploitation. This crime (trafficking for sexual exploitation) infringes on the right of autonomy of the victims with respect to their body. This right is known as sexual and reproductive health rights.

This paper, explores the interplay between trafficking and sexual and reproductive health by examining the definition and basic concepts in trafficking, and sexual and reproductive health. The paper also considers the current legal framework for the protection of these rights in the two countries, the root causes of trafficking in persons and status of the crime under international law. The paper further analyses the effect of trafficking on the sexual and reproductive health rights of the victims.

The paper concludes that trafficking in persons for commercial sexual exploitation has grave consequences on the sexual and reproductive health rights of the victims. The paper recommends domestication of all international treaties on human trafficking and sexual and reproductive health to ensure that each country has adequate legal framework to protect these rights. The paper further advocates for human right education to ensure that human rights of all are valued and respected.

Bodies of Immigrants – Migrants Bodies

The background question of this research are tensions between identities, otherness and inequality in contemporary society. That is, through this research we propose to study the interfaces between culture and power in the consumer society. We propose to study this question from the migratory phenomenon, the production of the stranger (SHUTZ; SIMMEL, BAUMAN, ELIAS, STOLKE) and ethnics surgeries. The realization of ethnic surgery was observed in the end of the 19th century and gets new signification in the contemporary society. The fieldwork was made in 2013 and 2014. The study had Lisbon and Madrid as empirical research universes. Forty Immigrants and six cosmetic surgeons were interviewed. The interviews were realized through semi structured questionnaire and we look to know the life trajectories of the interviewed, as well as the their points of view about the immigration question and about the ethnics surgeries and other kinds of bodies modifications. The contents of interview was analyzed based in the literature about the body social construction (FEATHERSTONE, LE BRETON, ORTEGA), ethnic surgery (GILMAN, NIECHAJEV E HARALDSSON, KIM-PONG TAMIS), consumer society (BAUDRILLARD, BAUMAN, CANCLINI), and identities (HALL, BAUMAN, ENNES & MARCON). The result analysis demonstrated that immigrant bodies and their modifications can be understood like expressions of multiple and ambivalente affiliations and the expression of social subordination and transgression dynamics at the same time. These dynamics are produced both by their immigrant status and by stimuli of the consumer society.

Work-Life Balance and Working Time Policy in Sweden and in the EU

Historically, the working time policy has had a balancing role in the so called "Nordic model" of negotiations between employee and employers representatives. The outcome of these negotiations has, during a dominating part of the 20th century, been a reduced working time to compensate workers due to social risks of intensified working pace. These working time reforms have established its legitimacy in state law. That solution is not on the political agenda

anymore, even though a flexible and intense working life is of current interest and that problem of reconciling work and private life is one of the new social risk factors. The aim is to create an understanding of Swedish national working time regulations in a document study of Swedish working time policy from 1911 and onwards. What arguments for or against a general reduction in working time is presented in official reports, propositions and department publications? Results shows, that working time policy goals have changed, from being anchored in a social discourse to being rooted in an economic one. This changes the position of working time as an important instrument in the socio-political discourse and makes the reduced working time agenda fade in the light of economic goals such as expansion, growth and flexible working time arrangements. The theoretical approach is based on a policy theory where four different levels of political policymaking are discovered. Policy analysis is a way to find out the underlying causes and motives of the actors. The results end up in a discussion about working time policy changes and policy directives from the European Union.

How Can We Communicate with Others By Food Risk?

In recent years, food security experts and government officials across the world have pointed out the need and importance of "risk communication." We can say that it is a global concern. In Japan, The Food Safety Commission plays a key role in "risk communication." However, it does not assume the existence of communication failure and distrust. My question in this presentation is, "is risk communication valuable?" My discussion is based on a concrete instance of shared communication regarding food risks. The answer to my query becomes clear through my analysis of discourse, fieldwork, and interviews. I use Japanese cases as examples; however, similar situations may be evident globally. In my research, I consider three phases in connection with agriculture: first, governmental discourses of risk communication in which experts reference decreased food risk due to the efforts of farmers; second, improved food safety is consistent with the economic growth related to the 2020 Tokyo Olympics. Standardized, globalized agriculture is promoted by adhering to qualifications such as Good Agricultural Practice (GAP); third, various groups as well as individuals seek other ways to avoid food risks—for example, by raising crops themselves—especially after the accident at Tokyo Electric Power Company's Fukushima No. 1 nuclear power plant. Additionally, farmers whose crops and land were damaged by the nuclear accident struggle to rebuild connections with consumers. These concerns are primarily about food safety, but there also exists a political issue. Finally, I consider building relationships to address the problems of food risks in the context of politics. I conclude that we do not need "risk communication," which explains food risk through narrow scientific discourse. However, the importance of food safety connects us, and is a necessary and shared political interest.

The Impact of Gender Specific Occupational Values on the Choice of a Flexible Employment

The Impact of gender specific occupational values on the choice of a flexible employment

Today young women and men want to participate similarly in the working as well as in the family sphere (Allmendinger 2013). Anyway, while young men are describing their future career without including additional family demands, young women anticipating restrictions in their career resulting from family responsibilities even before they enter the labour market (Rosowski 2009). These private life performances might become a crucial criterion for chances and risks in the labour market under flexible working conditions (Oechsle 2009). Because they do not only create new opportunities to reconcile work and family but also require a comprehensive temporal and spatial availability and a subordination of private to professional issues (Pongratz and Voß 2003). These demands are in contradiction to the needs of a family and might prevent young women from choosing a flexible employment which is associated with special career opportunities (Lott and Chung 2016).

Therefore, we want to examine the impact of occupational preferences, defined as "occupational values" (Gottfredson 1981) on the choice of a flexible employment and want to ask whether this influence differs between young women and men.

Hypotheses:

The influence of the occupational value "work-life-balance" differs by sex. While this value has a negative effect on the choice of a flexible employment for women, it has no effect on the choice of men. This is explained by the anticipation of family demands by women but not by men.

The higher the extrinsic occupational value, the higher the probability to choose a flexible employment. Because we expect higher extrinsic values for men, this might explain why women chose a flexible employment less often.

We estimate regression models using the data from the Socio-Economic Panel (individual questionnaire waves 2011 and 2015; youth questionnaire waves 2010-2015).

ENTRICH, STEVE* (*University of Potsdam*)

Which Japanese Study Abroad? Concerning the Accumulation of Transnational Human Capital in Japan and Its Impact on Social Disparities

Japanese families are known for their massive private investment in supplementary education. Until recently, however, such investments did only rarely target the increase of students' 'transnational human capital'. In international comparison only a below OECD-average percentage of Japanese students studies abroad at the tertiary and upper secondary education levels. However, according to recent data of the Japanese Ministry of Education, the number of university students enrolling at universities overseas actually increased recently. Besides making investments in shadow education to increase the chances of gaining access to high ranked schools/universities, other ways of improving one's skills, such as the accumulation of transnational human capital through studying abroad have become increasingly attractive – not least because of the possible positive effects on future income. As Lucas (2001) argued when proposing his effectively maintained inequality (EMI) concept, socioeconomically advantaged families seek advantages wherever possible. The question addressed here is whether socioeconomically advantaged families invest in transnational human capital to gain competitive advantages as a means of maintaining their status advantage? Based on data of the 2013 Benesse Gakkōgaikyōkuhi Chōsa (for 15.000 students aged 3 to 18), the determinants for investments in this increasingly valued type of capital is analyzed across 15 age cohorts enrolled in four education levels: pre-school, primary school, middle school, and high school. Findings show that high status parents are most likely to invest in study abroad for their children, particularly when children become older. If these children have already experience with staying abroad and with certain types of supplementary education (particularly additional English language classes), they will be most likely to study abroad in the future also. Therefore, it seems likely that upper class families make such investments to achieve competitive status advantages during their children's school life course in preparation of entrance to tertiary education and job market.

ENTRICH, STEVE* (*University of Potsdam*)

Worldwide Shadow Education and Social Inequality: When Do Shadow Systems Become a Threat to Equality of Educational Opportunities? a Comparison of 50 Countries

International research highlighted the expansion of supplementary education markets worldwide and often emphasized that such a development would inevitably result in growing educational and social inequality in numerous countries. However, research often falls short of providing hard empirical evidence based on directly comparable, international data on the subject, enabling us to scrutinize at which developmental stage shadow education systems become a threat to equality in educational opportunities. Based on theoretical considerations using new institutionalist theory, differences in the effects of social origin on shadow education participation according to developmental stage of shadow education systems, which are classified as being either *advanced*, *diversified*, or *traditional*, are hypothesized. To test whether the impact of shadow education varies according to a country's developmental stage of its shadow system, data of the 2012 *Programme for International Student Assessment* (PISA) are used to examine *prevalence* (country-specific enrolment rates), *intensity* (country-specific duration of enrolment per week), *institutionalization level* (country-specific proportion of students enrolled in supplementary schools), and the *primary functions* of shadow education (country-specific strategies with which shadow education is pursued) to classify shadow education systems in 50 countries. Finally, the impact of students' family background on their probability to participate in shadow lessons according to shadow system is calculated (social inequality increase or reduction). Findings show that shadow education considerably affects social inequality in *advanced* (e.g. Korea, Greece, or Russia), and increasingly, *diversified* systems (e.g. Poland, Australia, or Germany). A reduction of social inequality is highly unlikely, even in *traditional* shadow systems (e.g. Finland, Belgium, or the United States). These findings imply that with the international expansion of shadow education, inequality of educational opportunities will only grow further, wherefore the development of these shadow systems and how to adequately respond to their expansion calls for more recognition of and more research in the field.

ENZLER, ISABELLA* (*Georg-August-University Göttingen*)

Members of Migrant Organizations, Refugees and Volunteers – a Study Based on Figurational Sociology and Biographical Research

In this paper I will present findings from my PhD project on figurations between members of migrant organizations, volunteers and refugees, as well as the biographical processes that lead to participating in the field of 'refugee support'. I argue that with a biographical and figural approach, it is possible to analyze an individual's lifeworld embedded in organizations, power relations and discourses in the past and the present. This approach draws attention specifically to the power relations between the members of the involved groupings and the interrelations between life courses, collective histories and types of engagement.

To present how power relations in this field are entangled with different types of (biographical) engagement, I will discuss case reconstructions of members of migrant organizations and participants in so-called befriending programs, where refugees are matched with volunteers for social, emotional, informational and instrumental support. One finding of my case studies is that the relationship structures in befriending programs, which are initiated and overseen by an organization, are characterized by the denial of traumatizing experiences. In terms of power balances – in the sense proposed by Elias/Scotson – between refugees and volunteers, this weakens the refugees' (interactive) power, while it increases the power of the (established) volunteers.

In accordance with my findings, I will discuss possible ways of rectifying this imbalance, for instance by giving refugees a voice in the organizational structure, or developing refugee self-organizations.

EPIKHINA, YULIA* (*Institute of Sociology of Russian Academy of Sciences*)

Cohort Analysis of the Education Mobility in Russia

The education mobility as a kind of the social mobility helps to clear two questions: 1) the education mobility indexes gives an additional measurement of the educational inequality; 2) the education mobility indexes describes the education as the social institute, its ability to be a channel of the social mobility, to be the institute of the modernity interrupting the transmission of the class advantages from one generation to another. The Russian educational system faces dramatic changes that forces many researches to write about the increasing education inequality. According to some experts, the educational social policy of the Russian state is directed to reduce the educational opportunities for unprivileged social groups. Therefore the education as a social institute becomes rather the institute of the social reproduction than the channel of the social mobility.

We are going to use data of the two structural surveys (the whole sample counts 10397 respondents) to present the main patterns of the education mobility in Russian and its dynamic across a few generations. We suggest to connect the patterns of the mobility with the data of the educational inequality and main directions of the social educational policy.

Anticipating the Social from the Ecological: An Ecoconstructionist Reflection for Environmental Sociology

Present theories of Environmental Sociology are inadequate in investigating ecological challenges. This is the thesis of the present article. This situation is brought about by two mutually reinforcing factors: (i) by sociology's limited and limiting notion of the social (as a result of its bias to modernity and to the experience of the West) and (ii) by environmental science's lack of language to articulate the *sociality* exhibited by modern day environmental realities. Thence, the paper examines how the two disciplines' disparate notions of the social given their conceptual and linguistic confinements can be bridged in order to expand the functionality of the social – one that is capable of not only explicating the evolving nature of human-nature nexus, but also adept in anticipating likelihoods and ramifications of *preferred environmental futures*. Using biodiversity as a test case, the paper ends by suggesting how the invigorated notion of the social can be explored via the *ecoconstructionist* reflection suitable for both sociology and environmental science unhampered by their respective disciplinary frontiers.

The Reconstruction of Labour Unions in Turkey during the Akp Rule: The Case of Metal Industry

Turkey has been experiencing a serious problem of not being able to create employment since the economic and political crises of 1999. The most important component of the system, which is sought to be restructured within the axis of global value chains, is the fact that labor is taken under control with insecure-flexible working hours and the pressure of unemployment under the title of global competition. An important part of this process is de-unionization. Policies which are mentioned within the scope of enabling "Turkish firms" to gain competitive advantage in value chains which are shaped by leader firms and have an international dimension also aim at deepening this exploitation. In this work, we will focus on the neoliberal policies of the AKP government and their impact on the fabrication processes of legal regulations on trade union and social rights. We will explain how the trade union activists adopt different strategies on regional and national levels as well as on workplace level. The metal sector as one of the leading industries of Turkish economy and the most dynamic and powerful sector in terms of class struggle and international and European solidarity networks will be taken as a case study. Our research is based on the fieldwork that we have conducted from 2011 to 2016 during which we have made participatory observations and 111 semi-structured interviews with the trade union activists affiliated to three labour union confederations: leftwing union confederation (DİSK), the Islamic labor union confederation (Hak-İş) and and nationalist labor union confederation (Türk-İş). The quantitative data of the case study is gathered throughout a research conducted in metal industry. The distinctive strategy of the Birleşik Metal İş in metal industry is based on the results of a survey based on 1000 workers selected on the basis of random sampling.

Migration in Capital Theory: Proposition for a Multi-Level Spatio-Temporal Framework

This paper explores how migrants utilise and access different forms of capital. Using a Bourdieusian approach to capital, we focus on how migrants' temporal and spatial journeys, are shaped by and in turn shape their opportunities to mobilise resources and convert them into varied kinds of capitals. These processes depend on migrants' social positioning, including their gender, class, ethnic and national positioning, as well as citizenship status, and how this is articulated in relation to different fields in different spatial and temporal contexts. Drawing upon our combined corpus of data on migration to the UK, and a lesser extent Germany, with Third Country Nationals and EU citizens, as well as new data collected since the Brexit referendum, the paper examines these issues through biographical approaches to migrant women's life stories. In so doing, we build theory on capital accumulation as dynamic, multi-level and spatio-temporally contingent processes thus challenging any simplistic view of linearity over time.

How Deprived People Experience Their Exclusion Via Today's Welfare Regimes

My talk investigates how people who often experience numerous traits of deprivation deal with life situations of dependency and social exclusion. I will dwell upon typical modes of reacting to harsh and severe life circumstances that appear to be imposed by outer forces – e.g. the implementation of neoliberal welfare policies by Job Centres, prejudices towards seemingly 'undeserving poor' etc.

The results I will present are taken from a research project based at Leipzig University (Germany) that compares different ideas of welfare and their impact on semantics, institutional implementation and individual (self-)conceptions of poor relief. Thus, the 'cultures of poverty' in the different national contexts are questioned. We use qualitative research methods to analyse biographical interviews, group discussion and documents from the field that we gathered during our stays at various sites in the UK, the Republic of Ireland and Germany.

Alienation theory comes into play by the analyses of how deprived people develop habitual attitudes that take the shape of anger and resentment on the one hand, or passiveness and depression on the other hand. These attitudes towards life and society in general can be explained (partly) by a feeling of detachment. The people we talked to express the conviction that they do not belong to society anymore and are excluded from crucial parts of its reproduction. The feelings of being alienated and living in an anomic world determines how they perceive their life world. The alienation theory I will present is thus based on and grounded in empirical research.

ERICKSON, BONNIE* (*University of Toronto*)

Measuring Ethnic Social Capitals with the Position Generator

The position generator measures social capital in the sense of ties to people in varied occupations. The more different kinds of occupations one knows someone in, the more varied a range of resources one may access. Access to varied locations in other forms of stratification (other than class) also provides potential access to varied resources. In my study of the three largest ethnic groups in Toronto (White, Chinese, and Black) I pioneer the use of both the occupation and the ethnic group of alters to measure ethnic social capitals. I use questions such as "do you know a social worker who is White? Who is Chinese? Who is Black?" I illustrate the value of this form of measurement through two theoretically interesting sets of results. First, Black and Chinese respondents have similar levels of ethnic social capitals, with occupationally diverse ties to the dominant White majority and even more diverse ties within their own groups, but get these capitals in different ways consistent with their different cultures. Second, occupationally diverse ties to the dominant White group bring greater rewards in the labour market.

Critical Analysis of Socio-Environmental Transitions in Institutions, Politics and Practices in Russia: Towards More Sustainable Cities

The study provides holistic insights on the post-soviet Russia's structural socio-environmental transformations in the technological, institutional, political domains and actors' everyday life. The research adopt a multi-level perspective on change including examining the interactions of different level of transitions. Based on the semi-structured interviews with various actors, mass media discourse analysis and desk research, the research portrayed that over the past 20 years, the structural and functional organizations of Russian cities have been changing significantly. The development of large transnational oil and gas production, the redistribution of private property, changes in geopolitical situation, the seizure of land in forest and water protection zones in cities and villages, the tightening of legislation regarding public participation in the discussion and decision-making processes have changed the social landscape of post-soviet Russian cities. In a micro level, retrospective analysis portrays a tendency toward the routinization of environmental values and in much less degree - the environmental practices. The study showed that Russians express paternalistic values and switch the responsibility of a healthy environment from themselves to the governmental officials when it comes to real action. The research suggest that despite concentrating entirely on the elaborating of state programs towards developing sustainable cities, more attention should be paid to the empowerment of local communities due to their stronger engagement in the environmental decision-making, introduction the accessible green infrastructure and new planning policies integrated with taxation and financial instruments.

Public Reflections on Climate Change and Energy Efficiency in Post-Socialist Perspective

The study provides holistic insights in the form of the case study on the Russian lay people versus expert community attitudes, behavioral practices and mitigation actions towards the climate change and energy efficiency. Based on the representative survey of the citizens, semi-structured interviews with key stakeholders and desk research of the secondhand sources, the research portrayed that public awareness about the climate change issues has been constantly raising. The given trend could be associated with an increased role of post-materialist values, recent extreme weather events amplified by wider media coverage, and by a greater prominence of climate change in international politics. However, some experts express skepticism towards climate change, which they rationalize by normal climate fluctuation processes over time and general mistrust on climate change data. Consistent with on-going climate research, the study portrays a discrepancy between the high concern on climate change and low environmental sound practices. The main barriers of behavioral contributes toward climate change for Russians are associated with external and internal barriers. Key internal barriers include lack of knowledge, uncertainty, paternalistic values and switch the responsibility of a healthy environment from themselves to the governmental officials. Main structural barriers include the underprivileged role of climate change for the Russian government, resource-driven economy, undeveloped environmental infrastructure and poor execution of environmental legislation that could create the feeling of cynicism and fatigue among citizens. Thus, both experts and population prioritize legislative improvement and its constant adaptation to the current climate processes as a productive climate change mitigation and adaptation action.

RC44-740.6ERNE, ROLAND* (*University College Dublin*)STAN, SABINA (*Dublin City University*)***From Horizontal Market Integration to Vertical Integration Effected through the Direct Surveillance of Member States. Labour Movements and the EU's New Economic Governance Regime***

This paper focusses on labour and the European integration process, namely on the way in which established European trade unions and new social movements respond to the EU's new economic governance regime. Until very recently, European labour politics has been shaped mainly by EU 'horizontal' market integration through the free movement of goods, capital, services and people. Since the Euro crisis however, the latter has been complemented by 'vertical' hierarchical integration effected through the direct surveillance of member states' macroeconomic policies, including industrial relations and social policy. The resulting new EU economic governance regime (NEG) opens contradictory possibilities for labour movements and politics in Europe. On the one hand, the NEG's reliance on vertical surveillance makes decisions taken in its name more tangible, thereby offering concrete targets for contentious transnational collective action. On the other hand, the NEG mimics the governance structures of multinational corporations. By using performance indicators and coercive comparisons that put countries in competition with one another, it therefore implicitly constitutes a deterrent to transnational collective action. Moreover, the interventionist strains and competitive pressures associated with NEG increase the threat of nationalist counter-movements. This is undermining the structuring of the political space along transnational cleavages, namely, the class cleavage. This paper therefore tries to contribute to a better understanding about the interrelation between NEG and existing 'horizontal' EU economic governance and the shifts in labour politics triggered by NEG. This is important beyond the particular European case, as the trend to ever more interventionist vertical governance structures can also be detected in other transnational "free trade" regimes.

RC22-411.2EROMONSELE, ANDREW* (*Ambrose Alli University, Ekpoma,*)EGUAVOEN, AGATHA N.T. (*Ambrose Alli University, Ekpoma,*)ELABOR, GABRIEL (*Anglican communion*)***Religion, Women and Pulpit Effect: The Politics of Submissiveness in the Family Setting.***

It has been observed that most Christian Religious Institutions have not evolved from the traditional emphasis of wives' submissiveness to their husbands using Ephesians chapter 5:22 as their point of reference. The same book of Ephesians chapter 5:25, also gives a reciprocal condition that husbands should love their wives... as their own body. Logically, husbands are being admonished here to love their wives as their own body in other for their wives to willingly submit to them. Unfortunately this reciprocal assignment for the husbands does not enjoy much emphasis in the church today especially in African societies including Nigeria. The church seems to have shied away from emphasizing this conditionality of husbands love for their wives and in consequence wives are under undue pressure continually to meet up with the supposed biblical injunction of submissiveness to their husbands irrespective of the odds against them. In view of this, this study examined the extent to which religious institutions have further helped to reinforce violence in the family setting. Qualitative method was used to collect data from a sampled population in Ekpoma Edo State, Nigeria. One major finding from this study, among others, is that pulpit effect has contributed to domestic violence and power play in the politics of marriage.

RC32-589.5EROMONSELE, ANDREW* (*Ambrose Alli Univeresity*)EGUAVOEN, AGATHA N.T. (*Ambrose Alli Univeresity*)***Universally Held Gender Based Violence, Cultural Tolerance and Its Implications on Marriage Institution Among the Esan People of Nigeria.***

Generally violence against women has always existed in every society. Until very recently violence against women, particularly domestic violence was considered a private issue. It comes in different forms: from physical, sexual to psychological abuse. These forms of violence have been internationally recognized as forms of human rights abuse. But what is not clear is whether violence against women is perceived the same way, across countries and cultures, such that required responses to them are agreed to across countries and culture. Hence this study investigated how married women perceive and respond to intimate partner violence in Esan land and the implications of such attitudinal responses to the marriage institution among the Esan people of Nigeria. Our population of study was married women who have been married for the past ten years. Through the

Multi-Stage sampling technique 240 respondents were selected for the study while in-depth interview were conducted to elicit information from respondents. The data were analyzed through content analysis. Our findings show basically that Esan women would rather abide by Esan cultural orientation regarding the treatment of women, being the shared values of Esan people, rather than universally based precepts. Hence the women responded peculiarly to spousal abuse, depending on the circumstance, as against the universal definition and there is a high level of culture of tolerance and endurance, even in the midst of justifiable reasons to leave violent partner which informed the low level of divorce rate in the studied population.

RC48-JS-25.1ERTAN, SENEM* (*Social Sciences University of Ankara*)***How Women's Associations' Members Evaluate the Policies for Preventing Violence Against Women in Turkey***

NGO's and civil society are one of the key actors for adoption of women's policies. NGOs have been influential in determining the global policy framework on gender equality and women's empowerment as well as national policies in many countries. Thus, one can say that strong women's movement is important for adoption of good women's policies. The women's civil society organizations is strikingly increasing in Turkey but the effectiveness of them on policies is still an issue that is rarely studied. This study aims to analyze the extent to which policies to prevent violence against women were responsive to the main demands of women's organizations' members in Turkey. This study deals with two key points. First, it will investigate whether constitution, legislations and policy action plans satisfy the women's organizations' members. In relation to this, it will demonstrate whether there are any differences between attitudes, perceptions and opinions among the members of different types of women's organizations. Second, it will investigate whether implication of such legal changes are seen successful or not by the women in the women's organizations. This study is a part of a project funded by Scientific Research Coordination Unit of the Social Sciences University of Ankara. In the framework of this project, we run a survey with app. 1000 women which are a member of a women's association in November and December 2017. These women are randomly selected from a representative sample of women's association including app. 200 women's association from İstanbul and Ankara, two biggest cities of Turkey, in Turkey. The results of this study will reveal the attitudes of women's organization members on different forms of policies produced to prevent violence against women. Moreover, this study also aims to show differences between women's organizations.

RC48-805.6ERTUGRUL, KURSAD* (*Middle East Technical University*)***Significance of Gezi***

This paper defines Gezi as a struggle against the neoliberal-cum-neoconservative conduct of conduct under the AKP rule and its leadership taking the form of an ahistorical pastoral form of power through a de facto pseudo-presidential regime. The action process during the Gezi insurgency is not limited with a mere opposition to this form of power. It bears the character of autonomy politics through prefigurative experimentations with different ways of being and direct democracy in the reclaimed public spaces. Therefore, it is not only against a certain form of conduction in Foucauldian sense but conduction itself in search of possibilities for reinventing the daily life and social and political existence. There was no particular group, organization or identity which represented and led the movement. It has been an active and creative process of action of mostly the unaffiliated and unorganized people, especially young who underwent a process of self-transformation within the process in terms of gaining a political subjectivity. Though Gezi has not been revolutionary in the generic sense of the term the subjects experienced a creative praxis of self-transformation from repressed, subordinated, exploited and inactive subjectivity towards autonomy through creative social and political action.

RC05-110.1ERWIN, KIRA* (*Durban University of Technology*)PILLAY, KATHRYN* (*University of KwaZulu-Natal*)***The Power of Dreams: Researching Young People's Imaginings of Non-Racialism***

Non-racialism is a founding principle in the South African constitution and frequently found in political, media and public discourses. Yet there is little critical debate or consensus on what lies within the concept. Its common use vaguely suggests a way to live together harmoniously in South Africa, but this belies both its contested history and its present lack of content. There is also a paucity of research in South Africa on how people imagine a future non-racial society. Existing studies either focus on how non-racialism is not yet practiced, through examining racial tensions and inequalities, or as in the Ahmed Kathrada

Foundation project, investigate South Africans' perceptions (or lack thereof) of non-racialism in the present. This study therefore develops and extends into areas, and in ways not done before, by implementing a future orientated theoretical and epistemological framework. It explores how Grade 11 students from five different schools in the city of Durban, South Africa envision a non-racial future. It uses a methodology called Dreaming Workshops designed specifically to answer the questions posed in this study: whether and how these young people imagine race and non-racialism in this future; and what present day obstacles they identify to obtaining this dream. Designing this methodology, rather than selecting one or two traditional methods, enabled us to craft a collaborative and creative space to imagine radical utopian futures, yet also direct the discussions in relation to the focused research questions. Dreaming Workshops encourage participants to engage in future dreaming discussions through incorporating various creative methods. This paper explores how these dreaming sessions were designed, and discusses how these workshops not only offered a space for utopian dreaming, but importantly how these dreams were used to identify and reflect on practices and power relations in the present that create obstacles to these future trajectories.

Foreign and Area Studies in Japan: Imaginary Curriculum Subjects Under Colonial and Anti-Colonial Positions

Foreign studies are facing a curricular transformation in Japanese Universities. Because of historical developments linked to higher education structure, foreign studies derived from core foreign language programmes. Thus, students who wanted to conduct regional studies on Latin America, for instance, had to enrol in a Spanish (from Spain) as a foreign language programme and then supplement it with narrower area studies courses such as Economic Development in Mexico or Post-boom literature in Argentine, usually taught in Japanese. The Ministry of Education has issued a 3-component policy on pre-graduate programmes which tries to balance the teaching of language skills and area studies. However, it is unrealistic to think that students can learn a foreign language from scratch and master a complex set of theoretical knowledge and methodologies at the same time during the 4 years that undergraduate programmes last. Such programmes are condemned to emphasize the teaching of theory in Japanese avoiding first-hand contact with local areas and sources, and with the literature, theories and methodologies produced in the language of the areas being studied. In this presentation, I explore the meaning and reasons of the reform and the consequences it may bring upon the higher education system. Whilst anyone could agree on the need to structure language and area studies to serve the intellectual paradigms of Japanese society, instead of serving colonial purposes, one should ask if the new curriculum policy could end up alienating and isolating Japan, as the possibilities of producing a synthesis between area and Japanese knowledge are being reduced. The study draws on Bernstein's sociology of education, especially on the key notion of 'pedagogic device', with the purpose of analyzing how knowledge produced in true production fields is captured and delivered as imaginary subjects by the educational system, and its relationship with colonial and anti-colonial positions.

Building Better Future Scenarios: From Fragmentation to Strategic Collaboration in the Elderly Care Policy at Local Level

Given the challenges that it presents to contemporary societies, demographic ageing can be considered a *wicked problem*. In the context of an ongoing austerity and low government financial transfers to local authorities, the ability to anticipate demographic and sociological aging trends and allocate adequate resources appears to be critical competencies, and must necessarily translate into a strategic collaborative orientation towards the future. Drawing on a case study conducted in a municipality in the Lisbon Region related to local aging welfare policy this paper aims to examine the processes of inter-organizational collaboration and networking and explore the future scenarios (the "policy possibilities" model) opened up to local mixed welfare arrangements facing severe demographic aging and poverty in the region.

The preliminary analysis of the data, collected through a set of policy planning documents, semi-directive interviews to local policy-decision makers and a participatory methodology applied to a panel of different stakeholders revealed some tension between fragmentation and strategic reorientation to sustainability along four axes: (1) basic care, subsistence and life support; (2) inclusion in the community; (3) socioeconomic and civic participation, lifelong learning and cultural life fruition; and (4) organizational qualification and social responsibility.

Applying the future scenarios model - still in progress - we demonstrate that the intensification of the collaboration and networking processes, involving actively all the stakeholders (local government, state agencies, NGO's, corporations and older people representatives) are necessary conditions to ensure a more balanced and sustainable welfare-mix model at local level.

Incidencia Del Capital Social En El Logro Ocupacional: Comparando Procesos Que Generan Desigualdad Social

La explicación de los logros ocupacionales en cuanto movilidad social constituye un aspecto clave en el estudio de las desigualdades. En la elaboración de indicadores comparados de desigualdad social, el proceso de movilidad remite a la transmisión intergeneracional de las oportunidades, estableciendo el peso de los factores adscriptivos y el logro. En esta ponencia agregamos las relaciones sociales de los individuos para responder la pregunta ¿Cuánto contribuye el capital social de los individuos a explicar la desigualdad de oportunidades en el acceso a las ocupaciones e ingresos, junto con los efectos que aportan la educación, la experiencia laboral y el origen social, entre la población económicamente activa de Chile y Uruguay? La interpretación general plantea que los activos de capital social con que cuentan los sujetos aportan efectos específicos sobre los logros ocupacionales y por tanto sobre la desigualdad social. Los efectos pueden ser positivos o negativos, vale decir que pueden reducir o profundizar la desigualdad social, dependiendo del tipo de capital social. La ponencia utiliza el modelo y los datos de capital social de Nan Lin sobre logro de status, que considera el acceso y la movilización del capital social. El análisis compara resultados de encuestas retrospectivas de movilidad social aplicadas en Santiago en 2000 y en Chile en 2009 (ENES), así como los datos de la encuesta ENCOES 2014 y ELSOC 2016 y 2017. Para el Uruguay se utiliza la encuesta EMOTE en años comparables.

Social Capital and Social Cohesion. Ascertaining Social Cleavages from Everyday Interaction in a Latin American Context

Recent debates on social capital have disputed about the association between bonding and bridging social capital. Putnam (2007) conjectured that they would be complementary, as long as personal networks were large enough. Research by DiPrete and colleagues (2011) provided evidence against the compatibility of both types of social capital. Recently, Abascal & Baldassarri (2015) argued that these hypotheses are contingent on compositional effects affecting diversity. This debate has strong implications for the characteristics of social cohesion and social trust at the macro-social level because, following Granovetter's (1973) seminal argument, bonding social capital would be associated with fragile social structures characterized by lack of solidarity and distrust.

I will examine Chileans' personal networks to establish to what extent their social connections cut across the social boundaries of class and territory. I will argue that Chilean social structure stems from mostly homophilous social networks garnering kin and close friends. At a macro-social level this composition yields social and geographic segregation, reducing the opportunities to access distant social circles. Additionally, regarding the normative side of social capital, segregation fosters distrust among socially diverse groups and amplifies perceptions of conflict.

Data consist of a positional network generator of 13 occupations used in the first wave of Chile's Longitudinal Social Survey (ELSOC), a 2016 nation-wide survey. The survey also includes indicators of social trust and perception of conflict. Three indicators of social capital can be generated from these data: diversity, volume and quality (highest status). As a first step in the analysis, social capital indicators are regressed (multilevel) on selected demographic, territorial and ideological covariates. In a second step, personal networks indicators, considering their composition, along with individual and territorial data are used to predict individual levels of trust and perception of conflict. Finally, I run comparable analyses for kin and non-kin contacts.

ESSACK, SHAHEEDA* (Nat Dept Higher Education & Training)

Inequality in Higher Education? Promises and Contradictions.

Perhaps, the largest student protest movement since 1976 has been the #Fees Must Fall Movement at most public universities in South Africa. Characterised by student protests, and led by students, often depicted as violent on the media - the underlying message is clear. Inequalities continue to plague South African society finding its fullest expression in the unending student protests of 2015. Whilst the impetus was for "free-education", serious social and political issues

became intertwined with the protest movement. For example, debates around access, social redress, quality, knowledge production, the corporatization of higher education and sustainability became key issues on debates on the private public funding of higher education.

Whilst the protest movement was seen to be driven by the increase in student fees, oppressive social forces that were covertly or overtly hidden emerged with greater passion as seen in the discourse on colonial symbols (the Rhodes statue), embedded racism, decolonization of the curriculum, transformation, oppression versus freedom, Africanising institutions of higher learning, changing the names of institution's buildings, employment equity, indigenisation of knowledge, language, culture and bigotry.

Clearly, society and institutions that fail to address social challenges pose a risk to the well-being of the country. A common cry is that Black students continue to be treated as "the other" in their own land.

This paper then, seeks to examine the underlying historical and political factors that led to the fee protest, with a focus on whether free higher education is a possibility and in what contexts.

Critical to the above examination is the relationship between state and higher education, state and society, universities and the societies they serve and finally the student and society.

ESSACK, SHAHEEDA* (*Nat Dept Higher Education & Training*)

The Development of Private Higher Education. Whose Interest Does It Serve?

Higher education in South Africa has seen a slow but steady growth in the establishment of private higher education institutions, since 2000. Legislation has been enacted to ensure that the private higher sector is well regulated. The quality of programmes and institutions is assured by a statutory Quality Council, the Council on Higher Education. Programmes lead to qualifications registered on the National Qualifications Framework, the maintenance of which is the responsibility of the South African Qualifications Authority. One of the most visible gains has been in the area of eliminating fly-by-night and dubious private colleges. The need for filling the gap for education and training as espoused in the White Paper for Post-School Education and Training is paramount is critical.

In a society that is riddled with inequalities and where public universities are seen to serve the needs of the working class, middle class and upper class and where public universities have reached their maximum capacity, private higher education institutions are seen to serve a complementary and supplementary role to the public university sector. Private institutions are not state funded and rely on shareholder capital, student fees and other revenue. Often, they offer a range of diverse programmes in a range of disciplines. Most private institutions are Diploma and Degree awarding institutions.

The provision of private education allows a range of stakeholders to advance particular interests. The focus of this paper is to highlight the interests served from the shareholders to students and establish the kind of role played by private higher education institutions within the broader context of higher education and post-school education and training.

MILLAN, RENE (*Instituto de Investigaciones Sociales, UNAM*)

Family Policies in Double Earner Families in Mexico

Double earner families have increased in the last 30 years in Mexico. Today, about 1 out of 3 or 4 biparental households are families formed by couples with both members at work. Though this figure varies according to the different regions of the country, the types of localities and socioeconomic groups, the increase is important. This fact implies tensions and needs resulting from the relationship between family and work.

Within this framework, the hypothesis of the paper is that these tensions haven't been sufficiently addressed in the complexity that this phenomenon represents. On the one hand, there is a lag in policies supporting families; and, on the other, there is a maladjustment between the cultural norms, understood as institutions that regulate behaviors, and the emergence of new values and practices promoted precisely by the changes involved in the double-earner families phenomenon. With this aim in mind, the paper will make a general assessment of the main actual programs, institutions, and public policies (such as child caring, parenting, policies addressed to save or balance time). Emphasis will be made particularly on the type of policies, its reach or coverage, its integral character, and the normative and cultural assumptions implied by them. Likewise, an analysis on how the tensions between practices and values within double-earner families are or not incorporated on the actual policies will be made.

Building the "Relational Commons", Envisioning Peaceful Futures: The Role of the Ecovillages Movement in Promoting Grassroots Resilience in Crisis Areas

This paper makes an exploratory analysis of the potential and limitations a form of activism which so far has been understudied by the social sciences: That of the intervention of the ecovillages movement in crisis areas, with the purpose of promoting solutions to conflict in the form of regenerative models of human settlements based on synergies between humans and nature. Such intervention takes the form mainly of support to the building of support networks of solidarity among individual actors and organizations in the field, namely through advocacy, networking and the introduction of social technologies for regenerative community-building. It also takes the form of transfer of knowledge and technology on regenerative farming, as well as the promotion of autonomy in the fields of renewable energy, water and food production and consumption.

The analysis, supported by a review of literature and multimedia material on this topic, is based on fieldwork carried out in 2015 at Tamera - Healing Biotope I in Portugal, as well as among partner projects in Israel-Palestine, in the framework of its "Global Campus" initiative. The data has so far brought forth the following conclusions, which open paths for future research:

- The absence of favorable political conditions for the development of physical commons (natural, agricultural, buildings) in crisis areas limit the implementation of the knowledge and technology transferred by ecovillage partners;

- However, the advocacy and networking activities, as well as the introduction of social technologies for regenerative community-building, promote group resilience despite the political and material pressures for dispersion. That happens through the development of what is hereby defined as "Relational Commons", composed by feelings of identification, belonging and trust, reinforced by shared norms and values, which promote group consensus and the development of a common vision for peaceful futures, including perspectives for building the physical commons.

The Two Faces of the Same Coin. National and Individual Refraction on Curriculum Policies in Portugal.

In liquid times when the social institutions have difficulties in adapting themselves to changes at the same time they happen (Bauman, 2007), one of the visible effects of the various processes of globalization has been the conduct of society in a more individualized way, which has a dual effect on education: the need to listen their actors and understand through this listening, how to build educational processes; and the need to identify the social consequences that this individualization has on school knowledge and how does school react to these changes.

In this paper we want to identify the processes of refraction of transnational curriculum policies both at national and school level, discussing the role of OECD framework, in particular in the project Education 2030 on curriculum policy in Portugal and understanding how this conceptual construction has conditioned official curriculum knowledge. We want to see the relationship between this *think* discourse and the design of Portuguese curriculum.

On the other hand, it seems that the confrontation of two rationalities could also enlighten the process of curriculum change in Portugal. We have at the same time OECD working on skills and competencies to shape the future, developing a conceptual learning framework relevant for 2030 and teachers' work and organization mainly based on contents, products and results. Our goal is to identify teachers' refraction of this transnational organization's work on official educational knowledge and its consequences on teachers' work and identity.

This is part of an on going project of follow up changes in two schools in a process of change within curriculum flexibility and autonomy framework launched this year by the Portuguese Ministry of Education. We consider documental analysis - OECD Education 2030 project, national curriculum policies, school documents - and teachers' statements using the concept of teachers' professional life histories.

Breaking the Silence, Biographical Narrations of Violence Naturalization

Social studies of intractable conflicts has focused on how these enduring situations cast doubt on the likelihood of peaceful solutions, by their appealing to national unity, demand patriotism and self-sacrifice. In this regard, scholars of different disciplines consider the long lasting conflict between Israel and Palestine

as a paradigmatic case. It has become a social laboratory of protracted conflict—conflict that is perceived as irresolvable, demanding extensive investment (military, technological, economic, psychological), perceived as zero sum in nature (neither side will consider compromise and/or concessions), and central for social actors (members of society are involved constantly and continuously with the conflict). This proposal questions how difficult it is for a society that is engulfed in an “ethos of conflict” to move beyond mutually reinforcing spirals of violence. In an asymmetric conflict, such as the Israeli-Palestinian, the acceptance of human rights violations and denial of responsibilities by members of the in-group is stronger than in a symmetrical conflict.

Since today the study on everyday life and conflict reproduction is underestimates on social science. We wish to approach the intractability by exploring the sociological key question of everyday life reproduction and experience, how human agency is expressed and regulate under the rule of occupation. We wish, also, to explore the relation between victim and victimizer by studying interaction between Palestinian residents, settlers and IDF soldiers. In order to better understand the process of violence naturalization, the proposal will investigate on the biographical narration of members of *Breaking the Silence*, a group of Israeli soldiers who served in Hebron and emerged into the Israeli public sphere by telling about the harsh behavior of the Israeli Army in the Occupied Territories.

“Teacher Knows Best?”: Parents’ Approach to Warning Signs of Early Literacy Problems

Past research acknowledges the importance of early identification and intervention methods for students at risk of developing a learning disability. Much of this research has targeted medical professionals, teachers, and educational assistants. However, the current research examines the increasing involvement of parents during this process, and how this shapes their ability to identify these warning signs. Drawing on interviews conducted among parents in the Niagara region, this paper examines the qualitative dimensions that occur as they identify (or fail to identify) the warning signs their child signals. Our findings suggest that very few parents were intentionally disengaged. Some choose to remain disengaged as they believed ‘teacher knows best.’ Others sought to become more involved, but report that challenges and barriers impeded their engagement. Therefore, there is potential benefit to educating parents on how to identify warning signs, and subsidizing or facilitating resources for further engagement.

Asian Family Values in the 21st Century: Overview of Comparative Asian Family Survey Data

Family values in Asian have undergone a dramatic change since Asian societies were exposed to modernization and Westernization. Changes of family values, however, are not homogeneous across all Asian societies. Tradition, history and culture in each country have affected timing and direction of family values changes throughout modernization, so changes of family values are very heterogeneous across Asian societies.

Family values changes are also very diverse even within a society. Socioeconomic and sociodemographic conditions affect value changes differentially among a population in a society. Asian societies are not exception to this.

To capture dynamics of family values changes in Asian societies, Asian family sociologists from Japan, Korea, Thailand, Vietnam, Malaysia, India, Qatar and Turkey have made efforts to conduct family surveys with the same questions for the last 10 years in the name of Comparative Asian Family Survey (CAFS). Thus this Comparative Asian Family Surveys cover East Asia, Southeast Asia, South Asia and West Asia, namely all Asian societies. Family values, intergenerational exchanges, family formation history and gender division of labor have been explored in Comparative Asian Family Surveys.

We aim at overviews changes of family values in Asia for the last 10 years based on Comparative Asian Family Survey data in this paper. Various features of family values such as values and attitudes on marriage, divorce, patriarchy, gender role, women's paid work, and gender division of household labor are explored by socioeconomic and sociodemographic conditions from a comparative perspective. We hope that this paper gives a clear idea on Asian family values change in the 21st century and contributes to enhancing our knowledge of the dynamics of family values changes in Asian societies.

El Silencio De Las Universidades Frente Al Acoso y El Hostigamiento Sexual

En 2015 realizamos un diagnóstico regional cuantitativo y cualitativo que profundiza en la comprensión de las relaciones de género y los mecanismos organizacionales que generan, toleran y reproducen la violencia de género en ámbitos universitarios, con énfasis en el hostigamiento y acoso sexual. Se aplicó una encuesta en línea donde participaron 5154 estudiantes de cuatro universidades públicas localizadas en Chiapas, Oaxaca, Tabasco y Yucatán, México. El 52% de quienes participaron en la encuesta son mujeres y el 28% hombres. El 40% afirma haber sido víctima de alguno (s) de los 11 eventos de HAS explorados en el último año dentro de su centro de estudios pero el 99% no denunciaron. También realizamos 25 entrevistas en profundidad a víctimas de este tipo de violencia y 12 entrevistas y grupos focales con autoridades escolares. En esta ponencia analizamos las entrevistas a víctimas con énfasis en aquellos casos que interpusieron denuncia ante representantes institucionales para así develar los obstáculos puestos a la misma, a través de mecanismos organizacionales que fundamentalmente imponen el silencio. Contrastaremos estos hallazgos con la normatividad institucional existente para salvaguardar los derechos de las víctimas como estudiantes pero sobre todo como mujeres para así identificar los retos que se tienen en términos de atención de este tipo de violencia de género en las universidades.

EVERATT, DAVID* (*Wits School of Governance*)

Student Struggles in South Africa, 2015-2016

For the last two years (2015/16), South African universities have been the site of violent struggle between students and the higher education system – its funding base, content, pedagogy, ‘whiteness’, the racial profile of staff, students’ own living conditions and debt-ridden future and more. Identified as #feesmustfall, in 2015 the movement had a clear focus, internal unity and won public support, forced government to concede a 0% fee increase, and obliged universities to ‘in-source’ workers. In 2016, they won greater financial concessions from government - but lost most public support as students broke into smaller ‘#fallist’ blocs, turned to violence, disruption, arson, racism and an overarching tactic of ‘decolonisation’ by either shutting down the tertiary system – or burning it down. Political parties and other external players found the large, legitimate student movement irresistible, and #feesmustfall became its own site of struggle. Victimhood replaced agency, and racial essentialism became the dominant narrative with predictable loss of politics or tactics, severely damaging the important theoretical work done by student leaders in creating the theoretical base for the movement.

School Gardens: Unpacking the Potential to Reduce Food Insecurity Among Alabama's Children

This applied sociological study examines school-aged children's food insecurity in Montgomery, AL and Troy, AL (USA). This study used a one-group pretest-posttest research design to investigate if gardening and nutritional activities could be used as an effective applied sociological intervention to reduce levels of food insecurity amongst school-aged children. Statistical results found that several of the participants live in urban food deserts. Food insecurity scores were higher for participants in Montgomery compared to those in Troy, AL. The relationship between parental income, household size, and location were important indicators for measuring food insecurity amongst participants. Recommendations for future research include expanding the scope of study to different sites and climates with larger samples to enhance our understanding of gardening and nutritional educational activities on food insecurity amongst school-aged children.

Equal Rights to Earn and Care- the Case of Iceland

Icelandic law from 2000 provided parents with equal entitlements to paid parental leave. The explicit aim of the legislation was twofold: to ensure that children enjoy the care of both parents; and to offer both parents the opportunity

to coordinate family and work life (Act on Maternity/Paternity and Parental Leave no. 95/2000). The aim of the paper is to examine what changes these policies have brought in Iceland. How have fathers utilized their entitlements to parental leave and how do the parents share the joint entitlements? Does the legislation enhance parents to share the care of their children and to co-ordinate family and work life? Finally the chapter will examine the effects of the 2008 economic crisis on the policies.

Icelandic fathers have made use of their quota rights, even though the cuts in the benefits after the crisis resulted in lower take up rates. The data used in the study is quantitative data, both from four surveys among Icelandic parents of first borns in 1997, 2003, 2009 and 2017. The surveys provide information about how the parents have divided the care between them for the first three years after birth and how they arrange their participation in the labour market. The paper also makes use of qualitative interviews with parents in order to gain knowledge about why they have chosen to divide care and work outside the family the way they did. Hence the paper investigates policies and the practices of parents.

Exploring Barriers to Health Care of People Living with Disabilities in Anambra State, Nigeria

Existing evidence shows that 80% of People Living with Disabilities (PLD) live in developing countries including Nigeria where more than 22 million citizens are estimated to be disabled. The high estimate of disabilities in the country is attributable to endemic preventable diseases, inadequate immunization coverage, as well as poor maternal and neo-natal care in the country. Although health care is a human right, access barriers to health care remains one of the major challenges among people with disabilities in Nigeria. However, there are no known studies on access barriers to health care among people with disabilities in the country. This partly explains the gaps in policy and implementation of appropriate interventions for people with disabilities in Nigeria. This study is therefore aimed at exploring the barriers to health care among people with disabilities in Nigeria focusing on Anambra state. This cross-sectional survey design utilized quantitative data collection instrument and multi-stage sampling technique. The sample size was 525 people living with disabilities using Cochran's sample size formula. Descriptive and inferential statistics were used to analyze the data and in testing the study hypotheses. Logistic regression was used to predict the effects of the variables in the study. The findings show among others that people with disabilities face barriers to health care including physical, medical equipment, and communication. There is thus an urgent need for a comprehensive disability law in Nigeria to target access to health care delivery amongst people living with disabilities in the country.

The Concept of 'Religious Freedom' and Experiences of Religious Discrimination in Public Submissions about Anti-Discrimination Legislation in Australia

Default conceptions of religion in terms of belief and organisational membership (Spickard 2017) are often drawn upon in arguments to defend the privilege of dominant western Christian traditions. In contrast, the lived experience of religion, including practices, relationships, and experiences of discrimination and vilification are typically elided and ignored. This argument is developed through an analysis of public submissions to an inquiry into Australia's Federal Anti-discrimination legislation. While the legislation primarily focuses on racial discrimination there is a substantial debate about religious freedom and discrimination in the submissions.

The Role of Climate Change, Food Scarcity and Social Inequality - Societal and Individual Risks Factors

The influence of climate change on food production and a scarcity of healthy food are grounds for societal risks. Furthermore, the increased uneven distribution of healthy food and cost increases are underpinning risks to individual well-being and societal security. In this paper is discussed the equitable distribution of environmental risks and food burdens, health hazards and subtle inequities, such as limited access to healthy foods. The human right to fair treatment refers to that no population group, because of policy or economic disempowerment, should be exposed to disproportionate encumbrance of risky environmental conditions. The risk of food shortages underpins the development of genetically modified food (GM) to manage food shortages. However, the fear of the unknown, and the difficulty faced by producers, scientists and experts to guarantee the nonexistence of short or long term negative health effects from GM food products, have raised questions about future implications of genetically altered food. Beck's risk society discourse focuses on modern industrialisation and the risks posed by new procedures and products released for public consumption before being scientifically tested in clinical trials over a longer period. The issues around the origins of food and weaknesses in the whole production chain have reignited the question of organic food, as an alternative to the inclusion of artificial ingredients in industrial production of food, and if people would be safer and healthier if they were mainly eating organic food. However, this is a food source out of reach for many low-income people.

Violeta Parra: Singularidad y Genio Femenino En Una Trayectoria De Artista

En 2017 se conmemora en Chile el centenario de Violeta Parra. A este propósito hemos asistido a numerosos homenajes tanto artísticos como académicos en los que se evocan distintas figuras de la artista, destacando a partir de ella valores como la autenticidad, la universalidad, el instinto y la espontaneidad los que realzan a la vez representaciones del genio del arte y del genio del pueblo. La presente ponencia busca analizar estas figuras de la artista a partir del concepto de régimen de singularidad propuesto por Nathalie Heinrich, así como también sus oscilaciones y variaciones con el régimen de comunidad, teniendo en cuenta la versatilidad de la obra de esta artista desplegada tanto en su labor como investigadora del folclore, como en su trabajo creativo como compositora e intérprete, arpillerista, alfarera y artista visual. Paralelamente se explorará en Violeta Parra la dimensión de una cierta singularidad de lo femenino, siguiendo a Julia Kristeva, considerando las estrategias de la artista para existir socialmente en la escena musical chilena y latinoamericana desde su condición de mujer. A partir de esta triple pertenencia (arte, pueblo, mujer) se buscará profundizar en las representaciones simbólicas de la artista y sus proyecciones a cien años de su nacimiento. Con ello buscamos insertarnos en la discusión más amplia acerca de los imaginarios de la música y del territorio a partir de una trayectoria musical y su proyección internacional, considerando para ello las estrategias y las operaciones de la artista para transitar en los distintos mundos del arte de su tiempo así como también en sus resignificaciones en el presente.

The Permaculture Movement in India and Its Transformative Potential

In this presentation I show how permaculture activists and practitioners in India have adapted and localised permaculture principles that constitute alternative possible futures geared towards augmenting equality and fostering sustainability. Permaculture denotes both permanent culture and permanent agriculture and advocates three principles; care for people, care for the Earth and fair share. It draws on local cultures and indigenous knowledge, customs, political opportunities and resources. Since the introduction of permaculture in India thirty years ago, there has been constant negotiations between public institutions and permaculture practitioners and activists with regard to permaculture practice as a means of developing solutions at the grassroots level to create resilient communities, safeguard biodiversity, improve water and waste management and re-localise food production. This presentation explores these historical and ongoing negotiations and is animated by the following questions: who are the main promoters and practitioners of permaculture? What are their strategies for

grassroots innovations? How are permaculture practices fused with indigenous knowledge, political opportunities and resources? To what extent do they offer the potential to cohere into alternative possible futures?

Participation in Research As an Activist Tool – the Example of the Czech and Slovak Paedophile Community

Cases of sexual attacks on children are in the popular media discourse almost exclusively connected to paedophilia. Popular media thus contributes to the emergence of moral panic saying that all child molesters are paedophiles and every person with a paedophile preference is a (potential) child abuser. Members of the paedophile movement oppose this discourse - they argue that most paedophiles do not abuse children and many sexual attacks on children are committed by non-paedophile persons. Realising the fact that a deviant label is socially attached to the individuals with paedophile preference, they strategically prefer to choose defensive, not offensive ways to change public opinion. They do not act as "legislators", but "interpreters" (using Zygmunt Bauman's terminology). While legislators struggle to impose their supposedly expert world-view on the society, interpreters try to communicate, translate and explain their ideas (their understanding of paedophilia in this case) to the public arguing that "common paedophiles" do not molest children. Research among members of the Czech and Slovak Paedophile Community (internet based mutual aid fellowship of paedophile persons) reveals that one of the main motivation of the common members of the community for their active, voluntary, and even enthusiastic participation in my research was their aspiration to change the public and media discourses on paedophilia. My research activities have been seen by them as a part of their interpreting strategies and they hope to use results of the research as an activist tool for contesting the stereotypes and moral panics about paedophilia.

Self-Positioning and Appropriation of New Media Among Prophetic Ministries in Botswana

In the past two decades or so, Botswana has witnessed a spectacular growth of prophetic Christianity. As of May 2015, Botswana already had 1,936 registered churches, most of which fall into the category of Pentecostal charismatic churches and prophetic ministries. In recent years, Botswana has also experienced a media revolution through the emerging use of new media. While studies have generally focused on either the growth of Pentecostal Charismatic Christianity or the new media revolution, little attention has been paid to the characteristics of the emerging prophetic ministries, entailing the appropriation of new media and technical innovations by prophetic ministries and how this has accelerated the development of religious expressions and practices. In light of positioning and mediatization theories, this paper examines the following questions: In what ways do prophetic ministries position themselves and shape the religious landscape of Botswana? To what extent are prophetic ministries adopting and appropriating the use of new media technologies? What roles do the new media play in expanding religious discourses and practices among prophetic ministries in Botswana? This paper advances two related propositions: firstly, power dynamics of a religious institution depends on how such an institution "positions" and "places" itself in a given society. Secondly, new media open an avenue for social acceleration of religious practices through the digitization of religious resources and discourses. While suggesting that new media have been used as tools for self-positioning, the paper further argues that the synergy between prophetic ministries and technological developments of new media opens a new space for cultural production of religious practices and experiences. Moreover, digitization effort of prophetic ministries through the use of new media does not only function as a way of archiving religious resources, discourses and messages but also a way of affirming and reinforcing religious authority and institutional identity.

Social Media Use and the Reconfiguration of Religious Virtual Community and Religious Authority Among Prophetic Ministries in Botswana

New Media, including social media, play a central role in producing and reproducing socio-cultural and religious discourses and practices. The presence of new media has not only brought changes in the way religious beliefs are practiced but also the ways religious meanings are expressed. In the past 2 decades or so, scholars have studied the relationship between new media and religion. Generally speaking, scholars have been dealing with questions relating to the intersectionality of religious engagement, new media technology and digital culture, particularly how new media technology informs and influences

religious engagement and how new media technology enables religious groups to practice and preach their religious beliefs to a broad audience. This paper focuses on the use of social media among prophetic ministries in Botswana and how social media have contributed to the making of religious virtual communities and the reconfiguration of religious authority. Two questions will be explored. Firstly, in what ways does the use of social media among prophetic ministries in Botswana facilitate the formation of religious virtual communities? Secondly, how is religious authority perceived and understood within the context and constellation of social media use? Against the general notion that the flow of religious knowledge through the use of social media allows for a more democratic approach to religious communities and religious authority, this paper argues that the synergy between prophetic ministries in Botswana and technological use of social media in fact maintains the traditional characteristics of a religious community in the formation of religious virtual communities on the one hand and reaffirms religious authority of religious leaders on the other.

The Spatial Dimension of Poverty

Spatial arrangements have been seen as a critical aspect of poverty since the mid nineteenth century. But sociological as well as political narratives have differed sharply on whether space is a cause or an expression of poverty, as well as on the extent to which space is a source of exploitation or a foundation for group solidarity and political mobilization. In the past the terminology spoke of the "slum" and the "ghetto," while more recently it has included "spatial mismatch," "spatial fix," "social exclusion," "racial segregation," "concentrated poverty," and "moving to opportunity." In this chapter we examine the political-sociology of the spatial dimension of poverty/inequality in the United States and Western Europe. We discuss the interaction of class, ethnicity, and race in the context of varying political arrangements and the evolving dynamics of capitalism, the spatial bases for political isolation and power, as well as the consequences of full spatial integration for social heterogeneity and pluralism.

Representing Violence: Three Decades of News Coverage of Intimate Partner Homicide in Toronto, Canada

News accounts of intimate partner homicide both reflect and perpetuate beliefs about intimate partner violence and influence the degree and nature of social responses to these crimes. In this paper I explore news coverage of intimate partner homicide in Toronto, Canada and consider how this coverage has changed over time. Drawing from *The Globe and Mail*, *The National Post*, and *The Toronto Star*, I compare coverage from 1975-1979, 1998-2002, and 2013-2017. I analyze these articles to explore (1) representations of intimate partner homicide victims and perpetrators (e.g. victim blaming); (2) information about the context and nature of these crimes (e.g. premeditation, a history of violence), and (3) who is used as news sources and how often. Frame analysis is used to identify key themes, narrative devices, and explanations for these crimes, and I consider if and how the characteristics of intimate partner homicide coverage vary over time. Policy implications are discussed.

The Implications of Defining Domestic Violence for Vulnerable Populations

In this paper, we draw from work conducted as part of the Canadian Domestic Homicide Prevention Initiative with Vulnerable Populations (CDHPVP). This national partnership focuses on four populations with unique vulnerabilities for domestic homicide: children, Indigenous peoples, immigrants and refugees, and rural, remote, and northern populations. Domestic violence has serious and potentially lethal consequences, yet mainstream prevention initiatives fall short and these groups are often overlooked as victims in these crimes. Furthermore, domestic violence death review committees (DVRs) have expanded in Canada and internationally in recent years, and face challenges in defining and preventing domestic violence and in addressing the needs of vulnerable populations.

In this paper we ask, how do we define domestic violence, and what are the implications of these definitions for vulnerable populations? Drawing from and comparing domestic violence death review committees in Canada and internationally, we explore (1) how these definitions are constructed; (2) how children, Indigenous

people, immigrants and refugees, and rural, remote, and northern communities factor in to these definitions; and (3) what gaps these categorical boundaries create. We consider how the gendered nature of these crimes shapes vulnerable communities' exposure and risk for domestic violence, and consider intersecting vulnerabilities that are important in understanding victims and perpetrators.

In unpacking how victims and perpetrators are constructed through definitions of domestic violence, we argue that an intersectional approach with particular attention to vulnerabilities stemming from systemic marginalization (e.g. colonization, racism), as well as generation and gender, is important for designing and implementing domestic violence prevention initiatives. We conclude by highlighting existing domestic violence prevention mechanisms that consider unique circumstances stemming from generation and gender as well as vulnerabilities related to Indigeneity, immigrant and refugee status, and geographical location. Potential directions for future research are discussed.

From Voice to Exit? Cross-Border Migration as a Transnational Social Question from the 19th to the 21st Century

On a world scale, distress and social instability are reminiscent of the social inequalities that obtained in a large part of nineteenth-century Europe. At that time the "social question" was the central subject of extremely volatile political conflicts between the ruling classes and working-class movements. Are we now on the verge of a new social conflict, this time on a cross-border scale, characterized by manifold boundaries – such as those between capital and labour, North and South, developed and underdeveloped or developing countries? Looking at cross-border migration, this paper identifies crucial mechanisms resulting in the reproduction of old inequalities and the emergence of new inequalities. The analysis shows how the "transnational social question" relates to political conflicts around the inequalities connected to cross-border migration in immigration and emigration contexts. Among the general social mechanisms relevant for the understanding of the transnational social question are hierarchization, exploitation, and social closure – but also opportunity hoarding and inclusion. One of the major challenges for theory building is the identification of more concrete social mechanisms, depending on the respective historical-structural contexts under study.

Settling into Conceptual Motion: The Role of Migration Sociologists in Constituting the Nexus between Research and the Public Sphere

Academic and public debates on forced migration and labour migration often raise the question whether and in what ways social scientific research may form a basis for rational political decisions and "best practices". The main argument in this paper is that such a question is ultimately misleading. Sociological research may indeed offer crucial information for describing, understanding and explaining (post-) migration processes. Ultimately, however, the logics of the scientific and political/policy systems are different. The most important role of social science is not to give policy advice but to offer concepts and patterns of interpretations - based on empirical research - which can guide political debates in the public sphere. This means that sociological analysis should go beyond focusing on research-policy links, and bring the social scientists' role in the public sphere in a much more forceful way. Based on empirical research in selected European countries, including Turkey, this analysis discusses selected concepts which have found their way from research into public debates, such as diaspora, externalization of control, and inclusion.

The Production of Standardized School Assessments: Eclectic Assemblage of Techniques, Rationales and Actors in the Case of Chile

The use of standardized tests has expanded to different countries around the world (Ball, 2008, Verger and Normand, 2015). However, little has been researched about the policy's foundations and historical trajectory. This paper offers a genealogical analysis of standardized tests in the Chilean case and its gradual constitution towards a *performative school market* (author, 2014, 2015).

The research project attempts to "follow the actor" (Latour, 2005), which means re-building the assessment device network production. The study covers an extensive documentary analysis from the beginning of the XIX century to our days,

added to the review of written and audiovisual press, and over 60 interviews to those who were involved in the policy device production.

The research findings show a rich and complex polycentric network which intermingles multiple components that, although are different in nature and rationale, converge in favor of the constitution of standardized tests and accountability measures. These historical components involve the influence of technocratic curriculum approaches coming from the 50-60s; neoliberal logics introduced during the country's civic-military dictatorship (70-80s); and 'school effectiveness theory' mixed with more recent notions of 'whole school assessment' and 'subjective well-being' (post-2000s). The production of the device is also interwoven with the scientific and technological advances, as well as with state's political pragmatism and a tradition of centralized school control since late 19th century. The device network additionally has converged with international organizations' thinking, such as the World Bank, OECD, Unesco, ETS, IEA, among others.

In short, it would be erroneous to reduce the construction of standardized tests to a single historical fact or rationale. In the case of Chile, the origin and development of the policy device is understood, using Latour (2005), as an eclectic *assemblage* of ideational, circumstantial, pragmatic, and technical components.

Young Migrant Workers: Stratification of Labor Market and Differentiation of Social Security: A Study in Chinese Developed Eastern and Southern Coasted Cities

Since the economic reform and opening up in the 1980s, the scale of population movement in China has been expanding, and a migrant worker group mainly coming from rural areas has emerged. Unlike their predecessors who were committed to economic goals, the current migrant workers are mainly young people pursuing urban lifestyles. However, due to the existence of China's household registration administration system, young people outside these institutions have been faced with social exclusion with their integration into local societies and with social security when they encounter risks in their daily lives. Based on the field interviews of migrant young workers in the developed areas of the southern and eastern coastal cities of China, this paper analyzes the social stratification of the young migrant workers during their employment in the context of the current urban household registration system reform, and the corresponding differentiation of social security, revealing causes of migrant workers' own human capital and external market selection. This paper also analyzes the dilemma faced by the national macro - policy and the local policy in the social security of migrant migrants, and puts forward the corresponding countermeasures from the perspective of the social investment policy.

FARAKHUTDINOV, SHAMIL* (*Industrial University of Tyumen*)

Mapping As a Tool of Improving Cluster Analysis Results

Cluster analysis is widely used in sociological research. One of the crucial issues for the researcher is an optimal number of clusters. On the one hand, he should not fall into excessive describing; on the other hand, the number must be enough to reveal the whole range of possible elements' groups to reach the research goals. The studies, where research objects have spatial localization, the use of mapping technics and spatial analysis can be rather helpful for determining an optimal number of clusters. This idea is based on our research experience, dedicated to rural municipalities cluster analysis.

The polarization process of the Russian rural territories continues and lasts more than 20 years. It is a consequence of the USSR collapse. Studying these processes we have collected empirical data and chosen 7 key quantitative markers. Then, a hierarchical cluster analysis was conducted with SPSS. The case was in one of the West Siberian regions.

It was noticed that socio-economic development of rural settlements was determined by their geographical position. Natural and climate conditions, soil fertility, degree of remoteness from towns and major roads, proximity to oil and gas pipeline stations, agricultural enterprises, administrative borders and national enclaves are the "magnets" with different force of gravity or repulsion. We used QGIS to put these "magnets" on the map to define their strength as factors, distinguishing clusters. Subsequent analysis allowed us to reveal general trends and latent mechanisms of rural space polarization, discard minor factors, enlarge and rebuild our cluster model.

Using mapping technics and spatial analysis is a good way to visualize data to ease its perception. Also, it is a research tool to identify new social phenomena. If the research object is localized in space, visual information allows complementing analysis with factors, difficult to reveal and describe both quantitatively and qualitatively.

RC15-JS-17.1FARBER, REBECCA* (*Boston University*)*Transnational Health Flows and Local Inequalities: Medical Tourism and Transgender Rights in Thailand*

Thailand has become a global center for gender reassignment surgeries, with the state launching new strategies to advance medical tourism, or health-related travel. At the same time, Thai transgender women have taken on highly visible roles in cabarets and beauty pageants, often using various "technologies of embodiment" (Hoang 2015), such as hormones and surgeries, to qualify as beautiful and gain economic/social mobility. While medical tourism may "trickle down" to impact local industries, I argue it is co-constructed in Thailand by the transgender entertainment industry, in which Thai transgender women to circulate norms of sex, gender, and the technologically-enhanced body on a global stage. As medical tourism can drain doctors and resources from public to private healthcare sectors, it may also exacerbate existing inequalities for Thai transgender women, who often lack access to culturally- and clinically-competent healthcare. Based on one year of ethnographic fieldwork and over 50 in-depth interviews with transgender women, state officials, doctors, hospital directors, private business owners, and civil society members, this research analyzes the social elements of medical tourism in Thailand, illuminating its multiple connections to Thai transgender women. By understanding shifts in Thai transgender women's gendered labor roles, social status, and health inequalities within the context of medical tourism, the project elucidates the complex relationships between gender, bodies, labor and technologies in a global era. The research bridges transnational feminisms with medical sociology to propose the sociology of transnational health, an analytical model which addresses intersecting issues of transnational health and transgender health by looking beyond predefined borders of sex, gender, and nation.

TG06-995.1FARCY-CALLON, LÉO* (*Université Rennes 2/ESO*)*French Spaces of Detainment for Juveniles: Securitization and Humanization*

A branch of new closed institutions for juveniles was developed the last 20 years in the French legal landscape. Recent sociological studies show how new ideology of juvenile care is emerging (Lenzi, Milburn, 2015; Sallée, 2016). While there is a privatization and a diversification of closed institution, forms of confinement are changing. I observed those institutions with an ethnographic methodology in attempt to understand the deprivation of liberty toward juveniles.

Looking at spaces in those institutions is a good way to understand experiences of confinement, professional practices in the context of coercion, and ideologies underlying intervention. As Marion Seguin has shown, form and use of spaces need to be synthesized to understand how societies are founded, inhabited, and transformed (Seguin, 2010).

This presentation will reveal an ambivalence appearing on closed institutions' policies, especially regarding spaces: between immobilization and mobility, openness and closedness, securitization and humanization (Darley, Lancelevée, Michalon, 2013). The first role of the deprivation of liberty is the isolation of the body from society; "It is subject to specific requirements of separation, security organization, control and visibility of detainees" (Chamond, 2014). At the same time, we observed a tendency towards the opening up and humanization of closed institutions, mostly by renovation of spaces, access to rights, individualization (Bouagga, 2015) and extramural intervention.

This new principle of confinement is enforced in attempt to reduce coercion and involve the juveniles in their detention and judicial path. To that end, individualization of detention, autonomy and responsabilization of juveniles are in the center of interventions. However, results of our survey show how this humanizing process does not reduce spatial coercion, and can even creates a new form of control operating extramurally, on the subjects' minds, biographies, and paths (Comfort, 2003).

RC16-300.6FARIA, FLÁVIO* (*Asa Norte*)*The Elective Affinities between Simmel, Weber and Kafka*

The present article seeks to trace a few affinities between the literature of Franz Kafka and the classical sociological theory of Georg Simmel and Max Weber. However, Simmel is the main author in this theoretical construction, since the proximity between him and Kafka is much stronger than with Weber. This affinities will be elective according to the contingent characteristics, consonants or dissonants, between this three authors. Therefore, the substance which ascends in this matter and its confrontations takes to a solid theory of modern life and, for this reason, the objective of this article will be show it under the aegis of kaffian literature. Also, the essay of Walter Benjamin about Franz Kafka will be used, along with various essays of Simmel, as a guide for the whole work.

A literature, how Lukács has already stated, in which pale its scenarios, its world while a perspective of superficiality, its images, have capacity to be sociologically apprehended. There is, in Kafka, the critical compromise with what defines the modern life, with what is caused by the spirit and the culture: the subjectivity in dialog, or distance, with the social context and its conflicts. Equally, the social types created by Georg Simmel reflects this same preoccupation.

This work proposes to approach three pieces of Franz Kafka: The Metamorphosis (1912), The Trial (1914) and Contemplation (1914). The first one is a novella, the second one is a romance and the latter one is a short-story collection. The following pieces represents main works from Franz Kafka and, therefore, this selection might be enough to a precise analysis of kaffian terms and its connection with those two classical sociologists, always in the attempt to reach new concepts and interpretations about modernity.

RC01-40.7FARIAS, RAFAEL* (*Exército Brasileiro (Brazilian Army)*)*Brazilian Blue Helmets in Haiti: An Instrument of Smart Power for the Brazil Foreign Policy?*

The United Nations Stabilization Mission for Haiti (MINUSTAH) meant a new perspective for the Brazilian foreign policy. Thanks to the Force Commander – indicated by the country since the beginning of the mission – and the highest troop strength – the tasks performed by the Brazilian peacekeepers in Haiti became worldwide known, especially after the pacification of violent neighborhoods of Cité Soleil and Bel Air. Acting always on behalf of the UN mandate, and facing harsh situations, such actions might be considered a manifestation of the Brazil Hard Power. At the same time, Brazilian blue helmets have brought a great contribution to rebuild the country, particularly through the work carried out by the Brazilian Engineering Company (BRAENGCOY), and performing Humanitarian Assistance and Disaster Relief operations in the aftermath of natural disasters such as hurricane Katrina and the earthquake of 2010. In these tasks, some Brazil typical cultural features stood out, such as solidarity, generosity, and affection towards the local people, should be understood as one of the manifestations of its Soft Power. Either through actions intended for the pacification of the country or by the bias of humanitarian actions, Brazilian peacekeepers have been able to acquire heart and minds, in a synergy of hard and soft power. In this regard, the article aims to analyze if does exist a skillful combination of hard and soft power which allows conclude if the Brazilian blue helmets in Haiti might be considered a Smart Power instrument for Brazil's foreign policy.

RC48-JS-31.2FARINI, FEDERICO* (*University of Northampton*)SCOLLAN, ANGELA (*Middlesex University in London*)*Narratives of Refusal, Narratives of Engagement, Narratives of Organisation. School Activism As Citizenship-in-Practice for Young Refugees and Migrants in Italy*

This presentation discusses the results of four researches with young refugees and migrants that took place in three different regions of Northern Italy between 2006 and 2014, crossing an unfinished economic crisis, the rise and fall of xenophobic political parties and a continuing debate around migration and inclusion in different social contexts. Data consist of young (age 13 to 18) people's

narratives, promoted and collected through 62 focus group and 118 individual interviews. Notwithstanding different aims, the four researches share a similar methodology, consisting in the facilitation of young people's narratives to support a phenomenological description of how they make sense of events and actions in their lives, through examining the story they produce.

The presentation focuses on a common thread emerging from data collecting over a 8 years period: whilst experiencing a situation of inequality in the participation in the political system, due their legal status, nevertheless young refugees and migrants build spaces of active political participation through social movements, in this way taking ownership of urgent social issues related to inclusion and equality that do not concern only minorities. Examples discussed will include: participation in students and trade unions, support offered to unaccompanied migrant/asylum-seeking children, protest against global capitalism and global wars.

The rich narratives collected suggest that for young refugees and migrants (as well as for young Italians) participation in social movements and political associations is context for the development of trust commitments in intercultural groups, built on shared political objectives. The presentation argues that the commitment for a more inclusive and equal society is a social space where young refugees, migrant and non-migrant become agents of cultural hybridization and practiced citizenship. The presentation concludes by reflecting on how these narrated experiences challenge hegemonic representations of young refugees and migrants as inhabiting marginal areas of society.

FARMER, DIANE* (*OISE, University of Toronto*)

KENNEALLY, NOAH* (*Ontario Institute for Studies in Education-University of Toronto*)

Nonviolent Research Methods: Uncovering New Ways of Researching with Children

Broström (2005) and Einarsdóttir (2007) raise an important point in regards to researching children's lives and experiences of childhood – how to balance children's rights to privacy and protection with the potentially invasive entry into children's spaces and lives that is required of research? These uninvited forays can be understood as acts of symbolic violence (Bourdieu, 1999), and are a clear demonstration of the unbalanced power dynamics between adults and children. Are there ways of designing and conducting research that reduce or constrain the symbolic violence and power imbalances existing between adult researchers and child subjects?

In an effort to explore ideas of potentially nonviolent research methods, this presentation examines the processes and practices in two of our own projects. One, a SSHRC-funded study looking at children's understanding and experience of their own mobility; and the second, a pilot project testing out arts-based methods of data collection and analysis. We found that by emphasizing research as a social relationship reframed the research processes so that we engaged with adult-child power dynamics in less violent ways. However, along lines suggested by Punch (2002) and Hill (2005), and contrary to some of the literature existing on adapting research to be appropriate for children, we uncovered other means to share power and space, and creatively engage in research with children. Critiquing some of these "child-friendly" methods, we point towards the strengthening effects cultivating reflective space with children has on designing research, involving young people, and investigating children's experiences and issues of childhood.

FARRO, ANTIMO LUIGI* (*Sapienza University Of Rome*)

MADDANU, SIMONE* (*Sapienza University Of Rome*)

A Collective Action to Rebuild the School: Parents' Mobilizations in Rome

Criticizing the lack of welfare and public policies in the city, new collective actions attempt to cope social fragmentation and integration issues, which are particularly at stake in the latest decades. They intervene, as occurs in Rome, in order to create what they define as participatory spaces, based on popular consultation in support of schools and neighborhood. These interventions aim at rebuilding a social fabric that is supportive of and controlled by the neighborhoods themselves – whether central or peripheral – or in order to demand the care and management of common goods, either through subsidies or as an alternative to existing institutions. Based on a fieldwork research in different urban areas (central and peripheral), the research has considered different collective actions in Rome led by citizens claiming for direct democracy and active participation. We focus on the agency of Parent Association of two public schools in Rome. Engaging in an integration process that take place in the micro perspective of companionship and in the neighborhood, they aim at responding to the multiculturalism and multi-ethnic issues of this school. By studying their bases for action, we highlight the subjective and shared experiences of the "open school", through a symbolic re-appropriation of common goods. According to this mobilization perspective,

the school represents an exemplary place to re-build institutions and active citizenship as an ethical model of democracy for the next generations.

Some Theoretical Issues on XXI Century Social Movements

This paper aims to contribute to the debate on the theories of social movements in the XXI century. According to some empirical and theoretical studies, collective movements such as Occupy Wall Street or Umbrella Movement, are characterized by a subjective affirmation, which represents a personal path of liberation from systemic domination forces (as global financial groups, cultural model makers, as well as authoritarian political powers) that shapes the individual life. Within this frame, we can define a XXI century collective movement as a common agency led by individual subjects who aim to affirm themselves as self-directed social actors, and pursue universalistic alternatives to dominant cultural, economic, and social systemic orientations. These individual subjects carry on a common action that seeks to identify and challenge its opponents – the systemic forces conditioning systemic development – in order to control the direction of those systemic orientations. Then, the collective movement constitutes the highest level of intervention, which aims, on one hand, to construct conflicts with systemic forces and, on the other hand, to integrate these problematic relationships through the regeneration of institutional system. Therefore, these collective initiatives take on meaning as a subjectivization of collective action, in which individuals struggle for the affirmation and recognition of their political, social and cultural rights. Following these subjective and collective goals, social actors pursue a broader definition of universal rights of all human beings.

Neoliberalism, Crony Capitalism, and the Political Economy of Resource Extraction in Bangladesh

In a recent study, a Bangladeshi sociologist has argued that neoliberal transformation of Bangladesh's economic policy has replaced social contract between the state and society with crony capitalism. This is the departure point of this paper where I will examine this assertion with an analysis of the political economy of resource extraction. I will use the development of the Barapukuria coal mine in the northwest region of the country as an empirical case. I consider that the prevalence of crony capitalism is not a new phenomenon in Bangladesh. It has merely been strengthened with the institutionalization of neoliberal agenda of Bretton Woods Institutions through their Structural Adjustment Programs and other loan conditionalities. Scholars attribute the rapid growth of crony capitalism as a dominant mode of business-politics relations to the politics of military regimes. However, the trend did not change after the advent of 'formal democracy' in the early 1990s. I suggest that we can make a nuanced sense of this continuing trend by drawing on the conceptual framework of 'extractive institutions' developed by Acemoglu and Robinson. Instead of connecting crony capitalism with neoliberal policy agenda, I pay attention to the quality of institutions that perpetuate it and emphasize how it contributes to 'resource curse.' I argue that illiberal democracy is intimately tied with crony capitalism in Bangladesh. The result is the plunder of precious mineral resources for the benefit of a few politically well-connected power elites. The dominant narrative of economic growth and development obscures this institutional problem as it requires major overhauling of the system that will threaten the existing political order and the sustenance of the status quo.

Social Struggles over the Commodification of Nature: A Comparative Analysis of Two Resource Conflicts

Resource extraction in the era of neoliberal globalization has generated a 'double movement.' On the one hand, we see the rise of 'land grab' on a global scale to reinforce the commodification of nature. In response, there is a growing resistance movement to assert community rights over natural resources. In this paper, I will present a comparative analysis of two resource conflicts over the commodification of nature in Phulbari, a rural town in the northwest of Bangladesh and Melancthon, a rural township in the northwest of Toronto, Canada. A British mining company planned to build an open pit coal mine in Phulbari, which would require more than 6000 hectares of prime agricultural land. An American resource company planned to build a limestone quarry in Melancthon, which would need nearly 1000 hectares of potato farms. In both cases, capitalist industrial development would transform a rural community; grassroots communities did not support these resource extraction projects anticipating devastating consequences of slow violence unleashed by extractive industries. Gradually their struggles drew the wide-spread support of like-minded allies from within and outside progressive political groups and environmental movements. In the end, they succeeded to halt both projects. Opponents

deployed more or less similar mobilization framings and tactics. However, there remained a noticeable difference between these two social struggles regarding the outcome. Drawing on social movement studies and institutionalism, I will analyze mobilization processes and outcomes of these resistance movements. I will ask: why the company behind the Melancthon quarry abandoned the project while the company behind the Phulbari coal mine remained hopeful to begin the project. My argument will emphasize the role of accountable, transparent, and democratic institutions to address the grievances of concerned citizens in the face of increasing commodification of nature.

FARZIN, SINA* (*University of Hamburg*)

Theorizing through Literature

Sociology and literary fiction have long competed and complemented each other as sources of knowledge about the social world. Novelists like Honoré de Balzac and H.G. Wells proclaimed their fiction sociology, while sociologists used literature to articulate their sociological concepts. Pierre Bourdieu used Flaubert's novels not only to illustrate but to develop the concept of habitus, and W.B. DuBois experimented with more literary forms of writing—to name just two prominent examples.

The history of boundary work to exclude literary fiction from the realm of "real sociology" and the resulting scientification and institutionalization of the discipline are well documented (see, for example, Wolf Lepenies' *Between Literature and Science*). But sociology and fiction are still entangled in a number of ways, particularly in the field of social theory, where literary imagination is used to initiate and enable theoretical creativity and undercut the binary logic of "theory" vs. "empirical data." Social theorists such as Axel Honneth, Eva Illouz and Alain Ehrenberg regularly draw on novels to inquire recent relations between individual subjects and society. Others, like Frederic Jameson and McKenzie Wark, make use of the world-building techniques of speculative literature to theorize phenomena like climate change and the anthropocene, which challenge traditional social theoretical concepts. In my presentation I identify and discuss the different uses of literary fiction in contemporary social theory and place them within the broader debate about methods of theorizing that Richard Swedberg, Andrew Abbott and others have initiated in recent years.

Analysis of Different Dimensions of Women's Social Exclusion in Rural Iran

One of the quality of life dimensions is the quality of social relations between individuals, groups, and institutions. Meanwhile, poverty can deprive people of social relations and interaction. One group of people exposed to poverty and social exclusion are women. The main purpose of this paper is to analyze the different dimensions of rural women's social exclusion. The qualitative method used here is based on data collected by observation, and semi-organized interviews, from Chamran village of Saveh town, in central Iran.

The results show that exclusion from the labor market, inequality in access to social rights and freedom, exclusion from participation in local community and involvement in decision-making processes, limited access to basic amenities and services, poor social communication limited to intragroup networking, and lack of social support, are the different dimensions of social exclusion of rural women in poverty. Some of the cultural norms, negative views of the rural folks, especially men, to women's presence and employment outside of home, illiteracy or semi-literacy, low knowledge and skill, and lack of employment opportunities are some of the factors that keep women deprived of finding jobs, membership of out-group networks, and social interaction with others. This situation has ultimately caused frustration, seclusion, and isolation for the rural women.

In community-based development programs, empowerment of villagers, familiarization of their rights, creation of educational means, employment opportunities, and improvement of the infrastructure has been effective in contributing to the improvement of quality of life for the rural women. Also, media and approaches based on dialogue and participation can be used to grow local community awareness in order to change cultural and patriarchal attitudes towards women's status and their increased inclusion into the society.

Women's Attitudes Towards Rural Lifestyle Based on Agriculture in the Case of Gilan Province-Iran

In recent years, lots of changes in different aspects of Iran's rural life have happened. This study aimed to analyze the attitudes of Gilan's young rural women towards jobs in the agricultural sector. Our primary research involved gathering

data through interviews with single women between the ages of 15 and 25. The findings showed rural girls have the negative attitudes towards working on farms. They are not inclined to live or work in rural areas anymore. They like to marry men who do not work in the agriculture sector, and prefer to move to cities in order to use city amenities. Similarly their parents also do not like the agricultural activities as a future job for their girls. They nurture them in a way that they won't have any exposure to work in the agricultural sector. They imagine their children's life in cities. Being affected in such a way by city regions, the values of living in the city from the rural folks' view, prioritization of getting education over working on farms for young girls, rejection and inferior treatment of villagers by some city people for simply living and working in villages, deprivation of some rural areas from civil amenities, and prioritization of consumption, and leisure over production, are some of the contributing factors to the development of such a situation. Overall, it appears that with the increase of mentioned changing trends in rural areas, there will be a gradual decrease in the number of women working in agricultural sector.

Tackling Rural Poverty in Nigeria: Issues and Challenges

The description of poverty varies over time and clime. However, every society recognizes and describes it in relation to its socio-economic circumstances. As a universally recognized social problem, poverty has attracted many action packages across the globe. Nigeria, like many other countries, has enunciated and indeed, operated several policies aimed either directly or indirectly at eradicating or reducing poverty to its lowest level. Poverty alleviation strategies in Nigeria span various spheres in the economy. However, the strategies aimed at mitigating rural poverty have been most prominent in Nigeria. Recognizing that the root of poverty is in the soil of the economy, most of the rural poverty alleviation strategies were aimed at improving the economy, especially in the area of agricultural production in the rural areas. This paper critically evaluates the rural poverty alleviation strategies in Nigeria for more than two decades alongside the objectives, performances and problems of these strategies. The paper also suggests pithy ways of avoiding noticeable pitfalls in these strategies.

Legal and Illegal Boundaries in the Socio-Economical Southern Italy Development

In Italy, the organized crime of mafia-style, which is mainly prevalent in the various southern regions and is expanding to those of the north, has in the course of time evolved showing great adaptability to the changes in local development policies. Among the models of interpretation, the model of the networks and the theorization of the so-called "gray area" (Sciarrone, 2011) has played a significant role to make synchronic processes intelligible and highlighting elements of hybridization with society and the market in the last decade. The "gray area" is a complex system of relationships that mafia groups build around themselves, composed of entrepreneurs, politicians and professionals of various levels, in order to penetrate the economic and political territories, acquire useful expertise pursuing their goals and creating the basis for control, not only military but based on trust and reciprocity. The paper has a dual purpose: the first, theoretical, oriented to the study of the relational dynamic mutations of the mafia with the outside world of the organization, which have evolved in parallel with a new definition of modernity; the second, empirical-methodological, consisting in the analysis of the operative "cosche" on the territory of Catania - adopting the network approach and applying the techniques of social network analysis - which highlighted the delicate balance of relationships that define the area gray.

Religion As Aesthetic Reflexivity in the Social Experience of Italian Muslim Women

Religion as aesthetic reflexivity in the social experience of Italian Muslim Women

The paper is a contribution to the debate on the social construction of Islam in the Italian context from the point of view of young women of Muslim culture. We observe this process through the lens of their religious path to understand how it is involved in sustaining subjectivation. As an essential component of difference, the notion of subjectivation is central to the contributions of Touraine (see in particular Touraine 1992, 1994) and other scholars of the *Centre d'analyse et d'intervention sociologiques* - CADIS; it concerns a demand for personal and collective freedom, equally distant from both community and societal adaptation.

Subjectivation emphasizes acting in a auto-reflexive way and return to society with creativity in order to contribute to the redefinition of the social space. In the paper religious gender discourse are critically examined in terms of its relevance to Italian Muslim experience in life, cultural tradition, friendship, love, intimacy and recognition of the difference in the public sphere. The empirical data of this work, collected in Rome in 2016, consists of 50 interviews with young women between the ages of 18 and 35, predominantly 2nd or 1.5th generation, and of 2 focus group with 13 women. We have described the main results with special reference to Dubet's concept of social experience and Lash's mimetic reflexivity: the young women we interviewed are able to criticize universals by aesthetic detail, in a hermeneutical direction capable of influencing a reflexivity on the forms in which the domination of homogenisation is expressed.

Organizational Learning in Civil Society Organizations (CSOs) of the City of La Plata (Argentina) That Develop Programs Linked to Responsible Social Innovation

The economic, political and social reality of Latin America and Argentina reveals the social debts or unfinished / pending problems on the agenda of the countries of the region: poverty, the deficit in education, social exclusion and inequality. In this context, the public National University of La Plata (UNLP), has a fundamental role not only in the ethical and professional training of students, but also in promoting the strengthening of the capacities of civil society organizations whose mission is to confront these realities.

This presentation addresses the problem of the incorporation of knowledge in CSOs executing programs linked to responsible social innovation in the framework of the joint work with the UNLP. It was based on the realization of a survey of the CSOs that are included in the Directory of Civil Society Organizations of the city of La Plata of the Institute of Administrative Investigations of the School of Economics (UNLP) in order to put together a typology in relation to the target population, intervention objectives, intervention modality (among other variables) and from that point select the case studies.

This paper presents the work in progress analysis on interviews with the relevant actors in each of the selected organizations, and on a process of participant observation of the activities concerning of the programs implemented. In order to detect the changes and learning that occurred in these organizations from the perspective of the actors (members of the organizations and users of their services) and from that point, on make proposals to improve the quality of their learning, processes and productions.

Redefiniciones De Las Experiencias Infantiles De Sectores Populares En Contextos Institucionales

Las tensiones entre visiones normativas sobre la infancia moderna y las múltiples experiencias de infancia, en particular aquellas de niños y niñas de sectores populares, constituyen uno de los modos de invisibilización de la agencia y la voz de tales niños y niñas. En este paper, exploraremos los modos de negociación, resistencia y subordinación desplegados por niños y niñas en barrios populares de Villa María, Córdoba (Argentina), para procurar hacer luz sobre las maneras en que son redefinidas las relaciones intergeneracionales, en especial en relación a las dimensiones de cuidado y protección. Con ello, buscaremos aportar al debate sobre las relaciones de poder desde un punto de vista intergeneracional enfocando en las nociones de agencia y experiencia. El posicionamiento teórico incorpora al campo de estudios sociales de infancia los debates de la teoría cultural británica sobre la experiencia y la resistencia, y la teoría feminista, en especial los debates sobre agencia, autonomía y subordinación. Por su parte, la estrategia metodológica es un estudio de caso con etnografía ampliada, y la producción de datos combina una estrategia de observación participante, con recopilación documental y entrevistas en profundidad.

The Dog without Feather: The Artistic Message of Social Transformation Intrinsic in the Deborah Colker's Spectacle

The *Dog Without Feather* is the new spectacle by reputed Deborah Colker's dance company, which was inspired by a homonym poem by João Cabral de Melo Neto symbolized by a dog whose image is a metaphor of what the poet and, posteriorly, the choreographer wanted to address.

The *Dog Without Feather*, mistreated, starving, miserable and covered by mud is a symbolic representation of the man of particular Brazilian region, which is characterized by poverty and an inhospitable nature. Such nature is also a meta-

phor of social life that is marked by misery and consequently human indignity – something inconceivable and inadmissible; applying words of the choreographer herself.

This actual work corresponds to a proposal of sociological analyzes of such spectacle with emphasis to the metaphors and the symbolic representation inherent to it. Metaphors ranging from the poem that provides the name and the aesthetics support to the choreography to the mud, which is represented both the costumes and the rhythm of *manguebeat* music.

Such metaphors add to other symbolic representations combined to innumerable subtle and complementary elements that, together, constitute a complex and provoking interpretation of Brazil today. Interpretation that outlines a sensible and pungent criticism, which is able of communicating and mobilizing the necessary strength in the public to transform social reality. Reality that annoyed both the author of the poem when writing it and the choreographer nowadays and consequently the public that represent a broader universe in which a whole nation is reflected.

The Solidarity of the Musical Utopia in Contemporary Brazil

Apart from the current Brazilian *mainstream* music scenario of huge concerts, there is an informal and organized network of independent musicians united by the ideals of composing refined popular music. Most of which are also united by the search for a national identity expressed by the connection with popular thematic.

Found in over thirty Brazilian cities with recent expansion to neighborhood countries, this group dubbed Dandô provides to its members a network of solidarity that resembles the one of *couchsurfing*. Such analogy derives from the fact that musicians offer hospitality to other musicians as long as it is reciprocal.

The analogy with *couchsurfing*, however, does not explain the particularities of such network of solidarity. For example: the definition of an annual calendar of accommodations that is elaborated by a central coordination, requirements for musicians to have at least a recorded album, and the hospitality is only offered by a music producer who will also assist the production of local concert.

This work aims to present a preliminary study of such national-range network through interviews carried out with members (musicians and producers) of a specific region in Brazil. The initial proposal of these interviews is to map how such solidarity network functions, not only from the perspective of an esthetic and musical ideal but also from the reflection of such experience and artistic hospitality upon music renovation and contemporary reality in search for solidarity and for an alternative different from the establishment.

Internal and External Power Dynamics in Heterogeneous Coalitions: The Campaign for \$15/h in Quebec

Launched in the U.S., the "Fight for fifteen" campaign has now been adopted by different Canadian organizations (rights-based NGOs, trade unions, community organizations and left-wing political parties). Though the advantages of labour-community coalitions are widely studied, in facts, action coalition work is still rising some tensions in-between organizations.

This proposed research will be addressing the challenges embedded in inter-organizational alliances within the \$15 campaigns in Quebec. It argues that coalition work engages a threefold domination relationship which is due to 1) the power imbalance between organizations, 2) the role and position of spokespersons inside their organizations and 3) the representation by the coalition of precarious workers. Accordingly, it identifies coalitions as a dynamic structure of power relations that we can't deconstruct without critically investigating their internal (within organization and small groups of activists) and external (networks of allies, target groups) relational contexts.

This research builds on more than 15 months of participation-observation in various active coalitions engaged in the fight for improving the living conditions of the working poor in Quebec.

FAY, MARY ANN* (*Morgan State University*)

When Legal Worlds Collide: Law and Liberation in the United Arab Emirates

My paper analyzes a legal case in the United Arab Emirates involving a woman who took her husband to court for physically abusing her and her adult daughter. According to the National newspaper, the husband inflicted injuries on his 23-year-old daughter and wife that required medical treatment. The woman in this case chose to adjudicate the complaint against her husband in the civil courts.

The case went from the lower courts to the Federal Supreme Court. Citing a verse from the Quran, Chief Justice Falah al-Hajeri of the Federal Supreme Court

upheld the conviction of the husband in the lower court while also acknowledging the right of a husband to discipline his wife – but not his adult daughter – “provided he does not leave physical marks.” The ruling ignited a nationwide debate with conflicting opinions aired in the press in letters to the editor and in essays by legal and religious scholars and clerics. The ruling was criticized by Human Rights Watch on the grounds that violence against a wife by her husband is a crime and should not be condoned in any circumstances.

My paper argues that the woman in this case chose to act as a citizen with rights rather than as a subject of her husband's arbitrary authority within the family. Her action, perhaps more than the ruling itself, can be regarded as liberating because it challenged her husband's unchecked authority over her and her daughter and identified her as a citizen with rights according to the UAE constitution. This case allows us to examine the various ways that contrasting legal frameworks define gender and women's rights and the role that shari'a plays in the country's legal system.

Power Dislocation, Income Differences and Spousal Violence in Urban Nigeria

Earned income disparity has strong explanatory power in understanding spousal manifestations of love, exhibition of power and domination including physical, sexual and emotional violence. In this paper, we argue that this becomes stronger in Nigeria patriarchal milieu where the normative order of power in a family is traditionally located in the man. However, power and authority may be weakened from the husband and stronger with the wife if economic superiority favours her through earnings. This twist of fate may have direct emotional and physical dimensions of violence against the wife as the husband becomes daily confronted with the reality of loss of power in the family. This study therefore examines the influence of income difference on spousal violence using 2013 Nigerian Demographic and Health Survey (NDHS) dataset. The unit of analysis is currently married women in urban Nigeria. This gives a total weighted sample of 7279 women. Spousal violence was measured in 2013 NDHS by asking questions related to experience of physical, emotional or sexual violence using the shortened and modified version of Conflict Tactics Scale (CTS). The prevalence of at least one form of spousal violence among currently women who earns more than their husband is 36.1%. This is significantly ($p < 0.000$) higher than those who earns less than their husband. Income difference as a form of power play as well as a change in family role in a patriarchy society like Nigeria has varying influence on forms of spousal violence experienced by these women. Percent of urban currently married women in Nigeria who earn higher than their husbands experienced emotional violence, physical violence and sexual violence is 30%, 21% and 3% respectively. Odds of at least one form of spousal violence is 61% significantly higher among women whose income is more than their husband than the other group.

Experiences with Images Senses and Sentiments in the Student Occupations in Paraná in 2016 # Ocupatudo #

I propose a reflection on the process of reconstruction of an experience of political action of young high school students who were engaged in the Occupations of the Public Schools, as a resistance to the proposals of Temer Government High School Reforms. There were more than 1,000 student-occupied schools across Brazil in 2016, in a process of widespread mobilization in the context of recent political struggles in the country. Two elements guide my thinking: one is the Didi-Huberman perspective associating image, action and emotion (2016), the other is the question of the recognition struggle as proposed by Honneth (2009). So, I put together an image workshop with some students about each moment of that experience. This activity was thought of as a reflection process shared with students about the experience of that involvement in the political struggle. We have the question: how to translate that experience / feelings into images? The result will be an exhibition at the university and a collage of the photographs produced by them on a city wall. Three elements guide my reflections: 1. deals with these images produced by the agents themselves (emic) from their cell phones; 2. concerns the material dimension that they will have with their impression and intervention (drawing, collage) in the construction of other meanings and meanings and; finally, the ethical dimension implied since the exhibition of the images and of these juvenile bodies has two consequences: from the consent in its exposition there is a legal implication and that only now they return to a critical and reflective dimension of that experience; and the political dimension in the re-signification of “Occupations” for “Spring Student”. It is about these multiple aspects that I intend to reflect with their epistemological and methodological meanings in the perspective of visual sociology.

Impact of Neoliberal Globalization on Contemporary Societies and Its Discontents! a Post Marxist Cross Cultural Study .

Digitization and automation has become an integral part of our consumer life. Facebook, twitter, surveillance cameras, and digital representation of everything has literally transform every aspect of business aesthetics and political logic of contemporary life. We can see the effects of these technical, technological and cyber revolution every where around. In Communist Manifesto ,Marx described capitalism as a force that would dissolve all feudal , national and religious identities, giving rise to a global or universal civilization governed by market imperatives. But in general on the other side we can only mourn the death of our salesman by the logic of domination, curtailment of expression, and dialectics of terror. Paradoxically with the advent of social media, digitization and mass communication, political terror and social marginalization is now being used as a inflammatory source to penetrate and usurp means of representation, as surveillance cameras produce endless hours of visual footage on media and world wide web . The way the information exchange is constructed and controlled by the state has a devastating effect on individuals whose minds are outsourced, digitized , automated or robotized for the enhancement of intellectual poverty and market friendly social and cultural degradation. The paper will further critically cross examine the concept of globalization and why it is alienating huge flux of population in poor and underdeveloped countries like Pakistan. The study will be conducted on the marginalized and different layers of working class communities, students, and petty bourgeois class of shopkeepers and peasantry. The data will be critically and philosophically analyzed and the final conclusions will be drawn on its behalf.

FAZAL, HINA* (Bahauddin Zakariya University Multan, Pakistan)

Sexploitation of Women, Religious Extremism and Globalization, the Trinity Formula of Neo- Colonialism! a Marxist Analysis..

Women are the most terrified people on the face of earth. The over whelming majority of those persecuted ,tortured raped and executed are living in Muslim patriarchies, although sexually or mentally liberated women is not safe in any part of the world. If i reconceptualize the religious history of Western europe after 15th century , the majority of those who convicted or brutally punished for witchcraft or heresy were sexually liberated working women who tried to rebelled. From the historical perspective it is very empirical for sociologists and anthropologists to investigate, compare and specify the routs from which anti women behaviour was metamorphosed deep in our psyches, hierarchies, archives and lexicons for the violent abuse and sexploitation of women especially in situation of conflict she is perceived as a public concern. Medieval witch persecution and modern day honor killing, rape, prostitution, pornography, genital mutilation, forced marriages and other gender related issues are the expressions of same brutal class hierarchy which controls all the means and tools of production through families ,private property, private wealth and repressive state institutions as they all provide material and ideological foundations to promote and preserve anti women social stereotypes which we usually noticed in traditional Muslim hierarchies. Phenomena of globalization debauched women's sexuality in more crudest form with more dewomanizing effects. Globalization as a neoliberal political cult of the West with invasions of cultures caught women in a deadly crossfire between secular and fundamental forces while reactionary forces were being encouraged and used as an unconscious tool to bring more bloodshed and that plague of terror has already devastated our life. The only solution i think is democratic socialization of all the means and tools of production. PS. During presentation I will use art works of women,s right activist .

CHINITZ, DAVID (Hebrew University-Hadassah, Braun School of Public Health and Community Medicine)

“That Number Doesn’t Reflect All I Do”: Health Professionals’ Perceptions of Quality Measurement in Health Organizations

Quality measurement of medical care has become common in health organizations. The rationale behind it is that using evidence-based professional standards, health organizations can improve the quality of care they provide. Publication of this improvement serves to increase transparency of these organizations while fueling health organizations’ dominance with professional criteria. Thus, measurement is both an expression and an end of managerialism. However, the literature describes difficulties in the implementation of quality measurement and/or its publication from the point of view of both health professionals and organizations’ administrators. We conducted a qualitative study in order to map the perceptions of key stakeholders and of hospital- and

community-based physicians and nurses, regarding extant programs of quality measurement in the Israeli health system. The study included open-ended, in-depth interviews with stakeholders at various levels and in various sectors of the health system, and 11 focus groups with hospital- and community-based physicians and nurses. Data was analyzed using thematic analysis. This paper focuses on the perspectives of focus groups' participants (N=49). They tended to distinguish between quality measures and the quality of care they provide according to professional standards. Nurses appeared more comfortable with quality measurement programs in their work contexts, while physicians struggled to balance standardization with professional autonomy. Participants perceived too many measures are implemented, and that some of them are inappropriate vis-à-vis organizational and professional contingencies. They favored internal publication of quality measures results, but viewed publication to the general public with more skepticism. We conclude that professionals articulate familiarity, understanding, and positive attitudes towards quality measurement, especially if used to improve professional performance. On the other hand, they expose tensions between difficult-to-measure professionalism aspects and organizational managerialism. Quality measurement culture in health organizations needs to balance between professional and organizational tenets for patients' health continuous improvement.

FEDER-BUBIS, PAULA* (*Ben-Gurion University of the Negev*)

Who Does What ... and Where? Perceptions of Resident Physicians in Periphery Hospitals about the Contents of Their Residency Program and Their Implications

Residency, the period of graduate medical training, is a professional formation stage during which the young physician performs supervised work in a clinical setting. This period may extend to several years, exposing the trainee to a profession-stipulated curricula while performing a specified type and number of procedures. Upon its successful completion, the physician is identified as a specialist in a clinical area, and is licensed to perform autonomously. At the formal level, specialisation acquired during residency is not necessarily validated internationally, rising questions regarding the universalism of medical training, and affecting the occupational trajectories of physicians. Can this universalism be questioned also at the national level? Based on a qualitative study including face-to-face, in-depth interviews with 54 residents in non-central hospitals in Israel, the perceptions of what accounts for a residency program and its implications were analysed. Residency was interpreted as a "hard-working phase", a period in which young physicians described themselves as "merely a pair of hands" in understaffed departments. Constantly comparing themselves to their colleagues in central, advantaged catchment-areas hospitals, physicians in periphery hospitals yearned professional-learning opportunities (such as protected "library time" and "interesting cases") as well as (greater) availability of diagnostic and treatment technologies. Concurrently, study participants stated that seemingly professional disadvantages such as lack of equipment and staff, as well as complex patients' case-mix, offer them the opportunity to "practice hands-on, real medicine" much earlier than their colleagues in advantaged settings. In conclusion, differentials in residency programs question the universalism of medical training at the national level, especially due to system and organization constraints that shape the contents and structure of the residencies. Differences among these programs might track physicians to specific practices, thus functioning as a stratifying mechanism of physicians also in a specific country.

Multilingual Practices Vs. Monolingual Language Regime. Evidences from St. Petersburg's Linguistic Landscape

Multilingualism in urban spaces is mainly studied as an oral practice. Linguistic landscape studies can serve as a good explorative method for studying multilingualism in written practices. What is more, the recent researches on linguistic landscape (Blommaert 2013; Shohamy et. al. 2010; Backhaus 2006) shed some light on the reflection of power relations between different ethnic groups in urban public space. Multilingual practices exist in a certain ideological context, and not only official language policy but speakers' linguistic stereotypes and attitudes as well can influence and modify those practices.

The paper deals with the situation in St. Petersburg, the second large city of Russia, where presence of foreign visitors, on the one hand, and Asian labour migrants, on the other hand, is currently becoming more and more visible in linguistic landscape. At the same time this multilingual trend is hampered by traditionally strict language policy and, even to larger degree, by monolingual ideological bias still characteristic for Russian native speakers. Linguistic landscape study conducted in 2016-2017 in central and residential districts of St. Petersburg reveals that spheres of written use for languages other than Russian and non-Cyrillic scripts are very limited. There is strong divide as well between public and private use, 'open' and 'closed' urban spaces. Both official language policy

and attitudes of ethnic majority tend to ignore actual city's diversity, maintaining therefore urban monolingual 'façade'.

Unionization without Bosses: Informal Workers' Organizing in Argentina

After the crisis of neoliberal reforms in Argentina, in the early 2000s the economy recovered, and this in turn secured a reduction in unemployment, robust job creation and salary rises for many workers. However, after 10 years of growth, a third of workers remained informal and a larger number worked in insecure and precarious conditions. A sizeable portion of the workers has stayed outside of the circuits of accumulation within the formal economy. For them, economic growth has brought few changes, except for the inclusion in some social assistance programs. They have also remained marginal to traditional forms of union organizing, as the struggle against precariousness has not occupied a primary position in unions' negotiations with employers and the government. These workers, however, have started to experience with novel forms of organization and mobilization.

Our paper will consider the experience of the *Confederacion de Trabajadores de la Economia Popular* (CTEP Confederation of Popular Economy Workers), which has developed in the early 2010s with the purpose of organizing member of work cooperatives, self-employed and informal workers in diverse economic sectors and activities. CTEP aims at creating works for precarious workers, gaining recognition as a union and bargaining with the state.

Our paper will explore the organizational innovation, the connections with previous forms of employed and unemployed workers organizing and the challenges facing an organization that attempts to fight for working conditions and income for workers who do not formally work for an employer. We will also analyze the implications of the fact that organizing is for this sector a form of creating jobs and at the same time a form of representation and struggle and of addressing issues pertaining to the social reproduction and access to services for these workers.

Filtered: The Café and Contemporary Urban Experience

The contemporary café's popularity and growth from the late twentieth century is unparalleled; it is tightly linked to profound social, cultural and technological change occurring in cities across the world. A visit to the café is an embodied, emplaced and sensual experience through which forms of social distinction and markers of taste are reproduced or challenged (Johnston & Baumann 2010). 'Having a coffee' is a ritual of everyday life for many, yet it is more than a latte or cappuccino that draws people to a café. It provides a "third space" (Oldenburg 1989), a place outside the home or work in which to meet, work or be alone. The café is an urban phenomenon, and its role is of increasing importance as cities grow in scale, diversity and density. This paper explores the tensions and contradictions inherent in contemporary global café culture. It investigates how café culture reproduces both techniques of inclusivity and exclusivity, its relationship to urban gentrification and belonging, and its role in the growth of global aesthetic and food cultures. The focus is mainly on specialty or independent cafés in which taste and an artisanal approach are paramount. The paper draws on ethnographic and qualitative research in cities in Australia, Asia and Europe.

Gender and Ethnicity in Israeli High School STEM Courses: Students Beliefs and School Policies

The underrepresentation of girls and women in STEM and its persistence, has attracted a great deal of attention over the past decades. So far research has mostly focused on individual or social-structural explanations to this phenomenon. In recent years critical sociologists have also adopted a more intersectional approach examining the intersection between gender, race and class. However, what have yet to receive adequate attention is the impact of school policy on gender patterns in STEM. In particularly the ways in which choice

and tracking policies affect the participation in advanced STEM classes of girls and boys from diverse social and ethnic backgrounds.

Recent data from Israel show that while Jewish high schoolers exhibit the well-known gender gap in advanced physics and computer science course taking, Arab students show gender equality, or female advantage, in such courses. Inspired by this intriguing pattern, this explorative study compared two schools in the south of Israel: One a general state schools that serves the secular Jewish majority group in Israel. The other, is an Arab-Israeli state school that serves the indigenous Bedouin minority. Using qualitative data (interviews with the teachers and the schools' management teams) we unpacked the school's policies in relation to advanced course-taking. Using quantitative data (students' questionnaire) we examined differences and similarities in students' perceptions of STEM courses and careers. Findings show that gender differences towards STEM fields of study and future occupation are similar among both Jewish and Arab students. Yet, Arab girls take advanced physics and computer science courses in a much higher rate. This can be explained by different school policies. While the school that caters for Jewish students prioritizes student choice, the school that caters for Arab Bedouin students has a more rigid placement policy that oblige high-achieving girls to enroll in physics and computer science courses.

Inequality in Israeli Higher Education: A Multidimensional Perspective Using Administrative Data

The Israeli higher education system has undergone dramatic processes of expansion and diversification since the mid-1990s. This has been mainly due to the establishment of new collegiate institutions and the grant of academic accreditation to the undergraduate programs of the older-established ones. The expansion has increased the number of degree-granting institutions from about 10 to over 55. In order to explore the consequences of these processes for educational inequality in the undergraduate level we created a large dataset based on a representative sample of about 20% of all Israelis born between 1978 and 1981. These individuals were teenagers when their families were sampled in the population census of 1995. By merging additional information on achievement in high school and a national university entrance test, on enrollment in tertiary education and on degree completion we were able to examine vertical (access and completion on time) and horizontal (potential returns in the labor market) gaps, as well as mechanisms that may account for them. The findings indicate that Ashkenazim, the privileged Jewish group, remain the most advantaged regarding enrollment in higher education, but their advantage over other Jewish groups is mainly due to high school tracking and achievement. Among the enrollees, new immigrants from the former Soviet Union have the highest odds of enrolling in the most lucrative academic programs. Israeli Arabs are disadvantaged compared to Jews regarding both the vertical and horizontal dimensions. In addition to the importance of high school processes to the understanding of inequality in higher education, results from binary and ordered logistic regression models highlight the importance of secondary effects in horizontal inequality and institutional characteristics to graduation on time. We conclude by presenting future plans for this project and by discussing our experience with using administrative data for studying educational inequality.

Managing CCTs in Brazil 2001 to 2017: Power, Agents, and Reputations

In this paper, we analyse the effects of alternations in power on CCTs in Brazil from 2001-2017. Our central argument is that the instrument constituency that promotes and advocates for CCTs, plays an important role in explaining this policy's development and continuity. We examine how these policy actors behave/respond to various types of alternations of power, and the policy consequences of their reactions. The paper's central claim is that although the main factors of interest that condition the coalition dynamics of CCTs change with each alternation of power, this specific policy has, in contrast to other programs and policies in Brazil, been relatively consistent across administrations. Why? Our central goal is to explain this continuity beyond the mainstream institutional analyses that stress the standard policy feedbacks literature emphasizing the *self-reinforcing effects* of policy (Hacker 1998; Myles and Pierson 2001). We suggest that there are common operating processes in Brazilian politics, in particular at the bureaucratic level, that promote, protect, and defend CCTs as a policy instrument from elite and mass level politics, generating self-reinforcing policy effects that have been highly understudied. Based on reputation theory (Carpenter 2001; 2002; 2010), we suggest that it is because certain actors and institutions in Brazil have come to exist by and for this policy instrument, that they must strike a balance between

responding to new demand pressures, and protecting their reputations via the instrument's refinement, by articulating solutions that provide agency to the "supply-push" of the instrument itself (Voss and Simmons 2014).

'We Can Do It!' – the Mental Health Promoting Effect of Female Communities

Women have to cope with multiple roles (household duties and workplace responsibilities) resulting at more mental and somatic health risks like stress and worse health status (Ádám, Cserhádi, Balogh and Kopp, 2010; Nistor et al, 2015). However, to balance this effect women are more health conscious and effective in health communication - they willingly report on any changes in their health status (Caroli and Weber-Baghdiguian, 2016; Susánszky, Susánszky and Kopp, 2009).

Community mental health promotion is becoming more and more important (Erdei and Lippai, 2014), so our research aims at investigating the activities and participants of a self-organized workplace leisure group initiated by the researchers themselves. Our target group consists of volunteering women working at the Dean's Office of the Juhász Gyula Faculty of Education at the University of Szeged, Hungary. The observed group is heterogeneous by age and education. We would like to study how the strength of the community affects the mental health of the examined sample, whether the group is able to and to what extent reduce the effects of everyday stress.

The mental health status of the participants will be measured before and after the community program, as well as the activities of the self-organized 'female club' will be monitored. We believe that by utilising the methodology of workplace health promotion and building on the strength of the community, our research will clearly underline the positive impact of community-based mental health promotion on the female group under study. The research results can provide the bases of a workplace health promotion project to be extended to the complete teaching and non-teaching female staff of the faculty.

Global Policy Responses to Crises of Youth Unemployment: Business As Usual or Radical Change?

As the consequences of the 2007/8 global financial crisis (GFC) continue to spread through economic, welfare and labour systems in the global north and south alike, it is clear that young people are disproportionately (and in many contexts severely) adversely affected. Interest amongst IGOs during the early years of the unfolding crisis resulted in some measure of convergence in their emergent policy positions that reflected emphasis on pro-welfare policies in many nation-states, and fuelled interventions to increase demand for young people's labour (Fergusson and Yeates, 2014). Ten years after the GFC, with the normalisation of mass youth unemployment, the ephemeral neo-Keynesian policy revival seems to be receding rapidly. Now, the balance-sheet of interventions amongst IGOs leans towards supply-side measures and work-based conditionalisation of welfare entitlements. Two global partnership initiatives reflect these trends - the 'Youth Employment Network' and 'Solutions for Youth Employment'. This paper argues that their approaches largely promise to consolidate the characteristically-neoliberal trend. Both partnerships have a strong focus on improving the capabilities of young entrants to the labour market. Their priorities also suggest that advocacy of comprehensive, universalist social protection systems providing adequate unemployment benefits is weakening substantially. And yet the two key IGO players in both partnerships have also continued to adapt their own core positions in ways that would have been especially surprising before the GFC. The paper traces the mixed and sometimes apparently contradictory priorities of these two IGOs and the partnerships which they cohabit with other IGO, global-corporate and transnational Third Sector entities. It qualifies claims that they are dominated by neoliberal positions on labour market and social protection policies. It briefly discusses how these developments may bear upon the SDG ensuring that all young people will have full and productive employment in decent jobs by 2030.

FERNANDEZ, LARINA* (*Tata Institute of Social Sciences*)

Exploring Food Security, Disasters and Gender-Justice

Disaster discourse generally refers to and is largely influenced by sudden geophysical catastrophes. There is little literature on the conceptualization of disasters from 'routine' events that disrupt the social system and the built environment. Reflecting on this thought, my dissertation aims to locate food security within disaster studies and explore the idea of gender justice within.

Food insecurity is often perceived as a consequence/ secondary impact of disasters. The factors, causes and effects of nutritional disasters that aggravate pre-existing vulnerabilities (of regions) are hence poorly understood (Dirks et al., 1980). The lackluster approach in dealing with food emergencies is also discussed by Mayer. As Balatibat (2004) rightly points out, "the persistence of hunger and malnourishment in a world of plenty is the most profound moral contradiction of our age". Most of these food insecure pockets are also primarily occupied by the socially, economically and culturally backward (Chakravarty & Dand, 2005). Furthermore, women are disproportionately affected despite being producers of 50-70% of the food consumed in developing countries.

My dissertation hence explores the interplay of social interactions and human-environmental dynamics that shape food vulnerability. Why women are rendered vulnerable during a food crisis is discussed with the objective of ensuring gender-justice while planning food security programmes/policies. The causality also paves way to new thematic research areas within disaster studies while driving home the need to perceive food insecurity as a silent disaster.

Note:

The abstract summarizes parts of my Masters dissertation. My research participants were members of the Irula tribe of Attapady, Kerala. Despite high HDI, pockets like Attapady where women are undernourished and infants die due to malnutrition exist within Kerala on account of which, the state initiated a number of interventions, including one on Community Kitchens, to address the crisis.

Understanding Innovation Behavior: A Sociological Approach

The value of innovation for economic and social development is widely accepted. Several strands of research try to capture the importance of human aspects of innovation. A great amount of research has been focused on identifying factors that may encourage and enable innovative behavior at work, in teams, groups and organizations, as well as in the use and diffusion of technologies. Nevertheless, there is scarce evidence on what innovation means at societal level. Surprisingly, sociology has not paid much attention to the conceptualization and measuring of innovation from the point of view of the population of innovation systems.

The goal of this paper is to explore the main features of the innovative behavior of people. We depart from a wide definition of innovation as a kind of purposive social action. In addition to the more technical aspects of innovation, we consider creative thinking, collaboration, initiative, openness, a positive approach to failure and trust in other people. We assume that such dimensions of innovation behavior are interrelated, and that they are shaped by both culture and elements of social structure.

We test this approach by using a representative survey of the population of Spain designed for the purpose. The random sample is formed by 2500 people by face-to-face interviews. We first depict the innovative behavior of the whole population and some social strata. Then we use factor analysis and cluster analysis to detect innovation profiles. In addition, we use causal analysis to explore the influences of social class, work conditions, social capital, cultural capital and beliefs.

The results suggest that, when studied at societal level, behaviors, attitudes and abilities related to innovation appear as a central aspect of social differentiation. The conclusions discuss how in the knowledge society this social divide may have important implications for welfare, development and cohesion.

Intervening in Communities: Community Networks and Impacts of Urban Regeneration Programmes in Andalusia (Spain)

Urban regeneration policies are an emblematic example of a public intervention aimed at improving living conditions in a given community. These interventions require the participation of different communal actors, institutional or not, present in the area. Previous studies have shown how the different contexts of interaction in which this type of policy is developed (characterized by the territorial context and the design of the intervention) can generate different coalitions of governance during the implementation of the projects. The aim of this communication is to examine if different coalitions of implementation generate different impacts in the intervened areas. To this end, different projects belonging to the same programme developed by the regional government in different cities of Andalusia will be analyzed. These cases present different contexts both in the situation of the areas involved (centers vs. peripheries), the design of the project or the dynamics of collaboration between the different actors present in the field. This work presents advances from the "Urban-Impacts" project, financed by

the Spanish Ministry of Economy and Competitiveness, and uses data from the project "Urban Regeneration and Social Cohesion in Andalusia (Rucosa)" financed by the Department of Development and Housing of the regional government of Andalusia.

Title: Attitudes about the Women's Movement in Different Cultural Region

In this communication we will present the results of a research on attitudes about the women's movement of the different cultural regions present in the last wave of the World Values Survey. We will compare 1. The sociodemographic profile of those who support such organizations and 2. To what extent do the attitudes of those who trust the women's movement correspond to their attitudes towards equality between men and women and sexual tolerance. Our starting hypothesis is that the sociodemographic profile of those who defend the women's movement varies according to the cultural regions. In addition, the relationship of attitudes to the movement of women with other attitudes related to gender equality and sexual tolerance will also be different. We will discuss the results of our analysis regarding civil society values in the planet.

ZIPPEL, KATHRIN (Northeastern University)

What Do We Say When We Talk about Women and Science? Framing Problems and Solutions in the EU and US.

Around the world, there is a steady output of reports decrying the gender imbalance among scientists in particular. However, even what counts as "science" is a contested concept and the construction of the social problem of "women's underrepresentation" even more so. In this paper, we combine quantitative and qualitative content analysis of the discourse defining what the problem is understood to be, to identify variation in frames for intervention offered by different actors to different audiences. We construct a topic model (using LDA) of the reports from between 2000 and 2015 from the US and EU's task forces and study groups to see the similarities and differences in the words chosen to describe the situation. We also subject a smaller set of 25 full reports (and another 25 executive summaries) to a qualitative analysis of the kinds of problems constituted by gender disparity and for whom these are problems, the approaches suggested for remedying them, and who precisely is to do something to fix them. The quantitative topic model emphasizes how specific terms cluster together. The qualitative model provides a more integrative look at the types of argumentation deployed in when these concepts are invoked, and how problems and solutions are connected in individual documents. We find that EU discourse is more overtly political and addresses educational systems as part of a broader policy commitment, while the US approach is more closely tied to the internal practices of individual universities and integrates gender with other forms of diversity. The role of academic capitalism in the framing of the problem lies more in the style of argumentation than in the choice of specific frames for either problems or solutions.

FERREIRA, ANA* (Centro Interdisciplinar de Ciências Sociais CICS.NOVA - Faculdade de Ciências Sociais e Humanas - Universidade Nova de Lisboa (CICS.NOVA.FCSH/UNL))

Portugal in the Semi-Periphery of Scientific Research

In 2015, almost half of the world's population was at risk of developing malaria and 212 million new cases were reported. As such, malaria is a major threat for public health, particularly in geographies where it is endemic, mostly in poor countries and regions. Despite these numbers, malaria was the focus of only 0.4% of all biomedical research, with studies being mostly conducted in North America and Europe.

In Portugal, science has long contributed to the understanding of malaria, a feature commonly attributed to malaria's endemicity in continental Portugal until 1973, and to the long-standing relations with Portugal's former territories, where malaria remains endemic. However, it was never addressed whether the organizations where malaria research takes place, the research practices and their underlying *ethos* are framed by Portugal's relations with its former territories, or rather, by Portugal's relations with more developed scientific and technological systems, such as the ones of the European Union.

This paper addresses these issues through the characterization of the scientific landscape of malaria research in all Web of science-indexed publications involving Portuguese organizations (1900-2014; n=467). First, data was systematized by

content and bibliometric analyses. Subsequently, multiple correspondence analysis revealed a bi-dimensional landscape (who's publishing; what's published) and cluster analysis identified three profiles: beginners (early non-experimental publications); local appropriations (low-impact research in which Portuguese organizations lead others from former Portuguese territories); global patterns (applied research developed by heterogeneous actors, in which Portuguese organizations are subordinated to others belonging to countries from more established S&T systems).

These profiles reveal the construction and considerable growth of the Portuguese scientific system. Nevertheless, it further unveils Portugal's participation in a world system where it assumes a semi-peripheral role, embodying performance- and application-driven modes of production from the center, and reinforcing them, by imposing some of its features in the periphery.

"the Less Smelly Bathroom": The Scape of Children from Symbolic Violence in the Classroom

This study aimed to analyze the children's perceptions about their favorite places at school. The results are part of a master's thesis. We selected a 5th grade class from a full-time public elementary school with a traditional institutional model in Brasilia, Brazil. Twenty-five children between 8-11 years old participated. The classroom was warm and too small; the children had a low mobility and the teacher used to give a myriad of orders to them. Data were collected through the children's drawings regarding the theme: "My favorite place at school". We also asked each child to explain his/her drawing. We highlight responses from two 10-year-old girls. Both represented the bathroom as their preferred place. The first girl replied: "The bathroom is my favorite place because I can express my emotions there. For example, when I am sad, I use to cry alone to feel better. In the classroom I cannot express my feelings, because everybody asks me and this bothers me". The second girl said: "I like the bathroom, because I can cry alone there. I feel more comfortable there. When I am humiliated by someone else, I want to be alone". The last girl also reported that she chooses a specific bathroom in the school, one that does not smell too bad so she can express her feelings more easily. The symbolic violence in the context of the classroom acts directly on children who, in turn, try to react to it. In the process to react to that violence, the bathroom became the only space where they can truly express their feelings. We consider that the school with a traditional model keep using elements of the symbolic violence and it generates children's aversion to the learning environment when, in fact, this environment should be welcoming to them.

Anthropocene: Focus on Human Dimensions of Climate Change (Brazil, China and Mozambique)

Human activities are central to the debate on global environmental changes, configured as unprecedented challenges to contemporary societies in the transition to the Anthropocene. This paper is part of the discussion on social political dimensions of climate change, focusing on the question of how society responds to the risks arising from these changes.

Within the understanding of the social and political dimensions of global environmental changes from the perspective of risk society and sociology of climate change this article aims to investigate the way in which Brazil, China and Mozambique have internalized the environmental issue, especially regarding climate change issues, analyzing three social spheres fundamentally present and relevant in this process: the governmental sphere, the scientific community and the organized civil society.

From a theoretical point of view, we propose an analysis able to foster the dialogue among environmental sociology, sociology of climate change and social theory and sustainability. In order to meet the objectives in this research different methods of research was adopted, including the analysis of primary and secondary data and sources, literature and documentary research, and semi-structured interviews with government officials, scientific agents and civil society organizations' representatives relevant to the issues addressed in the project.

Cartographies of Homosexual Aging: A Study of "Successful Age Markers" in the Gerontological Literature

From 1969 emerged the first theoretical essays on homosexuality and old age. In the first wave of "LGBT gerontology" (1969-1975), scientific discourses tended to approach a pathological perspective, associating cognitive deficits, depression and isolation, as well as stigmas and discriminations in the erotic market related to the decrease of virility and loss of youth; in the second wave, from 1975, researchers from different places sought to break with the paradoxes between youth/old age and safeguarding a "successful" notion of aging. The markers of "successful" aging, thus, crystallized in the expressions of *family support, heterosexual marriage, monogamy, reproduction, financial independence, autonomy* etc. This research aims to describe analytically and historically the "successful" aging markers from LGBT gerontology, resulting from the literature in Brazil, United States and England, from 1969 to 2017. As specific objectives: (a) to map and analyze these markers contrastively, (b) situate academic production geographically, tracing the places from which the literature emerges, and thus the markers, and (c) articulate the reflection on the scientific production to the problem of the proliferation of segmented models in commercial media, liberation movements and homosexual visibility, as well as the achievements of rights and social recognition in the last decades. In methodological terms, this is a qualitative research, which is based on a systematic review of literature. Finally, we will offer a partial balance on the markers of "successful" aging, the changes and the continuities during the last forty-eight years, articulating a critical reflection on the triad "success"-homosexuality-old age.

FERRENO, LAURA* (Universidad Nacional de Avellaneda)

Communication and Interculturality

The paper will describe the centrality of the communicational strategy in policies aimed at poor communities and cultural ascriptions other than the dominant ones. In particular, it will analyse the Program of socio-sanitary intervention on population exposed to risk of contamination with lead in Villa Inflamable. The interest in this program lies in the difficulties that were manifested in transmitting to the affected population, sanitary practices and a food culture that would improve the quality of life of the community.

The program was developed from a multidisciplinary approach (having professionals as diverse as doctors, social workers, nutritionists, environmental specialists, psychologists, engineers, architects, nurses, biochemists, among others) and with a multisectorial point of view (through the participation of public institutions dependent on the different levels of the government, and the two most prestigious universities in the country). However, it lacked of a socio-anthropological perspective that would have facilitated the communication with the affected population and the introduction of induced preventive practices.

Villa Inflamable, is a marginal neighbourhood that grew near the Petrochemical Complex of Dock Sud in the Municipality of Avellaneda (Province of Buenos Aires, Argentina); its inhabitants are exposed to air, water and soil pollution. A lawsuit forced the State to monitor the health of citizens and the implementation of a series of measures to improve the quality of life of its inhabitants until the neighbourhood was relocated. The news derived in the interest of a team of anthropologists in the problematic, whose findings had an important repercussion in the academic world, although unknown for those who were in charge of the program.

This presentation will analyse the key role of sociologists and anthropologists in the elaboration of communication strategies aimed at communities that are culturally different from where those that were initially think for.

FERRENO, LAURA* (Universidad de Avellaneda)

Mujeres Contaminadas: El "Destrato" En El Trato. El Caso De Villa Inflamable

Villa Inflamable, una barriada de Avellaneda (Provincia de Buenos Aires, Argentina) sufre el flagelo de la contaminación además de la pobreza, la marginación y el estigma. Ubicada en las cercanías de un Polo Petroquímico, no solo el agua y el aire están contaminados, también la tierra. La situación afecta la salud de toda la población, pero los más vulnerables son los niños: algunos tienen enfermedades crónicas y otras malformaciones congénitas. A pesar de la conformación de equipos interdisciplinarios para abordar la problemática y la obligación del traslado de sus habitantes, los programas gubernamentales no mejoraron los problemas sanitarios.

Las mujeres son quienes cargan sobre sus espaldas los padecimientos de los enfermos a quienes cuidan: hijos y ancianos. Ellas conviven con la desidia y las falsas promesas de profesionales y asistentes sociales gubernamentales, qué irónicamente son mayoritariamente mujeres: incumplimiento de protocolos y controles sanitarios, carencia medicamentos, programas que no alcanzan las metas propuestas, escasa o nula política de concientización respecto a las consecuencias de la contaminación para ellas y su entorno. Inmersas en una maraña burocrática de promesas incumplidas, enfermas y sin dinero, recorren los pasillos de instituciones gubernamentales y de hospitales públicos esperando acciones paliativas que no llegan o llegan tarde.

RC30-JS-36.5FERSCH, BARBARA* (*University of Southern Denmark*)*Freelancing on an Online Market Place: Exploring Freelance Work Practices in the Context of Digitized Regulation Mechanisms****Freelancing on an online market place: Exploring freelance work practices in the context of digitized regulation mechanisms***

In the last couple of years freelancing on crowdsourcing based online marketplaces has become increasingly common. This paper provides an in-depth look at the practices of freelancers at one of these marketplaces, fiverr.com. Here a very broad range of services in the cultural field is offered, such as translation, writing, design and video animation. The emerging field of research on online freelance labor markets emphasizes the importance of digital reputation based ranking systems ("reputation economy") and algorithms (e.g. Gandini 2016) as digitized regulation mechanisms (instead of strongly network based modes of working in "offline" freelancing (e.g. Neff 2005, Fersch 2008)). In this context, what practices do the freelancers apply to handle the relatively anonymous customers in the low-trust context of a global online market place? Which strategies do they use to earn money and sell services in a sustainable way? The paper aims to contribute to a deeper understanding of these new forms of work practices. Empirically it is based on an analysis of chosen relevant forum threads of the very lively forum of fiverr.com and observations.

RC40-707.2FEUER, HART* (*Kyoto University*)*Geographical Indications out of Context and in Vogue: The Awkward Embrace of European Heritage Agricultural Protections in Asia*

Populist policymakers in many Asian countries have recently begun embracing the European model of geographical indications (GIs) as it promises a pathway to international prominence for famous domestic agricultural products. The motivations share consistent themes in most cases, with proponents suggesting that territorially-defined product differentiation is already informally recognized and that the products in question are world-class but under-marketed. Although the premise for such a 'policy transfer' is persuasive, it has led to divergent and inconsistent policy results across Asia due to the myriad local adaptations to the regulations. While legal and technical variations have long been a facet of the migration of such policy for intellectual property in food, the challenges that face Asian countries largely can be delimited to a specific subset: the spectrum of *sui generis* models of geographical designation established among countries with divergent levels of economic development. While this area remains relatively underdeveloped empirically, scholars have suggested that a particular focus should go to the prospects for spurring rural development (strong producer institutions and preservation of biodiversity and knowledge) and raising welfare in an ethically-sound manner. This paper approaches this prescription by contrasting the roll-out of such GI policies in Japan and Cambodia. This paper evaluates the differences in policy orientation in each country, the initial roll-out and suitability for domestic agricultural producers and value chain, and the extent of inconsistencies vis-à-vis other Asian countries and the European Union. While the Japanese policy's rapid deployment has largely relied on strong producer support structures and pre-existing market structures for heritage agriculture, Cambodia has trodden slowly to create new institutions and defuse potential conflicts. As the initial perceptions of success have started to fade, light has been cast on the incongruous definitions of GI products and the long-term viability of the European model.

RC47-JS-22.4FIALA, ELISA* (*Instituto Superior de Ciências Sociais e Políticas*)*Brave New World of Work – through the Lens of Disability*

Work and paid employment has become the central aspect of the social identity in our contemporary work societies. The assumed positive aspects of wage labour and employment on the individual well-being are hardly questioned. It is instead claimed that work offers the individual a sense of purposefulness, a possibility to contribute to the collective good and a daily structure. The exclusion from work and employment has played an important role in the struggle of the disability rights movement. All over the world, people with disabilities belong to the most marginalized group in the labor market. Celebrated as an international milestone in advancing and developing the recognition of disability as a human rights issue the Convention on the Rights of Persons with Disabilities and its Optional Protocol were adopted in 2006.

This paper explores what role the disability movement and the disability rights framework plays in shaping and transforming our present work society. Based on the German context, it is outlined to what extent social policies have been implemented that address the exclusion of disabled people from the labor market. It is further shown to what extent the disability rights movement can contribute to a

more equal and just world of work that not only benefits people with a disability but also other marginalized groups.

RC47-JS-22.13FIEDLSCHUSTER, MICHA* (*Universität Leipzig*)*The Complexity of Representation in Social Movement Democracy: The World Social Forum and Occupy Wall Street Movement*

Many social movements criticize representative democracy as a political system and consider representation ill-suited for democratic social movement organizing, which should be participatory in principle. Despite the anti-representative stance, representation is an important aspect of studying democracy in social movements: leadership, diversity in joint statements, and presentations in the media etc. relate to issues of representation, pose challenges to the participatory quality of a movement and often result in tensions. This is the fact in both of my empirical cases: the World Social Forum (WSF) and the Occupy Wall Street Movement (OWS).

In both cases, representation is largely rejected as a mode of decision-making and organization: The WSF's charter of principles states that it does not represent global civil society or that anyone can speak for its participants. Nevertheless, representation is an ongoing issue: first, in regard to leadership and vanguardism in the organizational structure. Second, in regard to the Forum's representativeness of the diversity of activist networks in the world. Based on my fieldwork, I will show how representation concerns the facilitation of building alliances for collective action and the facilitation of inclusive participation.

The OWS set up a radical participatory space in Manhattan and, by that, created a symbolic representation of the marginalized in the U.S. population in the heart of financial capitalism. Representation was strongly objected as a mode of organization and Occupiers had to creatively define mechanisms how to (re)present the movement and its complex constituency in the public without sacrificing their radical participatory ambition.

Comparing the different aspects of representation in both cases, this presentation shows the complex relationship between representation and participation. It makes the case for conceptions of representation that go beyond the classical view, which denotes political representation as a formal process of conferring political power from the electorate to few individuals.

TG07-1004.1FIGOLS, FLORENCE* (*Concordia University*)*The Fluidic Quality of Listening: Sensory Continuum in the Dance Studio*

This paper proposes to highlight the sensible continuity between speech/voice and kinesthesia/movement through an incursion into rehearsal studios and practices in the contemporary dance field.

In actual choreographic and training practices, dancers generate movement from verbal directions rather than from the "visible" information given by an already made movement sequence moving away from mimesis. Choreographers do not necessarily demonstrate a movement to be reproduced; they direct, they suggest, they propose. They give content rather than the form, the essence rather than the appearance.

Even if the choreographic work is not meant to be narrative, verbal directions are more and more present in the process. They intercede and participate in the emergence of the not-yet-manifest, trying to saturate the performers' bodies and the space with sensible resonance. But if language can prompt a physical action, the perception of that action will also inspire the next verbal direction, creating here an on-going loop in the kinaesthetic-visual-verbal process: this invites the dancers to listen rather than looking in order to promote a new sensory ecology.

The ear receives the information from all around, in a tri-dimensional modality. Sound fills and travels through the air, it goes "around corner" and "does not need light"; in other words it frees the dancer from watching; they can face in any direction to access the information, triggering new spatial configuration and moving away from frontality. Stressing the aural rather than the visible, involves here, the fluidic and continuous quality of listening which allows the dancer to process sensory information in simultaneity.

What are the sensible and physical resonances between speech and movement? How the voice can trigger a physical experience from within? How socio-economical contexts and somatic approaches have influenced those new ways of doing?

RC08-163.4FILGUEIRA DE ALMEIDA, DULCE* (*University of Brasilia*)*The Influence of Donald Pierson on Body Studies in Brazil and How He Is Received There*

This article aims to present results obtained from a study on the influence the North American sociological school of thought has had on the constitution of the

Sociology of the Body in Brazil. For this purpose, bibliographical and documentary research was developed using archives from the University of Chicago and the University of Florida, both located in the United States. With the goal of discovering points of contact between the beginning of the sociology of the body in Brazil and the presence of foreign authors there, it became evident that, besides the French authors, the North American school of Chicago greatly influenced our formation. Donald Pierson (1900-1995), a North American sociologist belonging to the Chicago School tradition, lived in Brazil between 1937 and 1957. He contributed to the formation of the first Brazilian sociologists, such as Oracy Nogueira; he was her academic advisor. It is based on Donald Pierson that the first sociology of the body matrix is formed, with works that focus on themes that are extremely similar to those investigated in Chicago, such as racial questions, immigrants, and field studies that use the city as a laboratory. In this trajectory, the matrix of sociology of the body is constituted by Donald Pierson, Oracy Nogueira, João Baptista Borges Pereira and Renato da Silva Queiroz.

Age-Based Attitudes Towards State Welfare for the Elderly: Setting Conditions for the Intergenerational Contract

The welfare state is sometimes conceptualised as an implicit intergenerational contract. Old age pensions and elderly care are the main sources of support targeted at elderly. Moreover, older people consume more healthcare than other groups. Thus, considerable public resources are transferred from the active population to retired elderly. However, due to tight budgets and restructuring of welfare states, in part driven by population ageing, the generational contract has come under pressure. We might speculate that intergenerational conflict will gradually emerge as a prominent political cleavage. To say something about the likelihood of such conflicts, attitude surveys are helpful. However, survey data struggle to reveal why people hold the views they do. Thus, the proposed paper complements existing research by analysing data from focus groups interviews with young adults and retirees in four countries (Germany, Norway, Slovenia and the UK) representing different welfare state regimes.

We explore attitudes towards the use of conditions in programmes targeted at the elderly. Little is known about how the general trend of increasing conditionality is reflected in social policies for the elderly. Old people are generally considered deserving recipients of state welfare. Attitudes towards old age policies may also relate to self-interest, or normative arguments, based on convictions about fairness or obligation. These arguments are always articulated within a context of institutional variations across welfare states.

Interested in expressions of intergenerational solidarity and conflict and their underlying motivations, we look for differences between the old and the young. We examine attitudes toward undeservingness of elderly and arguments for and against conditionality when awarding public old age pension benefits and elderly care services. The analysis is comparative at two levels: First, we investigate whether attitudes and justifications differ between age groups within each country. Second, we examine differences and similarities across the four cases.

FINE, MICHAEL* (Department of Sociology, Macquarie University)

Aged Care Utopias: The Promise and Contradictions of Recent Radical Transformations of Long-Term Support.

The past half century has seen massive and unprecedented changes in the way that care for the increasing numbers of older people needing support is conceptualised and delivered. This is particularly evident in the market societies in which changes in care are the deliberate product of policy shaped by the neo-liberal politics of welfare capitalism. While the process of innovation has both local and global dimensions, the broad outlines of the goals and results are remarkably common: the development of alternatives to family provision and institutional provision; case-management and more integrated and individualised/personalised forms support; and a move away from centrally organised and publicly funded provision towards more flexible funding, which increasingly involves marketized provisions. Yet we also continue to be confronted by the contradictions, failures and shortcomings that are the product of these changes, including the continued devaluing of caregivers, paid and unpaid; the ongoing gender imbalance in responsibility for direct provision; and inequalities in access and outcome. This paper explores the promise of these utopias and their contradictions, through a focus on three distinct socio-analytic perspectives: the political-economy of welfare; the quantitative research dimension; and the precarity of care.

FINE, MICHAEL* (Department of Sociology, Macquarie University)

DAVIDSON, ROBERT (Department of Sociology, Macquarie University)

The Marketization of Care. National Responses to a Global Paradox - an Australian Case Study.

Over recent decades there has been a shift away from more traditional forms of public services towards increasingly marketized systems of provision. These are associated with an increasing reliance on private capital and competition between a variety of providers, with public agencies competing alongside private for-profit and not-for-profit non-government agencies. Drawing on care theory as well as historical sociology and political economic analysis this paper examines the conflicting tensions that shape aged care under marketization. Using Australia as a case study, it is argued that aged care is increasingly the site of ongoing conflicts over governance. Tensions are also evident as larger commercially-focused bodies, both privately owned and non-profit, increasingly threaten to take over space historically occupied by government and small locally based non-profit providers.

FINGER, CLAUDIA* (WZB Berlin Social Science Center)

Do Information on Returns Reduce Gender and Socio-Economic Inequalities in Field of Study Choices? Information on Returns Make a Difference?

It is well known that there are marked gender and social background differences regarding field of study-choices. At the same time graduating from different fields of study leads to different labor market returns both in terms of income and occupational prestige thereby transferring inequalities in the educational system to the labor market. In this paper I ask whether gender- and social background-specific differences in field of study-choices are not only due to socialization processes and role models, but also to information deficits on returns and whether such inequalities can be reduced by providing information on this topic. To answer these questions I use data from a field-experimental longitudinal study on high school students in Berlin, Germany (5 waves, one year before high school graduation – 1.5 years afterwards). The first questionnaire included questions on aspired educational levels and fields within these levels. After the first survey we provided information on labor market returns to students from 8 (out of 27) randomly selected schools. We focus on students who plan to enroll in college and analyze whether those in the treatment group more frequently change their field of study in an upward direction (i.e. towards more rewarding fields) than students in the control group and whether this reduces social background and gender differences in field of study-choices. We examine different outcomes: first, students' fields of study-plans three months after the treatment, second, applications for and third, enrollment in different fields of study. As admission restrictions strongly vary by field of study in Germany, the distinction between these outcomes also yields insights into the question whether enrollments mirror (changes in) preferences or whether they are also due to institutional selection processes. The findings provide important insights into the mechanisms behind inequality within the higher education system and - ultimately - the labor market.

The Renegotiation of the Large Scale Assessment's Heritage on School Evaluation in Europe

IEA (PIRLS and TIMSS) and OECD-PISA results have entailed a political and media impact which paved the way to several reforms in the school system of many European countries, although they were introduced in different times and with different ways. The large scale assessment has received severe disapprovals for the theoretical and methodological system which characterizes this kind of assessment. Criticisms largely question the low attention of the up-bottom approach given by standard tests in school system analysis. A growing attention has been given to vertical and horizontal dimensions in the last years (Jansens e Eheren 2016; Eddy-Spicer 2017). The vertical dimension focuses on the decentralization of powers towards intermediate public or not-public organizations. The horizontal dimension refers to school managers and teachers' powers in creating schools networks and peer relations among schools (Hargreaves 2010). National and supranational governing bodies, based on the

increasing legitimacy of polycentrism in assessment measures, are adapting their approach to a decentralized decisional process, creating a link between the edge and the core system. This work aims at giving a review of the main assessment methods (self-evaluation, external evaluation and improvement) used in European school systems, while focusing on the heritage, the links and the redeployment of the methodological systems applied by both national and supranational organizations (Oecd 2017) including intermediate organizations and schools networks (Eheren et. al 2017). The analysis will reflect in particular on the complex and controversial evolution of the decentralization process and the developing polycentrism of European school institutions.

Sociology of Philosophy Versus Sociological Philosophy: Differences, Similarities, and Potentialities for Alliance.

This paper aims to compare two subdivisions of sociology, sociology of philosophy and sociological philosophy in terms of their basic assumptions, problem areas, and theoretical positions. In the first part, sociology of philosophy is debated based on its strengths and its close relation to the history of philosophy. Especially, as an undisputed pioneer of the field, Collins' work is being reviewed. In the second part, Chernilo's project of a new idea of the philosophical sociology is debated by referring to the main discussion on normativity and humanity, highlighting its potential to reflect on the future of philosophy. Thus, in the concluding part, it is stressed that both subdivisions have substantial contributions to the sociology of knowledge but they have quite different positions: sociology of philosophy takes a historical position while philosophical sociology is more like futuristic in its attempts.

From the Dream of Hyperconnectivity to the Nightmare of Immobility

In "The Electronic Eye"—one of the cornerstones of surveillance studies in sociology—David Lyon situates the circulation of personal information as one of the most important issues to be inquired within the technological changes of the late twentieth century. The ethics and the politics of surveillance became a major concern to social sciences. It was 1994 and the Internet was in its infancy, while many were dreaming with the wonders of a democratic hyperconnected society, tackling problems of social inequality through online communities. More than two decades on—and after 9/11 and Snowden—personal information is now personal data, and there is Big Data as well as powerful algorithms to govern the movements of data and everything that can be done with it. Inequalities have grown, and so the apprehensiveness with the augmented way in which personal data is shared, exchanged, sold, and classified for social sorting purposes. Algorithm is, in many ways, as powerful and determinant to shape changing-present and future societies as the car was (and still is) to the industrial modernist cities. Algorithm represents everything that can be programmed, planned, scripted, predicted, and preempted. It is the essence of what seems to be the next urban form in terms of connection, communication, and (im)mobility. In this environment, data is coded and compared with behavioral patterns to produce methods of social and spatial sorting, and access control. If something deviates from these patterns, actions are taken to bring things back to what is considered normality. Each algorithm defines, thus, a specific rhythm for movement and connection in the city. In this paper, I aim to use some of today's examples of territorial manifestations to show how a potential hyperconnected society is, in fact, resulting in some patterns of immobilization for targeted individuals and groups.

Social Networks and Intergenerational Transmission of Poverty

Research finds that economic deprivation continues throughout family generations and children raised in poor family households are at higher risk of adulthood poverty. As this process does not have a traceable genetic background, it is assumed that poverty risks are "inherited socially".

While there has been research on family-related processes that may explain the intergenerational transmission of poverty (e.g. parenting behaviour, parental warmth or involvement), there is still a gap of research that systematically applies a network perspective and taking intra- as well as extra-familial social relationships of the child and the social space into account.

The main theoretical framework in this respect has been provided by Bronfenbrenner's (1979) ecological model of human development. The ecological model takes a systems perspective, and provides a framework for understanding how factors that influence parents and children are nested within a hierarchy of four

main levels; socio-cultural (macro system); community (exo system); family /peers /school (micro system) and individual (ontogenic). These levels also describe a path of influence reaching from social and community factors to the more proximal, family and individual factors. Thus, to understand the factors of poverty transmission, all levels need to be taken into account.

Our research is applying this (inter-)level perspective and seeks to understand the structure and resources involved in different social ties/systems that surround the child during socialisation and the context of family income poverty and how these social ties/systems either enhance or mitigate the risk of later adulthood income poverty.

In order to analyse the effects of social networks on intergenerational transmission of poverty, we use longitudinal data from the German Socio-Economic Panel Study (GSOEP) as well as longitudinal regression methods. GSOEP is a large-scale annual household panel survey which has been conducted in Germany since 1984, providing life-course information on respondents and their parents.

Kitchen Girl Activists: Domestic Worker Global Policy Coalitions

This paper portrays the development of a domestic worker movement through mobilization around Convention 189. With the prospect of the first policy protection through the International Labor Organization, domestic workers around the world joined forces to bring their struggle directly to the negotiation of their rights. Unlike any other policy process, the International Domestic Workers Network positioned their own social locations as a site of policy advocacy, progressive action and movement building. This session explores the intersection of a burgeoning international movement of migrant household workers and the centrality of care policy in the global scope of human rights protections.

Human Rights-Based Approaches to Development in Contexts of Dam Dispossession

Conservative estimates place the number of people displaced by major dam projects at between 40 to 80 million people. Since the report of the World Commission on Dams in the early 2000s, International Rivers, an International Non-Governmental Organization (INGO) based in Berkeley, California, has promoted a human rights-based approach (HRBA) to development to address the impacts of dam projects for the people who call the rivers home; a politics with a questionable track record in preventing dispossession and market violence. Dam projects often proceed despite INGO initiated HRBA opposition in conjunction with the struggles or movements of affected people, or resume after what may have been an initially successful campaign to prevent their construction, sometimes under the auspices of the 1986 United Nations Declaration on Right to Development.

Informed by a critical interpretive methodology, this case study is a critical exploration of how International Rivers utilizes HRBA to development including human rights education (HRE) in contexts of development dispossession by big dam projects in Asia, Africa and the Americas. Staff members of International Rivers based both in the United States and at one of their regional offices were interviewed, and secondary documentation and materials produced by IR were analyzed. Relying primarily on select neo-Marxist concepts and analytical critiques of a human rights politics and the globalization of capitalism, the study demonstrates the contradictions and limits, if not the complicity, of HRBA to addressing dam related development dispossession in neocolonial regions by INGOs such as International Rivers. The emergent critique has implications for how INGOs use these approaches, including HRE and praxis, in contexts of development dispossession in these regions, and contributes towards the growing body of empirical and critical analytical literature on human rights, human rights education, capital and development dispossession, especially by mega dam projects.

Crisis and Opportunity: Gendered Citizenship, Structure and Agency in Exile

Expulsion from the state is approached as a crisis within both human rights and refugee studies, with Hannah Arendt proposing that the 'loss of national rights was identical with the loss of human rights' (Arendt 1976, 292). This analysis, conceptualises the state as a protective structure and seeks to rehabilitate the refugee into the state system, whether within a reformed natal state (through return), or into a new state (through local integration or resettlement), ultimately restoring the refugee as 'citizen'. This model is rooted in what Nira Yuval Davis

(1999, 119) terms 'the "fraternal" enlightenment project' and is both western centric and has a male, purportedly universal imagined citizen at its heart. Postcolonial feminist scholars have articulated the many ways in which third world/non-western women's relationships to the state are more commonly either distant or repressive. Expulsion from the state may not, for those who have held only notional or marginal citizenship, entail the 'radical crisis' of human rights (Agamben 1998, 126) that refugee studies and human rights theories conceive. Moments of rupture and crisis that disrupt powerful socio-cultural norms and break the alliance between constraining state and civil society structures can also be moments of social transformation and opportunity.

In this paper, we discuss a community of refugees in transit in Indonesia who are using their expulsion from the state to challenge constraining patriarchal norms within their community, profoundly changing gender, age and power relations. Tahira was a leader of this community for several years until her resettlement to Canada in 2017. We draw on the social practices and testimonies of this refugee community to examine the assumptions underpinning citizenship and question whether the social good that citizenship aims to deliver needs to be tied to the state.

Making Clients out of Citizens? Humanitarian Aid in Transitional Justice and Post-Conflict Interventions

Post conflict interventions are dominated by legal, security and development discourses. There is an emerging standardized 'set' of international responses to conflict including internationally mediated peace negotiations, prosecutions, truth commissions and an influx of aid and development International Non-Government Organisations (INGOs). After sustained efforts from women's movements and civil society, international actors are broadening their concerns to include the impacts of conflict on women. Many high status interventions deal primarily with elites from within conflict communities and seek to rebuild on a western neoliberal democratic model with little accommodation of local practices or involvement of those most adversely impacted by the conflict. This model often reinforces pre-existing structural inequalities, further privileging those most able to access power, and further marginalising those with least access to political, economic and cultural power. Meanwhile, INGO development interventions are fraught with tensions, often emerging from and operating within colonial charitable paradigms which paradoxically reinforce dependency and powerlessness. In this paper we draw on fieldwork conducted with women affected by violence in Kenya, eastern DRC and northern Uganda to examine the effects of humanitarian interventions on women's agency and their self-identification as citizens. We question whether large scale INGO service provision might be both relieving governments of their responsibilities to their citizens' needs and rights, and, shifting women's identities away from citizenship and towards the less autonomous and more passive role of 'client'.

WALKLATE, SANDRA (*Professor*)

From Keeping Men at Arm's Length to Fearing the Foreign Other: Examining the Transference of Responsibility in Responses to Sexual Violence Against Women Perpetrated in Cologne on New Year's Eve 2015

On New Year's Eve 2015 in Cologne (Germany) there were reports of 'mass' sexual violence perpetrated against women. In the weeks that followed media reports of the incident estimated that up to 1000 women victims and 40 male perpetrators of (alleged) migrant refugee background were involved. In the weeks following similar incidents were reported in other German and Scandinavian cities contributing to public fears that this was not an isolated event but rather a coordinated one symptomatic of the risks associated with the increasing numbers of refugees entering Germany and other neighbouring European countries. These attacks took place against a backdrop of decades of feminist advocacy, whereby private acts of sexual violence against women have often failed to attract attention or motivate change. This in itself raises interesting questions surrounding *what* forms of sexual violence against women garner public concern and *who* is held to account for such violence.

To date responses to the Cologne attacks have been subjected to limited analysis. This paper addresses that gap by examining the transference of responsibility in media and official responses in the aftermath of the attacks. In order to do so, we draw from the findings of a thematic analysis of over 500 media articles written in the wake of 2015/16 Cologne New Year's Eve attacks to question the degree to which responsibility for the public acts of sexual violence against women were transferred from the women themselves in the first instance to the collective foreign 'other'. We consider the implications of this transference in terms

of gendered responses to violence against women and constructions of risk in a global world.

Work Intensification in Neoliberal Times: Insights from the Australian Education System

The percentage of Australian teachers working very long hours has been increasing over the last decade. Compared to other OECD countries, a large amount of their time is spent on paperwork and general administrative work, an outcome of increased accountability measures in the country's neoliberalised education systems. In this paper, we report on a qualitative 2017 study of school teachers' workload in one Australian state, New South Wales. This study found that the scale of teachers' workload has been expanded substantially through additional administrative tasks, government reporting and the pressures of standardised national and international benchmark testing. We analysed data from across a range of diverse school settings and looked for patterns of response that were related to school geography, socio-educational status, and school type (primary, secondary and central). Overall, increases in workload are felt universally: there was surprising uniformity in responses in relation to high hours of work and administrative sources of workload. This suggests that the issue is a systemic one, with a diverse and extensive policy settlement blanketing the entirety of the NSW public school landscape in a layer of increased requirements. This policy bricolage supports an overall neoliberal framework similar to other Australian states. Given the symbiotic relationship between teaching conditions and students' opportunities to learn, these findings hold particular significance, which may extend to other educational sectors. The paper will examine the consequences of changes for processes work intensification and de-professionalization. The necessity for decisions by teachers about what components of workload excess must take priority makes this a particularly complex and demanding aspect of their work.

Marriage Equality in Australia – the 'No' Vote and Symbolic Violence

In 2017, there are no legal provisions within the Commonwealth of Australia for same-sex couples to marry in the same sense that their heterosexual friends and family can. Civil unions provide *similar* legal protections as marriage, but many argue that this is not enough – that same-sex couples occupy a 'second-class' citizen status in relation to marriage. Many jurisdictions globally recognise marriage equality: the UK, New Zealand, Canada and the USA to name but a few globally, and those societies most similar to Australia's. This paper explores the attitudes towards elements of marriage equality among a group of gay men in Australia. Despite the 'yes' vote for marriage equality polled at about two-thirds of eligible voters, a slew of symbolically-violent messages have appeared, including 'Vote No' skywritten across the emblematic Sydney Harbour, and 'Vote no to faggots' graffiti etched across Sydney train carriages. In particular, this paper examines how two such contradictory positions can emerge in society that ostensibly privileges the 'fair go.' Perhaps by July 2018, marriage equality will have been enshrined in Commonwealth law – at present however, Australians await the result of a marriage equality postal vote, from which a 'yes' vote will 'allow' members of the ruling centre-right party a 'conscience' vote on the bill. On the eve of this result, and within months of the 40th anniversary of the Sydney Gay and Lesbian Mardi Gras, it is timely to revisit perspectives from the original '78ers' and the experiences of physical violence on that cold night in June 1978. How might the rhetoric of the 'no' vote rekindle those experiences, and historically (and currently!) what have these men used to combat this threat? The importance of friendships and solidarity across lines of difference are key in this defence and action.

FLAM, HELENA* (*University of Leipzig*)

Catching up with the Times: Research Designs for Transnational Movements

Social movement research has relatively recently turned its attention to transnational movements. Much social movement research still suffers from

methodological localism and nationalism. In my talk I would like to present a few designs for a study of transnational movements that go beyond discourse import-export analysis, ethnographic reports on or on-the-spot surveys of participants at international fora or describing transnational movement coalitions without explaining how they came about. Newer designs build on such concepts as governance regimes, explore the contribution of earlier mobilizations to institutions calling for transnational movement (expertise) mobilization, inspect the causes of regional domino effects, etc. etc. I would also like to suggest that it is about time to study local, national and transnational mobilization of various professional groups, such as doctors, journalists or lawyers – and show how one could go about it. It is my thesis that that not just the sociology of professions but also social movement research has failed to take note both of their various mobilization forms and their importance in contemporary world.

RC52-872.6

FLAM, HELENA* (*Institute of Sociology, University of Leipzig*)

Professions As the Critics of the Status Quo

The classical sociology of professions has posited professions as exposed to the pressures of the state and the (capitalist) market. It did not include the relationship between professions and the civil society in its purview. More recently much of it has been narrowly concerned with the neo-liberal pressures reducing professional autonomy. Modest English language literature (see Sarat and Scheingold, eds. and also Holliday, Karpik, Feeley, eds) approaches professions in a different manner. Focused on lawyers this literature shows that they have offered professional support as individuals or law firms to (right-less, underprivileged, discriminated) citizens and social movements mobilized against states and corporations. The so-called “cause” or “politicized” lawyers are defined as those who have moved beyond such occasional support activities. These (i) focus on social groups or (transgressive) issues with a conflict potential in their everyday work, and possibly cross the usual “professional boundaries” by (ii) engaging in educational/media campaigns, lobbying or committee work or by (iii) starting professional or citizen initiatives to push these issues. Not to be ignored, there is also professional status quo critical collective mobilization. This mobilization assumes different forms: (a) organizing own training, workshops and conferences, (b) setting up professional organizations and journals, c) cooperating around key court cases or reform proposals, d) partaking in and mobilizing for lawyers’ own or lawyers-led demonstrations, and, finally e) establishing and running political parties. Examples from Germany, Hong Kong, Japan and possibly also the transnational sphere will illustrate these points.

How to Remain a Detached Sociologist While on the Payroll of the Perpetrator of the “Tobacco Holocaust”? Paul F. Lazarsfeld and Philipp Morris Research and Development

There is widespread consensus with regard to two propositions: First, the (US American) tobacco industry perpetrated something which some scholars call, without blushing, “Tobacco Holocaust” (Rabinoff 2006) or “Golden Holocaust” (Proctor 2011). Secondly, those who commission a (social) scientist usually exert enough leverage on their contractors to get the messages they are interested in. The appropriateness of comparisons like “the Tobacco Holocaust is at least 25 times the high estimates of the Jewish Holocaust” (<http://www.rense.com/general65/UwSSL.HTM>) legitimated by the first mentioned consensus might be questioned. The second consensus is a truism if we adopt the worldview of popular media, political discourses but also some serious sociological writings. The debate between Martin Bulmer and Donald Fisher in the 1980s about the role of the Rockefeller Foundation for the development of empirical social research, Stephen Turner’s criticism (1998) of Jennifer Platt’s 1996 book are indications from sociology, and the saying “the one who pays the piper calls the tune”, nicely explained in *The New Dictionary of Cultural Literacy* (2002, p. 55) as “The person who hires another determines the services to be rendered”, should suffice here as evidence.

Beyond any doubts, a leading sociologist of the 20th century, Paul F. Lazarsfeld, got a check about \$ 45,000 back in 1972 (the equivalent of \$ 262,273 in 2016) from “Philipp Morris Research and Development”, kind of a cover for one of the big American tobacco producers.

The proposed paper will present archival evidence about the negotiations between Philipp Morris and Lazarsfeld in the run-up of the contract, give a detailed report about the research done for these dollars and conclude with a somewhat non-conformist rejection to the second consensus mentioned above: In a nutshell, Lazarsfeld did not sell his conscience.

Roads and Barriers Towards Social Investment Policies

Across the OECD world, social investment policies are on the rise, which Hemerijck (2015) describes as a “quiet paradigm revolution”. Whilst Nordic countries are typically considered the pioneers in social investment policies, we observe that latecomer countries of not only Europe but also East Asia have made considerable efforts to catch-up with Northern European frontrunners.

The rise of social investment policies, especially the expansion of family policy presents an important dimension of the recent transformation of advanced welfare capitalism, which despite the prominence of retrenchment cannot be reduced to welfare state regress. However, we observe great cross-national variation in the speed and scope of family policy expansion. Unlike family policy, labour market policy did not experience a similar social investment turn, but is instead rather characterised by retrenchment with declining efforts to improve the employability of jobseekers.

What explains the differences in the social investment turn? Not only comparing family and labour market policy but also comparing across countries within each policy domain, this paper analyses the *roads* and *barriers* towards social investment policy. It engages with institutionalist political economy theory, which is typically considered well placed to explain policy stability, but struggles when paradigmatic change is experienced. By contrast, public policy approaches allowing more room for political agency appear to have greater explanatory power to grasp policy change. We review competing theoretical accounts and discuss the implications of our findings for the “management of change”.

A History and Overview of CAPACS Accreditation, and Accreditation in the Social and Behavioral Sciences

Dr. Michael Fleischer, CAPACS Chair, will present a brief history and overview of CAPACS, with an interactive slide-show and handouts, covering global higher education accreditation, the CAPACS accreditation process, and the benefits of Program accreditation. Particular attention will focus on the increasing demand to accredit disciplinary and professional programs in higher education as a process of external quality review, including in the social and behavioral sciences; the oversight of higher education accreditation commissions; and the creation of CAPACS in 1995, as a joint initiative of the Society for Applied Sociology (SAS) and the Sociological Practice Association (SPA), which merged in 2006, to form the Association for Applied and Clinical Sociology (AACS). The presentation will highlight CAPACS accreditation standards, and the benefits of CAPACS accreditation for Program faculty, students, and alumni, their host institutions, and the public-at-large.

FLEISCHMANN, LARISSA* (*University of Konstanz*)

Responding to a Moral Imperative to Act: The Mobilization of Compassion and Solidarity for the Plight of Refugees in Germany

In this proposed contribution, I will offer a glimpse on the forms of practical solidarity that emerged within local communities in response to the increased arrival of asylum seekers in Germany around the so-called ‘refugee crisis’. I ask for the techniques of mobilization that generated compassion and feelings of responsibility among citizens and led to an unprecedented willingness to engage in acts of humanitarian assistance and support for refugees. This development gained momentum in the national and international media through the narrative of a German ‘Welcome Culture’, which presented the society as being characterized by an extraordinary level of open-mindedness, hospitality and compassion towards the newcomers. In my paper, I will demonstrate how the notion of a ‘Welcome Culture’ came with a *moral imperative to act* that mobilized German citizens to support refugees in localized contexts. It triggered a diverse range of immediate helping practices, among them, for instance, the collection of donations, the organization of joint leisure time activities, language courses, or the support in bureaucratic procedures. My paper will reflect on two techniques of mobilization in more detail. On the one hand, feelings of a *humanitarian duty* were produced that generated responsibility for the plight of refugees. On the other hand, a *need to help* triggered the notion of being obligated to act. Yet, as I will show, these moralized techniques of mobilization were not free of power relations. To the contrary, they were employed in order to further certain (political) strategies by, for instance, governmental actors or leftist activists. I will draw on striking examples of my qualitative and ethnographic fieldwork throughout Germany between late 2014 and mid-2016, around the so-called ‘refugee crisis’, in order to highlight these points.

RC48-802.1FLEISCHMANN, LEONIE* (*City, University of London*)*Solidarity Activism: Power and Democracy Among Israeli and Palestinian Anti-Occupation Activists.*

The Israeli military occupation of the Palestinian Territories has reached its 50th anniversary, with no clear end in sight. Since the beginning of the occupation, Israeli and Palestinian activists have tried to challenge the prevailing realities through both normalized institutionalized channels and civil resistance campaigns. As of yet, these efforts have not achieved their ultimate goal of ending the occupation. However, daily resistance activities continue to be waged. Drawing from the literature on civil resistance and fieldwork in Israel/Palestine, this article will analyse the various Israeli anti-occupation campaigns that have been waged in the past seventeen years, since the outbreak of the second Palestinian Intifada and the collapse of the political peace process.

This study will focus specifically on the Israeli Jewish activists engaged in civil resistance campaigns against their own government, alongside and in solidarity with Palestinians activists. It will explore the power dynamics between Israeli and Palestinian activists, questioning how Israeli activists contribute to the political struggle to end the Israeli occupation of the Palestinians. In doing so, it will consider the role and influence of a privileged group of activists acting in solidarity of an oppressed group and how this affects democracy in decision-making processes. This is relevant to all situations where privileged individuals and groups act in solidarity of others.

RC44-739.1FLEMMING, JANA* (*Friedrich-Schiller-Universität Jena*)*Players in a Socio-Ecological Transformation? Industrial Workers and Unions on the Environment*

Unions are made up of members who, in their mode of living, rely on and profit from global value chains. These value chains function at the expense of the health and quality of life of the workers themselves and produce environmental destruction. That is, the "ecological crisis" is global in scope and "social" as well as "ecological."

German unions see economic growth as a helpful tool that supports the realization of workers' interests in earning higher wages and thus improves quality of life. Thus increased production of environmentally friendly goods, such as electric motors for cars, is seen as a "win-win" strategy for workers and businesses, and also as one pathway for solving the socio-ecological crisis. I suggest that, besides the logic of economic growth and unions' cooperation with state players, cultural norms and values — especially for example the persistence of the cultural logic of the automobile and the automobile industry — have an impact on unionists' decision making on environmental issues.

I propose that it is not only the mode of production that has to be altered in overcoming the socio-ecological crisis, but also the mode of living. The mode of living is based on workers' every day culture, whose norms and values on environmental issues differ from other social groups. I ask which attitudes of wage workers exceed the limits of the hegemonic way of living, and thus provide a basis for a social-ecological transformation, which might differ from unions' current cultural norms and values.

These attitudes have concrete implications for future union strategies and struggles. I ask which sociocultural reasons hinder and support strategies for a socio-ecological transformation and to what extent industrial workers' attitudes concerning the environment can play a role in such strategies.

RC25-478.1FLINKFELDT, MARIE* (*Uppsala University*)*'I Just Can't Live There': Housing, Identity and the Costs of Living in Institutional Talk about Housing Allowance*

This paper investigates the situated meaning-making of housing and identity in the context of economic hardship, as these matters are brought to life in the details of language in naturally occurring institutional interaction. The study examines 366 audio-recorded phone calls to the Swedish Social Insurance Agency's customer service about housing allowance, which is a benefit targeting economically vulnerable families with children, covering some of their costs for housing. Using conversation analysis and membership categorization analysis, we investigate how housing is discussed in these phone calls as part of clients' identity work and requests for information and help from the Social Insurance Agency. This implies laying out in detail how language is used to assemble spatial identities and how the terms for receiving economic assistance with housing costs are negotiated in situ. For instance, we discuss how clients and social insurance officials together work out, in real-time, how much space a family actually needs, what kinds of neighborhoods that are desirable to live in, and what standards of accommodation that are acceptable, in short, what is fair and what sort of responsibilities the welfare state has for families' living situations. The paper's focus on language use in a large amount of naturally occurring situations offers a

novel way of exploring housing norms, not as set standards that influence people's lives, but as something achieving practical meaning in and for the context where they become an issue.

RC47-JS-67.4FLORES-MÁRQUEZ, DORISMILDA* (*Universidad De La Salle Bajío*)*I am Mexican, what is your superpower? Migration, political subjectivity and digital activism*

In this paper I discuss the link between political subjectivity and digital activism among Mexican migrants. According to previous studies, digital media itself does not determine the participation, but provides to the engaged citizens spaces for that.

The study approached the cases of Mexican citizens living abroad (United States, Canada, Guatemala, Argentina, Spain, France, Germany and the UK), who have digital activism practices. The methodological framework was based on digital ethnography, ethnographies of participation and the biographical approach. Data collection included posts in Facebook, Twitter and Instagram, an semi-structured interviews with Mexican migrants, to explore their experiences.

The findings confirm the relevance of digital media in the migrant experience, as it expands the access to the information and public expression, enables the formation of social and activist networks, and contributes to the emergence of new kinds of political actors. Migrants experience a renewal interest in Mexican public issues as a product of different factors, such as the opportunity to rethink Mexico by comparing it with other countries, the concerns about their family and friends that still live there, and the work of nostalgia. In this way, the changes in their political subjectivity motivates them to do online activism about their country. Online activism of Mexican migrants is strongly linked to the sociopolitical context, their agendas change according to political events. The study of political subjectivity and digital activism among Mexican migrants contributes to the understanding of the public space and its reconfigurations in the global age.

RC44-748.3FOLEY, BENJAMIN* (*Rutgers University*)*Confederate Flags and Black Power: How the Young Patriots Used White Ethnic Nationalism to Organize Poor Whites to Ally with the Black Panther Party.*

This paper explores how the Young Patriots Organization connected claims of white ethnic nationalism to an anti-racist, anti-capitalist platform to organize poor whites to fight in solidarity with other oppressed people from around the world. The Patriots were a group of young white poor self-described "Hillbillies" from Appalachia that formed in the impoverished neighborhood of "Uptown" in Chicago in 1968. Between 1970-1972 they had chapters operating in a handful of cities across the United States. Organized "of, by, and for poor whites," they wore Confederate flags stitched onto their jackets and rallied for the cause of "oppressed white people." Yet they also wore "Black Power" pins and identified the Black Panther Party as the vanguard of the revolution against the "pig power structure" of American capitalism, racism, and imperialism. In doing so, the Patriots claimed a position of "white revolutionary" solidarity with oppressed people of color around the world. Remarkably, the Illinois Black Panthers recognized the Patriots—a group brandishing Confederate flags—as an ally and recruited them to join the Rainbow Coalition, alongside the radical Puerto Rican activist group, the Young Lords Organization. Together they organized rallies against police brutality, gentrification, and abusive landlords. They also ran free breakfast programs and health clinics.

The Patriots clearly complicate how we think about the role of "whiteness" in interracial class struggle. Through a discourse analysis of their writing and speeches as well as interviews with former members, this project examines how the Patriots' "white revolutionary" discourse challenges the way activists and scholars alike have thought about "whiteness" and the anti-racist potential of poor whites. It also brings the Patriots' ideology, organizing tactics, and identification as "white revolutionaries" into dialogue with other cases of interracial class struggles, which more often than not, have disintegrated along racial lines.

RC28-526.5FOLKES, LOUISE* (*Cardiff University*)*Re-Imagining Social Mobility: The Role of Alternate Value Systems, Social Class and Locality in Reconstructing Notions of Mobility*

As neoliberalism has flourished, the responsibility for 'success' and self-improvement has shifted onto the individual. Social mobility policy in the UK has focused its attention on marginalised and disadvantaged communities, utilising programmes focused around education and employment as a vehicle for individual social mobility. Often drawing on a discourse of 'lack', this paper questions the power, violence and justice of these hegemonic, individualistic constructs of social mobility.

Based upon an ethnographic study in a small, white working-class community, this paper will focus on the ongoing analysis of family interviews that explored biography (imagined and actual) and community. The importance of the familial bond and keeping close is central to many participants' narratives, alongside discourses of happiness that are decoupled from wealth and work. Furthermore, the complex and varied constructions of community are vital to many families' subjectivities. This paper will argue that constructing the self-through-others, such as nearby family or community members, may be more salient to the working-class families in this study than the individualism propagated by dominant social mobility discourses (Skeggs 1997). By focusing more on the 'social' of social mobility, such as family and community, we can see how the families in this study reconstruct the notion of social mobility. The importance of this aspect is undervalued and overlooked in the dominant social mobility discourses that permeate government policy and academia. It is not that these families are not 'strivers' or 'lack' certain abilities, but that the focus of success is not always based on individual gains alone.

FOLLONI, ANDRÉ* (*Pontifícia Universidade Católica do Paraná*)
DIB, NATÁLIA (*Pontifícia Universidade Católica do Paraná, Brazil*)

Development As a Complex ISSUE and the Challenge of Multidisciplinary

Development is traditionally a concept connected to economic growth which could be measured by economic standards such as Gross Domestic Product or Per Capita Income. In this sense development emerged as an economic concept studied by the Economics, specially the Welfare Economics. This means that development was studied within a single scientific domain, according to its methods and its terminology, which makes things easier for the researchers but at the same time allows scientists to a partial and limited view of the problem. This concept of development was questioned within the Economics by authors who noticed that both GDP and PCI focus on resources only and do not consider how the real people make use of these resources. At the same time development became a central concept in the international politics, to a point when the United Nations Organization put out a declaration of the right of development, so it became a political, ethical and legal concept as well as an economic one. So nowadays it is mandatory that development should be studied under a multidisciplinary point of view able to understand both its material (e.g., Economics) and immaterial (e.g., Ethics) elements. This research claims that this multidisciplinary approach can be enlightened by Complex Systems Science at least in two different ways. First, since development is a state of affairs that emerge from the interaction of different agents in different domains such as politics, economics, law, science and so, a systemic vision might be useful to understand the differences and the relations among these different systems. Second, since development can be understood as a process of elimination of unfreedom by increasing capabilities of individuals, focused on the agency aspect of people (e.g., Amartya Sen), a science that is used to deal with agents and agency can be specially helpful.

Immigrant Youth Unemployment of Different Religion Affiliations in Canada

Youth unemployment has been a major concern in most countries across the world. This topic has generated considerable interest because unemployment can have long-term scarring effects on future pay and job attainment of individuals. A high rate of youth unemployment also suggests that a significant portion of young adults are unable to translate their human capital into first job. For immigrant youth, high unemployment rate may also suggest difficulties in their economic integration. Our study explores the relative importance of human capital resources, immigration status, and religious affiliation in affecting the likelihood of being unemployed among youth of various religious groups in Canada.

The data for our study are drawn from 2011 Canadian National Household Survey. The survey provides detailed information about religious affiliation of its respondents. Following the OECD definition, youth are defined as individuals aged 15 to 29. Given that a large proportion of immigrants to Canada originate in Asian and Middle-Eastern countries, our sample contains a substantial number of youth of non-Western religions. Our study explores the relative effects of human capital, immigration status, and religious affiliation on their likelihood of being unemployed. It also controls for the effects of racial and ethnic differences. The results of our analyses show that Muslim youth have a higher unemployment rate than youth of other religions. In terms of race/ethnicity, the results also show that youth of west Asian groups have a higher unemployment rate than youth of other racial/ethnic groups.

FONJONG, LOTSMART* (*University of Beja*)

Gender Analysis of the Impact of Large-Scale Land Acquisition on Rural Women in Cameroon

Large-scale land acquisitions (LSLA) in Cameroon are carried out both by foreign and national investors. Most of the land is taken over is land where rural communities have only used rights claimed by effective occupation but without legal rights before corporate acquisition. The Ndawara Tea Estates (NTE) is one of the corporate investorsthat has legal claims to the vast quantities of land in the North West Region. Recently, the women who had been in effective occupation and exploitation of land in the region were forcefully displaced by NTE on grounds of its legal ownership (land certificate). Using the example of the NTE, the study examines the impact of LSLA on women's economic and social performances and its implication on their contribution to national development. In-depth interviews are conducted with affected women, local authorities and authorities of plantation companies to understand the dynamics, processes of land take over and plantation investments and women's development. The Harvard Analytical Framework is used to carry out the gender analysis. Although the framework has four functional tools (1) Activity profile; 2) Access and control profile; 3) Influencing factors; and 4) Project cycle analysis), this paper concentrates on the activity, the access and control profiles. The activity profile helps to answer the question 'who does what' by gender and thus enables us to understand the economic and social structure of communities whose land has been taken over by corporate investors. Findings point to gender differential impacts of LSLA in terms of gains and losses on the population. This affects women's role in food and environmental securities. There is therefore need to engender the processes of land take-over by corporate investors and the types of investments so as to ensure win-win outcomes for investors, affected communities and women.

For an Existential Ecofeminist Democratic Socialism

The 21st century is the century of the Anthropocene, that awe- and fear-inspiring transformation of the Earth wrought by the contradictions of two centuries of fossil capitalism that have witnessed the dangerous pushing of several Earth systems beyond "livable" boundaries – most notably biodiversity (we have entered the age of the Sixth Great Extinction) and climate change.

At the same time, the 21st century – if we are to survive the changes in motion above – must the same time become the stage for the end of capitalism. New realities have always called for new paradigms, and both Marxism and the sociology of revolutions are due for an update, if not an overhaul. The most obvious and relevant development along these lines has been the cluster of perspectives that fly under the banner of "ecosocialism," and we are in the first two decades of the elaboration of this promising new paradigm.

My presentation will explore the potential of an "Existential Ecofeminist Democratic Socialism" as a constituent part or thread of an ecosocialism for the 21st century. The relevance of Sartre's contributions to Marxism, the rise of an ecological-feminist critique of capitalism, and the elaboration of various democratic paths to socialism will be critically investigated as a promising synthesis of theory and practice for an ecosocialist understanding both of the climate crisis in the context of capitalism, and the radical climate justice movement as the only historical agent with the scope, creative ideas, and post-capitalist alternative visions capable of rising to the occasion we face, and by so doing, helping to secure the "least worst" outcome humanity might hope for by the middle of this fateful century.

Nationalism, Islamophobia and Social Media: An Analysis of Online Comments on Syrian Refugees in Quebec

This paper seeks to examine a singular configuration of the normalization of national belonging in the mode of worrying and racial governmentality regarding Muslim presence in Western societies. Public expressions of islamophobia tend to become commonplace in Quebec while islamophobia is regularly denied. These discourses are now widely deployed on social media. The study focuses on social debates concerning the Canadian Syrian Refugee Resettlement Initiative in the fall of 2015. What are the dominant representations of these refugees in digital discursive practices of "ordinary" members of the ethnic majority? How do these discourses take part in the reproduction of the national symbolic boundaries? Aiming to scrutinize articulations of nation, ethnicity and race, the study is based on critical theories of nationalism, race and whiteness, especially the work of Stuart Hall and Ghassan Hage.

The methodology is inspired by Critical Discourse Analysis and more specifically the Discourse-Historical Approach intended to unveil power and domination structures supporting homogenization and discrimination. The analysis is

organized around discursive strategies and uses the concept of *topoi* to identify commonplaces associated with positive self-presentation, negative other-presentation and denial of racism. The data come from online comments published on the Facebook pages of the five largest media in Quebec. 15 articles on Syrian refugees and 1000 comments were analyzed.

Five discursive topics are identified, namely the *topoi* of number, fiscal burden, national responsibility, security and cultural threat. While overtly racist comments represent only a small minority, most users frame negatively the arrival of these refugees. Their reduction to the racialized figure of the Muslim is structuring since it largely constitutes the subtext of resentful nationalist arguments. Attributed muslimness cannot be separated from self-presentation of white nationals as victims of the hospitality and tolerance of political elites for strangers pictured as threatening and undeserving.

Meritocracy, Human Capital or Social Reproduction? Outcomes of Educational Pathways in Canada

Educational pathways between vocational or community colleges and universities are an important objective of policy in liberal market economies such as the United States, Britain, Australia, New Zealand and Canada. Governments seek pathways to build a nation's human capital and to support social mobility. There are four main ways in which educational pathways are theorised.

1. Liberal theory, which posits that pathways support upward social mobility and provide opportunity. This is the meritocracy thesis in which those who work hard and have ability can progress to higher level credentials and the opportunities that this brings in the labour market;
2. Human capital theory, which sees pathways as the way individuals can make rational decisions about how to invest in their human capital to support their occupational pathways;
3. Social reproduction theorists who argue that pathways can challenge unequal power relations by challenging intrinsically unfair structures of education and hegemonic power relations;
4. An alternative 'reading' of social reproduction theory could be that pathways contribute to existing hierarchies by providing limited opportunities for social mobility, and at the same time contributing to the hegemonic notion of the meritocracy.

This paper uses Canada as a case study to explore these alternatives. It uses data from the 2011 Canadian National Household Survey to compare the occupational destinations, job skill level and income decile of graduates with college credentials, with both college and university credentials, and with university only credentials. It finds that pathways support modest social mobility, and that the labour market outcomes for those with both college and university credentials are higher than those with college credentials, but lower for those with university credentials. It suggests that pathways make a difference in people's lives, but that they do not necessarily challenge elite and stratified hierarchies in higher education or the labour market.

FORD, LAURA* (*Bard College*)

Formal and Substantive Rationality in Law: Legacies of the Axial Age?

In his essay on *The Developmental Conditions of Law*, Max Weber identified a cluster of factors that contributed to the emergence of formal rationality in law. Crucially-important, in his view, were legacies from Roman law. Building on these legacies, a new set of rationalizing culture-carriers ("jurists") emerged during the high middle ages. Formal rationality in law, which Weber sharply distinguished from substantive legal ideals of justice and righteousness, was their unique legacy. Drawing on early work in evolutionary anthropology, Weber located the deepest roots of this legal rationalization process in magic and animism.

In his essay on *Ancient Judaism*, however, Weber offered another possibility, one that aligns well with the scholarship of Raymond Westbrook, who argued that Biblical and Roman law should be seen as separate strands of a common legal tradition, one that draws on intellectual legacies from the ancient near east. Rather than locating the origins of legal rationalization in questionable assertions of anthropological universality, perhaps we can instead trace an historical line of development leading from ancient near eastern legal casuistry to Roman law and Abrahamic faith traditions. This historicized alternative for the earliest roots of

legal rationalization is one that could potentially align with an Axial Age hypothesis. Might law itself be, in certain respects, a legacy of the Axial Age? Is it possible to see the emergence of substantive ideals for law – justice and righteousness – emerging against an older background of casuistic formal rationality, as part of transformative developments connected with the Axial Age? My paper will explore these possibilities, drawing particularly on the scholarship of Raymond Westbrook, on Weber's writing about law in *Ancient Judaism*, and on criticisms that scholars of Roman religion have leveled at anthropological theories, especially the notion that magic and animism rest at the heart of ancient religions.

Emerging Forms of Collectivity Among App-Based Transport Workers in Indonesia

In advanced economies, the emergence of Uber and other digital transport platforms has been criticised for undermining more traditional and secure forms of employment. Less-developed contexts—where informal work and non-standard employer/employee relationships are ubiquitous—present a more complex picture of the relationship between the gig economy, employment standards and labour activism. In Indonesia, many app-based transport workers have at least as favourable income and working conditions as their counterparts in the conventional taxi sector. A less obvious (and unintended) effect of the rapid growth of app-based transport companies has been the emergence of greater opportunities for collective action. While the companies that connect app-based transport workers with customers refer to them as 'partners' rather than 'employees', they nevertheless provide a focal point for those workers when seeking to act collectively to demand better working conditions. Drawing on extensive fieldwork, this paper explores the impact of online transport on employment relations, with a particular focus on emerging forms of worker collectivity among app-based transport workers in Indonesia.

Supranational Complaint Mechanisms and Global Union Campaigns

Global Unions support campaigns in various forms (corporate, country-based, thematic and campaigns to support local union affiliates) but the interaction between these and other repertoires of action and forms of leverage has remained largely unexamined. This paper takes up this task with reference to the interaction between global union federation campaigns and the OECD Guidelines for Multinational Enterprises, one of the oldest international mechanisms for addressing complaints about the conduct and practices of multinational corporations. First formulated in 1976, the Guidelines were initially designed as a normative guide for firms headquartered in OECD member countries. However, revisions in 2000 and in 2011 saw the creation of a 'specific instances' mechanism through which unions and other interested parties can raise complaints and resolve disputes related to alleged breaches of the Guidelines. This mechanism includes a significant role for 'national contact points' located in the member states of the OECD and other adhering nations, which not only receive and assess complaints but also participate in promoting dialogue and dispute resolution between complainants and the multinational enterprise in question. The latter typically involves the facilitation of direct meetings and mediated dialogue to resolve disputes, although participation in these processes remains voluntary. Based on an analysis of descriptive statistics generated from an original database of all specific instance complaints lodged between 2000 and 2016 and qualitative assessment of a selected number of GUF complaints that were supported by wider campaign interventions, the paper suggests that while the use of the complaint mechanism can be effective when backed by a strategic and sustained campaign intervention, GUFs differ in the extent to which they combine these tactics and, when they do so, the effect is moderated and conditioned by the efficacy of the GUF and the particular characteristics of the MNE in question.

Dificultades a La Hora De Comprender El Ejército Nacional De Colombia

En 2002 Catherine Lutz invita a la antropología a ocuparse de las instituciones que determinan el destino de las naciones y así avanzar en una topografía del poder. Para ello propone estudiar etnográficamente al ejército. Esta invitación trae consigo algunos desafíos que como antropóloga dedicada al estudio del ejército colombiano he debido enfrentar. Preguntarse sobre como el ejército nacional de Colombia inventa su tradición, sobre cómo se autorepresenta como

una institución herida, sobre los procesos de profesionalización, ha implicado sortear una serie de desafíos metodológicos y teóricos.

En esta ponencia me concentraré en algunos de ellos:

1. ¿Qué dificultades se presentan a la hora de construir preguntas de investigación sobre el ejército colombiano (institución asociada a la represión) en el marco de la antropología latinoamericana cuya agenda se ha concentrado en el indigenismo y en la comprensión de otras minorías?
2. ¿Qué características tiene el trabajo de campo cuando se inquiera por el ejército, institución en la que es imposible establecer la 'intimidad etnográfica'?
3. ¿Cuáles implicaciones existen en el posicionamiento ético cuando se estudian grupos de poder?
4. ¿Qué implicaciones hay en el momento de dar cuenta (escribir) sobre la investigación?

Crowdfinancing Operations and the Public Interest of the Financial Activity

Crowdfinancing platforms have rapidly emerged and growth since 2001. People around the globe resort to these intermediaries asserting that they give the opportunities and easy procedures that traditional banking lacks.

Currently, many species of crowdfinancing operations are popping up throughout Internet: In addition to the well-known reward-based crowdfunding, we have got sponsorship, equity, real-state, P2P lending, insurance, royalty, factoring, foreign exchange and even crowdfunded cryptocurrency production. Though it is possible to find antecedents of open financing operations along human history, the open global structure of Internet is giving them a complete new scope.

On the one hand, it appears to be an excellent mechanism to deal with the open access to credit, which is one elemental pillar of the equality of opportunities in the contemporary world. On the other hand, most of the Constitutions and financial statutes abroad define the financial activity as one of the 'public interest'. In consequence, States are vested with the jurisdiction to exert surveillance and control over the financial agents and enact special regulations that provide for the risk management mechanisms, funds sufficiency of the intermediary, and specific rules of communications while offering and closing operations.

This paper aims to discuss how crowdfinancing markets are redrawing the access to credit and how the terms and conditions of the platforms' contracts are drawing transnational financial architectures; whereas States' strategies remain ineffective to protect the public interest without eliminating the new commercial actuality.

Raising Today's Young Citizen for Tomorrow

Schools and youth organizations are the first to convey sets of expectations for being a citizen. What are exactly these expectations? And how are they conveyed? We suggest that youth civic initiatives aim to fabricate "good citizens" through experimentation. They highlight the normative postulates of what should be a citizen in a specific society. In proposing an ethnography of the Gatineau Youth Commission, a group that has been developing collaboration between schools and the city of Gatineau, we try to identify and analyze how democratic values and practices are transmitted in daily life. Is it part of an emancipatory vision (Vitiello, 2016) or an ethical and political experimentation (Dewey, 1916)? Or is it a transmission of democratic values and emotions (Nussbaum, 2013)?

This Commission brings together 26 young people from all sectors of the city of Gatineau (Quebec, Canada) to ensure "the development of alert, accomplished, committed and thoughtful citizens". It is particularly concerned with making recommendations to the authorities and to support projects related to young people's interests. We have followed the Commission for almost a year and it allowed us to refine our understanding of a democratic educational experience. We will present our analysis of the democratic norms of the group, the environments that facilitate change in political postures and the tension between different expectations of being a "good citizen".

Aspects Concerning the Criticality of Karl Marx's and Georg Simmel's Approaches

The hereby proposed presentation aims to discuss to which extent both theoretical contributions brought forward by Karl Marx and Georg Simmel can be seen as critical theories. While hereto I shall focus primarily on the writings *Capital* and *Philosophy of Money*, further of their texts and reflections will subsidize my argumentation. The point of departure is the fact that both authors have (albeit different) philosophical roots, but while Marx explicitly avoided disciplinary specialization, Simmel made deep efforts to institutionalize a certain concept of sociology, contributing to constitute sociology as a discipline. Nevertheless, after his formulation was overwhelmed by the views of Émile Durkheim, and following the difficult academic path he had to endure, Simmel gradually redirected his studies, aiming to problematize wider and varied aspects of culture.

Here it is where, simultaneously, lies their proximity – thus a possibility of building conceptual bridges –, and their difference. My theoretical analysis departs from the roles exerted by *commodity fetishism* and *reification*. Since each wrote during different historical contexts, culture (as a concept) never became a centerpiece of Marx's work, who among others organized his thoughts around the centrality of *critique* as a fundamental standpoint. For his turn, Simmel – writing on the verge of the XXth century, and thus being influenced by another set of thoughts – took up a materialist debate, moving towards establishing dialogues between philosophical, psychological, and sociological traits of culture. Interpreting aspects concerning this fractured dynamics of rupture and continuity appears as my main objective, understanding that therefore, both authors share a vital common ground, in that they never restricted themselves to a particular discipline throughout their works, even while aiming to design and establish certain novel viewpoints. Finally I shall present a few insights regarding how this process positioned them in relative core or periphery positions.

Higher Education and Mobility in the Periphery: When Borders Represent Obstacles

The hereby proposed presentation aims to critically assess the process of intellectual colonialism by analyzing the Brazilian Programme called *Ciência sem fronteiras* (Science without borders), undertaken from 2011 to 2016. The programme's idea was to broadly contribute towards globalizing Brazilian higher education, with its focus on internationalization: it was directed towards allowing students and researchers to spend from a few months to a few years abroad, in many cases set to achieve a foreign degree. While designed as a possibly interesting manner of funding the circulation of people and thus ideas, effectively it was possible to observe a number of aspects that clearly were shaped through forms of intellectual colonialism and academic dependence as portrayed, among others, by Alatas (2003).

We shall focus more specifically on characterizing and critically discussing the circulation of post-doctoral researchers, that represented just under 5% of the over 90.000 fellowships that were awarded during the programme's existence. What we are interested in taking a deeper look at are (i) the locations to which these fellows decided to go, and (ii) the academic disciplines predominantly funded, while (iii) observing the various geopolitical/academic disputes and disparities as well as certain forms of concentrating types of fellowships and institutions of destination, that by and large tended to reproduce existing inequalities on a global higher education level. This outlook is based upon identifying certain discrepancies and convergences when comparing the total number of distributed fellowships with those specifically allocated to post-doctoral research, that is, which countries, institutions, and research areas comparatively attracted more post-docs than undergraduates or master/doctoral students. Our preliminary findings seem to indicate that the programme, thus, largely reinforces intellectual colonialism through its attempt at participating in a crescently globalized higher education.

Housing Pathways: A Tool for Approaching Everyday Life of Unaccompanied Minors

Housing pathways: a tool for approaching everyday life of unaccompanied minors

Qualitative research methods have a long and honourable history in studies on immigration, related mobilities and families. *The Polish Peasants in Europe and America* by Thomas and Znaniecki is often mentioned as one of the earliest works studying the culture and social organization of immigrants and their family rela-

tionships, and also developing new methods of social investigation (qualitative analysis of letters). Today we face similar challenges: Europe has encountered its greatest refugee crisis since WW2, with tens of millions of people from Africa, the Middle East and South Asia leaving their homes to escape wars, conflicts and persecution. The significant and rapid increase of "strangers" has also activated efforts to get to know and understand the Other – also through research-based information.

The aim of this paper is to reflect on *the idea of housing pathways* for examining the sequential, multi-local experiences of minor children who apply for asylum (in Finland) unaccompanied by their parents. Unlike previous research on refugee children, focusing on the children's mental state from the perspective of trauma, an analysis of housing pathways employs the concepts of place of residence, moving and change of residence, suggested to be close to children's ordinary daily life. A housing pathway is understood to be constructed through children's meaning giving, but also in interaction with the structural conditions of life (e.g., war, refugee policy and practices). It is argued that a study of housing pathways broadens the previous debate on the situation and well-being of these children. Accounts of feeling a sense of place, including a sense of home with family-like close relationships, increase our knowledge about social conditions where the experience of being a stranger/the Other may sometimes even become less powerful.

Penser l'Ethos Public Avec Une Approche Clinique Et Le Concept Ricoeurien d'Identité Narrative. - to Conceive of Public Ethos through a Clinical Approach and the Ricoeurian Concept of Narrative Identity

Une approche ricoeurienne nous amène à penser la spécificité du secteur public ainsi: Un ethos public ancré dans une gouvernance démocratique (un des lieux de concrétisation de la société pluraliste). Un ethos compris dans une perspective éthico-politique (pour soi, pour autrui, dans des institutions justes). Un ethos public ancré dans la durée et la mémoire: historicité (spécificité), contingence (sagesse pratique) et fidélité (malgré le changement). Ainsi, avec une approche clinique et à l'aide de la méthodologie des récits de vie auprès de gestionnaires publics, nous tentons de saisir un ethos en tant qu'activité relationnelle qui ne peut se limiter à un souci de soi et d'autrui dans un face-à-face ni à l'instantané mais dans la durée, ce qui nous renvoie à la dimension temporelle que portent les institutions.

A ricoeurian approach brings us to conceive the specificity of the public sector as such: A public ethos anchored in democratic governance (the space for actual pluralist society). An ethos conceived with an ethico-political perspective (for the self, for others and within just institutions). An ethos grounded into duration and memory: its historicity (specificity), its contingency (practical wisdom), and its fidelity (despite changes). Therefore, with a clinical approach and life stories' methodology with public managers, we try to give meaning to this ethos as a relational activity that goes beyond the issue of self and others in face-to-face interactions and its instantaneity, but in its duration, a dimension that is pertaining to institutions.

Can Signaling Assimilation Mitigate Hiring Discrimination? Evidence from a Survey Experiment

With increasing numbers of people with migration backgrounds worldwide, a pressing question is whether the ethnic penalty they oftentimes face can be mitigated. We focus on integration in the labor market as participation in this domain is both an essential prerequisite for and an important outcome of successful integration into the host country. Using a survey experiment, we test whether HR managers' discrimination against candidates with a non-native background can be counteracted by these candidates signaling assimilation into the host society. In our study, HR managers evaluate descriptions of fictitious CVs in which we vary the nationality of the candidates and different signals of cultural attachment to their background or to the host country. The findings reveal that candidates with Polish- and Turkish-sounding names are evaluated worse than candidates with Swiss- and Spanish-sounding names. More interestingly, however, signaling civic engagement within a traditional Swiss volunteering organization increases the opportunities given to individuals born to Polish and Turkish parents, while engagement in an organization connected to their parents' background dramatically damages their evaluation by prospective employers. We also show that candidates born to Polish or Turkish parents, who 'whiten' their CVs and who indicate fluency in only the local language (either German or French) fare much better than those who convey a cultural attachment to their country of origin. We conclude that there are limited opportunities to

ameliorate the evaluation of a CV by signaling assimilation into the host country; conversely, non-whitened CVs and CVs that convey multiple signals of attachment to one's parents' culture of origin are heavily sanctioned by assessments of lower productivity.

FOSTER, KAREN* (*Dalhousie University*)

Marx after Work

In this paper, I make the case that we are living in the midst of a "productivist ideational regime" (Foster, 2016; cf. Somers, 2008), a hegemonic belief, operationalized through political and sociocultural practices, that economic growth, achieved through ever-higher labour productivity, has made us happier and richer and is indeed essential for our quality of life. This ideational regime makes questioning the necessity of employment, the virtues of (paid) work and/or the dependence of income on employment (Livingston, 2013) *almost* heretical. It has dominated the way we think about work and income, economy and society, for at least two centuries. However, it has never completely silenced its ideational alternatives--"antiproduktivist" demands for less work and more leisure, warnings about the ecological limits of economic growth, and anticonsumerism. These alternatives have bubbled up again in worldwide debates about the "end of work", impacts of automation on employment, Guaranteed Annual Income/Basic Income schemes, and Degrowth and related movements.

Taking up the critiques that other sociologists and theorists have made of Marx's "valorization" of work (Weeks, 2011), I show that Marx's writings contain a paradoxical mix of productivism and antiproduktivism--expressed, for instance, in the tension between the freedom *from* work and the freedom *in* it--that offers some creative grist for the mill for those of us who wish to engage the contemporary expressions of antiproduktivism listed above, and to question work's sociological significance at micro- and macro-sociological levels.

FOUBERT, CAMILLE* (*Ecole des Hautes Etudes en Sciences Sociales*)

Distribute Public Benefits within and Outside Public Hospitals: Healthcare Professionals' Practices and Social Justice

Professionals in the public medical sector are key actors in the distribution of public resources. Beyond caring and curing services provided within the hospital and the medication, they can deliver certificates, sick-leave certification, prescriptions of spa treatments, and reimbursements of transportation fees... The increased need for profitability of social and health services combined with the "migrant crisis" leave them in the position of gatekeepers of the public spending. It has also transformed their conditions of work.

My proposal is based on an ethnographic fieldwork (mixing observations and interviews) led during six months in two university hospital centers in Paris and its near suburb (France). I will discuss the ways healthcare professionals, especially but not only doctors, construct the frontier between the legitimate and illegitimate recipients of social security benefits in their daily practice. Thus, they build and apply local representations of social justice.

Medical observance is then constructed as a citizenship issue, especially for patients from minorities and/or lower classes, suspected of looking for "secondary benefits". The range of services or care proposed and furnished by the professionals is directly impacted by the evaluation of patients' compliance. The necessary tasks (to fill out forms, certificates, etc.) are also seen by the physicians as a specific type of *dirty work*, boring, repetitive and time-consuming. Finally, healthcare workers build their solidarity across gap between occupations in what we can see as a professional *ethos* of the public service, based on principles of hard-working, devotion, but also awareness of cost and realities of the health system but also of the entire welfare system.

Les Usages Sociaux De La Barrière Linguistique Par Les Professionnel. Le.s De Santé De Services Hospitaliers Français Et Québécois

Si l'on a tendance à opposer la France et le Québec (et plus globalement le Canada) en matière de respect, de gestion et de prise en compte de la diversité culturelle et religieuse, il apparaît fondamentalement d'analyser les pratiques quotidiennes et localisées des agents de l'État travaillant en relation avec la population. Une enquête par observations prolongées et par entretiens réalisée dans le cadre de ma thèse en 2015 et 2016 au sein de services d'endocrinologie et de médecine interne d'un centre hospitalo-universitaire francophone de Montréal et de deux centres hospitalo-universitaires situés en Ile-de-France propose de montrer, que les pratiques dans ces hôpitaux ne diffèrent pas fondamentalement. A partir de l'exemple de la gestion de la diversité linguistique des patients et pour expliquer cette étonnante similarité, je montrerai l'intérêt d'une analyse fine des

usages sociaux que les soignants font de ce qu'ils perçoivent comme "l'obstacle" de la "barrière linguistique". La prise en charge des patients non-francophones peut être vue comme un exemple paradigmatique de la gestion plus globale des patients issus des minorités à la fois de race et de classe, qui témoigne du décalage entre les cadres institutionnels et les espaces de pratique.

La « barrière linguistique » est utilisée par les soignants pour donner du sens à des désaccords ou difficultés rencontrés avec des patients, mais aussi pour justifier des réponses apportées : donner des informations supplémentaires ou négocier est vain puisqu'ils « ne comprennent pas ». Nous verrons donc d'abord comment la barrière linguistique sert à l'organisation du travail : malgré l'existence de services d'interprétariat, ce sont les soignants bilingues et/ou d'origine étrangère qui sont particulièrement mis à contribution pour démêler des situations où la communication fait défaut. La « barrière linguistique » permet aussi une certaine délégation des soins, notamment vers les familles et les proches.

Conversions and Erasures: Colonial Ontologies in Canadian Traditional, Complementary and Alternative Medicine Integration Policies

In Canada, approximately 75% of the population use some form of Traditional, Complementary and Medicine (TCAM). One of the responses to the widespread use of TCAM in Canada is that an increasing number of medical schools are including TCAM in their undergraduate curriculum so that physicians can oversee its use. However, the nature of this integration, and the ways that integration may influence TCAM practices remain under examined.

This paper critically examines the integration of TCAM in undergraduate biomedical education in Canada. A qualitative thematic analysis, guided by a anti-colonial theoretical framework, was employed to critically assess thematic continuities within TCAM policy related documents (N=140) from the World Bank, the WHO, Health Canada, and curriculum materials from a Health Canada endorsed project seeking to facilitate and standardize TCAM curriculum in undergraduate medical education.

This preliminary study suggests that there are ontological parallels to the colonial era conversion of Indigenous medicine evoked in the contemporary integration of TCAM into biomedical education, elicited through a call for the surveillance, standardization and regulation of TCAM within a biomedical paradigm.

Within a anti-colonial framework the integration of TCAM practices into biomedical settings, such as undergraduate medical curriculum, may be viewed as part of an entrenched pattern of indigenous knowledge and worldview expropriation, homogenization, and in some cases even erasure.

Building Labour Internationalism 'from below': Lessons from the International Dockworkers Council's European Working Group

The European working group of the International Dockworkers Council provides an important model of transnational organisational form for labour that manages to avoid the "elite embrace" of the European Union, remaining firmly tied to shop-floor trade unionism. The organisation's networked rank-and-file structure, in contrast to the bureaucratic, professionalized structure of mainstream international union organisations like the European Transport Workers Federation, increases the efficacy of transnational unionism by removing layers of bureaucratic mediation that slow down action, fostering a culture of militant solidarity based on friendship and trust. Nevertheless, the findings also serve as a caution against viewing rank-and-file internationalism as a panacea for labour. The IDC's model as currently constituted implies trade-offs of benefits

provided by the ETF's model, in the form of high personal costs for rank-and-file activists who continue to labour on the docks. The IDC's shoestring budget and lack of paid professional staff have also posed limitations at times for the kinds of activities that are possible, resulting in an organisation that is most effective at addressing the immediate needs of its members in disputes while finding greater difficulty in delivering more long-term projects. Finally, while rank-and-file internationalism solves a number of specific problems plaguing more bureaucratic forms of labour internationalism, it does not solve problems stemming from differing national contexts, namely, a lack of agreement among unions on campaign goals and an uneven ability to engage in various forms of industrial action. In other words, changing the organisational form of labour internationalism – from a professionalized bureaucratic model to a rank-and-file networked model – addresses a number of problems stemming from *within* the labour movement, while problems emerging from *outside* the labour movement, in the broader politics in which labour unions find themselves embedded, remain.

Challenges and Opportunities for South-South Labor Internationalism in Latin America: The Case of the International Dockworkers Council

While scholars of the new labor internationalism have identified the need for increased collaboration among trade unions in the Global South, few examples are available for study. What are the challenges that workers outside of the Global North face in building global unionism with one another and how might these challenges be overcome? This paper responds to this question by drawing on participant-observation and in-depth interviews conducted between 2012 and 2017 on regional-level labor internationalism among Latin American dockworkers unions affiliated to the International Dockworkers Council, an autonomous global union network.

Despite tremendous growth in affiliation, the IDC continues to face significant challenges to building a powerful regional-level network within Latin America. First, the weakness of Latin American trade unionism in general poses a significant challenge. When trade unionists are struggling to build even local level organizations with very limited resources, the international level may seem quite distant. Second, the absence of a robust transnational governance framework comparable to that found in Europe has meant a similar systematic logic for co-operation is lacking in Latin America. Finally, the large distances and cost of travel in Latin America, coupled with poorly resourced unions, create practical barriers to internationalism.

In the final section of the paper, I examine the role of North-South internationalism in labor internationalism *within* Latin America. Because of the far greater resources available to dockworkers in the Global North, the fees they pay to the IDC are used to subsidize the organization's work in Latin America and Africa and Northern unions play an outsized role in the organization, which is based in Europe. I consider the implications of the potential dependencies and inequalities this entails on the Latin American region and possibilities for transcending these challenges.

El Problema De Las Masas En La Teoría Social Argentina: Ramos Mejía, Ingenieros y Germani

El problema de las masas, fundamental para la teoría social europea desde mediados de siglo XIX, se convierte, desde el siglo XX, en central también para la teoría social argentina. En este trabajo, rastreamos cómo fueron conceptualizadas las masas en tres autores clave: José María Ramos Mejía, José Ingenieros, y Gino Germani, debatiendo las lecturas corrientes sobre los mismos.

Así, Ramos Mejía suele ser considerado como un integrante de la elite gobernante preocupada por la irrupción de las nuevas multitudes urbanas producto de la inmigración. Sin embargo, a partir de un estudio pormenorizado de su libro *Las multitudes argentinas*, pretendemos complejizar la idea anterior ya que para éste autor las multitudes argentinas si bien pueden llevar a la anarquía también pueden constituirse en un actor social fundamental para la constitución de un ideal de nación.

Respecto a Ingenieros, su propuesta en *El hombre mediocre* fue leída como la de un escritor elitista que desprecia toda masa de seres sumisos, rutinarios y prejuiciosos. Pero intentaremos mostrar que éste no busca distanciarse de los hombres mediocres, sino acercárseles, convenciéndolos de la necesidad de transformar la sociedad, por medio de valores como innovación, singularidad y crítica. Así, Ingenieros pretende que cada hombre mediocre se convierta en un idealista, y que la masa mute en vanguardia moral de la sociedad.

Finalmente, Germani se ocupa de estudiar el rol que cumplieron las masas en los regímenes autoritarios, específicamente, en el peronismo argentino. El mayor

éxito de este proyecto fue el de haber sabido encauzar muchas de las demandas de los sectores más desfavorecidos del tejido social argentino de la época. Así, a partir de una relectura de *Política y sociedad en una época de transición*, nos proponemos analizar los modos en que el concepto de masas es puesto a funcionar dentro de su esquema interpretativo.

Precarious Beginnings: How Working Class Kids Still Get Working Class Jobs?

Evidence from many developed economies shows that transitions from education to employment are becoming longer, more difficult and more precarious (Shildrick et al. 2013; Standing 2011), and the need to undertake multiple and diverse labour market activities seems increasingly characteristic of initial entry into the labour market (Roberts 2012; Bradley and Devadason 2008). Spells of involuntary unpaid, casual, short-term, part-time and fixed-term working now seem more prevalent amongst both lower and higher qualified young workers. These phenomena are not especially new (Mizen 2004) and a substantial amount of theoretical analysis and research has been undertaken on irregular, casual and flexible forms of payment employment, but the growing significance of precarious employment – whether unpaid, part-time or temporary working – has been scarcely investigated in the transition from education to employment. This neglect is particularly significant given that their incidence appears to be increasing (Ainley and Allen 2010). In this paper we explore why, how and where young workers engage in these practices and what the costs and benefits of these processes are. We then argue by drawing on the work of Bourdieu that while there has been significant changes in young people's trajectories into work, education and training, social class still remains significant in reproducing young people's pathways towards adulthood. While precarious work is impacting on both working and the middle class young people those with the power, resources and networks are able to build resilience and avoid the worst ravages of the new political economy of work. In this context class still matters.

The Criminal Justice System As a Tool to Prevent Femicide in Brazil-Goiás : Deficiencies and Possibilities.

The Criminal Justice system as a tool to prevent femicide in Brazil-Goiás : deficiencies and possibilities.

This paper aims to discuss the potential role of the Criminal Justice system in the prevention of femicide in Goiás, state of Brazil. According to the UN, Brazil has the 5th highest index of that crime in the world, and Goiás' rates are the second in its country. Although since 2006 Brazil had implemented important Laws to prevent and punish gender based violence, thirteen women are killed each day in this country. It is known that femicide generally is the apex of a cycle of violence previously perpetrated by the aggressor, mainly in the context of domestic violence. Regarding to domestic violence, the main Law in Brazil is the nº 11.340/2006 " Maria da Penha Law", which defines domestic and family violence and also creates mechanisms to restrain and prevent crimes of that gender. One of the most important mechanisms implemented by the law are the protective measures that the police department chief is entitled to ask the judge in case of serious threat. In this sense, the research here exposed, analysed the administrative femicide data collected by the Public Security Secretary where the cases of the crime above are reported. The research encompassed all narratives collected by the police of Goiânia, capital of Goiás, between 2012 and 2017. These documents are supposed to provide the circumstances of femicide, the victim's characteristics, and her relation with the murder. Here we intend, in addition to understanding the aetiology of the problem, to evaluate if these mentioned protective measures were conveniently applied to women who died as victims of femicide. It's, therefore, a prevention intervention research conducted for the purpose of subsidize public policies to decrease the worrisome level of this hideous crime in Brazil.

Stratification within the Middle Class: Is It Only about Income?

Classical sociological theories posit that economic conditions are the basis for people's subjective class identities. However, the amount of mismatch between subjective and objective measures of class is non-trivial. Within Canadian society, the majority identify as middle class and there is a tendency to discuss this group as if it were homogenous. Few surveys ask respondents about their subjective social class and those that do rarely distinguish between different strata within

the middle class. A new data set that links the Canadian General Social Survey with income tax data provides an opportunity to investigate differences among those who identify as middle class. This paper will examine whether there are socio-demographic, occupational status, and income variations among individuals who self-identify as upper-middle, middle, or lower-middle class. In addition to providing a profile of individuals who self-identify with these three social classes, results will provide insight into whether objective measures such as income and occupational status account for distinctions within the middle class.

Media-Ting the "Need of Formula for My Baby": Online Food Seeking, Sharing, and Selling As a Response to Infant Food Insecurity in Canada

This paper reports on research conducted in Canada on the use of social media websites for the distribution and acquisition of infant food outside of commercial and regulated foodscapes. Trends concerning informal infant food distribution (selling, trading, and seeking) are documented and described based on qualitative and quantitative content analysis of ads collected from the most popular Canadian online classified advertising service (Kijiji), and a range of localized and context specific facebook groups. This paper reveals an emerging food acquisition strategy among mothers who utilize online platforms to acquire food to either 'feed the baby', or make small amounts of income from selling personally unusable infant food products. This research demonstrates that addressing infant food security in this way has both positive and negative effects. On one hand, a mother-to-mother sharing economy motivated by the ethos of trading and recycling serves as an alternative acquisition practice. On the other hand, this research offers fodder for a critique of 'do-it-yourself' responses to infant food insecurity that has the potential to expose mothers to poor bashing and claims of neglect as they make public their struggles to afford food. Ultimately this paper argues that while online platforms offer an alternative source for food acquisition, the very existence of the phenomena is an outcome of neoliberal social welfare reform typified by weak state support for the work of feeding the baby (inadequate maternity provisions, inadequate food allowances for welfare recipients, the absence of children's food programs) and the inability of food charity organizations to meet the needs of food insecure families.

Distance Caregiving (DiCa): Care Potential across National Distances and International Boundaries

Background: In most European countries labour market mobility and changing family patterns are increasing while the number of family carers of elderlies in close proximity decreases. These trends result in a rising demand of insights on „distance caregiving“. So far, there is limited research on a) characteristics of distance carers and health differences compared to caregivers living close by, b) concepts on communication structures and behaviour in the social network around the care arrangement, and c) challenges for wellbeing when distant caregivers try to reconcile work and care.

Objectives: The binational „DiCa“ project (BMBF-SILQUA, 2016-19) with an interdisciplinary German and Swiss research team aims to explore challenges for distance carers and implications for family relationships, social networks and wellbeing of distance caregivers. It also aims to identify strategies for the labour market and health care systems in order to foster carers' workplace continuity. Therefore, research questions refer to triple actors: employers, health care system, and family and friend carers.

Methods: In order to establish a strong empirical data basis, the applied project is embedded in a framework of primary and secondary data analysis. (SHARE and the German Ageing Survey). This paper presents the results from N=30 qualitative interviews with distance carers with specific focus on health dynamics and support from network partners around the care arrangement.

Results: At the conference, results will highlight challenges of distance caregiving with a focus on the ambivalence of support from far away. The findings also highlight the social embeddedness of these care arrangements and how the research design contributes to evidence-based interventions and implementation.

Mature Entrepreneurs in Germany and Poland – a Life Course Perspective on Self-Employment

The phenomenon of increasing entrepreneurship rates among older adults can be observed in many industrialized capitalistic countries, but also in the societies in Central and Eastern Europe, where the free market economy has a shorter and more turbulent history, even though the general rates of latent entrepreneurs are much lower in CEE countries. The topic has been studied empirically for over three decades revealing many facets of this type of activity (e.g., motivations, different push and pull factors, opportunities and barriers of starting an enterprise, types of businesses or typologies of older entrepreneurs). However, still little is known about the construction of life courses of mature entrepreneurs, their future perspectives, or the influence of institutional factors. This paper presents first findings from the binational research project MOMENT "Making of mature entrepreneurship", which compares the life courses of older entrepreneurs 50plus in East and West Germany and Poland. The project takes on a dynamic perspective on the process of becoming an entrepreneur. The empirical material includes qualitative interviews with mature entrepreneurs and experts as well as some findings from a secondary data analysis (incl. SHARE). The paper will compare the similarities and differences in the socio-cultural backgrounds and their impact on the path to self-employment. The analysis includes identification and interpretation of the most significant transitions, trajectories and turning points on the path to self-employment.

Urban Commons As Emancipatory Spatial Practice? Challenges and Potentials in the Post-Democratic Era

In the context of the economic and financial crisis, which has profoundly reshaped cities and regions around the globe, alternative forms of social and economic organisation are increasingly discussed in urban and regional research and practice. Particularly commons are (again) hotly debated as an alternative way to organize the production, distribution and consumption of certain resources. We interpret urban commons as relational processes (not a product); as socio-spatial and socio-political practices of actors collectively producing and appropriating, maintaining, distributing and consuming certain urban resources. Commons are produced by actors with the aim to satisfy basic needs beyond state and market. However, an understanding of neoliberal urbanization helps to contextualize the potential, as well as the challenges, of urban commons. The practice of commoning may have potential to emancipate various social groups from hegemonic neoliberal structures in the post-democratic city, hence the potential of changing power structures in urban development. Emancipation and the related approaches of 'emancipatory city' help us to define urban commons in the context of the neoliberal city: emancipation means active political and social self-liberation from paternalistic and hegemonic structures, and a democratization of social and political orders by citizens (e.g. through self-organization), a political process often hindered by the political order and its institutional and spatial structures.

Based on two case studies of urban food commons in Vienna, these questions are answered: how can urban commoning as a relational practice unfold its emancipatory potential? How can urban commoning cope with challenges as the instrumentalization by neoliberal rhetoric, as well as the risk of becoming socially exclusive through institutionalization and defining concepts of 'us' versus a 'them' and thus reproducing inequalities in the production of urban space?

Claiming Place: Race, Land, and Spatial Justice

In 1973, Robert Browne wrote "Only Six Million Acres", a seminal report on the rapid land dispossession among African American farmers, mostly in the rural south. Today, African American farmers own an estimated 3.6 million acres (NASS, 2012). This rapid decline has not only stripped African American communities of a primary wealth asset, it has affected the place-making strategies of those that live on and near these landholdings. This project departs from simply viewing land as an asset in order to explore how African American farmers make places, in spite of or in addition to land ownership.

The goal of this project is to present a *visceral geography* (Hayes-Conroy, 2010) of African American rural landscapes by displaying the interconnection of spatial construction, movement, and emplaced stories. In order to do so, this project combines different types of materials: video tours of African American farms, oral histories, maps, statistical information, and written context. These materials

are combined within an interactive website in which viewers can move between them. Within the website, viewers can also select more curated forms of engaging with the materials through guided "tours" that construct narratives with the material. This presentation will offer a brief overview of the website.

This format offers a number of advantages over standard textual or video formats. First, within the digital platform, the films are presented in a non-linear format through which meaning is derived from the relational patterns that emerge among and between pieces. Second, the interaction of materials provides a means to visually display the dialectical interplay between material structures, social relations, and human agency within the multi-faceted production of space. Third, by showcasing emplaced stories, this project contends that more than land rights, people claim spatial rights – the right to make, name, reside on, and value places.

The Role of Union Feminists in Building Coalitions and Alliances between Social Movements

The Role of Union Feminists in Building Coalitions and Alliances between Social Movements

Mary Kay Henry, President of the Service Employees International Union, told Steven Greenhouse of the *New York Times* (November 27, 2016) that in these very challenging times, unions would need to team up with the women's movements, the environmental justice movement and immigrant groups to press the struggle for decent wages and better working conditions. We examine the role of union feminists in building organizational bridges between labor and these other social movements. We focus on how the insights and experiences of union feminists with building coalitions and alliance across movements and diverse constituencies might hold the key to building a broad-based mass movement with labor and economic justice at the core. Such movement building necessitates an intersectional analysis and practice to ensure that gender, race, sexuality, immigration status, indigeneity, and disability are not subordinated to a labor politics where the unmarked important subjects and actors are men. Unions offer the spaces, structured opportunities and material resources for movement building and women are taking advantage of such opportunities to challenge the sexual and racial politics of unions, to reform the culture and practices of unions, and to form alliances with other social movements. Their activism is helping to revitalize the labor movement and its relationship to other social movements. We draw from our research on union feminists in Canada, Australia, UK, and US to illustrate the strategies, discourses and practices being utilized by feminists for social movement building. We focus on how feminist union activism is sustained during challenging and uncertain times for labor. What new models of leadership, organizing and mobilizing are emerging in this climate? What do feminist bring to the table?

FRASER, KYLE* (*Department of National Defence*)
RUSSELL-MILLER, SHANNON (*Department of National Defence*)

The Role of Researchers Supporting "Operation Honour": Investigating the Impact of Gender-Related Values on Military Socialization

The *External Review into Sexual Misconduct and Sexual Harassment in the Canadian Armed Forces* (CAF; Deschamps, 2015) reported that, while instances of sexual harassment are not unique to military organizations, there is an "underlying sexualized culture" in the CAF that contributes to an environment "hostile to women and LGBTQ members", and thus called for a change in organizational culture. Among the organizational initiatives developed to respond to the challenges outlined in the *External Review*, "Operation HONOUR" provides senior leadership direction which seeks to eliminate harmful and inappropriate sexual behaviour in the Canadian military. Researchers, internal to the Department of National Defence (DND) and the CAF have a responsibility to senior leadership to provide evidence-based recommendations to aid in mitigating instances of sexual misconduct and harassment, and to foster an inclusive environment for Canadian military personnel. This paper will explore the challenges of gaining access and conducting data collection for a qualitative study exploring CAF recruit socialization, and risk factors associated with sexual misconduct in the context of early training environments. Data collection methods include conducting focus groups with new entry candidates on basic recruit and officer qualification courses, interviews with trainers, and non-participant observation of the training environment. The impact of applying qualitative sociological research in a high surveillance institution will be examined as it relates to reflexive considerations of the dual insider-outsider (native/external) status of the researchers, social desirability response bias of participants, the sensitive nature of the topic being investigated, and the potentially vulnerable population under study. In particular, the paper will explore researcher experience and positionality as sociologists undertaking research related to sexual misconduct in the CAF.

Aiming "High" in College: Potential Links between Existential Authenticity and Drug Consumption in/As Leisure Experience

The life stage of young adulthood is characterized by the sense of invincibility and immortality, while the college environment offers a playground for risk taking and experimentation with self-identity. In this study, we are looking at the use of drugs in/as leisure experience for college students as a means for such exploration. Although drug consumption is socially construed as risky and deviant, its meanings, outcomes, and leisurely connotations might be more complex. Hence, the purpose of this phenomenological study is to clarify the essence of drug consumption in/as leisure experience and its potential links to existential authenticity and self-transformation, as perceived by U.S. college students. Using 15-20 in-depth individual interviews, we will implement transcendental phenomenology to identify the textures and structures of the drug consumption experience, proceeding through the stages of epoché, phenomenological reduction, imaginative variation, and synthesis. Based on existing literature, the phenomenological textures associated with the drug consumption may encompass the sense of liminoid, escape, detachment from reality, potential reappraisals, self-transformations, and sense of intrapersonal and interpersonal existential authenticity. Relevant phenomenological structures could include the kind of drug (e.g., stimulants, depressants, or hallucinogens) and the phases, the frequency and the context of drug consumption (e.g., companions, location, purpose, and leisurely characteristics of the experience). Researching recreational drug consumption in/as leisure experience for college students from this novel angle will benefit knowledge by shedding light on the under-researched phenomenon in leisure scholarship. This study can also provide relevant insights for drug prevention, intervention, and rehabilitation programs around U.S. college campuses based on the improved understanding of drug consumption in/as leisure experience. This study has the potential to enhance the effectiveness of the programs that currently undervalue the exploratory state of mind or existential state of being as possible motivators for and/or outcomes of the college students' drug consumption.

RC10-208.2

FREDDANO, MICHELA* (*INVALSI- Italian National Institute of Educational Evaluation*)

PAR for the Empowerment of Teacher Assessment Literacy

The focus of my article is the use of participatory action research to develop assessment literacy among teachers. The article shows a recent case study of PAR that involved sixty-six teachers of an Italian region to become awareness observers of the processes on evaluation and strategic planning developed by all the schools of the interested region. The aim of the decision maker was to take a snapshot of the region and to train some teachers to be aware on school evaluation and planning. In Italy the culture of assessment and evaluation is progressively developing starting from some considerations: firstly, the development of international standardized tests as well as PISA testing; second, the presence for more than ten years of the standardized testing to assess the Italian students achievement; third, the fact that since the 2015 year the internal and external evaluation of schools has been systematically implemented. Into this framework it's relevant for teachers be more aware and involved so that being able to use appropriately evaluative both tools and language and to be supported by experts are required aspects. The article deepens a case study of participatory action research done to improve teachers' assessment literacy. The assumption is that for a successful training course with teachers it's more useful the active engagement as well as using action-research than direct instruction strategies. Results show that action research is an important training tool for teachers that allow them to empower the assessment literacy, from the fulfilment of evaluation actions to the development of aware evaluation practices, developing the culture of evaluation; increasing sensitivity towards the use of results retrieved from national and international standardized testing for effective internal and self-school evaluation.

FREDERIC, SABINA* (*Universidad Nacional de Quilmes/CONICET*)

¿Quiénes Contienen Emocionalmente a Los Peacekeepers? Acerca De La Dependencia Familiar De Los Militares Desplegados En Haití (2004-2015)

La tradicional dependencia de los militares de sus familias fue desafiada en la última década tanto por los cambios en la vida familiar como por la redefinición de las Fuerzas Armadas en la Argentina contemporánea. Como consecuencia, los militares demandaron a la institución el reconocimiento del divorcio y del concubinato, considerados por la normativa familiar tradicional como "situación

irregular de familia", y la eliminación de esta categoría. Buscaban así evitar que sus "vidas privadas" fueran usadas para interferir en los ascensos y obstaculizaran sus carreras. Asimismo, un creciente número de oficiales y suboficiales rechazaban sus destinos y solicitaban ser trasladados donde pudieran reunirse con sus hijos y parejas, las que dejaban de "acompañar" al marido militar donde fuera que lo destinaran.

Sin embargo, nuestra investigación sobre el lugar de la familia durante el despliegue en la misión de paz a Haití (MINUSTAH) sugiere que esos desafíos no disuelven la mencionada dependencia. Por el contrario, el análisis arrojado por las más de cuarenta entrevistas realizadas en 2014 y 2015 con ex *peacekeepers* hombres, instructores/as en cargadas del entrenamiento pre despliegue y psicólogas a cargo de la evaluación pre y post despliegue, muestran otras tendencias.

Así, la operación en Haití introdujo el concepto siguiente: "el desempeño de los militares que despliegan depende también de sus familias", habilitando un programa específico del centro de entrenamiento. Por ello, nos preguntamos por las convergencias y tensiones entre el recurso institucional, y los modos en que los ex *peacekeepers* lidian con sus familias, antes, durante y luego del despliegue. Exploramos, siguiendo las perspectivas de Arlie Hochschild y Marilyn Strathern, los recursos usados para lidiar con emociones como el extrañamiento, la angustia, la tristeza o la bronca, y las normas actualizadas para evitarlas.

RC35-JS-24.5

FREDERIKSEN, MORTEN* (*Aalborg University*)

Market Impurity: Welfare Liberalization As Moral Transgression

One of the most fundamental differences between welfare regimes is found in ascription of social responsibilities. The legitimate, moral order of the responsibilities of state, market, family and civil society are divided in different ways and justified by valuations ascribing superiority of different roles and memberships over others: e.g. citizenship over market agent, family membership over citizenship, or market agent over community membership. These symbolic patterns are largely homologous to the structures of formalized welfare institutions. The institutional arrangements of actual welfare states are, however, far from static and the ever changing fashions of welfare institutions and social policy may challenge these preexisting ascriptions of responsibility and create legitimacy problems. This paper investigates and compares the evaluations of welfare liberalization, marketization and institutional hybridity in Sweden and Denmark. Both country cases belong to the universal model of welfare and the introduction of market agents and market principles represents a significant departure from former policies. However, the two cases differ importantly on the historical trajectory of mix-model welfare: Sweden has historically been the more purely statist country, whereas the mix of state, market and civil society organisations has played a more prominent role in Denmark. The papers draws on the work of Douglas (2013) and Lamont (1992) in investigating the way such institutional reforms challenge and 'pollute' institutionalized valuations of social responsibility and on Boltanski & Thevenot (2006) in comparing the ability and willingness to justify hybrid welfare institutions. The paper is based on a comparative, qualitative interview study of 61 Swedes and 54 Danes.

RC35-633.2

FREDERIKSEN, MORTEN* (*Aalborg University*)

HANSEN, UFFE KJÆRGAARD (*Roskilde University*)

Trust and Confidentiality: Secrecy As Trust-Building Device

In Danish industrial relations the employee elected shop steward 'tillidsrepræsentant' (literally 'trust representative') constitute the fulcrum of local negotiations between management and labour. These shop stewards are, on the one hand, representatives of the institutionalized mistrust between labour and management. On the other hand, their ability to influence management decisions hinge on the mutual trust between shop steward and management. This produces an inherent paradox where those shop stewards who seek the trust of their colleagues must be completely transparent in their dealings with management, thus becoming less trust worthy in the eyes of their management counterpart. Those shop stewards who seek a high level of influence must treat much of their dealings with management as confidential, thus making themselves subject to criticism and mistrust from their colleagues.

The qualitative study reported in this paper is based on qualitative interviews with 29 shop stewards from 9 different chapters of a Danish trade union organizing the low-skill workers within the care sector. The study shows how, as claimed by Georg Simmel, secrets are important devices in creating and maintaining trust relations. However, it also reveals how the transparency needed for confidence in procedures and institutions may be incompatible with the reciprocity and confidentiality needed for intersubjective trust to arise. By taking into account the more complex interconnections of multiple simultaneous trust relations, this study reconfigures much of our current thinking on the trust-control nexus.

RC17-332.2FREDRIKSSON, CECILIA* (*Stockholm School of Economics*)*(In)Dependence in Meta-Organisations: The Dynamics of Independence within the European Accreditation Infrastructure*

Independence and independent auditing is seen as the ruling ideal within accreditation, described as the process by which an authoritative organisation gives a formal recognition that a certifier is competent, and the audit society as a whole. When reading regulations and strategies which auditing organisations are required to follow; an independent and objective activity is central. In 2008, the European Commission (EC) established a European accreditation infrastructure to assure the quality and safety of goods within the internal market and a harmonized European accreditation service, which changed the European audit society and the roles of accreditation organisations within Europe. A meta-organisation – European co-operation for Accreditation (EA) – was established with the national accreditation bodies as its members. The notion of independence becomes interesting in this constellation, as the national accreditation bodies are obliged to be members of the EA and follow certain requirements according to the Regulation 765/2008. Thus, the membership of the EA can be seen as a form of dependence. Earlier studies show that difficulties with independence in accreditation can be managed through the involvement of, and *dependence* on, additional organisations and audits in terms of escalating control structures (Brunsson et al., 2015; Gustafsson & Tamm Hallström, 2013; Tamm Hallström & Gustafsson, 2014).

The aim of the paper is to add to the understanding of independent auditing in a European perspective, by studying the membership as a possible way of organising the difficult task of being 'an independent auditor'. Analytical questions raised in the paper touches how a membership in the EA may affect the experienced independence in the national accreditation bodies; the dynamics of autonomy in meta-organisations; and the membership in the EA as a possible providing factor of legitimacy for independent auditing.

RC09-185.5FREER, COURTNEY* (*London School of Economics*)SABBAN, RIMA (*Zayed University*)*Identit(ies) and Heritage in the UAE: Examining the Roles of Kinship, Family and the State*

Since their independence, governments of states of the Gulf Cooperation Council (GCC) have devoted considerable resources to the preservation of heritage and perpetuation of national identity. We take the case of the UAE as a prime example of state promotion of heritage and identity. Nowhere have efforts to provide a ruling myth and national culture been more broad-based and ambitious than in the UAE, which has worked determinedly to promote a sense of shared identity and values among its citizenry. This is no coincidence. Indeed, the union of the seven emirates forming the UAE was famously contested, with Ras al-Khaimah, agreeing to the union months after its creation and with national armed forces fully unified only in 1996. Benefitting from substantial hydrocarbon wealth, the Emirati government is able to devote considerable funds to a variety of heritage projects, which foster shared identity in a state where citizens compose less than 15 percent of the total population. Many of these efforts emphasise a shared tribal past unique to the Emirati population. The UAE houses an impressive variety of government-linked bodies with authority over heritage preservation.

This paper in particular will focus on the role of the state in advancing messages about national identity and values, particularly how these have shifted since Emirati independence as different political ideologies have come to influence the region. Because both scholars have conducted previous research on identity, society, and politics of the UAE from different disciplinary backgrounds (Dr. Sabban is a sociologist; Dr. Freer is a political scientist), this paper will include an extensive literature review to aid further, multidisciplinary discussion of the topic of state promotion of heritage and shared identity, in addition to providing an extensive review of past Emirati policies on identity formation and heritage.

RC26-JS-23.1FREGIDOU-MALAMA, MARIA* (*University of GAVLE, Department of Business and Business Studies*)*Why Microfinance in RICH Developed Countries?*

This research deals with microfinance. Microcredit means giving people access to financial resources to borrow a small amount of money to invest in income generating context related to business activities. The study analyzes how microfinance is structured and its influence on business development in Sweden. A multiple case study is applied for data collection. Qualitative data have been collected in form of semi-structured interviews. Direct observation and documents have also been used as data source. The study shows that microfinance contributes to development of sustainable enterprises and innovative product and services development. It is argued that microfinance leads to sharing risk and

financing projects in social enterprises, cooperative businesses and associations. It provides people with social networks, enhances their independence, empowers them and improves the quality of their life by generating economic resources. We suggest future comparative studies on the influence of microfinance on business development and women empowerment in emerging economies and developed countries.

RC33-608.1FREHILL, LISA* (*George Mason University*)*Measuring the "Light Touch" of Library Programs in the United States*

U.S. public libraries have faced many challenges in the past decade. The increase in digital information has resulted in realignment of collections and efforts at libraries towards digital content and away from print collections. Additionally, U.S. libraries are increasingly offering educational programming. Concerns about accountability for public expenditures have resulted in calls to evaluate the efficacy of this programming.

The U.S. Commission on Evidence-based Policymaking (CEP) recently completed its work, which focuses on accountability for public expenditures. The CEP's recent [final report](#) emphasized the need for Federal agencies to increase use of administrative data and to more effectively link various data sets. Increasingly, U.S. public-funded institutions are being held accountable for producing impactful results. Recent examples, such as the corporatization of prisons and privatization of schools, suggest these are not empty threats.

Within the changing environment for libraries, the "Measures that Matter" project seeks to develop indicators of the impact of public library programming upon the communities they serve (e.g., see a recent working paper associated with this effort). However, as will be shown in this paper, careful attention to the macro-micro link is critical in the assertion of impact when the associated programming is best characterized as a "light touch." That is, library programs, unlike formal educational programs, tend to be incidental and of short-duration, presenting a significant threat to causal assertions due to spuriousness, especially when aggregating measurements of different programs.

This paper will use administrative data along with 51 states' evaluation reports about the use of federal grants funds for the past five years, and data on public libraries available in two longitudinal establishment-level surveys to explore the linkages between projects and outcomes and the issues associated with aggregation from the micro to the macro level. The paper's focus is on measurement and cross-level linkage challenges.

RC52-867.4FREHILL, LISA* (*George Mason University*)*The Struggle for Professional Control in a Time of Financial Crisis: Librarians Credentials in the United States*

There are 9,000 public libraries with 17,000 outlets in the United States. Library agencies in each state certify librarians. The main credential, the Master of Library Science (MLS) is a postgraduate tertiary program accredited by the American Library Association. The economic crisis of 2008 merely intensified the pre-existing struggle for professional control – and, survival, itself – of public libraries and librarians.

The financial crisis occurred along with significant social forces impacting U.S. professional librarians. The internet and digital information revolution resulted in the rise of "information science" programs, sometimes within, but sometimes outside established MLS-conferring library science schools. Complicating these changes are status differences across libraries and gender differences of these fields; i.e., library science remains heavily female, while information science, especially those in computer science tertiary organizations, are proportionately more male. Such programs reflect the changes occurring in the technical content of librarians' work.

This paper draws upon data from two major, longitudinal surveys. The U.S. Public Libraries Survey (PLS) has been collected annually since 1988 with response rates of 95%+, provides rich information on activities and programs of public libraries and about its workforce. A second collection, the State Library Administrative Agency (SLAA) survey, has been collected annually since 1994 (biennially since 2010) with 100% response from the U.S. states and District of Columbia (51 reporting units). The SLAA provides information about state trends in programming and services to libraries of all types and how states govern libraries. These datasets show the extent to which the 2008 financial crisis impacted libraries differently, with significant differences across the 51 reporting units. They, along with policy documentation, provide insights about how the U.S. library profession has attempted to mitigate challenges to the profession.

TG08-1010.4FREITAS, AMÍLCAR* (*UFPEl*)*Criminalization, Social Control and Media in Brazil*

Since the end of the 1970's, practices of punishment and incarceration have grown in modern states all over the world; in Brazil, only in the 21st century, prison population has tripled. In parallel to this fact, some television shows are approaching police themes using a discourse that demands longer and more harsh penal sentences. The goal of this paper is to comprehend, through the analysis of these shows, how they can be perceived in relation to the transformations of current capitalism. As empirical data, is presented the analysis of "Cidade Alerta" and "Brasil Urgente", to television programs on that matter with nationwide exhibition. Thinking the transformation in capitalism and in the labor force, we take the notion that each laborer is becoming an entrepreneur of his or her own self, in a way that the worker has to build a trajectory that allows him or her to be able to obtain income, even as an employee. Hence, ideas such as subjective engagement and individual responsibility have grown, and thus that the motivation to work and the perfect labor force should come individually from each laborer. Nonetheless, some possibilities of obtaining income are forbidden due to their criminalization, like theft or drug trafficking. We present, as a working hypothesis, the idea that these criminalizations generate new forms of social control over the poorest extract of the population. Moreover, these criminalizations, and its subsequent mass incarceration, are only possible due to a strong moral reaction against the practices that are criminalized, and this moral reaction is largely potentiated by the television programs that are analyzed here. Thus, these programs articulate themselves with new forms of social control provoked in the wave of mass incarceration of the 21st century.

CAVALCANTE, RICARDO (*Federal University of São João del Rey*)

Sociology, Technology and Primary Healthcare – the Dilemmas of a New Paradigm

These notes outline the theoretical review chapter of a post doctor project about the information systems applied to the primary healthcare. The concepts and paradigms discussed in this chapter were drawn from the work of Bruno Latour, Boltanski and Thévenot.

The work shows how key social science concepts and paradigms can be applied by researchers on studies about complexities generated by the introduction of the technologies of communication and information in healthcare. Some studies highlighted the introduction of these technologies provoked deeply changes on professional identities, doctor-patient relationships as well as on human-machine relationships.

The key contributions of this work is considering social system as one dynamic process in which humans and non-humans are always interacting, negotiating their interests and according new rules and behaviors. In these theories, humans and non-humans have similar capacity in terms of agency and of influence.

The authors believe that all individuals have the capacity to formulate the theories to support their choices. In this way, it is the responsibility of the analysts to follow them and to take the notes.

It has led to a lot of applications, some which will be exemplified in these notes: 1. Innovative conceptualization about role of humans and non-humans in social systems (both of them can change social systems through negotiation processes); 2. Actors are self-motivated; 3. Actors and objects can occupy positions of representative, influence or discordant voices (when an actor speaks for the network, he is occupying representative position); (when an actor influences another one in solving problems situation, he is occupying influence position); (when an actor's claim provoke changes in network structure, he is occupying discordant positions); 4. The disputes show how the power is distributed between actors and what the tools of control used by them.

The Concept of Social Responsibility Applied to the Health Care Sector: The Case of Portugal.

This paper aims to show that the concept of Social Responsibility (SR) has been fundamental to consolidating, reformulating and implementing the changes of socio-economic rules of hospitals in a period of social controversy around health care. For instance, elaboration and divulgation of sustainability reports, communication on social responsibility programs through hospital's websites, implementation of certification ISO 9001 and ISO 140001, application of internal and external audits systems and stakeholder's management models.

The research shows that SR practices grew up when Portuguese healthcare sector was undergoing a period of intense criticism from the public-private partnerships consolidated with the Portuguese State. The study showed that at the same time the period of controversy has been fruitful to implementation of SR in

healthcare because it generated "social immunities" so that the hospitals could adopt behavior, symbols and languages to legitimate the new public management (NPM) models in healthcare.

The concept of Social Responsibility seemed to be a new way through which healthcare organizations and professionals could achieve the social license that they needed to operate their NPM systems.

One of the motives that also contributed to hospital mobilization was the necessity to achieve the equilibrium between the demands of universal access to healthcare and the demands of economic efficiency within the new public management decisions taken by managers and clinicians. Undoubtedly, SR contributed to this equilibrium. But Social Responsibility found institutional and cognitive barriers that make difficult its introduction and expansion. To overcome these barriers, hospitals developed a network of partnerships and negotiation models in very different modes as well as creating new social regimes, for instance, increased transparency and democratic participation within decision process. Case studies (of public, public-private, and private hospitals) provide empirical support for the analyses and conclusions presented in the paper.

Playing with Risk: Video Games, Virtual Goods, and Volatility in Markets

Abstract

Theorizing the nature of derivatives in late capitalism, Benjamin Lee and Randy Martin (2016) argue that their volatility plays a key role in economic risk management and risk-taking. Derivatives can be thought of as "contingent claims", and as "contracts among counterparties with a payout that depends upon some uncertain future event" (Lee and Martin 2016: 8). And volatility "is the randomness in things that is felt as the intensity of change," as we approach this uncertain future event (Lee and Martin 2016: 4). With reference to derivatives and their volatility, this paper explores everyday practices that play with risk in markets. Instead of foregrounding the markets of finance capitalism, however, key cases considered will be the representation of markets in video games (e.g. the stock market in *Grand Theft Auto V*), and the real-money market in virtual goods associated with skins in video games (e.g. Valve Corporation's *Steam Marketplace*). In these markets, users learn to play with risk in interesting ways, inviting a re-thinking not only of the role of play in the types of edgework and risk-taking characteristic of economic life, but also of the (derivative) linkages between markets of all kinds in late capitalism.

Students' Educational Biographies within a Changing Higher Education System in Austria

Societal shifts towards knowledge economies and the globalisation of markets have caused significant institutional change within European universities. One central aspect of universities' transformation process is the Bologna Process which has been implemented in order to meet the demands of a global economy. Particular in German speaking countries, the Bologna Process and the introduction of a new two-tiered study structure, consisting of Bachelor and Master programmes, has affected students' educational trajectories. This structure has increased both rigid regulations (such as the successive achievements of credit points) and flexibility (as students can more easily change study subjects and study across European countries) and thereby reconfigured individual biographies. However, the interrelation between individual biographies and a modified higher education system has not yet been examined. Therefore, this paper focuses on the question of how students shape their educational biographies and experience higher education under changing institutional environments. Biographical-narrative interviews with former students of educational science at two Austrian university sites have been carried out to explore how they construct their educational biographies within a specific study environment. To assess the impact of the new study structure students are sampled into two groups: one that graduated before and one that finished their Master degree after the implementation of the Bologna Process. Students' narratives are analysed abductively following principles of reconstructive methodology. The results highlight differences and commonalities amongst the two student groups in the ways in which they form their educational biographies. It is outlined that individuals' constructions of their educational biographies are clearly embedded within institutional imperatives and the given study context. However, the analysis also highlights that individuals used biographical meanings as reflective spaces to influence regulations and to shape their educational environments.

FREY, PHILIPP* (ITAS-Karlsruhe Institute of Technology)

SCHNEIDER, CHRISTOPH (Munich Center for Technology in Society)

Concrete Utopian Thinking As Socio-Epistemic Practice. the Case of the Automation and the Maker Movements

In our talk, we want to show that an analysis of the generation of alternative futures can draw inspiration from Ernst Bloch's notion of concrete-utopian thinking. Bloch analyzed the social embeddedness of utopian thinking and promoted the conscious mediation of (scientific) investigations of present social tendencies and the normativity of classical utopian visions. Consequently, we propose that concrete-utopian thinking can be understood as a socio-epistemic practice that facilitates the generation of alternative futures. Instead of reifying these ideas, we will show that their development takes place in contested fields of practice with divergent interests and complex (power) dynamics involved. Precisely because of this, the focus of 'concrete utopias' on developing and imperfect forms of experimentation in a dynamic and unfolding present enables us to trace emancipatory potentials without romanticising the realities of social development. Rather, we will argue that precisely in these opaque fields of practice lies potential for novelty that might not yet be expressed in public discourse. Our case studies will be two major emancipatory visions that have received increased attention in the past years: the emancipation from socially necessary labour propagated by progressive commentators in light of the accelerating wave of automation on the one hand and the self-determination of creative work due to highly adaptable, individualized and decentralised technology on the other hand. In the first example, progressive actors aim to push a new emancipatory discourse into politics. In the maker movement, novel digital platforms for knowledge sharing and production (e.g. 3D-printers) have spurred a wave of experimentation with novel organizational forms and emancipatory visions. Providing insights from both participatory action research and discourse analysis, we will shed light on the question how these ideas are embedded in social context and practices and how particular actors combine 'imagination' and 'practice' to push towards their alternative futures.

Fighting Against Injustice and Discrimination in the Labor Market: Career Paths of Poor Young People Graduated from New Universities in Greater Buenos Aires, Argentina

In the period 2007-2015, 17 new national universities were created in Argentina, 8 of which are located in Greater Buenos Aires. These universities meant an expansion of university education offer, since they are placed in territories where there was no university previously. Moreover, these institutions were born with an inclusive mandate, implementing many of them strategies to improve the access and permanence in the university of young people from popular sectors. This implied, for many of these youngsters, to be the first to study at the university in their families.

Some of these new universities already have their first graduates. For these young poor students, graduation does not imply to face for the first time the challenges of the labor market, since they usually combine study and work, to be able to sustain themselves through university studies. Like other young people of popular sectors, they have had irregular career paths, with precarious and informal jobs and high turnover. They have experienced injustices and discrimination in the labor market.

The paper address the question: how has university education influenced these young poor people's labor market trajectories? What challenges do they face as graduates in the labor market? Which competences and resources have they acquired in university and how do they use them in the search for a suitable job? How do they combine the skills and resources obtained from university with those developed in their previous work experience?

To answer these questions, I have reconstructed the career paths of graduates in Social Sciences and in Health Sciences, men and women, who attended two of these new national universities in Greater Buenos Aires: Arturo Jauretche University and University of Avellaneda. With this purpose, I have compiled life stories of young men and women recently graduated.

FREYTES FREY, ADA* (Universidad Nacional de Avellaneda/Universidad Nacional Arturo Jauretche)

The Construction of Inclusive Higher Education in Greater Buenos Aires, Argentina: Institutional Strategies and Students' Perspectives.

In the period 2007-2015, 17 new national public universities were created in Argentina, 8 of which are located in Greater Buenos Aires. This is a sign of political commitment with the expansion of university education offer, since they are placed in territories where there was no university previously. These institutions were born with an inclusive mandate: to create the conditions for the access to university of groups traditionally excluded (exclusion related with social, gender, ethnic inequalities).

In order to respond to this mandate, these institutions carried out a reflection on traditional university practices and generated innovations in institutional structures, in student orientation and support dispositives and in teacher training. They also intended to build a close link with the communities where they are located, in terms of knowledge transfer and technological linkage. In this paper we intend to critically analyze these strategies in two of these new universities of Greater Buenos Aires, to identify their achievements and their deficiencies regarding democratization of higher education.

To do this, we do not only resort to institutional documents and in-depth interviews with university authorities in charge of different institutional areas, but we also seek to put this institutional perspective in counterpoint with the perspective of students from disadvantaged groups. The latter allow us to explore the challenges these students encounter in accessing university and developing their career. We also analyze how the institutional strategies implemented respond to students' needs, and which challenges remain disregarded.

In order to grasp students' perspective, we have collected life stories from junior and advanced students of Social Sciences and Health Sciences. The reconstruction of educational, family and labor trajectories has allowed us to understand the university experience in the context of their whole life experience.

(De)Racializing Italianness. a Visual Essay on the Conflict about the Reform of the Citizenship Law 91/1992

My paper discusses the role played by the images in the reproduction of racial hierarchy and in its criticism. Visuality is part of the history of european capitalist modernity (Mirzoeff 2011) and its visual oppositions between "us" and "them" still have dramatic material effects, in Italy too. Visuality classifies and divides social groups, then legitimates those divisions through an "aesthetics of status quo" (Fanon 1961). I will show the research example of the long campaign against and in favour of the reform of the Italian citizenship law 91/1992, focusing on the "right to look" (as a visual claim to a political subjectivity) of children of migrants (the so called "second generation") and of young people self-defined as "Afro-Italians" and "Italians without Citizenship".

A visual essay will be screened in order to facilitate a debate on the reproduction of white supremacy in the neo-fascist propaganda and on the celebration of Black Italianness in the alternative public sphere created by social media (Nakamura 2007).

FRISINA, ANNALISA* (University of Padova)

Unlearning Everyday Racism (and sexism) in Italy. a Photovoice Research with Young People

The first part of my paper introduces the theoretical framework (a dialogue between Post/de-colonial sociology, Critical Race Theory and Visual Studies) and offers a reflexive account of a participatory visual research with young people from the North East of Italy. They were invited to take pictures on three themes: "Self-portraits of a new generation"; "People/places in the city I live in that make me feel (in)secure"; "Feeling a citizen, feeling a foreigner". Thanks to *phovoice* method, children of migrants claimed citizenship through images and challenged everyday racism/sexism lived in their cities (Padova and Verona) and in their schools (two technical upper secondary school, one vocational school and two scientific lyceums).

The second part of my paper is devoted to discuss methodological issues. Drawing from critical reflections on the limits of participatory visual research (Luttrell and Chalfen 2010; Guillemin and Drew 2010), I will propose to "unpack photovoice" in three methods (subjective image making; serial focus groups with photo-elicitation; participant observation, for understanding the audience's reception of the research visual representations). The paper will thus underline the relevance of focus groups with photo-elicitation for negotiating Otherness, questioning the whiteness of Italians and offering a transformative safe space for racialized young people

RC20-JS-78.2FRITSCH, NINA-SOPHIE* (*Vienna University of Economics and Business*)EBENSPERGER, SABINE (*Friedrich-Alexander-University Erlangen-Nuremberg*)*European Perspectives on Occupational Gender Segregation*

Occupational gender segregation is prevalent across Europe and has been a remarkably persistent characteristic of the labor markets in Western industrialised countries. There have been few changes with respect to the extent of gender segregation over the last decades, even though the female participation in the labour force is steadily increasing and levels of qualification are converging. The majority of studies concentrates on various outcomes of occupational gender segregation – particularly by referring to the gender wage gap. But in order to intensify our knowledge on this research topic, it is necessary to take a closer look on the actual causes and backgrounds by applying a detailed analysis of the occupational level itself. Therefore, the main research questions of this paper are: How has gender composition developed in different occupational groups in Europe over the last 10 years? And which occupational preferences and working conditions help to explain occupational gender segregation? Drawing on secondary data from the LFS (2005-2015) and the EWCS (2000, 2010, 2015), in the first step of the analysis a descriptive overview is established using various index measurements determining gender segregation and gender concentration. In the second step exploratory factor analyses are applied in order to detect intrinsic and extrinsic professional values. The factorial values are subsequently integrated into an OLS regression model, whereas the share of women resp. men in different occupations are serving as regressands in this context. In a final step, we examine in greater detail if occupation specific working conditions regarding work-life-balance (e.g. part-time work) can contribute to explain occupational gender segregation. We focus on Germany and generate an occupational panel dataset which is based on individual information from the German Microcensuses (1996-2011). Results of this case study will show if changes in working conditions lead to changes of occupations' gender composition.

RC42-JS-66.3FRITZ, JAN MARIE* (*University of Cincinnati*)*Cities for CEDAW: Notes on Effective Intervention*

The UN General Assembly adopted the Convention on the Elimination of All Forms of Discrimination against Women (CEDAW) on December 18, 1979. The treaty has thirty articles and covers topics such as educational opportunities; sex trafficking; women's rights in political and public life; access to health care; rural women; women's economic and social rights; and equality in marriage and family life.

The United States (US) is one of the few UN Member States that has not ratified CEDAW. In the US, there has been a movement to have cities declare themselves as CEDAW cities. This initiative has the support of the United States Conference of Mayors (2014). This kind of effort raises awareness about CEDAW, provides a framework for community action and calls attention to the fact that the US has not ratified the treaty.

Cincinnati, Ohio is now considered a City for CEDAW. Based on my experience as a founder of the Cincinnati for CEDAW Community Coalition, a number of points may be made about effective intervention: identify needed community partners; do not underestimate the importance of political will; provide adequate financing; develop "right-sized" basic documents (e.g., resolution, ordinance); help set priorities and timelines; discuss girls as well as women; look for opportunities to use the different levels of intervention to support the initiative; and make plans for community monitoring.

RC19-362.2FRITZ, MARTIN* (*Bielefeld University*)*Sustainable Welfare in Public Opinion: Analyzing the Relations between Attitudes Towards Social and Environmental Policies*

The causes, costs and consequences of ecological degradation are distributed unequally between social classes and countries: There is a 'triple injustice' (Gough 2013) meaning that the rich make for the most of the environmental pollution while the poor bear the brunt (Büchs, Bardsley & Duwe 2011) and pay the bill. The emerging eco-social policies and practices tackling social and environmental injustice vary among welfare types and according to their underlying basic values, beliefs and conceptions of society-nature relations. So far relatively little is known about these different ways of thinking about how to reconcile social and ecological needs.

This paper seeks to increase such knowledge and investigates how attitudes towards environmental and welfare policies are related to each other. Building on recent contributions (Koch & Fritz 2014; Fritz 2016; Jakobsson, Muttarak & Schøyen 2017) it analyses new data from the European Social Survey 2016 which con-

tains two thematic modules: questions about welfare policies and climate change attitudes. This unique set-up allows for comparative and multidimensional analyses exploring the latent eco-social patterns within public opinion. In the analyses the relations, tensions and interdependencies between social and ecological issues will be discovered and compared among welfare regimes, countries and classes. The results will contribute to a better understanding of cross-country, welfare state and class differences in society-nature relations and provide useful information about the public support that eco-social policies may get or not get from these actors.

RC19-366.1FRITZ, MARTIN* (*Bielefeld University*)*Towards Global Eco-Social Policy: Combining Social Justice and Environmental Sustainability.*

The idea of environmental sustainability always had a hard time against firm economic interests and the power games of political actors. Nature cannot speak for itself and the people mostly affected by ecological damage were not heard in political debates for a long time. Green issues gained major political influence only as an attachment to the more popular concept of socio-economic modernization. Environmental concerns were used for greenwashing business interests and promoting visions of 'sustainable development' and 'green growth'.

While these ideas are still predominant today, a new political alliance is forged: Global social policy more and more is concerned with the problem that the causes, costs and consequences of ecological degradation are distributed unequally between social classes and countries. There is a 'triple injustice' (Gough 2013): The rich make for the most of the environmental pollution while the poor bear the brunt (Büchs et al. 2011) and pay the bill. Tackling these problems requires to combine environmental and social policy efforts within an integrated 'eco-social policy' approach (Gough 2013). The adoption of the SDGs was a first important step but more need to follow.

Using the analytical distinction of the three Rs (Deacon 2007), this paper traces the latest developments in the emerging field of global eco-social policy and discusses to what extent major projects, actors and institutions refer to unified eco-social strategies in the fight against social and environmental injustice. Theoretically, the paper follows Gough's suggestion that there are three stages of integrating social with environmental policy. It critically assesses whether instruments and strategies are designed as compensation, co-benefit, or unified eco-social policy. The paper argues that despite the current political roll-back trends in many world regions, there is a growing global awareness of ecological risks such as climate change and the massive social consequences they entail.

RC49-824.3FRIZZERA, MARIANA* (*Faculdade de Direito de Vitória*)PAZÓ, CRISTINA (*Estácio de Sá de Vitória*)*The Effectiveness of the Sexual and Reproductive Rights of the Women with Mental Disorder and Intellectual Disability in Brazil*

This article has the aim to reflect about the discriminatory treatment given to women with intellectual disability and mental disorder, who had their sexual and reproductive rights, historically, violated. We attempt with this study to understand these rights as human rights and as formateurs of identity, representing an important dimension in life of people with mental disorder and intellectual disability, who must be protected. Therefore, we can see urgency in carrying out these rights, since they involve study of gender, hypervulnerability, exclusion and social stigmatization of woman, besides violence suffered by them due to lack of information and sexual education. Women with mental disorder and intellectual disability face a double vulnerability which is related to both question of gender and cognitive impediment that exist in relation with social environment. The disorder and the disability arise as a collective health problem and also as the health of the own woman during her life since the actions addressed to the attendance of her necessities are almost inexistent, mainly concerning her sexual and reproductive rights. In light of this context, the law 13.146 (Brazilian Law of Inclusion of Person with Disability), is in force since January 2016. Among changes made by it, there is the reform of the Disability theory, since people with disability became fully capable after it. So, is it pertinente to make the following question: how do sexual and reproductive rights of women with mental disorder and intellectual disability, which are conferred by Law 13.146, can be effected? The purpose is to demonstrate the importance and necessity, not only of the statement of the laws, as the Statute of People with Disability, which recognized several rights to people with mental disorder and intellectual disability, but also the adoption of public policies that effectively promote these rights in a fully way.

RC47-799.4FROELICH, JOHANNA* (*University of Oldenburg, Germany*)*Expectations of the Future As Motivation in New Rightist Movements*

Social movement research focused for quite a long time on movements aiming at progressive and democratic social change. However, there has been little to no sociological interest for rightist movements and their aspirations, even though certain similarities are obvious: the struggle for an alternative future through the medium of protest. The major distinction lies in the assessment of past, present and future. In contrast to many left-wing-movements, right wing movements rate present and especially the past as rather positive -- the future however as fundamentally threatening. Thus, the struggle for an alternative future is focused on preserving the past against the perceived threats.

In my contribution I analyze to what extent the perception of the threatening future motivates new-rightist-activists in Germany to commit specific actions. My analysis is based on Gesa Lindemann's concept of *care*. According to Lindemann the motivation to act is always connected to the specific reference to the subjective relevant future, which the self expects. The person gets confronted with the potential failure of the future and gets motivated to act in order to prevent the future failure. This present motivation is called to *care*. The concept of *care* rests on the subjectively perceived relevancy of the future: If the potential failure of the future does not affect the person, *he or she will not care*.

This implies that for my analysis I need to investigate how individual activists perceive themselves as affected by the threatening future. Therefore, I conducted an ethnographic field research for several months. I observed four new-rightist-groups at informal gatherings, training and political actions like demonstrations. Furthermore, I interviewed key participants and evaluated public self-representations. The qualitative data were coded based on the grounded theory.

RC47-784.3

FROELICH, JOHANNA* (University of Oldenburg, Germany)

The Immediate Dimension of Violence in the Communication of German New-Rightists

In the *Neue Rechte*, a new-rightist movement in Germany, the participants proclaim themselves in public as strictly non-violent. This non-violent attitude seems to be a strategic way to distance themselves from the "Old right" Nazis, who have a poor reputation in Germany and are antagonized. The strategic dimension of the non-violence becomes evident considering that the participants are presenting themselves to each other as having the potential to commit acts of violence. This provokes the question whether the communication about potential violence does in fact serve to replace immediate violence in far-right groups.

In the sociological discussion the term 'violence' is not neutral. Colloquially, to call something 'violent' means to delegitimize it. Nonetheless, in order to understand violent phenomena, it is necessary to have an analytical concept that incorporates the social specifics of violence. Thus, I adopt the violence concept of Gesa Lindemann, who describes violence as 'mediated immediacy' according to Helmuth Plessner. This concept allows to describe the immediate dimension of violence, in the sense of violence as an immediate embodied interaction in the Here-Now. Furthermore, this immediate act is mediated through the reference to mediating third parties. These third parties are important to understand the morality of violence: the existence of violence indicates breached normative expectations. In committing violence the perpetrators state, that their expectations are valid, even if they were breached.

To study the communication about potential violence as violence means in fact to study to what extent the immediate dimension of violence can be found in the verbally mediated violence. In my contribution I try to answer the question based upon ethnographic field research consisting of participatory observations over several months in different groups, interviews with key actors and public self-representations in the *Neue Rechte*. The qualitative data were coded based on the grounded theory methodology.

Leisure, Urban Planning and Socio-Spatial Segregation: Reflections on the City of Belo Horizonte - Brazil.

This article presents partial results of a study achieved by the master's thesis defended at the Postgraduate Program in Leisure Studies, at the Federal University of Minas Gerais - Brazil, where answers were sought to understand the engagement of young people from working - class areas to the events and equipments of Sports, Leisure and Culture in the city of Belo Horizonte. The research method used was the bibliographic review of the history of urban planning of Belo Horizonte, in which concerns the construction and distribution of leisure equipments throughout the city. The study's findings have shown that since its foundation, the poor have been segregated and have gained limited access to leisure equipments. The reorganization of urban space from the perspective of construction of leisure facilities, such as public parks, cultural centers and sports areas, took place almost one hundred years after the foundation of the city,

together with the rise of popular parties to the state power of the city, from the creation of mechanisms for participatory democracy.

Conceptual Modeling of the System of Symbolic Construction of Doctors Professional Identity in Russian Media Space.

A large number of different factors influence the process of constructing professional identity of the individual (personal circumstances, family, education, community, economic situation, labour market, etc.). In the modern world, in the era of information society media has very meaningful role in the process of forming a professional identity modern doctor.

Media, on the one hand, are the product of social relations, on the other hand, they determine those relations and processes. Modern media are key factors of formation of professional identity of the modern Russian doctor, reflecting such important components of his professional identity, as the prestige of the profession in society and the attitude of the public towards the representatives of this branch of labor. Also by means of different sources of mass information (TV and radio, broadcasting, print media, Internet) is the formation of the so-called portrait of a modern doctor. This article provides approbation of conceptual modeling methodology in the context of constructing professional identity of doctors in Russian media-space. Conceptual modeling makes it possible to study static structure of the system in the context of goal-achievement in transition. The authors proceed from the premise that dominant forms of media determine identity matrices through various instruments, be they the mass media, social networks, blogs, films, advertising, animation or TV series. All these forms of communication transmit certain symbolic codes perceived by individuals, that are built into multi-level identification matrix.

This paper is written within framework of the interdisciplinarity paradigm and implements the method of social modeling, in particular conceptual modeling. Conceptual modeling makes it possible to study the static structure of the system in the context of its goal-achievement while in transition.

The article was written with the support of the Russian Science Foundation project No. 16-18-10306.

Parents' Attitudes Matters: A Research on Parents' Attitudes Towards Homosexuality in China

LGBTQ rights fighting has experienced hardship with no public support, and this is what China LGBTQ groups are encountering. Gaining parents' acceptance usually taken as the first and most important cornerstone for pushing LGBTQ rights forward. So, in this research, we aim to explore the parents' attitudes towards homosexuality in China: what features parents' attitudes and what changes parents' attitudes to homosexuality in the past decades? Based on three theories of attitudes change ---- Learning theories, Social judgment theories, Functional theories, this article explores how parents' attitudes towards homosexuality are formed and changed. We use longitudinal regression analysis on samples from CGSS (Chinese General Social Survey) from 2003 to 2015 to explore the multilevel factors' effects on the parents' attitudes.

Online Contact Patterns and Network Resources: Integrating Social Media Records into a Large-Scale Sampling Survey

The role of social media interactions in social network analysis has been an important yet puzzling issue. As social media become a regular and convenient platform that facilitates an increasing proportion of interactions, for example, to what extent do online contacts help explain why some people get access to more social resources through their personal networks? The question is difficult to answer without integrating actual contact records on social media into data analysis. In this study we show how integrating Facebook contact records and self-reported data from a large sampling survey could contribute to understanding an individual's social resources in general, and social capital in particular. Data on network resources and social capital come from the 2017 module on Social Networks and Resources of the Taiwan Social Change Survey (TSCS). As a member of the International Social Survey Programme (ISSP), the TSCS team collected rich information about social resources and social capital, along with other network measures, from a representative probability sample of the adult population in Taiwan (N=2,000). Among those respondents who used Facebook regularly, about 80% also authorized the use of their contact records on Facebook. With detailed

Facebook contact records from about 800 respondents, we plan to extract and construct various features at individual, tie, and contact levels, and examine how different online contact patterns help differentiate the respondents' network resources and social capital. The information about resources and social capital will be derived from both position generator and resource generator in the survey data. The study is expected to reveal key connections between recorded data on social media and self-reported survey results, both from identical individuals in a nationally representative sample.

Observing Facts and Values

Observing Facts and Values: A Brief Theory and History
Abstract

Not acknowledging the history and metaphysics of the fact/value distinction has led to confusion about the difference between the normative and the cognitive, and disputes on whether there are ways to move from one side, facts, to the other, values. One solution is to recognize values as more "objective" than facts, and thus blur the common way of drawing this distinction. The origin of the distinction between facts and values appears in the space between them, when and where it is uncertain whether an observation becomes fact or value. Once values turn into subjective beliefs, the entire distinction collapses, and modernity begins to end.

FUCHS-SAWERT, LUCIA* (*Free University of Berlin*)

Non-Governmental Volunteer Receiving Organisations in Ecuador: Disciplining Global Citizens

International development volunteering (IDV) has become a popular practice of development in the last decades: Young people from the Global North go to the Global South to contribute to development – whatever this might mean in the specific context. IDV is actively supported by Governments in the North, like in the German programme *weltwärts*, which has sent more than 26.000 volunteers to the South in the past 10 years. Most of the practical work with the volunteers is managed by (I)NGOs that cooperate with the programmes. While the Government provides funding, programmatic guidelines, and the public representation, (I)NGOs take over the practical tasks. Especially (I)NGOs in the South are the ones that work with the volunteers during their placements. Therefore, they shape the way IDV is performed in situ, and which meanings and identities are (re-)produced through it.

With a discourse ethnographic approach, and through a postcolonial lens, I investigate how IDV is interpreted from the perspective of non-governmental volunteer receiving organisations in Ecuador. How do they conceptualise the role of the volunteers and their own role? What does development mean for them? Which are the discourses that structure IDV on the ground? First results indicate that the concept of development does not figure prominently in the imaginary of the people involved in the receiving organisations. They were mostly concerned with keeping the volunteers safe and happy, and disciplining them sufficiently so that they would not be too much of a hinderance to the projects' work flow. However, their lack of experience and discipline was tolerated, because, based on their origin from the North, they were associated with positive values like modernity and cosmopolitanism that the locals supposedly lacked. This shows that IDV, in the way it is currently organised, carries the risk of reproducing traditional North/South hierarchies.

RC33-610.3

FUCHS-SAWERT, LUCIA* (*Free University of Berlin*)

The Construction of Space in International Volunteering and the Global/Local-Split

International volunteering is an increasingly popular practice in the field of development: Young people from the Global North go to the Global South to work in social projects there. While the North/South divide includes more than geographic locations, international volunteering depends upon a material movement in geographic space: The volunteer has to go to a specific place, which automatically acquires a symbolic meaning through that. Even though the North/South distinction is downplayed in most programmes, this place is necessarily located in the Global South. Without this location, and what is associated with it on a symbolical and discursive level, the practice would not be possible.

Examining the websites of volunteer sending organisations with a discourse analytical approach, I analyse how the global space is separated in volunteer sending and volunteer receiving places. I argue that a part of this construction is the dissolution of the significance of space for some, while it becomes very important for others. This leads to a global/local-split: Global people, who are detached from a specific location, go to a fixed point in time and space to perform their role as volunteers there. Those who receive their services, on the other hand, are closely associated with their local place. These results will be comple-

mented with an analysis of the perception of space of people involved in international volunteering in Ecuador, based on both interviews and blog entries.

On a methodological level, I focus on the question how, with the means of discourse analysis, the spatial dimension can be analysed in a practice where it is, at the same time, very present and very absent. For this purpose, I will follow traces of space in a mixed sample of materials, including blog entries, photographs, websites, and interviews.

FUENTES, SEBASTIAN* (*CONICET/FLACSO-Argentina*)

The "Secundarization" of Higher Education in Argentina: Recruitment and Distinction in Institutional and Pedagogical Formats

The purpose of this paper is to analyze the process by which private universities in Buenos Aires develop strategies to recruit students from upper-middle and upper classes families. The universities implement pedagogical and institutional actions that allowed them to "hold" students during their courses, fostering students' belongings and wellbeing at the institutions. I call this process as the "secundarization" of private universities: an adaptation of the format and organization of high schools ("escuelas secundarias"). This designate a set of practices that make the university more "friendly" and "close" to the students: tutoring, participation in student centers and "pastoral-catholic" activities, new students mentored by advanced students, closer relationship between teachers and students, small groups in classroom, and *green* campuses and technological infrastructure which reminds students the spatial experience they had in private and wealthy secondary schools. The trajectory between secondary and the higher education level is perceived as a continuum. These are instances to preserve the distinction of upper and upper middle class families, because they assure the graduation and attachment to institution and family values, reinforcing social selection in a context of higher education expansion, locally and globally. At the same time, I signal a tension in this continuum and social selection: young students experience university as if they were high schools students which may also mean being *teenagers*, people who still need to be tutored and controlled. This representation appears as a risk in front of young people who study in crowded universities and develop self-autonomy as a sign of their maturity as future adults. Social selection challenges social representations of age that still are common to different social classes in Argentina.

FUERSICH, LAURA* (*FAU Erlangen Nuernberg*)

Educational Standardization within Occupations: Explaining Inequality in Sweden

The role of educational attainment in labour market outcomes is a widely-reported phenomenon, though there remains a residual, unexplained part of this inequality. However, the interplay between micro and macro levels still lacks important investigations, since wage setting mechanisms at the individual level cannot be considered as independent from the context in which they arise. Therefore, we examine the role of heterogeneity in educational backgrounds within occupations as factor in explaining income inequality in the Swedish labour market. The Swedish registered microdata provides a unique opportunity to investigate the interrelation of heterogeneity in educational attainment and inequality. By building on theories of social closure, functionalism, and human capital; we can bridge the gap between the micro and macro analyses of inequality in the labour market.

We demonstrate patterns of standardization using the tSNE visualization algorithm, and subsequently, we apply the Theil index to estimate inequality and to calculate the effect of heterogeneity on inequality from 2002 to 2012. In particular, we distinguish between inequality within and between occupations by looking at the variance of wages within occupations and between them. The above noted heterogeneity of educational backgrounds is measured on the occupational level, whereas we calculate an entropy index on the basis of marginal attainment within educational categories to operationalize heterogeneity. Calculating descriptive correlations, we observe a positive correlation between the entropy index, which represents homogeneity of educational backgrounds within occupations, and occupational inequalities within as well as between occupations. The preliminary findings show that standardization expands over the study period. Furthermore, higher standardization leads to an increase in inequality between occupations, while inequality within occupations declines. A specific line of inquiry arising is the restriction of access to more standardized occupations for vulnerable population subgroups.

RC28-JS-82.2FUJIHARA, SHO* (*University of Tokyo*)ISHIDA, HIROSHI (*University of Tokyo*)*Class Origin, Education, and Class Destination: Analyzing the O_E_D Triangle in Japan*

We examine the trends observed in Japan with respect to the three pairs of association involving class origin (O), education (E), and class destination (D), which is the OED triangle. The association between class origin and education refers to educational inequality, and the association between education and class destination pertains to returns to education. The association between origin and destination relates to intergenerational mobility and the openness in class structure. Recent studies on social mobility in some European nations report a trend of the OD association weakening, implying greater social fluidity and openness, and suggest the role of education in increasing social fluidity over time.

To examine the long-term trends in Japan, we use data from the Social Stratification and Social Mobility Surveys (SSM), which are nationally representative surveys that have been conducted every ten years since 1955 in Japan. We restrict our analysis to men between the ages of 30 and 64 because earlier SSM did not include women respondents.

We find that the pairs of associations (OE, ED, and OD) are remarkably stable in post-war Japan. Despite the expansion of the educational system during this period, the extent of inequality of educational opportunities (OE association) remained the same over time, as did the extent of returns to education (ED association). We confirm the earlier finding that Japan does not exhibit any clear trend toward greater openness in the OD association. Furthermore, we find that the OD association does not vary by the level of education in Japan. In contrast to some European nations and the United States where the OD association is weak or absent among the highly educated, class origin continues to affect class destination even among those who attended the institutions of higher education in Japan. We discuss the implications of these empirical findings.

RC24-450.17FUJIKAWA, KEN* (*Meiji Gakuin University*)*Environmental Justice and Addressing Radioactive Contamination: Fukushima Nuclear Accident in Japan and the Withdrawal of Evacuation Orders in 2017*

In the aftermath of the Fukushima nuclear power plant disaster, the Japanese government and Tokyo Electric Power Company, the owner and operator of the plant, were criticized for that they concealed crucial information about the disaster. News of more violations has begun to surface since rehabilitation and revitalization efforts began at the areas contaminated by radioactive emissions. In this report, I seek to examine the new claims from the standpoint of a fieldworker in Fukushima.

The Japanese government repealed evacuation orders in 2017. However, while it was estimated that over 32,000 residents could return to their homes, only about 1,000 residents have returned to these areas. The government insists that these areas are habitable as the annual cumulative radioactive dose is estimated to be lower than 20 millisieverts. On the other hand, many Japanese believe that only an annual cumulative dose of lower than 1 millisievert is safe. There is also a notable lack of communication between the government and people who claim the latter. The lack of communication has led to problems related to social and environmental justice.

While the sustainability and resilience of these communities have been threatened because of decline of population and aging, in the name of revitalization, forests and farms are replaced by factories and solar panels; some are even converted into radioactive waste storage areas. Some residents have expressed their concerns against the conversion of farm lands and forests. However, it is difficult to facilitate a democratic conversation to chart long-term plans for these areas because large numbers of ex-residents have not returned. For, democratic decision-making is an important component of justice.

Japanese nuclear energy policies have long been criticized for the exclusion and displacement they engender; the Fukushima incident does not challenge this allegation.

RC52-871.1FUJIMOTO, MASAYO* (*Doshisha University*)*Bureaucratic Attitude of the Public Sector and Employee Attitude of the Private Sector in the Same Professions: Cases of Socialization of Researchers and Engineers in Science and Technology*

This report compares attitudes towards the organization of researchers and engineers of public and private sector research institutions, awareness about missions, ethos and so on. This research is a comparative analysis by data

using the same questionnaire on government laboratory and private company laboratories. Researchers from government research institutions are rich in research funds and emphasize raising performance in basic research rather than aiming for business efficiency and commercialization. Furthermore, they receive equal treatment as senior government officials and receive missions from senior bureaucrats. Their mission is expected to contribute to science and technology policy. There are also coaching on research results to SMEs etc. that can not have research institutions. As a result of the survey, we found that their ethos is a double standard of researchers and bureaucrats. In contrast, researchers and engineers at private research institute laboratories are employed in the same organization such as clerical workers, manufacturing workers, and salespersons, so they are expected as R & D workers and are synchronization with other workers is also required. They are expecting research that leads to commercialization, and under the management philosophy of Japanese companies, they receive training at factories and shops, and are asked for their attitude as employees. It is sometimes observed in synchronized behaviors in clothing and behavior. Therefore, even in science and technology researchers and engineers, there is a marked difference in the attitudes of organizational socialization due to the characteristics of the organization to which they belong, rather than occupational socialization.

RC23-430.2FUJIMOTO, MASAYO* (*Doshisha University*)*Rationality By Institutional Change and Unexpected Result: A Case of Japanese National Science and Technology Research Institute*

In this report, we will describe the institutional change of research institutions based on science and technology policy aimed at streamlining and the case after ten years. This is an observation of the phenomenon caused by the science and technology policy conducted in 2001 to effectively invest research expenses in the "required" research and to achieve results. A number of unexpected results occurred in one of the largest national research institute in Japan, whose organizational structure was greatly changed due to a major institutional change. For example, changing the decision-making autonomously done by each research department to the top-down of centralization. The lack of information among researchers became prominent and the distrust to the organization increased. Senior researchers are also placed in a competitive environment, and research opportunities beyond the rank of researchers had given to young researchers. But researchers placed in competitive environments, and reduced mutual aid. They felt anxiety in an isolated situation. This institutional change had exacerbated the relationship between researchers and engineers and organizations. The intention of streamlining through institutional change brought unintended consequences such as division of researcher's network by reorganization, distrust of the organization due to lack of information, promotion of non-cooperative attitudes towards other teams of organizations under a competitive environment were invited. However, after ten years from that, when we conducted an investigation of the same organization again, the rationalization policy left organizational distrust in the members of the organization, but the researchers have become accustomed to the rules of the organization, they were working in a low stress state like before change.

TG04-981.1FUJIOKA, MASAYUKI* (*Hirosaki-Gakuin University*)*The Influence of Government Credibility on the Attitudes of Consumers to Radioactive Material in Food*

Since the Fukushima nuclear accident in 2011, there has been a marked dichotomy in the attitudes of Japanese consumers to the issue of radioactive material in food. On the one hand, some people maintain that it is simply too dangerous to eat vegetables, fruits, and fish produced or caught near Fukushima, while on the other, some people and the government say that the risk of radioactivity is minimal as it has been scientifically assessed. It remains unclear why this dichotomy in opinions has persisted.

The objectives of this study are, first, to determine whether watching television affects the consciousness and behavior of consumers in relation to radioactive material. Secondly, it is important to assess how opinions on government credibility influence the consciousness and behavior of consumers.

The data utilized in this study are derived from a postal survey carried out in the city of Tokyo and surrounding areas in 2015. As these data comprised a two-stage stratified random sample (n = 1,529), multiple regression analysis was used to investigate the effects of television watching and the credibility of the government.

The results of this study suggest that watching television exerts no significant effect on either the anxiety or behavior of consumers. Secondly, as consumers afford less and less credibility to the government, the more anxious they are likely to become and they will consume less food produced near Fukushima.

The results of this study suggest that the main reason people are anxious about food produced near Fukushima is because they do not trust the government. To remedy this, additional transparent and politically neutral information is needed to reduce consumer skepticism about food risk. However, if this informa-

tion is not provided, consumers are likely to search for alternative information to avoid anxiety about food risks.

Creating the Unity of a Community through Collective Memory

This study shows the way in which collective memory is used as a constituent part of community cohesion, especially after the occurrence of a disruptive event. For this, the works of Bergson (1896) and Halbwachs (1925) on memory have been explored. The results of the study are obtained through fieldwork in Miyakojima, a remote island of Okinawa, Japan.

Miyakojima is an island, one from the group of Japanese Southwestern Islands. The government plans to deploy the ground arm of the Self-Defense Forces in this island. Nobaru where the construction of facilities is planned is a rural settlement in which about 300 households live. During the Second World War, a Japanese fortress was built on the hills above this settlement, and the inhabitants were at war. After the war, it was handed over to the US military for use as a base station, and the air branch of the Self-Defense Force was deployed here, even after the island was returned to Japan in 1972. The pros and cons of accepting further facilities were discussed throughout the region, and a refusal of acceptance was declared at a briefing session with the government. The rejection came about because the reasoning of the government in favor of the base was inadequate, and residents were already struggling with noise from the existing air base. Though regional history has been published, and traditional festivals are also popular, due to the island's declining population, the collective memory of the area is diluted. Collective memory, which had been gradually fading, has clearly revived due to the prompting from the outside in the form of the planned Self-Defense Forces base.

Thus, the community keeps its unity in various ways. However, the key element is collective memory. It can clearly revive, given the stimulus of an external force.

Respecting and Considering Others: How Democracy Is Inactivated in Japan?

It is important to respect and consider others in everyday life. It could be true in almost every society. But what "respect" and "consider" mean should vary from a society to another. How you respect and consider others depends on what kind of society you live in. In some societies, respecting and considering others could mean controlling and suppressing others' will and Japan is one of the good examples of such societies.

Respecting others often means respecting others' status and role in Japan. It has tendency to neglect what they really want. But this neglect doesn't necessarily mean disrespecting or destroying their dignity. If you breath an atmosphere of a society where people are basically supposed to behave according to their status, respecting status of others is directly respecting them for you. It is the case especially when they identify themselves with their status and want to perform its role. They may sometimes appear an automatic and emotionless humanoid that doesn't have their own will.

Accepting an assigned status and performing its role as perfectly as possible is one of the most important thing that Japanese children are taught and trained. There they have almost no time to think about what they really want. They are led to think that their hope is to meet others' expectatoin, which means they identify others' expectation as their own wish.

Negotiating 'Generativity' Among Human and Non-Human Actors: Re-Organizing Aquaculture in Social- Ecological Restoration of the Contaminated and Devastated Coastal Spaces in the Post-War Japan

This paper examines socio-cultural assumptions underlying to what White (1996) has framed the 'organic machine model' and contrasts it with the so-called 'adaptive ecosystem management model' as they are implicated as dichotomous forces in notions of 'productivity' in redevelopment of lands and waters polluted and devastated as an externalized consequence of economic modernization. Through a case study of historical processes of re-organizing coastal aquaculture in postwar Japan, we can decipher that this dichotomy has underpinned governmental and capitalist actors in their efforts to optimize 'productivity.' Use of discourse analysis, along with ethnographic and archival materials, elucidates that such disparate policy interventions have functioned as an ordered, hegemonic, and disciplined system amidst these two sets of contradictions: On the one hand, the 'organic machine model' promotes supplanting natural population stocks and biophysical ecosystem processes with artficed and simplified ecosystems, underlain by naïve instrumentality and

focused on maximizing short-term sustained, commodified quantities, as seen in postwar mono-culture cultivation of fish. In contrast, the adaptive ecosystem management model promotes participatory governance among relevant human-community stakeholders, in service to (re-)establishing ecosystem resilience and sustaining replenishable populations of desired resources, as witnessed in recent efforts at organic oyster farming in Seto Inland Sea. A case study highlights how these two sets of contradictory systems can interact dialectically, including through biodiversity-oriented political framings, market and consumers trends, and changes in local livelihood strategies by local producers seeking to (re-)make generative livelihood practices and placeness. As such, in practice, re-organization of aquaculture regenerates natural forces and adaptive networks among humans and non-humans, while tactically using scientific-engineering coupled with adaptive governance of social-ecological dynamics. The paper concludes that human efforts to negotiate 'generativity' among human and non-human beings, which originally differentiates among species, arise as an essential pillar of creating local governance for socio-ecological resilience in the Anthropocene.

Memory, Others, and Intergenerational Responsibility Among the Japanese Youth

Memory wars in Asia still revolve around Japan. It has been seventy years since the end of the last war and Japan has never fully reconciled with its Asian neighbors, especially China and South Korea. Japanese society is still haunted by the question of how to commemorate Japan's past wrongs and atone for the physical as well as the psychological wounds it caused in Asia. In this context, also problematized is the question of Japan's apparently rising nationalism among its youth. As it is reported that the Japanese public's sense of affinity toward Asian neighbors (China and South Korea) was greatly deteriorated in the 2010s with territorial disputes with them, it seems imperative to capture a current state of affairs in Japan. In this study, by referring to the original interviews of 31 college students, we try to explore and clarify the cognitive connection between the Japanese youth's sense of nation and their perception on and moral responsibility about Japan's militaristic past. Can the members of a generation feel responsibility and obligation to make restitution for wrongs perpetrated before they were born? If so, how? If not, why not?

Art World Urbanism: On Iconic Cities and Urban Myths

This paper seeks to answer the questions: What kind of cities does the art world mobilize in and pay attention to? How do cities shape the careers of artists? Looking at iconic cities within the art world of contemporary visual art, I suggest that the concepts of iconicity and myth help us answer these questions. Drawing upon research on early career artists who are seeking to establish themselves as visual artists in Berlin and New York, this paper traces how these iconic cities are imbued with myths that are collectively shared and widely recognized. These myths, such as the central importance of New York's galleries and institutions or Berlin as a mecca for up-and-coming artists, resonate beyond the city and into the global art world. Early career artists who are 'based in Berlin' or 'live and work in New York' benefit from the symbolic resonance of myths. This resonance on an international scale is important for early career artists, especially in an increasingly 'global' art world. But on a more local scale, within both cities, artists learn to embody, perform and confront myths that circulate differently in New York and Berlin. The myths of these and other iconic cities take on a deep and sustained power, even when the specific urban conditions of a city change.

Les Peines En Milieu Ouvert Destinées Aux Femmes: En Quoi Sont-Elles Différentes?

Face au phénomène de la massification des *peines de travail communautaire* (PTC) que l'on constate, au cours des dernières années, au Brésil, nous cherchons à savoir s'il est possible d'identifier, dans les pratiques et représentations des acteurs sociaux qui participent de la mise en œuvre de cette peine des innovations sémantiques qui tendent à la décrire et à la justifier comme une forme de punition. À partir de l'observation des interactions quotidiennes entre les condamnées et la *Maison de Peines et Mesures Alternatives-Femmes/SP*, qui s'occupe de l'exécution de PTCs, nous avons analysées les significations que l'on attache à la punition en liberté, par le travail communautaire, dans ce milieu institutionnel spécialisé dans la gestion des peines destinées exclusivement aux femmes.

La bibliographie sur le thème des peines alternatives souligne l'incapacité, de cette forme de sanction pénale, de réduire de manière significative les taux d'incarcération. Cette constatation faite, on doit bien admettre qu'un certain nombre de questions, qui pourraient sans doute élucider une partie au moins des raisons de cet échec, demeurent encore sans réponse. Elles constituent le noyau principal de l'objet de notre recherche.

Qui sont-elles ces femmes qui purgent une PTC ? Est-il possible d'identifier, dans les interactions quotidiennes qui ont lieu entre les opérateurs institutionnels chargés de l'application de la PTC, des schèmes de représentations différenciés sur la manière d'interpréter et traiter cette forme de pénalité, lorsqu'on l'applique à des femmes ? Enfin, l'« obstacle cognitif », dont nous parle Alvaro Pires, qui empêche le droit pénal de se renouveler par le refus d'incorporer à son arsenal punitif des modalités des sanctions propres à d'autres systèmes normatifs se constate-t-il également dans l'exécution des peines alternatives aux femmes ou, au contraire, peut-on y voir de nouvelles significations de l'acte de punir ?

Social Class and Health in Canada: Can Sociological Theory Inform Data Collection?

Background. Recent theoretical developments in sociology emphasize cultural and relational aspects of social class. Although many quantitative health studies support a positive association between social class and health, much of this research does not have an explicit theoretical grounding. Existing data sources may not permit quantitative research on social class and health that takes into account modern theories of social class. **Objective and Methods.** Our objective was to examine the extent to which Canadian national data sources permit theoretically-informed quantitative research on social class and health. We first compiled a list of all population-based Statistics Canada data sources available to Canadian academic researchers. Next, drawing from various sociological theories of social class (ranging from Marx to Bourdieu), we developed a full list of potential quantitative indicators of social class, including economic, social, cultural, and relational indicators. We systematically searched each data source's questionnaire or codebook and documented the presence or absence of variables which could be used to operationalize each indicator. Simultaneously, we assessed whether health measures were also included in the data source, and examined the data source for additional measures of intersectionality (including gender, race and ethnicity, and immigrant status). **Findings.** We identified a total of 397 population-based survey cycles which were accessible and had complete documentation, with collection dates from 1965 to 2016. Data extraction and analysis are still in progress, but to date our findings suggest that 1) indicators of economic capital are the most common indicators of social class; and 2) it is relatively uncommon to have rich theoretical indicators of social class, and indicators of health, in the same survey. We conclude with recommendations for future quantitative data collection efforts that would enable researchers to include cultural and relational aspects of social class in their analyses of the effects of social class on health.

The Emotional Landscape of Accessing Formal Supports: How Social Contexts Shape the Stress of Caring

Family members often engage in considerable navigational work with and for older adults, serving at the interface between informal and formal care. This work is more extensive and more challenging in the context of fragmented, uncoordinated and often under-resourced formal systems. As such, systemic features of formal care contexts can generate structural burden. Although in-depth knowledge of how this occurs tends to be lacking, carer emotions may play a central role. Stemming primarily from interpretive and thematic analysis of interviews with 32 family carers of older adults, I explicate the emotional dynamics of, and emotional work involved, in navigating a range of health and social services. For instance, carers' fears of retribution invoked a need for emotional self-control to maintain good relationships with providers. Self-control was also necessitated when carers might otherwise give up on particular services in frustration. When navigation was slow or unsuccessful, carers grappled with guilt and worry. In other cases, navigation required 'becoming angry,' and for some carers this was difficult to reconcile with their identity. In addition, although the imperative of adopting a carer identity to access some services might shift feelings of isolation towards feelings of belonging, it may also generate other more problematic emotional outcomes. There were important temporal elements to emotions; as their caring experiences progressed, carer emotions generally shifted from feelings of being lost or confused, to surprise/shock, anger and frustration, and in some cases expanded to simultaneously include elements of pride and confidence. In

discussion, I summarize how a sociological understanding of emotions can help in understanding how broader contextual features shape the emotional dynamics of carers' navigational experiences, indirectly contributing to carer stress and burden.

Violence in Relations of Care: Older Adults with Cognitive Impairment

Elder abuse dominates much of the existing literature on the topic of violence and older adults. However, there has been growing attention in recent years to aggressive behavior in older adult care recipients with cognitive impairment, particularly in institutional settings. In this paper, we draw on findings from a multi-faceted, qualitative inquiry to examine how aggressive actions from older adults with cognitive impairment are framed: by paid care workers, facility representatives, family carers, tenant neighbours, and in the media. Data include in-person interviews, diaries, and print and online news sources. The interpretation of aggression from older adults with cognitive impairment was particularly complex, since the perpetrators were often (but not always) simultaneously viewed as victims. Different settings (e.g., home vs institution), and different types of care relationships (formal, family or friend) operated to shape interpretations of, and responses to, violence from older adults with cognitive impairment. These interpretations also manifested broader social and cultural forms of knowledge (e.g., common-sense, ageist, biomedical) in particular ways. Findings will be positioned in relation to sociological and criminological theory on victimization.

FURSOV, KONSTANTIN* (*National Research University Higher School of Economics*)

From Public Understanding of Science and Technology Towards Innovation Behavior of Population

Waken up in the era of European Enlightenment the dragon of science continues to inflame passions and minds of the contemporary societies. Scientific knowledge remains the major source of new technologies and innovation and therefore is considered as one of the key sources for economic growth and social welfare. However, in this trinity the latter phenomenon remains less conceptualized. Since early 1960-s sociologists have been searching for ways to explain factors that influence public perception and understanding of science and technology to justify the need for continuous and growing investments in research and development. Studies implemented within the framework of so called "deficit model" showed that the perception of science by lay people is not limited with the level of their literacy. Moreover, the growing awareness of the economic and social effects of scientific and technological development eliminated the need for a dialogue between science and society to provide public control over R&D activities and public engagement in S&T policymaking. Finally, a series of studies has shown that consumers themselves can act as innovators developing new products for their own use, solutions for common social problems and new behavioral patterns. Thus, there is a need for revision of dominating conceptual model that consider innovation as one of the expected and desirable outcomes of scientific development in order to explain if there is a fundamental difference between public understanding of science and public understanding of innovation. The paper suggests a brief review of recent studies in the area and proposes an approach to operational definition and sociological interpretation of innovative behavior of population.

Youth Newcomer Settlement in TO2015 Shadow Host Communities

As the recent host of the 2015 Pan/Parapan American event (TO2015), Toronto is an opportune site to interrogate dominant ideologies underpinning event-led urban (re)development as well as the lived impact of event construction on local communities. This paper will explore the extent to which TO2015 impacted the settlement experiences of (newcomer) youth in a particular neighborhood within Toronto (St. James Town). Situated in the southeast corner of the downtown core, this multicultural enclave is a "shadow host" on the fringe of communities more popularly celebrated in event rhetoric. Spatially, St. James Town is located directly north of the 2015 Pan/Parapan American Village on the outer edge of the Sherbourne corridor, which is in the midst of sport-prompted gentrification. We draw on qualitative data—in particular a series of semi-structured interviews

with young people living in St. James Town—to document the extent to which sport/recreation is interwoven within urban imaginaries of (re)development to influence the manner in which (newcomer) youth interact with, and reinvent the urban.

Coping with Intensive Scientific and Academic Careers: A Gendered Work/Family Interference

Men and women remain in unequal positions in coping with their very intensive scientific and academic careers. Several of the mechanisms dissuading or preventing women from pursuing scientific careers have already been described in the literature: women getting stuck with paltry, undervalued tasks, thus manufacturing a "sticky floor"; structuring the scientific field around a masculine habitus; the "Matilda" effect for women... An additional cause of these inequalities is observed in the relationship between the private and professional aspects of the individuals' lives. The university transmits a "gendered order" in its organisational structures, principles, customs and habits, in short in the practice of scientific work. That is due in particular to the ancient structuring of the University around a male figure: the "university professor" or "scientist" entirely invested in his work, freed from domestic necessities by an invisible carer (he or she who 'cares' for him), so he can devote himself to science. Hence the university was constructed on a "greedy" model expecting a total, voluntary and impassioned engagement in work, coupled with a model of work/family dissociation. Based on a research programme dealing with post-doctoral researchers and recently tenured researchers, this proposal analyses the role of private life and how it relates to the professional sphere in their experience of scientific work. In this respect, it provides some explanatory elements on both the greater vulnerability of researchers-mothers in the university game and on the configurational supports (configurations of professional life and private life) needed to offset that vulnerability.

Learning to Keep the Faith: Investigating Young People's Participation in Multi-Generational Dance Music Culture

Social researchers have been studying youth culture in the UK for over five decades. The seminal work of the Centre for Contemporary Cultural Studies at University of Birmingham highlighted the potential subversive and counter-hegemonic objectives of youth 'sub' and 'counter' cultures as forms of resistance against structural social order. Subsequent academic work heralded a post-subcultural epoch with emphasis on young people's use of stylistic resources, artistic creativity, cultural consumption and the incorporation of images, music, dance and contemporary forms of art, such as graffiti in shaping the cultural identity of modern-day youth.

Emergent research evidence is increasingly concerned with the intergenerational influences on youth culture as ageing adults participate in long-standing music and dance scenes alongside younger peers. The Northern Soul Scene (NSS) typifies such a multi-generational cultural context. The origins of the NSS are the industrial towns in North West of England during the 1960s and 1970s. The scene was built around the celebration and showcase of often-obscure 1960s North American soul music. Unlike many contemporary music and dance club cultures, NSS straddles age boundaries due in part to the longevity of the music and mutual engagement across generations.

Drawing on findings from a small-scale study conducted in the contemporary NSS, this paper presents and discusses aspects of participation and learning in a multi-generational cultural setting. The project utilises the notion of situated learning in the context of the NSS, which in turn is conceived as a community

of practice. (Lave 1991 & Wenger 1998). The enquiry focuses on the respective learning experiences of both seasoned NSS participants (adult 'old-timers') and more recent joiners (young 'newcomers'). What can we learn about contemporary youth culture and identity from this multi-generational community of practice?

MERCIER, HUGO (*Institut des Sciences Cognitives*)

TORRONI, PAOLO (*University of Bologna*)

Argumentative Agents with an Empirical Test

Gabbriellini and Torroni (2014) proposed an agent-based model for social simulation with a micro-model inspired by the argumentative theory of reasoning (Mercier and Sperber 2011) and a computational underpinning based on abstract argumentation.

Such model highlighted some limitations of abstract argumentation that motivated us to further our investigation by consider structured argumentation.

We defined a new, cognitively-aware computational argument model. These model reflects patterns of reasoning and communication observed in a number of works in empirical psychology. We consider the set of experiments done by Hugo Mercier (Trouche, Sander & Mercier, 2014) aimed at measuring the effect of a single argument on intellective tasks. We describe our model and experiments with one of these logical problem, defined as:

"A bat and a ball cost \$1.10 in total. The bat costs \$1.00 more than the ball. How much does the ball cost?"

Mercier's experimental results showed that good arguments can change people's minds on intellective tasks.

Our agents engage in dyadic dialogues, with a typical turn-taking structure, up to a point when they stop because: they agree in the intuitive but wrong answer, or they agree on the correct answer, or they agree on the correct answer, but without having really understood the problem.

The results of our simulations agree with what observed in Mercier's experiment. Circa 50% of our initially wrong agents change their mind when compelled with arguments favoring the right answers.

ABM models in Sociology rarely explicit the level of actor's reasoning: actors either adopt some conclusions or they don't, because of some sort of "pressure" that somewhat wins their resistance (many mechanisms have been proposed in the literature). Our research instead puts an emphasis on reasoning.

The empirical results obtained so far make us believe that our approach could open new avenues in opinion dynamics research.

GABOWITSCH, MISCHA* (*Einstein Forum*)

From Sites of Practice to Collective Action: Examples from Commemorative and Protest Movements

It is often assumed that social movements can be conceptualised solely in terms of agendas, strategies and outcomes. The only alternative sometimes appears to be a rather undifferentiated realm of culture and emotions. This paper attempts to go beyond such assumptions and to specify the ways in which strategic behaviour and emotional attachments are articulated in collective action. Building on the study of regimes of engagement developed in French pragmatic sociology, it looks at how a person's investment into emotionally charged sites of practice, or common-places, can telescope into collective action of different kinds. The empirical data for the paper comes from (a) research on protest movements in contemporary Russia, (b) a multi-year, eleven-country collaborative research project on post-socialist commemoration and war memorials, and (c) the study of an international initiative titled *Les nouveaux commanditaires* that seeks to enable ordinary citizens to commission locally relevant works of public art directly from artists, without using curators or administrations as intermediaries.

In particular, the paper shows how the study of sites of practice can help us understand two types of movements that often remain outside the field of vision of social movement studies: non-progressivist social movements, such as the commemorative movements that are remarkably powerful in a number of non-Western countries; and the populist movements that have recently risen to prominence in countries ranging from India to the United States.

RC48-806.2

GABOWITSCH, MISCHA* (*Einstein Forum*)

War Commemoration As a Transnational Social Movement in Post-Migrant Societies: A Case Study from Berlin

By looking at war commemoration, this paper focuses on a type of collective action that is not easily classified as justice-seeking, violence-espousing, or identitarian. Nevertheless commemorative movements have been remarkably

prominent in some parts of the world in recent years, sharing certain features with more conventional social movements.

Many movements maintain the memory of significant events in social movement history, or those commemorating martyrs for a cause. In such cases, commemoration lends greater emotional salience to that cause. In other cases, commemoration itself becomes a movement's central cause.

Migration, caused by events ranging from the Armenian genocide through repression in e.g. Latin American or Middle Eastern countries to the Soviet collapse, has created transnational commemorative movements and post-migrant societies where different cultures of commemoration mix and clash. Drawing on several years of fieldwork, this paper looks at a case study from Berlin: a small initiative that campaigns to transform the famous Soviet war memorial in Treptower Park by individualizing soldiers who were deliberately buried in an anonymous mass grave, as well as renovating other war graves in the region. The initiative was created by a blue collar worker born in Tajikistan and involves both local and international participants, recruited either through family and friendship networks or through contacts with the massive volunteer search and reburial movement that looks for the remains of World War II soldiers in former Soviet countries. In the process, the initiative has developed both conflictual and collaborative relationships with state institutions ranging from municipal administrations to embassies of post-Soviet countries.

The paper analyzes the Berlin initiative itself and embeds it in a broader reflection on transnational commemorative movements. In addition to local fieldwork, it draws on data from a multi-year, multi-sited collaborative study of war commemoration in eleven post-socialist countries.

GABRIEL,, NORMAN* (*Plymouth University*)

You Are Young and Life Is Long: Understanding Young Children's Experience of Time

You are Young and Life is Long:

Understanding Young Children's Experience of Time

Thorne (2007: 150) has suggested that it is central to the interdisciplinary study of children and childhoods that we articulate 'different types of *temporality*'. In this paper I will argue that the work of Norbert Elias can provide an important theoretical advancement for understanding society, by looking through a young child's eyes at their experience of time: 'The sociality integral to human beings only becomes apparent if one is aware what relations to other people mean for the small child' (Elias, 2010: 28-29).

Elias argues that we need to clearly define the difference and relationship between *biological evolution*, *social development* and *history*. In biological evolution, ten thousand years is a very short period. The changes that have taken place in the biological constitution of our species are relatively slight. However, in social development ten thousand years is a considerable period of time because the changes in social organisation that have taken place are relatively enormous. Historical change is possible because the experiences gathered from one generation need to be transmitted to the next. But in terms of the 'biographical' time it takes for young children to grow into old men and women, long-term social developments take place so slowly that they seem to stand still. Passed on from one generation to the next, young children need to learn and internalise an enormous social fund of knowledge about the world. I will illustrate my argument by reviewing some of the recent investigations that have explored temporality as a non-linear and relational process in the lives of young children, focusing on the processes that enable them to regulate their feelings and behaviour to the social institution of time.

Are the Self-Rated Health, Education and Economics the Best Indicators to Measure the Social Perception and Behaviour in a Public Health Survey?: A New Framework for Measurement Invisible Inequalities

There is a growing interest in the role of public opinion in explaining patterns of population health. Attitude and opinion data provide a basis for inferring the meaning of opinions held by individuals and society and also for predictions about their future behaviour. Despite the existence of impressive bodies of literature on the subject, there are still many unanswered questions about the changing nature of opinion expression and assessment. This paper discusses the relationship between public opinion shape in public health and its levels of credibility in introducing variations on measurement instruments. In doing so, this analysis departs from the influence of standard approach which puts forward a dominant explanatory set of variables (self-rated health, education and economics) versus non 'standarized' health questionnaire constructed ad hoc. The new framework for conceptualizing and measuring public health through specific

statistical analysis conducted by us (logistic regressions, multiple correspondence analysis and cluster), explains the processes and drivers by which society adopt and express particular opinions in this crucial issue. In this respect, exploring public opinion by introducing more innovative variables such as the level of awareness on a problematization of health and disease (concerns projections), spiral of silence (no responses / neutrality), political attitudes (conservative versus progressists) post-truth assessments and self-preventive representation inter alia, has allowed us to discover new complex interrelations with these variables. This study is an advance of the results of the first survey on "public health" held in Spain on the basis of qualitative and quantitative methodology (N=2000). Our findings suggest revisiting the instruments of measure of population health. This approach further shows the utility to change current instruments in order to identify crucial population targets, inequalities in health and new directions in risk that appear "invisibilized" in standard health surveys.

What Drives Breast Cancer Clinical Research and Practice in Spain? Barriers and Facilitators for Achieving Best Professionalism in a Time of Crisis

High variability in clinical research and recruitment in clinical trials in oncology has generated a growing interest in the scientific literature. There are limited studies on factors affecting the performance of professionals involved and how they perceive their work. This is especially important to enable behavior patterns improvement. This study assesses Spanish multidisciplinary health professionals' perception on clinical and translational research based on a new combination of theoretical frameworks focused on identifying variables which play a significant role on trial management and professionalism. A mixed multicenter study which included in-depth interviews (n=11), four discussion groups (n=33) and an individualized questionnaire with validated scales associated with the theoretical corpus: situation awareness, sensemaking, professional self-perception and resource scarcity. The participants, selected by theoretical sampling carried out all over Spain, included: oncologists, radiotherapists, radiologists, surgeons, pathologists, study coordinators, nurses, monitors, pharmacists, IEC members and managers. The overall items analyzed were: current and preferential participation in clinical trials; breast oncology training; hours dedicated to study; beliefs associated with oneself (professional self-image, personality, control and self-efficacy, social status); work beliefs (mindfulness, attitude, effort/satisfaction balance, burnout; workflow and recruitment; work team, coordination and cooperation; training and learning; resolution and readjusting of problems and decision making). The results of the questionnaire were compared with the participants' narrative discourse. The psychosocial factors that impacted the most on job performance were multidimensional. Interdependent variables with a greater influence for achieving professionalism were the self-perception and personality. Professional identity and full attention to work performance were negatively affected by the number of work stressors, emotional vulnerability, resource scarcity and job dissatisfaction. This was especially recurrent in coordinators, monitors and pharmacists. These results will allow designing transformative strategies to improve more target-oriented professional performance and the creation of more dynamic and effective teams and organizations in research and recruitment.

Mapping Clusters of Innovative Companies in Polish Cities: Naturally Occurring Innovation 'Districts' Vs the Top Down Model.

Social sciences offer a number of alluring formulas for increasing creativity and innovativeness through architectural and urban interventions (T-triad by Florida). These models often present a bird's eye view and focus on the macro indicators. On the other hand, we see the multiplicity of case studies whose potential ends in the listing of good practices (Landry).

As part of our project entitled „Innovation Districts? Creative Industries and Urban Changes”, we are looking at the practices of generating ideas and implementing innovations from a field perspective and attempt to compare several models, simultaneously. Our analysis focus on urban clusters of entities that can be classified as creative companies. The research is conducted in three Polish cities (Cracow, Łódź and Poznań); our sample consist of 3 bottom-up (grass root) clusters of innovative companies that have emerged as a result of the spatial re-location of freelancers and businesses and 3 top-down clusters established by municipal authorities or urban planners.

The paper presents the results of the first stage of the longitudinal observation (first measurement out of six). We analyze how and why clusters came to be/ have been settled up, and map how they fit into the broader urban fabric (GIS

mapping). We are focusing not only on urban dimension, but also on the space and organizational culture of selected enterprises located in 6 clusters: we apply multi-sited intensive ethnography approach focusing i.a. on spatial organization of work spaces and organizational cultures (3 companies per cluster). The urban and spatial dimension is supplemented by perspective of employees and freelancers operating within these spaces (18 interviews per cluster).

Generally, we are interested in whether there is a strong link between cultures of innovation and the urban form. Moreover, we want to address the problem of how imported solutions work in post-transformation and post-socialist urban realities.

The Orchestration of Work and Home. Teleworkers and Materiality of Home.

Telecommuting still remains relatively new and marginal phenomenon in Poland but it widely promoted mainly as an attractive tool for professional life, especially for women. The separation of home and work in the course of industrialization had enormous implications for construction of both individual and group identities and materialities of homes. The construction of everyday work practices at home has serious consequences for the social, material and finally symbolic ideas about "home" and "work".

By focusing on group of 36 freelancers, and professionals who work using ICT technologies we have captured new working conditions that make so called integration strategies much harder to employ: in case of ICT it is possible to be more independent and mobile, but technologies cause additional conflicts and cause not integration but segregation patterns. The problem of work „visibility” seems to be crucial in case of the telework (as paid work), just as it is in case of the unpaid home work.

Our research project (financed by the Polish National Science Center) was a strictly qualitative project, base on the 3 years ethnography. It combined the challenges of the classic workplace studies and the private sphere ethnography issues (privacy, household duties, etc.). We have analyzed the practices and everyday life choices made by men and women when dealing with career involvement, domestic duties and materialities of their homes (it includes time budgeting, self reports, autophotoethnography) in 36 households and over 50 indepth interviews (both joint and individual). The results of the study (published as a book) fostered by the experience of work present at home and influence the development of an interesting & multi method perspectives joining the individuals, couples and materiality of the household and work.

Visualizing Violence in Contemporary Film : A Regression of "the Civilizing Process"?

This paper will explore visual representations of violence in contemporary movies (as *Brave Heart*, *The Passion of the Christ*, *Kingdom of Heaven*,...) in order to analyze the apparent paradox between a current context- which seems to privilege combat at a distance , considered as more "respectable", and more "civilized"-, and a medium's discourse - where direct violence is widely, extensively shown .And while media discourse tends to occult violent images, movie discourse seems to have adopted a "voyeuristic" tendency. Is it just a sort of nostalgia for fierce emotions that were experienced by our civilized societies in the past? Probably not. Through a semiotic analysis, this paper tries to question the relationship between the real world and a fictional one, focusing attention on the phenomenon of proliferation of direct violence in cinema, especially in films whose topics deal with conflicts and wars, and where protagonists are divided into two opposite groups: "the good guys" versus "the bad guys", "us" versus "them", "the civilized people" versus "the barbarian people". The film industry is producing a huge number of violent scenes that remain in viewers' minds, and may afterwards affect their behavior, reflecting negative impulses. Through decrypting discourse mechanisms in several cinematographic examples, the research aims to explore the impact of such representations on "the civilizing process", for a better understanding of "civilization" as a notion.

Community - a Classic Revisited

After the partial disappearance from the analytical inventory of sociological inquiry, the concept of community has returned full force. This recovery and reassertion of community is taking place in academic sociology, as well as wider, everyday political and cultural fields. It is hardly a coincidence that the theme of

the recent British Sociological Association's 2018 annual meeting was precisely 'Identity, Community and Social Solidarity'. Just as it is not just a slip in expression that recently Facebook, whose ambition has grown exponentially with its size, changed its mission statement: 'Making the world more open and connected' was replaced with giving 'people the power to build community and bring the world closer together'.

The aim of this paper is to reconsider the notion of community as presented in Ferdinand Tönnies's seminal argument from 1887 — his famous *Gemeinschaft/Gesellschaft* (community/society) dichotomy. As is often the case with classical statements, Tönnies's text has not been read in its entirety, as an analytical and historical statement that strikes at the heart of modern life, for quite a while. The paper seeks a way of updating Tönnies's classical take in a way that could renew or at least re-direct our sense and definition of a community as type of 'ready-made' space of inclusion or exclusion. Tönnies's classical statement, as I argue, holds the promise of a model that can break through the standard inclusion-exclusion understanding of how communities are bound and defined. That promise is based on the notion of 'enfoldment' and entwinement of modern individuals in each other's fates. The crucial shift occurs by replacing responsibility at the level of traditional community, with public opinion/responsiveness that defines mass society. The fundamental question here, one that we need to consider anew, is the nature of the social bond at the core of contemporary life.

Constitutionnalisation Du Droit Et Conceptualisation Polymorphique De La Discrimination : Impacts Sur La Démocratie Syndicale

Au Québec, les protections contre la discrimination au travail se sont accrues au cours des dernières décennies et prennent maintenant assises dans une multiplicité de sources juridiques. Par une analyse comportant des dimensions socio-juridiques et empiriques nous cherchons à mieux saisir les défis auxquels sont confrontés les syndicats dans l'application de la norme d'égalité. Cette communication veut examiner comment les syndicats traitent certains problèmes de discrimination au travail à la lumière de la norme d'égalité introduite par la Charte des droits et libertés de la personne. L'intérêt est de comprendre pourquoi ils ignorent ou sous-estiment les processus de discrimination systémique (Legault, 2005, 2006) qui contribuent non seulement à redessiner les frontières de la relation de travail, mais également à fragiliser l'acteur syndical en ébranlant certains de ses fondements, comme la démocratie syndicale.

Dans les deux cas à l'étude, les travailleuses et les travailleurs ayant un statut d'emploi précaire ont déposé une plainte de discrimination à la Commission des droits de la personne et des droits de la jeunesse. Cependant, les plaintes ont échoué dans les deux cas, pour des raisons qui laissent présager la prééminence des droits de gestion sur la norme d'égalité légitimée par la Charte. Cette situation soulève des questionnements sur l'effectivité du droit en matière de lutte contre la discrimination dans les milieux de travail syndiqués.

Les cas mobilisés montrent aussi qu'un ensemble d'acteurs contribue à la reproduction et à la régulation des arrangements institutionnels qui maintiennent les processus de discrimination systémique. Les syndicats apparaissent comme des acteurs contraints par le cadre juridique actuel et les représentations dominantes, cependant, ils participent directement à la création de normes discriminatoires et à la reproduction de ces arrangements institutionnels parce qu'ils donnent la priorité à la défense d'une forme institutionnelle de représentation collective associée à la hiérarchisation des conventions collectives.

RC10-206.1

GAGNÉ, DIANE* (UQTR)

Crise De Représentativité : Le Mouvement Syndical Vecteur Et/Ou Victime Des Clauses De Disparités De Traitement?

Bien que le mouvement syndical soit généralement présenté comme un important vecteur d'amélioration des conditions de travail et de vie des salariés, il peut également contribuer, volontairement ou non, à institutionnaliser la discrimination en milieu de travail en négociant des clauses de disparité de traitement dans les conventions collectives. Cette conjoncture bouleverse l'univers des relations de travail et la pratique du droit des rapports collectifs, puisque les travailleurs sur le marché de l'emploi ne sont pas tous égaux.

Pourtant, à ce jour encore, nos recherches empiriques montrent qu'il demeure périlleux d'évoquer la notion de discrimination pour expliquer cet état de fait, tellement les différents acteurs du marché du travail apparaissent « frileux » devant cette utilisation. Considérant que de telles clauses contribuent à l'accroissement des inégalités sociales, les enjeux sont multiples. Notamment, à cause des éventuelles ruptures dans les solidarités intergénérationnelles ou sociales et de la crise de confiance envers les institutions. Mais alors, comment évaluer la déficience de la mission de représentation des syndicats et des institutions traditionnelles en relation de travail?

À partir d'un système québécois singulier, parfois déraisonnable, où, malgré l'existence de droits à l'égalité, le travailleur lésé ne parvient pas à les faire re-

specter ; peu importe le recours utilisé, il demeure difficile de concilier les visions du droit constitutionnel et du droit du travail lorsqu'il s'agit de reconnaître les conséquences et les victimes de la discrimination. De cette incapacité émanant une multiplication de travailleurs à statut « précaires » dans un groupe de travailleurs traditionnellement « protégés ». Conséquemment, il apparaît des fractures au sein du mouvement syndical et des différents groupes de travailleurs, créant ainsi de larges brèches par lesquelles le discours populiste s'inscrit et où le travailleur plus ou moins protégé ne sait plus « vers qui se tourner ».

The Gender Gap in Promotion Among Academics: Are We Doing Any Better?

The paper investigates gender inequalities in promotions among academics in a longitudinal perspective. Most of the studies on women and academia are based on cross-sectional data or qualitative methods. This contribution analyzes data on 2000 professors and researchers at the University of Milan (UMIL) through event history analysis and by comparing cross-sectional datasets in time. The aim of the research is twofold. First, it aims at investigating time differences in women and men's career promotion. Second, it aims at analyzing the variation of women's rate of promotion in time. Both issues are of great importance to understand whether the vertical segregation in Academia is due to demographic dynamics or to gender discrimination. Longitudinal data on demographic, work and family characteristics have been collected from three different UMIL institutional databases and merged. From a first analysis of the 2016 data, UMIL outperforms the rest of Italy both in terms of vertical (28% and 40% of women are full and associate professors) and horizontal segregation (the percentage of women is higher than the national average in seven disciplines among which six STEMMS). On the other hand, two aspects remains problematic. First, the proportion of women among fixed-term researchers (a recently introduced position which has substituted open-ended researchers) is much lower, both at UMIL and at the national level, than the traditional proportion of female open-ended researchers. This may be due to an "anticipation" of the gender gap in promotion from the B grade, as it was before the reform, to the C grade. Second, women are promoted in lower proportions than men at each stage of the ladder and, for those in A grade, in lower proportions than the stock of women at the same level. This suggests that discrimination occurs. Analyzing promotion data through time will allow to test this hypothesis.

Dealing with (Un)Expected in Qualitative Research Field-Work

Qualitative research aims at delving deeply into subjective perspectives of research participants, their life practices, biographies, and surrounding social contexts. Therefore, in qualitative field-work a researcher needs developing ability to build rapport with research participants, keeping balance between scientific aims and human sensitivity, and being able to open up for realities of participants.

Field-work is probably the most interesting and challenging step within qualitative research process due to its unpredictability, regardless of the level of methodological preparedness. Indeed, there is a vast methodological literature and teaching about the philosophical and methodological grounds of qualitative research as well as guidelines how to properly conduct it to best correspond to the core presumptions of qualitative approach. However, it is also clear that often things do not happen "by a book" in qualitative field-work and there is always an element of (un)expected (when even a well thought-of plan is hindered by strangest circumstances). Moreover, such experiences are rarely reflected in methodology literature as well as in descriptions of researches in articles or research reports. Though this to be an area in research practice that should be more often revealed and discussed.

The presentation attempts making development in this regard. Based on experiences in field-work of qualitative interviewing authors present unexpected situations which corrected initial research plans and which caused consideration of solutions or dilemmas not reflected in the literature. What happens extra when collecting data? How far can the reality get away from the scheduled plan? How to negotiate recruitment when prepared reasoning does not work on potential participants? How to deal with psychologically intense situations, which could not be foreseen? How much improvisation may be required to conduct interview of high quality? What safety of researcher issues may emerge? The presentation provides real-experience based cases and urgent solutions made in the field.

Paid Job and Grandparenthood in a City: Individual Reconciliation Practices

The age of retirement in Lithuania is being increased from age 55/60 for women/men in 1995 to 65/65 in 2026 in response to the challenges of population ageing. This causes emergence of a substantial category of "working grandparents". Similar to other East European countries, due to family traditions and limitations of public child care system grandparents traditionally are seen as help-providers in the care of grandchildren and in Lithuania more than half (55.2%) among employed grandparents are involved in such a care (Kraniauskienė, Gedvilaitė-Kordušienė, 2012). However, the interplay between work and family has been mostly analysed from the perspective of childcare and employment of parents (Jonkarytė, 2003; Reingardė, 2009) whereas the issue of working grandparents is underdeveloped.

It is reasonable to ask what possible new tensions appear when trying to reconcile the roles of labor-market-participants and grandparents? Is the traditional provision of intensive grandparent childcare in danger? If and how the extended working life changes the perception of grandparenthood as well as perceptions of "good" grandmother and grandfather? How it affects intergenerational relations, family and personal life?

Original qualitative research is conducted aiming to answer the above questions. Research participants have been purposely selected: a participant must be currently employed; must currently have at least one grandchild of "dependent" age (under 10); and both a grandparent and a grandchild (grandchildren) must live in the same city. Also, recruitment follows principle of diversity seeking to involve both grandfathers and grandmothers, different forms of family arrangements, different types of employment statuses and positions. Whenever possible, research seeks to capture dyad of two generations: a grandparent and a grandchild. In-depth semi-structured individual interviews are being conducted with each participant.

GAL, RÓBERT IVÁN* (*Hungarian Demographic Research Institute*)
MEDGYESI, MARTON (*Centre for Social Sciences, Hungarian Academy of Sciences*)

Redistribution in the Welfare State: Between Income Groups or between Age-Groups?

The welfare state has multiple roles in developed countries. Welfare programs redistribute income among overlapping generations in order to finance human capital investment and consumption of people in the inactive phases of their lifecycle from contributions of those in working age. Also, the welfare state alleviates poverty and mitigates inequality by transferring income from the relatively well-to-do to the poor. In this study we propose a cross-sectional framework to analyze redistribution by age and income simultaneously and assess the relative importance of these two variables in explaining the access and contribution to public benefits. Our data from 2010 (based on EU-SILC and Household Budget Surveys) covers government transfers (cash and in-kind) and both direct and indirect taxes in selected countries representing different welfare regimes (Sweden, France, Spain, Hungary and the UK). First, we describe graphically concentration of transfers and taxes by age-income groups. Then we compare the importance of age and income in explaining government transfers and taxes in a regression-analysis framework. We assess both causal importance (via comparison of coefficients) and dispersion importance (using the Shapley-value decomposition) of age and income in explaining transfers and taxes. Our preliminary results show that redistribution between age-groups is more important than redistribution by income position. The welfare state dominantly finances benefits for age groups in inactive age from resources collected from the well-to-do in working age. Our results call for a revision of the image of the welfare state in general and questions traditional approaches to the analysis of welfare state efficiency.

GAL-EZER, MIRI* (*Kinneret College on the Sea of Galilee*)

Illiberal Democracy Practice and Media Discourse: From the "State of Israel" to the "Land of Israel"

The welfare, parliamentary "Jewish democratic State of Israel" (established 1948), based on pre-state Labour Movement apparatuses since 1920, deteriorated following 1967 Six Day War conquest and occupation of the West Bank, Gaza and Golan Heights, to a capitalistic state, and since 1977, the Likud right wing governments expanded neoliberal nationalistic political-economy policies. Following the PM Rabin assassination by an extreme right student (1995), Israel became to be a militaristic, authoritarian, nationalistic, illiberal democracy.

The state's degeneration since 2009, is rooted in the PM Netanyahu's admiration and deep identification with the neoliberalism's "Founding Father", Noble Laureate Milton Friedman and the US "Tea-Party" Republican ideology. While from 2016, Netanyahu enthusiastically adopting the illiberal governing Trump's presidency form - both supported by the same 1% US tycoons funding - of inciting intellectuals, "leftists", liberals, LGBT's, Muslims, refugees, women etc., breaking democracy rules, allegedly meddling and concealing private and family interests with state's and citizens interests, allegedly interfere in state's investigations and allegations of corruption and allegations of possible endangering state security; however, remedy is very old: media ownership and occupation, in addition to frightening and firing journalists, constructing alternative facts and fake "reality", while obscuring the real.

A recent milestone israel's state ceremony was held on 26 September 2017 at the Gush Etzion settlements, and was titled "50 Years of the 1967 Great Victory: Jerusalem Reunification" [East Jerusalem annexation] and the "Eternal Return to Judea and Samaria" [West Bank occupation]. PM Netanyahu promised that: [...] "there will be no more uprooting of communities in the Land of Israel". However, since it was a controversial state event, the recently retired Supreme Court President Miriam Naor canceled the judicial representative participation in the ceremony (Haaretz Editorial, 28.09.2017). Nevertheless, the Supreme Court is repeatedly threatened by the right wingers in Israeli parliament and government.

Vickie Knafo "Leading the People"? Single Mothers (2003), Poor Disabled (2016) Protest Pilgrimages to Jerusalem

"Liberty Leading the People" (1830), Eugène DELACROIX's iconic painting, depicts 1789 Revolution; Liberty is personified by rebellious, victorious young woman. "In her raised right hand is the red, white, and blue flag, a symbol of struggle [...] like a flame" (The Louvre). On 2 July 2003, Vickie Knafo, a Mizrahi (Eastern Jew) single mother of three children, left home in Negev Desert development town [Mitzpeh-Ramon](#) to Jerusalem, marching 205km pilgrimage protest to meet Netanyahu, then Finance Minister. Knafo, kindergarten cook, earned only third of her monthly income, the rest was state benefits. But new neoliberal allowances' austerity measures, cut two thirds of her income by Netanyahu, thus she decided to act: "I grabbed my Israeli flag from Independence Day and set off," (Gal-Ezer, 2006; [Urquhart](#), 2003). "Like a flame", eager single women and men, disabled and the elderly, followed her pilgrimage to Jerusalem government district encampment. Israeli media titles were enthusiastic: "July Revolution" or "the rebellion of the poor."

Many Israeli Ashkenazi (Western origin Jews) middle class women's peace and security protests movements, had resources for their successful activities (Benski, 2005); but the first woman leading social economic protest was working class hero, Vickie Knafo. Deliberately on French Revolution Day, July 14th 2011, Daphne Leef lead Israel's middle class young educated new generation Social Justice Protest encampment over Israel, relatively the world sizable 2011 new movements' wave; the enthusiastic media represented Leef and the social movement, and also Knafo.

November 2016, saw Knafo accompanied by social activists, heading protest pilgrimage for the poor and disabled, marching from Netanyahu Caesarea private luxury house to Jerusalem, they met parliamentary members. The disabled struggle, embarked on 2001 was reaching its peak on September 2017, supported by 85% of Israeli citizens. Together, with workers union ally, the disabled leaders were negotiating government for final agreement.

GALADARI, ABDULLA* (*Khalifa University*)

Thank God for Altered States of Consciousness

People usually fear the stigma of psychological health, as mainstream health practitioners label it as mental illness or disorder. However, with modern scientific analysis, there is a hairline between high creativity and mental illness sharing the same genetic link. The symptoms of the Muslim prophet Muhammad are compared using modern neuropsychological techniques to evaluate his mental state, when he first claimed to be receiving a revelation from God while meditating in a cave. His symptoms suggest an altered state (psychotic episode). However, it is suggested that he had above average intelligence that when he entered the altered state, it protected him from falling into mental illness.

From the Bible, Ezekiel is considered by some scholars to have had suffered from schizophrenia. Buddha's teachings and the Hindu Upanishads include that one must not have blind faith and remain open to various truths, since nothing may be taken as absolute. These teachings may mean that a person must have what we today call high openness to experience from among the big five personality traits in psychology. Perhaps enlightenment is the coupling of an altered psychological state with high intelligence and high openness to experience. In the case of Buddha, when he entered an altered state, not only has high intelligence protected him from psychosis, but his high openness to experience fortified him from going into delusion.

When knowing that religious leaders may have experienced psychological disorders, it may provide patients of such disorders and their families a positive perspective of such altered or psychotic states. It is the level of intelligence that differentiates between those who are in highly creative states to those who are in psychotic states. However, the neuropsychological and chemical interactions that are causing the mind to enter such states are perhaps indistinctive. Humanity progressed due to these genes.

RC22-422.1

GALADARI, ABDULLA* (*Khalifa University*)

The Qur'an and the Corruption of Other Scriptures

One of the reasons of some Islamic views of exclusivism of its message is the Qur'anic concept of "*tahrif*" that other scriptures, mainly the Bible, has undergone. The interpretation of the term "*yuharrifūn*" in the Qur'an has caught the attention of past and modern scholars alike. The interpretation of the term ranges from the distortion of text (*tahrif al-lafz*) to the distortion of meaning (*tahrif al-ma'na*). It is argued that the Qur'anic use of the term "*yuharrifūn*" neither describes the distortion of text nor meaning, but simply is defined by the root meaning of "*yuharrifūn*," which is to turn away or to bend (*inḥirāf*). The Qur'an accuses the Jews of "*yuharrifūn*" in Q. 5:41, but two verses later in Q. 5:43, it describes how the Jews already have the Torah with God's laws in it. If the Qur'anic use of the term "*yuharrifūn*" is an accusation that the Jews distorted the text in Q. 5:41, then it would not have almost immediately after state that they have the Torah with God's laws. On the contrary, it is argued that within the same chapter, the Qur'an requires the People of the Book to stand upon their scriptures, using the term "*tuqimū*" (i.e. Q. 5:66, 5:68). The root of the term "*tuqimū*" means "*istiḳāma*," which is to straighten. It is contrasted with the Qur'anic use of the term "*yuharrifūn*," which means to bend (*inḥirāf*). If that be the case, the Qur'an cannot be viewed to be exclusivist, but asking the followers of the Bible (People of the Book) not to turn away from the Bible.

GALANTINO, MARIA GRAZIA* (*Sapienza University of Rome*)

From Villains to Victims and Back. the Oscillating Image of Migrants' Risks in Germany and Italy

Risk is a constitutive part of migration, both at individual level, in terms of biographical risks, and at collective level, in terms of risks for families, groups and societies. Due to the growing concern of European (and Western) societies over incoming migration flows, however, the framing of migration discourses has focused mainly on *risk posed by migrants* rather than on *risks taken by migrants*.

Using the sociological approach on risk and uncertainty, the author discusses the relation between migration and risk by examining the framing of migration in the major newspapers in Italy (2011-16) and Germany (2015-16). The analysis revealed a narrative centred on our societies as the main object at risk, particularly in the sphere of public security, thus confirming a tendency to securitising migration in the media discourse. However, evidence of continuous frame changes due to events unfolding at international level are also visible.

Ultimately, migrants' image in the media seem to oscillate between two poles: from people *generating risk* to people *at risk*, from "villains" to "victims" and back to villains again. If the lifeless body of the three-year old Alan on the Turkish beach became the emblem of migrants' tragedy, terrorist attacks in Europe impressed an opposite turn in political and media discourse, amplifying once again the potential threat posed by migrants. Today, as populist leaders all over Europe engage in protection of internal borders from *foreign invasion*, through checkpoints, barbed wires, defensive walls, the *we-centric* discourse over migration risk appears still as the dominant one and, we argue, it is probably here to stay.

TG04-974.1

GALANTINO, MARIA GRAZIA* (*Sapienza University of Rome*)

The Terrorism-Migration Nexus: A Comparative Analysis of Media Discourse in Two European Countries.

The recurrence of terrorist attacks in European countries together with the surge of mass migration and the associated increase of refugee numbers have ignited a debate over causal links between the two phenomena. The assumed nexus between terrorism and migration is part of a wider discourse portraying international migration as a risk for hosting societies in multiple social domains – health, work, welfare, public order. At the same time, it is worthy of particular attention as it changes the meaning of migration from a *risk* to a serious *threat* to national security.

This paper examines how a link between terrorism and migration is constructed through media discourse by analysing the content of major newspapers in Italy (2011-16) and Germany (2015-16). Our analysis reveals not only how and when discourse on terrorist threats conflates with migration discourse, but also how media are particularly concerned with one direction of the assumed causality: migrants as potential terrorists or susceptible of radicalisation. Our results also

show the performative power of language in mobilizing resources, institutions and people against the perceived threat. Ultimately, migration control – if not rejection – are the most discussed courses of action for countering terrorism, while discourses and measures on community or individual resilience do not seem to gain media attention and rise a broad public debate.

Renovating the Colosseum: Heritage Preservation in Neoliberal Times

Rooted in cultural studies, this paper examines on-going debates about the renovation of the Roman Colosseum in order to better understand how heritage protection in Italy has been transformed by the demands of neo-liberal politics. The public discussions about the modernization of the Colosseum (2012-2015) offer a case study of how the "protection" and "valorisation" of heritage have been shaped, first, by the national politics of Silvio Berlusconi and subsequently, by the centre-left policies of Matteo Renzi. These debates constitute part of an on-going national public conversation about the pressures of global tourism and the consequences for national heritage of the neoliberal orientation of the market. Italy's leading archaeologists and public intellectuals themselves remain divided. This paper examines these debates within a broad historical and political context and concludes with critical observations about the importance of the preservation of historic urban centres and monuments to a democratic society, and to our constructed sense of historical memory.

Performativity and the Politics of Change: Challenging Racism through Public Education

Representations of crisis around issues such as asylum seekers have been significant in contributing to the rise of patriot groups and the growing level of exclusive nationalism in many western nation states. In stark contrast, the images of the 'child on the beach', and the 'boy in the ambulance' became representations that challenging racism and the opposition to asylum seekers. Such images in the media challenge popular perceptions of asylum seekers and patriot politics. This paper explores the potential for art and performance, and education curriculum to contribute towards more inclusive societies and challenge racism through public education, tertiary education courses, and other levels of education. The paper examines examples of creative performance and representations that contribute to change and explores the possibilities for public education to effectively engage in contemporary political debates on issues such as asylum seeker policy.

Riesgo y Reducción Social De La Contingencia En México

La presente ponencia tiene por objetivo central llevar a cabo una aproximación al tema del riesgo y la incertidumbre desde la teoría de la reducción social de la contingencia (TRSC). Para poder hacerlo se abordarán diversas manifestaciones del riesgo y la incertidumbre que se presentan cotidianamente en México: desastres naturales (sismos, inundaciones, riesgos ecológicos), inseguridad (crimen organizado), etc.

Para la TRSC la estabilidad relativa de la realidad social es el resultado de la reducción de la contingencia inherente a las relaciones sociales mediante el accionar de tres operadores sociales reductores de contingencia (OSRC), a saber: la comunicación, las disposiciones prácticas y la materialidad tecnológica. El concepto de contingencia con el que se trabaja en esta teoría refiere a aquello que no es ni necesario, ni imposible. En este sentido, lo que hay en una determinada sociedad (sistemas funcionales, ciudades, etc.), existe justamente porque la contingencia fue reducida mediante comunicación, disposiciones y materialidad.

Si bien es cierto que la reducción de la contingencia no implica la desaparición de la misma, no puede negarse que hay ocasiones en que las estructuras sociales (simbólicas y materiales) adquieren una mayor estabilidad y parecen absolutamente sólidas e inamovibles. Sin embargo, esta aparente solidez puede ser puesta a prueba por eventos socio-naturales. Justo esto es lo que hemos experimentado en México en los últimos años. Así, por ejemplo, el Estado se muestra hoy en día incapaz de brindar seguridad a los ciudadanos ante los embates del crimen organizado y desastres como los recientes sismos ponen a la población en un estado de indefensión. Sociológicamente lo interesante es que todos estos casos pueden verse como déficits en los procesos de reducción social de la contingencia. En muchas ocasiones estos déficits generan crisis de confianza.

TG06-997.1GALLAGHER, JEANINE* (*Queensland University of Technology*)SPINA, NERIDA (*Queensland University of Technology*)*The Responsibilisation of Teachers: Defining and Reporting on "Educational Adjustments" for Students with a Disability*

In Australia, a new system of collecting data on school-aged students with disability is currently being rolled out. The Nationally Consistent Collection of Data on Students with Disability (NCCD) establishes a mandatory data collection process in which teachers are required to categorise and report on individual students' level of educational support needs in the classroom. The NCCD will facilitate funding for students with disability, with the stated policy goal being to facilitate student access to, and participation in the curriculum and schooling. We argue that this policy can be seen as part of a growing shift towards the responsabilisation of teachers. In this case, teachers are positioned as personally responsible not only for assessing student needs, but also for reporting on their own practice. Yet, while teachers are tasked with this responsibility as part of their everyday work, the undefined nature of "educational adjustments" means it is difficult for educators to understand their reporting responsibilities, even though they are made personally responsible for defining their responsibility with the NCCD as a ruling text. This paper reports on an institutional ethnography that is seeking to reveal how this policy is being experienced by teachers. A key aim of the research is to find out how the responsabilisation of teachers is hooked up with the coordination of teachers' work via textually coordinated ruling relations.

RC34-624.2GALLAGHER, KATHLEEN* (*OISE/University of Toronto*)STARKMAN, REBECCA (*OISE/University of Toronto*)RODRICKS, DIRK J. (*OISE/University of Toronto*)*Leaning in with Theatre: Global Youth Holding Space for an Imagined Tomorrow*

Youth, Theatre, Radical Hope and the Ethical Imaginary (2014-2019), uses a socially-engaged, collaborative model of research to examine how theatre can become a forum for the creative exploration of civic engagement- who am I, relative to others, and what compels me to act upon my world. The mixed methods ethnography, and the cycle of plays which has been created from it, offer a theoretically rich and empirically grounded account of the ways in which the concepts of *hope* and *care* function in the lives of young people today and in turn how participation in artistic practices and local-global social relations provoke forms of engaged citizenship worth considering in times of increasing youth social unrest.

The five sites offer very particular micro-ecologies with distinct aspects of sociopolitical unrest: i) Lowest caste girls in Lucknow (India) learning how to transgress the gendered limits imposed on them; ii) disenfranchised youth in Coventry (England) creating a counter-narrative to Brexit; iii) young people in Tainan (Taiwan) seeking to marry tradition with modernity; iv) youth in Athens (Greece), searching for ways to thrive within economic and refugee crises and; v) Toronto (Canada) youth making sense of their imagined futures in a rapidly gentrifying and socio-economically polarized city. Using Hannah Arendt's (1979) 'thinking without a banister', we employ storytelling through theatre as a way to think the present moment otherwise.

Now four years into the study, this paper will offer a set of early findings on how the affective intimacies of applied theatre mobilize civic engagement, youth activism, and work across differences of social location; how youth in diverse urban spaces offer a barometric check on our thinning global democracies; and how arts-based methodologies can begin to respond to Appiah's (2006, p. xxi) central question: "What do we owe strangers by virtue of our shared humanity?"

RC34-613.9GALLAGHER, KATHLEEN* (*OISE/University of Toronto*)RODRICKS, DIRK J. (*OISE/University of Toronto*)STARKMAN, REBECCA (*OISE/University of Toronto*)*"Talking Back" to the Paradox of Gentrification and Violence: A Youth-Centered Case Study*

Gentrification largely refers to "the production of space for – and consumption by a more affluent and very different incoming population" (Slater, Curran, & Lees, 2004, p. 1145). It typically involves the displacement of low-income residents into more undesirable neighbourhoods (Filion, 1991; Murdie & Teixeira, 2011). In research with a Grade 12 drama classroom in Toronto's east end, we questioned how this gentrifying neighbourhood had come to experience 7 homicides in 18 months, all within a 2.5 km radius of the school. This denoted a paradox: gentrification should result, in part, in better property values, increased income, and reduced crime – all indicators of a "better" quality of life for residents. However, this violence complicates the community revitalization plan underway, leading us

into a two year mixed methods research project entitled, "Youth Perceptions of Violence, Safety, and Schooling in One Gentrifying Neighbourhood in Toronto."

News reports on the neighbourhood violence cited politicians, business owners, and adults (parents, etc.), but conspicuously absent were youth perspectives. Why are so few youth voices invited into debates about the meaning of gentrification despite being mobilized as the prime recipients of its desired effects? Given this critical omission, we place in conversation different voices (activist, parent, teacher, businesses, youth), focusing on how young people understand violence, this neighbourhood, and the school; in particular the tactics they have used to negotiate the structural and symbolic violences of everyday racism and within the context of a drama unit exploring police brutality of young, Black men. Using an illustrative case study of a racialized young man named Jamal, the paper will focus on the socio-spatial perspectives of differently situated youth and how they experience violence, safety, and security in a neighbourhood that has not kept pace with the promise of increased safety, and access to opportunities and resources.

RC34-611.2GALLANT, NICOLE* (*INRS Urbanisation Culture Société*)LONGO, MARIA EUGENIA* (*INRS*)*Sociology of Youth in French Canada: Nourished and Deepened By Multiple Academic Traditions*

This presentation showcases interdisciplinary research on youth at the *Observatoire Jeunes et Société* (OJS), an international, mostly French-speaking research network based in Québec. A variety of national academic traditions (North American, French, Latin American) permeate our research approaches and conceptualisations (e.g., sociological transitions paradigm; precarity in work). We illustrate this with recent findings in four fields of research: work, education, culture, and marginalised youth. We conclude with an innovative ethical design for large-scale sharing of qualitative data, intended for a new, interdisciplinary project on youth engagement in various areas of life.

RC49-832.2GALLANT, SARAH* (*University of Prince Edward Island*)BELL, BRANDI (*University of Prince Edward Island*)*Mothers' Care-Seeking Journeys for Daughters with Depression*

The objectives were to explore Atlantic Canadian mothers' experiences seeking mental health care and support for their adolescent daughters' depression, to illustrate the power dynamics that mothers face in the system while seeking care, and to understand how support for mothers of youth with depression can be improved. The depression care-seeking journeys were depicted through the narratives of seven mothers whose eight daughters accessed their provincial mental health system and obtained a diagnosis of depression. Qualitative semi-structured interviews and visual patient journey mapping methods guided data collection and analysis to assist in understanding mothers' and daughters' experiences in the mental health system, education system, and family life.

The interview transcripts and journey maps were analyzed using narrative and thematic analysis, where narrative summaries and theme webs were created and analyzed in combination with the participants' journey maps. The three overarching themes in the care-seeking journeys were marginalization and loss of control, becoming empowered, and hope for the future. Participants' narratives and visual maps displayed fragmented journeys and exemplified power struggles in their interactions with people in the mental health system, education system, and family life. Examples of marginalization and loss of control included receiving blame, being ignored, and lacking support and guidance. Examples of becoming empowered included questioning professional treatment, educating and advocating for daughters, and understanding daughters' mental health needs through experience. The final theme of hope for the future consisted of mothers' main recommendations for improving and facilitating depression care-seeking journeys through the mental health system.

The depression care-seeking journeys of mothers and daughters in Atlantic Canada could be improved by enhancing the continuity of mental health care, increasing collaborative team-based supports within and between systems, and strategizing quality mental health education and accessible service navigation resources for parents, educators, and health providers.

Supporting Teacher Professional Development through Learning Communities to Improve Classroom Teaching Practices.

In Mexico, the Escuelas Normales (EN) are teacher training institutions at kindergarten and primary level for public and private schools. Every year, the average of graduated teachers is 60. These graduated teachers present a preliminary examination to be employed as a permanent or provisional contract in public schools. Teachers are evaluated in their basic competencies (intellectual skills, basic education knowledge, and teaching competencies). In Tabasco, the results of this examination have fluctuated between 60% to 40% of suitability. On the other hand, the TALIS 2013 Mexico reports that 24% of teachers feel less prepared to do their work.

In September 2017, the government- within the framework of the Educational Reform- implemented an educational policy creating a national network called RECREA (Community Network for the Renewal of Teaching and Learning in Higher Education).

This educational policy was designed to be implemented within a period of four years, from four stage. The first stage consists on a pilot study, based on action research, supported by Morin's complex thinking theory and the ICTs, as a result of this stage, a formal methodology to be implemented in the following stages, to create communities of practice.

The presentation is focused on the methodology retrieved from the experiences of implementing the strategies used in the seven networks formed throughout the country, with the aim of improving the process in the initial training of teachers.

This study is funded by PRODEP (Professional Development Programme) and SEP (Secretary of Public Education)

Artistic Practices in Later Life – Creativity and the Practices of Growing Old

In the cultural field of the third age, cultural expression, creativity and artistic practices gain importance in the doings of age in everyday life. Findings so far have supported the notion of creativity and ageing as processes of individual expression, underestimating the role of symbolic power that is inherent in artistic practices in later life. Drawing on the notion of creative assemblages (Fox, 2013) and Pierre Bourdieu's (2014) concept of cultural fields, this paper aims to analyze how ageing becomes relevant in artistic practices and how the meanings of age in artistic production differ due to different positions older adults have in their cultural fields.

Drawing on data from 10 qualitative case studies with older adults regularly involved in artistic practices, this paper analyses the different actors of ageing that shape processes of doing age in artistic practices of older adults. Results identify three main narratives through which ageing was made relevant in the analyzed case studies: *The artistic biography, the ageing body and productive subjectivity*, all of which differ in their meaning depending on the social position the artists had in their cultural fields. Narratives around the legitimacy of artistic production reveal a hegemonic age-less 'artistic habitus', which holds the power of consecration (Bourdieu, 2015) in the analyzed cultural fields.

The paper emphasizes the role of symbolic power in artistic practices of older adults - creativity in later life cannot be understood without taking into consideration different positions in the cultural field from which art in later life is being produced. Hence, future research on late-life creativity should focus more closely on the mechanisms of age-related social inequalities that are involved in artistic practices in later life.

Online Leisure and Wellbeing in Later Life

Research has shown considerable evidence demonstrating positive associations between Internet use and *subjective wellbeing* (SWB) in later life (cf. Damant et al., 2016; Fosman & Nordmyr, 2015), arguing that Internet use may play a central role in successful ageing. Existing research, however, also includes conflicting findings that demonstrate no association or even negative associations between Internet use and SWB (cf. Berner et al., 2012; Matthews & Nazroo, 2015),

which calls for a differentiated approach to the analysis of older adults' Internet use and wellbeing.

Relying on recent research emphasizing the significance of online leisure (Lifshitz et al., 2016), this paper suggests three pathways towards a better understanding of the roles online leisure plays in older adults' SWB: Simultaneous exploration of various online leisure activities, concurrent examination of both online and offline leisure activities; and differentiation among discrete subgroups of older Internet users.

To demonstrate the effectiveness of these three paths, we examine data collected in an online survey of media use among 814 Internet users aged 60 years and over. Results indicate that there are six factors of media-based leisure activities, two of which associate positively with users' life satisfaction (*online updates* and *offline content*) and one negatively (*offline radio*). Analysis also identifies three groups of Internet users, based on the activities they engage in: *Onliners*, *Offliners* and *Lighter Users*. Despite differences in leisure involvement, these groups report similar life satisfaction. The groups' background characteristics reflect a balancing mechanism wherein participation in certain online and offline activities compensates for distressing conditions to some extent.

Overall, this study suggests that the association between Internet use and SWB in later life depends on the functions the Internet serves for older users, its role in their overall media and leisure repertoire and various background variables affecting access to and competence in media use.

Sociocybernetics and System Dynamics

This paper presents the continuation of what was presented at the 14th International Conference on Sociocybernetics held in Medellín, 2017, on reflection about the possibilities, alternatives, barriers and potentials of Sociocybernetics and System Dynamics combination. It continues with the revision, as a critical theoretical comparison between the fundamental elements of observables and observers from System Dynamics and Sociocybernetics as well as the origins and the fundamental elements that make up each of these knowledges. There is also a recount and an analysis of the works developed by the students of the course System Dynamics 1, in charge of the author since 2014. Finally, a presentation and an analysis of the positions of authors representative of each of the two knowledges and their criticisms regarding the relation explored is made. With these analyzes the exploration of the answers to these questions continues: How is it possible to observe systemically the reality? What are the minimum elements necessary to capture systemically the reality? What can be observed systemically, what is managed to observe and what is intervened? What new meanings are found of reality through simulation? The paper ends discussing and concluding around an epistemology that allows to study the combination Sociocybernetics and System Dynamics tending interdisciplinary bridges between them.

Transforming Local Socio-Political Relations through Citizen Science in South Africa

South Africa, the most unequal country in the world, has experienced a rapid rise in service delivery protests over the last decade. When municipal engagement through existing channels fails, water users often use protest to gain attention to their water and sanitation problems. However a creative form of engagement that includes elements of protest merits greater attention: citizen science. People exert their agency by gathering data, which gives them power to challenge environmental injustices. While the literature on citizen science focuses on its role in protecting natural resources, this research explores how the practice of citizen science can—at the same time— promote socio-political transformation at the local level. It examines this issue in the context of citizen monitoring of water quality of the Vaal River, one of South Africa's largest rivers that is in crisis due to pollution from waste water works, acid mine drainage and industry. Here two non-profit organisations gather data that they then use in a variety of ways to hold polluters to account. Based on key informant interviews with citizens from both organisations, this paper seeks to understand how the dramatically different class and racial backgrounds and interests of the two groups interact and transform each other as they work together around a common aim—to protect their water resources.

Rituels Urbains Comme Espace d'Inclusion: Une Signification De l'Espace Public

Une ville ouverte est un espace ouvert d'inclusion qui de même permet à la ville de survivre. D'un côté cette ouverture augmente les contrastes et les confrontations entre de différents styles de vie; d'un autre côté, favorise les

contacts, le respect pour les autres aussi bien que la conception des différences comme valeur. Parmi les différentes modalités d'activer cet espace d'inclusion, à côté des activités formalisées telles que les politiques d'intégrations ou le marketing ou branding de la ville, l'on retrouve aussi des activités informelles et auto-organisées qui se déroulent dans les espaces urbains publics en mesure d'améliorer les dynamiques d'appartenance et de coexistence pacifique entre les résidents et les nouveaux arrivants. Il s'agit d'une expression culturelle importante pour la ville : les rituels urbains. Avec cette expression l'on entend de nouveaux rituels, inventés ou re-inventés, n'appartenant pas nécessairement à la tradition, dans le sens qui ne sont pas la simple répétition des rituels déjà existants. Ainsi, par l'invention d'un rituel, l'individu et la collectivité créent une histoire, qui met en relation le passé avec le futur, la vie passée personnelle, mais aussi le passé du territoire, de l'espace urbain en lien avec le futur du territoire. Et dans ce cas là aussi le rituel acquit une haute valeur symbolique en ce qui concerne les dimensions de l'identité, de l'appartenance, de l'inclusion qui se jouent au moyen d'un espace public.

L'intervention vise à souligner les aspects incluant des rituels urbains à partir des observations menées dans les villes de Turin et de Genève.

Hyperlink Analysis As a Tool for Exploring Collective Action

New forms of collective action, even before they assume the dimension (and relevance) of a movement, are very descriptors and vehicles of the global transformations our world is facing. As a prism of growing social change, contemporary forms of collective action capitalize the relevance of different relational milieu as the virtual dimension. The aim of this presentation is to critically discuss the potential of hyperlink network analysis as a feasible tool - in a multi-method research design - for the investigation of contemporary forms of collective action. Hyperlink networks can be (or not) related to other forms of collective action; nevertheless, the systematic analysis of hyperlink networks unveils interesting elements to be taken into account in collective action/social movement research. The network perspective - through hyperlink analysis - will be presented and discussed as methodological option to merge in concrete research practices. Concrete examples of embedding hyperlink analysis results in fieldwork research strategy (and tools) will be provided.

The Impacts of Museum-Led Dementia Awareness Programmes on Informal Caregivers' Subjective Wellbeing. a Critical Analysis about the House of Memories Programme

This paper draw on the results of an empirical understanding of the impact of House of Memories Family Caregivers' Awareness Day across four museums in England on the subjective well-being of 66 participating dementia caregivers. House of Memories is an award-winning dementia awareness programme led by National Museums Liverpool (NML) in the UK that uses museums' collections to support caregivers to develop reminiscence activities with people with dementia. My House of Memories app was launch in 2012 and since then has register more than 12 000 downloads worldwide.

Crossing Boundaries: The value of museums in dementia care developed a mixed-method pre-post approach, combining quantitative profiling of participants' care responsibilities and museum engagement; standardized measures of subjective well-being and care burden (adaptations of the Warwick-Edinburgh Mental Wellbeing Scale and Zarit Burden Interview); and delegates' comments on the session collected by National Museums Liverpool Marketing Department. Parametric statistic and thematic exploration were used for data analysis.

Profiling of care responsibilities and perceived burden shows that the research sample can mostly be defined as 'care managers'. Concerning the wellbeing of participating carers, data show positive outcomes concerning strategies to reduce the stigma associated with dementia; from a strategic perspective, social value data validates the personal outcomes of the programme relating to carers' subjective wellbeing, dementia knowledge and awareness and person-centred care practices. Our research also demonstrates that almost all (91%) House of Memories participants had never used a museum for memory or reminiscence activities and the majority of them (75%) never used an iPad for the same purpose before House of Memories.

Findings are suggestive of the potential of the House of Memories programme to improve the lives of informal caregivers, particularly concerning three areas: dementia awareness, carers' self-recognition, and subjective well-being.

GANGAS, SPYROS* (DEREE-The American College of Greece)

The Ladder of Hope: From "Orthopedia" to the Antinomies of Social Systems and Back.

To hope for a regeneration of Bloch's "principles of hope" is a task today both urgent and taxing. Contemporary forms of suffering in conjunction with the fact that capitalism's crises do not automatically translate into coordinated resistance call for a reconstruction of the problem of hope. This reconstruction is founded not only on value-claims (e.g. orthopedia, human dignity) of the dispossessed but also on moral values which are held to be represented by the critical social scientist. Yet, Adorno, for example, deferred the problem of the value-constitution of society solely to the domain of reification. This error was not committed by all Critical Theorists. Marcuse's "The Concept of Essence" is a notable exception. I shall argue, first, that the shape of a reified moral constitution of the institutional totality under capitalism requires rethinking the problem of hope at the level of dialectical mediations (the 'ladder') in a complex network of societies (e.g. Hegel, N.Hartmann, Honneth). It thus presupposes conceiving the social totality in terms of its antinomic features, namely, as a double society marked not only by alienation but also by social shapes of its appeasement. It is at this juncture that Critical Theory risks jettisoning a 'determinate negation' of society opting instead to a reified 'total negation'. Second, Critical Theory ought to consider broadening Bloch's 'warm streams' to include other normative projects against alienation (e.g. Durkheim, Sen). Thus, to reclaim Bloch axiological kernel of "orthopedia" requires exiting Critical Theory's moral isolationism and guarding oneself from a reification of critique that eschews reconstruction of categories in face of a social reality's recalcitrance, the dual-form of which is obfuscated in ways that explain away available non-reified spaces of hope.

GANGAS, SPYROS* (DEREE-The American College of Greece)

'Simmelian Marxism': A Radical Project of a Relational Modern'Life?

Canonical interpretations of Simmel's work place his sociology and philosophy strictly under the neo-Kantian epistemological paradigm; it is often assumed that Simmel's work operates solely at some unbridgeable distance from Marx and the latter's Hegelian heritage. Simmel's 'Hegelianism' is all too often held to oppose synthesis in favor of 'tragedy'. At best, Simmel's metaphysics is seen as a skeptical opening of the Spirit to individuated forms of authentic ethical valuations. In this paper I shall argue instead that Simmel's prolific, and often contradictory, writings invite affinities to the "Kant-Hegel-Marx" constellation of normativity. I will thus: a) briefly discuss Simmel's relationism through a normative lens, with emphasis on the notion of 'reciprocity' (e.g. Papilloud) in modernity; b) consider Simmel's critique of normativity not as an outright rejection of 'universality' but, rather, as a claim to differentiate 'universality', mediating it with 'individuality' - a project tied to modern life's disjunctive logic; c) argue that reclaiming the Marxian project of an emancipated 'life' as an anthropological and normative nexus, requires a reconsideration of a relational process of life that corrects Marxism's myopia on the 'openness' of a differentiated modernity; at the same time it recovers the 'undifferentiated' *a priori* of a life free of (surplus) alienation, a concept that sustains the normative force of Marx's 'universality'. Thus, Simmel's 'practical idealism' (Leck) can potentially inform Marx's emancipatory vision. This normative bridge can be further accentuated by similar attempts to think 'Life' in Marxian terms (i.e. early Marcuse). So whilst it may still be premature to identify a systematic "Simmelian Marxism", the roots of such a program lie not in debunking Simmel's metaphysics of life but in critically recuperating the 'regulative ideal' of life's modern movement, 'free' of coercion, alienation and moral fundamentalists of sorts.

Disruptive Behavior and Difficult Adolescents in the Emergency Department : Contribution to a Comparison between France and Canada

Background:

For the last two decades, mental health related visits for adolescents in the Emergency Department (ED) have been a developing issue in North America as well as in Europe. When emerging, this issue met two opposite apprehensions in the medical community. If all authors agreed that this trend reflected unmet mental health needs and was connected to certain clinical and social characteristics of the patients, they were opposed on the legitimacy of these demands.

Objective :

We focused on the political and institutional background against which this trend occurred and we analyzed how it was detected as an issue by these actors at hospital.

Method :

A critical review of medical literature on the topic was performed, comparing its approach in France and in Canada. This review was compared to institutional and policy making reports. Data were analyzed with conceptual tools from the pragmatist sociology on public issues.

Results :

ED patients more often received social welfare benefits, had a social or correctional follow-up and belonged to ethnic minorities. Self-harm and violence represented the two main complaints. However, gender played a role. Female adolescents more frequently reported depression symptoms or self-injuries while male were admitted for violence. The population of disruptive behavior and violent adolescents is at higher risk of returning to the ED. Recent researches have shown that making contact with outpatient care did not prevent ED readmission and even facilitated it. With rare exceptions, no specific intervention has proven efficiency in preventing readmissions to the ED. Standards of care and evidence-based references for practice are lacking. Ethical issues regarding the use of constraint (seclusion, physical and or chemical restraint) to treat these adolescents add to the trouble of professional caregivers.

We propose a future ethnographic fieldwork in the ED.

To Investigate Union Work: Between Professionalization Processes and Vocation, Union Organizations and Their Members at the Origin for Redressing Inequalities or of Their (re)Production?

Trade Unions in most of democratic countries are at the origin social processes of "democratization" in employment conditions. In which conditions and how unionists could appear at the origin of social change? What are they doing to shape social spaces? In which conditions and how could they reduce social inequalities? Through a socio-historical and ethnographic work on collective bargaining studied as a social activity and from actors' point of view and social situations locally and geographically situated, Gantois demonstrated that collective bargaining constitutes an institutional device at the origin of the production and the reproduction of socio-economic inequalities in working establishments. It also constitutes a tool used by unionists and employers to change their positions and to shape claims in union and political fields. Through an anthropological work on state democratization processes focus on childhood, Boone showed how state devices shape forms of political socialization for citizens in "democratic countries". After works on collective bargaining and on political socialization processes, we studied union work inside and outside unions during one year to better understand social conditions and forms of politicization of the making of union claim for social change. Our survey in one of the most important French union (*Confédération Française Démocratique du Travail, CFDT*) mobilised tools of sociology and ethnography to investigate the making of union claim from working and social situations identified by unionists as "unequal" or "unfair". We will describe and analyse union work for the making of – or not – union claims in working establishments in front of employers and, more broadly, in public and political spaces in relationships with association members and politician makers. This proposal will shed light on conditions and constraints of the work of unionists to identify social situations as "unequal" until to (or not) transform them to reduce social inequalities.

Democracy of Collective Will (DCW) in Info-Communication Globalization: Digital Democracy, Citizenship and Public Interest

Representative democracy has been seriously challenged by the domination of digital technology, internet and social media. A digital democracy has at least two plausible meanings: (1) a democracy that is being transformed or re-oriented through digital technology and (2) a digital representation or reflection of some aspects of representative democracy in info-communication globalization. In the first case, that of the democracy becoming more digitally-oriented, the traditional attributes of the representative democracy itself are changing to new type of democracy i.e. the Democracy of Collective Will (DCW). It is true that the representative democracy is undergoing change due to the domination of digital information and digital communication in free market economy. This paper focuses on the digital democracy, public interest theory and info-communication citizenship, particular the type of democratic presence typified by the idea of 'digital citizen', for it is primarily through the work of this democratic system that democracy problems get address and democracy 'progress' is furthered. Digital cities, citizenship and info-communication culture are setting up a new democratic ecosystem to cultural, social and economic development both locally and globally. Finally, we recommend the 'Democracy of Collective Will' (DCW) as a new democratic system in info-communication globalization.

GANTZIAS, GEORGE* (*HELLENIC OPEN UNIVERSITY, SCHOOL OF SOCIAL SCIENCES, CULTURAL ORGANISATIONS MANAGEMENT, MSc*)

Fake News in Info-Communication Public Sphere: Control of Resistance in Digital Ecosystem

Digital democracy and fake news are changing our democratic systems. Fake news is a reality in our representative democracy. The digital media together with internet web sites are making money by producing fake news i.e. stories that have the flavor and style of faithful journalism but are written in bad faith and without care for accuracy. According to Stanford University researchers, across the US, many students can't tell the difference between a reported news article, a persuasive opinion piece, and a corporate advertisement. This lack of media literacy makes young people vulnerable to getting duped by "fake news" — which can have real consequences. This paper examines the role of fake news in our representative democracy, the info-communication public sphere and digital democracy. It points out that 'Fake-news' is a deeper socio-democratic shift. Finally, it examines and analyses the "Dynamic Real and Fake News Algorithm" (DRFNA), the blockchain model for monitor monitor and evaluating real and fake news in our democratic ecosystem both locally and globally.

An Examination of the Authority of Health Professionals in the Climate of Inter-Professional Practice and Patient/Family Engagement

This paper investigates the authority of various health professional groups in the climate of inter-professional practice and patient/family engagement. The health care system in Canada and around the world is implementing inter-professional practice and encouraging patient/family engagement to provide safer and more coordinated care. However, the effect of the two initiatives on the practice of health professionals and the experiences of patients/families is not well examined. This paper intends to understand: 1) the status of professional authority in health care delivery through the lens of patient/family engagement; and 2) how authority varies among different health professional groups through the lens of inter-professional practice.

Data for this research were collected through individual interviews with 29 health professionals who come from a wide range of professions, 7 health professional learners, 11 patients and 6 families on medicine and pediatrics at a tertiary care teaching hospital. Data were analyzed using thematic coding, informed by grounded theory to reveal gaps in perspectives and experiences.

Several mechanisms were adopted on both wards to engage various health professional groups and patients/families in health care delivery, inter-professional rounds being the biggest initiative. However, I argue that professional authority exists among health professional groups with medicine leading the rounds and asking for input from other professions, while patients/families are not yet integrated members of the health care team. The research reveals workload, resources, and practice variation as some of the significant factors. There are shared perspectives on patient/family engagement and inter-professional practice among health professionals and between health professionals and patients/families. However, I propose that there are gaps between perspectives and experiences (both the working experiences for health professionals and the hospital experiences for patients/families). Training that integrates patient engagement and inter-professional practice for current and future health professionals is essential to providing patient- and family-centered health care.

The Chinese Pedagogical Imagination of the "New Socialist Man" in Cold War Geopolitics

This paper, based on archival and published sources, investigates how Chinese educators and psychologists in the first decade of the People's Republic of China became involved with a radical shift of knowledge about the human mind. Upon the founding of the new socialist regime in 1949, they adopted a considerable amount of American scientific knowledge that often positioned thoughts, capacities, attitudes, etc. as located in the individual mind and affected by natural laws. Over the course of the 1950s, their understanding of the human mind was significantly altered by China's alliance and split with the Soviet Union. By 1958, many revolutionary educators and psychologists had come to dismiss American scientific knowledge as a false ideology, and postulated a sociopolitical ontology that emphasized the power of class struggle for creating the "new socialist man". Accompanying this knowledge shift were the requirements that students should achieve comprehensive development in all academic subjects as well as physical labor, and contribute an extraordinary amount of social service both on and off campus. This shift in knowledge, while partly affected by China's postwar recovery

and class struggle, was deeply entrenched in the Sino-Soviet relationship and Cold War competition. In both academic debate and pedagogical practice, Chinese educators and psychologists alternated between, on the one hand, borrowing knowledge from America and the Soviet Union, and, on the other, treating the two competing super powers as ideological tokens to legitimize particular knowledge in relation to China's socialist revolution.

BISCHOPING, KATHERINE (*York University*)

The Geopolitics of Authenticating and Denaturalizing a Communist Hero

In 1963, Lei Feng, an ordinary soldier of socialist China, was acclaimed by Chairman Mao as a national hero for having done numerous selfless deeds. Skeptical readers in western countries denaturalize Lei Feng's heroic status, regarding the copious photographs and diaries of Lei Feng as ridiculously adulterated evidence that erects a façade of propaganda. However, our interviews with 41 Chinese reveal an alternative conception of such materials and the associated project of "xuan chuan" (their term for "propaganda"). Many of our Chinese respondents saw *xuan chuan*, including particular forms of the curation and display of historical records, to be a legitimate means of governance for the sake of societal good. Further, by focusing on the earnest reception in China of a Lei Feng-related April Fools' joke, supposedly invented by a western news agency, we trace the history of authenticity in China's socialist political culture. By taking advantage of the mutual unfamiliarity of the Chinese and the western populations, we argue that authentication and denaturalization are indexical practices, pointing to geopolitics more than to the truth or falsehood of the Lei Feng stories.

TRABUT, LOIC (*National Institute of Demographic Studies*)

At the Social and Cure Border : Redefining the Balance of Power in the Field of Elderly Care

The field of dependent elderly care has changed over the last 20 years in France around a double direction. On the one hand, at home professional care has been structured and professionalized (extension of the scope of legal competences, professionalisation through training) but faces financing problems. On the other hand, the public authorities are pushing for a rapprochement between the cure and social sectors in order to promote a comprehensive approach for dependent elderly care. This is particularly the case with the setting up of a system on "care pathways for the elderly at risk of loss of autonomy", which aims to improve coordination between these two sectors and reinforces the role of medical doctors.

In this paper, we examine the effects of these changes on the division of work in the system of care/cure for elderly. We will show that if the role of the health sector is strengthened, they are struggling to engage in a logic of cooperation with social actors and remain driven by a medical logic. At the same time, at home professional carers are obliged to carry out activities outside their field of competence in the area of health care. This shift of tasks may be interpreted as sign of the difficulty in having their profession recognized and the predominance of the medical sector over the social sector. These transformations are a source of tension between social and health actors, which show the difficulty of agreeing with each other on the place of care and cure in the relationship of assistance to the elderly.

This paper is based on two field surveys carried out in France over the last four years with policy makers, health and social actors at different territorial levels, as well as home helpers and trade union representatives.

TRABUT, LOIC* (*National Institute of Demographic Studies*)

Evaluating the Evolution of the Ways of Taking Care of the Elderly: An Approach Based on the Trajectories of the Territories

Dependency, or the management of the loss of autonomy of the elderly is today a major issue for the public policies in Western countries and in particular European countries. In France, one of the main trends is home care rather than institutional care. However, beyond this national trend, it can be observed that at the subnational levels, forms of support for the elderly are very heterogeneous (public, associative, family). In this paper, we try to understand the explanatory factors of these territorial disparities.

This paper argues that the history and trajectories of local environments, taking into account both population structures and the socio-economic contexts of

the territories, help to structure the supply of services and explain current disparities in the forms of help (family/professional/ mixed).

To demonstrate this, this paper is based on varied material. First of all, we will analyze a series of contextual data from the large databases available in order to characterize the territories. Then, we propose a monographic analysis of 4 contrasting territories (in two French departments) chosen because can be assigned to different types of public policies. This study is based on interviews with the different actors of public policies (about ten in each territory) in relation to the elderly people losing their autonomy, the strengths and weaknesses of the provisions put in place, their capacity to meet the needs of the elderly and more generally on their flexibility, their logics of action and their capacity for innovation. They will help to trace the decision-making processes at the origin of policies or specific instruments linked or not with local demographic and socio-economic changes.

The Causes of Trust in the Military: The Case of Slovenia

Measuring of public trust in the military has been an important part of a social research; especially the researchers of defence sector and military organization are prone to make it and analyse the data and also the broader social environment that could influence the data and trust itself. There has been the decades of such research in Slovenia (some publications: Grizold & Jelušič 1992; Grizold 1995; Grizold & Prezelj 2000; Malešič & Jelušič 2006; Garb 2008; Malešič & Vegič 2009; Malešič 2011; Garb 2013; Malešič 2014; Malešič & Vuga Beršnak 2014; Garb 2015; Malešič et al 2016). The data has been followed by domestic and international science, the Slovenian defence ministry and the military, and the public as well. Since 2013 there an attempt was made to deepen the knowledge on trust in the military. Therefore a theoretical study of the causes of the trust into institutions was made as well as some empirical research to reveal the actual/ concrete causes/reasons why the people trust the Slovenian Armed Forces (Garb 2014; Garb & Malešič 2016). The survey indicated that the prevailing cause was connected with the perception of the activity of the military. The future research will focus on confirming the thesis, that the activity/performance is the main source of the public trust in the Slovenian military.

Market, Violence and a Movement: Decolonization and Precarious Work at the University of Cape Town

In April 2015 a student at the University of Cape Town staged a protest in front of a brooding statue of British imperialist Cecil John Rhodes located at the heart of the university. As part of his protest accoutrements, the student procured human faeces from a township (the urban ghettos Apartheid carved for non-whites) and emptied it on the statue, in order to, in his words, "bring our shame to this white (read violent) space". His protest gave birth to the movement #RhodesMustFall demanding the removal of the statue and other colonial memorials on campus. The movement further demanded, among other things: the full employment of workers who were outsourced as a cost-cutting measure, and the centering of Africa and African knowledges in curricular. The first hurdle was how to define decolonization: Is it a return to a status quo ante? What will decolonization mean in an intellectual workplace dominated by precarious work? In this paper I explore aspects of the debates and tensions that animated the movement around: what exactly a decolonized university will mean relative to precarious workers among whom are janitors, contract lecturers and tutors; and the question of the militarization of the campus by the state and university management. I look at the case of precarious academics who identified with the student-worker movement but whose employment conditions were too unstable for which reason showing solidarity by boycotting classes meant a risk that permanent academic staff were relatively immune from. I conclude by showing how a joint disciplinary mechanism from the commodified university in curtailing dissent via tenure insecurity, and the militarization of campus by the state contributed to the fragmentation of a struggle for a de-commodified and open campus.

GARBA MUHAMMED, FAISAL* (*University of Cape Town*)

Organization As Solidarity: African Migrant Workers in Germany

This paper looks at the experience of a group of African workers that established and lead a works' council in a firm based in Frankfurt, Germany. It is ordinary for shop stewards of the works council to extend (informal) solidarity to other workplaces by passing on ideas and lessons onto African workers in the various work places in the city of Frankfurt. The paper looks at what this form of direct worker-to-worker-experience-sharing means for labour organizing in a setting where the working class is deeply racially segregated in a climate of constant threats of retrenchment faced by migrant workers as firms close down or downsize. The paper traces the strategies, social formations and vision of

alternatives that the workers construct within the works council and in places they frequent such as mosques, churches and African shops.

The paper will probe beyond the media and popular image of African migration as headlined by rickety, ever-ready-to-drown boats ferrying desperate women, children and men across high-seas with the ominous consequence of swamping and worsening the plight of a crisis-ridden Europe. It will show that the constant desperation that defines the reality of African workers occupying the margins of European society is muted by this outlook. Neither is it grasped by the celebratory tone of glocalization, pluralism and globalization from below. Also not revealed, in spite of works of thick ethnographic description of the lives of African migrants in Europe, is the implication that the determination to seek an alternative livelihood and life, has for their resistance in the workplace and in the larger society against narrow, self-contained notions of territoriality and belonging prevalent in Europe.

"Pseudo-Feminization" of the Journalistic Profession in Spain: The Case of Women War Correspondents

Although the profession of war correspondent has traditionally been considered a man's job, in the last decades, several women have joined the profession in Spain. Today, there are dozens of women working for the Spanish media, covering armed conflicts, violent crises and jihadi terrorism. On the other hand, despite the apparent feminization of the journalistic profession in Spain, defended by many authors since the early 2000 years, one can speak of a pseudofeminization or a false feminization of the job. To this end, the author has made a case study of the women's professional group of war correspondents. This research is aimed at dismantling the triumphalist theses that state that the journalistic profession is today a feminized profession. To this end, the author has carried out a multimethod research, based on the triangulation between the qualitative method through in-depth interviews and audiovisual analysis. She has discovered that the profession is still a male profession, from different findings: there is a high abandonment of the profession throughout the trajectory, there are persistent phenomena such as glass-ceilings and there is an understudied wage gap. The qualitative results show that in addition to the gender gap that limits their careers, these women face harassment practices ranging from harassment to sexual assault.

Social Innovation and Governance in Chicago and Barcelona: The Strength of Social Agency and the Challenge of Building Inclusive Cities

Since the Global Economic Crisis of 2008 local governments have suffered financial constraints caused by national austerity policies which have jeopardized the delivery of responses to citizens' social needs. At the same time bottom-up claims have emerged from citizens concerned about their basic social needs (housing and employment) and about the preservation of their neighbourhoods. In Chicago and Barcelona residents organized claiming affordable housing and income opportunities as the two cities experienced rapid processes of gentrification and sharp increases in social inequalities. The response to the unequal outcomes of urban transformations in both cities was bottom-up social activism organized at neighbourhood and city levels. Moreover, citizens developed socially innovative strategies that resulted in changing the local governance orientation (Barcelona) or in changing urban regulations (Chicago). The two contrasting city governance trajectories with different private and public actors and partnerships between them provide the context to explain the shades of social innovation in Chicago and in Barcelona. In both cities civil-society organizations and social movements have been active in responding to immediate social needs. In addition, they established "bottom-linked" governance relations with local institutions to adopt innovative programs. The paper also discusses how the use of the concept of urban citizenship and the global idea of 'right to the city' help explain these social processes.

Complexity, Contradiction and Conflict: Inherent Parties of Mexican Political Behavior in Decision-Making Process

The socio-political conditions of today's Mexico reflect an environment in conflict that has completely permeated the relationship between the State and citizens. Through at least three generations of structural reforms over the last twenty years, political operability has been characterized by imbalance of decision-making processes and significant changes in the links between political actors - syndicates, parties, entrepreneurs and a few groups of civil society,

detonating with it scenarios of conflict, complexity and possible contradiction in political operations.

The core interest of this work lies in the political behavior within the framework of decision processes with legislative implications, shown an effort to understand a kind of inner rules that establish a set of actions in all political actors, and that formulates an operative procedure that reproduces tension and conflict in their interactions and in the rest of the society. This way, the emphasis is not on isolated practices, but on patterns of behavior in political operations that express a recurring phenomenon of power, injustice and violence in Mexico.

So on, in order to understand the operations of the political system in certain frameworks, it is imperative to focus on the reproduction and construction of the guidelines that moves the political exercise, that according to the systemic contributions of Niklas Luhmann, it's about to the study of the structures of the political system and the important role of its self-reference.

La Ineficiencia De Las Políticas Públicas De Desarrollo Social En LOS Procesos De Exclusión, Pobreza Y Vulnerabilidad En México (The Inefficiency Of Public Policies For Social Development In Exclusion, Poverty, And Vulnerability Processes In Mexico)

El presente trabajo es un análisis de las políticas de desarrollo social en México en las últimas tres décadas. El gasto social creció enormemente pero ello no ha correspondido con el mayor acceso efectivo a los derechos sociales. La enorme dispersión de programas de desarrollo social entre los tres niveles de gobierno (local, estatal y federal) aunados a los altos niveles de corrupción asociada al gasto en desarrollo social, ha supuesto un gasto cada vez mayor, poca focalización y resultados insuficientes e ineficientes.

Las prácticas están politizadas y con un retraso considerable en la creación y extensión-cobertura de la red pública de servicios sociales. Las acciones gubernamentales en muchas ocasiones están regidas por intereses corporativo-políticos y el recorte en el gasto público. La sociedad es cada vez más compleja por lo que las soluciones son también cada vez más difíciles.

La mayoría de las intervenciones tienen un carácter reactivo en lugar de preventivo. Se interviene con esquemas de protección social obsoletos que no dan una respuesta nueva ni integral a las necesidades. Los programas sociales hacia la pobreza, vulnerabilidad y exclusión deben ser integrales, más allá del asistencialismo y el paternalismo.

El foco de las políticas sociales no puede estar centrado únicamente en incentivar el crecimiento económico y la incorporación al mercado de trabajo. Es necesario que el enfoque no deje de lado el carácter estructural y cultural simbólico de las desigualdades sociales, por lo que las respuestas tienen que ser transformativas de la sociedad en conjunto. Debe haber una mayor integración entre los programas sociales y los económicos.

Propuesta Conceptual Y Metodológica PARA La Medición De La Exclusión Social EN América Latina (Conceptual and Methodological Proposal for the Measurement of Social Exclusion in Latin America)

Una de las grandes limitaciones para la medición de la exclusión social en América Latina es que no existe ni un marco teórico ni los instrumentos metodológicos pertinentes pues el modelo de referencia es muchas veces tomado del contexto europeo. Más bien lo que se encuentran son una serie de explicaciones aisladas de alguna dimensión o factor que intervienen en la generación de la exclusión social. Así pues, este paper es una propuesta sobre todo metodológica.

El valor analítico de la exclusión social recae en la importancia de adoptar este enfoque para entender los factores de riesgo y procesos individuales, sociales, culturales, político- institucionales y estructurales que desencadenan y mantienen una situación de vulnerabilidad y/o exclusión.

Para ello se propone un modelo mixto: En el análisis cuantitativo se analizarán los elementos clásicos de análisis de la exclusión social (económico, laboral, formativo, sanitario, vivienda y relacional); y en el análisis cualitativo nos centraremos en los ámbitos socio-cultural, político-institucional y al del contexto espacial como elementos que reflejan la especificidad de la realidad latina; especialmente nos referiremos a los derechos de ciudadanía y a la participación social, aspectos que potencian la cultura de la discriminación y de la pasividad social, a la vez que ahondaremos en el factor de la segregación espacial. En esta línea, una de las limitaciones básicas que se encuentra en toda medición de la exclusión social, es respecto a los aspectos intangibles, es decir, las dimensiones críticas del acceso a redes, las políticas de apoyo, la libertad política, la participación ciudadana, la seguridad personal, la ciudadanía, las amenazas a la sostenibilidad y la equidad intergeneracional, entre otros muchos aspectos; aspectos que en

muchas ocasiones son los determinantes o detonantes del verdadero desarrollo y de la exclusión social.

Involvement Spaces and Religious Sociabilities of Muslim Women in Argentina

Current academic output addressing the gender and religious issues surrounding Argentina's Muslim community is still very thin on the ground. In what is, therefore, relatively virgin territory, this paper deepens and develops the discourses, practices, memberships, identity constructions and modes of socialization among Muslim women in contemporary Argentinian society.

This investigation demonstrates that the current forms of religious sociability of Muslim women in Argentina are developing within the dynamics of a framework of 'syntony'/'asyntony'-transformation' in response to the discursive output generated within and without the membership group. A process of identity building is activated, driven by the dynamics of the discursive and counter-discursive development of the narratives emerging among the actors (state-institutions-individuals). This production of gender identities and identities is not isolated; rather, it enters into dialogue with memories and other discursive fabrics at the community-institutional, national and transnational levels.

Finally, this paper involves intersectionality and permanent dialogue across anthropology, sociology and gender studies when addressing the complexity of identity recompositions pervaded by gender issues.

Aporte De La Comunicación a La Sostenibilidad Organizacional Y SU Impacto EN La Reducción De La Violencia. Estudio De Caso EN Colombia

APORTE DE LA COMUNICACIÓN A LA SOSTENIBILIDAD ORGANIZACIONAL Y SU IMPACTO EN LA REDUCCIÓN DE LA VIOLENCIA. ESTUDIO DE CASO EN COLOMBIA

En la construcción de un país menos violento, luego de que Colombia firmara un acuerdo de paz con la guerrilla de las FARC, las organizaciones deben replantear su aporte a una nueva sociedad, a partir de la generación de desarrollo sostenible, que incluye la creación de valor tanto individual (de cada entidad) como colectivo (bienestar de la comunidad). La gestión estratégica de la comunicación debe contribuir a la sostenibilidad pero poco se ha estudiado sobre su impacto. Conocer el nivel de incidencia de la comunicación en los procesos asociados a la sostenibilidad organizacional en la dimensión económica, es el objetivo de la investigación realizada en dos entidades, referentes en el país. La comprensión a profundidad de este fenómeno, poco explorado, se propicia desde el enfoque metodológico cualitativo, a partir del diseño "estudio de caso". Se procede a una ponderación de las variables identificadas en el análisis documental y en las entrevistas de personajes clave de la organización. Los resultados a la fecha muestran que las entidades estudiadas realizan proyectos e inversiones que favorecen el desarrollo sostenible en las regiones de influencia, lo cual permite advertir que se aporta igualmente a la paz. Además, se evidencia un sistema de comunicación e información para relacionarse con los *stakeholders* y una clara postura del aporte del Departamento de Comunicación al logro de los objetivos corporativos. El análisis cruzado de lo declarado por la compañía, frente a la percepción de los directivos, resulta clave para describir la relación comunicación y sostenibilidad, en pro de identificar el aporte de grandes organizaciones al desarrollo integral, a los propósitos de paz del país, para evitar a la vez la formación de nuevos focos de violencia.

Embodying Transformative Futures: The Relationship of Agency and Anticipatory Competence.

For universities engaged in sustainability research, there exist two major streams of inquiry, the descriptive/analysis stream where sustainability problems are explored, and the transformative stream where the aim is to develop "evidence-supported solution options to solve these problems" (Wiek & Lang, 2016 pp31). Anticipatory competence is described as the ability to craft, evaluate and analyse rich images of the future and is seen as a key component in educating for sustainability change agents (Wiek *et al.* 2011; de Haan, 2010). However, many see it as a more descriptive than solutions-oriented component in comparison to other competencies (ASU report, 2017). Indeed many graduates may fail to see the practicality in post-third level use of formal future studies methodologies, e.g. backcasting (Robinson, 2003) or scenario development (Schwartz, 1996).

As universities are at the heart of the transition to a more sustainable society (Fadeeva and Mochizuki, 2010; Wals *et al.*, 2016) and indeed many can be seen as microcosms of a more sustainable society, formally and informally educating students through engagement and a "pedagogy of place" (Sterling, 2001; Tilbury, 2016), this researcher explores the role that informal learning has in the development of anticipatory competence in the university setting (Barth *et al.* 2007). Specifically this work will cover the engagement of student members of sustainability initiatives in the University of Vechta and through focus groups, seek to understand the role that active student engagement with the future can have in higher education.

A Transnational View on Domestic Workers' Organising Against Violence

In correspondence to the ILO Convention 189 (2011) coming into force, scholars and activists have increasingly turned their attention to domestic workers' groups, investigating the original forms of organising that this traditionally 'unorganisable' workforce managed to develop in the last decades.

The transnational domestic workers' movement arguably represents a unique case to study the ways in which social change in the field of gender violence may be produced intersectionally. Evidence suggests that, while domestic workers globally articulate their claims in the labour rights field, their struggles keep at the center the issue of violence - symbolic and material - that they are subjected to, at work and outside, also on the basis of their intersectional subordinated social positions - as migrant women, ethnicised women, or women of lower classes and caste. Labour organising in this case appears to go hand in hand with self-help work around self-image and identity, and domestic workers mobilise deep emotions related to stigmatisation, shame and silence.

The present paper addresses these questions by taking a comparative look at domestic workers' organising in the nine countries involved in the DomEqual project: India, Philippines, Taiwan, Italy, Germany, Spain, Ecuador, Colombia, Brazil. We focus on how transnational relations were and still are played out in these movements around the ILO C189, and how they are relevant to their current involvement in the ILO roadmap towards a Convention on Violence and Harassment at Work. We try to assess the encounters, tensions and collaborations taking place at the regional and international levels on issues of violence against domestic workers, both among domestic workers' groups and between these groups and other governmental and non-governmental organisations working in the same field or in close-by fields, namely in relation to race and caste, migration and trafficking, women's rights, labour rights, and disability.

Social Movement in a Changing Sociopolitical Matrix: Chilean Case in the Latin American Context

Taking ground on the concept of socio political matrix, that is the relations between State, representation system, socio economic basis and cultural orientations all them mediated by political regime, we will examine the role that social movements in Chile, specially student movement, have played in the transformation of the post dictatorship matrix. For this we will describe the classic matrix of movement and the role that movements played in it, describing what we call the imbrication between social movement and politics. After a long period of incomplete democracy, Chile is combining this incomplete democracy with the emergence of a democratic situation, where social processes take predominance over the institutional aspects of regime, which can be called continuous democracy, and this led to the rupture of the imbrication between politics and social actors and movements. In 2011-2012 the social movements took the classical role of political parties defining a new socio historical project that was to end with the post authoritarian society and the political process that followed were oriented in that sense during the period of Bachelet government, but after five years of the movements it seems that this change has been stopped. The paper will examine how the components of socio political matrix has evolved and how the relations between social movements and politics are redefining themselves. And this will be made in comparison with the general trends of a possible Latin American new socio political matrix and the characteristic of what has been called the recent waves of social movements in the world.

Governing Healthcare Safety at the Margins: The Challenges of Good Governance in the Care Home 'Hinterlands'

Safety is a priority concern for all health and social care systems. To date, research and policy has tended to focus on the governance of safety within primary and secondary care settings, with corresponding calls for the implementation of safety management systems more commonly found in other high-risk industries. There is growing recognition, however, that patient safety is equally, if not more, at risk in more marginal care settings where notions of 'good governance' seem especially problematic. In many developed nations, care homes have become a major site for patient (elderly) care, but where funders, regulatory and public scrutiny is often lacking. Care homes typically have low status within the wider care system, employing predominately low-skilled staff, and with limited regulatory oversight. Yet, they care for some of the most vulnerable people with complex care needs, and where emerging evidence suggests safety issues are significant. Drawing on qualitative research within the UK care home sector, the paper explores the challenges of good governance in care homes, mapping the regulatory environment for care homes, and exploring staff and manager perceptions of patients safety and its day-to-day management. Taking both a macro and micro perspective, the paper reflects on the limited reach for regulatory oversight of care homes, rendering care homes a type of hinterland for variable, and often poor practice.

A Critique on Progress: The Sociology of Gay Men's Mental Health in a Period of Social Acceptance and Biomedical Advancement

Research has long indicated that gay men face an excessive burden of mental illness, including anxiety, depression, body dysmorphia, sexual compulsivity, suicidal ideation and addiction. In this paper, we critically review and expand on two theories explaining this health disparity. Minority stress (Meyer, 1995) argues that poor mental health among gay men results from experiencing homophobia. Syndemics (Stall, Friedman, and Catania, 2008) positions mental illness along with HIV and poly-drug use as one of several mutually reinforcing epidemics. However, recently we have witnessed significant progress in the mainstream acceptance of gay men and with biomedical advancements in HIV prevention and care. So are gay men any healthier? Drawing on original findings from several gay men's qualitative health projects in Canada, we argue that (1) gay men continue to face a substantial mental health burden; (2) that we need to be critical of discourses of 'progress' in this story; and (3) research must better account for the socio-structural stressors gay men face. Progress discourses of overcoming homophobia and HIV—propagated in research and the media—can minimize the harms gay men continue to experience (e.g. HIV stigma, treatment side-effects and accessibility, violence, intimacy struggles). Some progress can produce new social opportunities that increase stress, as gay men are expected to easily advance in a 'tolerant' society (e.g. marriage) and manage/prevent HIV 'successfully.' Research based on the above two theories has focused heavily on quantitatively examining sexual risk behaviour at the detriment of critically investigating neoliberal socio-structural features corrosive to mental well-being, like precarious work, debt, unaffordable housing and limited social and mental health services. We need to understand how gay men can heal from the psychosocial traumas resulting from homophobia and HIV stigma, in a society determined by socio-economic uncertainty, individualistic models of risk management and 'self-care', and inaccessible health services.

Animating the Sexuality-Health-Technology Nexus

Our project investigates hook-up apps targeting gay men and men who have sex with men (GM) as important socio-cultural contexts for researching how new biomedical HIV prevention technologies – their imperatives, messaging and uptake – resonate in GM's virtual, cultural, erotic and systemically mediated worlds. These biomedical and social/sexual technologies act on GM's bodies—in the feeling of excitement when cruising on an app, as a pill swallowed, as a condom on the skin, and as sexual acts that confound boundaries between virtual and non-virtual worlds. They are also aesthetic and visual—app users trade pictures, style their bodies, and view campaigns for PrEP's little blue pill. The visual research methodology of body mapping is, at first glance, a promising tool to trace the difficult to articulate, fluid connections between a participant's personal, bodily and emotional experiences and the biopolitical sphere they navigate. And yet conventional approaches to body mapping assume the stability of a subject's bodily experience – an ontological understanding that fails to capture the multi-temporal, multi-spatial nature of GM's technologically mediated social-sexual lives. To address these limitations, we subjected body mapping to a theoretical intervention and then piloted the instrument. Drawing explicitly from emerging debates in trans-feminist, new materialism and queer of colour scholarship, our new methodology accounts for how a subject's embodied sense of self, risk, and well-being, manifests and shifts over time, in our engagements with others, in relationship to biomedical technologies, and through our fantasies and insecurities. In this presentation, we detail the building of our theoretical scaffold, and the ways in which our newly devised body mapping protocol allows for new thinking on how relational assemblages of inanimate biomedical and social-media technologies, experiencing subjects/bodies and the mediating influences of pharmacological and pornographic industries are productive of new worlds of sexual intimacies and health risks.

How Does Montreal 'fabricate' Involved Youth?

The social involvement of young Quebecers differs from that of other Canadian provinces in its different modes of social participation. It is not surprising that

Montreal is the first city in the South to host the World Social Forum since its creation in 2001 in Porto Alegre. We note that several spontaneous initiatives are emerging: collective gardens, public benches to promote solidarity; artistic expressions of citizenship (Ferraris, 2014a, b, c, Folie-Boivin, 2014). Quebec society has 'fabricated', as Gagné and Neveu (2009) put it, a generation of young people committed to certain common goods (Katz 2015) and who say they are paradoxically political orphans (St-Pierre Plamondon 2014). How has this social and political citizenship been fabricated? Our experience as observers during Citizen summer school of the Institut du Nouveau Monde (New world institute) a non-profit organization based in Montreal has shown that young people attend many types of organizations through their social participation paths and that they allow them to engage in different process of political subjectivation. In this paper, we will analyze the narratives of young people who have attended a citizenship school. We will analyze the life events and organizations that influence their social participation trajectory on the one hand, and analyze how this trajectory articulates or not with a process of political subjectivation and social change.

GAUPP, LISA* (*Leuphana University Lueneburg*)

„It's Irie!“ a Post-Postcolonial Approach to Diversity at „World Music“ Festivals

The planned paper analyzes how diversity is being standardized through conventions in music. It takes a look at how different notions of diversity are curated at renowned international music festivals while analyzing the respective meanings of diversity. The focus will be set on so called 'world music' or 'non-European performances' and on the figure of the 'festival curator' understood both as a cultural leader as well as a gatekeeper. Here, the performances including their socio-cultural settings are often assigned with certain meanings, and the players of these global art worlds are often labeled as possessing certain stable (ethnic) identities. It will be shown through which othering mechanism both individuals and aesthetic expressions are constructed as belonging to a certain place. Likewise, it will be discussed how diversity changes its meaning and how alternative spaces develop when these ascriptions are being challenged, contested, deconstructed or rewritten through the breaking of established sociocultural conventions.

Curatorial strategies are seen as a discursive social practice, which (de)construct identities, symbols and relations, or, put differently, the 'curatorial' is understood as a complex field of different intermingling practices, persons and institutions where dominant ideologies, terminologies, habits etc. are (re)produced, but where the curator also embodies a special role when it comes to defining (social) conventions in the respective field: Festival curators, in directing, administering and mediating music performances, work at the interface of the production, mediation and consumption of these aesthetic expressions. In doing so, they contribute to how the terms and conditions for diversity are set.

Therefore, the paper deals with how conventions in music develop and takes a look at the interdependencies between diversity, music, space and place, thereby combining performance, cultural and postcolonial studies with sociological and ethnomusicological theoretical and methodological approaches.

Development and Disparities in Nepal: Deconstructing the Myth of Equality

Development has become an important global agenda for all countries in the world. It is said that development aims to create equality among citizens and societies in the country as well as in the world. In this context, this paper raises a question whether this modern development process ongoing all over the world including Nepal really creating equality among people and societies or not. Based on large scale survey data available in Nepal this paper examines what the modern development has actually done during the last 5-6 decade period of modern development in Nepal. While doing so this paper identifies 70 different indicators of modern development on education, health, employment, transportation, communication and so on and argues that the modern development has created at least 70 different forms of inequalities among Nepali people rather than equality. This paper further argues that this modern development has not only transforming traditional Nepali society into modern society but also continuously creating multiple forms of inequalities stratifying people into different social categories. We can easily observe these new forms of inequalities, such as illiterate-literate, poor-non-poor, skilled-unskilled, rural-urban, and so on for instance. Moreover, new forms of inequalities will be also be invited in future as well. It can be observed together with the efforts put on achieving sustainable development goals. Within the next 10-15 years, there will be at least 100 different forms of inequalities in Nepali society. This is how development has constructed new social categories in Nepali society. Finally, the paper highlights the fact that the global agenda of modern development process does not only create equality among people and societies but also creates disparities. Therefore, the global

development agenda as creating equality among people is just a myth rather than reality.

Broadcasting of Ideology By Means of Music: The Case of "Working Class Culture" in the Early Soviet Times

This historical-theoretical research is based on the method of the comparative analysis of the texts, forming a discourse about music in the USSR in 1920s. The main purposes of the new sociology of music as an academic and ideological project were the designing of the explanatory models providing cultural legitimization of working class as the main agent of social action, as well as defending the necessity of art forms updating, which had to contribute into the construction of new types of society and personality. At the same time, musical space in the 1920th was riven by the different interpretation of the realization methods of these goals. Besides the search of the academic musicology and dominated musical forms democratization opportunities, the well-known avant-garde experiments (conducted by A.Abraamov, L.Termen, the composers of the "Association for Contemporary Music") laid the foundation of innovative styles and acoustic practices.

There have been defined the conceptual bases of the early Soviet sociology of music such as social and economic determinism and naturalism; attention to the role of music in social dynamics; counteraction to "formalism" and cultural autonomy; aspiration to paradigmatic and disciplinary synthesis; the research of music functioning in the context of everyday life; strengthening of social integration as mission of creative and scientific activity. It has been established that music was given the aim to structure daily occurrence, motivate labor activity, cultural education and support an aspiration to solidary, collective action on the basis of emotional acceptance of ideological postulates of that time. The research attention has been focused also on transformation of the crucial points of the main ideologists of "proletarian culture" from the utopian romanticism directed to the achievement of class solidarity towards the total distortion of basic humanistic ideals in favor of fixing of the developed hierarchies of power.

MALENKOV, VYACHESLAV (*Tyumen State University*)

"the Generation of Stability": Russia's Vectors of Development in the Youth' Consciousness.

The results of the research represent the perception of an image of Russia and possible directions of its development in the consciousness of the modern youth. The concept "image of the country" have been explicated in the following aspects: *spatial* (a geographical position, extent, etc.); *symbolical* (the official and informal, historically developed and designed symbols); *personal* (historic figures, the outstanding people, acting politicians); *temporal* (an image of the past and future, social memory); *civilizational* and *geopolitical* (ideas about a country place in the world, symbolical identity within the limits of system of co-ordinates «the East - the West»).

The empirical base is represented by the mass poll of Tyumen citizens at the age of 17 - 77 years old. The volume of representative samples constituted 1600 respondents, then it was divided in four segments on the generational approach basis: Soviet generation, late-Soviet generation, post-Soviet transitive generation and "stability generation".

The results of the research demonstrate the growth of traditionalist tendency moods in all allocated groups. It is paradoxical that some basic parameters «the stability generation» (covers the youth of 1994-2000 year of birth) show more traditionalism in comparison with the senior generational groups. On the contrary, the most senior Soviet generation respondents have shown more modernist position than young respondents on a number of the key questions.

The youngest generation civil political socialization period was passing in "stable" Russia when the key steps to the consolidation of the split Russian society were undertaken. The system of patriotic education at schools and youth organizations was renewed. Conservative values were basic; great support was given to the military-patriotic education of children and youth. Nevertheless, despite the broad support of the modern course of Russia, a considerable protest potential among the youth has been fixed.

Security and Empowerment of Indian Women: A Study on the Role of Protection of Women from Domestic Violence ACT 2005

In Indian society women occupy a vital position and also a vulnerable place. Today they are the most vulnerable section as far as their safety and security are concerned. Although the constitution of the country has the largest number of laws ostensibly for the benefit of Indian women but their conditions is still far from satisfactory. Protection of Women from Domestic Violence Act 2005 was passed by the parliament and gives special protection to women- being aware of their work position. This Act helps in protecting women and also provides safety to economically, physically mentally challenged women. There are many organizations which conducted welfare awareness and help program campaigns to stop domestic violence. This research paper focuses on the role of Domestic Violence Act (2005) and its social implications. The study has been conducted in Madhya Pradesh state of India. This paper is based upon descriptive design of research, besides interpretation of data. The research objectives on this study were as follow: 1) To know the Domestic Violence Act as understood by Indian women; 2) To find out the role of this act in protection, security and empowerment of Indian women; 3) To find out its reflections on Indian women's status, social change and justice. The findings of the study suggest that Domestic Violence Act (2005) has been found to be more than effective for the protection of the rights of Indian women guaranteed under the Indian constitution.

Women in Profession: Case Studies of Doctors in Central India

The problems and challenges of the women doctors in India have been discussed in an historical perspective. The first Indian women 'Anandibai Joshi' graduated in 1886, 131 years earlier. Currently, Indian women started to outnumber men in admissions to medical colleges and the trend still continues. For the last five years India has produced 4,500 more female doctors than male ones. This research paper is based upon three case-studies conducted in the city of Bhopal in India. There is still an acute shortage of female doctors in Indian society. The very problems and challenges faced by women doctors in government and non-government hospitals & clinics have been identified and discussed in this paper. Additionally, the problems arising out of the dual role between professional life and household work and its mechanisms for resolution have also been discussed in this paper. Some of the important findings are discussed towards the end of the research paper like: The role conflict emerges out for female doctors at both the levels-higher and lower ;(ii) the professional life consumes a lot of available time with them ;(iii) specially at the time of night-duties they have the fear of sexual-harassment, violence and (iv) women doctors and their services are appreciated by the society in general and have acquired a higher status.

Seniors for Democracy - Social Activation of Seniors in the Prospect of Ukraine.

Demographic studies confirm the aging of the Ukrainian society. The elderly aged "65+" are in the Ukraine 21.4% (according to НАСЕЛЕННЯ УКРАЇНИ: Імперативи демографічного старіння, Київ, 2014) and in 2025 is expected rate of 25%. In Ukraine, seniors are a social group perceived as passive, weak physically, economically unattractive, unskilled, which is a burden for the public systems of social welfare. According to the Global Age Watch Index 2013 Ukraine took the 86 place out of 91 countries in terms of quality of life of seniors. These data justify the need for action to improve cooperation with the administration and enforcement of the civil rights of seniors. Social activity in Ukraine is low (83.6% of Ukrainians do not belong to any NGO- "Ukraine Analysen" No. 114, 03.12.2013). An important task is therefore to enable seniors to build a democratic society and their participation in the creation of public programs for the elderly.

Worth to discuss seem to be an initiative taken in cooperation of polish and ukraine partners. The project titled "*Seniors for democracy - activation, participation, volunteering*" was implemented in 2016. and funded under *The RITA - Region in Transition Program* (an initiative of the Polish-American Freedom Foundation). Its main objective was to strengthen public and social participation of seniors in Ukraine. This was achieved by activate seniors involved in the Universities of the Third Age (UTA) in 6 Ukrainian cities (Lviv, Lutsk, Ivano-Frankivsk, Uzhgorod, Chernivtsi and Stryj). In this project UTAs were partners for social dialogue with local authorities on the issues of the local community (including the matter of health and social care policies for seniors). The long-term goal was the establishment of Councils of Elders and improve the quality of life of Ukrainian senior in six local communities.

Streetcorner Politics: Urban Public Life, Civility and Everyday Citizenship (France)

Streetcorner politics : urban public life, civility and everyday citizenship

This paper will draw on an ethnographic research to shed light on how everyday urban interactions raise normative questions about what it means to be a good citizen: civility "rules" and democratic principles in the making. Good behaviour, as we'll see, never only means complying with the rules. Civility is also an activity of defining and criticizing the way things happen (gender interactions, for example). So we'll approach ordinary citizenship through these everyday trials that civil interactions provoke. What is at stake is to define "how to be good", how to do well, when facing a homeless, when being bullied, etc, and more generally, what can be said, done, argued, requested, with and among others.

Considering democracy as a way of life (Dewey, Lefort) means studying citizenship as a daily experience of belonging to a political community, being attentive to the way individuals practically define what is the perimeter of their responsibility, what can be done and said. From forms of mutual perceptions (categorizing processes) to forms of interventions (the ways people commit into situations to help, avoid, educate, quarrel, and so on), everyday urban interactions allow to study the way (urban) public life participates in the making of everyone's political culture and opinions regarding the world we live in.

Data : ethnographic descriptions from a 7 year long research lead in France (Paris & a large city in the south) on public life, observing interactions in public settings, streets, cafés, gardens, public transportation, etc, and producing hundreds of little scenes of interactions. Plus, more than a hundred interviews and narratives about the experience of urban everyday life and the importance those fleeting (and apparently superficial and neglectable) relations actually have in people's experience of the society they live in.

GAYTAN ALCALA, FELIPE* (*UNIVERSIDAD LA SALLE MEXICO*)

Religious Populism in Latin America. the New Face of Conservatism Against the Laicite and Sexual and Reproductive Rights.

The concept of populism in Latin America has moved through different forms and political experiences. From the charismatic leadership of the XX century who assumed the tutelage of the people against the oligarchy (Perón in Argentina and Velasco in Peru) to the populist discourses of the XXI century that strategically used the defense of the homeland against imperialism and the Latin American identity to the globalization (Chavez in Venezuela, Correa in Ecuador and Kirchner in Argentina).

But there is a type of populism that escapes the traditional political canons, it is the religious populism that has grown in Latin America to combat and contain the laicism of the National State and the advancement of sexual and reproductive rights. Such religious populism is driven by the Catholic Church and evangelical organizations to counteract what they call "moral relativism" which, according to them, come from foreign interests that try to destroy the people chosen by God.

Religious populism appeals to three discursive strategies. First, the people of God are defenseless before foreign ideologies such as the gender ideology that attempt to destroy the primary concepts of society as the family and the defense of life. Second, churches must be guardians of the elected people to counteract the moral relativism of sexual and reproductive rights. Third, laicism is a threat because promoting the rights of citizens generates an individualism that will destroy the collective identity of the Christian and Catholic nation.

This work shows how religious populism has been shaped as a discourse and leadership of the ethical and moral against the politics of diversity and how the individual freedom is managed.

GAZSO, AMBER* (*York University*)

When Addiction Splices Poverty in Canada: The Elusiveness of "Work-Family Balance?" or, an Opportunity for Re-Visiting the Concept

Changing labour market opportunities and social policy supports mean that many Canadians, no matter their family composition, struggle with juggling time spent in employment and caregiving. In this paper, I adopt a feminist political economy perspective and a qualitative method to focus on those whose work-family dynamics are perhaps least understood: individuals living with low income and addiction. Through in-depth interviews with 27 participants (15 women, 12 men), many of whom are parents, I explore whether they experience the juggling of paid and unpaid work and in what ways. In doing so, I additionally unpack the ideologies and assumptions that infuse understandings of work-family balance in academic, political, and policy discourse.

My analysis reveals that when addiction intersects with poverty, participants' practices often fall outside the hegemonic models and norms of working and family life associated conventional family relations (i.e. nuclear families), sobriety, and consistent connections with the labour market. And yet, participants' experiences of juggling paid and unpaid work vary greatly depending on marital and family status, employability, and whether they are actively using substances (i.e. alcohol or drugs). For example, some single participants actively use substances and engage in under-the-table paid work but this income supports caregiving relations. Mothers in recovery with children in the care of guardians (e.g. extended family, child welfare services) may have their employability efforts and caregiving regulated by social welfare institutions but this does not mean that attempts at balance are not sought.

Thus, despite challenges posed by economic and social marginalization, to argue that attempts to achieve work-family balance are elusive for individuals living with low income and addiction is an opaque and dubious conclusion. Ultimately, the findings suggest a need to move past conventional understandings of family and work in order to create inclusive scholarship and policy.

RC19-361.2

GAZSO, AMBER* (*Department of Sociology, York University*)

When Social Assistance Confronts Addiction: A Canadian Case of Competing Discourses of Social Justice and Social Control

Across 'liberal' welfare states, income support restructuring in the late 1990s and early 2000s has been understood to produce punitive, coercive and regulatory welfare-to-work policy and programming. Critique has been levelled against how discourses laden with power such as 'less eligibility' and 'the deserving poor' have fueled this neo-liberal reform and the nullification of individuals' social rights of citizenship and the deepening of their poverty as a result.

In this paper, I assume this material and discursive historical context but focus on a Canadian case, the social assistance policy of Ontario Works (OW). My specific objective is to ask whether the social control mechanisms oft associated with welfare-to-work are relevant at this contemporary moment for OW recipients living with addiction to drugs or alcohol. Through a critical discourse analysis of policy restructuring from 2009 to 2017 and in-depth interviews with OW caseworkers and recipients, I explore the ideas and discourses that inform how persons living with addiction are conceptualized as eligible and then experience income support.

Based on my analysis, I arrive at the troubling conclusion that discourses of social justice and social control inform the relationship between social assistance and addiction in Ontario. For example, persons living with addiction seem to be bracketed from the primary mandate of OW, to activate persons' labour market potential; a "work first" discourse seems to have little utility for this caseload, at least since the province's passing of the *Poverty Reduction Act* in 2009. And yet, shaping caseworker and recipient experiences are other discourses productive of domination, evident in the form of recipients' self-discipline and surveillance. Recipients overwhelming construct a subject position of "the recovering addict" in order to maintain income support. The implications of this conclusion are further discussed, especially in view of any future change in provincial government.

Resilient or Vulnerable Livelihoods? Assessing Urban Social Vulnerability from a Network Perspective

Over the last three decades, urban growth has been exponential in China: its urbanization rate has soared from 19.39% in 1980 to 57.35% in 2016. Such rapid urbanization has not only promoted economic development, but also led urban residents to be more vulnerable. Crowded cities have incurred a heavy price at home and increasingly inequalities in the physical or social infrastructures, such as housing quality, accessible green spaces and medical services. Meanwhile, accelerating urbanization has exposed a host of environmental and fragile problems of cities. This situation would be exacerbated by climate change. As we known, China's urbanization is characterized by concentrating a large share of population and wealth along the coast, especially in three large urban agglomerations: Yangtze River Delta (YRD), Capital Region (CR) and Pearl River Delta (PRD). Whereas, these areas are extremely vulnerable to climate change due to their flat and low landscape. In a word, China's cities have been threatened by multiple stresses from physical and social inequalities, environmental problems and climate change. In order to build resilient livelihoods, it's imperative to develop the ability of assessing urban social vulnerability. Therefore, this paper explored a methodology of social vulnerability assessment for urban agglomeration from a network perspective. Yangtze River Delta (YRD), Capital Region (CR) and Pearl River Delta (PRD) were used as case studies. Combined with attribute data collected from the statistical Yearbooks and relational data retrieved from the

Baidu search index, an integrated social vulnerability index was evaluated for urban agglomeration. The social vulnerability profiles of urban agglomerations were displayed through GIS mapping. Based on the results, a conclusion was drawn that the network connectivity had an influence on social vulnerability of urban agglomeration. Hence, promoting the connectivity among cities can help urban agglomeration buffer risks and plan a sustainable future.

GULOWSKI, REBECCA (*University of Augsburg*)

Doing Memory of Violent Experience, Performative Approach

As studies on conflict and war societies show, the way of dealing with violent experiences and trauma depends on the (in-)stability of social order and objective circumstances of living, besides one's own psychological resilience. Especially with regard to violence and sexual violence, we argue that the institutions of conflict transformation a society provides ("help-system") for dealing with these kind of issues, e.g. concrete assistance for the victims and persons who are affected, the police, social workers or the law, reveal that violent experiences and traumas have more than their individual dimension; rather they are tied to social and political conditions. Based on the analysis of the narrations of victims, perpetrators and representatives of institutions, this paper wants to shed light on the way how the relationship between institutions in the German "help-system" structures the interwoven dimensions of our experience and the doing memory processes of violent experiences. We particularly focus on the narrations of offenders and how they memorize and legitimate their actions and experiences. Methodologically, we want to discuss the approach of the "embodied knowledge" understood as the link between experience, social metaphors, narratives and political institutions and apply embodied methods (e.g. active listening, theatre and collage technique) of research on (sexualized) violence, in order to demonstrate that the "doing memory process" of violent experiences oscillates between speechlessness and a language-dependency and that the societal and political discourses are responsible for the self-positioning and integration of violent experience in the own biography. We want to give first answers to the question how an institutional setting should be arranged to offer an open space for people who have experienced violence (as victims and/or offenders) and to provide an opportunity to process their memories.

GEHRINGER, NATALIE* (*University of Augsburg*)
GULOWSKI, REBECCA (*University of Augsburg*)

Making the Invisible Visible. the Intersectional Discrimination in Law Governing Sexual Offenses

By analyzing the discourses of sexualized discrimination und sexualized violence, we show how the racist, sexist and classist notions of sexuality and violence in the German law lead to a highly moralized way of dealing with such issues and how this maintains female victimization and male offending processes. Prominent cases (e.g. Brock Turner) demonstrate that the US law treats white, male athletes differently than PoC, relating to the degree of penalty. Women instead who suffered sexualized violence are often confronted with a treatment that blames or shames them as doing something wrong by police officers, attorneys or judges. Even this context is already well researched, particularly in the USA ("rape culture"), we expanded our focus by analyzing interviews of male and female offenders and victims of sexualized violence regarding the question of how they legitimate and integrate their own violent actions and experiences in Germany. In these interviews we identified the impact of discursive narratives (e.g. victim blaming, hegemonic/toxic masculinity) in order to understand the pretended invisible forces which structure the pretended blind jurisprudence and jurisdiction. For example, in 1997, the German law included sexual violence within marriage with the term "marital rape" as statutory offence. Also gendered agents e.g. "male offender" and "female victim" were replaced by gender-neutral ones. Before this reformation, male victims of sexual assaults and victims of marital rape did not exist in law and thus, these persons were made invisible and even their existence were questioned. The same applies in the attempt to understand the complexity of cases of domestic and family violence, which often remained invisible as a private affair.

GEMAR, ADAM* (*Durham University*)

Sport As Culture: Sports Participation and Styles of Cultural Consumption in Canada

Despite the prevalence of sport in contemporary societies, academics know little about how sports participation fits into broader cultural lifestyles. We know much more about other cultural domains, such as music. While Bourdieu's social theories are most frequently applied to sports participation, other theories of

sports participation, such as omnivorism, remain under researched (Widdow and Cutts, 2014). However, even fewer explorations seek to place sports participation in the wider cultural context of consumption. This study examines cultural consumption and sports participation in Canada to further understand how patterns of sports consumption fit into these broader cultural lifestyles. By investigating how each of Canada's five most popular team and individual sports are consumed, it forms conclusions about the cultural lifestyles of these consumers, by which prevailing theories of cultural consumption can be assessed with regard to sport. Through a Latent Class Analysis (LCA) of the General Social Survey (GSS) of Canada, and accompanying regression modelling, this paper finds that intense cultural omnivores and pop culture consumers are by far the most likely participants in the five team sports (baseball, basketball, ice hockey, soccer, volleyball). The five individual sports are much more widely dispersed along the spectrum of cultural engagement. However, four of the individual sports (tennis, downhill skiing, cycling, swimming) map most strongly onto intense omnivorism, while golf maps onto more high-brow consuming patterns of cultural behaviour.

Politics of Social Assistance in South Africa: Containing Racial Political Unrest

In emerging market economies, social assistance programs have considerably increased over the past two decades and South Africa is one of good examples. In the existing literature, social policy expansion in South Africa has mostly been explained by structuralist theories that put emphasis on socio-economic and demographic factors. Nevertheless, this dominant approach to explain the expansion of social assistance programs underestimates political factors, especially that of containing racial unrest. Based on Fox Piven and Cloward's theory of social assistance as a counter insurgency strategy, this article shows that social assistance has a similar function in South Africa of containing racial political unrest. Through a cross-sectional dataset obtained by a random sample survey conducted in South Africa, this article shows that race is a statistically significant determinant in access to social programs, after controlled for socio-economic, political, and demographic variables. This paper contributes to the welfare literature by improving our understanding about the political determinants of welfare expansion experienced in emerging market economies.

Knowledge and Attitudes about Breast Cancer Among Women: A Wake-up Call in Nigeria

Preventable deaths resulting from the scourge of breast cancer has become alarming and worrisome in many societies in developing countries including Nigeria. Of much concern is the fact that breast cancer has continued to claim the precious lives of young, middle aged, old, educated and non-educated women irrespective of their religion, socio-economic background and socio-demographic characteristics. This study attempts to ascertain the knowledge and attitudes of women to breast cancer in South-western Nigeria. The study adopts both primary and secondary data and relevant sociological theories to examine the level of knowledge and attitudes of women towards breast cancer with the view of suggesting probable solutions and recommendations for policy.

From Defeats to Polarization: The Dynamics of Right-Wing Chauvinism in Germany

From a historical-materialist perspective, the recent upsurge of right-wing populists across the globe is often explained as a reactionary, even proto-fascist counter-movement to the multiple crises of global capitalism, among them crises of accumulation, wage labour, democracy, care, food, ecology and climate. Critical analysis, however, must move beyond such broad assertions. To do this, the paper will examine the dynamics of chauvinist forces in Germany in the 2010s. Its main argument is that the growing visibility of right-wing forces – densified in the electoral successes of the new party *Alternative for Germany* (AfD) – is the result of a dynamic *polarization* between different social forces. On a general level, empirical research by Michael Vester et al. into ›class cultures‹ in Germany shows that right-wing actors are rooted within two distinct ideological (class) factions, both mainly petty-bourgeois with some support in the under- and upper-classes: a ›resigned authority-dependent camp‹ and a ›rebellious-authoritarian‹ or ›frustrated-aggressive camp‹. The successful mobilization of these two milieus by the AfD

and others can be interpreted as coming out of a position of defence and relative weakness, as reaction to a series of defeats, among them (1) the assertion of a ›post-migrant society‹ in Germany, giving greater recognition and representation to People of Colour; (2) an uneasy migration policy alliance between ›progressive neoliberals‹ and the liberal left; and (3) the partial opening of the German border for refugees in 2015/2016. However, for now the proto-fascist potential of right-wing actors in Germany is checked by the strength of liberal and leftist forces. The paper closes with a discussion of three counter-strategies, namely anti-racist activism and practical anti-fascism, a ›new class politics‹, centred around common interest of different sections of the working class, and, most important, the building of real progressive alternatives to the neoliberal dogma of ›austerity forever‹.

Criticising the Neoliberal within Us. Beyond the Economic-Utilitarian Perspective in Social Movement Studies and the Subordination of Sociology to Economics

The study of collective action and social movements have been one of the area of strongest criticism against neoliberalism. However, it is often overlooked how this area of analysis has ended unwittingly absorbing many typical tenets of neoliberalism, starting from an economicist and utilitarian view of people's motivation to participate in protest. An example is the strong influence acquired by Mancur Olson theory of collective action (1965), which posits that people participate in protest movements because of "selective incentives" which justify what otherwise would appear as altruistic and collectivistic behaviour. A similar tendency is seen in the language of the enterprise introduced by resource mobilisation theorists authors, describing social movements as an industry of sort and their organisers as "social movement entrepreneurs". In this context, social movements have come to be understood as companies of sort, thus profoundly misunderstanding the specificity of social movements vis-a-vis the economic field. Counter to this distortion of social movements, and the subordination of sociology to economic thinking, it will be argued that social movement studies need to go beyond this neoliberal worldview, and the idea of individuals as egotistical actors who are participating in protest only to satisfy individual motives. Instead, what current movements demonstrate is the primacy of collective motivations, the fact that people participate in protest movements, because of their commitment to collective aspirations, and the sense of identity, belonging and recognition that springs from them. The paper will conclude looking at some of the implications of this proposed shift in the way to approach social movements, and the need to use a different terminology and frame of analysis in the study of social movements.

GERBAUDO, PAOLO* (*King's College London*)

Post-2008 Movements and the Biographic Dissonance of Millennials

The movements that have emerged in the aftermath of the 2008 have been strongly supported by the millennial generation, those born between 1982 and 2003. This is a generation whose character has been widely debated. Until few years ago, it was deemed to be a politically apathetic generation, a "selfie generation" or a "me me me generation" far more concerned with celebrity news than with politics. Furthermore, they have often been accused of being politically apathetic and lacking in social empathy. Yet, millennials have surprised analysts by taking the lead in a number of recent political mobilisations, from protest movements, as the Occupy protests of 2011, and have demonstrated to be highly critical of the capitalist system, at least far more than previous generation. Drawing from my long-standing research on protest movements in the post-2008 era, this paper will explore how the new movements, with their popular and majoritarian appeal, and their pragmatism reflect the experience and dilemmas of the millennial generation. It will argue that this wave of protest movements articulate the sense of betrayal felt by many young people, who pertain to the most educated and well-travelled education in history but also one that is faced by serious economic difficulties. Furthermore, it will argue that the apparently post-ideological character of some of these movements, or better their refusal of 20th century ideologies, stem from their perception that we live in a situation of social emergency in which it is necessary to identify viable and short-term solution to impending economic problems. The paper will conclude exploring some of the long-term implications of this situation for social movements and contemporary politics.

SCHUELL, ELMAR* (*Salzburg University of Applied Sciences*)

Standards and Quality Criteria for Futures Research

While quality criteria are well established and discussed in quantitative and qualitative empirical social research (e.g. Aeara 2006, Flick 2011, Bortz 2015, Mayring 2016), it remains an open question, how quality in scientific futures research could be assessed. This contribution presents a set of standards and quality criteria in futures research, developed and published by German professionals from academia and practice (Gerhold et al. 2015). The quality standards are organized in three groups that correspond with three principles of quality in futures research: First, there are standards of futures adequacy that focus on the intricacies that originate from dealing with future developments, i.e. developments and events that are not (yet) a fact. Second, there are standards that are derived from the scientific nature of futures research and which mark a fundamental difference to other non-scientific ways of dealing with future-related questions. Third, there are practice-oriented standards of effectiveness that ensure that futures studies serve the purposes they were launched for in the first place.

Inspired by the Standards for Educational Evaluation (Sanders 2006) all of the proposed quality standards are described according to a common structure consisting of an abstract, an overview text, specific guidelines, common mistakes, and a case example that illustrates the consequences of applying or ignoring the standards. Within the contribution, we will present the rationale of the general approach and describe how the standards could be used in research as well as in teaching futures studies by drawing on the authors' experiences in teaching in the master's degree programme on futures studies at Freie Universität Berlin.

GERLICH, REGINA* (Careum Foundation - Careum Research)

Life Satisfaction and Its Changing Sub-Dimensions of Family Caregivers over Time

Life satisfaction is made up of different sub-dimensions. But how does it change when an incisive life event occurs which demonstrates how relative the importance of some things in life is? What happens to the subjective weighting of sub-dimensions when transitioning into the caregiver role? How do these sub-dimensions develop over the time of caregiving?

This study shows that the individual weighting of sub-dimensions such as satisfaction with family, health, income, and even home, will change as soon as one becomes a family caregiver.

The analyses are based on the data of the German Socio-Economic Panel, which provides annual information about caregiving situations in German households and life satisfaction since 1997. Using panel data allows to capture intra-individual changes by controlling time-constant unobserved heterogeneity. The longitudinal research design also enables to identify re-weighting of sub-dimensions over time.

Therefore, it can be shown that persons who care for their relatives within the same household re-weight their sub-dimensions of life satisfaction after their transition into caregiving. Thus, the importance of satisfaction with the family becomes stronger, the impact of satisfaction with income is significantly reduced.

Education and Privilege in Contemporary Argentina: Between the Demand for a Meritocratic Individuation and the Production of Solidarities

The Argentine educational system is strongly unequal. Since the 1980s, educational research has been documenting the deepening of its fragmented configuration as a result of a myriad of processes among which we highlight: contemporary processes of individuation, the expansion and diversification of goods and services consumed by the different groups social, neoliberal economic policies carried out since the last quarter of the twentieth century in Argentina and educational policies addressed to the sector. This paper presents partial results of a larger research project that intends to understand the relationship between education and privilege in contemporary Argentina. Based on semi-structured interviews with two generations of alumni (graduated in years 81 and 97) from two elite schools in the metropolitan area of Buenos Aires, one public and one private, this presentation addresses the formative experiences of these alumni as a central part of the active work of construction, maintenance and justification of elite positions. The paper describes the strategies and bets of two fragments of the elite to show that this process involves the articulation of two logics: the demand for a meritocratic individuation and the production of multiple forms of solidarity. It then moves on to describing the heterogeneous meanings that both logics assume in each fragment and the ways to resolve their tensions and contradictions in the process of disputing and consolidating an elite position. In addition, by including the generational dimension, it depicts continuities and ruptures in the way these two fragments of the elite have historically understood and disputed the role of education in the production and maintenance of the privileged position.

Videoactivism As an Urban Phenomenon: Rio De Janeiro and Cape Town

"Anywhere, where something is happening in the world, there is a cellphone. Almost everywhere, there is 3G", answered the filmmaker during our interview in Cape Town. Moving images of mass protests, burning cars and barricades or clashes shot through cameras of smartphones and distributed via social media have become part of global media consumption latest since the Arab spring 2010/2011. Since then, news production by citizens through smartphones and social media potentially create viral videos everywhere at any point.

Videoactivism – sometimes also labelled as media-activism (mídiaativismo in Brasil) or citizen-journalism – signifies the appropriation of video production and distribution by activists, together with witness-videos made by amateurs. By re-embedding the practices of videoactivism in their specific urban contexts, my analysis shows how online-activism emanates from particular settings which it simultaneously transforms. Theoretically drawing on Henri Lefebvre's work of "The Production of Space" (1974) and "the Right to the City" (1968) my goal is to describe the mutual infiltrations between the "streets" and the "net".

This research looks at Rio de Janeiro and Cape Town's videoactivism(s) to illustrate current developments in two metropolises from the Global South. Methodologically, I research online-videos through an ethnographic approach, which allows in depth descriptions of the practices of videoactivism and hereby focuses on the perspectives of videoactivists themselves. Based on an excellent field access I generated a rich set of qualitative data. The goal of my presentation at ISA is to show some insights from the resulting thick description of the practices of videoactivism in both cities. With my contribution I wish to offer a detailed account of videoactivism to substantiate politicized discussions about "digital revolutions": Certainly these debates about digital revolutions are of high social and academic relevance, especially in regards to the rapid urban transformations in the Global South.

GEWINNER, IRINA* (Leibniz University of Hanover)

Does Digitalization Contribute to Career Advancement of Early Career Researchers?

While most studies focus on social networks in the private sector of economy, the importance of social resources for academia, in general, and for early career researchers, in particular, is less addressed. In fact, it is postulated that networking and accumulation of social resources can also yield success in scientific career in terms of obtaining professorship or demonstrating academic achievement (Bozeman & Corley 2003, Besio 2011, Heinze 2012, Sagebiel 2014, Gewinner 2017). Yet, the issue of spatial location of social actors in creating academic networks has not enjoyed much attention so far. To this end, this contribution aims at reducing the existing research gap and seeks to explore, to what extent

spatial location of early career academics affects establishment of their scientific networks and, more broadly, contributes to career advancement in academia. Do digital modes of communication and hence, diminishment of spatial distance constraints, make it less difficult to shape scientific networks and benefit from them in terms of career promotions?

This contribution exemplifies publication related networking activities of young German researches at the early career stage. German highly competitive academic labour market incorporates the scarcity of resources and a lack of employment opportunities. For this reason, the qualification phase is becoming increasingly important for a career progression. For junior scientists, this status passage is usually the key to further career advancement and professional success.

This paper extends our knowledge by investigating the effects of different types of PhD, since it takes into account individual doctorate and graduate schools. Drawing upon an interpretative research perspective, the contribution rests upon a series of telephone interviews with early career researchers in social sciences and the humanities. Additionally, it thematises gender related differences in publication strategies of young researchers.

SCHENK, ANETT (*School of Social Work, Lund University*)

Gender, Networks and Career in Academia: Reevaluating Evidence from Germany and Sweden

The issue of gender and career advancement in academia has been raised in a number of European studies and publications. Although research has enhanced our understanding of inequalities faced by women who pursue academic careers, they have only to a very little extent highlighted the link between academic career advancement, social networks and their role in dynamics of inequalities for further career trajectories. In contrast, the intensification of meritocracy related discussions shapes the current notion of academic performance and eclipses the meaning and importance of personal connections and networks for career progression and scientific excellence.

This contribution aims at extending and systematising more thoroughly the relationship between social networks and females' academic careers by reviewing the scope of pertinent literature on networks and academic labour market. Specifically, it seeks to identify the dominant patterns and intersections of gender, social networks and career progress in academia. By doing so, this contribution challenges the significance of the idea of excellence for career success, measured by obtaining a professorship or demonstrating academic achievement. Moreover, it emphasises the process of career advancement from early career stage to professorship and exemplifies evidence from Germany and Sweden. German academia has historically large proportion of junior staff in contrast to a dramatically small amount of senior scholars at tenure positions. In Sweden, increasing focus on excellence combined with management reforms and cut-backs in teaching begin to undermine the country's previous reforms aiming at equal changes and levelling out hierarchies in academia – at the same time affecting academic identities, in particular for women (Berg, 2010).

At this juncture, special attention is paid to interactions between networks effects and expectations towards social actors, family formation of academics and different fields of study.

What Alternatives to Secularisation? Analysis of Islam and Modernity between West and East

Religion constitutes one of the social phenomena that has changed and evolved most over time, influencing the course of human civilisation. Following the post-Enlightenment thought, the gradual decline of the public role of religion in modern industrial societies has been foretold in the last centuries, defining modernity as the product of a structural dissociation of religion from other spheres, its progressive privatisation and the decline of its public functions.

A brief overview of contexts other than West, however, seems to question this consolidated tradition of thought and the illusory inexorability of the secularisation process. Islam provides a cause for reflection on alternative analyses of modernisation and secularisation; the recent news reports -the apparent revival of fundamentalism and the creation of a self-appointed Islamic State at the gates of Europe, to name a few- exhort us to wonder whether these phenomena represent anomalies which requires innovative analytical tools, and if sociology is able, today, to provide them.

This work will explore the main reflections on secularisation and the relationship between Islam and modernity. I will present the responses and criticism of thinkers, from the Islamic world and beyond, to the above-mentioned concepts. The 1979 Islamic Revolution, which led to the fall of the Pahlavi monarchy and the birth of the Islamic Republic of Iran, will be exposed as an emblematic case; a revolution regarded often as a confirmation of the dichotomy between a modern and secular West and an East that "has gone through no process of secularisation, because [...] Islam admits no separation between religion and State".

Finally, I will discuss one of the most illustrious figures of the Iranian history, Ali Shariati, and the interpretation he gave of the great phenomena of the last century, in an original and worthy of attention effort to combine Islam, sociology and modernity.

The Analysis of Particularized and Generalized Social Trust in Iran

Social trust as one of the crucial indices of social capital has a key role in the process of development. Trust is an important dimension of both civic culture and urban life in which ties strictly to the quality of life and mental health. Radius of trust brings about divisions in the concept to some main categories in the sociological literature. For us in this paper the concept of trust falls into 2 major groups: "Particularized trust" and "generalized trust".

Generalized trust which stands at a higher level of particularized trust means the trust between intimate ones, relates to the wider and more abstract facts like social guilds that occupy positions beyond boundaries of family, neighborhood and ethnicity and should be defined in a national scale. Although the particularized trust is less risky it doesn't lead to a success above a local community while the generalized trust arisen through democracies brings about the sustainable development. Furthermore, particularized trust reinforces the social segments for it hinders the constitution of "social we" which is the main basis of consensus, consistency and dynamic social order. As a matter of fact, a society with generalized trust has a more tolerance to deal with issues of collective actions which is mentioned in the game theory and rational choice of act.

In this paper, according to our definition of trust and its categories we've made a comparison between particularized and generalized trust in Iran through secondary analysis of the results of a national survey conducted in 2015 in Iran. Our findings indicate that the social trust in Iran doesn't have a vast radius. On the other word, trust has strength in a limited sector in Iran and this fact can slow down the process of development in the country.

Pushing Back Against Stereotypes: Muslim Immigrant Women's Experiences of Domestic Violence

This paper explores implications for service provision, social work education and policy regarding domestic violence among Muslim immigrant women. It provides some practical strategies and recommendations for service providers, on how to work with this group of marginalised women who experienced domestic violence. These strategies are based on the study capturing the vignette of 14 Muslim immigrant women in Australia with respect to their perceptions and experiences of, and responses to, domestic violence, while applying a feminist intersectional approach. While the literature that reflects the complexity of domestic violence situations for immigrant women from different ethnic backgrounds is growing, much remains unknown about Muslim women, their lived experiences of abuse and the challenges they confront in dealing with domestic violence in Australia. This lack of knowledge may contribute to the perpetuation of stereotypes or generalisations about these groups of women, their cultures and their religions. This paper contributes to knowledge about the specificities of Muslim immigrant women's experiences in Australia. It explores the intersections of gender, culture, religion and immigration, and the ways in which different social locations interact in Muslim immigrant women's experiences of abuse.

Comparative Content Analysis of Online Cyber Salafism and Jihadism

Mainstream literature on radicalization in Europe and North America has long passed the point of ignoring religion. Indeed today, such work increasingly converges on methodological considerations of religion in the study of violent extremism. In the case of Islamist violent radicalization, one of the key debates concerns the issue of the "radicalization of Islam" versus the "Islamization of radicals." The former contends that the standard *Wahhabi* Salafist literature matters less in the process of violent radicalization because extremists instrumentalize Islam to justify their political or *nihilist* motivations. The latter meanwhile, advocates a more correlationist or linked approach between the faith and the extremism. This presentation will enter into a dialogue with these controversies. More specifically, it will examine and discuss current research in French, English, Arabic and Persian languages on the weight of online exposure to Islamist extremist literature in selected but representative cases of Islamist violent radicals. It will offer a comparative examination of online content of selected *Wahhabi/Salafist* media and violent extremist cyber outlets. The analysis will touch upon variables such as

objectives, target audience(s), the confluence of complex interests, global reach, funding, strategies and means. The paper will call for movement beyond the simplistic dichotomy or sameness of global Salafism and jihadism in favor of a greater exploration of the in-text/ context of online media (including Social Medias) to assess common perceptions and intellectual/political affinities between these two streams of religious activism.

Reconceptualising Gender in Afghanistan: Cultural Production Among Contemporary Afghan Youth.

This paper focuses on the movement among young Afghan men and women in Kabul who utilise cultural production for self-expression, cultural critique and to build networks beyond their immediate locales through which knowledges are shared. I argue that, in doing so, contemporary Afghan youth are using creative expression to shape their society and explore new constructs of gender which disrupt perceptions outside and cultural tropes inside the country. This movement reflects more broadly the role of cultural production in forming civil society which, rather than exist in a vacuum, is in global dialogue. Through music, visual art and poetry, progressive young Afghans are creating space for subaltern voices. Participation in dissident/progressive cultural production is particularly significant by young Afghan women who are operating under highly regulated patriarchal customs and through post-war political instability. This paper draws on interviews with graffiti artists, poets, musicians, and other artists, providing insights into the richness and complexity of the intimate thoughts, feelings and modes of self-identification among Afghan women, in dialogue with their male counterparts.

Interviews conducted with young artists will offer insights into the aspirations of Afghan youth for their country in terms of gender, modernity, sexuality and civic engagement, providing a novel entry point into contemporary Afghan society. Through the works and words of young Afghans, this paper unsettles many stereotypes about Afghanistan, questions the applicability of western liberal feminist theory to understand Afghan women's experiences and seeks to understand young Afghan's social, political and creative strategies from within.

Why Ethnic Parties Form? the Social Bases of Politics in Multicultural Society of Nepal

This paper investigates the social bases of ethnic politics in the multicultural society of Nepal in general and explores the causes and conditions of ethnic party formation in particular. The study assumes that the ethnic political parties, like other kinds of political parties, are one of the manifest products of the social, political and economic structure of society and their social foundation of formation is different than non-ethnic parties. The study shows that despite having a number of national political parties, the formation of ethnic parties in Nepal have been growing in number with democratic practices after 1990 and intensifying after the political transformation of 2006. Therefore, the paper deals with a key question: why ethnic parties form? To answer the question, the paper argues that there are multiple factors like multi-ethnic society and non-inclusive state and party structure; democracy and indigenous social movement; failure of existing political parties to address the ethnic concern; rise of new issues such as identity, federalism and proportional representation; and legal-structural changes with international factors are responsible for the ethnic party formation. The paper concludes that ethnic politics and ethnic parties, as a manifest product of democracy, are contributing to the process of democratization in Nepal. In that sense, the rise of ethnic parties is essentially a social phenomenon rooted in the multicultural society of Nepal. The analysis is based on qualitative and quantitative data collected through keen observations, in-depth interview with purposefully selected key informants and other secondary sources.

On the Social (dis)Embedding of the Economy: Where Anthropology and Sociology Meet, Listen, and Talk to Each Other.

In *Fragmented Societies* Enzo Mingione was one of the first sociologists to critically revisit the Polanyian concept of embeddedness after Granovetter's seminal essays of the 1980s. He called for an attentive analysis of the market and the reconceptualization of the term embeddedness in order to deconstruct the influential idea of the market as a separate system from social conditioning, as well as an encompassing and dominant structuring force in social life. This is not only an ethnocentric conception of the market paradigm, widely accepted in sociological tradition, but also fictitious. To begin with, the market, constrained

by its own logic of competitiveness, cannot endure self-regulating patterns and atomized individuals without causing social tensions; moreover, within alleged competitive social relations we continuously observe the formation of market exchange relations concealing non-economic behaviour (friendship, affinity, reciprocity and so forth) which contradicts both the idea of competitiveness and that of atomized decision making. This theoretical debate about the abstractedness of the economy fits perfectly with the anthropological inclination of calling into question the reification of the market, through empirical research. Polanyi's perspective, for example, was influential in shaping economic anthropological thinking several decades ago (i.e. the substantive and formalist debate), but most of the research was carried out in marginal or non-Western societies. The renewed interest in the concept of embeddedness among current economic sociologists, as I will argue, has contributed to resume such anthropological debate, this time with reference to global capitalism and post-Fordist societies. Thus, my argument is that anthropology through ethnographic investigation may collaborate fruitfully with sociology to provide a 'thick' description of the social embeddedness of the economy by bringing into the framework the importance of culture and of the production of meaning stemming not from innate market behaviour but from power struggles.

Social Causes of Rise of Democracy

Democracy neither rises nor falls spontaneously. The rise and fall of democracy does not solely depend on the desire of some actors, parties and leaders. The construction, destruction and reconstruction of the social relation and structure in the society play a crucial role for the rise and fall of democracy. Democracy gets birth, and grows in a type of socio-economic structure while it falls on the other. Similarly, the international structure also affects to democracy. The bourgeoisie or the middle class is the main agent behind democratization process. The working class mobilization in developing countries often immediately precedes a regime change. So, the working class plays a major role in pushing forward democratic regime. In this paper I shall attempt a quick and preliminary discussion of the major factors for the rise of democracy.

In 2006 an important democratic movement took place in Nepal. This movement raised democracy by abolishing the autocratic regime of King and controlling Maoists' faith on Peoples' republican system. The strong bourgeoisie did played an important role for the rise of democracy in 2006. The alliance between urban middle class and peasants is also important for it. The expanding facade of capitalism helps for the rise of democracy. International factor has also played an important role in the movement. At that time, globalization made democracy unavoidable. Individual choice of middle class, peasants, working class, elites, businessmen and other people has also played an important role for the rise of democracy in Nepal in 2006.

Cosmopolitanism As Transformative Experience: Education, Extremisms and a New Social Ethic in the Post-Truth Era

Arguably more pertinent now than ever before, this paper calls for a serious commitment to cosmopolitanism, not as an abstract idea(l) or linked in any way to a hegemonic elitist culture, but as a (new) social ethic. I argue that secular and religious ethics are no longer the appropriate pillars for social relations – nor are nationalism or neo-liberal globalism. Rather, we need a post-universalist cosmopolitanism that offers a framework for critical discourse as well as concrete strategies for daily living. I attempt to operationalise this argument through what I call 'every-day flexible transformation'. Furthermore, my argument implicates ideas of education – formal and informal – as paramount in conceiving of and implementing the sort of cosmopolitan discourses, practices and policies needed to ensure a safer, more inclusive future. In this context, I critique the taken-for-granted nature of secularism in contemporary Western education systems and call for a 'critical secular studies' (on a par with Religious Studies) particularly at the level of secondary education.

Understanding Transnational Sexuality in India: Globalization and Institutional Schemas

Through in-depth interviews of middle class, English-speaking, metropolitan dwelling, self-identified gay men, lesbians, and queer individuals in India, I explicate several transnational pathways through which my respondents appropriated Western notions of sexuality. Consistent with the schematic cognition view in institutional theory, I find that these pathways make the sexual schema of moral ambivalence in India intersect the sexual schemas from the North, such as, sexual exuberance, leading to a configuration of differential congruence, wherein the local and global schemas coexist in an individual's life, but in different spheres. In addition to foregrounding the generalizability of schemas across cases, my

findings suggest a demarcation of my respondents' family lives being occupied largely by the schema of moral ambivalence on sexuality whereas parts of their non-family lives (e.g. personal, work, or non-work social) being influenced more by the Western schemas.

When the Local Meets Global: A Take on LGBTQ+ Social Movement Organizations in India

Considering the queer political, cultural, and religious traditions in India, I argue that the working of LGBTQ+ (lesbian, gay, bisexual, transgender, queer, and others) social movement organizations in India cannot be understood through the dichotomies of assimilationist versus differentiating forms of activism. These binaries have quite accurately distinguished the activism of queer organizations, like ACT-UP, from that of corporatized HIV/AIDS focused gay organizations in the United States. But I argue that the Indian context needs to be understood in light of the flux that LGBTQ+ organizations often experience—the interaction between their allegiance to the causes of sexual fluidity embraced by the Indian queer forms and the forces of global LGBTQ political economy. Thus, I show that the working of LGBTQ+ activist organizations in India offers a compelling case wherein we find that the normalizing and differentiating forces can synchronize with each other to achieve movement goals. Considering the queer political, cultural, and religious traditions in India, I argue that the working of LGBTQ+ (lesbian, gay, bisexual, transgender, queer, and others) social movement organizations in India cannot be understood through the dichotomies of assimilationist versus differentiating forms of activism. GHOSH, NANDINI* (*Institute of Development Studies Kolkata*)

The Inaccessible City: Impaired Bodies in Urban Spaces

The city is one of the crucial factors in the social production of corporeality providing the context and coordinates for most of the contemporary forms of the body (Grosz 1999). Public spaces play a vital role in the social life of communities. They act as a 'self-organising public service', a shared resource in which experiences and value are created (Mean and Tims, 2005). Yet accessibility to public spaces is very often limited by norms, representations, and symbolic images linked to different functions and identities. Disabled people confront hostile built environments within the city, as both building form and design are inscribed with the values of an 'able-bodied' society, reflecting and legitimizing oppressive and discriminatory practices against disabled people. The problematical aspects of access, of exclusion and segregation, is part of the comprehensive system of social oppression where the actions and practices of agents and institutions in a wider framework of social structures, values and ideologies circumscribe the possibilities of access for disabled people. The streets of Indian cities have almost always been a nightmare for people with disabilities.

The state in India has adopted guidelines and space standards for barrier free built environment for persons with disability which covers universal accessibility standards and responds to the varying needs of all users, in order to promote inclusion of persons with disabilities. This paper will explore how, despite inclusive state policies, contemporary urban spaces are rendered exclusionary for persons with different disabilities, thereby reflecting social attitudes and values where non-normate bodies are shunned and avoided. The paper will reflect on accessibility provisions in specific public spaces, like the streets and market places, to elaborate how, instead of becoming inclusive, urban spaces, facilities and amenities are increasingly catering to ableist ideologies of the fit and young user/consumer, while denying access to disabled people.

GHOSH, NANDINI* (*Institute of Development Studies Kolkata*)

Webs of Care: Families and Communities in India

Disability as often been interpreted as physical, cognitive, or emotional impairment that impedes one's ability to navigate their social world and relationships, or participate fully in society. Non inclusive social arrangements almost always locate the responsibility for addressing the impairment in the individual having the disability and his/her family, instead of exploring communitarian and state. The overwhelming majority of individuals with disabilities live in family settings and thus disability, by default, becomes a personal and family "problem", which

involves learning to manage the life challenges that having a disability can bring. Problematising familial experiences in terms of how families negotiate disability or impairment, leads to exploring caring as a process that complex negotiations of interpersonal relationships. Feminist theory has highlighted the significance of gender in the process of caring, as traditionally care needs have been met within families and communities, mostly by women, through labour that has remained largely unpaid. This paper will explore the ways in which families of children with a range of impairments negotiate care and other relationships within a largely normative social framework. Through case studies of disabled children and their families in villages of West Bengal, Jharkhand and Odisha in India, this paper seeks to reveal the emotional and physical labour of women, enhanced by the affective bonds of empathy, responsiveness, and attention to the needs of the impaired child to interrogate the complex phenomena of care-giving and caring.

Commoning Against 'Resource' Extractivism: Indigenous and Feminist Complementarity and Alliances in the Fight Against Extractivism and for a Life-Centred World

This paper reflects on my research and activism as a non-Indigenous woman from North America/Turtle Island seeking to understand how the world's people are moving beyond capitalist extraction and promoting alternatives grounded in feminist, anti-racist, anti-colonial and anti-imperialist analysis and action. I suggest that there is a great deal of complementarity between specific Indigenous analyses and feminist analyses (by both Indigenous and non-Indigenous women) that seek action on the basis of the three following recognitions (1) in North America/Turtle Island, Indigenous women and their allies amongst Indigenous men are at the forefront of action to challenge the root causes of interconnected social and ecological crises and defend and expand political economies and cultures that promote life through shared, non-hierarchical forms of control over and with Nature (also called commoning). (2) Capitalist accumulation and extraction of Nature is fundamentally patriarchal, racist, colonial and imperialist. The power and profitability of extractive corporations and the settler-colonial state depend upon access to Indigenous people's territory and the 'free' labour power of all women and nature. Settler colonialism sets up the conditions for more extreme and more violent forms of exploitation and oppression of Indigenous women compared to non-Indigenous (especially 'white') women. (3) As the threats to land, water and human life intensify, Indigenous women are being joined by non-Indigenous women and men who are seeking to challenge extractivism and expand forms of commoning. Alliances between diverse Indigenous and non-Indigenous women and men to challenge extraction have tremendous power to transform capitalist relations and expand new and already existing life-centred political economies and cultures. The development of alliances depends, to a large extent, on non-Indigenous, especially white women and men, taking action to challenge the supremacy of the settler colonial state and seek justice for Indigenous women and men, both within and beyond state institutions.

The Good Shepherd and the Black Sheep? How IMF's Economic Experts Describe Debtors in Sight of the Public

The media coverage about government debt crisis in Greece mostly lacks of a differentiated view on the involved parties. Apparently, according to mass media there are on the one hand self-inflicted, heavily indebted national states –the most recent example is Greece– and on the other hand the altruistic triad of IMF, World Bank, in the event of Greece debt crisis the European Central Bank, and WTO with their mutual task to help insolvent countries stabilizing their solvency. However, in daily press it is much less common that sticking to credit terms, namely implementing the structural adjustment programs, has profound effects on societies, which is increasingly and critically debated. Thus, conceding new facilities shall not be considered as neighbourly help but rather as a sell-off of former state property for profit maximizing purposes of banks only. And IMF is attributed to play the role of a debt-collection agency. In short, these two examples of black and white thinking raise awareness of the author's perspective. Therefore, the paper focuses on the IMF's description of debtors that is observable by broad non-specialist public.

Inconsistencies of these linguistic framings and in particular neoclassical pre-disposition of legitimate debtors are of peculiar interest. Which behavioural requirement does a state debtor have to meet, being regarded as credit-worthy? The heuristics, which guides analysing the relationship between creditor and debtor via the picture the IMF draws of Greece, is based on linguistic analysis and conceptual debates about the role of third parties in competitive relationships in market sociology. The particular of the present case is that IMF acts as 'lender of last resort'. IMF, more precisely the banks IMF represents, is practically unrivalled. In fact, a rejection of IMF's offer equals an outrage, which IMF tries to prevent by appealing to the 'mysterious third party', the non-specialised audience.

RC20-371.3GIANNAKOPOULOS, ANGELOS* (*University of Dortmund*)*Corruption and Power: Tracing the Elusive Borders of Political Corruption. a Comparative Study between Germany and Japan*

The aim of the present comparative study is to examine legal, institutional but also cultural preconditions of political corruption in Germany and Japan against the background of the legal framework for party financing. The study derives from research carried out in an EU-founded project within the Framework Programmes of the European Commission. By focusing on severe party financing scandals in the most recent history of both countries we shall show the extent to which certain ways of understanding and patterns of perceiving corruption in general and political corruption, in particular, play a role in the violation of legal rules and thus lead to 'deviant political conduct'. Both countries demonstrate marked similarities when it comes to their historical, economic, and political development, in particular after Second World War and their standing as western, democratic nations. Nevertheless, they are two countries with different cultural traditions, which add a special dimension to the comparison. This dimension consists in identifying the relationship between the institutionalised fight against corruption and patterns of perceiving corruption and the influence of the latter on corruption prevention. Accordingly, the main objective of the proposed paper is to complement the structural analysis on the causes and effects of political corruption with the everyday cultural understanding of corruption of involved political actors. This is a crucial analytical prerequisite, in view of the assumption that not only systemic imperatives and socio-political scope conditions, but also mentality-related perceptions as well as action- and value-orientations can have a structuring impact when it comes to corrupt conduct. Methodologically seen, the empirical study is based on a computerised content analysis of different types of documents including parliamentary debates on party financing scandals, print media reporting on major scandals and semi-structured interviews with politicians representing both political parties in power as well as those in opposition.

RC15-JS-72.1GIANNOTTI, MARIA* (*The Hospice Windsor Essex County*)*Pioneering a New Way Forward: Windsor – Essex County's Compassionate Care Community*

Unlike the UK and Western Europe where such initiatives have a long history the Compassionate Community movement in Canada is just beginning to blossom. In such a community people are motivated by compassion to take responsibility for and care for each other. From a palliative care perspective, a compassionate community recognizes the needs of those who are most vulnerable in our community especially those facing life-limiting illnesses, their caregivers and the bereaved. It aims to provide access to the many social aspects of care that are not provided by the health care system but which are central to the well-being of patients with advanced illness and their family / friend caregivers.

In past 2.5 years The Windsor Essex County Compassion Care Community in collaboration with The Hospice of Windsor Essex County has been working together with a unified vision to help people living in isolation (including people who are elderly, disabled, palliative and facing end of life issues) get the support and social connections to live well throughout their life span. This initiative is somewhat unique in that it has taken on a broader mandate recognizing that compassion is something we need not only in dealing with death and dying but in living life well throughout the journey. It seeks to increase the happiness and connectedness of everyone in the community, raise quality of life for citizens with life-long care needs, and to reduce the inequitable outcomes experienced by the most vulnerable. The purpose of this presentation is to share some of the current work being done in Windsor Essex County's using palliative care as a public health model and volunteers to achieve their goal of helping citizens live well until their death.

RC57-JS-7.2GIBAS, PETR* (*Czech Academy of Sciences*)BOUMOVÁ, IRENA (*Institute of Sociology, Czech Academy of Sciences*)*Displacing Urban Nature: Visual Tools of Post-Socialist Neoliberal Urban Planning*

Nature is indisputably an inherent part of the city. However, the production of urban nature represents a political-ecological process embedded in a complex web of relationships and predicated on as well as productive of specific, context-bound power relations. In this paper, we analyse changes in the production of urban nature brought about by the fall of socialism and the nascent of post-socialist neoliberal governance in Prague, the Czech Republic. We disentangle the power relations in behind the planning of urban nature in Prague and explore how they have shifted after the fall of socialism in 1989 and what has contributed to their present form. We conceive of land use plans as tools to implement urban policies, which have been changing along with the ideas about urban planning, its supposed role in governance and form since the end of the WWII. The changes

concerned the visual properties, content and focus of the plans. We focus on the changing visual properties of Prague land-use plans and the ways they categorised, ordered and represented urban nature. We link the changes to how urban nature features in land-use plans to profound changes in terms of urban planning and its understanding of urban nature. Based on the (visual) analysis, we argue that after the fall of socialism land-use plans became tools to represent and introduce particular ideas about urban space heavily influenced by neoliberalism and led to a production of a highly unjust and uneven cityscape by means of massive displacement and remodelling of spaces of urban nature.

TG07-1000.1GIBAS, PETR* (*Czech Academy of Sciences*)*Touching Soil, Smelling Flowers: Endangered Senses of Urban Nature*

This paper considers the sensory aspects of urban nature and their role in establishing the spaces of belonging in a post-socialist metropolis. In particular, it concentrates on spaces of urban gardening in Prague, the capital of the Czech Republic. Based on semi-structured interviews, go-along research strategies and (participant) observation in allotments and community gardens, it explores the sensescape of this type of urban nature and traces the links between sensory experience, bodily activities and emerging sense of attachment and belonging of the gardeners to their gardens. The sensescape of the spaces of urban gardening is profoundly different from the purified sensescape of the common spaces of the neoliberal city where the gardens are located and which exerts pressure on urban gardens for their displacement to free the land for redevelopment. The sensescapes of urban gardening are endangered; nevertheless, they have a potential to become a locus of critical re-assessment of contemporary neoliberal modes of governance and their outcomes. This paper argues that taking the sensescape of urban nature in general and spaces of urban gardening in particular seriously can help us to vividly capture the struggles which form and inform contemporary cities and thereby enhance our understanding of the impact of neoliberal urban developments on urban sensescape.

RC33-599.5GIEHL, CHRISTOPH* (*TU Kaiserslautern*)MAYERL, JOCHEN (*University of Kaiserslautern*)*Explaining Response Styles and Response Bias Using the Attitude Towards Surveys and the Attitude Accessibility Towards the Research Topic*

Cognitive dual-process models of response behavior distinguish between two groups of respondents: those giving answers based on simple decision heuristics (quick respondents) and those giving answers based on deliberative thoughts (slow respondents). Empirical studies show that both response styles are susceptible to different types of response effects.

For fast respondents, the chronic attitude accessibility is assumed to be a moderator of the attitude-response process: if the accessibility is high, respondents' will answer based on their attitudes. If it is low, they will answer based on simple decision heuristics or situational cues. We assume that those respondents who give automatic-spontaneous answers without chronic attitude accessibility are those who will most likely be affected by response effects which demand lower levels of elaboration (like acquiescence effects).

Furthermore, respondents' can be distinguished based on their general attitude towards surveys, which leads to a specific role in surveys. Those roles can either be cooperative, which means respondents' try to answer every question as true as possible, or the role can be conforming, which means respondents' are using cost-benefit-considerations when answering questions, which often leads to a biased answer. Since those considerations presuppose a higher level of elaboration, we suppose that the general attitude towards surveys is a moderator only for slow responses. Therefore, response effects which demand higher levels of elaboration (like the contrast effect of question order) should be observable especially for slow responders with a negative general attitude towards surveys.

To examine this assumption, we investigate the link between the general attitude towards surveys, the attitude accessibility and the occurrence of response effects (e.g. the acquiescence effect and the assimilation and contrast effect of question order) to explain method effects and response styles. For this examination, we will use the data of a German longitudinal mixed mode study, the GESIS panel.

RC23-431.2GIERYN, THOMAS* (*Indiana University Bloomington*)*Truth-Spots: How Places Make People Believe*

One possibly profitable new direction for the sociological study of science is to examine the places where scientific knowledge is made or shared: laboratories,

field-sites, botanical gardens, zoos, museums, observatories of all kinds and classrooms. These sites of science are "truth-spots," places that lend credibility to claims that come from there. The challenge is to figure out how each of these places makes people believe--given that they are dramatically different in their geographic locations, natural landscapes, built environments and in the stories we tell that give meaning and value to each. For example, laboratories trade on their material disengagement from immediate physical contexts while field-sites celebrate the contingencies and particulars of natural surrounds--yet both manage to produce credible scientific claims. To figure out how these truth-spots work, I suggest that it helps to examine other places where knowledge is made (or contested), other places where beliefs are affirmed (or denied)--places that are not ordinarily thought of as sites of science: pilgrimage destinations; courthouses; commemorated sites of history, memory and identity; even oracles. Perhaps new sociological insights into the workings of science will result from comparative analyses of other culture-producing institutions and practices--with a focus on the places where such activities occur.

The Content, Context and Future of STI-Policy: Towards a New Framing?

The world seems to get more complex and unpredictable. Yet universal values as they are shared by the UN Sustainable Development Goals sketch a direction for policy making and for a better life for all. In the context of European STI policy making, the question is: What will be Europe's role in the world and can European STI-policy making make a difference?

Looking at the future, the junction of the SDGs with megatrends provides a framework for identifying key transitions for the future, and challenges and opportunities associated with such transitions. Presently we seem to enter a new era of innovation policy that is directed toward transformative change, overcoming the old paradigms of "growth" and "competitiveness". Using this new framework, our paper covers future scenarios (2030) from a European project on "Beyond the Horizon".

Looking at the transitions towards the SDGs the following general observations can be made:

- Inclusiveness and fairness are key principles of transition processes and key objectives of transitions.
- Coordinated action between European, national and regional level is essential
- There are strong interconnections between the scenario areas.
- Governance is key for innovation and value creation.
- The city emerges as a key level of governance and social and economic organization.
- Experimentation, rapid prototyping and testing solutions need to become an important part of policy

The aim of developing these scenarios is to explore strategic options for Europe in a world where there are major shifts in political and economic structures taking place. The key perspective underpinning the scenario approach is that the EU has the potential to magnify the importance of its citizens and its Member States in the world, while, as economic globalization advances, the global weight of the EU decreases. The EU will be a smaller part of the world economy, population, emissions and so on.

GIESECKE, SUSANNE* (*Austrian Institute of Technology*)

The Magic of the Circle. Sociocratic Modles of Self-Organisation and the Transformation of Democracy in European Cities

Western European cities are under a lot of pressure for growth in terms of migration, economy, infrastructure, educational opportunities, etc. At the same time value sets among citizens are changing and certain citizens demand more participation. One promising phenomenon against this background is the self-organisation with regard to food supply, housing and mobility. As part of the non-profit sharing economy groups of people organize their daily matters in coops and have a significant effect on urban life. Especially the sociocratic circle model that is practiced in some of these organization points towards a new era of democracy in our future lives and cities.

Sociocracy is an approach for transparent and democratic decision making within any kind of social organisation. Other than the conventional norm, a sociocratic organization makes decisions not by majority rule but by consent. Consent is given when no-one in the circle has an objection with regard to the proposed decision.

The individual is the smallest unit of the organization and several individuals are organized in a circle in order to achieve a certain goal. The sociocratic principle acknowledges that conventional democratic decision-making by majority rule has the disadvantage of leaving those people behind who are in opposition of the decision. Thus, it can evoke the same reactions as authoritarian decisions. The

minority is defeated, not convinced. In an era where a lot of voters are frustrated with majority-rule democracy, sociocracy may point to an alternative and attract people for civic engagement at least in their neighborhood. This approach of decision making gives every member responsibility to ensure the realization of the objectives in a productive way.

The paper explores in what kind of bottom-up organisations and to what degree sociocracy is implemented and how its democratic practice is spilling over and changing the urban way of life.

"You Are Fake News"

The problem of "fake news", intended as an umbrella term that includes misinformation, disinformation, gaslighting and propaganda, prompted a broad debate about the role of information in contemporary society and the ability of online consumers to verify the veracity of news. To better understand this phenomenon in the Italian context, News-Italia observatory conducted a survey (June 2017) on a representative sample of adults citizens (N=1007). The study aims at measuring the level of trust toward the Italian news ecosystem and consequently the news consumers perception over the problem of "fake news" as well as the self-awareness of digital literacy skills. The survey results point out that 53% of respondents often encountered partially false or entirely fabricated news online; furthermore, the "fake news" phenomenon is perceived as a relevant problem with more than 90% of online user declaring that the phenomenon contributes to sow confusion among fellow citizens. On the other hand, the vast majority of respondents shows confidence in being able to recognize unreliable information and claims they do not share false news online, neither deliberately nor by mistake. Despite being aware of these issues, the majority of respondents tend to trust online sources more than legacy media. On the backdrop of this complex and apparently contradictory picture - in which italians admit to encounter "fake news" but fail to recognize their role in the process - the paper adopts a second-order observation framework (Luhmann 2012, Von Foerster 1984) to make sense of the data and address its paradoxes. In doing so, it points out the eminently self-referential nature of the epistemological relationship between news consumers and information and the role played by the "informativeness of misinformation" in the persistence and reach of so called "fake news".

GIL, MAGDALENA* (*P. Universidad Católica de Chile*)

Constructing Risk and Responsibility: Lessons from Chile's Seismic History

People have tried for centuries to understand, explain and, hopefully, predict earthquakes. Pre-modern societies did this through religion, producing semantics of punishment and Providence. Modern societies, however, seek to comprehend disasters in the form of risk; this is, we understand that the future depends on decisions to be made at present. In order to make informed decisions, thought, we need to be able to understand risk, to measure it. Following Niklas Luhmann, we can understand this process as the transformation of danger into risk; what was once wild and uncontrollable becomes something that can be calculated. The only "sin" now, is the omission of prevention. In this paper, I trace this cultural development in one specific and highly seismic country: Chile. Using newspapers and public records as the principal historical sources, I trace the social and cultural life of seismic risk from early 19th century to the present. I focus my analysis in two areas. First, I take into account public discourses on earthquakes to understand how ordinary citizens interpret their causes and cope with the consequences. And second, I analyze the recovery plans of major events in order to question when, and how, risk management was included in the designs for reconstruction. As a conclusion, I argue that the more scientific ideas are incorporated to public discourses of earthquakes, the highest people's expectations about risk management and earthquake-damage prevention. In other words, we learn that danger is politically safer than risk. If disasters depend on decisions made by people, then who is responsible when things go wrong? As my case shows, with the advancement of the twentieth century the answer will increasingly be: the state.

Indigenous and Refugee: Pageantry, International Migration, and the Reconstruction of Mayan Cosmology

My paper will explore how international migration serves as an important catalyst to redefine the "traditional" within indigenous Mayan cultural frameworks

– along racial and gender lines – and the power relationship between indigenous communities and the Mexican secular state. Specifically, I examine how an annual pageant in Chiapas, Mexico serves as a site to perform gendered and indigenous Mayan identities that reference a “traditional” past, displacement from military conflict in Guatemala, and cultural survival in Mexico. Ethnographic observations of two public performances: 1) the coronation of the Migueleña Princess, and 2) a military raid on a village will be examined. Findings reveal how the pageant serves as a public site where racial and gendered hierarchies are contested. The recreation of a military raid will also illustrate divergent perspectives regarding the participation of *mestizo* “outsiders” during the pageant as either denigrating or affirming of indigenous customs and beliefs. As a whole, both performances serve as sites where indigenous Mayan community members test the limits of public discourse for the purpose of reproducing the past, resisting the present, and redefining claims for national belonging and membership to a larger transnational Mayan diaspora.

From Racial to Social Typologies: Area Studies and Race Relations in the Work of Charles Wagley after WWII

In his 1947 report on the “study of world areas”, the Columbia-based anthropologist and Brazilian specialist Charles Wagley marvelled at the fact that the “area approach” was being touted as a wartime innovation. While the study of other regions such as “Southeast Asia” and the “Near East” by US scholars was just in its infancy, Wagley argued that because of the “relatively long history of area studies” in South America, scholars of the region could feel confident that they had solved many of the basic problems facing specialists in other areas and could instead limit their discussions to “field research problems.” Recent histories of “area studies” have confirmed Wagley’s account. Instead of treating area studies as a response to World War II and the Cold War, Timothy Mitchell and Ricardo Salvatore have recently located its beginnings in the context of Oriental studies and Latin American studies in the US during the interwar period. In doing so they have sought to highlight “area studies” entanglements with US imperialism. In this paper, I build on these recent histories and track the early stages of Charles Wagley’s career in Brazil. My paper argues that the formation of area studies was also important for post-WWII attempts to reorient the study of racial difference away from the study of rigid Mendelian typologies and towards the sociological study of race relations. In addition to his work in advocating for the area studies approach, Wagley was an important figure in UNESCO’s post-WWII campaign against scientific racism and participated in UNESCO’s landmark studies of Brazilian race relations. In his UNESCO research, Wagley combined the sociological study of race with an anthropological approach to area studies that sought to understand the inter-relationship between social groups, their culture, and their environment.

GILGEN, SANDRA* (*University of Bern*)

What Is Fair to Whom and Why? – Examining the Spread of Distributive Justice Principles Using Modified Choice/Vignette Experiments

When deciding on how to divide resources fairly, individuals can rely on different justice principles, the most prominent of them being 1. equity (or deservingness/merit), 2. equality and 3. needs. The reasons for choosing one principle over another can lie in rather time-constant individual (e.g. class) (Robinson and Bell 1978; Shepelak 1989) or contextual factors (place of residence) (Arts and Gelissen 2001; Henrich, Fehr, and Gintis 2004) or time-variant situational logics (e.g. family vs. workplace context – Deutsch 1975). While there is a long line of research focusing on single aspects of attitudes towards distributive justice, a comprehensive overview on who opts for which principle, in which situations, and how context influences the mechanisms behind the preferences, is missing. Focusing on mechanism-based explanations, the research project “Justice: an Individual, Contextual or Situational Affair?” (JInCS) tackles these questions using a mixed-mode design (PAPI and online) with a national sample of individuals 18 years and older in Switzerland. In order to address the problem of social desirability bias, which is especially salient for research on attitudes, a modified version of factorial survey / choice experiments is developed. Instead of applying the most prevalent approach of capturing justice principles by presenting respondents with descriptions of people and stating their income and then asking for an evaluation thereof (vignette experiment – Alves and Rossi 1978; Jasso and Rossi 1977; Liebig et al. 2009), the respondents are asked to actively distribute different amounts of money among people characterized in vignettes, according to their preferences in regard to distributional justice. This modified version of a factorial survey / choice experiment has the advantages of capturing the trade-offs between the different distributional principles – which often stand in contradiction to one another – more directly and delivering richer information.

GILL, RITU* (*Defence R&D Canada - Toronto Research Center*)

Social Media Networks and Influence in the Military

In the defence milieu, social media has been defined as “internet connected platforms and software used to collect, store, aggregate, share, process, discuss, or deliver user-generated and general media content, that can influence knowledge and perceptions and thereby directly or indirectly prompt behavior as a result of social interaction within networks” (Nissen, 2015, p. 40). Indeed, social media networks have become a critical player in the information environment, representing a platform for sharing and collecting information, as well as influencing and persuading members of the target audience in the area of operations. Social media networks have become powerful tools in information warfare, and in order for social media networks to be employed as an effective operational and/or tactical tool, it should not only be used for communication, but also *engagement* and *interaction* with the target audience. Increasingly, social media networks are being employed by non-state and state actors in modern day warfare; as a result, there is a strong rationale and need for government defence organizations and military to also operate in the same space in order to effectively optimize operational success. This presentation explores the best practices and recommendations for armed forces across the world to employ social media networks as an effective tool or resource for influence and information.

Trust and Information Sharing in Diverse Teams

International responses to complex humanitarian disasters, terrorism, criminal activities, and pandemics have increasingly involved integrated multiagency civil-military teams – teams whose success is largely tied to their ability to effectively share information. Trust has been called “the single most important precondition for knowledge exchange” (Rolland & Chauvel, 2000, p. 239) and has been critical to effective collaboration and information sharing in civilian, military, and multiagency teams. Yet the dynamics of trust are often a poorly understood dimension of information sharing. This issue is addressed by defining trust and its essential characteristics, and then specifying the variety of ways in which trust can affect information sharing. We also outline the array of challenges faced by most multinational and multiagency teams that can undermine the trust-information-sharing relationship. We conclude by outlining principles that promote trust and some ways in which trust may be developed and maintained in the demanding context of multinational-multiagency missions.

From Peterloo to Occupy: What Difference Does Two Centuries Make to Pro-Democracy Movements? (Work In progress)

On 16th August 1819 60-80,000 people gathered in St. Peter’s Field, Manchester, ‘To consider the propriety of adopting the most LEGAL and EFFECTUAL means of obtaining a REFORM in the Commons House of Parliament’. It was brutally suppressed with 15 known deaths and 4-500 injuries, and soon dubbed the Peterloo Massacre (Hernon, 2006, p.28, 41). Peterloo occurred in a context of a sweeping economic crisis and protesters argued that Parliament, despite its democratic pretensions, was irretrievably wed to landed interests and would never therefore tackle the causes of crisis.

While it would be glib to draw too many parallels between newly industrialising England and the most recent wave of protest, this central idea that deepening democracy was necessary to address economic crisis was central too in the movements of the streets and the squares from 2010 onwards. This paper offers a hermeneutic frame analysis (c.f. Gillan 2008) of the pro-democracy movement signalled by Peterloo, which is suitable for comparison with what we already know from empirical studies of the Occupy wave. Through analysis of original pamphlets and flyers, eye-witness testimonies and journalistic reports I will detail the character of democracy demanded by the Peterloo protesters, as well as their justifications for it. I then address two sets of questions. First, to what extent are they consistent with more contemporary pro-democracy movements? Second, how do the dynamic temporal and political environments of these movements (or timescapes, Gillan forthcoming) affect the nature of demands and justifications. The latter will particularly allow us to consider how past pro-democracy movement successes, ossified in institutional representative structures, might provide constraints or opportunities affecting the discursive features of movements today. In sum, this allows a very long-term analysis of shifts in the ways radical democrats envision alternative futures.

Our communication is based on our research carried out in the aviation sector (civil aviation), with the largest or most well-known airlines in Europe (France, Germany, Netherlands, Portugal, Italy, Spain) and Canada (with scheduled, charter, low cost flights). It focuses on the work of the Cabin Crew (flight attendant, steward, chief of cabin). We advance scientific knowledge of the work of the Cabin Crew, which develops in specific types of organizations and working conditions, with important safety rules and particular constraints (sometimes in "extreme context"): atypical working hours (night shift, staggered working hours) and jet-lag, work / life balance, material, physical and technical conditions of work, turnover of short-lived crews, etc. Moreover, the activities take place in a national and international context increasingly subject to stress, crises and risks (political and military insecurity in some countries, diseases in certain countries, terrorism, etc.). In this communication, we will focus on the relation between work and family (or personal) life, which is important for understanding how working conditions and their recent degradation are experienced.

Our research is in the field of sociology of work and organizations as well as of the sociology of professions. Our communication is based on some 80 qualitative interviews (between 1h30 and 3h each) conducted with Cabin crew from large legacy and low cost companies. As a backdrop for comparison, we might use some elements from the over 1400 responses to a questionnaire distributed to the cabin crew in these same companies but also in many more throughout Europe, as well as some elements from direct observations of the work of cabin crew. Therefore, the research investigates working situations, professional realities of the flight crew.

RC52-858.5GILLET, ANNE* (*CNAM, LISE-CNRS*)*The Work of First-Line Management (supervisor): A Managerial Function or a Profession ?*

This communication relates the results of researches on the work of the supervisory framework of first-line management (or supervisor), in France, with some comparisons with Quebec/Canada and with Europe, in different companies (public transportation, nuclear sector, civil airline companies) and in the professional sector of social intervention.

These professionals are "first-line managers", or "supervisors". This terminology refers to the first level of supervision in work organizations, those exercising a responsibility between the second-level manager (with associate status) and the technician or operator. In permanent contact with the field and in direct relationship with higher management, their functions are at the operational centre

of the business. In proximity with the workers and other managers, the role of the supervisors is to guarantee the smooth daily running of the workplace at the social, organizational and technical levels. In France and in most countries, the supervisors are often neglected in social and professional current events and are rarely the focus of in-depth scientific research. Complex sociological variables reveal the different action logics used by supervisors, and their professional dynamics, drawn from a diversity of professional activities, modalities to accomplish the work and representations of work. We have constructed an analysis with different theoretical bases: sociology, sociology of work and organization (Becker, 1963; Goffmann, 1968; Sainsaulieu, 1977; Sainsaulieu *et al.*, 1995; Dubar, 1991; Alter, 2000;). To analyze the work and socioprofessional transformations of first-line management, we also used the theories of the sociology of the occupations professions (Elliott, 1972; Chapoulie, 1973, 1984; Dubar, Tripier 1998...) and the theories of the sociology interactionnists which participates in the research work on professional groups ("career of an occupation" Hughes, 1996; Bucher, Strauss, 1992; Strauss, 1992). We also used part of the managerial literature and we participate in the construction of a sociology of management.

RC38-JS-3.1GILLIERON, GWENDOLYN* (*phd Candidate at Goethe-University Frankfurt*)*Intersectional Analysis of the Self-Perception of Binational Descendants in Switzerland and in Morocco*

For everybody, the experience of otherness can occur since the perception of one's self is always in relation with one's perception by others. But some persons are more vulnerable concerning their (self-)perception, for example, adolescents of mixed origin. Here, multiple dimensions become relevant such as skin colour, gender, national origin of the parents, processes of othering and/or social origin, to name just a few. My research looks at the self-perception and positioning of young adults of mixed descent in Switzerland and Morocco. Comparing my field studies for my PhD research, I noticed that social discourses as well as my own positioning in the field and the research situation influence the biographical narratives of the young adults.

My presentation will be based on a contrastive comparison of biographical interviews with adolescents of mixed descent in Switzerland and Morocco from an intersectional perspective. My analysis will highlight the different dimensions that influence the biographical constructions of the young adults, especially also the role of their specific social and societal context. Why do they present themselves the way they do? Which processes and categorisations influence their self-perception? In which way is their self-perception a reaction to social conditions such as racism, identity politics, gender, and social class? An intersectional perspective on the life course can show how experiences of difference may develop and change over time. For example, an experience of racism during childhood may influence identity constructions in the present. Furthermore, I intend to look at the individual biographical experience and at the resources the young adults have developed to deal with their positioning.

RC38-672.3GILLIERON, GWENDOLYN* (*phd Candidate at Goethe-University Frankfurt*)*The Place of Argumentations in Biographical Narrations of Young Adults*

In the narration analysis as developed by Fritz Schütze the genre of argumentation has a minor stand in reconstructing biographical experiences. Schütze (1983) himself argues that narrations mainly reflect experiences while argumentations have to be contrasted with narrations to understand their sense for the life story. Further, Riemann (1986) sees argumentations as a result of painful experiences or as a sign that the person has not yet gained some distance of the narrated experience. On the other hand, Bartman and Kunze (2008) show that argumentations can also be a form to express a particular kind of experience.

In my presentation, I will look at biographical narrations of young adults of mixed origin and reflect on the importance of argumentations and their relation to biographical experience. I take up the stance that the use of argumentations by my interlocutors is due to their phase of adolescence (King 2004). In this phase, the young adults experience processes of collectivization (Vergemeinschaftung) and individualization. They are interviewed at a moment when reflections on the self and the positioning in society are most pertinent; this is why, I would argue, they narrate their experiences in the argumentative modus. Arguing from a symbolic interactionist perspective, we could say the interview reflects a discursive positioning where the young adults look at themselves from different perspectives. In this sense, argumentations are not a sign for painful experiences but the most natural form to express themselves at that moment. Here, the interview is used as a space of reflection. It may be the first time that the young adults reflect about themselves and their becoming, and that they try to give a sense to their lives. Thus, the interview itself is part of their 'biographical work' (Inowlocki/Lutz 2000). Hence, argumentations can reflect the experiences of being an adolescent.

TG04-969.7GIRITLI NYGREN, KATARINA* (*Mid Sweden University*)OLOFSSON, ANNA (*Mid Sweden University*)OHMAN, SUSANNA (*Mid Sweden University*)*Analytical Perspectives in Intersectional Risk Theory: Actor, Structure and Ambivalence*

In this presentation, our aim is to explore how the interplay between risk and inequality can be understood from four different angles: (1) as a pure structural and/or systemic process as governance and normalization of risk. (2) How the subject becomes possible through structure, for example through interpellation and normalization. (3) How the subject as an actor negotiate and navigate among and between different discourses of risk and finally (4) as a pure lifeworld based experience where we ask if it is possible to find conjunction between risk, power and inequality beyond norms and hegemonic structures, or at least how this is played out in contemporary theorizing. We want to highlight the importance of both the external constraints on human beings often conceived of as 'social structures', for example collective habits formalized as legal rules, policy, norms, moral obligations etc., and on the other hand the often contrasting/opposite concept of 'action' or 'agency', for the understanding risk and inequality. We will put together a jigsaw puzzle that at first glance might seem to fit well together in its familiar division of concepts: Social theorists have batted structure and agency to and fro for generations, and as such it is a known picture (Connell 2004). However, by mixing pieces from different puzzles and carving the intersectional approach of inequality and risk into the picture, the result is skewed and ambiguous. We will not use violence to make the pieces fit together, or try to hide the misfit, instead we will do our best to tell a story that convince the audience that the pieces do not necessarily need to fit. Because it is only in a broken mirror we can find ways to understand and put our own time in perspectives.

TG04-969.6GIRITLI NYGREN, KATARINA* (*Mid Sweden University*)NYHLÉN, SARA (*Mid Sweden University*)*Intersectional Policy Analysis –Doing Risk in the Case of Gender Based Violence*

Drawing from the experiences of a research project focusing on gender based violence in rural Sweden and South Africa the paper focus on how government policies aimed at addressing violence against girls and young women is framed, understood, negotiated and contested in relation to space and place. Rönblom (2008) has already shown how bringing space into the intersectional policy analysis increases the knowledge about how the political is produced in policy. To this perspective we also add on 'doing risk' theory where risk is seen as performative. This makes the different power relations visible and the production of power in policy is better understood as it highlights how some dimensions is given priority in relation to others. The way in which national policies are implemented are not an natural given response to what the policy suggests but is also affected by the ways in which the actors involved understand translate and enact them as they perceive and define the situation at hand. The paper draws on intersectional risk analysis applied in the field of policy and is based on policydocument analysis as well as interviews with stakeholder, school authorities and school personnel working in the local community. The analysis shows how policy originating from the center often gives urban dimensions priority over rural and different risks related to gender equality is negotiated in relation to different axes of power including place.

RC39-681.2GISQUET, ELSA* (*IRSN*)MERLE, IVANNE (*CSO*)*Predictive Knowledge and Decision Making Process for Protecting Civilian Populations in Emergency Situations*

Experts advising governments in various areas have long been using modeling techniques and simulations. Prediction technologies are fast increasing the capacity to simulate, visualize and anticipate disasters. In this sense, they represent technical innovations in governance and public action because they hold the promise to be able to anticipate and act on uncertain situations. However, the impact of these prediction technologies on decision-making in emergency situations has so far been little analyzed.

Through the presentation of the case study of the "Mercaptan cloud", we analyze to what extent the use of prediction technologies is likely to affect public decision-making processes for the safety of civilian populations. On the January 21st 2013, a leak of Mercaptan gas from a chemical plant occurred for several days in France. Without being harmful to health, these gaseous emissions (smelling as the domestic gas) could be smelled on a very large perimeter, causing considerable inconvenience to the population. Emergency services, local and federal gov-

ernment and various institutional experts constantly interacted during the event to assess the danger.

From this case study prediction technologies that were used, will be reviewed. Their shortcomings due to socio-organizational constraints will be presented. These include: structural, institutional and individual mechanisms that shape the process of technical expertise and limit the direct translation of results into recommendations for deciding whether or not to evacuate the population. Meanwhile, different and complex uses of the technical expertise, broader than just the issue of the evacuation, were identified.

Although predictive technologies do not reverse the decision-making process, it will be highlighted that these predictive technologies can make it possible to propose alternative solutions to evacuation, and thus broaden the spectrum of public action. At least, this paper identifies social sciences approaches that could render the use of predictive technologies more accurate and realistic.

RC33-610.4GIUGLIANO, ROGERIO* (*Federal University for Latin American Integration*)*Global Flows, a Spatial Approach Towards Global Development*

Throughout a seven-year research about the diffusion of cash transfer poverty-reduction programs across the global south, several challenging political/epistemological issues had to be addressed in order to make such investigation feasible. This paper's main objective is to share one of these critical discussions. To address a global matter that is traditionally connected to a linear, chronocentric and Universalist narrative a spatial methodological approach was implemented in order to acknowledge: a) the diversity that coexists in the global south, b) the heterogeneous affects that global formulas have in these societies and, at the same time, c) expose the movements, directions and relations in global space that underlie this issue. In a sociological incorporation of the thought of the Brazilian geographer Milton Santos, we will present development and the global diffusion of cash transfers using the author's perception of "global space" as a "theatre of flows". The paper will discuss in which way this perspective was incorporated to the research methodology and its connections to contemporary sociological approaches to global issues. Within this framework, this paper will argue: a) that issues of global development such as poverty reduction schemes can be perceived as flows in global space; b) this approach opens way to a clear perception of the inequality of the global development dialog through the characterization of the flows as hegemonizing, hegemonized and counter-hegemonic, and c) this paper will contend that this strategy of spatial analysis provides a clear cartography of origins (agents and territories) and targets of global development policies exposing the main directions that the flows assume in global space.

RC48-801.16GIUGLIANO, ROGERIO* (*Federal University for Latin American Integration*)*The Brazilian Workers Party and Organized Social Movements: The Difficult Paths a Radical Democratic Experience*

The Brazilian Workers Party (PT) is still the largest left leaning political party in Latin America and has a unique history and structure in the region. PT emerged in Brazil as a unifying force for a diverse group of social movements and organizations that resisted the military dictatorship that lasted from 1964 to 1985 and forged a promise of radical democracy for the country. Although the majority of the party ranks come from labour organizations, PT's broad political spectrum encompasses a variety of perspectives and interests that range from the progressive Catholic Church to hard left ex-guerrilla groups. Researchers and political figures have described its internal multiplicity, as its greatest strength and one of its major weaknesses. Internal diversity underpinned the design of PT's internal procedures and organization establishing an intense inner democracy that broke with the hierarchical and personalistic traditions of the Brazilian left. Simultaneously, this interior multiplicity was a driving force for some of PT's most innovative governmental actions such as its south-south oriented foreign policy, its drive towards the democratization of the Brazilian State, and also its redistributive social agenda. This paper presents an analysis of PT's relations with Brazilian social movements at three different moments: a) first, during its formation and social opposition phase from 1979 to 1989, b) second, its period of institutionalization and parliamentary opposition that ranged from 1990 to 2003, and c) third, its four consecutive national administrations that started in 2004 and ended in 2016 when Dilma Rousseff's presidency was interrupted by an impeachment process that is perceived as a coup by the party and its allies. The paper will focus on the intense and rich, but often difficult, relations between the internal factions, the positioning of social movements representatives in governments posts and the reaction to the 2016 coup.

RC10-208.1GIULLARI, BARBARA* (*University of Bologna (Italy)*)DE ANGELIS, GIANLUCA (*University of Bologna*)*Beyond the Reification of Knowledge: The Participatory Mapping As a Methodological Perspective for Building the Informational Bases of Judgement for Justice (IBJ) of Public Choices.*

The aim of the proposed paper is to expose an experience of participatory mapping (PM) in a policy-making process targeting young people in a Social District in North Italy.

Participatory Action Research (PAR) and PM share questioning on the nature of knowledge and the extent to which knowledge can represent the interests of powerful people or enable citizens' capacity for voice to contribute in the construction of the informational bases (IB) of the collective decisions.

The critical analysis of the contemporary characteristics of the relationship between knowledge and IB highlights a growing use of quantified, formalized, standardized information; consequently, matters that public policies address are deprived of the element of subjective and experiential learning. These processes affect the policy-making discourse, both supporting isomorphism in political patterns and reduction to a technical matter. In this scenario, participatory practices may remain formal, to justify political choices. By contrast, substantive participation practices, i.e. redistribution of power in decision making processes, claim as many and plural IB as possible.

The experience of co-research was focused on participatory mapping, supported by new technologies. This is a chance to allow young people to depict their living space and keep their voice up, promoting their recognition in public debate. Through the implementation of an open source platform, to sharing and geo-localizing multimedia contents, the researchers involved youngster groups to collect information to categorize what is relevant for them in the territory. Lastly, the map itself is not as important as the mapping process: the dialogue between researchers and young people generated a reflective cycle about their aspirations in terms of relationship between young and adults and their expectations in terms of recognition. Each pinpoint on the map is not just the digital representation of a place, but a part of the collective discourse emerging from the ground.

RC44-744.3GLEESON, SHANNON* (*Cornell University*)*From Co-Optation to Radical Resistance: An Examination of Organized Labor's Response(s) to Immigrant Rights in the Era of Trump*

The election of Donald Trump has ushered in a new era of brash racism and xenophobia, marked by declarations of Mexicans as murderers and rapists, calls to build a wall on the Southern border and ramp up deportation efforts, and most recently the pardoning of convicted criminal sheriff Joe Arpaio, who terrorized Latino communities in Arizona for over two decades. This has prompted a wave of strategic responses from immigrant rights groups and their allies. Organized labor, which has had a complex legacy concerning immigrant rights, has often found itself vacillating between complete co-optation and radical resistance. This paper looks at the official responses of the AFL-CIO and the largest labor unions to the Trump administration's attack on immigrant labor. To do so, we examine the press releases issued by the ten largest labor organizations and public statements by union officials in leading newsprint over an 18 month period: from March 1, 2016 (right before the start of the Republican presidential primary) to September 1, 2017 (10 months following Trump's presidential victory). In this analysis we analyze three key components: 1) Which are the leading unions championing immigrant rights?, 2) How do these rights narratives frame and justify immigrant rights?, and 3) To what extent are union responses to restrictionist policies in Washington D.C. and elsewhere advancing an explicitly intersectional platform that declares solidarity with Black, Muslim and LGBT workers, for example. In addition, this analysis will assess moments of seeming co-optation by leading labor organizations who have courted favor with the Trump administration, and document resistance from factions of members who reject such instrumental alliances. We end by considering what the Trump administration has meant for the emerging platform of immigrant rights within organized labor, less than two decades since the AFL-CIO reversed its own explicitly anti-immigrant platform.

RC30-539.4GLEESON, SHANNON* (*Cornell University*)*Worker Rights and Immigrant Resistance in Trump's Racist America*

Worker Rights and Immigrant Resistance in Trump's Racist America

RC13-249.3GLOVER, TROY* (*University of Waterloo*)*The Symbolic Violence of Leisure Lifestyle in the Production of Urban Space*

This presentation focuses on the contemporary role(s) of leisure lifestyle in legitimizing and normalizing existing social orders in city life. In so doing, it draws on Bourdieu's notion of symbolic violence, a form of violence "... exercised upon a social agent with his or her complicity" (Bourdieu and Wacquant 2002, p. 167), yet to his or her detriment. Though often perceived as trivial, leisure lifestyle functions effectively as an everyday instrument of social control and exercises symbolic violence on marginalized groups by imposing a subtle, yet powerful vision of social division among urban inhabitants, division based on leisure tastes and preferences. Specifically, the presentation will explore how leisure lifestyle and its associated amenities/practices are leveraged intentionally to attract affluent individuals (i.e., tourists, residents) to urban spaces, to facilitate the colonization of those spaces, and to displace those whose leisure tastes differ. By premising social division on leisure lifestyle rather than on social class, gender, ethnicity, or race, the covert process of producing "vibrant urban space" is deemed generally palatable so that its consequential displacement comes to be regarded as unfortunate collateral damage and nothing more. To contrast this scenario, the presentation will offer counter examples of transformative acts of resistance aimed at exposing symbolic violence through the production of "spaces of hope" in which urban inhabitants on the margins assert their "right to the city" and appropriate public space for alternative leisure use.

RC22-414.7GODAZGAR, HOSSEIN* (*Al-Maktoum College of Higher Education*)VELAYATI, SHIVA (*Nabi Akram University*)*From 'Islamism' to 'Spiritualism'? the Individualisation of 'Religion' in Iran*

In the first four centuries of Islam in Iran, Mosques were arguably the only sacred places for Iranian Muslims to pray. It was only after the invasion of the Mongolians and the resulting expansion of Shi'ism and Sufism throughout the country that the tombs of some sacred figures ('*Maqbarahs*') became shrines and important sites for pilgrims. It is interesting that pilgrimage to both Imams' shrines and *Maqbarahs* and its associated expressions and perceptions lie at the centre of Shi'ite experience of 'religion', although they are rarely mentioned in the relevant core sources of Shi'ism.

During the Islamic revolution of 1979, Mosques became the main 'vehicles' for the religio-political ideology of the revolution. Unlike *Maqbarahs*, they embraced dissidents from a variety of social classes ranged from emigrants from rural areas to educated liberals and intellectuals. Approaching the fortieth anniversary of the revolution now, the findings of our three-year research project illustrates that whilst the religious status of Mosques is decreasing, *Maqbarahs* as well as other apolitical venues are increasingly becoming the main 'vehicles' for the expression of more individualistic and spiritual sensations, rather than the manifestation of an established and institutionalised religio-political ideology.

Taking inspiration from a social constructionist approach, participant observation and thirty semi-structured interviews in three *Maqbarahs* in north-west Iran, this paper aims to partly report the findings of this project by focusing on the meanings of 'religion' (and of course 'non-religion') attached to *Maqbarahs* and their material culture as well as the changes our informants have experienced through time and space, particularly during the last thirty years.

RC22-422.3GODAZGAR, HOSSEIN* (*Al-Maktoum College of Higher Education*)*Is 'Islamic' Text Consistent with Diversity or Exclusion? Insights into Sunni and Shi'ite Exegeses of the Qur'an with Reference to (physician assisted) Suicide*

Diversity is becoming an essential characteristic of a globalised, so-called 'post-modern' world, where increasing collectivities of 'religion' and 'non-religion' emerge and rightly claim the right to life in various arenas. One of the consequences of this is the materialisation of different views of the value of life itself. Some people tend to deny a value of any sort to life, while others may be deeply disturbed by the idea that life is of no value or that it is meaningless. Against this background, there are also some people who 'grit their teeth and continue with their day-to-day existence' whilst holding to the thought that the value of life is something of concern to only the individuals themselves, and differs from person to person depending on their conditions and circumstances – its value is personal, local and frequently temporal. For instance, a person may find no value in their own life and commit suicide; but another who suffers from progressive multiple sclerosis (MS) may look to a physician to assist them in committing suicide. A different person in the same conditions may enjoy and value their life and, therefore, refuse to commit suicide. Informed by the philosophical notions of instrumental,

intrinsic and personal value as well as a social constructionist approach to 'Islam' and referring to eight arguably major exegeses, this paper addresses the case of (physician assisted) suicide and will examine the question: 'How far do Qur'anic exegeses address the diverse understanding of the end of life issues in tackling the view that life can be "valuable to" or "not valuable to" a person?'

Everyday Discrimination in Canada: Prevalence and Patterns

Using nationally representative data from the 2013 Canadian Community Health Survey, this article examines the prevalence and patterning of everyday discrimination in Canada. Almost twenty-three percent of Canadians report experiencing at least one form of everyday discrimination, with many experiencing more than one. The most common types of discrimination are gender, age, and race, followed by discrimination based on physical characteristics such as weight. Sex, age, marital status, race, place of birth, and body mass index all contribute to individuals' experiences of discrimination, while indicators of social class have smaller effects. Gay men are particularly at risk for discrimination based on sexual orientation, Blacks, Asians and Aboriginals are particularly at risk for racial discrimination, and Arabs, South and West Asians and Aboriginals are particularly at risk for religious discrimination. There is strong evidence of the persistence of everyday discrimination in Canada, despite over thirty years of federal human rights legislation.

GODRIE, BAPTISTE* (*Montreal Research Center on Social Inequalities and Discriminations*)

Epistemic Injustices and Mental Health : Can Peer Support Workers Help Bridging the Hermeneutical Gap between Service Users and Health Practitioners ?

This paper presents the first results of a research funded by the *Social Science and Humanities Research Council* (SSHRC) on experiential and professional knowledge in mental health. The reflection takes place within the theoretical framework of epistemic injustices borrowed from constructivist feminist and postcolonial epistemologies. For these epistemologies, as conceptualized among others by Miranda Fricker, Nancy Tuana and Boaventura de Sousa Santos, the recognition and production of knowledge are the product of the systemic inequalities and oppressions that structure social relations.

The concepts of testimonial and hermeneutic injustice seem relevant in the context of oppressive psychiatric treatment. People with mental health problems (PWMHP) are vulnerable to testimonial injustice through the presumptive attribution of characteristics like cognitive unreliability and emotional instability. The lack of first-hand knowledge from the majority of health practitioners also creates a gap in collective hermeneutical resources. These epistemic injustices affect the quality of the care.

By providing a better understanding of mental health problems, peer support workers employed in intensive case management teams (ICM) and assertive community treatment (ACT), can help reducing these kind of injustices between health practitioners and PWMHP. In some teams, however, peer support workers' knowledge is kept at the margin, which contributes to maintain epistemic injustices and professional boundaries. The qualitative data presented are based on a field work (2017) combining direct observations of peer support workers' employed in various ICM and ACT teams in Montreal and Grenoble (France) and 40 semi-directed individual interviews with PWMHP and health practitioners.

The Paradox of Green Consumption: Is It for Social Justice?

What is the ground of environmental justice? Can anything green get a green light in the line of environmental movement? Previous studies of green consumption indicated the behavior of green consumer impacted by the environmental attitude, knowledge, beliefs and norms. However, this paper explores the paradox of green consumption, in that the environmental-friendly market and purchasers worsen the social polarization, particularly in the organic food market in the USA. In other words, the "green" product is used as a tool for social differentiation (Elliott, 2013) which contradicts with social justice; the organic food purchasers consequently distinguish themselves from people who can't afford it; the market promotes the organic products by publicizing a good image of "green" and increasing its price.

In this paper, there are three main objectives. First, it aims to highlight how people spend their money differently on organic food related to several aspects, such as their socioeconomic status, age, sex and race. That is, it seeks to scrutinize how green consumption could differ depending on the consumer's demographics. Second, it aims to analyze why the purchaser choose to buy organic food and

to go to organic food market. That is, it seeks to explore the complicated reasons affecting environmental friendly decision-making. At last, it aims to reveal not only the side of demand, but also one of supply. It seeks to highlight how the market has manipulated the image of "green" with their marketing strategies. The data will be collected by doing document analysis (investigation reports, news articles, and other primary source materials) for the market analysis and conducting on-line survey of local people in SLC, Utah in order to analyze who purchases organic food more and which factors make people buy it. In conclusion, this paper will be a theoretical and empirical on green consumption.

GOHN, MARIA DA GLORIA* (*University of Campinas*)

Participación Social De Los Colectivos, Movimientos y Grupos Sociales En Las Protestas En Las Calles y En Las Políticas Públicas Del Estado Brasileño: 2013-2017

El objetivo de este trabajo es discutir temas centrales en los procesos contemporáneos de la democracia en Brasil, centrándose en dos áreas: primero, las protestas y manifestaciones en las calles de movimientos sociales y colectivos organizados, entre el 2013-2017; y, segundo, las formas de participación institucional en las políticas públicas del estado, antes y después de los cambios en la escena política nacional en el año 2016 (impeachment del Presidente). El documento hace un mapeo de los movimientos y grupos civiles organizados bajo diferentes corrientes políticas y culturales, comparando sus pentagramas, demandas y actuaciones con la participación institucional de los individuos y grupos en el Consejo, cámaras, etc. en las políticas públicas del estado brasileño. ¿La gran pregunta es: hay relación o sintonía entre las prácticas, objetivos e la cultura de estas dos formas de participación?

GOHN, MARIA DA GLORIA* (*UFABC-Federal University of ABC*)

Social Movements in Brazil- from 1988 to 2013-2018: Two Different Political Cycles

This work aims analyzing a striking period on political, social and economic situation in the history of contemporary Brazil highlighting two moments: 1988 and 2013-2018. The first focuses on the social rights enshrined in the Constitution of 1988 and the second covers the period of 2013 to 2018, as regards the rights of individuals and groups to participate in different spheres of civil society and public policy. Highlight the achievements of citizenship rights in 1988, the transformations that have occurred in the period and the emergence of new social movements conservatives in 2010 decade. The paper seeking to draw a horizontal line to articulate three issues: the different types of social rights demanded and implemented; the gains and losses in terms of civil participation in public policies; and the transformations of the actors on the scene in the streets in protests. The look on the actors highlights the networks of activism that has built since 2013 events focusing on: what are the subjects in the public scene, forms of organization, the repertoires of social and political action, mobilization, strategies and demands. Three issues are investigated: 1- What were the advances and retreats of the citizenship rights to celebrate 30 years of the Brazilian Constitution (1988-2018)? 2- What are the social bases and inspiration of the brand-new conservative groups (Brazil Free Movement, Comes Out to Street (Vem Pra Rua), etc.) and the brand new autonomist groups (Free Pass Movement and high school students), 3-what happened at the 2010 Classic old social movements (unions, struggle for land, housing etc.) and with the new social movements (cultural identity-gender, race, ethnicity, etc.)?

GÖKALP, EMRE* (*Anadolu University*)

The Local Belongings, National Identities and Global Flows in Turkish Football: The Case of Eskişehirspor Fans

Industrial football, which has been neo-liberalized and increasingly articulated to consumption culture, seems to be a field on which almost all features of globalisation appears. Historically, the increasing cultural complexity of football as a substantial agent of local/national identity reflects the globalisation more. Inevitable consequences of the globalisation from global football trade and the fan culture to the economical organisations of the football clubs are also seen in football extraordinarily.

Does the globalization process weaken the position of football as a fundamental source of local and national belongings or does the globalization in football also make localization possible concurrently with homogenization at global level? To what extent do the earlier boundaries between local, national and global become vague as football increasingly becomes globalized? In the light of these questions, this paper aims to discuss how and in which way do the global and local dynamics transform the world of meaning of supporters along with industri-

alization and globalization of football. Based on a sociological fieldwork conducted on Eskişehirspor (Turkish football club located in the middle Anatolian city of Eskişehir) fans (1,117 questionnaires were used and 40 in-depth interviews were conducted in the research) this paper argues that the dialectic between the globalization of football, local belongings and nationalism preserves its importance in the case of Eskişehirspor, although it seems to be complicated and contradictory. [A high degree of sentimental attachment to the team, a strong feeling of a sense of a loyalty not only to the city's identity but also to Turkish nationalism have always been regarded as the one of the distinctiveness of the Eskişehirspor fans in Turkey.] The paper maintains that the simultaneous coexistence of the globalizing football culture and the nationalism(s) will continue to widespread in the Turkish case as seen around the globe.

GOLDENBERG, IRINA* (*Department of National Defence Canada*)

Military and Civilian Personnel Integration and Collaboration in Defence Organizations - Introduction

Defence organisations consist of military and civilian personnel working in partnership while governed by different personnel management systems and reflecting distinct cultures – all of which may affect military-civilian collaboration, personnel outcomes, and organisational effectiveness.

Although the issue of civilian-military personnel integration has not received much empirical attention to date, Defence organisations are increasingly recognizing the importance of optimizing collaboration between their military and civilian workforces, with many adopting organizational terms implying that the military and civilian workforces form a cohesive whole: the *Defence Team* (Canada), the *Whole Force Concept* (United Kingdom), *One Defence Team* (Sweden), and *Total Defence Workforce* (New Zealand). This presentation provides an introduction of this domain as it pertains to military and security establishments in order to set the stage for the subsequent panel presentations. The panel invited proposals examining conceptual, theoretical, and empirical analysis of military-civilian personnel integration and collaboration in defence organizations, including topics such as intergroup leadership and supervision, organizational identity, organisational culture, civilianization of military occupations, aspects surrounding fairness and perceptions of fairness for service members and civilian employees, civilians on operations, and the analysis of policies, procedures, and best practices relating to civilian and military personnel management.

The Chutes and Ladders of Precarious Non-Citizen Legal Status Trajectories and Incorporation in Toronto.

This paper identifies and analyzes impromptu, unofficial and contingent approaches to gaining permanent status undertaken by Latin American and Caribbean migrant workers in the City of Toronto. In the absence of official regularization programs, migrants navigate the chutes and ladders of immigration in an effort to extend their stay, acquire a work permit, and make their presence secure rather than precarious. We draw on data from a mixed-method survey of 190 migrant workers who entered Canada with precarious legal status. Our analysis shows that approaches to improving legal status and security are embedded in distinct regional histories and networks of migration and different types of Toronto-specific institutional practices with variable opportunities for discretionary and predatory practices. The case study demonstrates the importance of conceptualizing legal status trajectories towards precarity and security as contingent and institutionally-embedded chutes and ladders of incorporation.

Operationalising Love within Austerity. Can Love Become an Organisational Asset?

This paper considers the emotion of love as a response by small voluntary and community organisations to austerity, whilst also recognising the symbolic violence implicit in a requirement of staff and volunteers to offer such an emotional attachment. In the context of this paper austerity is considered as the consistent reduction of funding to public and civil society organisations, by successive governments since the 2008 financial crash, in order to address the national deficit of the United Kingdom.

In considering the negotiation of love and power within a British small voluntary and community organisation (VCS), this paper argues that in order to offer a distinct, innovative and alternative response to austerity; the VCS needs to address its strengths, to utilise the love that exists within an organisation and to embrace the emotional. To build love as a response to austerity.

This paper considers the emotion of love, as key to a small VCS organisations' response to austerity policy. This love was evidenced in the solidarity of the organisations' staff, its collective values and mutual support. The research with this small VCS organisation revealed that key charismatic, committed and passionate individuals within the wider local VCS and within the organisation were integral to its organisational response to austerity. Research findings identified the role of key individuals in building the organisational environment and responding to the challenges posed by austerity. Within this organisation these key individuals operated using what this paper argues to be a key organisational capital, love. In considering the negotiation of love and power within the organisation, this paper argues that it was able to offer a distinct, innovative and alternative response to austerity. This paper argues for love as an organisational asset.

New Forms of Family in Iran: Media Representation of White Marriage and Bio-Politics

New forms of family in Iran:

Media representation of *white marriage* and bio-politics

This paper extends emerging discussions about *white marriage* (Ezdevaj e Sefid) as a new form of family in Iran (Azad, Sharifisaiy, Eisari, & Talebi, (2012), Afary, (2009) by analyzing the thematic and structural patterns of the news coverage. White marriage is an urban, middle class phenomenon among heterosexual Iranian young women and men who choose to live together without the religious and the legal approval, similar to cohabitation in the west. Drawing on qualitative research, I examine: first, how the Iranian media expresses explicit and implicit messages about white marriage; second, how the Iranian media validates the stand point of some individuals and groups but not some others; third, how the media's approach to white marriage have been gradually re-oriented from hostility to reluctant tolerance. Debates about white marriage manifest provides us when a lens to understand contestations over ideological and religious concerns in Iran. Tracing media portrayal of white marriage and inspired by Foucauldian perspective, my main argument is that political interests gradually shifted from decisions over the existence and the non-existence of white marriage to the management of it, for the purpose of encouraging population growth. I posit that this shift is best understood it as a gradual transition from sovereign power to bio-power in Iran (Shahrokni, 2014).

Within-Family Inequalities of Inheritance and the Transmission of Social Status from Generation to Generation in Contemporary France

Based on statistical and ethnographic French data, this communication will examine intergenerational transmission inequalities according to sex and sibship birth order, beginning with an analysis of inheritance transfers from one generation to another in contemporary France. To understand these disparities we shall combine the statistical analysis of the INSEE "Household Wealth Survey" (2013-2014) and the study of a monograph of a French family.

Statistical analysis shows that later-born siblings prove to be the favoured recipients of early financial transfers. But first-born sons access to better educational and work achievements. This increases their income expectations and predestines them to receive the family property, albeit belatedly. Only children, whether male or female, receive both these different resources. Ethnographic interviews and observations show that plans for social mobility including academic success are specifically invested in first-born sons. The intergenerational transmission of between-family inequalities is based on within-family inequalities. Inequality in terms of inheritance reflects specific positions in social reproduction strategies, as revealed by the unequal educational and work achievements of boys and girls, and first-born and later-born siblings.

The analysis of inheritance transfers from generation to generation thus reveals the differentiated treatment of children in the same sibship, above all when it comes to the passing on of cultural capital. Despite changes in the role of inheritance in social stratification, all resources – including cultural capital – which can be passed on to reproduce or improve social status remains a "rival" good that is shared between brothers and sisters in a more or less unequal fashion.

Autonomy of Politics and Economy As a Challenge for the Former Communist Countries: A Comparative Perspective

The paper addresses the significance of autonomous self-organisation of the functional subsystems as one of the key challenges of post-communist transformations in Europe and Asia. Particular emphasis is placed on the autonomy of the political subsystem, which is supposed to be produced by the processes of democratisation, and the autonomy of the economic subsystem, which is supposed to be produced by marketization. While the initial challenge has been establishing the autonomy of various subsystems from the domination of the political subsystem (typical for the communist regimes), more contemporary challenges also include the problem of maintaining the autonomy of politics and other functional subsystems from the (neoliberal) market principles typical for the economic subsystem.

In theoretical terms, the paper draws from Niklas Luhmann's social systems theory. Methodologically, it applies quantitative (path analysis) and mixed methods (fuzzy sets based qualitative comparative analysis). It demonstrates that a radical break with the former communist regime is sufficient for the self-organisation of the political subsystem and necessary for the radical market reforms. The latter, on the other hand, are sufficient but not necessary for the self-organisation of the economic subsystem, indicating a variety of ways into market economy. Moreover, though this is far from typical, a democratic self-organised political subsystem can also be established without a radical break with the past, as demonstrated in the case of Slovenia. Due to its specifics, this case is thus more precisely analysed, connecting the change and continuity in social structures with the reproduction of the political and economic imaginaries through the dominant discourses.

The Public Schools for Poorer Brazilians: Unequal Educational Policies in Brazil

In the course of the last governments, public policies have been implemented, which have resulted in the reduction of the social inequality in Brazil. Nevertheless, the literature available on the subject shows that the public policies developed in the country lack equity. This paper discusses the relationship between the federative organization of Brazil and the offer of unequal opportunities in education in the different states of the country. More specifically, it analyzes how the difference in the investment capacity in education of each state affects the infrastructure conditions of its schools. It also investigates the hypothesis that in the states with a lower budget for education, students have worse school opportunities, assessed from the infrastructure conditions of the public schools. In methodological terms, this paper uses information related to the public budget in education to compare the investment capacity of the federated entities or states in the year 2013. On the other hand, the characterization of the school infrastructure is based on data from the 2013 School Census, submitted to a latent class analysis. The results of this study show that there is an association between the unequal investment capacity in education existing among the states in Brazil and the infrastructure conditions of their schools. Overall, in the states with the lowest financial resources, schools have worse material conditions, confirming the hypothesis presented in this research. Thus, the reduction of the inequality in Brazil also requires federative changes that enable more equitable public policies and the provision of more similar educational opportunities among states.

Las Mujeres En El Cine Latinoamericano Contemporáneo: Entre La Violencia Simbólica y El Empoderamiento Femenino

La experiencia de ver una película para disfrutar el ocio permite que los espectadores establezcan contacto audiovisual y un vínculo emocional con personajes, situaciones, tiempos, espacios y contextos. En este proceso, son instigadas interpretaciones sobre el lugar de cada persona en el mundo y, muchas veces, esto ocurre en medio a situaciones de violencia física o simbólica hacia las mujeres plasmadas en las películas. Atenta a estas cuestiones, la presente investigación tuvo como objetivo comprender de qué manera las mujeres son representadas en películas latinoamericanas contemporáneas, con el fin de identificar la existencia de situaciones de violencia ejercidas por personajes masculinos sobre los femeninos, y las posibilidades de empoderamiento para ellas. De enfoque cualitativo, la metodología involucró investigación bibliográfica, entrevistas con 54 espectadores y análisis fílmico de 15 películas latinoamericanas que cumplieron los criterios previamente establecidos. Estas fueron organizadas

en tres grupos: películas construidas bajo una mirada masculina (10), que traen personajes femeninos en posición de dominio/poder (2) y películas que empoderan a personajes femeninos (3). La violencia física no fue identificada, pero la violencia simbólica de los hombres hacia las mujeres está presente en casi todas las películas analizadas. Se constató la naturalización de la violencia simbólica, lo que produce efectos en los comportamientos y en la forma en que cada espectador se reconoce y se posiciona en el mundo. Solamente 3 películas presentan mujeres viviendo situaciones complejas, con voz y visibilidad en la narrativa, enunciando diálogos contextualizados y bien elaborados que desafían valores establecidos y estándares normativos. El empoderamiento femenino fue representado de formas diferentes: por la inversión de papeles atribuidos a mujeres y hombres, en contextos profesionales y en el despertar de la conciencia sobre las desigualdades sociales. Apoyo: CNPq/FAPEMIG/CAPES.

GOMES, CRISTINA* (*Facultad Latinoamericana de Ciencias Sociales, FLACSO Mexico*)

Economic Principles, Implementation and Results of Universalist and Focused Social Policies in Latin America.

Under neoliberal policies, social programs, social security and labor rights, should be suspended in order to reduce labor costs and promote international competition. However, due to recurrent economic crises, trade and financial liberalization has demanded increases in social expenditures, based on higher unplanned state indebtedness (Avelino et al., 2005). Keynesian economics proposes different compensatory responses at each stage of the economic cycle. In times of crisis, it suggests that the State should stimulate consumption; invest in policies to promote employment, workers' protection and social security; maintain or increase its expenditures on education, health, and works (Stiglitz, 2010; Avelino et al., 2005). This paper describes the predominant economic thoughts, the evolution of social spending and the implementation of different types of social policies, adopted, universalist and focused in the last decades in Latin America (LA). Since the 1950s, universal policies, inspired by the European welfare states, have been implemented. However, contributory pension schemes cover only formal wage earners, while more than 50% of the workers are not wage earners and make up a broad informal sector. Universalism has never existed in LA.

The 1980s are seen as a "lost" decade, with recurrent crises, rising poverty and inequality. During the 1990s, commercial and financial liberalization policies and privatizations of public enterprises were implemented, with increased unemployment, de-financing and privatizing traditional social security systems (Levy, 2013). Since the beginning of the 2000s, Keynesian measures were adopted to protect employment and stimulate consumption, high investment in social policies, including non-contributory pensions, health insurance and monetary transfers aimed at the poor, which increased social spending since 1990, but with positive results on poverty reduction (from 26.8% to 13.3%) and on inequality (around 6 to 3 percentage points), achieving higher levels of inclusion, not universalism.

Partnerhood and Parenthood Among Poor Families and Social Policies in Salvador, Brazil

In Brazil, most social policies deliver benefits to women with children (Lagard et al, 2007; Handa et al, 2006; Rasela et al, 2013; Rawlings & Rubio, 2005). In addition to material goods, such as money or home, there are goods that depend on the interpersonal or relational ties and relationships which the market can not offer. Relational goods are identity and motivation dependents, such as conjugality, paternity and motherhood, membership, mutual support, commitment, and self-reliance (Bruni, 2008; Becchetti et al, 2008, 2011); protection and care, which are largely provided by families, primarily by women, according to the patriarchal tradition.

Some authors assume that surrendering resources to women to promote children education and health could reinforce the domestic role of women and create marital conflicts such as gender-based violence. This research evaluates how social policies promote relational changes and modify women perceptions and aspirations, experiences and behaviours in domestic roles, conjugal and maternal relations. The qualitative methodology was adopted, applying ten interviews with women who are beneficiaries of policies, and three focus groups of men and women who are relatives, neighbours or friends of beneficiaries; the results are interpreted using discursive analysis. The results of interviews with women indicate that, in addition to the reduction of monetary poverty, these policies promote positive changes in marital and parental relationships, such as increased self-esteem and empowerment of women in financial decision-making, greater dialogue among partners and with children, negotiation skills and planning in relationships among spouses and children. However, the woman does not feel independent at all. Men who participated in focus groups coincide with women and indicated greater satisfaction with changes in women's self-esteem and

fatherhood satisfaction after receiving benefits from programs. On the contrary, relations with neighbors can experience conflicts due to competition for scarce resources.

Asymmetric Mobility and Migration of Highly-Skilled Workers in Europe

Emigration is a chronic structural process of the Portuguese society. The discussion and key arguments raised in this chapter are mainly focused on data from a research project (Bradramo) on Portuguese skilled emigration; based on the outcomes of the Bradramo project it can be suggested that recent phenomena in general, and the crisis that began around 2008 in particular, profoundly transformed the patterns of Portuguese emigration. Nowadays, the country faces a brain drain dynamic that is dramatically altering the profiles of national emigrants, emigration destinations, self-identity, and the strategies of those who leave the country. Academic mobility, mainly that promoted by the European Union (through grants from the Erasmus Programme), created and fostered mobility flows that reinforced a latent mobility phenomenon. Once engaged in academic mobility programmes, Portuguese higher education students tend to stay in the country of destination or, upon returning temporarily to Portugal, to evince a very strong predisposition to move to a country of the European Union. The profile of Portuguese high-skilled emigrants reveals a trend towards a permanent and a long-term (as opposed to a temporary or transitory) mobility, an insertion in the primary segment of the labour market of the destination countries, a predominance of professionals connected to the academic/scientific system and to professions requiring high skills, and a latent mobility (after a period of study in the country of destination) rather than direct mobility flows (after having entered in the employment system of the sending country).

Prison, Ethnicities and State – Establishing Theoretical and Empirical Connections

Throughout this paper the intersections among crime, prison, race, ethnicity and State are examined, revealing that the State has a central role in the reproduction and production of social inequalities and direct criminalization of certain ethno-racial groups. This reflection began with a review of the literature on crime associated with racial and ethnic groups in North American and European contexts which traces the central role of social inequalities in the explanation of the phenomena under study. After this theoretical reflection, a study developed in Portugal is presented, which illustrates precisely that the pathways to prison of individuals of certain foreign and ethnic groups must be understood in two ways: (i) not only in terms of objective living conditions, which are a result of various social inequalities in life, leading them more easily to prison, but also (ii) in terms of the role that the criminal justice system itself plays, with difficulty in accessing law and justice that makes it easier for individuals to be caught and maintained in the justice system. Finally, struggles and dilemmas are discussed while the research considers a theoretical and practical understanding of criminal phenomena connected to race, ethnicity and nationality at the political level.

El Monólogo De Género y Las Implicaciones De La Violencia En Mujeres Universitarias

Los cambios actuales orientados a apoyar la igualdad de género, se reflejan y comunican en diferentes acciones cotidianas, debates académicos, estudios de investigación, esfuerzos colectivos y políticas públicas, no obstante tan ardua labor, la discriminación y el maltrato hacia las mujeres prevalece. La preparación académica femenina y su profesionalización son insuficientes y se han conservado en diferentes grados, hábitos e ideas culturales de sumisión y desvalorización a través del modelo de la educación patriarcal. Este estudio muestra los resultados de una Encuesta aplicada a ciento ochenta mujeres universitarias en los Estados de Querétaro y Guanajuato, México, durante los meses de julio, agosto y septiembre de 2017. El objetivo es conocer su situación de violencia en los ámbitos familiares y laborales. Los resultados fueron sistematizados y refieren la necesidad de

esfuerzos mayores incrementando programas preventivos, orientadores, monitoreados con seguimientos efectivos y prácticas de comunicación constante, para empoderar a las mujeres sobre sus derechos y reconocimiento en vías de una sociedad más justa, con mejores oportunidades de desarrollo, equidad e inclusión.

Self-Organization Under Natural and Social Catastrophes

Popular self-organization following natural or social catastrophes. The 2017-09-19 earthquake in Mexico

It appears that, under certain circumstances, in capitalist society it is possible for people to manage and govern society directly, without the mediation of a special political class of officials organized to perform those functions. In many instances, those circumstances arise from natural or social cataclysms that continually affect the social organization. People are driven to spontaneously organize themselves in order to take over, partially or completely, administrative and governing tasks, at first those directly related to the catastrophe itself, due to the disorganization or disability of the central political power, but then extending to other areas as organization dexterity grows, and the situation affords itself.

However, during and in the aftermath of these catastrophes, the centralized political power of capitalist societies confronts these self-organizing attempts by the population. Measures taken by government forces can exhibit a greater or lesser ability, be more or less violent, all to quell the spontaneous self-organization by the people in whatever attempt to take over the management and governing powers of society. The result of this confrontation will depend, naturally, on the correlation of forces between the two, but above all, on the organizational capacity and the level of consciousness achieved by the self-organized masses of people.

During the recent earthquake in Mexico, thousands of people went to the affected areas and spontaneously organized themselves in all sorts of rescue tasks. The government acted late, inefficiently, and many times in conflict with the self-organized volunteers.

Field work will be undertaken in Mexico City and surroundings to document these events and to try and describe possible outcomes.

¿Indiferencia Frente a La Política En Chile?: De La Neutralización De La Agencia Política Merced De Las Trampas Constitucionales a La Ciudadanización De La Política Por Vías No Institucionales

La ponencia pretende poner en entredicho el reiterado diagnóstico de la supuesta indiferencia que la ciudadanía chilena tiene en la actualidad respecto a la política. Se sostendrá que dicho diagnóstico de indiferencia refiere únicamente a una estrecha comprensión de la política, simplificada en lo que conocemos como real politik o política ejercitada únicamente por canales institucionales del Estado, dado que la principal argumentación de la indiferencia se sostiene en los bajos índices de participación política electoral, que han caído en picada pese a la reforma introducida por medio de la ley de inscripción automática y voto voluntario, ideada para levantar los índices de participación electoral. Se sostendrá además una argumentación sociológico-jurídica para explicar el descenso sostenido en la participación electoral, fundada en el diseño de lo que Roberto Gargarella denomina la "sala de máquinas constitucional" y que en el caso chileno se articula por el funcionamiento interdependiente de lo que Fernando Atria y la literatura crítica sobre estudios constitucionales chilenos denominan como "trampas constitucionales": el sistema electoral binominal, la existencia de un tribunal constitucional que funciona como una tercera cámara legislativa y cuyo nombramiento carece de elección popular; y finalmente los altos quorums exigidos para las leyes orgánicas constitucionales y las reformas constitucionales. El funcionamiento conjunto de dichos mecanismos tiene una responsabilidad central tanto en la neutralización de la agencia política ejercitada por los representantes elegidos por sufragio popular así como también en la pérdida de confianza ciudadana en el voto como instrumento útil para efectuar transformaciones políticas. Se sostendrá finalmente que lejos de la indiferencia política, se ha producido un fenómeno que Gabriel Salazar y la historia social chilena denominan como "ciudadanización de la política", mediante el cual la participación electoral se ha desplazado a vías ajenas a la institucionalidad del Estado como acontece con los movimientos sociales.

RC24-461.3GONCALVES, LEANDRA (*Unicamp*)TORRES, PEDRO HENRIQUE* (*University of Sao Paulo*)GOMES, MARCELA (*Federal University of Santa Catarina*)KLUGE, BRUNA (*Federal University of Santa Catarina*)*Smoky Boundaries: Greenpeace Brazil, NGOs and the Social Movements*

The study of social movements and of third sector organizations are still present and strong in academic debate, especially because of the changing character of the very essence of this political sphere. With the increasing intensity of environmental problems in the contemporary world, on the other hand, organized groups are emerging seeking to "save the planet".

One of the main organizations that proclaims itself in defense of the environment, is Greenpeace, which emerged in the 1970s. Through the classic and contemporary bibliographic review on NGOs and Social Movements, the present work has demonstrated the nebulous frontier to fit Greenpeace Brazil within these milestones, complementing the methodological part of the research with key actors, members and ex-members of the organization, to analyze how they perceive - and if they perceive - the demarcation of this border.

The objective of this work is to test the hypothesis that Greenpeace, unlike other environmental NGOs, has distinct characteristics of a Third Sector organization in its theoretical definition, approaching and, in a dialectical way, confusing and being confused by the actors and collective subjects with which it interacts, in relation to being an NGO or a Social Movement. In addition, it was assumed that the environmental movements have a heterogeneous character, being formed by distinct groups and interests, from foundations and organizations with market bias to community groups in defense of the preservation of natural resources as a means of subsistence.

Preliminary results indicate that the material served in a complementary way to our theoretical approach, validating and exposing perceptions that confirm the border nebula to locate, socially and politically, Greenpeace Brazil and its performance in the country.

RC02-57.2GOND, JEAN-PASCAL* (*City, University of London*)O'SULLIVAN, NIAMH (*Nottingham University Business School*)FURNARI, SANTI (*City, University of London*)*Relational Work for Sustainable Finance: Exploring the Political Dynamics of Shareholder Engagement on Environmental, Social and Governance Issues*

A recent development in our context of 'investor capitalism' (Davis, 2009; Useem 1996) is the rise of practices of 'active ownership' or 'engagement' that move beyond proxy voting and takes the form of direct dialogue between investors and their investee companies on environmental, social or governance (ESG) issues. Finance scholars suggest that engagement on ESG issues can lead to positive abnormal financial returns (Dimson, Karakas & Li, 2015); global institutions such as the United Nations-backed Principles for Responsible Investment actively promote engagement by enabling institutional investors' collective actions targeting multinational corporations (MNCs) (Gond & Piani 2013).

However, because engagement takes place 'behind closed doors', little is known about the cognitive, social and political dynamics that underlie engagement practices. In this paper, we build on the concept of 'relational work' developed by Bandelj (2012) after Viviana Zelizer (2005) to investigate engagement from the perspective of the individuals involved in the process, and with the aim to uncover the profoundly relational and political nature of engagement. To document engagement practices, we conducted 112 interviews with actors in charge of engagement on ESG at institutional investors (n=66) and dealing with investors' ESG requests at MNCs (n=36), as well as with field-level experts of engagement (n=10).

Our findings show that through engagement, new relations emerge between investment firms and MNCs that enable the symmetric consolidation of actors' position and relations within their own organizations, enhancing further these actors' capacity to engage in relational and political work for promoting sustainable development. By uncovering a neglected relational facet of investor capitalism and its complex connections with sustainability issues, our study extends the analysis of corporations as "open politics" (Weber & Waeger, 2017), allowing a discussion of the potential and limitations of relational forms of finance to move MNCs and investors towards sustainability.

RC37-655.4GONZALEZ, JORGE* (*University of Ottawa*)*Coloured Avant-Gardes in Postcolonial Cape Town: On How the Visual Arts Influence Racial-Ethnic Meaning Making*

With politics, economics, and facets of the physical scientific academy taking a very essentialist turn, traditional and historically consecrated understandings of race and ethnicity continue to inaccurately portray the reality of people in South Africa. In contemporary South Africa, the long-recognized and defined concept of "coloured" continues to be problematic for those claiming the label. This research analyzes the role of coloniality on the visual arts as a form of racial-ethnic meaning making for coloured avant-garde painters, graffiti artists, and sculptors in Cape Town, South Africa. This research explores the intersections of racial-ethnic identity, the avant-garde visual arts, and the construction of self by employing participant observation, in-depth interviews with coloured visual artists, discourse analysis of what it means to be coloured in South Africa, and semiotic analyses of artworks created by coloured avant-garde artists. This research project further contributes to the literature on Southern African studies, race-ethnicity, the sociology of art and culture, and postcolonialism. In a time with massive human migration due to war and political instability; racial-ethnic conflict and tension in North America, Europe, and Southern Africa; and the importance of cultural artefacts and symbols for uniting peoples and movements, the complexity of racial-ethnic categorization and racialization must continue to be elucidated and explored. With the increasing rapidity of globalization and the associated movement and intermixing of cultures, identities, and peoples, constructivist approaches to race-ethnicity empower mixed-race peoples to define identity for themselves. As an ever-growing contingent of the global population, mixed-race peoples and their lived realities must be explored and valued on par with essentialized racial-ethnic categories of people. What this research does is empower the voice and dignity of coloured peoples in South Africa in relation to their use of visual artworks for the creation of racial-ethnic meaning-making.

RC40-704.5GONZALEZ, JORGE A.* (*CEIICH-UNAM*)GRAVANTE, TOMMASO (*CEIICH-UNAM*)*Prosumers and Alternative Food Practices in Mexico: Between Pre-Hispanic Tradition and Social Innovation*

The nutrition transition and neoliberal policies that Mexico has seen over the last three decades have driven the country to (among other things) a sovereignty and food autonomy crisis on the one hand and an epidemic of obesity and illnesses connected to malnutrition on the other. This loss or gain of knowledge is intimately linked to incapacity or capacity for organization and to the generation, provision and analysis of information or its opposite, disinformation. As a response to this widespread loss of nutrition knowledge, a new type of consumer has emerged in recent years that is not only more attentive to what he/she consumes but also to the way in which food is produced and the people who produce it.

This process is creating a series of collective experiences that, on the one hand, recover some pre-Hispanic traditions of production (*milpa* or polyculture directed towards value in use), distribution (*tanguis*, as a way of selling immersed in traditional relationships) and the consumption of foodstuffs (recovering plants called *quelites*, which have a high nutritional and symbolic value). At the same time, they deploy a series of innovative social practices within the socio-cultural context of the country, characterized by a collective culture focused on resilience.

Taking our ethnographic work as a starting point, in this presentation we will show a range of experiences in different areas of Mexico (Altiplano Potosino, Mexico City, Guadalajara, Oaxaca) to identify the actors and the different conditions that form these emerging processes to build some levels of food sovereignty which involve developing an information culture, a communication/organization culture and a knowledge as a way of facing up to the world processes disabling food sovereignty.

RC47-JS-76.5GONZALEZ, JORGE A.* (*CEIICH-UNAM*)GRAVANTE, TOMMASO (*CEIICH-UNAM*)*We Are Kneading Another World. Alternative Food Practices and Futures in Mexico City*

The nutrition transition and neoliberal policies that Mexico has seen over the last three decades have driven the country to (among other things) a sovereignty and food autonomy crisis on the one hand and an epidemic of obesity and illnesses connected to malnutrition on the other.

This process of disabling food knowledge is impossible to achieve except as the integrated effect of food disinformation and both, in turn, are framed by disorganization and disconnection regarding specific decisions to do with anthropogenic production at all scales. As a social response to this widespread loss of nutrition

knowledge, Mexico has seen the formation of different social movements for food sovereignty.

In Mexico City, in particular, recent years have seen these classic collective action experiences joined by others characterized by attention not only on food production but on how they are distributed and consumed, thereby redefining an alternative lifestyle marked by the recovery and/or enhancement of pre-Hispanic production traditions – *milpa* – distribution traditions – *tanguis* – food consumption – and the recovery of *quelites*. The alternative lifestyle is also marked by a series of innovative social practices such as vegetarianism/veganism, the recovery of ties to nature in the city, sustainable habitation, solidary economic models, community participation and organization, development of appropriate technology, the emergence of a collective resilient culture.

In this presentation we will analyze some experiences in Mexico City and see how their alternative food practice and network experiences are shaping values, visions, projects, and strategies, and help transform one of the biggest cities in the world and open it to alternative futures.

STEPHENS, ANDRE (University of Washington Department of Sociology)

Governance from below: Examining How Grassroots Refugee Groups Expand the "Who, When, Where and How" of Welfare Services in the Resettlement Policy Domain

The top-down arrangements of governance that conjoin the welfare state with the private and nonprofit sector are increasingly challenged by heightened migration and advanced urbanism. Scholars focus on the "dark side" to public-private partnerships (O'Toole & Meier 2004), the "shadow of hierarchy" (Whitehead 2007) and "partnership crisis" (Bristow et al 2009) in ways that call into question the promise of NGO- and community-inclusion envisioned in public-private partnerships. Scholars of multiscale governance point to the 'lower scales' for renewed visions of participatory policy approaches (Sommerville 2011). In the US refugee resettlement domain of social welfare provision, grassroots Refugee Community Organizations (RCOs), formed and run by refugees themselves, operate alongside state-funded NGOs but are marginalized in official policy processes. Our study applies a critical perspective in re-examining RCOs within resettlement policy and the scope of services they provide vis-a-vis their state-funded counterparts. We draw on interviews with organizational leaders of RCOs in Bhutanese communities in 35 US cities, using directed content analysis. We find that the scope of RCO-provided services are wider—in terms of the "who, when, where, and how" of service provision—than those of state-funded organizations which are stifled by the regulatory and fiscal limits of federal policy. *Who and when*: Findings show that RCOs extend assistance well beyond the eligibility requirements and time limits of policy and target assistance to those neglected by work-oriented policies. *Where and how*: Whereas mainstream social welfare organizations have difficulty reaching marginalized communities, our findings show that grassroots RCOs are closer to the needs of refugee communities in terms of proximity and service delivery. In our final analysis, we argue that multiscale governance has not gone low enough. In the resettlement domain of social welfare, these most peripheral levels—at the grassroots—constitute the core and sustain multi-level governance.

Re-Thinking Social Responsibility and Business Ethics. a Review of the Thinking of Gilles Lipovetsky.

Re-pensando la responsabilidad social y ética empresarial. Una revisión del pensamiento de Gilles Lipovetsky.

Alba María del Carmen González Vega

El presente trabajo constituye una reflexión crítica desde el pensamiento de Gilles Lipovetsky sobre la responsabilidad social y la ética empresarial. Se exhibe la visión del autor sobre la naturaleza de la empresa y la función por la cual ha sido creada y su inserción en el mundo de la sociedad hipermoderna y posmoralista, la cual dirige ciertas prácticas para los negocios y los individuos. Se cuestiona la comprensión de la responsabilidad como un recurso moral imprescindible para mantener la legitimidad y credibilidad de la empresa. El centro de la reflexión presenta la instrumentalización utilitarista de la responsabilidad social a partir de sus antecedentes y el renacimiento del nuevo marketing que nutre la imagen con una vocación digna, un objetivo noble que supera la exclusiva ganancia (Lipovetsky, 1994).

This paper is a critical reflection from the thinking of Gilles Lipovetsky on social responsibility and business ethics. It shows the author's vision of the nature of the company and the function by which it was created and its insertion in the world of hypermodern and postmoralist society, which directs certain practices for business and individuals. It questions the understanding of responsibility as an essential moral resource to maintain the legitimacy and credibility of the company.

The center of the reflection presents the utilitarian instrumentalization of social responsibility from its antecedents and the renaissance of the new marketing that nourishes the image with a dignified vocation, a noble objective that surpasses the exclusive profit (Lipovetsky, 1994).

Practical TRUST

Our paper provides an outline of a praxeological approach to the sociological investigation of trust as a ground for social action. We aim to respecify the issue of trust by anchoring it at the level of the routine and practical accomplishment of the ordered and intelligible character of social action as a local phenomenon. To do this, we propose the concept of "practical trust".

Practical trust requires neither a specific act or relationship nor a particular cognitive basis, but is inextricably bound to the situated production and accountability of social action. We put forward that members of society act in trust by producing, for themselves and their partners, the observability of the courses of action they engage in. Practical trust is grounded in the features of the course of action that are available only in the here-and-now as produced *in situ* by the members. It is closely tied to the concerted production of joint action on the spot, contingently, using whatever is at hand. This trust is not granted beforehand, once and for ever, as a precondition for action, but rather enabled and sustained methodically and continuously by the participants, as the course of action develops.

In terms of empirical work, we suggest engaging in detailed investigation of the organization of talk-in-interaction, considered as the main resource for participants to grasp and display what they are doing together and how they can move forward. We thus stress the close link between trust and participants' concrete involvement in joint action, as well as the observability of social phenomena as they happen to be produced on the spot and in real time.

Interrogating Social Exclusion and Inclusion among Syrian Refugee Youth in Ontario

Definitions and measures of "integration" in Global North societies often presume a binary relationship between exclusion and inclusion, choice and force, and apply an individual categorical point of view to evaluate success and entitlement. Yet the social defiance of binaries belies such commonplace assumptions. This paper explores the "methodology paradox" of cognitive structures and legal categories organizing refugee research and policy, in an effort to move beyond binary inclusion/exclusion frameworks and reconfigure the focus to the analysis of social systems. Drawing on focus group data with Syrian refugee newcomer youth recently resettled in Canada, we conceptually map "symbolic economies" (Bourdieu) in which they engage, including school, work, and social networks. We also examine expressed fears, hopes and disappointments in resettlement. Their narratives speak of "unfavourable inclusion", citizenship capital, and double binds, offering an unusual opportunity to study the intersecting global and local forces of social exclusion within a fused market-state social field (Good Gingrich, 2016) and their paradoxical outcomes.

GOODE, LUKE* (University of Auckland)

Emancipatory Catastrophism and the Speculative Imagination

This paper explores Ulrich Beck's (2016) theory of emancipatory catastrophism by attending to the role of popular media in reframing environmental risk. Beck claims that disasters and potentially catastrophic risks generate new normative horizons, specifically the emergence of 'global justice frames'. The 'anthropological shock' of the risk society may be politically debilitating in the first instance but also leads to a new reflexivity, Beck argues. One significant result, he claims, is an emergent 'global environmental justice frame'. This frame, informed by a cosmopolitan ethic, also denatures climate change causes and consequences by connecting them to issues of racism, imperialism and social justice. For Beck, this new frame does not emerge automatically but as a result of 'cultural work' on the part of activists, media and others 'carrier groups'. The move from shock to reflection does not restore modernity's faith in progress or technocratic solutionism. Rather, citizens of the risk society must grapple with ceaseless social 'metamorphosis' (*Verwandlung*), provisionality and unanticipated consequences of intervention. This helps explain why the work involved in generating new emancipatory frames is *symbolic* and *imaginative*, and not merely evidence and solution-based (echoed also in Monbiot, 2017 and Klein, 2017). Beck points to the importance of popular culture as an agent of emancipatory reframing in the face of environmental risk. This paper discusses whether, and to what extent,

popular culture may serve as a vehicle for reframing climate change in terms of global justice and emancipation in the way that Beck envisages. Specifically, it explores two media genres, both geared to future-oriented speculations on the challenges of climate change: non-fiction coverage of emerging 'green' tech, and environmental science fiction ('cli-fi'). While adding detail (and complexity) to the theory of emancipatory catastrophism, the paper also juxtaposes significant counter-frames of 'elite catastrophism' and 'technological solutionism'.

GOODMAN, JAMES* (*University of Technology Sydney*)

Developmentalism and Climate Movements

Social movements make a normative claim on society. They seek to define future possibilities, and do so with or against the prevailing development trajectory. Their projects pose development futures, whether neo-, anti-, alter- or post-, and can be especially powerful where existing development models implode or become exhausted. In the face of deepened climate contradictions, social antagonisms increasingly centre on contests over development. Under the current climate crisis, developmental hierarchies can be up-ended, creating new co-related struggles in both high- and low-income contexts. The challenge of decarbonisation can politicise social relations in new ways, opening-up new political agendas centred on previously-normalised developmental projects. The paper analyses climate movements in terms of these developmentalist claims, addressing their existential depth, spatial scope and temporal urgency, and in terms of the trajectories they pose. It focuses especially on examples from India, Germany and Australia, across development divides and types of fossil-fuel dependence.

GOODMAN, JAMES* (*University of Technology Sydney*)

From Climate Crisis to Climate Democracy?

Continuing climate crisis politicises socio-ecological relations, and creates new fields of socio-political contention. In the first instance, energy becomes a key site of political advocacy, controversy and claim-making. As the crisis forces emission reduction into the political process, state structures are disrupted, and a cascade of democratising forces emerges. The paper explores this changing relationship between climate and democracy. First, at one level, climate change is immediately de-democratising, both in terms of negating living environments and inviting 'emergency' and exclusion. Against securitisation there is a politicization of impacts, notably through labour unions and also, especially, indigenous peoples organisations. Second, failing policy exposes the limits of political institutions, as public authorities display a structural incapacity to act in the general interest, against the dominant fossil fuel sector. Deep contradictions erupt at the centre of the formal political process, and in the institutions of the state, especially between climate and energy policy. Third, and more dialectically, failing policy politicizes the carbon cycle, across extraction, burning, impacts and sinks. Social mobilisations proliferate, creating new subjectivities, constituencies and blocs, articulating new demands and normative visions. These find traction for instance in the social relations of energy transition, around concepts of 'just transition', 'energy justice' and 'energy democracy'. Fourth, the persistent and intensifying crisis politicizes climate itself, as a social product. Here a wider agenda for ecological democracy comes into view. The exercise of intentional climate agency, made necessary by climate change, politicizes social relations with climate. A new and dynamic of contention opens up, posing concepts of de-growth, bio-civilisation and living well against the received wisdom of the 'green economy', 'global resource management' and 'earth systems governance'. The paper surveys developments across these four levels of climate democracy, reflecting on its distinct character and implications for broader dynamics of socio-political change.

Management and Control Via Apps: A Qualitative Study of Australian Gig Worker Experiences across Two Platform-Based Apps

The rise of the 'gig' economy has been enabled by advancements in online communication and mobile technology and fuelled by venture capital. Despite the explosive rise in 'gig' work, limited research exists on workers' lived-experiences in the sector. This paper explores questions of control and power in the labour process of the emerging 'gig' economy. More particularly, we focus upon the 'platform-based app' food-delivery sector of the Australian 'gig' economy, assessing how power and control is experienced and exercised by workers in these 'novel' organisational forms. The paper draws upon 40 semi-structured interviews and focus-group discussions conducted with food-delivery

workers across several Australian capital cities. The findings reveal how workers experience and challenge different forms of control, as well as seek to exert forms of agency. They further highlight the marginally or contingently attached nature of food-delivery workers in the Australian labour market, who seek out 'gig' jobs because of low entry barriers and limited alternative employment opportunities. Despite often cited issues around vulnerability and feelings of exploitation, the described behaviour by workers suggests they do not necessarily acquiesce to forms of 'normative' and 'computer' control that are employed by the two investigated 'gig' platforms.

Linking Past and Present: Working with Andy Furlong to Examine Changing Youth Labour Markets 1985-2012

Since 2011 we had been working with Andy Furlong on two 'restudies' revisiting key themes and data from his early work on school to work transitions. While Andy's work has always been central to our analyses and understanding our recent restudies led to collaborations focusing on a need to interrogate 'past' transitions data. More specifically, by linking past and present data in our research (Making the Precariat: ESRC) we sought to examine how the working lives of young people have changed between two key periods of economic instability in the UK: the 1980s and 2008 recessions. In our most recent project with Andy (*Youth Opportunities?: British Academy*) we revisited key themes from his PhD (1987) focussing on youth unemployment and Youth Training Schemes (YTS). Here he argued that 'the main short-coming of the YTS in Leicester lies in its failure to attract young people destined for low-skilled jobs (Furlong 1987: 227)'. However, he also found that those who joined the schemes regarded them favourably and as a route to the jobs they wanted, albeit dependent upon local labour market conditions. What happened to those who did YTS? What were the long-term career and life 'impacts' for those who participated in YTS during the 1980s? Were these 'tacky' job substitution schemes or did they provide gateways to real and meaningful work?

Based on our collaborations, this paper has three aims. First we present an overview of the 'Making the Precariat' project and the arguments developed with Andy for the book *Young People in the Labour Market*. Second, we reconsider some of the findings on YTS offered by Andy in his thesis via the reflections of those who participated in them. Finally, we consider the position of our collaborations with Andy in his broader scheme of work.

What Is Intimate Partner Homicide Represented to be?: A Poststructural Analysis of Recent Court Judgments in NSW, Australia.

Court judgements about men who are charged with killing their current or former intimate partner provide important insight into how women, men, intimate relationships, violence, homicide and legal responses are conceptualized in the legal arena, and in society more generally. This paper draws on analyses of recent court judgements (between 2010 and 2016) in the state of NSW, Australia, where women were killed in the context of intimate partner violence. The analysis of the judgements was undertaken using Bacchi's (2009) 'What's the problem represented to be?' (WPR) approach, a form of poststructural policy analysis (Bacchi and Goodwin, 2016). This approach has been used by other researchers to explore how policies constitute the 'problem' of violence against women, and is used here to scrutinize the taken-for-granted representations of intimate partner homicide in court judgments. The paper demonstrates that deeply held assumptions and presuppositions about what intimate partner violence is; what intimate relationships are; and who is responsible for perpetrating and preventing intimate partner homicide can be found within the texts of the court judgements. The analysis also demonstrates that there are alternative ways of thinking about violence, intimate relationships, and prevention and protection. Thinking through these alternatives could potentially radically alter the law's response to violence.

Living in favelas, home after all: An experience to make it more appropriate

The global south metropolises have grown into an accelerated and concentrated urbanization process, in a great inequality context that includes lack of social opportunities such as income, education, supply of land and housing, besides inadequate urban environment and infrastructure conditions. The results

configure an intense socio-spatial segregation and urban exclusion. In this context, many poor neighborhoods were raised on the city's outskirts and in the interstices of the old central areas, without appropriate parameters and public policies. They constitute a huge universe of slums, villages, invasions, tenements houses and other improvised housing provision, although gradually accumulating significant individual investments, which will persist for a long time ahead, as home to many people, after all. In Brazil, the case study to be presented, among the total of 212 million inhabitants nowadays, over 85% are urban population and almost half of that lives in major cities, where the slums population ranges from 20% to 60%. Urban and housing policies developed until then were innocuous concerning the transformation for better cities, although there were attempts for inclusive policies, with advances and setbacks towards the right to the city. People living in this condition keep building their places by themselves to make their home more appropriate. What are the design features that make a dwelling place "home-like" to its inhabitants? Within the described context, the work to be presented brings to discussion the possibilities that are being experienced currently by technical assistance participatory projects developed through a pilot university outreach program. The proposal focuses on a recent graduate experience of a Professional Residency in Architecture, Urbanism and Engineering at the Federal University of Bahia and its developments, already featuring its third edition, in network with other public universities in Brazil. GORSHKOV, MIKHAIL* (*Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences*)
 TYURINA, IRINA (*Federal Center of Theoretical and Applied Sociology of the Russian Academy of Sciences*)

Sociology of Youth in Russia: Historical Experience and Current Approaches

The focus of presentation will be two intertwined and critically important issues – to review historical and theoretical preconditions for youth studies in Russia and to analyze of the situation, problems and the livelihoods of youth in today's Russian society. It is known that in modern society several discourses of youth coexist. The authors treat youth as an object of socialization and self-fulfillment and study its role in reproducing social structure of the society. The topic is considered to be relevant throughout time but it is becoming particularly urgent today – in a post-crisis situation, during a quickly evolving international political tension that results in the "struggle" for the minds of the young, and the rapid advances in information technology which are adopted by young people to the point that an information space becomes their immediate environment, unlike the older generations. Youth as a distinct social group is reviewed in a multidimensional way. At the same time, special attention is given to developing youth public consciousness, the way young people perceive social contradictions within modern Russian society, their civic engagement, social identity, ethnic tolerance, etc. Some words will be said about those young Russians displaying delinquent behavior (drug abuse, alcohol abuse, etc.). The presentation is based on findings supplied by numerous national sociological surveys conducted under the leadership and with the direct involvement of the authors since the late 1990s onwards. Building upon the results from these and several other studies they revise some conventional for classical sociology of youth ideas and principles, identify the new options for its future development, request to resist any attempts at unification of this complex social group reducing the nature of today's youth environment's transformations to only one, albeit significant, feature, call on to reevaluate the new role and status of youth in society.

GORSKI, PHILIP* (*Yale University*)

Sinks and Webs: From Axiological Neutrality to Critical Engagement

The central goal of this essay is to explain why the fact/value distinction does not hold water and to reflect on what this means for the scientific ethos. The essay has three parts. The first reviews and synthesizes various well-known criticisms of the fact/value distinction. The critique is two-pronged. It not only argues that facts are value-laden – a familiar point to many sociologists – but also that values are factladen – a point less commonly made outside philosophy. The second part explores the conditions of plausibility of the fact/value distinction, the "background picture" that makes it seem convincing and even commonsensical. I argue that the fact-value distinction is based on an epistemological imaginary, which is, in turn, buttressed by certain ontological and moral assumptions as well. The third part develops an alternative conceptualization and corresponding imagery. It replaces the terms "fact" and "value" with the concepts "descriptive" and "normative." And it argues that the descriptive and the normative are always complexly entangled. Rather than trying to keep the two apart, I argue, a critical social science should attend explicitly and systematically to their interrelationship

Talking about the Same but Different? Cooperation in Social Movement and Industrial Relations Theories. an Integrative Approach.

In the European context, progressive social movements and trade unions have been key forces for the building and strengthening of democracies and the creation of the institutions that govern capitalism. Today, changes in the balance of power have resulted in the ongoing economic crisis, diminishing of democratic space, and multiple institutional failures. However, hope continues to be invested in the ability of trade unions and social movements to counter these developments by joining forces and cooperating with each other. Understanding the reasons for such cooperation and its failures is thus an important empirical and theoretical task.

Both social movement and industrial relations theories have attempted to theorise and empirically research such cooperation, however mainly from the point of view of their own theoretical backgrounds. This paper starts by comparing different yet similar theories of both research fields, calling for a further integration of resources, culture, and political-economic opportunity approaches both theories use, albeit in different ways. The paper suggests that using an integrative approach to study cooperation is an important step towards a more holistic thinking of the relationship between social movements and trade unions.

Transnational Coalitions and Networks: Cooperation between Trade Unions and Social Movements Against Ttip in Europe

In reaction to the progressive decline of trade unions, cooperation and coalition building with social movements has been described as a means of union revitalization. The start of the Transatlantic Trade and Investment Partnership (TTIP) negotiations in 2013 marked a point of convergence for such cooperation, as the agreement has the potential of affecting many policy areas other than trade. A European-wide network comprising more than 500 trade unions and social movement organisations has formed to mobilise the protest against TTIP in Europe.

Cooperation against TTIP has been hindered by two main factors. Firstly, there is a horizontal cleavage, as not all trade unions are opposed to it at a fundamental level, particularly those representing export based sectors. In contrast, social movements have a drastically less favourable attitude towards TTIP, thus finding themselves closer to trade unions from non-European countries. Secondly, there is a vertical fragmentation, since protest actions take predominantly place at the national level, so much so that the transnational nature of the mobilisation is sometimes called into question.

Given the number and geographical distribution of the organisations involved, the role played by trade unions in the coalition is difficult to gauge. This paper employs Social Network Analysis (SNA), in the form of hyperlink and website analysis to describe and evaluate the relationships and the connections between coalition members. The paper focuses on the national networks active in Germany and the United Kingdom, as well as the core actors at the transnational European level. SNA methodologies and tools are used to sketch graphical representations of the networks, which are then analysed and compared. This paper identifies and describes the central actors in the coalition and it highlights the position of trade unions and labour movement organisations within the wider European network against TTIP.

GOSSE, MEGHAN* (*Dalhousie University*)

In Pursuit of the "Designer Vagina"

This study provides insight into reasons women undergo female genital cosmetic surgery (FGCS) despite a lack of reliable information on the potential risks and long-term outcomes. Additionally, this project examines how FGCS is marketed and presented on cosmetic surgery clinic websites. The images of female genitals portrayed in pornography tend to present a very specific and homogenous image of strictly groomed genitals, with labia sometimes altered through surgical means into "normal" lengths. This increasingly specific and visible genital ideal results in more women wanting to, and feeling pressure to, alter their genitals in order to conform to a specific idea of female genital "normality."

Data was collected online between July 2014 and September 2014 and consisted of a comparative study using qualitative content media analysis to examine 30 posts on Canadian and American based online FGCS discussion boards, and 30 surgeons' websites promoting FGCS.

Results show that the motives women describe for undergoing FGCS mirror the motives presented on the surgeons' websites. Clinic websites and women's posts present appearance and physical issues as the two most common rationales for surgery, followed by physical discomfort and sexual issues. Furthermore, I found that women's genitals were divided into "right" and "wrong" or "normal" and "abnormal" genitals through the active processes of medicalization as well as the pathologization of female genital diversity through the promotion of one ideal genital aesthetic. Finally, I found that surgeons' websites advertise FGCS as a "low-risk" procedure, which acts as a reasonable solution for correcting an "abnormal" body part, and which women are increasingly becoming aware of in large part due to emerging normative standards of the vulva. Although genital distress is not a new phenomenon, women's genitals are now firmly a part of the self-surveillance and improvement imperatives of cosmetic surgery culture.

Measuring Child Well-Being in Bangladesh: Are Self-Reported Measures of Well-Being Reliable and Valid?

The growing recognition of children and young people's rights for having a good childhood and good future life chances, coupled with the injunction from the New Sociology of Childhood to consult with children and young people as active agents have resulted in an increasing number of studies on children and young people's well-being at national and international levels. However, developing reliable and valid measures of well-being suitable for comparative study is still considered as one of the major challenges for research with children and young people from different countries. This paper discusses the limitations and advantages of some measures of well-being using data from a survey in Bangladesh—one of the developing countries in South Asia. This study in Bangladesh is administered as part of the 3rd Wave of the Children's Worlds International Survey on Children's Well-Being (ISCWeB). In this paper, we will focus on the reliability and validity of both overall and domain specific measures of well-being.

Data for this paper are obtained from over 3000 primary and secondary school children (aged between 8 and 15 years) living in three large cities in Bangladesh. Exploratory factor analysis is carried out to examine the factor structure of the multiple-item measures of overall and domain specific well-being. Then Cronbach's Alpha is computed to examine the reliability of the scales. Finally, convergent, discriminant and criterion validity of the scales are assessed by testing the relations of these scales with other theoretically relevant variables e.g., age, gender, satisfaction with health, pro-social behaviour, emotional symptom, and self-esteem. These findings are discussed in the context of previous empirical studies on child well-being carried out in both developing and developed countries. Suggestions for future comparative research are also put forward.

Religiosity and Youth Subjective Well-Being: A Multilevel Analysis

There has been a growing interest among academics, policy makers and practitioners on youth subjective well-being over the past few decades. A large number of studies have been conducted in regional and national level to explain variations in well-being. Influenced by bottom-up theories, most of these studies emphasised micro-level demographic factors, which were consistently found to be able to explicate only a small amount of variation in well-being. To find better explanation, researchers are now focusing more on psycho-social and contextual factors. Although these studies have provided useful insights into youth well-being, there is little systematic evidence on how religiosity is associated with youth well-being especially whether this relationship is mediated by youth self-perceived discrimination. This paper aims to fill this gap by examining the complex relationship between youth subjective well-being, religiosity, and self-perceived discrimination by controlling a range of psycho-social and demographic factors including age, gender, religious affiliation, social class, level of civic and political participation, youth unemployment.

Data for this paper are from a recent survey conducted over 17,000 young people aged 16 to 25 from 14 European countries. The survey received funding from the European Commission under its FP-7 call. A multi-level model is used to examine the interaction of self-perceived discrimination and religiosity on youth subjective well-being. Although religiosity is found to be associated positively with youth subjective well-being, the effect of religiosity on well-being appears to differ significantly by level of discrimination reported by the youth. These findings are discussed in the context of previous empirical studies and theories of well-being, religiosity, and discrimination. Finally, the policy relevance of these findings in improving youth well-being is highlighted and suggestions for future research are put forward.

"I Teach Them That Everything Is Possible" – Adult Leader's Perspectives on How Civic Engagement Shape Youth's Collectively Capacity to Influence Social Factors Related to Mental Health

Research and prevention targeting youth mental health typically focus on individual behavior even when this involves civic engagement, which is essentially a collective activity. In the study presented here, we draw attention to the collective strategies developed through civic engagement to respond to social factors affecting youth mental health. Specifically, the paper aims to explore how adult leaders perceive civic associations as shaping teenagers' collective capacity to influence social factors related to mental health. Previous research shows that leaders have a central role in promoting youth mental health through civic engagement, demonstrating the positive impact of sustained caring relationships between youth and non-familial adults. Interviews were conducted with adult leaders engaged in various civic associations in Northern Sweden that involve teenagers such as sport and culture. Using thematic analysis, we developed four themes from the interview material. In the first theme, *creating a collective identity*, adult leaders described building a sense of a "we" within the group. The second theme, *commitment to a democratic structure*, consisted of adult constructing opportunities where teenagers could participate and take responsibility. Thirdly, through *being supportive to the group*, adult leaders portrayed their efforts to respond to signs of social factors related to mental health, such as achievement pressure, by empowering the group. The fourth theme, *providing an alternative*, depicted the importance of civic associations for generating collective values to counteract the individualistic discourses in society that put pressure on teenagers. Nonetheless, they recognized that their alternative was not accessible to all teenagers given multiple social hierarchies. Our findings contribute to existing knowledge on adult leaders' role in promoting youth mental health through civic engagement by highlighting their collective strategies to strengthen young people's capacity.

Money within Immigrant Couples. the Influence of Transnational and Extended Families.

In my ongoing thesis, I explore the financial arrangements made within couples during their migration process to the province of Québec. Lots of researchers studied money circulations and significances within couples. Moreover, they have shown their heuristic scope to understand families' dynamics. The originality of my research is to apply this approach in the context of international migration. Aside from the novelty of the subject, money is particularly important for immigrant couples given the problematic of installation costs, immigrant's unemployment rate and remittances, amongst others.

This study's main objective is to examine the transformations of the immigrant couples' financial situation and arrangements. This communication will focus on the preliminary analysis of the influence of transnational and extended families : have they financially contributed to the realization of the migration project? And which family : hers and/or his? Does the couple currently send remittances? And to which family, for what purpose, how many, etc.? What are the effects of these remittances on the couple's dynamics and on the financial situation of both partners? Are these remittances going to create mutual aid between partners to fulfill obligations to their parents or cause discord in the couple? This qualitative research is based on interviews conducted separately with qualified dual-income immigrant couples (having at least one child and living in the Montreal area).

Parcours d'Insertion Professionnelle De Femmes Immigrantes : L'Enjeu De La Conciliation Famille-Travail Et d'Une Intervention Adéquate

Cette présentation sera l'occasion d'offrir une partie inédite des résultats d'une recherche-action menée autour de l'expérience d'insertion professionnelle de femmes immigrantes installées dans la région de Montréal. Cette recherche, intitulée « Des approches novatrices pour répondre au défi de la déqualification professionnelle des femmes immigrantes », associe un Centre collégial de transfert de technologies en pratiques sociales novatrices (CCTT-PSN) et deux

organismes communautaires. Ce projet comporte deux objectifs principaux : la compréhension générale du processus de déqualification et les actions en vue de développer des stratégies efficaces pour aider les femmes immigrantes à accéder à des postes qui coïncident avec leurs compétences et leurs qualifications.

Qu'il s'agisse plutôt d'une « stratégie négociée » entre conjoints (Vatz Laaroussi 2008) ou une « inégalité persistante » à l'égard des femmes (Chicha 2009), les femmes immigrantes connaissent un plus haut taux de déqualification professionnelle au Québec que leurs homologues masculins. Nous tâcherons, lors de cet événement, de présenter, à partir d'une analyse intersectionnelle, les trajectoires d'insertion professionnelle des femmes immigrantes rencontrées en insistant sur l'un des obstacles majeurs qu'elles rencontrent : la conciliation famille/travail. Entre sentiment de sacrifice, priorité à la famille, emplois aux horaires atypiques et marge de manœuvre réduite, nous explorerons les perceptions des femmes sur leur propre parcours, mais également les points de vue et philosophies d'intervention d'acteurs de milieux communautaire et institutionnel sur ces enjeux : prennent-ils en compte cet enjeu ? Quelles en sont leurs lectures et leurs éventuelles stratégies d'action pour y répondre ?

Notre présentation s'appuie sur des données provenant d'entrevues semi-directifs réalisés auprès de 31 femmes immigrantes – dont 19 avaient au moins un enfant – et de 15 intervenant.e.s des milieux communautaire et institutionnel.

The Quest for a Good Death : (Re)Creating Natural Death in Hospital Settings

In France, medicine is heavily involved in the care of dying patients, as 58% of individuals die in hospital (IGAS, 2009; Observatoire de la fin de vie, 2011). In a 2015 exploratory qualitative study among 12 hospital physicians belonging to different medical disciplines, a research team composed of a physician and a sociologist investigated the conditions of the dying process, starting from the hypothesis that doctors seek to stage a natural death (Harvey, 1997; Seymour, 2000), in response to health care professionals' and lay people's representations of a natural and good death. In this presentation, we will show that physicians across disciplines put in place an informal medical protocol for dying patients. They medically monitor the dying process, whilst letting the physiological process of death take its course. There is thus a subtle and permanent balance between medicalization and an emphasis on natural dimensions of the end of life process. In the ICU, physicians switch the oxygen supply to 21% (which is akin to ordinary air) when a decision to stop treatment has been made and death is imminent. « We seek to put them [the patients] back to natural conditions » says an ICU physician. This organization of death is underpinned by a paramount principle: medicine must not induce death. Health care professionals and family alike await the patient's natural death. When it takes a few days, all involved face a disturbing wait and experience what we term performativity at a loss: they don't know how to care for the patient. We will also show that the standardization of end of life is characterized by the deletion of pain and anxiety of the dying patient, through the use of medication. A calm, serene and (most often) unconscious patient corresponds to a contemporary ideal of death.

Sectorial Wage Inequality in Australia: The Role of Trade Unions and the Industrial Relations Landscape.

Rising wage inequality despite rising productivity is a feature of late capitalism in the West since the 1970's. However the underlying causes of this decoupling are much disputed. While this is partly accounted for by an increased share of productivity growth going to capital owners, a more significant factor in the decoupling of wages from productivity growth relates to the growth of inequality within the distribution of wages across wage earning groups, particularly between the median wage and the top 10%, and top 1%.

Neo-classical explanations of growing wage inequality argue that more complex technologies have led to a growing demand for skilled employees, who are paid more than relatively unskilled workers who are less in demand. However, a Kaleckian political economy approach rejects this, arguing for the role of bargaining power of unions and related political and institutional issues in determining levels of wage compensation. Emerging empirical research support this explanation over a technology-driven account. This directly relates economic inequality to an underpinning political inequality.

Using publically available economic data sets, this paper maps longitudinal changes in the levels of wage inequality across different industrial sectors in Australia. Specifically, it examines the relation between median wages and productivity growth in the major private sectors of the Australian economy since the early

1990s, as well as aggregate outcome in the private sector. Informed by Kalecki's approach, it then compares this to trends in union density and related bargaining power in each sector, the extent of enterprise bargaining, levels of minimum wages and the changing landscape of industrial relations in Australia. From this analysis a clearer picture emerges with regard to the underlying processes driving the decoupling of wages from productivity growth and shifts in the wage distribution in the case Australia, as a resource-dependent economy.

Evangelizing through Social Work: France and Brazil's Experience

This research is justified by the interest which is provoked for the understanding of a missionary youth insertion's in the religious/humanitarian institutions as professionals of the faith. The objective is to understand the way that France and Brazil considers the proselytistics activities linked to welfare work implemented by the missionary youth. We had focalized on the study of the organisation Youth with a Mission based in both countries as a philanthropic, educational and health NGO. The members are the central figure in the relationship between religious group and social context. YWAM is an international volunteer movement from many backgrounds and cultures. YWAM's University operates in 650 locations in the world. According to them, the main goal is to teach and develop spiritually, culturally, intellectually and professionally. The concept and the actions of evangelism and evangelization has attempt also the youth. The idea of mission is taken in a wide sense and includes many activities in the fields of education and health. The youth has to engage in social action in order to work in the service of humankind and the dialogue is, for them, essential to reach the goal. Nowadays, the youth engage increasingly in the field of social action, either through activities oriented to assistantships, such as the distribution of food, creation of nurseries, the introduction of professionalizing courses and social transformation, as awareness of the contradictions of social reality and the possibilities of confrontation, commitment to causes that support the increase of social, human and political. The study is focused on: To understand the religious landscape, the concept of "Laïcité" and the public funding system for religious organisations in both countries. To present the interviews realized with the staff and students to understand the organisation's structure, trajectories of life, religious and denominational identity and motivations.

Islam, Christianity and the Development of Machine Capitalism: The Weber Hypothesis Revisited

This paper analyzes the autonomous effects of religious commitment on the development of machine capitalism. I explicate the logic of Max Weber's analysis in *The Protestant Ethic and the Spirit of Capitalism*, providing both a characterization of the economic preconditions for the institutionalization of machine capitalism, and a reconceptualization of the nature of ascetic Protestantism. My characterization of Protestant religious commitments makes clear how they led to the rationalization of the first stage of manufacture (Marx's formal subsumption of labor under capital), created the "spirit of capitalism," and thus resulted in systematic capital accumulation leading to machine capitalism. I then characterize the nature of religious commitment in (Sunni) Islam, arguing that while the economic preconditions for the development of machine capitalism were sometimes present in Islamicate lands, Islamic religious commitments neither rationalized economic production, created a tendency towards capital accumulation, nor created the "spirit of capitalism." Thus, Weber was correct both in assigning an autonomous role to ascetic Protestantism in the genesis of machine capitalism, and in denying a comparable role to Islam.

Information, Communication and Technology for Education-Some Issues and Concerns: With Reference to Ujjain, Madhya Pradesh, India

Reeling under shortage of teachers at one end and to impart quality education to many, the government of Madhya Pradesh, India has incentivized the use of Information Communication and Technology (ICT) in education as a tool to reach unreachable students. The ICT employs hardware and software for extending the reach. Mobile, computer and internet are the basic requirements for this system of imparting education. The government of Madhya Pradesh distributed mobile phones with internet facility to students to access educational material. Close examination of the policy shows perpetuation of two layers of narrative to explain the effect of ICT on students. At one end students are accessing whole plethora of information which is required for their education and which is the expressed aim

of the government. At the other end, students are vulnerable to all the content that are not supposed to be viewed by people at tender age or are increasingly involved in interacting in social media. Study conducted on the students of Ujjain district shows they are thwarting the professed goals of promoting ICT in education. The impact of ICT on students is also seen in terms of behavioural change, wherein students at times become very violent and aggressive even in slightest provocation. The full paper deals in elaborate the issues and the concerns of usage of ICT in education.

The "Operação Lava-Jato" and the Arendtian Antipolitics: The Brazilian Public REALM As a Spectacle of Impotence

The "Operação Lava-Jato" is one of the most relevant political and social facts in recent history of Brazil and Latin America. Its developments profoundly affect the stability and organization of the Brazilian State, implying high-level personalities from current and past governments, and even from other Latin American countries. However, the "Operação Lava-Jato" uses and it is used by mass media groups as a field of contention and an instrument of action. It assumes a logic similar to soap operas - television genre very popular in this region of the globe. Presented by mass media by phases, plea bargaining, and creative titles, its narrative structure reminds elements like episodes, seasons and plot-twists. Prosecutors, judges, police officers are treated as idols of pop culture. Seen as heroes who fight against enemies - the political and business class - "Operação Lava-Jato" becomes itself a actor within the Brazilian social arena. As a result, an aura of legitimacy is created around the "Operation", which authorizes it socially to supplant - not infrequently - certain instruments of democracy, such as public transparency, due process of law, procedural guarantees. The research investigates the novel logic, which imposes the political event as a spectacle for society, reinforcing the idea that civil society is powerless to promote the necessary transformations themselves - and that they can only be made from the performance of the heroes of bureaucracy. This qualitative researches uses documental and imagery sources. The conceptual debate brings the concept of politics and public realm, by Hannah Arendt; and society of the spectacle, of Guy Debord, the proposal of an antipolitical society - to explain the influence of the mass media as a factor of social normalization for the reduction of political and democratic quality in post-industrial societies.

Sociological Practice in Brics Countries

Sociological practice, and related sub-disciplines, doing sociology; everyday sociology; clinical sociology; pragmatic sociology, and so on, are focused at the experiential realm. Sociological practice may be viewed independently from sociological theory and sociological research (methods). However, sociological practice is best known for drawing from theory and research methods to propose real, everyday solutions to social problems; propose social policy; and develop social programmes.

Given that sociology originated and developed differently across the world, the same is true for sociological practice in the BRICS countries. The BRICS countries are cooperating economically and politically, providing the international sociological community with wide-ranging opportunities for studying similar and divergent concepts, phenomena and social issues.

Sociological practice is therefore located within different experiences and stages of development in the respective countries: China and Russia have moved away from communist to post-communist economies; Brazil has experienced regime change from dictatorship to democracy; India is balancing rapid growth and acute poverty; and South Africa is building a developmental state. Accordingly, the goal of the paper is to chart sociological practice in BRICS towards identifying best practices.

Promoting University- Industry Linkages in India and Its Impact on the 'Ethos of Science'

In the knowledge based economy universities have become the central source of knowledge and innovation and their engagement with industries are seen as the 'third mission' of university or the 'third academic revolution'. The policy makers are promoting such revolution by encouraging collaboration between university and industry through incentives to universities by granting

them ownership of intellectual property arising from their research and creating supporting organizations like Science Parks, Incubator Centres and Technology Transfer Organizations. However, universities' relationship with industry has been shaped by the historical and cultural factors of their host country and the institutions governing the university-industry relations have varied from country to country.

India has also taken several initiatives such as formulation of Science, Technology and Innovation Policy 2013, and the establishment of Technology Transfer Offices (TTOs) and the enactment of new intellectual property rights rules (IPR Act, 2005, 2015) in academic and public research institutes for commercialization of knowledge. However, the impact of these new initiatives on transfer of knowledge as well as on the production of knowledge has not been understood properly. On the basis of structured interviews of university researchers, technology transfer officers and IP managers paper seeks to analyze the different processes of transfer of knowledge and technology from universities to industries and how this interaction is affecting the production of knowledge in Indian academia. The study shows that despite the strong apprehensions among the academicians on the dilution of 'ethos of science', the importance of university-industry linkages is growing in terms of joint patenting, collaborative and sponsored research, consultancy and formation of spinoff companies and thus giving rise to the new ethos of science.

Occupational Health and Safety Situations of Airbnb Hosts in Ontario

Introduction: This study focuses on Airbnb, the world's largest shared accommodation provider. The economic impact of Airbnb on the hotel and tourism industries as well as the housing market has been well-studied, fueling current discussions on the need for tighter regulations for Airbnb. In particular, various occupational health and safety (OHS) implications need to be considered, especially as Airbnb hosts are self-employed workers and the protections under the Employment Standards Act do not apply to them. Airbnb appears to have adopted a rather laissez-faire attitude in relation to ensuring OHS, and there is scant literature on the OHS in Airbnbs. The closest comparator to Airbnb is hotels, and numerous studies speak to the OHS risks faced by hotel workers. This study explores the OHS situations of hosts, to inform the gap between policy and practice.

Objectives: To explore the OHS standpoints and experiences of Airbnb hosts, and identify challenges and possible changes in Airbnb's practices to improve their OHS

Methods: A critical realistic study on shared accommodation with Airbnb hosts will be conducted in Ontario, Canada. Drawing on document analysis of online forum posts as well as in-depth semi-structured interviews with Airbnb hosts, this study will explore how hosts identify, experience, and perceive OHS risks within the system. Documenting these experiences will position the OHS risks in the day-to-day contexts within which hosts live. In addition, a gender critical lens will help recognize differential experiences of OHS.

Implications: This study is the first of its kind, to the best of our knowledge, to study the OHS of Airbnb. As the sharing economy grows, it is important for us to consider the implications of Airbnb hosts' OHS. These OHS considerations will help inform policymaking and practice for housing, hotels, and short-term rental companies.

Respondent Perceptions of Sensitive Items on a Self-Administered Application Form

The United States Department of Agriculture (USDA), along with state agencies, administers the National School Lunch Program, which is then operated by local school districts or other organizations. Families requesting free or low-cost school meals are required to complete an application that collects detailed information on who lives in the applicant's household and all income received. USDA develops and makes available to States a prototype application with required data items. States and local school districts may choose to use this or develop their own forms, as long as the required elements are included. While not provided informed consent, applicants typically have expectations that their data will be protected and used for the purpose it was intended.

The Center for Survey Measurement (CSM) at the U.S. Census Bureau was asked to review and test the USDA application to identify specific examples of question items, concepts, terminology, or form design that might lead to respondent confusion and subsequent reporting error. CSM conducted more than 100 cognitive interviews with English and Spanish-speaking respondents in five states and the District of Columbia.

As part of this effort, respondents were asked directly if any items on the application were considered sensitive. They also described the process and any

concerns with receiving, completing, and returning the application. Some results were predictable; for example, respondents consider income or partial Social Security Number to be highly sensitive. However, our interviews also captured unexpected reactions. Respondents questioned the need for specific information being collected and how it pertained to the school meals program. This lack of understanding led to intentional misreporting by respondents. It was clear that some data items, while perhaps not necessarily considered sensitive in a different context, became so in this one as their need was not well communicated.

Peer Groups and Migration: The Sequences of Transitions from Education to Domestic and Foreign Labour Markets in a Longitudinal Perspective

School-to-work-transition is an increasingly dynamic and time-consuming process (Hodkinson 1997). This makes it the phase (Hillmert 2002) of the life-course which impacts on the later career trajectories (Korpi et al 2003). People transit from education to employment in differentiated ways, experiencing external structural influences (Brzinsky-Fay 2007). Based on the definition of ILO (2009), full transition is observed when an individual's situation on the labour market is stable or subjectively satisfying. This makes the school-to-work transition subject to the interplay of opportunity structure with an individual agency. The first job abroad might be a *rite of passage into adulthood* (Eade et al. 2007).

The aim of this paper is to present the longitudinal sequence analysis approach to transitions from education to domestic and international labour market of young people from the same peer-group (similar sociological background, potentially Weberian *equal life chances*) in three local communities in Poland (middle-towns). We are looking for similarities and differences between school-to-work transition of movers and stayers, depending on both types of peer-groups migration types in a longitudinal perspective.

The main research questions are: What is the role of international migration in the school-to-work transition over time? What are the educational and occupational trajectories of young movers and stayers nested in peer groups?

Methodology: The paper is based on two waves of the Qualitative Longitudinal Research (Neale, Flowerdew 2003, Bocciani 2015). We conducted 130 semi-structured interviews (Wave 1) and estimated follow-up 95 interviews (Wave 2) with people aged 19-34 and their friends from adolescence in three local communities in Poland. We mapped 25 peer groups and we walk with them across time (longitudinal study). Snowball sampling began from a migrant as an ego contact and we mapped his/her high-school peer-group. The project is funded by the National Science Center Poland, Sonata Bis 5.

FUCHS, SASKIA (University of Kiel)

Singing and Socializing: Applying Contemporary and Historical Data of Choirs As Proxy for Social Capital and Its Beneficial Impact on Wealth.

In a lot of recent studies, social capital has turned out as a stable predictor of a nations' or a regions' wealth. One major argument is that bridging social capital brings together different people and alleviates economic transactions. Bridging social capital has a positive outward-oriented impact on strangers. Societies with more bridging social capital groups produce more favorable economic and societal outcomes.

In this study, I attempt to generalize the evidence from modern social capital researchers about bridging social capital to historical times. The number of choirs and members in German regions are applied as proxy for bridging social capital groups. This approach brings in some comparability problems which will be explicitly addressed in the analysis. In the recent 200 years, German regions and choir structures have changed. Since a stable unit of analysis is required, only those choirs and regions enter the analysis which are comparable across time. Despite this drawback, there is some evidence that German historical regions with a higher amount of bridging social capital are wealthier.

This result adds to the findings of the beneficial impact of bridging social capital groups in modern societies. It suggests that social capital has historical roots. It also suggests that modern societies are still driven by the same positive forces as societies before. Since the data must be considered as rather weak, these results are tentative only and could be approved by qualitative historical studies.

GRAHAM, NICOLAS* (University of Victoria)

Canadian Fossil Capital and Post-Carbon Futures

This paper begins with a brief review of research on the political economy and ecology of fossil capitalism, which has examined the potentials for and social and political obstacles to a rapid and just energy transition. This provides the context for an investigation into the relationship between the carbon extractive sector in Canada and renewable energy development. Specifically, I examine the strategies employed by carbon capital to shape and control alternative energy and consider if we are witnessing signs of "transition capture," with some oil and gas producers investing in a gradual transition to climate capitalism. I investigate first, investments by fossil fuel companies in renewable energy; second, interlocking directorate relations between the fossil fuel sector and the renewables industry; and third, intercorporate shareholding and ownership relations surrounding Canadian renewable energy companies. The findings inform a discussion of competing post-carbon imaginaries, visions or projects.

Transnational Family Ties and Community Bonds: Indo-Caribbean Migrants in the U.K.

European colonization left in its wake a global displacement of people and rupturing of families. As subjects of these processes, Indo-Trinidadians were brought as indentured laborers from India to the Caribbean after slavery ended in the mid-1800s. Decolonization and the opening up of migration to the U.S. and Canada in the 1960s and 70s resulted in more disruptions in the lives of Indo-Trinidadian families (Grahame 2003, 2006, 2014). In a series of field studies, we have been mapping these changes and the transnational practices in which these families engage. Transnational families are conceived as those that "live some or most of their time separated from each other, yet hold together and create something that can be seen as a feeling of collective welfare and unity . . . across national borders" (Bryceson and Vuorela 2002, p.3). Drawing on work underway since 2016, this paper examines the experiences of Indo-Caribbean immigrants in the United Kingdom, focusing on their integration into U.K. society and their attempts to sustain family ties transnationally. Our prior research involved fieldwork on such families in Trinidad, the U.S., and Canada. The present research extends the international scope of this fieldwork. The U.K. became a major destination for Indo-Caribbean migrants following WWII, when the U.K. tapped its colonies for much needed labor. The U.K. case provides insight into the ways in which longer-term migrants (those who have resided in the U.K. for more than 40 years) have been able to sustain transnational ties based on extended family forms and the challenges of forging communities anew in the U.K., their host society. We also look at how in the U.K. Indo-Caribbean peoples are a minority within a minority (a sub-set of South-Asians), an aspect of their lives which creates complex issues of identity and belonging (Grahame and Grahame, 2014).

GRAHAME, KAMINI* (Pennsylvania State University - Harrisburg)

Transnational Fieldwork: Problems and Possibilities

I completed one of the early institutional ethnographies under Dorothy Smith's supervision. The research focused on how immigrant Asian women in the U.S. came to be organized into the labor market via the employment training programs into which they were screened. In a subsequent study I aimed to uncover how it is that women of color in the U.S. were deemed "unorganized" in a mainstream feminist organization's attempt to become inclusive—discourses of diversity and inclusion came to be essential conceptual currency in the organization's attempt to garner funding for its work. Much of the work I do draws inspiration from a central tenet of Smith's that we begin from experience to disclose the social relations of ruling, even when my studies do not turn into "classic IE." Completing the first IE project led me to reflect on the ways in which my own life has been transformed in and through processes that have unfolded over the course of the latter part of the 20th century. Projects undertaken have interrogated transformations in family life for Indo-Trinidadians across three generations and though the research has not been classic IE work, nevertheless it has been informed by it. My more recent work is concerned with "transnational families," focusing on Indo-Trinidadians who are dispersed across the U.S., Canada, the U.K. Basically, I seek to understand whether and how people manage and sustain "family" across borders. I have been working in 4 different national contexts (the U.S., U.K., Trinidad and Canada), tracing the processes which make it feasible for some but not for others. Citizenship, class, documented/undocumented status, and religious background, for example, shape families' experiences in what can be sustained and what is potentially lost.

TG07-1005.2

GRAHAME, PETER* (Pennsylvania State University - Schuylkill)

Good Looks and Guaranteed Sightings: Notes on the Sociology of Seeing

In reviewing the scope of visual sociology, Grady (1996) pointed out that a sociology of seeing would be concerned with seeing in its own right—practices of seeing such as glimpsing, gazing, scanning, and so on. A sociology of seeing, conceived along these lines, would form part of a sociology of the senses—a focus on seeing as sensory experience rather than on objectified visual materials. The sociology of tourism is a particularly good point of departure for considering how a sociology of seeing might be developed by focusing on the interactional details of different kinds of seeing practices. This paper draws on more of a decade of fieldwork on nature tourism. When encountering wildlife, tourists are particularly concerned to get a “good look,” but good looks are defined and achieved in different ways in different tour contexts. In addition, certain kinds of wildlife tours advertise “guaranteed sightings.” Good looks and guaranteed sightings are part of a complex social organization of seeing embodied in the tour context. In this paper, I address interactional dimensions of how looking is done and how sightings are produced and made accountable in whale watching and bird watching tours.

GRANER, ELVIRA* (Heidelberg University and ICAS:MP New Delhi)

(Dis-)Connected Youth. Political Dimensions of the Digital Divide in South Asia

with Siri Hettige (Colombo Univ.) and Sanjay Kumar (CSDS, Delhi)

At a global level, communication policies and e-governance regularly address young people worldwide as the ‘digital generation’. On the other hand, many countries in the ‘Global South’ still find it difficult to translate these ideas into national policies, and even more so to implement these at the local level. Some of these debates have been captured in discourses such as ‘digital divide’.

Our paper aims at providing analyses of countries in South Asia (India, Sri Lanka, and Bangladesh) where on the one hand digital policies and information technology are quite advanced. At the same time, these countries have been, and have remained until today, characterised by vast social and regional disparities. Thus, India in particular can be seen as the epitome of a communication hub, with globally well-connected centres such as Bangalore and Hyderabad on the one hand, but vast rural (and urban) areas where communication has remained limited to privileged social groups. Empirical evidence of such selective inclusion mechanism can be found, inter alia, in several Youth Surveys that have been conducted in recent years (for India in 2009 and 2016, for Bangladesh in 2011 and for Sri Lanka in 2009 and 2014). Thus, even the most recent of the Indian Youth Surveys confirms that half of Indian youth do not use social media (facebook or WhatsApp, and even more for twitter). Similar patterns have also been documented for Sri Lanka (2009 and 2013), as well as for Bangladesh, where the Youth Survey (2011) had shown that youth mainly used the mobile phone for giving each other missed calls, i.e. a no-cost utilization pattern.

GRANER, ELVIRA* (Heidelberg University and ICAS:MP New Delhi)

Governing Child Marriage in India – Where Global Visions Meet Indian Realities

with Prof. Samita Sen (Kolkata)

A universal understanding of childhood defines children not only as a demographic group (until 14, 16 or 18, respectively) but also sets in place the core political directives. These, first of all are to safeguard their protection from any possible form of human rights violation, and advance their quality education. Besides placing a strong responsibility on parents this also asks for a comprehensive commitment from state bodies, often supported by international development partners. Yet, local “realities” often portrait quite a different picture, and one matter which can be seen as the epitome of violating human rights of children are child marriages.

While common across the world, in India child marriages are of high political concern, due to the country's particular demographic profile. Thus, when the UN engaged in assessing and reformulating the MDGs and drafted the SDGs, child marriage was addressed as a crucial obstacle for all other goals. The paper will address five core issues. Besides analysing the demographic profiles of children in India, it will secondly address the alarmingly low annual rates of decline of child marriages. Thirdly, it will portrait the vast regional disparities, and showcase a few case studies from an ongoing project in West Bengal, where child marriage has gained sad prominence. Generally, these states are also characterised by significant gender disparities, in regard to core development indicators (health, education, or gender empowerment). Fourthly, the paper provides a brief overview about currently policies and legal reforms and debates at both the national and global levels (such as the Prohibition of Child Marriage Act 2006). Along with this analysis, it, fifthly, aims at providing a wider analysis about the governance framework that guides child marriage, and the support that needs to be taken up by international development partners.

MOOSBRUGGER, ROBERT* (Johannes Kepler University Linz)

Desired Outcomes of Drug Treatment Beyond Abstinence: Normative and Individual Meanings

Health care service providers are offering solutions to recognised problems. By setting treatment goals it is defined what “good outcome” is. Especially in Social Psychiatry – as drug treatment – success of an intervention goes beyond simple recovery and implies aspects of inclusion and empowerment. There is a certain set of beliefs on how inclusion and empowerment takes place and these meanings are implied by and on different actors using symbolic power and therefore contribute to the understanding of what is desirable (Bourdieu 1989).

In the context of a five-year-evaluation of an abstinence-oriented drug treatment facility in Austria available quantitative data from the patients at the beginning (n=129), at the end (n=56) and one year after the therapy was analysed (n=41). To gain a better insight on treatment processes, additionally, qualitative interviews (n=20) were conducted with patients (current and former – successful and not successful), professionals associated with the treatment facility and professionals associated with clients after or during treatment (Grausgruber & Moosbrugger 2017).

These data allows an approximation to the following questions from different viewpoints:

- How is desired outcome defined by different actors? What kind of inclusion do different stake-holders mean? To which extent are these definitions in accordance?
- Which processes within and outside the actual treatment are regarded as essential for reaching desired outcomes beyond recovery; which are regarded as hampering?
- How are these processes interrelated as well as related with the “official goals”?

Explosion of Violence, Anomic Condition and Regression to the Archaic Man: Three Features of Contemporary Society

Explosion of violence, anomic condition and regression to the archaic man: three features of contemporary society

The question about the reasons for the overwhelming spread of violence is becoming more and more crucial. We are witnessing an increase in violence in many different forms: terrorism, sexual abuse of women, which ever more frequently turn into feminicide; abuse of the homeless and in general toward every form of weakness.

In my paper, I would like to analyse this explosion of violence in the light of Durkheim's theory of anomie, that is the weakening of the authority of norms and values and with it the weakening of social ties. Durkheim argues that such social conditions have a strong impact on the individual causing a loss of orientation that can easily lead to deviance, in different forms.

Even though Durkheim's view explains the explosion of violence in contemporary society very well, it cannot be considered the only and last explanation. I believe that the condition of anomie, together associated with individual regression, both due to radical individualism and free market, well expressed in the ideology of the fittest, causes the emergence of the archaic instinctual man, as the other face of the rational man. In the former the ego is no longer fit to mediate but accepts the urge to kill the other, who is seen as the enemy rather than as his own kind. The main question I will explore is then the explosion of irrationality vis a vis an increase of rationalization (for instance the diffusion of Mac-Donaldization) and what we can expect in the future. In particular, is it a momentary explosion or will it transform society making the idea of solidarity obsolete and substituting it with the idea of social struggle as an ordinary condition.

Revisiting the Rebound Effect: Practice Perspectives on Current and Future Energy Demand

Average household energy consumption levels across the European Union continue to remain stubbornly high despite the implementation of a

considerable number of legislative and public policy instruments in recent times. Measures designed to reduce energy demand through efficiency gains or other technological advancement, and to sustain these lower levels into the future are often frustrated by a phenomenon known as the rebound effect. This effect describes a set of medium- to long-term changes that imply that reductions in energy use in a particular area (e.g. home heating) are offset and in some cases outstripped by increases in energy demand elsewhere (e.g. changes in the use of domestic appliances, new leisure practices requiring energy). While classical economic theory typically attributes these shifts in energy demand to basic income and substitution effects, this paper presents the rebound effect as a more complex, socio-cultural phenomenon, viewing changes in domestic energy use from a practice perspective. Drawing on insights from the EU-H2020 ENERGISE project, this framing offers a path to understanding changes in energy-dependent practices that potentially unfold over long periods of time. It is shown how these can result from diverse changes in the primary determinants of household energy consumption such as altered material conditions, skills or competences of its members and/or a shift in the meaning that householders attach to particular energy-dependent practices. By focusing explicitly on practices and their transformation, it is possible to make visible linkages between current efforts to reduce domestic energy use and future energy demand that have hitherto remained under-researched and poorly understood.

GREARSON, ADAM* (McMaster University)

The Object Other

This paper engages Judith Butler's concept of bodies which are abject or illegitimate. Similar to the sociology of the body as a whole, the concept of the abject body is an 'absent presence'. I divide this paper into four sections. Section one describes what an abject body is, comparing this body to its opposite: subjects. Section two identifies the bodies which are considered illegitimate, using the broad identity of marginalized bodies to suggest that individuals such as sexual and racialized minorities are illegitimated. With the intent to suggest that performativity is more than Butler's notion of "doing" only gender, section three suggests how the concept of performance / performativity can be applied to these bodies through the lens of Erving Goffman and his analysis of stigma. Focusing on treatment, section four outlines how illegitimate bodies are "Othered" and further marginalized by the privileged individuals who share the status of subjects. Here I compare the abject "Other" to Georg Simmel's concept of the stranger. I conclude by highlighting potential future research: I suggest that it would be very useful to investigate specific categories and intersections of abject bodies, including how racialized bodies can intersect with gendered bodies, disabled bodies, and the bodies of sexual minorities

The Ladder of Wellness: Relating Happiness, Subjective Well-Being, and Flourishing

This paper investigates the various rungs on what I refer to as the "ladder of wellness". Using a *eudaimonist* foundation – while setting out key differences with Aristotle's happiness – the concepts of happiness, subjective well-being (SWB), and flourishing are defined and contextualized. The highest and most desirable state on the wellness ladder is flourishing, followed by SWB, and finally happiness. Drawing on ethical philosophy, positive psychology, and sociology, I describe how there are basic objective requirements for achieving the above terms, conditions which are borrowed from Nussbaum's "ten central human capabilities" and expanded upon to become time-, space-, and agent-neutral. While these requirements are objective, they can be met through subjective means that vary from person to person. The paper concludes by contextualizing wellness in relation to Butler's concept of abject or illegitimate bodies. I explain how marginalized groups such as women, racialized people, sexual minorities, and people with disabilities all share in being illegitimated by subjects (i.e. more powerful social groups). I close by describing why these marginalized bodies are much less likely to achieve the states on the ladder of wellness, and I use the example of ascribed status within a caste system to illustrate how the concept of luck relates to abjection and thus wellness.

BARNARTT, SHARON (Sociology, Gallaudet University, Washington, DC, USA 20002)

An Historical Overview of Conceptions of Disability in Sociological Theory

Disability is a socially constructed category, and sociological theories and theorists reflect this process. This paper examines how sociological theorists

have—or, sometimes, have not—conceptualized disability throughout the years. Most early theoretical work tended to ignore disability (with a few exceptions, such as Martineau). When disability was discussed, in line with other disciplines of the time, American sociology applied a strong dose of eugenics to disability conceptualizations. Before World War II, despite its empirical presence, disability was mostly ignored in sociological theory. From the 1950's through 1970's, disability tended to be viewed either as sickness (Parsons) or deviance (Goffman). Both saw disability as being undesirable and stigmatized; however, they differed in their moral attributions and therefore in their views of society's expected reactions. There was one theorist (Nagi) who viewed disability as an interaction between person and environment, but his work was [and is] largely ignored. After 1970, newer conceptualization began to emerge in the US and the UK. Emphasizing a social rather than a medical or deviance model of disability, these conceptualizations emphasized the role of societies and social factors in producing disability and the lives of people with disabilities. They variously viewed people with disabilities as being in a role, being a minority group, being a cultural group, or (one subset—deaf people) being a linguistic group. Most recently, theorists have begun to use intersectional analyses, such as those applied to race, class, and gender, in order to view disability as similar to those characteristics although widely overlooked in those analyses.

Moving to Opportunity?: A Longitudinal Analysis of Residential Mobility and Metropolitan Opportunity Structure

Research on the Geography of Opportunity provides insights into the ways in which neighborhood effects can potentially influence long-term outcomes for residents (Briggs, 2005; Galster and Killen, 1995). Recent research highlights the importance of neighborhood demographic and socioeconomic conditions to intergenerational transfer of stability and advantage (Chetty and Hendren, 2015). In this paper, I take a novel look at this geography of opportunity as it relates to patterns of residential mobility in the Chicago, Illinois metropolitan area of the United States. Chicago is salient for this discussion not only given its size, but also given the long history of research on social processes including residential mobility within the region.

Drawing from a novel source of household and address level longitudinal data, I analyze residential location histories for over 8.1 million households living in the Chicago Metropolitan Area during the period 2005 to 2016, and parse out patterns of residential mobility based on theorized access to the geography of opportunity. Specifically, for households who have moved within the region during this time period, I compare neighborhood conditions at origin and destination to examine changes in exposure to certain types of empirically described social and economic opportunities. As a point of comparison, I also analyze the characteristics of households who have not moved during the same time period. This work presents a novel means for identifying housing residential mobility pathways, and uses empirically described elements of the Geography of Opportunity as a way to explore differential outcomes for movers and nonmovers based upon their demographic characteristics. The implications of this work are substantial, and are particularly relevant for regional policy analysis and understanding emerging regional phenomena including population loss in the urban core, the suburbanization of poverty, and persistent patterns of regional racial and economic segregation.

GREEY, ALI* (University of Toronto)

Illegible Genders in the Change Room: Improving Transgender Inclusivity in Sporting Spaces

For lesbian, gay, bisexual, queer, transgendered and intersex (LGBTQI) bodies, the change room is often a space fraught with vulnerability. Scholarship suggests that discomfort in the change room represents the most significant barrier to this community's inclusion in sport (Hargie, 2017; Keogh, 2006; Whittle, 2007). While several scholars propose gender-neutral alternatives to men's/ women's change rooms (Cavanaugh, 2010; Sykes, 2011), little literature examines how this existing infrastructure can be adapted to improve accessibility for LGBTQI participants.

My research examines the Change Room Project (CRP) as a model for mediating gender differentiated spaces to improve inclusivity for ambiguously gendered bodies (Fusco, forthcoming). My presentation draws on an autoethnographic account of my observations visiting change rooms around the world as an androgynous athlete competing for the Canadian women's boxing team. I will illustrate the CRP, and the phenomenon that I observed in the change room where it was displayed in 2015. My presentation will designate significant time for interactive discussion, I am particularly interested in panel/ audience members' explorations into how intersectional aspects of identity (eg. masculinity/ femininity, sexuality, being racialized, (dis)ability and body size) affect experiences and capacity for claiming space in the change room.

RC37-658.1GREGORY, DAVINIA* (*University of Warwick*)*Location and Digital Dislocation: Emerging Identities and the Legacy of the Drum*

The lifespan of The Drum arts centre in Birmingham, UK (1995-2016), was the period in which the internet became increasingly integral to everyday life, and during which most elements of life became organized according to networks. This paper examines two ways in which space has become increasingly contested since The Drum opened. Firstly, with The Drum as prism, it considers how far digital space has changed the way that identities are constructed / contested. Secondly, it considers the contestation of physical urban spaces in the UK.

The paper considers a range of intersections between race and class in the UK. The Drum was built on a social solidarity based on political blackness. As it has been argued that blackness has become increasingly fragmented in Britain during the period in question, the paper considers the effect that this had on The Drum's popularity. It also explores ways in which the widespread use of social media has progressively transformed public engagement with the arts. It asks: What is the role of strategic essentialism in enabling progress, and on what grounds can such unity be achieved in contemporary times? How far did local allegiances hold political blackness back and vice versa, in the case of The Drum? It examines the African diaspora online as a global network. Can "hashtag blackness" be used by physical, localized organizations to build and retain audiences? How far did The Drum fail in this regard? Next, how far can hashtag blackness be considered classless? What is the place of the Drum's former regular attendees, many locally bound by financial and class constraints, in this online world? Can online solutions or event series' replace The Drum's physical presence? If not, what does this mean for The Drum's new archive and its planned online presence?

RC05-110.10GREGORY, DAVINIA* (*University of Warwick*)OOMMEN, ELSA (*University of Warwick*)*Working Title: Towards a Self-Decolonizing Feminist Practice in Academic Collaboration***Working title: Towards a Self-decolonizing Feminist Practice in Academic Collaboration**

This paper uses collaboration as the subject of analysis and reflection, interrogating the potential of what we call a 'Self-decolonizing feminist practice' as a means of feminist activism and self-preservation within academic institutions.

The terminology 'Self-decolonising feminist practice' is influenced by Bourdieu's emphasis on reflexivity and practice which 'sets out to make explicit the truth of primary experience of the social world' (Bourdieu, 1977: 3). Drawing from the postmodern turn within social sciences and the emphasis on praxis and embodiment in social theory, we argue that a reflexive feminist practice should also be decolonial in its ambit. We argue that this decolonization needs to begin with the individual researcher. As female researchers of colour with differing intersectional identities, we reflect on our own embodied practices of occupying the neoliberal academic space in the UK.

Additionally, the paper considers strategic essentialism as a tool for creating unity, having enabled collective confidence, strategizing, and mobilisation in political and cultural decolonisation processes over the past century. The research question that guides our enquiry is: How far is political blackness useful in contemporary UK academia; what are its problems, and what may be the uses of strategic essentialism within academic institutions, in navigating academic careers? To grasp the core of the self-decolonisation process, we examine collaborative processes within our own academic practices to understand the usefulness of something developed from, but moving beyond the strategic essentialism of political blackness. These processes of collaboration enable us to reach beyond intersectional boundaries and dismantle intersectional hierarchies, to further decolonize each other's thought processes and those of a wider readership, through fruitful and truly equal academic collaborations. It is this broader potential of feminist practice, which begins with individual researchers, that we term - self-decolonising feminist practice.

RC06-140.1GREIVING, JENNIFER* (*University of Colorado Denver*)LÓPEZ, ANAYELI (*University of Colorado Denver*)VIRAMONTEZ-ANGUIANO, RUBEN (*University of Colorado Denver*)*The Role of Latina Women in Migration, Immigration, and Adaptation: Patterns in Central Indiana*

The Latino population in the United States has increased significantly over the last two decades. In North Central Indiana, the Latino population grew by over 500% during the early 2000s (U.S. Census Bureau, 2010). Many of these families emigrate in order to pursue educational and social opportunities for their family

members. As immigrant Latino families settle into these ethnic enclaves, family roles must adapt in order to navigate new social structures in schools and society. Latina women tend to take on new roles in the community, building social capital using service and leadership. Bronfenbrenner's bioecological model is used as a lens through which to view the difficulties and triumphs of resettlement and the development of new social capital.

This study focused on an ethnography of 63 families in the North Central Indiana region. Data were collected over the course of three years through an ethnographic study. Other forms of qualitative methods were used, including interviews, observations, and continued interactions with the families in the community. As a result, the researchers became active participants with the families in North Central Indiana.

Of those 63 families, 13 women were identified by community members as producing social capital both within and outside their family units. For this presentation, we look at how the family roles of Latina women changed due to their migration. We include information about aspects of motherwork within the family, with emphasis on familismo and educación, and also outside of the family, producing social capital using servant leadership and value systems (Lopez and Viramontez-Anguiano, 2013). Latina immigrant women provided advocacy that promoted both educational outcomes of Latino youth and better well-being for Latino immigrant families. Implications for practice and research include how the participation of Latina women is critical for culturally responsive outreach with Latino communities in the United States.

RC04-93.13GREMIGNI, ELENA* (*University of Pisa*)*From Competences to Work. Some Remarks on Italian Educational Policies in the Age of Neoliberalism*

Since the mid-nineties, the European Union has promoted a new form of didactics aimed at developing competences, in order to promote a system of comparable evaluations and certifications across Europe. Afterwards, the European Council explicitly recognised the need to specify new basic competences to be provided through lifelong learning as the essential response to the shift to knowledge-based economies. These key competences are defined as fundamental for Europe's response to globalisation and their tight link with a neoliberal perspective of the work world, which can also be deduced from the non-random choice of the term "competence", is evident.

Italy has implemented these guidelines, promoting the school-work alternating training as an educational tool. Nevertheless, this seems mainly aimed at having students acquire the certification of competences that can be used in the labour market.

Law no. 107/15, in particular, requires the school-work alternating training to be implemented in all classes of the last three years for at least 400 hours in technical and vocational high schools, and for at least 200 hours in lyceums. The diversification in the number of hours of school-work alternating training, apparently founded on the ground that lyceums have a more theoretical leaning than technical and vocational high schools, reveals that the educational aspect of the work experience is considered secondary to what appears instead to all effects a training activity.

Furthermore, this pathway comes to frequently represent a fragmentary and sporadic experience that on the one hand the students generally enjoy doing but on the other hand often takes time away from the basic preparation. The consequent impact on the curriculum lets us presume that students of technical and vocational schools will have less and less opportunities to undertake graduate studies, and will be used more and more like "cogs" of the global labour market.

RC04-86.8GREMIGNI, ELENA* (*University of Pisa*)*The "Misère De L'Éducation" in the Age of Neoliberalism*

Over twenty years after the publication of *La misère du monde* (Bourdieu 1993), Pierre Bourdieu's work is still highly relevant. The social order that has led to a proliferation of the "small miseries" of the world seems to have prevailed: Pierre Bourdieu's micro-sociological essay highlighted the symptoms of a disease that has gotten worse in the past few years, and prophetically predicted many of its current consequences. This paper aims to analyse the consequences on the educational field where practices of "service-sector Taylorism" are emerging alongside the usual mechanisms of social reproduction. These practices are allegedly inspired by meritocracy but actually aimed at the utilitarian exploitation of human resources. The students' potential is thus trivialised, dumbing down to a few measurable variables on which teaching and selecting are based, according to a view that treats humans as merely means to an end. Thus, by concealing the social fabric in which individuals are rooted, any failure can be surreptitiously blamed on individual responsibilities. Sociological research has the crucial task of revealing the peculiar logic of these kind of mechanisms, more and more common in several fields, and their ideological implications, typical of neoliberalism: because, as Bourdieu says, "what the social world has done, it can, armed with this knowledge, undo" (Bourdieu 1993: 629).

RC16-308.5GREVE, ANNI* (*Roskilde University Department of Social Sciences and Business*)*Credit Cultures: The Business Letter and the Conversation*

Georg Simmel's reflections on credit have gained renewed interest not least in the aftermath of the so-called financial crisis. He described credit as a new form of money in which "the pivot of the relationship between creditor and debtor lays outside the straight line of contact between creditor and debtor and set at a further distance from them: the individual's activity and transactions thereby gain the qualities of far sightedness and enhanced symbolism". It is a relationship that demands trust since, "in credit transactions the immediacy of value exchange is replaced by a distance whose poles are held together by trust". In modern money economy, however, "credit has become an impersonal organisation and trust has lost its specific personal character" [Simmel 2011, 520-21]. This paper takes up the challenge to reconsider conditions for "the distance whose poles are held together by trust". At key is the active role played by commission agencies in providing impersonal ties of finance in early modern Eurasian trade. It considers the constitutive role of the business letter in terms of writing: It was first used by commission agencies as a source of reliable information about prices, product availability, exchange rates, and insurance premiums, as well as the political, military, and diplomatic events that affected trade that merchants made decisions about how, where, and when to invest [Trivellato 2009, chapter 6-9]. Later the business letter gave rise to an entire etiquette of business letters that would crystallize in 'a language of the business correspondence' "in the eighteenth century, when conversation replaced reasons of state as the cornerstone of commercial society" [Rothschild 2001]. We shall be reassessing the equal important role of the business letter in ensuring the enforcement of contracts and obligations. "A merchants' letter became accepted evidence in courts and were exchanged by agents from disparate places".

RC16-314.1GREVE, ANNI* (*Roskilde University Department of Social Sciences and Business*)*Hospitality – Jacques Derrida's Contribution to Theory*

Cosmopolitan virtues conceived as an ethos of openness and reciprocity is often associated with a way to relate and 'a gesture for including the other' (Fine and Boon 2007), but is perhaps not always liberating and emancipatory; as argued by Mustafa Dikec (Dikec 2002, 228), these virtues may even "conceal an oppressive aspect beneath its welcoming surface". Immanuel Kant defined hospitality as "the right of a foreigner not to be treated with hostility because he has arrived on the land of another" (Kant 1795; 1990:41-42). He added that the claim is one that does not encompass any right to be a guest: "It is only a right of temporary sojourn, a right to associate, which all men have". At key of this paper presentation is the diaspora stranger in this restless and somehow indecisive position as "Sojourner" in which the stranger is always defined in relation to a host (Simmel 1908; 1971, 143-149, Levine 1077, 27). It takes inspiration from Jacques Derrida (1930-2004), who has offered an encompassing philosophy of hospitality with particular attention to the diaspora stranger forced in exile due to religious belonging: Despite being "a leftist Parisian intellectual, a secularist and an atheist" (Caputo 1997, xxiii) Derrida thoughts are deeply influenced by his diaspora identity. Derrida was born into a Sephardic Jewish family that immigrated to Algeria from Spain in the nineteenth century and like any other living in diaspora Derrida has a long memory, he identified himself as a crypto-Jew—"Marranos that we are, Marranos in any case whether we want to be or not, whether we know it or not" (Derrida 1993, 81, in Kleinburg 2015). The paper will introduce to four dimensions of Derrida's philosophy of hospitality and its relevance to sociology: *Negotiation, Mediation, Iterability and Khôra*

RC22-413.3GRIERA, MAR* (*Universitat Autònoma de Barcelona*)CLOT-GARRELL, ANNA (*Universitat Autònoma de Barcelona*)*Beyond Narcissism: Holistic Spirituality, Political Engagement and Social Transformations*

Holistic spirituality has traditionally been characterized as belonging to the individual private sphere, and anchored in the growth of narcissistic individualism. However, recent empirical evidence and theoretical developments point to go beyond the dualities individual *versus* collective, private *versus* public when approaching to holistic spirituality. The objective of this presentation is to explore expressions of the "engaged" dimension of holistic spirituality by paying special attention to the interplay between spirituality and social and political engagement. We aim to look at the development of an holistic theodicy that while makes intelligible the origins and the nature of the social world, becomes a driving force for social action. The presentation draws on the results of a research on holistic spiritualities in Barcelona. Particularly, we focus on two case studies: the

case of meditation encounters that are regularly organized in Barcelona's public spaces in order to promote local and global change, and the case of yoga courses taught by volunteers in penitentiary centers.

RC22-414.1GRIERA, MAR* (*Universitat Autònoma de Barcelona*)*Performing Religion in the Public SPACE: Visibility, Recognition and the Politics of Religious Diversity*

Theories of secularization predicted an unpromising future for religion. However, contemporary urban spaces are filled with a growing array of religious expressions that are indicative of the global revitalization of religious identities, and the religious pluralization of modern-day cities. The present paper takes open-air religious minority expressions as objects of study to look at how religious communities exteriorize their activities beyond the private space of their respective centers of worship. More specifically, the paper focuses on analyzing Sikh, Muslim and Buddhist religious events taking place in the Barcelona public space. The aim is to comparatively examine the impression management efforts of religious groups when organizing public events, and their 'efficacy' in producing public visibility and in gaining social and political recognition. Theoretically the paper is grounded on Erving Goffman dramaturgical approach (1971) combined with contemporary reflections on visibility, recognition and governmentality (Göle, Dean). The paper shows how minority groups strategically shape their public performances to challenge stigmatization processes, and adapt their public appearances to suit different audiences (global, national, local). The paper also reveals the structural limitations and spatial constraints that minorities face in obtaining public recognition.

RC11-229.1GRIGOROVICH, ALISA* (*Dalla Lana School of Public Health, University of Toronto*)KONTOS, PIA (*Toronto Rehabilitation Institute - University Health Network*)*A Critical Exploration of Unwanted Sexual Attention in Residential Long-Term Care Homes*

Female workers in residential long-term care homes frequently experience unwanted sexual attention from residents of these homes. These experiences can be difficult for workers to manage, and can negatively impact their health, occupational outcomes, and care relations. Despite these negative outcomes, limited research has explored these experiences of workers. This presentation reports on the preliminary results of an ethnographic study of unwanted sexual attention in a care home in Ontario, Canada. Data collected include participant observation and in-depth interviews with 23 workers of diverse professions (e.g. personal support, nursing) and roles (e.g. direct care, management) as well as a discursive analysis of relevant documents (e.g. legislation, professional practice standards and guidelines, descriptions of educational curriculums). Document analysis suggests that current legislation, education and training privilege the vulnerability of residents, to the exclusion of attention to the vulnerability of workers to harm. Further, review of educational curriculums shows that workers receive little direct instruction regarding how to manage sexual and intimate boundaries and respond to sexual advances in the context of providing care. Analysis of interview and observation data confirms that workers have limited knowledge regarding how to respond to unwanted sexual advances from residents, and that organizational policies and practices centre on workers' responsibilities to protect residents from sexual harassment. While workers report that sexual advances from residents were uncomfortable or offensive, they rarely reported these as they perceived these as unavoidable aspects of care work. To cope, workers normalized unwanted sexual attention by ascribing its occurrence to cognitive impairment, mental pathology, individual personality, or workers' 'unprofessional' appearance and/or practices. These findings suggest that unwanted sexual attention as treated in public policy and long-term care practices actively silences workers' experiences and additionally restricts their abilities to resist such attention. Implications of these findings for policy and practice will be discussed.

RC11-216.4GRIGOROVICH, ALISA* (*Dalla Lana School of Public Health, University of Toronto*)KONTOS, PIA (*Toronto Rehabilitation Institute - University Health Network*)*Exploring Ethics, Relationality and Justice in the Context of Resident-to-Resident Aggression in Nursing Homes*

Resident-to-resident aggression (RRA) is highly prevalent in long-term care settings. RRA is most commonly attributed to the characteristics of aberrant individuals living with dementia, captured by popular and empirical accounts in the representation of the 'violent resident'. Consequently, current prevention efforts focus on curtailing the actions of residents identified as "aggressive". This neglects that acts of aggression are influenced by broader social and physical environments. It is our argument that this reductionism can be traced to the biomedical ethic that underpins dementia care. Biomedical ethics are too narrow an approach to guide decision-making in the context of RRA. There is a need to engage broader discourse in political philosophy and philosophy of ethics to develop an alternative ethic to guide prevention efforts. To this end, we critically review the work of Nussbaum and Nedelsky, drawing on their strengths and identifying their limitations. With an interest in addressing these limitations we explicate an alternative ethic that is grounded in a model of citizenship that recognizes relationality and the agential status of embodied self-expression. The application of this ethic offers a more holistic prevention strategy by drawing attention to the systemic underpinnings of aggression and the critical need to promote human flourishing.

GRILLO, CARMEN* (York University)

Euthanasia in the Canadian Context: How Experience of Death Shapes Moral Views of Medically-Assisted Dying in Canada

In the past few decades, forms of voluntary euthanasia (physician-assisted suicide, for example) have become legal in jurisdictions in Europe (Belgium, Luxembourg, the Netherlands and Switzerland), the United States (Oregon) and more recently, in Canada. Concomitant with this legal change, and perhaps preceding it, moral support for the practice has increased, both within jurisdictions where it remains legal, and those in which it remains prohibited. Nevertheless, our understanding of the social processes through which people come to support voluntary euthanasia practices is limited. While scholars have hypothesized increased education, declining religiosity, and a culture focused on individual autonomy as explanations of why voluntary euthanasia has become more widely accepted in recent years, there is a lack of process-based, micro-level explanations of this support. Explanations of the processes whereby a person's moral support of voluntary euthanasia is motivated directly by the loss of a loved one are missing. How does the experience of death and bereavement shape laypeople's views of medically-assisted death? In this paper, the author presents preliminary findings of ongoing research on support for physician-assisted dying in the Canadian context. In Canada, medically-assisted death was legalized in 2016. The author presents findings of interviews with volunteers in a variety of pro-euthanasia organizations in Canada. The interviews suggest that in Canada, support for euthanasia is shaped by the experience of moral dilemmas over the course of care, particularly when close relatives and friends are asked to make critical decisions on behalf of a dying person. In terms of social processes, the author explores the idea that the experience of autonomy is shaped by the legal, institutional and relational contexts of death, contexts that individuals navigate as they try to ensure a dignified death for the people they care for.

GRINBERG, LEV* (Ben Gurion University)

When the "Old" Social Movements Become Relevant in the New Wave of 2011 Occupy Protests

The Tunisian General Trade Union (UGTT) won the 2016 Nobel prize for peace in recognition of its contribution to democracy in Tunisia. Indeed the UGTT was one of the most salient trade unions supporting the Tunisian Jasmine revolution. The success of removal of the dictator ignited the imagination of protestors all over the world, and 2011 became the year of global protest against inequality, and against the structural corruption of political parties that facilitate the anti-democratic imposition of neoliberal and austerity policies. However not everywhere the trade unions declared general strikes, or actively supported the 2011 cycle of protest. Moreover, the full success of removing the ruling party from government was also an unusual outcome, despite the fact that in every case where occupy protests had massive impact in the public discourse it also reshaped the political arena.

The paper will compare different levels of trade union participation during the new cycle of protests in 2011 and their impact in the political arena. It will argue that in cases of full integration of the trade unions in the struggle, including strikes, the government was removed in next elections by parties that supported the protests (Tunisia, Greece, Chile). In cases with weak support of trade unions, the reshaping of the political arena didn't lead to the establishment of governments representing the protests, and in some cases it led to reactive Governments or stalemates (Spain, Egypt, Israel, the US, Turkey, Brazil). The paper suggests two explanations to the distinct degrees of trade union integration in the protests: a. the level of union embeddedness in political parties; and b. the reluctance of activists to build coalitions with too embedded unions, due to their interest to frame the protests as the "people" against the elites.

GRINBERG, LEV* (Department of Sociology and Anthropology, Ben Gurion University)

When the Past Teach Us about the Future, the Case of Israel/Palestine Power Sharing

Since 2000 Israelis and Palestinians lost their hope for peaceful coexistence. 25 years after mutual recognition, and 18 years of violent clashes, no one can imagine a peaceful settlement of the conflict. Although the majority prefer to establish two separate nation-states, only a minority believes it can be agreed and implemented. They realize that Israeli settlements prevent partition, but the idea of one secular democratic state seems even more problematic, due to the difficulty to contain ethnic conflicts in deeply divided societies by liberal democracy. While despair and disillusion grow, and both "solutions" appear unrealistic, a new idea of power sharing is emerging, looking for institutional combination of consociation, confederation and condominium.

Surprisingly, very creative ideas of power sharing, similar to recent "new" ideas, were already suggested in 1947. Bi-nationalist supporters like Buber, Arendt and Magnes opposed partition, warning that it will lead to war, but also the UN resolution took in consideration that partition cannot be total, and suggested to establish important institutions of power sharing by international condominium (Jerusalem) shared confederative institutions (administration of the economy) and mutual protection of minority rights. These are precisely the key questions discussed today by new proponents of power sharing. The 1948, Palestinian disaster (Nagba) and Exile (Hijra) although proved the warning of bi-nationalists, but the present debates show that the UN Commission for Palestine deeply discussed the challenges of Jewish-Palestinian coexistence, and suggested creative ideas how to deal with them. The 1947 debates, can teach us a lot about a shared future in Israel/Palestine, despite the disastrous results of the 1948 war and 70 years of unilateral Israeli domination and Palestinian subjugation.

GRININ, ANTON* (Volgograd Social Research Center)

The Leading Technologies of the Sixth Technological Mode

Nikolay Kondratieff's theory of long waves still remains one of the most productive conceptions for making scientifically-based predictions. Combined with Joseph Schumpeter's ideas this theory serves as the basis for the theory of technological modes (or paradigms) maintaining that each long wave causes a transformation of the technological mode, and this allows making high probability assumptions about the leading technologies of the near future.

We have elaborated approaches that connect the long cycles (50–60 years long) and technological waves with superlong cycles of changing production principles (that is, of the whole system of productive forces and organization of production within the World System), which are formed as a result of production revolutions. We have found a close interaction between the stages of production revolutions and principles of production, on the one hand, and long waves and their phases, on the other[1].

In our opinion the sixth technological mode will be characterized by a breakthrough in medical technologies which will integrate with a number of other technologies and together they will make the MANBRIC-complex (medico-additive-nano-bio-robot-info-cognitive technologies). We believe that the sixth technological mode will involve a much wider range of innovative technologies than it is generally assumed, in particular, wider than the NBIC-convergence.

On the whole, the leading trend of the sixth technological wave in our opinion will be the transition to complex self-regulating systems[2].

[1] See Grinin L. E., Grinin A. L. 2015. From Biface to Nanorobots. The World is on the Way to the Epoch of Self-Regulating Systems (the History of Technologies and the Description of Their Future). Moscow: 'Uchitel' Publishing House.

[2] This explains why we call the described revolution a cybernetic one: management and information, the key elements of this revolution, are the most important categories of cybernetics.

KOROTAYEV, ANDREY (National Research University Higher School of Economics)

Kondratieff Waves and Deflationary Trend in the Modern Global Economy

The danger of deflation has been rather frequently mentioned recently among numerous concerns over the European and partly American economies. Analysts cite the Japanese economy which has been suffering from deflation for the last two decades despite the government's efforts. Similarly, notwithstanding many trillions of dollars, euros, and yen that were invested in economies over the past few years, the inflation in the Western countries still remains low. The reason for

disinflation at the moment lies in the fact that the change in inflation and deflation over fairly long intervals is cyclical, its dynamics in long term has a shape of long waves (or cycles), which can be explained by the theory of long cycles of Nikolay Kondratieff. Each long cycle has an upswing phase and a downswing one. For upswing phases inflation trends are more typical. The deflationary and depressive tendencies increase at the downswing phases. According to our estimations after the 2008 global economic crisis the 5th K-wave downswing began. It will continue till the mid-2020s, and the problem of deflation, apparently, will be quite serious till that time. There are also other reasons why European countries suffer from low inflation and deflation tendencies. The USA, albeit to a lesser extent, has signs of the disease as well. The present paper defines reasons of the problem, explains the peculiarities of the inflation-deflation processes in the world and also offers some forecasts on this basis. Based on our analysis of available resources and the theory of long cycles, we suppose that the new crisis will begin in 2018–2019. We also suppose that in the next 5–10 years, the global economy will continue being in the crisis-depression phase with rather sluggish and weak rises.

Dissemination and Translation of Public Policies for Rural Development in Mercosur

This paper discuss the performance of the Specialized Meeting on Family Farming of Mercosur (REAF) – an instance of the Southern Common Market (MERCOSUR), which includes the participation of government actors and representatives of rural social movements – as a public forum and collective actor that coordinates a process of construction and dissemination of rural development policies in this region. Policies transfer analyses have been an object of growing interest in social sciences, often focusing on the role of national governments and bilateral relations. Concurring with studies that seek to amplify these reflections, addressing the role of international organizations, social movements and civil society in the dissemination of ideas, this paper analyzes the convergence of instruments and public policies for family farming (ex. institutional markets, family farming registers and land governance), and discuss the origin of these ideas (prevalence of some country or social actor), the power relations involved (coercive, voluntary or mixed actions) and the processes of copying or translation in each country. The results highlight the importance of REAF in the institutionalization of family farming, and the role of Brazil as an exporter of policies in this region. At the same time, it questions the prospect of a unilateral transfer process, arguing that the success of the REAF is linked to the active role played by governments of other countries and, above all, the engagement of civil society.

Does Domestic Violence Exist According to Russian Church and Television?

While 12 thousand women die from domestic violence in Russia every year, the State Duma recently approved a change reclassifying first-time battery against a family member as a misdemeanor instead of a felony. Multiple questions were raised, including if the act can be viewed as normalizing violence and in what kind of society it is possible. In this light it appears important to examine the messages regarding domestic violence that are broadcast by local opinion-makers, and in my research I focus on Russian television and the Russian Orthodox Church. I have analyzed the TV series *Boiling Point* (2010) and *The Perfect Victim* (2015) and the public statements on the issue made by high-ranking members of the Church. I aimed to answer the following questions: is domestic violence ignored, condemned, normalized, or romanticized and glamorized? Is there a component of victim-blaming? What support options (legal, medical, psychological, spiritual, material) are really available to the victims and how they represented? I have found that both the Church ministers and the television writers often fail to conceptualize domestic violence as a real, pervasive and painful issue and never outwardly condemn it even if it is at the center of their speech or screenplay. They depict official support systems as useless and nonexistent, possibly normalizing the factual inaction, and offer unrealistic solutions to the victims' problems in the form of poorly motivated helping figures. Some television plots point to religion as a way to salvation, however, the Russian Orthodox Church often distances itself from the issue. Domestic violence is a territory in which the fundamental Russian concept of family values meets the law, and the dynamic between them can be viewed as a litmus test of the modern Russian society and its ideas of crime and justice.

GRISHINA, YULIYA* (*Bergische Universität Wuppertal*)

Domestic Violence on Russian Television: A Sociological Perspective.

My work is dedicated to exploring the representation of domestic violence against women on Russian television and how these images are interpreted by different women. Despite the pervasive nature of this issue in modern Russian society, the topic of domestic abuse remains taboo on television, and I have discovered only two series that discuss it: *Boiling Point* (2010) and *The Perfect Victim* (2015). Such series as the Brazilian *Mulheres Apaixonadas* (2003), the English *Broadchurch* (2013-2016), and the American *Big Little Lies* (2017) successfully addressed the issue in the form of what is known as E-E, entertainment-education. Produced by a channel with significant possibilities for outreach, both Russian shows had an opportunity to offer constructive help in the same way. A preliminary critical analysis, however, has demonstrated that these shows offered highly unrealistic solutions to the victims' problems and portrayed various forms of support as unhelpful and possibly dangerous, potentially discouraging victims from seeking help. Moreover, these shows have been found to objectify women and display examples of victim-blaming, alongside mythologizing the importance of family values. The second step of the research is collecting and analyzing data from Russian women to determine how they perceive the messages of these shows and if they are able to identify the characters' abusive behavior. I'm looking at how these abilities correlate with religious beliefs, living in cities, towns or villages, being employed, having children, and personal experience of abuse.

Transitions during Early Adulthood and Their Impact on Life Satisfaction and Subjective Well-Being in Germany, Japan and the United States

The aim of this paper is to assess the impact of various transitions during adulthood on life satisfaction and subjective well-being in divergent cultural contexts. The comparison focused on Germany, Japan, and the United States, three countries which are among the economically most developed countries in the world, but nonetheless retain significant cultural and institutional peculiarities to this day. Cultural dimensions of great relevance in the context of the transition to adulthood and its relationship with life satisfaction and subjective well-being are the divide between more collectivistic and more individualistic societies as well as cultural norms regarding family and kinship relations. These underlying cultural norms are expected to shape normative expectations regarding the importance of certain transitions as markers on the path to adulthood. From this perspective, complying with either these expectations or even one's own internalized values can be understood as a source of satisfaction and emotional well-being, whereas failure to meet the culturally defined requirements during the transition to adulthood may be associated with dissatisfaction and emotional stress. Among the transitions of interest are leaving the parental home and establishment of an independent household, formation of a partnership and starting to live with one's partner in a common household, marriage and childbearing. Beyond the substantive interest in the cross-cultural comparison, applying a panel approach whilst taking into account such diverse cultural contexts offers a unique opportunity to better assess the causal relationship between these transitions and changes in life satisfaction as well as subjective well-being.

For the empirical analysis, I use harmonized panel data from the German Family Panel (pairfam), the Japanese Life Course Panel Surveys (JLPS) and the National Longitudinal Survey of Youth (NLSY97).

Do Young People Acquire Excessive Education? Overqualification Among Recent Post-Secondary Graduates in Canada

Overqualification is often considered to indicate an unsatisfactory outcome for young people, recently completing education. Those overqualified have invested time and money in higher education acquiring knowledge and skills for which they are unable to secure recognition. However, in Canada and elsewhere overqualification is unequally distributed across cohorts. These observations raise the following questions: i) What proportion of young people is overqualified? ii) What are the causes of overqualification? iii) Have the prevalence and causes of overqualification shifted over time? Using Canada's National Graduate Survey we examine these issues using survey data on graduate cohorts in 2000, 2005, and 2010. Each of these cohorts was interviewed two or three years after graduation. This allows us to estimate early rates of overqualification and its determinants. It also allows estimates for distinct cohorts at three different periods.

GROSHEVA, LYUBOV* (*Tyumen Higher Military Command School of Engineering (Military institute)*)

National Factor in the Formation of the Image of Peacekeeping in the Eurasian Space

The formation of a peacekeeping contingent seems to be a difficult task due to the multicultural composition of both the contingent and population of the country where the military contingent is deployed. One of the significant difficulties is the training of peacekeepers to work in the conditions of divergence of habitual traditions and way of life and the accepted rules and norms of the society of the population of the host country. The situation in Cambodia, Angola, Somalia, Sierra Leone and Yugoslavia has clearly reflected the main problems of interaction between peacekeepers and the local population. On the one hand, this fact is related to the specifics of the reflection of peacekeeping in the media, according to the author's content analysis up to 40% of the information from the Internet media contain negative connotations related to crimes both from the peacekeeping contingent and from the local population who abandoned previous commitments, connected with the peacekeeping operation.

This fact correlates with the data of the sociological survey (N = 583, representatives of Russia and the countries of Central Asia), according to which 49.6% of military personnel aged 22-27 consider peacekeeping to be a mostly political action and doubt in its effectiveness. While 31.2% of the respondents consider the language barrier and the difference in cultural aspects to be significant problems of effective interaction. It should be noted that 18.4% when choosing the opportunity to participate in a peacekeeping operation rely on the analysis of conditions in the host country related to national specifics. While more than half of respondents consider the knowledge of traditions and customs of the local population as a guarantee of effective work of peacekeepers. Thus, attention to information coverage of peacekeeping, as well as to the training of a multicultural contingent is quite important for ensuring peace-building.

NAHON-SERFATY, ISAAC (*University of Ottawa*)

Sensory Work in Clinical Decision Making

Sensory experiences comprise an integral part of clinical decision-making (Sterne, 2003; Maslen, 2017), as Mol clearly indicates: "[l]ong before machines are put to use, clinicians diagnose with their senses. They notice posture, muscle tone and bruises; they hear sadness in a tone of voice or the signs of impaired breathing; they feel for the pulse, for lumps; and they may smell metabolic disturbances" (2008, p. 39). Clinicians' senses are constantly engaged (Schubert, 2011; Goodwin, 2010) and the senses are indispensable to clinicians' judgments of health and illness because information is partially collected via the senses, and this sensing is a process of knowing. Even if the multitude of studies recognizing that clinical decision-making integrates (or should integrate) a sensory dimension (Svensson and Jacobson, 2014; Bleakey *et al.*, 2003; Heiberg Engel, 2007; Manidis, 2013; Coget and Keller, 2010; Maslen, 2012), this dimension is not studied, observed, analyzed in detail. However, "research on sensory work in contemporary healthcare contexts is emerging in sociology of diagnosis and sciences and technology studies such as the dual use of senses and tests, and the delegation of sensory work" (Maslen, 2016, p. 173). The main objective of this communication is to investigate the role of sensory experiences in clinical decision-making. Based on a series of focus groups (building on a narrative approach) with nurses in diverse services at hospital (IUC, Surgery, Emergency, etc.), our study examines the "sensory work" of clinical decision-making (Maslen, 2017). During the video recorded focus group, the nurses share stories about the influence of senses on clinical decision-making. The analysis of clinical stories contributes to identify different situations of interaction revealing the "sensory work" that supports the clinical decision-making.

Police Practices and Social Identity: The Case of the Polices in the Federal District

The research that has originated this paper has as a priority the reflexion about the relationship between professional identities and policeman practices. They were thought considering their possible deployments in relation to police violence. The paper took into account some theoretical contents, however, the main goal is the analysis of the empirical context of the police practice.

A particular importance has been given to the social representation of the police officers about questions such as occupation; the meaning of their practices in the streets; their reference patterns; their ethos and identity as a policeman, the

distinction between the policeman and the non- policeman (that is the common citizen) and also the distinction between the civil and the military policeman, the pride of the profession and the motives for the choice of the profession.

The results pointed out to: a) the context of tension between civil and military officers; b) the tension between policemen and citizens which means; c) the differences about the social representations that policemen create about themselves and the ones they believe society creates about them; d) the deployment issue from the negative representations that the policemen create concerning a lack of recognition by society, as well as its consequences in the way they construct their own identities and organise their practices; e) the constant complaints they make about the difficulty in the communication between the command and the troops, due mainly to the hierarchic and rigid structure (specifically in the military force) concerning the bureaucratic and behavioral aspects of daily life and performance in the police forces; f) the meaning they give to their activity as a policeman; g) the pride (or the lack of pride) related to the profession; h) the intention to stimulate (or not) their sons and daughters to follow their profession;

The Decline of Organizational Sociology? An Empirical Analysis of Research Trends in Leading Journals across Half a Century

Organization-sociological works are said to have "largely disappeared" (Gorman 2014) from the sociological discourse. While from the 1950's until around the year 2000 organizational sociology was perceived as "thriving" (Haveman 2000), recent assessments conclude that the discipline is "on the brink of irrelevance" (King 2017). From an empirical point of view, this development comes as a surprise. In fact, organizations have become more important in our society than ever before and have experienced drastic changes in recent decades. Society is nowadays filled with organizations (Perrow 1991), and the number of organizations is rising around the world (Bromley & Meyer 2015). Meanwhile, organizations increasingly morph into new forms, presenting scholars with new challenges, while "old organizational forms outlive their usefulness and eventually are replaced" (King 2017).

Against this backdrop, we want to explore the current state of organizational sociology empirically. Building on a corpus of approximately 3000 research articles in six leading sociology journals since 1955, we will use both manual and semi-automated coding methods to assess the relevance of organizational sociology within sociology. Specifically, we will map the development of the relevance of organizational sociology within sociology from 1955 until today, using decennial steps with two consecutive years of each decade. We will also examine the prevalence of organization-related topics in sociological works as well as their use of theories, methods, and data. Our study will uncover dominant theory paradigms and methodologies as well as considered topics and issues. Thereby we will look at possible explanations for these developments. Our study will reveal to which degree existing assumptions about the development of organizational sociology are accurate. Therefore, we will unveil existing areas of high and low interest in organization-sociological research as well as promising future research agendas. To our knowledge, this is the first empirical study of this kind.

The Income Cliff in Households: Insights from Agent-Based Computational Modelling

In Western countries, the distribution of relative incomes within marriages tends to be skewed in a remarkable way. Husbands usually do not only earn more than their wives, but there is a striking discontinuity in their relative contributions to household income at the 50/50 demarcation line: many wives contribute less than or almost as much as their husbands, but few contribute more. This 'cliff' has been interpreted as evidence that men and women avoid situations where the wife would earn more than her husband, since this would run against traditional gender norms. In this paper, we use agent-based computational modelling to demonstrate that the cliff in the relative-income distribution can also emerge without such avoidance. We start from a simple economic matching model that has frequently been used in earlier marriage market research. We gradually relax some of the simplifying assumptions of this model, to create a series of increasingly realistic models. We feed each of these models with empirical income data from 27 European countries and submit them to systematic computational simulation experiments. Our results show that in each model a cliff can emerge from differences in men's and women's average incomes, even if they do not attach special meaning to a situation in which a wife earns more than her husband. For this, the specific assumptions of the different models do not matter. However, the fit between the empirical data and the simulation outcomes is closest for the model that makes the fewest simplifying assumptions. Taken together, our results shed light on some of the possible mechanisms that might have generated observed distributions of relative income within households, but

also caution against inferring people's partner preferences and social norms from aggregate-level mating patterns.

The Confictive Travels of Green Municipal Bonds. Comparative Perspectives on the Expansion of Financial Markets to Southern Cities

This paper traces the work of travelling ideas in **the globalization of financial markets and their effects on urban development in Southern cities**. Particularly since the financial crisis of 2008, much has been written about the growing influence of finance in the urban development of EuroAmerican cities (Aalbers 2008, 2015; Christophers 2012). Today financial markets also appear to be expanding southwards, into the 'rising' cities of Asia, Africa or Latin America (David 2012; Soederberg 2015; Rouanet & Halbert 2016). Empirical research on the influence of global finance in Southern cities remains limited, though.

In this context, we contribute a comparative account of the conflict-ridden integration of Southern cities into global financial economies. **More particularly, the paper examines the travels of a novel financial tool, Green Municipal Bonds (GMBs)**. GMBs are debt instruments that allow cities to raise capital through the issuance of bonds that is solely to be invested in certified sustainable projects. Since the World Bank started issuing GMBs in 2008, the use of this instrument has quickly gained momentum. First employed by European and North American cities, the paper examines its spread to Johannesburg, Mexico City and Delhi, the first Southern municipalities to issue (or prepare the issuance of) GMBs.

Based on the analysis of strategic and legal documents, government reports and preliminary interviews with international advocates, **we inquire into the ways in which this travelling policy was introduced, altered and implemented through local policy, but in interactions with global actors in the three case study sites**. In particular the paper highlights the role of international Standards Setting Organisations that work with local governments to certify GMBs, thereby circulate knowledge, foster market transparency, minimize economic risk, and, more broadly transnationalize and privatize regulatory environments.

Does Migration Pay Off in the Long Run? Income and Subjective Well-Being of Eastern European Migrants Aged 50+

Background

Most studies exploring the well-being of migrants are confined to their destination countries and use the native population as reference group. However, the classical comparison with the native reference group does not provide sufficient information on the consequences of migration itself. Stayers in the country of origin provide a potentially more fruitful comparison group for addressing the question of how migration influences migrants' well-being.

Data and methods

Our research contributes to the existing literature by asking: Does migration from an Eastern European country (Czech Republic and Poland) to a wealthier Western European country (Austria, Germany and Sweden) pay off in the long run in respect to both income and well-being?

Applying propensity score matching with data from the Survey of Health, Ageing and Retirement in Europe (SHARE), our analysis can be divided into two steps: First, we compare the income of older migrants to both stayers in the origin country and to natives in the destination country. Second, we relate this to our central outcome variable subjective well-being measured by the CASP-12 index, an abridged version of CASP-19.

Results

We observe an income gain of Eastern European migrants compared to stayers in all three destination countries. However, the relative income position of migrants compared to natives differs between the destination countries. Austria is the only country with a favorable income position of migrants. It is also the only country in which a positive and statistically significant gain in well-being is observed. In the cases of Sweden and Germany, it can be seen that migration does not necessarily lead to gains in well-being. Our results indicate that in the long run, migrants tend to compare their economic situation more to similar natives in the destination country than to their native counterparts in the origin country.

GRUBER, STEFAN* (Max Planck Institute for Social Law and Social Policy)

The Long-Term Effect of Intra-European Migration on Cognitive Abilities in Later Life

Background

This project aims at contributing to the existing literature by comparing European migrants to stayers in the origin country instead of the classical comparison with the native reference group that does not allow for measuring the effect of migration itself.

Theory

On theoretical level the direction of the effect remains unclear. On the one hand, the need to navigate a new environment including language, habits, working conditions, etc. might have a positive long-term effect on cognition. On the other hand, acculturative stress associated with migration could undermine cognitive abilities. As shown by previous research, overexposure to stress hormones can be sufficient to disrupt or even damage the hippocampus, the region of the brain that regulates memory, orientation, and the rate of cognitive decline.

Data and Methods

Using data from the Survey of Health, Ageing and Retirement in Europe (SHARE), the analytical strategy can be divided into two steps: In the first step, I analyze the effect of migration on the *level* of cognitive abilities. To deal with endogeneity the exogenous variation in migration outflows between countries and across time is used as instrument for migration. In the second step, I make use of the panel data structure of SHARE to investigate differences in the *process* of cognitive ageing by applying individual fixed effect models (FE).

Results

The results of the IV regression indicate that migration within Europe has a negative effect on the level of cognitive abilities in the long run. This negative effect turns out to be larger for women. The second analytical step showed no statistically significant differences between migrants and stayers regarding the process of cognitive ageing. Here, other factors seem to be more relevant.

GRUHLICH, JULIA* (Göttingen University)

Downshifting – a Silent Movement Towards Alternative Ways of Living and Working

In Germany, since the financial crises the discourse on downshifting attracted growing attention. The phenomenon is continuously visible especially in manager-magazines, coaching, and self-help literature. Here, the term downshifting stands for the individual's voluntary decision against the growth imperative in the context of work and career and entails a reduction of work hours, income, spending, and job responsibilities. Looking at this discourse, the most popular impression is that downshifting is the preserve of a privileged set of wealthy middle-class people. However, considering that employment and a strong work ethic are the centerpiece of capitalist societies, I argue that downshifters may have a broader impact on society. Furthermore, the middle-class tends to be a major preservative force in society and their lifestyle serves as a normative model. Therefore, downshifter can be understood as part of a silent revolution for a radically different society.

The intent of this paper is twofold: First, I will shed light on downshifter lifestyles. I explore what makes this movement special. Second, I will highlight its formation conditions. I examine what are the driving forces of these downshifters. Based on an ongoing research project that comprises a document analysis of the downshifter discourse in Germany and 19 biographic interviews with downshifters, I show that downshifting is essentially individualistic, white, middle class, and middle aged. Downshifters do not identify themselves as a political or social movement. They are neither well-defined nor well-organized. However, they form a collective phenomenon by questioning the growth imperative in their daily life. Downshifting is a pragmatic kind of criticism and it refers to imbedded social pathologies of flexible capitalism, but even more: It offers concrete visions for alternative ways of living and working.

GRUIC, IGOR* (Faculty of Kinesiology University of Zagreb)

Sociocybernetics of Science Versus Science of Sociocybernetics: Language of Industry Revolution 4.0 As a Niche for and Against Future of Sociology

Social theories—beliefs about relations between variables in the social environment—are often used in making judgments, predictions, or decisions (Anderson & Sechler, 1986).

Sociological theories/frameworks for testing different hypothesis are conservative Symbolic Interactionism, Conflict theory, Functionalism, and their contemporary constituents & branches i.e. Feminism, Critical theory, Labeling theory,

Structural Strain theory, Rational Choice theory, Game theory, Sociobiology, Social Exchange theory, Chaos theory etc.

Common science-specific language used for interpretation of confirmed or rejected hypothesis within any theory, blanches before new cause-and-effect digital 'language' of Industry Revolution 4.0 which is closer to programming, AI, automation, and more distant from variability, analogue representations of the World.

Industry 4.0 is a collective term for technologies and concepts of value chain organization. Within the modular structured Smart Factories of Industry 4.0, Cyber-Physical Systems (CPS) monitor physical processes, create a virtual copy of the physical world and make decentralized decisions. Over the Internet of Things (IoT), CPS communicate and cooperate with each other and humans in real time. Via the Internet of Services (IoS), both internal and cross-organizational services are offered and utilized by participants of the value chain. (Herman et al, 2015)

This informational 'bouillon' of revolutionizing theories forces 'sociologist of the future' to become less scientist in sociology, and more statistician and reporter of effects of automated Cyber-Physical Systems (CPS), or a politician that 'recycles' everything sociology was.

Agents which supported conservative role of sociologist emanated from demands of global religious institutions, national self-determinations, educational frameworks, scientific cross-disciplinarity, from global United Nations to local non-government organizations and individual actors. Modern sociologist aspires toward synthesis of conceptual frameworks with modern digitized and automated cyber-physical systems. International market, global companies, entrepreneurs holds automation of successful business protocols as a niche for perpetuation and growth of profit – often out of scope, tools and methods of common definition of sociology.

GU, CHIEN-JUH* (*Western Michigan University*)

The Resilient Self: Gender, Immigration, and Taiwanese Americans

This book examines how international migration creates gendered work and family contexts for middle-class Taiwanese women, which significantly affects their perceptions of themselves, others, and their roles and behaviors in the family, workplace, and the larger society. I used life-history interviews with 45 women (ranging from 2 to 12 hours with each subject) and ethnographic observations over 7 years to collect data. This approach and the theme of the book align with RC32's objective to "promote the development of theory, methods, and practice concerning women in society and the gendered nature of social institutions."

Although many sociologists have studied immigrant women's adaptation experiences, most focus on laborers. Previous studies also tend to examine only immigrant women's family or work lives, thereby neglecting the interconnections of work, family, and gender. Based on a middle-class sample, this book discusses the profound influences of the multifaceted connections of gender, work, and family (and other structural factors) and their influences on immigrant women's selfhood and lived experiences. By bringing self into the study of gender and immigration, my book examines gendered immigration from women's standpoints and understandings of themselves. This approach aligns with RC32's goal to "encourage the critical evaluation of current sociological paradigms from the perspective of all subordinate groups, including women."

In a global era, the topic of gender and immigration is extremely important, especially for gender scholars who conduct international research. My book discusses how gender, immigration, class, race and ethnicity, culture, family, and work intersect in varied ways to shape women's understandings of themselves, others, their roles in different social domains, and their behaviors in various social contexts. This broad coverage of topics would be appealing to scholars of various subfields in sociology, such as family research, immigration research, gender research, social psychology, and race and ethnic studies.

GU, XIAORONG* (*National University of Singapore*)

YEUNG, WEI-JUN JEAN (*National University of Singapore*)

"Half of the Morning Sky": Exploring Gendered Patterns of Chinese Adolescents' Educational Performance

Guided by theories of child development, gender and education, we report a mixed-method study on gendered educational performance among Chinese adolescents, drawing on two waves of China Family Panel Studies data and a field research in Hunan and Guangdong during 2014-2015. The quantitative analysis reveals girls' significantly higher test scores (especially in verbal skills). Moreover, this gender gap has widened across waves. That is, relative to the 2010 data, while girls in 2014 not only have maintained strength in word test ($p < 0.01$ in both waves), but also gained an additional edge in math score (from $p > 0.1$ in 2010 to $p < 0.05$ in 2014). Regression analysis indicates that home environment and parenting variables as well as adolescents' social and behavior skill variables are effective mediators between gender and test scores. In other words, Chinese parents' increasingly equitable investment in girls' cognitive development, higher aspirations and stricter involvement, together with girls' better social and behavior skills, are boosting girls' academic performance. Our qualitative analysis

explores how gender and class intersect in shaping gendered (or gender-neutral) parenting strategies and how the educational system provides channels of gendered learning experience. These results should be interpreted in view of the broader social milieu in reform China: state-engineered low fertility, expansion of free compulsory education, changing patterns of old age support and normative ideas of the gendered life course. The current study bears significant academic and policy implications. It opens space for empirical and theoretical discussions of how the gender stratification system is intricately interlinked with family and educational systems in a rapidly changing society. On the policy front, if further empirical evidence confirms these findings, for China's educational policy-makers, a rising concern would be how to better accommodate male students in their educational experiences and improve their performance for more balanced social development.

GUDMUNSON, KATHRYN* (*University of Leeds*)

The Impact of Drug Decriminalization on Organized Crime in the Czech Republic

After gaining independence in 1989, the Czech Republic decriminalized possession of drugs as part of a range of judicial reforms rejecting the authoritarian nature of the previous Communist government. Unlike most nations that have experimented with this type of policy, there was no differentiation between hard and soft drugs, placing it among the most progressive drug policies in the world. However, there was a negative side to these socially progressive policies. The open borders that came with independence brought new drugs into the region, as well as new trafficking groups which took advantage of the government's liberal stance on drugs. To combat these unintended consequences, the policy has been modified twice. The first shift was the criminalization of possession in amounts 'greater than small' in 1999; the second, the setting of threshold limits for possession of each substance in 2010. These major changes were accompanied by variations in penalty severity for drug crimes. This study evaluated the impacts of the drug policy changes on drug-related organized crime.

Using official crime rate data, documentary analysis, and semi-structured interviews with key figures in Czech drug policy, a longitudinal study was undertaken to examine how organized and drug-related crime changed under each policy shift. Changes in the demographics of organized criminal groups and those convicted of trafficking crimes were also analyzed. Initial findings indicate that threshold limits on drug decriminalization lead to an increase in serious drug crime prosecutions, but not organized crime prosecutions. Yet, members of certain foreign populations associated with organized crime, notably the Vietnamese diaspora, do have increased rates of arrest and receive harsher sentencing than Czech nationals. While some reasons for this discrepancy have been suggested in interviews, analysis is ongoing and will be further elucidated prior to this presentation.

The Global Vehicle Assembly Industry and Its Periphery: A Comparative Study on the Work Reconfiguration in Brazil

Since its very beginning, the vehicle assembly industry has been known as leading-edge in terms of technological and organizational development. The incorporation of Taylor's approach by Fordist assembly line has become a hallmark of modern factory, a paradigm which has spread for other industrial sectors, reaching even organizations from tertiary sector. On the second half of 20th century, the vehicle assembly industry was once more in the forefront in terms of organizational changes: Toyota system has spread all over North-America and Europe as a novel way to organize work in factories, being grounded on ideas such as leanness, flexibility and just-in-time. Such innovations, supported by microelectronics, extrapolate industrial and productive changes within factories, opening room for industrial re-territorialization. In this process, big transnational corporations have been developing new organizational networks, rearranging their value chain, and, at same time, relocating automotive assembly lines from big industrial cities to small cities with weaker trade union tradition, known as *greenfields*, what have resulted in changes in many areas of social life in those places. Such is the research context of this paper. Our main aim is to analyze the insertion of two assembly factories in two new industrial areas – Iracemápolis (SP) and Goiana (PE), guided by the following questions: which model(s) of management of labor process and workforce are adopted in those units? To what extent toyotism has been in use? Are there traits of taylorism-fordism? What kind of hybridisms exist in those factories? To what extent the local culture penetrates in those productive spaces, fostering resistance or adjustment mechanisms? What are the differences between the two assembly factories? The research is in process and initial data shall be presented in this Congress.

20 Years of Legislation on Childhood in Argentina. Progress and Setbacks in Key Rights and Guarantees

In 1994 Argentina included the Convention on the Rights of the Child (CRC) to its National Constitution. From that moment on, it became imperative to adequate the internal legislation to CRC's standards and prerogatives. Multiple legislative processes were activated. In terms of protection, and after several failure attempts, the 26.061 Law (of Integral Protection) was approved. Thus, different extreme situations of violation of rights became the subject of special and exceptional measures of protection, many of which require the control of judicial legality by civil family judges. In 2015, the new Civil and Commercial Code (CCC) containing innovations relevant to children and adolescent came into force. Combining the law of protection, the CCC with other laws with interference in the children and adolescent population (Sexual and Reproductive Health Law, Gender Identity Law, to name a few) has generated conflicts and tensions among the enforcement bodies, the institutions that make up the institutional framework and the intervening actors. Often, child and adolescent victims of severe rights violations are also perpetrators of disruptive behavior, and this activates criminal justice intervention, even though children and adolescent are not punishable. Also, many of these children and adolescent are habitual substance abusers, and their addict condition makes them "sufferers" and lenders of therapeutic measures under the aegis of the National Mental Health Law.

The purpose of this communication is to focus on the analysis of the laws that were put in place to consolidate protection networks of rights oriented towards children and adolescent. This objective will be carried out through the analysis of cases of children and adolescent that was intervened by the protection system in the City of Buenos Aires. Through cases is intended to show the progress and setbacks achieved, and the conflicts and tensions at stake in each of the levels of intervention.

Migration Narratives of Refugees in Morocco: A Reading in Sub-Saharan Women's Stories of Home and Host Country in the North-East of Morocco

Stories are our daily bread to communicate with others, survive trials and tribulations, and express joys and sorrows. Migrants' stories help the actors share their experiences of the terrible journey and how they survive in the transit and/or destination countries. In this paper, I am going to discuss Sub-Saharan women migrants' stories including those narrated by actual women living in Oujda, North-East of Morocco, and those posted on some web pages; notably Facebook groups and online blogs. My target population includes women migrants who have crossed the great Sub-Saharan desert to reach Morocco and then try to reach the northern bank of the Mediterranean Sea for better economic and social opportunities, as well as those who have decided to take Morocco as a destination rather than a transit country. I am going to focus on stories in which women migrants share their migration experiences and aspirations for a better life. Women migrants' narratives may take the form of stories, songs, and/or dances. Through my reading of such narratives, I am going to consider women's lives in both public and private spheres as far as my informants allow, to identify the problems they endure, including violence, exclusion -or inclusion- based on their gender, marital statuses, cultural and religious backgrounds, and their capacity to transform oral stories into texts.

GUERRA, EDGAR* (*Centro de Investigación y Docencia Económicas, CIDE A.C.*)

The Illusion of Art? Cultural Activism, Violence, and Symbolic Subversion

Most studies on activism and non-governmental organizations (NGOs) in Mexico have focused on their capacities for political advocacy, reforming government institutions or changing the rule of law. Further, much of this work has concentrated on understanding how NGOs are able to interconnect and mobilize in socio-political contexts of relative safety and democracy. However, few studies focus on activism in contexts of criminal violence and institutional fragility. Even less research is performed on NGO capacity to build cultural institutions and transform, through art, part of the symbolic network that sustains organized crime's culture of violence (*narco-cultura*). This paper focuses on *cultural activism* in contexts of *criminal violence* and *institutional fragility*, and how artistic products emerge from a cultural field that is structurally connected to the criminal field. The objective is to describe cultural activism strategies for resisting criminal and institutional violence, understanding the mechanisms behind artistic production,

and explaining how these are able to subvert the meanings behind drug trafficking culture. A case study is included following a qualitative method and Pierre Bourdieu's sociological perspective. The main methodological tools were ethnography, which allowed for the observation of cultural and artistic activist groups (synchronic perspective), and semi-structured interviews, which collected information directly from the actors, from their different positions within the field and the historical coordination of cultural activism (diachronic perspective). The results allow us to understand cultural activism as a series of collective actors immersed in a harsh competition for material and symbolic resources for their field. In the process, although they have been able to access main cultural institutions, they have also reproduced and legitimized structures of domination. Moreover, their proposed cultural products and artistic aesthetics play with and overlap cultural elements of the criminal violence they are trying to subvert.

El Diagnóstico: Elemento Clave En El Diseño De Las Políticas De Regeneración Urbana. El Caso De Los Programas Urban y Urbana Desarrollados En España

Cualquier tipo de intervención pública debe partir de un análisis riguroso de la realidad: problemas y necesidades, causas y consecuencias de los mismos. Sólo a partir de la correcta identificación de estas variables es posible proponer objetivos y medidas (actuaciones) que contribuyan a la mejora de la situación de partida.

La importancia del diseño y, dentro de éste, del diagnóstico en la elaboración de políticas públicas es neurálgico en los debates sobre las dificultades para reaccionar de manera eficaz y eficiente ante los problemas y necesidades de una sociedad cada vez más heterogénea, diversificada e individualizada. El diagnóstico, se inicia con la identificación de necesidades y problemas y concluye con la formulación de alternativas posibles para su solución. Su elaboración debería englobar todos y cada uno de los elementos contemplados en el proceso planificador. Y, aunque se reconoce su importancia para la óptima consolidación de las políticas implementadas, no es frecuente su elaboración de forma exhaustiva, sistemática y participativa, y raramente es evaluado.

Los resultados obtenidos con el desarrollo del proyecto URBAN_IMPACTS, a partir del análisis del diseño de los proyectos de regeneración urbana llevados a cabo en España, podrán, por una parte, corroborar si el diagnóstico elaborado para el diseño de los programas de regeneración urbana desarrollados en diferentes zonas de vulnerabilidad en España se corresponde con la situación de vulnerabilidad y las necesidades de cohesión y recuperación social de dichas zonas. Por otra, podrá contribuir a fomentar la elaboración de diagnósticos (completos y participativos) como punto de partida de los procesos de planificación de políticas públicas y, a su posterior evaluación.

Imaginar Un Lugar En La Nación: Afrodescendientes, Literatura y Nación En Buenos Aires, Argentina (Segunda Mitad Del Siglo XIX)

Las fuentes históricas del siglo XIX en Buenos Aires presentan una gran riqueza por ser testimonios sobre la vida de actores subalternos, como fue el caso de los afrodescendientes, autores de textos publicados en prensa y folletos de la época. En esta ponencia, me enfocaré en la poesía escrita por autores de dicha comunidad, parte de la cual fue difundida en periódicos elaborados por periodistas afrodescendientes. Mi interés al leer estos registros escritos es indagar de qué manera, mediante el lenguaje poético, los autores concebían su papel en la construcción de la nación argentina durante la segunda mitad del siglo XIX, en un momento en el cual la *raza* jugaba un papel central en la inclusión o exclusión a las naciones latinoamericanas en busca de su identidad. La literatura de las élites, que luego se convertiría en la literatura nacional argentina, difundía representaciones negativas sobre los afrodescendientes, las cuales animalizaban los cuerpos y minimizaban su capacidad de una agencia política razonada, a la vez que los asociaban con la barbarie opuesta a la civilización a la cual debía dirigirse la historia de la nación. De esta manera, mediante el uso de varios poemas y artículos de prensa, y en diálogo con otros autores que han analizado dichas fuentes históricas, la ponencia buscará responder a la pregunta de cómo los afrodescendientes respondieron a tales representaciones inferiorizantes difundidas por escritores y políticos de las élites. De esta manera, el trabajo presentará una reflexión sobre la forma como algunos intelectuales afrodescendientes pensaron su inclusión a la nación argentina, en una época en la cual la política de administración de la diversidad étnico-racial tendía a la eliminación de indígenas y afrodescendientes y al blanqueamiento del país.

RC15-289.6GUGUSHVILI, ALEXI* (*University of Oxford*)ZHAO, YIZHANG (*University of Oxford*)***Intergenerational Mobility in Relative Educational Attainment and Health-Related Behaviours in Europe***

Research on intergenerational educational mobility and health-related behaviours yields mixed findings. Depending on the direction of mobility and the type of mechanisms involved, we can expect positive or negative association between the two. One of the reasons why past findings are inconclusive might be the inappropriate operationalisation of intergenerational educational mobility and inadequate modelling strategy of mobility effects. Recent social mobility scholarship increasingly recognises that, in order to understand the net effect of intergenerational educational mobility, individuals' and their parents' education has to be viewed and operationalised in relative rather than absolute terms, that is, as a positional good, taking into account the relative prevalence of qualifications in parental and offspring generations. In this study, we use data from the 7th round of the European Social Survey (ESS) conducted in 2014 which contains information on a wide array of health-related behaviours such as smoking, alcohol and drug consumption, dietary intake, physical activity levels, risky sexual behaviour, and health service usage. The main explanatory variable, intergenerational educational mobility is operationalised in terms of relative intergenerational educational mobility based on the prevalence of specified qualifications in parental and offspring generations in 22 European societies. In terms of modelling strategy, we build on diagonal reference models (DRMs) in which the estimates for the consequences of intergenerational mobility are derived by comparing the health-related behaviour of intergenerationally mobile individuals to the health-related behaviour of intergenerationally immobile individuals located in the corresponding educational ladder of origins and destinations.

RC28-505.2GUGUSHVILI, ALEXI* (*University of Oxford*)***Intergenerational Social Mobility and Emigration Intentions: A Comparative Study***

In this study I analyse what are the links between intergenerational social mobility and emigration intentions. Existing research has shown that immigrants are likely to experience social mobility in host societies, but there are virtually no studies which suggest how upward and downward intergenerational mobility, taking place before individuals leave their countries, are associated with emigration intentions. The comprehensive analysis of the role of social mobility in actual emigration behaviour is inherently curtailed by the partial information available to researchers. Good quality data on actual migrants and their current demographic and labour market attributes are accessible in some cases, but these surveys are generally poorer at providing accurate information on the various individual, family, labour market and the macro-level characteristic of countries from which migrants arrive. The opposite is true for the nationally representative household surveys in which only limited information, if any, tend to be available on already emigrated local population. These two fundamental constraints have prompted migration scholars to divert their attention toward intentions to emigrate. Using multivariate statistical techniques and nationally representative and comparative Life in Transition survey data for 33 Western European welfare democracies and post-socialist transition societies, I test whether intergenerational mobility in educational attainment as well as subjective perception of intergenerational mobility have statistically significant links with (1) willingness to move abroad for employment reasons and (2) intention to move abroad within the next 12 months after they are interviewed.

RC13-250.2GUI, JINGJING* (*University of Alberta*)WALKER, GORDON (*University of Alberta*)HARSHAW, HOWARD (*University of Alberta*)***Leisure Conceptualizations in China and Canada***

Little is known about leisure in China, or how leisure experiences are similar and different between China and the West (Ito et al., 2014). The purpose of this study is to understand meanings of leisure and a leisure-like term in China—*xiuxian*—from lay people's perspectives. In order not to impose Western perspectives (Iwasaki et al., 2007), we modified Ito and Walker's (2014) Leisure Ten Statements Test such that participants provided 10 answers to each of the following questions: "What is leisure/*xiuxian* for you?" and "What is *not* leisure/*xiuxian* for you?" A convenience sample of 162 Euro-Canadian undergraduate students and 188 Mainland Chinese undergraduate students were surveyed. We coded 3,163 statements from Euro-Canadians and 3,550 statements from Mainland Chinese in total, both inductively and deductively (Neuendorf, 2017). A preliminary coding scheme, applicable to *xiuxian*, leisure, and their antitheses, consists of 23 themes. Ratios of each theme were calculated according to the frequency of themes as well

as the order of statements. Preliminary results indicate that Mainland Chinese conceptualize *xiuxian* mainly as mass media (17.5%), emotion (8.7%), outdoor and traveling (8.7%), relatedness (8.4%), and sport and fitness activities (7.2%), whereas Euro-Canadians associate leisure with emotion (20.8%), mass media (12.0%), sport and fitness activities (11.9%), relatedness (10.8%), and outdoor and traveling (6.6%). In terms of leisure's/*xiuxian*'s opposites, most frequent responses among Mainland Chinese were study and school (34.4%), time constraints (9.4%), emotion (8.2%), thwarted relatedness (7.9%), and thwarted autonomy (5.6%), whereas most frequent responses among Euro-Canadians were study and school (29.6%), emotion (12.7%), household work (11.0%), work (10.2%), and time constraints (6.7%). Our results suggest that there are more cultural similarities than differences regarding themes of leisure in China and Canada; however, the prevalence of the themes is slightly different between the two cultures. The potential for a universal leisure definition is discussed.

TG06-992.2GUILAMO, SARA* (*Pontificia Universidad Catolica Madre y Maestra*)***Garantia De Derechos Y Proteccion a Niños/Niñas Y Adolescentes EN Republica Dominicana***

Partiendo de una Etnografía Institucional en proceso, se presentan los hallazgos encontrados en República Dominicana, en materia de garantía de derechos y protección a niños, niñas y adolescentes en condición de vulnerabilidad. Los datos preliminares forman parte de una investigación en proceso, en la cual participa junto a otros 6 países, sobre cultura y práctica de instituciones de protección infantil. Los datos están organizados en 5 componentes: Análisis de políticas afectando a NNA, migraciones y las diferentes formas institucionales en respuesta a formas de violencia.

Encontramos que como país hemos avanzado en regulaciones y diseño de protocolos para el manejo de los casos de menores de edad; garantizando los derechos del niño y los convenios internacionales de los que somos signatarios; sin embargo, se observan en la práctica mecanismos de opresión y violencia en las instituciones por parte de los empleados encargados de su aplicación; lo cual contribuye a las desigualdades económicas y de género.

Palabras claves: protección infantil, derechos de la niñez, vulnerabilidad, sistema de justicia, violencia institucional, etnografía institucional.

RC57-931.3GUILAT, Yael* (*Oranim Academic College of Education*)WAKSMAN, SHOSHI (*independent researcher*)***Knitting the Urban Space: Is Yarn Bombing in Israel a 'granny Craft' or a Subversive Urban Craftivism?***

Yarn bombing are practices of knitting/ crochet/ embroidering made or displayed in public spaces around the world. Those practices are known also as, 'knit graffiti' and 'guerrilla knitting' etc. It involves attaching handmade textile items to street fixtures or furniture. The pieces could be discreet installations on a bench, handle, railing or potholes, or large and audacious pieces such as a tree wrap, a cover for a bus or a huge commemorative quilt such as the Aids memorial. Yarn bombers operate under the umbrella of global justice activism through graffiti genres and or community participatory craftivism. Following blogs and social media the phenomena arrived to the Israeli public space through individual and collective practitioners, institutional urban festivals and or artist & craftivist communal practices.

In our on-going research, we propose an in depth analysis, based on visual and ethnographic methodology, of those emerging practices in various cities in Israel. We will describe the characteristics of those urban craft (activist) pieces, the motivations of the artists and practitioners and the social network that enable those practices regarding to top-down/ bottom-up power relations. We will claim that within the complex context of the Israeli visual culture, the local yarn public practices gives material visualization to issues of gender, immigration and ethnic exclusion and inclusion. The preliminaries findings indicate that some of those practices allow interpersonal encounters between artists and non-artists in the public space promoting intergenerational solidarity. The 'inoffensive' nature of the so called 'Granny craft' enables to deal critically through visual arts with issues of social injustice and ethnicity, nationality, ageism and gender - based discrimination. Despite the subversive context of graffiti genre those urban knitting are perceived as "soft" expressions as Robertson writes: "...as a constructive approach to activism that encourages interpersonal interaction and everyday resistance" (2007, 210).

TG04-984.6GUILLAUME, OLIVIER* (*EDF Lab*)***Safety and Cooperation in Complex Organizations***

Complex organizations with coupled and automated systems would lead to "normal accidents", according to C. Perrow. Whereas, for the theories of the High

Reliability Organizations (HRO), the social system contains these difficulties and makes organizations safe through decentralized expertise, learning or collective functioning. But these theories do not describe or finely understand these collective phenomena. Other approaches emphasize the a priori and optimized coordination and coordination of collective functioning (theories of coordination and negotiation), routine operations governed by autonomous rules (Reynaud and Terssac's theories of regulation), or collective comprehension in order to deal with serious and unknown events (Sensemaking by K. Weick). Meanwhile, between anticipation by coordination and reaction to unusual events thanks to the "solidarity group", there is cooperation that needs to be detailed in order to understand the construction of safety and its culture. Cooperation is based on the intentional and coordinated participation of the members of a group in order to carry out a common action in which everyone derives a benefit whose gain is greater than that which each individual can secure. Cooperation partnerships do not determine in advance the nature and extent of the resources to be provided or the precise moments of their pooling. Therefore cooperation involves a process of donation that is not totally free. The personal investment is partly free because individuals hope that the collective project will be successful. The contributions are nonetheless unequal. In order to avoid a feeling of non-equivalence, contributors need that their contributions are publicly displayed. Moreover cooperation involves relationships of trust, recognition and collective comprehension, which can be organized around spaces of discussion. These points will be developed in this communication and will allow a theoretical lesson in order to understand the construction of the safety and performance in complex organizations.

Care Work and Crisis in Brazil. New Inequalities?

Since 2015 Brazil has been witnessing an intense shrinking in occupational opportunities as economic crisis intensifies. Surprisingly, care work maintains its continuous trajectory of growth. The presentation will explore the correlates of this intriguing movement from different perspectives. Firstly, it will characterize the profile of those care-workers who achieved to preserve their jobs amidst the transition from intense growth to deep crisis; as we investigate characteristics like sex, race, age, family status, schooling and regional origin the paper will allow us to observe changes in the survivors profiles. Secondly, it will compare care-workers labor conditions (mainly their working hours) and their employment relations (mainly type and length of their contract, and their wages) before and after economic recession, in order to observe if any deterioration has been taking place. Thirdly, it will contrast tendencies observed in care work with changes in the profile of domestic employment in Brazil under the recent crisis; is it possible to assume that different "circuits of care" express different movements when recession intensifies? Since care work is considered a paradigm for the intersection of class, sex, and race, is it possible to consider that this consubstantiality change amidst situations of crisis? Do those changes differ when we observe various forms of work inside the care economy (as institutional care, home care, nannies, traditional domestic service)? To address those questions the paper will rely upon information gathered by the Brazilian National Household Annual Survey (PNAD-Pesquisa Nacional por Amostra de Domicílios), complemented with data from the Research on Employment and Unemployment (PED-Pesquisa de Emprego e Desemprego) conducted at the Metropolitan Region of Sao Paulo, the most important concentration of care-workers in Brazil.

GUL KAYA, DUYGU* (*York University*)

Memory Citizenship in Diaspora

In this paper, I examine how memories of the Armenian genocide (1915-18) have reverberated among Armenian youth in Canada. I ask: How do young individuals of Armenian descent *remember* the Armenian genocide a hundred or more years after it happened, and thousands of miles from where it happened? In what ways do legacies of genocide shape their sense of belonging to Canada?

The data for this paper come from in-depth interviews I conducted using a semi-structured and thematic format. Between 2015 and 2016, I interviewed twenty young individuals of Armenian descent in the Greater Toronto Area. Although the interview data is multi-faceted and quite extensive, in this paper I focus on a specific set of themes and patterns, discussing how these young individuals articulate their sense of belonging to Canada. I argue that Armenian youth redefine existing notions of citizenship with their memory activism. Instead of seeing citizenship simply as a formal category of identification, Armenian youth interpret it as a cultural category of (un) belonging and they practice it through particular acts of memory. Their involvement in public performances of memory and identity, particularly by commemorating the Armenian genocide and demanding Turkey's recognition, has been key to the formation of their political subjectivities; i.e., their identities not only as the youth of the Armenian nation, but also as active agents of memory who insert the particular history of Armenians into the national historical narrative of Canada. Therefore, I contend that memory is central not only to these youth's constructions of ethnic identity in a diaspora

group, but also to their interpretations and practices of citizenship, such as civic participation, claim making and public visibility.

RC07-149.3

GUL KAYA, DUYGU* (*York University*)

Remembering the Armenian Genocide in Diaspora: Reconsidering the Role of New Media

This presentation will explore how Armenian youth use new digital media technologies to *remember* the Armenian Genocide a hundred or more years after it happened. At the core of my project are the "100 Voices: Survival, Justice, Memory," a multi-media project carried out by a group of Armenian youth in Toronto in 2015 to commemorate the centenary of the Armenian Genocide. As I hold, *100 Voices* is a digital archive of post-memory. The production team recorded and circulated individual post-memory narratives in the form of audio-visual testimony as it is often used in human rights activism. In this sense, 100 Voices functions as a counter-archive that challenges Turkey's ongoing denial of the genocide.

In opening up a space for these young individuals to speak up against genocide denial, the *100 Voices* project allowed for the formation of a distinct generational identity. The project's participants often articulated this distinct subject position through a sense of duty or responsibility not only to remember the genocide and transmit its memories to future generations, but also to work towards genocide recognition and reparations. Notably, this duty of memory shapes Armenian youth's relationship with the preceding generations, particularly that of survivors and victims, as well as the members of their own cohort. They see themselves as the youth the Armenian nation, who share a common past, work towards the same 'cause,' and dream of a future of restored justice.

BOZKURT, VEYSEL (*Istanbul University*)

Religiosity, Values and Violence

The relationship between religiosity and violence is one of the most controversial issues of our time. In particular, Muslims and violence are at constant agenda of the media. Religiosity affects both the values and violence attitudes. The purpose of this paper is to investigate the relationship between religiosity, values and approval of violence. Data was collected from university students in Turkey, who are 99 percent Muslim country. Schwartz Values Survey and Violence Culture Scales were used as data collection instrument. Our early findings are as follows: The relations of religiosity and values are consistent with the international academic literature. Practicing Muslims endorse conformity, tradition, security and benevolence more than skeptics/unbelievers. On the other hand, skeptics/unbelievers value more universalism, self-direction and hedonism than practicing / non-practicing Muslims. However, there was no statistically significant relationship between religiosity and violence endorsement.

GULIYEV, RUFAT* (*Azerbaijan Academy Public Administration*)

Intercultural Interaction As the Basis of the Population's Lifestyle of Azerbaijan

The nature of the interaction of cultures under the conditions of a multiethnic society, which has always been and continues to be the Azerbaijani society, is of vital importance for its sustainable development. It is not just social stability that depends on how the relations between the bearers of certain cultural traditions are built, but also the success of the development of Azerbaijan as a single, integral state formation. Modern Azerbaijani multiculturalism is a unique symbiosis of cultures characterized by the polyethnic and poly-confessional population of Azerbaijan. Sociological analysis of the phenomenon of Azerbaijani multiculturalism is impossible without taking into account the unique geopolitical position of the local society, initially located at the junction of European and Asian cultures. The correlation and dialectics of the European, Asian, Eurasian and local cultural traditions are of decisive importance here. It is obvious that under no circumstances will the Azerbaijani society become a unified socio-cultural system, but it will represent a qualitative diversity of many cultural systems and social types. The processes of globalization not only do not hinder, but, on the contrary, create additional opportunities for the development of local cultures, anciently existing in the country. The optimal model for the entry of a single culture into the global cultural continuum is managed intercultural interaction, in which not only the elites of society act as subjects of governance, but also broad masses representing the entire cultural palette of the Azerbaijani society. The cultural traditions existing in modern Azerbaijan are not considered public opinion as an obstacle to further civilization development, they are not connected with negative connotations and do not serve as the basis for confrontational intentionality.

Tolerant attitude to these cultural traditions is recognized as a socially approved behavioral model and a stable life strategy.

GUNES, ONDER* (Concordia University)

'Selling Mary Douglas' or 'Admiring Darth Vader': How Theoretical Knowledge is Commercialized in Market Research Projects in Turkey

In all over the world, corporations from various sectors increasingly tend to work together with market research companies or market researchers in order to increase the sales of their products in a competitive market conditions and try to determine the future of their companies. In that sense, market research companies have emerged as a response to a certain necessity and they produce "useful" and "effective" knowledge in accordance with this necessity. The main function of market research companies is to give a satisfying answer to "why" questions in order to explain the consumer behavior, predict the future actions and make projections to reduce uncertainty and unpredictability. Thus, the value of a market research depends on to what extent it provides, insights and workable solutions to the problems of the client corporations. Especially in ethnographic market researches, client companies demand "actionable insights" which should exceed the limitations of raw statistical data. Market researchers who conduct mostly qualitative methods, such as participant observations and in-depth interviews, push themselves to translate their findings into marketing language in order to "sell" the project. In this endeavor, what they often take advantage of is their "theoretical knowledge" in social sciences. In this presentation, I want to discuss how they use and "jazz up" their findings by the means of theoretical knowledge in researches. Based on a ten-month active participant observation in an ethnographic market research company in Istanbul/Turkey and in-depth interviews conducted with researchers who works in "qualitative departments" of various market research companies, this presentation will try to show 1) how social theory is transformed into a marketable and commercialized commodity in marketing research and 2) how market researchers, who are broadly graduates of social sciences, feel about this process.

MARTIN, PHILIPP (Federal Institute for Vocational Education and Training (BIBB))

Methods of Information Extraction in Job Advertisements

We search for developments in qualification requirements, skills or occupational profiles by the analysis of job advertisements. Our current dataset contains all raw texts of job ads, which have been registered at the job pool of the Federal Employment Agency since 2011. Therefore, we have a broad database with nearly two and a half million advertisements for extensive research to yield useful insight on the structure and changes in aggregate labor demand by occupations and changes in the relevance of specific qualifications or competences.

We used methods of information extraction with the aid of rule-based machine learning. In this procedure first specific expressions or sentences are sorted into specified categories. This procedure is constructed to first classify the raw text into four blocks: a) Self-definition of the company, b) Definition of the task, c) Definition of the required competences of the potential applicant, d) Other, as for example: contact information.

After that we formulate specific rules for extract information, for example, that every expression after "You are familiar in using [XY], XY is a work tool. After that we have to confirm if this term is a work tool or not and the application is able to extract new tools.

In the session, I will present our workflow and explain the classification and information extraction method. Additionally, I can describe the distribution in our taxonomy and show the results of the analyses of the advertisements: in which industries and occupations (digitalized) work tools can be found and how to find differences in the sizes of companies or qualifications.

In the near future, we will analyze all online advertisements in Germany. Therefore, this is a nice example for an advantage of the analysis of mass data for the Sociology.

The Transition to Adulthood Among Japanese Youth: Longitudinal Qualitative Research in Tokyo and Rural Area in Japan

In recent decades, many researchers have found that young people's transition to adulthood is greatly prolonged in terms of finishing education, entering job market, leaving parental home, getting married and having children. Accordingly,

they suggest that contemporary young people's transition trajectories have become radically different from those of their previous generations. Recently, a process of individualization and de-standardization became apparent among youth. However, individual transition to adulthood is socially constructed. Individuals under different social and cultural contexts may have various transition experiences. A recent review of the transition to adulthood literature from the life course perspective indicates that a systematic analysis of gender, race, and social class differences is needed. In Japan, with the growth of higher education opportunities and the increase of women's participation in job market, the experiences of transition to adulthood of women have changed a lot. This study explores the transitional experiences of highly educated Japanese single women. This study based on a longitudinal qualitative research of 31 women (aged 23 to 33) over time (at different time) and space (Tokyo and rural area). In this paper, I will discuss: 1) how Japanese single women perceive the meaning of work and marriage, 2) how the parent-child relationship and living area affect on their transitional experiences.

Conflict Resolution: The Gandhian Way

Today, we find an escalation in the number of conflicts at the individual, national and supranational level. These conflicts can be diverse in form, such as, road rage, resistance of foreign universities, environmental degradation, climate change, deforestation, fight for the scarce resources, civil rights and peace movements, etc. Most of the conflicts remain unresolved despite best and sustained efforts. My paper seeks to look beyond Gandhi to be able to explore the relevance of the Gandhian ways of *satyagraha*, civil disobedience, non-cooperation and adherence to non-violence towards world peace, democracy and conflict resolution in the 21st century.

To Gandhi, since all conflicts begin in human mind, it becomes absolutely necessary to make human mind the abode of peace. Unless and until there is spiritual growth, there cannot be peace at the individual level and without peace at the individual level, there cannot be democracy at the societal level. The discords and conflicts of modern complex societies cannot be resolved by better housing, social services and a higher standard of living. It requires certain valid means of conflict resolution based upon the principles of 'cooperation in lieu of confrontation', 'convergence in lieu of conflict' and 'dialogue in lieu of monologue'.

Unlike the judicial system, the Gandhian ways aim at conflict resolution through reconciliation and arriving at a consensus by dealing with the basic insecurities and lack of trust as the root causes. They are based upon conversion, persuasion, self-suffering and compassion instead of hatred, ill-will, suspicion or vindictiveness. The Gandhian ways aim at peaceful and amicable settlement to the satisfaction of both the parties by arriving at the truth through non-violent means. These methods seem to be more relevant in today's scenario than ever before. The methodology adopted is analytical, comparative and empirical.

Privatization in East Germany: Can the Treuhandanstalt Provide a Model?

The dynamics of privatization in the Eastern Germany can be better understood in terms of the 'economic polities' applied to the 'political markets'. The Treuhandanstalt played a key role in transforming the entire economy of the former GDR into the market economy in the wake of unification of East Germany with West Germany. The present study discusses the agency's structure, functions and responsibilities, on the one hand and financing, functioning and evaluation, on the other. Although the Treuhandanstalt provides a unique example of privatization by the state and the market, it cannot be duplicated or copied in toto.

Institutional Deliveries: A Study of a Slum in District Pathankot, Punjab

The National Health Mission (NHM), a centrally sponsored programme started by the Government of India emphasizes Institutional Deliveries to reduce maternal mortality rate. It has many components and one of the main components of the Mission is *Janani Suraksha Yojana* (JSY) which aimed to provide safe motherhood and implement other interventions related to mothers and child under NHM. The main objective of JSY is to reduce maternal mortality and neo-natal mortality by promoting institutional deliveries among the pregnant women, in particular the poor women. It also promises incentives and other related services for the beneficiaries and the facilitators.

In view of the fact that the programme was initiated in 2005, it is significant to assess how far the JSY has been successful in providing its services in newly carved out district Pathankot of Punjab. Further, it is also important to examine firstly what role do the Accredited Social Health Activists play as facilitators to make health services accessible to the beneficiaries and how efficacious they have been in extending their services for institutional deliveries. The present paper is an attempt to find out the possible causes due to which institutional deliveries are not preferred in the slum area of district Pathankot, Punjab. On the bases of responses received both from the health care facilitators and the beneficiaries during the survey, the paper also aims to arrive at a list of viable recommendations to strengthen the health care delivery system at the levels of Community and Primary Health Centres.

Multiple Morbidities Among Immigrant Populations in a Context of Universal Healthcare Coverage: Evidence from Canada.

The prevalence of type-2 diabetes, cardiovascular disease, and many other chronic non-communicable diseases is increasing rapidly worldwide. These diseases share many common risk factors, including their underlying socioeconomic determinants. In Canada, where essential medical and hospital services are covered under publicly funded health insurance for all residents, inequalities in chronic disease outcomes and in the factors influencing health persist across population groups. For example, prevalence of diabetes among persons 12 and older ranges from 4.4% for those in the highest income quintile, to 9.8% for those in the lowest. In other words, universal healthcare coverage alone is not sufficient to reduce inequalities and improve the health of disadvantaged groups. While recent immigrants may be less likely than the Canadian-born population to have chronic disease, studies suggest the healthy immigrant effect tends to dissipate over time. This research examines trends and tests hypothesized relationships between immigrant status (recent immigrant, longer-term immigrant, or non-immigrant), ethnic minority status, low income and material deprivation, and the occurrence of multiple chronic diseases. Using data from the 2016 Canadian Community Health Survey, we apply multinomial regression to examine the association between different individual- and community-level dimensions of marginalization and the risk of multiple morbidities. Preliminary findings from an earlier 2000-01 survey indicate 1.4% of recent immigrants (less than 10 years since immigration) had been diagnosed with diabetes, compared to 7.8% of longer-term immigrants (20 or more years since immigration). Meanwhile, 5.9% of recent immigrants were living with hypertension, versus 23.2% of longer-term immigrants. Drawing on the latest survey findings, we examine the trends to consider whether and how convergence in socioeconomic status and risk behaviours attenuates differentials in multimorbidity by immigrant status. The results are expected to enhance the evidence base on co-occurring chronic diseases among immigrant populations to inform health planning and promotion.

Abstract on "a Study of the Economic Activities of Banjaras in Gurugram Town Involved in Vending & Blacksmithy Trade in the Context of Their Socio-Economic Status and Political Voice."

The Paper focuses its attention on Banjara-vendors (gypsy-vendors) squatting on illegal land for purposes of vending Earthenware, Ceramics and Wooden Items and practising blacksmithy. They are uprooted by the Municipal Committee from time-to-time. The Paper examines the socio-economic characteristics of these Banjaras in terms of health status, educational level, livelihoods and political voice. Further, the Paper dwells on the problems which the Banjaras face with reference to improving their social, political and economic status and how they can be made to join the mainstream of society. The spotlight is focused on the role that the Municipality can play, given the availability of political will, in legitimising the livelihoods of Banjaras. Legitimation of vending can prevent Banjaras from being regularly uprooted thereby providing their children with continuity of school education and consequently, an opportunity to improve their educational status. The Paper examines the perceptions of persons in authority: in the Municipal Corporation, Housing & Urban Development Authority and District Administration with reference to opportunities for Banjara Vendors to improve their socio-economic status. **Keywords- Banjara-Vendors, Blacksmithy, Earthenware, Socio-Economic, Vending**

The Politics of Social Assistance in Contemporary Asia: Comparative Analysis of China, India, and Turkey

This paper investigates the role of social assistance in the making and unmaking of political power in contemporary China, India and Turkey. We argue that despite the variation of political regimes (one-party versus multi-party regimes), social assistance (in-cash and in-kind assistance to the targeted poor populations through various types of programs) has emerged as a powerful tool to obtain poor people's consent to political regimes in all three countries. Effective provision of welfare through grassroots party and non-party organizations as well as local administrations has underlined the spectacular rise of political Hinduism in India and Islamism in Turkey during the last two decades. Capitalizing on their successful capturing of political power at the center, the Justice and Development Party (AKP) and Indian People's Party (BJP) have been attempting to use the massive financial resources under their control to expand the coverage and increase the quantity of social assistance to low-income groups and thereby consolidate their power. Although Chinese Communist Party (CCP) is, unlike the AKP and BJP, not under the pressure of electoral competition, perceiving a potential threat of low-income groups (such as migrant workers and poor villagers) to regime stability, it has taken a similar path of expanding social assistance to maintain its political power. Overall, there is an ongoing convergence among three countries in terms of the political significance of the poor and social assistance as an apparatus to manufacture their consent to political regimes.

The Expanding Boundaries of Crime Control: Governing Security through Regulation

The objective of this paper is to explore shifts in the rationale and logic of current crime control that have led to an expansion in regulatory practices. We review the trend lines of commonly used and available metrics with a focus on regulatory agencies and their discretionary role in defining violations and sanctioning behaviors as well as laws that are designed toward pre-crime prevention grounded in the assumptions of risk. We discuss findings in the context of debates relating to temporal, spatial, and sectoral dimensions of regulation and control within the broader framework of governance, risk, and preemptive crime prevention in today's global capitalist society.

The Economic Lives of Students. the Relation between Economic and Educational Capital at Different Places in the Landscape of Swedish Higher Education

At the same time as the number of students in Swedish higher education has dramatically increased during the last 25 years the economic inequalities in society at large has widened, thereby increasingly reaching into the life of the average student. Yet there is little knowledge on the economic lives of Swedish students: *where* in the educational landscape is the situation particularly dire and for which students are the financial means scarce – or abundant.

The Swedish student aid system is perceived to be generous: all students have access to it. As a consequence there is a widespread assumption in the public and scientific discourse that there are no real financial barriers surrounding higher education. However, the *public* financial arrangement includes substantial *private* co-funding. Apart from a minor *grant* the public means comes in the form of *loans*.

In this paper the distribution of different modes of study financing (study loans, wage labour, own and inherited wealth, etc.) is analysed and related to the distribution of the formal prerequisites for entering higher education (grades and/or results from aptitude tests). Thereby the paper sheds light onto the material preconditions for acquiring meritocratic goods in a social democratic welfare regime.

Pierre Bourdieu's theories serve at the theoretical point of departure. What is the importance of economic capital – the dominant form of capital in capitalist societies – for the accumulation of educational (and cultural) capital? Datasets from Statistics Sweden, covering all students in Swedish higher education, are utilized to answer the research questions.

RC08-162.1GUTH, SUZANNE* (*University of Strasbourg*)*An unpublished manuscript: The Chicago Forty Two gang alias Sholto or Kip gang*

Working for the *Institute for Juvenile Research* and its Sociology Department (Chicago), Saul Alinsky set out to collect autobiographies of a gang whose real name was the *Forty Two*, the intended title of the book was *Companions in crime*. It was the first time that the Department chose to work on an Italian gang in the Near West Side. Saul Alinsky collected a large amount of life stories, interviews with parents and police documents; a book based on the gang material was to be published at the University of Chicago Press, but it never came out. The outline was ready and was to be similar to the *Jack Roller* and the *Natural history of a delinquent career* with experts' writings inducing thus, the sandwich effect James Bennett had already mentioned in *Oral History and Delinquency*.

The autobiographies of the gang members are quite different from one another: the shortest is 40 typed pages long, and the longest is over a hundred pages. The 14 biographies we have studied show two high points related by several members: the first one, when they are still young teen-agers and are robbing things from their own school, the Jackson school, they eat preserves together in the school kitchen, the second high point quoted by many older boys mentions a famous Saturday night when they are having a gang shag with *Broads* on the school campus.

The life story is not the best methodological tool for a group observation, nevertheless it was the first time the IJR tried to study a gang as a whole; later on they studied two groups of brothers: *Brothers in Crime* and the *Bartzon Brothers*, the latter still remains unpublished.

RC05-110.4GUTHRIE, CHRISTY* (*University of Toronto*)*Listening to and through Place*

This paper highlights the conceptual and political importance of *place* and *land* for participatory cultural production methodology with anti-racist and decolonial aims. Drawing from a research project with arts educators in Toronto, Canada, I outline the collaborative production and analysis of site-specific sound recordings (soundscapes) with research participants. Using a critical place inquiry framework (Tuck & McKenzie, 2015), I position soundscape as a methodological intervention against settler colonial understandings of place that naturalize white settlement, erase Indigenous presence, and render Blackness as out-of-place. A critical conceptualization of place forwards its role in meaning-making and subject formation. As Anishinaabe artist Rebecca Belmore reminds us with her 2017 installation series "Wave Sound," listening to the land is a way to invoke reflection on social and political relationships and relationships to non-human forms of life (Nixon, 2017). Within this relational understanding of place and land, I frame the cultural production process as a focused opportunity to engage with researchers' and participants' positions within ongoing projects of imperialism and settler colonialism. Noting that outsized claims of inclusion and improvement often circulate within creative interventions—both in arts-based civic development projects and arts-based social research—I also consider the limitations and complications of this critical place soundscapes approach. This paper responds to the Congress theme by asking how social researchers can reject colonial framings and methodologies, and instead seek to centre Indigenous and decolonial conceptualizations of land and relationality.

RC04-81.13GUTIÉRREZ, JOSE MIGUEL* (*Universidad de Valladolid*)GÓMEZ, FRANCISCO JAVIER* (*Universidad de Valladolid*)*Push/Pull Dynamics As Conditioners of School Retention and Abandonment: Analysis of Survey Results in the School Population of Castile and León*

The European Union through EUROSTAT defines early school leaving as the percentage of young people aged 18 to 24 who are not studying and who do not have a higher than compulsory education. This paper presents the results of a survey conducted by 1106 students attending the 4th grade of secondary public and private schools during the months of October and November in 2015 in Castile and León. The push and pull theory, which inspired the design of the questionnaire, groups the variables as expulsion and attraction factors. The questionnaire includes 55 items that have to do with factors that determine abandonment. The immediate consequence is the proposal of 16 factors of expulsion/attraction, the consequence of the reduction of the items. Once this reduction was made, a logistic regression was developed to predict a categorical variable depending on independent or predictor variables. The results determine that the three factors with the highest incidence in the decision to leave are the ones that correspond to the attraction of work, problems of coexistence and parental pressure.

The conclusion of the binary logistic regression analysis is the balance between expulsion and attraction factors, with a certain advantage of the factors of attraction towards the labor context and a protagonism of the cohabitation aspects as expellers.

RC34-621.15GUTIÉRREZ, JOSE MIGUEL* (*Universidad de Valladolid*)FERNANDEZ, EDUARDO (*Universidad de Valladolid*)CREMADES, IRENE (*Universidad de Granada*)*Young University Students and Transmedia Narratives: A Participation Project in a Hiperconnected Society*

This article presents a research carried out with young university students enrolled to the Degree of Social Education at the University of Valladolid. It is focused on the analysis of the design, creation and diffusion of transmedia narratives. After a brief introduction about the role that transmedia literacy and the culture of convergence can play in formal education institutions, connections between transmedia storytelling and educational innovations are established.

This study focuses on analyzing the process of creation of transmedia narration in two spheres: on the one hand, describing the mediated learning tools used in instructional design (guided participation); and, on the other hand, exploring their possibilities as a collective strategies to encourage digital literacy in the connected society (participatory appropriation). Methodological design mixes narrative research and digital ethnography.

Thirdly, this study presents the main results derived from students' development and production of transmedia content. Finally, some conclusions are numbered where we defend the transmedia educational advantages to breed social and technological mediation processes that not only recognize students' tacit knowledge which is engendered in the hiperconnected society but also, such as their possibilities empowerment.

RC34-613.13GUTIERREZ, NELSY* (*McGill University*)*Race to the Future: Emerging Civic Identities of Salvadoran Youth*

El Salvador experiences fourteen gang-related murders each day (World Bank Report, 2011). The looming presence of gangs is the daily smog that suffocates Central America's smallest nation. Like the mythological Hydra, gangs have been gifted with eternal reproduction—more members keep appearing as more members are imprisoned (Arana, 2005). What is it like to enter adolescence in El Salvador? Political and police forces have declared war against gangs, turning the gang member profile into one that targets all those who fit the age and socioeconomic background deemed threatening, applying Achille Mbembe's (2003) necropolitics to dictate the fate of young Salvadoran bodies. Who lives, who dies, and who reaps the benefits of security (Seelke, 2011)? Using Paulo Freire's (1968) Participatory Action Research and the Interagency Working Group's theory on Youth Positive Development, I have designed a mentorship program grounded in long-term commitment and civic visibility to encourage Salvadoran youth to pursue their fight against symbolic and structural forms of violence by exploring post-high school opportunities—acknowledging their right to imagine a future. In spite of the discriminative profiling surrounding potential gang members, young people's abilities, dreams, and skills are necessary assets to Salvadoran society. This program actively challenges the violent necropolitics of both governmental institutions and gangs towards Salvadoran youth. The program design explores how educational institutions have failed their future generations by neglecting long-term mentoring that teaches civic visibility and validation, areas that gangs excel at when courting potential members (Hernández, 2015). Shaped by existing local youth development programs, and narratives of students recruited or courted by gangs, the project fosters community action under the belief that Salvadoran youth are currently, and constantly, pushing back against their violent environment, and it is every Salvadoran's civic duty to provide aid throughout their struggle.

RC04-84.4GUTIÉRREZ, SERVANDO* (*Universidad Autónoma Metropolitana*)RAMIREZ, DAVID FRANCISCO (*Universidad Intercultural del Estado de Hidalgo*)VALLADARES, CLARA ELENA (*Universidad Autónoma Metropolitana*)GUTIERREZ, ADRIANA (*Universidad Intercultural del Estado de Hidalgo*)*Social Inequality or a Path to Success? Perceptions about the Professional Training Received at Intercultural Universities in Mexico: The Case of the Intercultural in the State of Hidalgo.*

Scholars on the educational issue in Mexico point out that the Intercultural Universities in the country have been conceived as: "[a] new educational model,

[that] can represent the academic solution to the urgent demands and vindication of the indigenous people that have been forgotten and discriminated against by the Mexican State, so they can be recognized and have the right to self-determination" (Gullo, 2006: 121; Gaete, 2015).

However, a discussion has emerged around this educational model that questions its academic and formative relevance, and the Intercultural term in this social sector — it is emphasized that the target population is specifically indigenous— (Gaete, 2015, Flores, 2015, Garcia, 2015: 302).

The Intercultural University of the State of Hidalgo (UICEH), clearly shows the situation presented in some Higher Education Institutions (HEI) in the country, where the contents of several study programs are created without the intervention of pedagogues, educational designers or even professors who are knowledgeable in the matter; offering study programs that do not add up to the desired professional training due to having subjects with little curricular value.

Based on the mentioned arguments and through semi-structured interviews, the opinion of the graduates of the first two generations of the UICEH is analyzed, in terms of the impact of the training received for their professional development and that of the region in which they live. The goal of this research work is to know if, from the perspective of graduates, the possibility of a social ascent from their studies in a HEI such as Intercultural is possible, or if it is only a purely political matter, whose purpose is to serve a sector of the vulnerable population of the place, as suggested by Gaete (2015).

Are Youth Offenders Getting the "Worst of Both Worlds"? the Legitimate Construction of Youth Justice By the Superior Court of Justice

Authors from different countries have argued that youth offenders are being treated with the lack of procedural protection that has historically guided youth justice, while simultaneously being punished in a harsher fashion, as is the tendency in adult justice. This situation has been described as the "worst of both worlds". This paper investigates how the Brazilian Superior Court of Justice (SCJ) ruled in 53 landmark youth justice cases. In these cases, the court dealt with the possibility of expanding or restricting incarceration and other forms of penal control and procedural protection. Unlike other studies on judicial behavior, this paper addresses both practices and discourse. It employs Bourdieu's sociology to frame judicial decisions as acts of state, which carry the monopoly of physical and symbolic violence. This construction emphasizes the role of the state in communicating the legitimate response to certain situations and the ways to address these situations linguistically. In order to account for the court's decision making-pattern, qualitative comparative analysis is employed. The SCJ institutes two youth justice models. In serious cases, it expands penal control and the use of incarceration, while restricting procedural protection. In non-serious cases, it behaves contrariwise. Thus, the court promotes a differentiation of two types of youths: the ones who deserve to be treated like adults and the ones who should be protected from state intervention. Both models rely on rehabilitation discourses, though the punitive goal is mentioned almost exclusively in serious cases. Other justifications are common to both models. The court promotes a juxtaposition of different ideal types of justice: it is legitimate both to apply adult criminal law *and* to reject it, to focus on cases' seriousness *and* on offenders' characteristics, to protect offenders *and* society. This combination of discourses, usually seen as contradictory, expands the possibilities of penal intervention.

RC12-242.9

GUTIERREZ CORNELIUS, EDUARDO* (York University)
ALVAREZ, MARCOS (University of Sao Paulo)

The Legitimate Construction of Youth Punishment By the Brazilian Superior Court of Justice

Youth justice was created under a rehabilitative banner. Yet, authors from several countries argue that it has recently shifted towards a more punitive approach, going through an "adultification" process. In Brazil, the Statute of the Child and Adolescent (SCA) is deemed to establish youth's "best interests". However, incarceration rates and other forms of penal control have skyrocketed. This paper addresses whether the judiciary contributes to this situation. It focuses on 31 landmark cases decided by the Superior Court of Justice (SCJ) since 1990. Unlike other studies on judicial behavior, it addresses both judicial practices and discourse. It employs elements of Bourdieu's sociology to frame judicial decisions as acts of state, which carry the monopoly of physical and symbolic violence. This construction emphasizes the role of the state in communicating the legitimate penal response to certain situations and the legitimate ways to address these situations linguistically. In order to account for the court's decision making-pattern, qualitative comparative analysis is employed. The SCJ institutes two youth justice models. In serious cases, it expands penal control and the use of incarceration. In non-serious cases, it behaves contrariwise. Linguistically, the

court communicates that some acts are too serious to avoid punishment and incarceration, while others not serious enough as to entail any form of state intervention. Both models rely on rehabilitation discourses, though the punitive goal is mentioned almost exclusively in serious cases. Thus, the Court maintains the SCA model for non-serious offenders, while treating serious offenders more like adults. Other justifications are common to both models. The court promotes a juxtaposition of different ideal types of justice: it is legitimate both to apply adult criminal law *and* to reject it, to focus on cases' seriousness *and* on offenders' characteristics, to protect offenders *and* society.

Music as an Outlet for the Experience of Deterritorialization: The Trajectories of Refugee and Migrant Musicians in Turkey

Migration movements have long been a key factor in analyzing Turkey's sociocultural environment and transcultural music scenes. In addition to being a country, which represents at the same time a space of transit and a place of destination, Turkey now hosts the world's largest Syrian community displaced by the war and ongoing conflict in their country. Due to the fact that new migratory flows and the dislocation of people are significantly occurring more than the last decade in the world, the experience of deterritorialization breaks out in different forms in the metropolises of Turkey, particularly in Istanbul. Music as an artistic way of expressing the self, is one those forms. Therefore, the main objective of this paper is to question the exclusion and precarity that the refugees and migrant people face throughout the evaluation of their public performances and concerts. This paper further aims to discover the exposition of an unresolved liminality and the consciousness of being the other at these concerts. In addition to the findings of the in-depth interviews realized with Arabic and African migrant musicians performing on the streets of Istanbul, this study presents a through analysis of the transcultural musical activities that took place within cultural projects and independent performances in 2016 and 2017 in Turkey. The main findings reveal that the refugees and immigrants use music as an outlet for their uprootedness, despair and wrathfulness. This study also highlights that the main purpose of these musicians is to find a temporary comfort and strength with their local tunes and to make some money for survival. This paper further discusses how the migrants use music to engage in public discourse and how they consider these performances as a way of enhancing a dialogue among non-migrant and migrant community and developing awareness within the larger society.

Do 'women of Valor' Feel More Self-Fulfilled? Gender, Religion and Work Among Ultra-Orthodox Jewish Women

We examine the concerted effect of gender and religion on self-fulfillment in the context of work-family balancing by looking at the case of ultra-orthodox Jewish (haredi) women in Israel, who are traditionally expected to be both mothers and breadwinners so as to allow their husbands to immerse themselves in religious studies. Recently, many of these women are seeking employment in non-traditional jobs, including the high-tech industry. We first describe survey findings showing that haredi women report the highest self-fulfillment while haredi men report the lowest. We then draw on interviews conducted with employed haredi women in order to examine the relationship between self-fulfillment and the ways in which these women experience work/family negotiations. Our findings focus on the haredi women's distinctive solution to the work/family conflict—the valuing of family life over the pursuit of career. The conclusion offers a re-consideration of religiosity and self-fulfillment through the prism of gender, discussing how together with the potentially empowering effect of work on haredi women's subjective self-fulfillment, it is also important to consider more objectively, and from a broader social perspective, how empowering the new work arrangements actually are as they may also reproduce gender discrimination. Such a gender

perspective broadens the investigation of the multifaceted contextualization of self-fulfillment and the nature of social and religious change for women

RC16-311.8

GUY, JEAN-SEBASTIEN* (*Dalhousie University*)

Humanism and Anti-Humanism: Operationalizing (with) Luhmann

In developing his systems theory, Niklas Luhmann intuited that sociology was standing at a crossroad between humanism and anti-humanism. He advocated the latter as the way forward. He argued that social phenomena cannot be accounted for in terms of human attributes like actions, beliefs and interests. The autopoiesis of social systems occurs through communication, not action, while individuals are relegated in the environment of these social systems. At the same time though, Luhmann's theory provides us with the conceptual resources for operationalizing the dichotomy humanism/anti-humanism. As a result of this, we do not have to choose between a sociological description of social reality that would be completely humanistic or entirely anti-humanistic. Instead we can envision social reality as compartmentalized into multiple pockets (like a patchwork) where local conditions are alternatively humanistic and anti-humanistic. The operator allowing us to travel from one pocket to the next is Luhmann's concept of self-description: we can move from humanism to anti-humanism and back again if we allow for social systems to be described and re-described anew from within themselves. Thus, both humanism and anti-humanism can be understood as enacted through two separated yet similar processes. Each process extracts different forms out of a crowd of individuals functioning as a medium of communication. Social reality takes on a humanistic aspect when a distinction between human and non-human is applied so as to arrange the many individuals into different categories, thus dividing the entire crowd into different groups. However, rather than making a difference between individuals or groups, the crowd can also be organized by exploiting the difference between activities as with the functional systems of modern society analyzed by Luhmann: politics, science, law, etc. Social reality then takes on an anti-humanistic aspect simply because the difference human/non-human is suspended and made irrelevant.

The Generative Side of Boredom: Evidence from Twitter Data Analysis

Boredom has a generative aspect that has been well-documented. However, it is an aspect of boredom that is less often explored empirically, since generativity is difficult to observe and measure. To remedy this, this study provides an analytical case study of boredom as observed in interaction over Twitter in hopes of illustrating this generative dimension. In so doing, this study measures and analyzes the varying degrees of generativity of tweets that involve the emotion of boredom. Across different degrees of generativity, I investigate the changing use of emotional and relational processes in these tweets. The findings suggest that positive emotion is a stronger predictor for generativity, compared to overall affect, negative emotion, and specific emotions like: anger, sadness, and anxiety. In addition, the findings suggest that generativity of tweets rises when the focuses is directed at others rather than the self. These findings are inconsistent with previous research that sees boredom as having a solely negative and asocial dimension. Given the fact that current research on boredom sees it as a highly individualistic emotion, with a narrow set of problematic consequences, this paper provides a compelling case study to examine how social network sites create new possibilities and directions for emotional expressions.

Scholar Leadership and Educational Achievement in Basic Education Principal in Mexico. a Comparative Study in Four Educational Contexts.

Scholar leadership and educational achievement in basic education principals in Mexico. A comparative study in four educational contexts.

Studies framed in educational Sociology made in different educational contexts around the world have proven the existing relation between the leadership style of the school principals and the academic results of the students. Here are presented the results of a research made in 32 schools in the state of Tabasco, Mexico, in which work was done with the same number of school principals. The sampling was stratified by quotas, according to the four educational modalities that are implemented for primary schools in Mexico: general primary schools, located in urban, suburban and rural regions; primary schools with private funding; indigenous primary schools and CONAFE schools located in high marginalization areas. The research sought to find answers to the following enquiries: what is the existing relation between the leadership of basic education principals and academic achievement? Are there differentiated characteristics in the skills and

the leadership styles of basic education principals whose students have obtained protruding, regular or insufficient academic achievements? What is the influence that different contexts in the leadership styles of the principals has? What is the existing relation among the educational climate, academic achievements and the principal's leadership? By means of a quantitative methodology, the results of the research aim at the direct influence that leadership skills of the principals have on the academic results of the students, which in itself influences on the school's organizational climate and how this relationship is kept among the four educational contexts that were studied.

The Lived Experiences of Women in Ghana's 7th Parliament

Globally, women's participation and representation in governance has increased over the last decades. However, the statistics are not the same across the world, whereas some countries have witnessed an increase in women's participation and representation in politics, others are either experiencing stagnation or no change. The differences can be attributed to several factors such as the political, social and religious environment women find themselves. In Ghana, many analysts and social commentators have suggested that women's participation and representation in governance have stalled, although the results of the 2016 Presidential and Parliamentary elections have seen a slight increase in the number of women elected as parliamentarians. This paper seeks to explore the lived experiences of some female Ghanaian legislators in Ghana's 7th Parliament to shed light on the political, social and religious factors they had to overcome to 'make' it to parliament. To achieve this, 12 in-depth interviews were conducted with female parliamentarians. In addition, content analysis of media reports from one national electronic media and two print media are analyzed. The findings of this paper have the potential to influence policy makers and other stakeholders to identify the struggles and resistance women go through to become representative in governance.

HAANPAA, LEENA* (*Social work, University of Turku*)*Child Subjective Well-Being in Leisure Context. a Cross-National Perspective*

This study investigates child subjective well-being (SWB) by examining firstly, how family togetherness is connected to child activity on leisure time and secondly, how these two factors explain child SWB. Previous research has shown that leisure activity is related to perceived well-being and that family togetherness mediates this relationship. This study draws from Bronfenbrenner's (1979; 2016) ecological system's theory and the importance of recognizing the contexts in which children live and position themselves. Bronfenbrenner (1979) has argued that certain leisure time activities and social contexts represent distinct opportunities for psychological growth.

To test these arguments a cross-national comparative research setting is applied. Data are drawn from the Children's Worlds study's (www.isciweb.org), which surveyed children between the ages of 8 to 12 in diverse contexts (N = 61,234). The Brief Multidimensional Student Life Satisfaction Scale (BMSLSS) is applied to obtain children's own perception on their well-being. Family togetherness includes items assessing child's evaluations of family functioning, whereas leisure participation is evaluated by frequency of activity. A structural equation model (SEM) is used to estimate the effects of leisure participation activity and family togetherness on SWB. Preliminary results indicate that children's well-being is explained in terms of personal, relational and contextual factors.

HAAS, ODED* (*Faculty of Environmental Studies, York University*)*Violent De-Politicisation: (sub)Urbanising a Palestinian Middle-Class*

New cities are being built in Israel and Palestine as neoliberal responses to the current 'housing crisis'. This paper combines a production of space perspective with the Zionist settler-colonial doctrine of conquest of labour and conquest of land, in order to examine how such projects are re-producing colonial spatialities. Specifically, interviews with planners, activists and inhabitants are used for comparing two current suburban developments that target a so-called 'Palestinian middle-class' on both sides of the 1967 Green Line. They reveal private homeownership as a new state strategy in the ongoing production of periphery and national territory. In Israel, the first 'Arab city' planned since the 1948 Palestinian Nakba/founding of the Jewish state supposedly marks a transformation in the state's conduct towards its Palestinian citizens; in Palestine, a private development is tasked with expressing the state's financial and political independence, ostensibly signaling a shift towards a particular 'urban' as grounds for proclaiming nationhood. Both cases are linked by market approach to housing, by architecture and planning as means for nationalising disputed landscapes and by practices of sprawl, land grabbing, displacement and dispossession. They become concrete abstractions of a de-politicised Palestinian middle class – spaces of counter-resistance violently integrating anti-colonial potentials into the (sub)urbanisation of Israel/Palestine as a whole. Still, in the Palestinian case, some inhabitants reject criticism of normalising the occupation and are instead optimistic about the power of real estate to promote their 'right of return'. In Israel, the new development has engendered a local movement that draws on the democratic facets of the centralised planning mechanism for anti-colonial activism. Eventually, while the framing of local conflicts as 'housing crisis' legitimates violent suburbanisation of contested territories and facilitates attempted de-politicisation of the Palestinian anti-colonial struggle itself, it nevertheless opens new possibilities for resisting the colonial regime.

HAASE, SANNE* (*Centre for Studies in Research and Research Policy*)
CONRADSEN, MARIE LOUISE (*Interdisciplinary Nanoscience Center, Aarhus University*)*A Paradigm Shift Towards Knowledge in Higher Education? Student Learning in an Open Science Basic Research Project Involving Private Companies*

Knowledge should be freely available to the public, and rather than restraining knowledge development by means of IPR clauses, basic research should be shared. A paradigm shift towards openness in basic research is currently being pushed for in an Open Science initiative from Denmark's second-largest comprehensive university.

The OS initiative puts aside the pursuit of patenting, and brings private companies and university researchers together in order to collaborate on basic research projects that are undertaken by students and come to form part of their learning. Since project initiation in January 2017, 19 students have been involved in the OS project along with a range of PhD students and postdocs.

Attempts are made to affect student culture and learning. A course is provided in order to qualify the interdisciplinary problem-solving practices of the students and lay the foundation for new types of knowledge-creation and learning.

Based on a comprehensive data collection harvested in a mixed-methods evaluation design, the paper presents results from an investigation focusing on how student knowledge acquisition, learning outcome and motivation are affected by this new type of HE structural framework that transgresses ordinary boundaries of discipline, organizational affiliation and methods. Mechanisms of exclusion via student self-selection are also investigated.

Preliminary findings suggest that student involvement in the OS project has a positive effect on: student motivation, the development of a sense of collectivity, and inclination to approach specific companies upon completed education in the boundary-crossing from student to employee.

By examining the opportunities and challenges of this open approach for organizing research and higher education, the paper contributes to the understanding of HE under increased demands of HEIs for accountability, strategic capacity and responsiveness in accordance with the current challenges of the predominant narrative of the university as a main driver in the global, competitive knowledge economy.

HADDAD, SAÏD* (*Saint Cyr Military Academy*)*Digital Soldiers in the (French) Armed Forces: An Emerging Cyber-Military Identity?*

In 2013, Cyber defence security has been defined as a national priority by the French White Paper on Defence and National Security. One year later the French MOD launched the Cyber Defence Pact. This Pact is dedicated to counter cyber-attacks and cyber-threats by allowing to what is called the defence community to "explore, invest and take control of this new strategic field". Indeed, cybersecurity and cyber defence have emerged as a national priority while a new cyber command unit (CYBERCOM) has been launched on January 1st 2017. This new unit is dedicated to increase French cyber-defence and offence capabilities. CYBERCOM will employ nearly 2,600 people belonging to the French armed forces. If CYBERCOM seems to be the natural development of France's developing strategy, the rise of cyber specialists among French armed forces has to be underlined while there's a shortage of skills. Recruiting, training and retaining cyber specialists in uniform are among challenges France's Defence faces.

In the light of this emerging and consolidating priority and based on interviews and analysis of French digital soldiers (e.g. officers) biographical trajectories, this communication is devoted to discuss how and why militaries decide to become digital (or cyber) ones. This communication will turn to the perceptions that digital or cyber soldiers have of their own trajectories and their cyber skills. How their identity as militaries and cyber specialists is articulated and constructed will also be examined.

HADJ-MOUSSA, RATIBA* (*York University*)*The Persistence of Injustice, Community Dislocation and Political Redefinition in Maghrebian Sahara*

This paper reflects on the paradoxical relations between populations living in the Southern periphery and the "State" in the Maghreb. The paradox arises from the political and economic minoritization of these populations and the wealth of their territories. Since the mid- 2000s, however, some important contesting voices started to uncover this paradox and to make claims a better economic distribution, a just integration within the nation and/or a territorial autonomy. These claims are as a matter of fact contextual to each country (Algeria, Morocco and Tunisia) and should not be blended despite the similarities between them. This paper will explore each case by looking at the ways in which claims for justice are enunciated as well as the relationship to the center and not only to the State per se. In doing so, we will examine how the notion of "region" is been transformed by these claims from an exoticized anthropological tool to a political one which has to be counted for. Finally, we hope to propose a reflection on the new forms of the political.

Violent and Non-Violent Gender Lessons from the Southern European and the Juarez, Mexico Refugee Crisis

This presentation is based on qualitative research that has been conducted in Greece, Ciudad Juarez, Mexico, and the Permian Basin, of Southwestern Texas. The women interviewed were both undocumented migrants, as well as refugees, who have provided a magnificent collection of personal narratives that illustrated the disparities in the distribution of economic and political resources both in Southern Europe, Northern Mexico and in the Southwestern U.S. The analysis of these women's narratives enables us to witness the rich, dynamic and diverse historical trends of human suffering and empowerment in those regions, and the similarities in their experiences, since they were all affected by a male dominated paradigm of Border-crossings (Fronteras). The presentation will explore more than one level of Border-crossings in a theoretical analysis of multidimensional intersectionality.

TSUTSUI, KIYOTERU (*University of Michigan / Ann Arbor*)

Minority Status - an Overlooked Source of Continuing European Identity. Evidence from the Issp Surveys 1995, 2003, and 2013.

The outcomes of recent elections and referenda across Europe show that parties emphasizing nationalist topics and issues revolving around such ideas are gaining support. Yet, popular support is not unequivocal, considering that the outcomes in urban areas often differ from those in rural areas. This difference is usually explained by pointing to the economic gains for urban areas and to the fact that individuals with more cosmopolitan views more often reside in cities.

While these explanations may have some merit, we also point to another factor – the status and identities of minorities. Drawing on theories on sociopolitical identities, we hypothesize that minorities are more likely to identify with the European Union, but are less likely to identify with their nation.

The dependent variable is the respondents' attachment to the nation and Europe, which were included in the 1995, 2003, and 2013 modules of the International Social Survey Programme (ISSP). At the national level, we examine the impact of country-level factors such as having a communist past, the duration of EU participation, and the levels of economic development and international integration. At the individual level, we propose hypotheses regarding the effects of individuals' geopolitical, ethnic, class, and national historical backgrounds on their national and European identity. Methodologically, a multilevel analysis is applied that considers both individual and contextual characteristics as well as changes over time in a single model.

Our contribution speaks to two audiences: Firstly, to scholars who are interested in the individuals' national and European identities, the changes of these identities over time, and the underlying determinants. Secondly, it speaks to scholars who are interested in the methodological aspects of how to analyze cross-national and time-comparative survey data in unbalanced datasets.

HADLER, MARKUS* (*University of Graz*)

World Society and Environmental Behaviors. an Increasing Gap between Ongoing Institutionalization and Private Actions?

After some substantial agreements at the 1992 UN Conference on Environment and Development in Rio, the environmental movement was characterized by optimism. This optimism, however, was short lived, after the subsequent failure of various agreements. Correspondently, international comparative survey data also shows that individuals' support for environmental organizations and related public actions peaked in the early 1990s and have declined ever since. Private behaviors, on the other hand, have remained strong in many countries or have even increased in the same period.

Considering these contrarian trends as backdrop, this contribution investigates individuals' public and private environmental behaviors across countries and over time using data from the International Social Survey Programme of 1993, 2000, and 2010. Independent variables include various socio-demographics and attitudes at the individual level. At the country level, the international embedding of a society, its economic position and related ecologically unequal exchange as well as other national characteristics such as the level of affluence and pollution measures are considered.

Methodologically, a multilevel analysis is applied that considers both individual and contextual characteristics as well as changes over time in a single model. A novel unbalanced time-comparative design is used, which allows to include countries regardless of how many of the three ISSP waves were fielded. This strategy

allows to differentiate between over-time and cross-sectional effects, which has been done rarely in previous analyses.

The contribution thus speaks to two audiences: Firstly, to scholars who are interested in individuals' environmental behaviors, the changes of these behaviors over time, as well as differences and similarities in the underlying determinants. Secondly, it speaks to scholars who are interested in the methodological aspects of how to analyze cross-national and time-comparative survey data in unbalanced datasets.

The Role of Religion in the Lives of Serbian Immigrants in Sweden

Sweden became a destination country for Serbian immigrants in the 1960s. After the disintegration of the socialist Yugoslavia at the beginning of the 1990s, Sweden became an important reception country for Serbian refugees from war-affected areas, as well as for the young, highly educated workforce from Serbia. Data on Serbian citizens immigrating to Sweden indicate that the number is constantly increasing. Traditionally, many of them are related to the Serbian Orthodox Church. However, the role of the Church and religion has not always been evident. There has been a strong revival of religion in Serbia in recent years which affected the Serbian immigrant community in Sweden in different ways.

This paper aims to present an ongoing research dealing with Serbian immigrants in Sweden and the role religion has in their identity formation. The primary focus is on the ways in which religion enters the lives of Serbian immigrants and the implications of it for the integration process. The presentation will be based on the analysis of data collected through the appropriate ethnographic work, as well as a number of in-depth interviews conducted with different actors related to this particular immigrant community.

Climate Governance and the Transformation of the Science-Policy Interface in Canadian Cities

In the last decade, cities positioned themselves as central players of the global climate governance. Has this engagement of cities with climate change transformed urban environmental governance? Did it modify the type of knowledge and stakeholders involved in policy-making? And if so, how? And to what extent? To explore these questions, we conducted a pan-Canadian comparative case study analysis of 6 cities: Vancouver, Calgary, Toronto, Ottawa, Montreal and Quebec City. We conducted in-depth interviews with decision-makers and performed a discourse analysis of interview transcripts as well as policies documents produced by each city. Our findings indicate that consideration of climate issues by cities have, in fact, transformed their approach to environmental governance. Most Canadian cities have integrated climate science into their governance strategies. Some have integrated climate quite extensively within their structure and have bona fide climate scientists on the City payroll. While not all cities have thriving Sustainability Offices, many have sub-divisions dedicated specifically to climate issues embedded within Energy or Environment departments. The size of the city and the relative influence of elected officials are also important factors affecting the extent to which climate issues are addressed and, in turn, how climate has transformed urban governance. Smaller cities are more likely to be influenced by elected officials' agenda, while public servants within metropolitan areas can sometimes resist the power of a strong Mayor. In conclusion, the integration of climate in urban governance has factored in the transformation of the science-policy interface in Canadian Cities. In many cases sustainability – considered a "fuzzy" idea – has been superseded by quantifiable data and mathematical models. Climate scientists are thriving, and many sustainability offices have undergone significant restructuring. These findings raise interesting new questions for environmental, political and urban sociology as well as for the social studies of science.

What Language Does a "Plangineer" Speak? Cross-Disciplinary Expertise and Environmental Governance in Canadian Cities

Cities have become key players in environmental governance. As such, they mobilize a broad range of experts producing an exponential amount of policies documents, environmental strategies and action plans. What type of expertise is favored when drafting urban environmental policies and planning strategies? How do radically different types of expertise work towards common goals? Who defines what should be on the policy agenda? To explore these issues, we conducted in-depth interviews with decision-makers (e.g. civil servants, engineers, planners, biologists, climate scientists, elected officials, and NGO representatives) involved in

environmental governance in 6 Canadian cities (e.g. Vancouver, Calgary, Toronto, Ottawa, Montreal and Quebec City). Using the NVivo software, we performed a discourse analysis of interview transcripts and policies documents (Sustainability Strategies, Climate Action Plans, etc.) produced by each city. Our findings indicate two trends with regards to the role of expertise in environmental governance at the city-level. First, there is an increased acknowledgment of the need to work collaboratively across disciplinary fields and to break down the silos within environmental urban governance structures. A trend dubbed “plangineering” by some to underline the intertwining of planning and engineering practices. Second, measurable goals, quantifiable data, and mathematical models have, in many cases, replaced the concepts of sustainability as a common ground upon which to build a common understanding of urban environmental challenges. This trend is concomitant with the integration of climate concerns within the urban governance agenda and climate science within the governance structures of many cities. New public management practices (e.g. performance indicators, benchmarking), as well as international emulation of environmental governance amongst global cities, also play a role. And while we can recognize the emergence of hybrid experts such as “plangineers”, there is a need to question the language such experts speak and, more importantly, in whose name do they speak?

Family Violence and Gender-Based Violence As Political, Legal and Strategic Concepts in Europe

Since 2002, when the Council of Europe issued comprehensive recommendations on “The protection of women against violence” for the 47 member states, the diverse approaches to implementation have been monitored and the data analysed. About half the member states use the concept “family violence” in policy and laws dealing with violence against women. The 2011 European Convention “on protecting and combating violence against women and domestic violence” ambivalently juggles the concepts of gender and family/household.

From 2009 until 2016, our in-depth comparative research has explored how the understandings of violence against women, of domestic violence and of child abuse and neglect shape not only policy in the legal frameworks, but also the practices of intervention and their cultural premises. Drawing on insights from these studies, the presentation will discuss differing historically rooted intervention cultures within Europe and the part that concepts of family, gender and violence play. A theoretical approach to understanding why certain concepts have become dominant will be sketched.

Rising awareness of the impact of witnessing violence on children has been conflated with intergenerational transmission of risk factors as if violence were a disease (see the widespread use of the term “epidemic”). In consequence, women-and-children are often bracketed together, so that intervention can itself become a form of coercive control. Among practitioners however, such tendencies coexist with strong feminist convictions that gender-based violence can only be overcome by empowerment, supporting and restoring women's agency. As these tensions remain unresolved, policies can proclaim a norm of non-violence for the family (demonstrably the site where both women and children suffer the most violence) without addressing issues of power or hierarchy. It is proposed that a failure to bridge the gap between the discourse on violence against women and that on child protection created space for intellectual confusion.

Liberator for the Oppressed, or a Useful Tool for the Dictatorship? Analyzing Controversial Art Projects in North Korea, in Light of Goffman

In his descriptions on performance and reality, Erwin Goffman (1959) describes two kinds of extremes, *sincerity* and *cynism*. Here I discuss a Norwegian artist's controversial art projects in North Korea, and analyze how the projects are debated in the media in light of Goffman. The Arts Council Norway supports the projects economically with a great amount of money, and in particular, I look at how the artist and the Arts Council defend the project in the media, in order to legitimize the costs and make the art project that appear unethical to many people, appear ethical. The projects involve North Korean performers and audience, including youths and children, and the artist claims that the projects are for the best of the North Korean participants. However, many of his statements to the media reveal another attitude to the projects, which is also in accordance with the theory of Goffman.

Political Art Activists in the Past and Present Time

The well-recognized Norwegian artist Per Kleiva (1933-2017), was one of the front figures of the Norwegian art activist group “Gras” in the late 1960s and early 1970s. These artists, who mainly worked within graphic art, were engaged in a variety of political problems both in Norway and around the world, for example the Vietnam War and the military coup in Chile, in 1973, and expressed their protests through their art expressions. The printing techniques of Pop art, in particular serigraphy, inspired the members of the group. The most iconic serigraphic print of Per Kleiva; “American Butterflies” (1971), show American war helicopters over Vietnam, applied with butterfly wings. In this paper, I discuss these Norwegian art activists in the perspective of a broader tradition of artists as political activists, as well as the political conditions and movements of the current periods. Finally I look at: how do art activism appear in contemporary art (after 2000), and what are the main issues of today's art activists compared with those of the 1900s?

Organizational Measures As Key: Who Introduces Family Friendly Work Practices and Why?

The workplace and the existing range of Family Friendly Work Practices (FFWP) are key to enable parents to balance work and family. Nevertheless, research investigating the patterns and motivation of organizations to introduce FFWP for their employees is scarce and theory driven quantitative research is even scarcer. Against this background the paper examines the role of structural elements of organizations for the introduction of FFWP: firm size, sector, share of female workforce and share of highly skilled staff.

Our hypotheses are derived from competing neo-institutional and rational choice arguments: neo-institutionalism would emphasize the need for organizations to maintain their legitimacy vis-à-vis their organizational environment. We would thus expect large firms and public sector organizations to be most likely to introduce official FFWP on grounds of being under intense public scrutiny. Rational choice theory, in contrast, focuses on efficiency. Following this second line of reasoning, we would expect small firms, organizations with a high share of female workforce and organizations with a high share of highly skilled and specialized employees to be most likely to offer FFWP.

We test our hypotheses, using official longitudinal data from the German Institute for Employment Research (IAB), the Linked Employer-Employee Data of the IAB (LIAB) which is representative for the German labor market. Germany is a uniquely informative setting for testing our competing hypotheses. Since, during our window of observation (1993-2014), work-family norms and policies have shifted in the direction of stronger dual-earner family support. These changes should be associated with contradicting influences on organizational behavior: intensified legitimacy pressures resulting in rising FFWP or relief from providing FFWP out of efficiency.

Preliminary results support the neo-institutional perspective, large employers tend to offer more FFWP than middle and small companies. Further analyses will address the aspect of change over time.

Acts of God, Man, and System: Knowledge, Technology, and the Construction of Disaster

This paper that risk and disaster, as problems of knowledge, are fundamentally shaped by the dominant knowledge paradigms and technological ecologies of the periods in which they are generated, experienced and examined. To illustrate the idea, this paper proposes three distinct periods in the construction of disaster as a public problem, each linked to changes in scientific knowledge for understanding the world and developments in technologies for manipulating it. These periods confront disaster, sequentially, as acts of God, acts of man, and acts of global systems. The periods are illustrated in this paper through examinations of one characteristic event in each time period: (1) The Lisbon earthquake of 1755, along with the disenchantment of natural disaster and the attendant rise of the environmental sciences that followed, (2) the Halifax munitions explosion of 1917, which occurred amid the statistical revolution in efforts to confront communicable diseases, urban fires, and the newly emerging problems of industrial and railway accidents in the nineteenth and early twentieth centuries, and (3) The devastation of Puerto Rico by Hurricanes Irma and Maria in the summer of 2017, which took place against the backdrop of global anthropogenic catastrophe and network failures, a framing genealogically rooted in the problem of nuclear war beginning in the 1950s and continuing to the present threats of global warming, emerging infectious diseases, terrorism, and cyber-disruption.

Doing Age, Doing Gender. Negotiating Deviant Bodies Via Self-Made Fashion

Clothes are important signifiers to show belonging to social groups and so is the act of clothing. While traditional structural perspectives on clothes and especially on fashion offer insights on social stratification and social change, a praxeological approach allows for the implementation of the used material of clothes, the clothed body and other practices that reveal how individuals produce and reproduce their social affiliation or deal with for example societal norms that are related to their gendered and aging body. Using the example of sewing blogs, I develop an analytical framework to understanding processes of 'doing age' and 'doing gender' in the sphere of home dressmaking of women*, focusing on descriptions of the aging body, images of femininity, associated clothing norms, and related strategies to negotiate these topics in the public sphere as can be illustrated via international blog postings. Analyses show that dressmakers understand the (subjectively perceived) defiant body to be a life-long changing material that is not only affected by an increase of age but also by other circumstances, such as job careers, pregnancies, etc. The deviant body is addressed as a material that needs to be covered appropriately. While age norms are mainly refused when it comes to its neutrality, non-sexuality and industrialized ideas of beige clothes for older women, gendered norms in contrast are highly internalized and reproduced. Women* tend to present themselves as seductive but dignified.

HAHMANN, JULIA* (*University of Vechta*)

Supported Community Creation Processes in Retirement Communities. Habitual Fit and External Control of Socio-Spatial Structures.

Retirement communities – especially those for upper class individuals – support their residents to establish feelings of belonging to their new homes and environment that can be understood as a city within the city with its own formal and informal set of rules, norms, and obligations. To support community creation staff organizes classes, trips, and evening events but also relies on the residents' willingness to participate and engage. By comparing a German and an US-American retirement community, I illustrate different strategies to support, control and perform community creation processes within retirement communities. Interview material from residents, staff as well as ethnographic field notes allow for reconstruction of a supported "doing community", including the use of spatial material and informal social rules related to semi-public spaces within the setting. Semi-public spaces, such as the communities' restaurants or the entry hall ("la Plaza") simulate public, well-known spatial structures and offer residents to continue internalised interactions of everyday life by simultaneously modified conditions of age-friendly design and supervision. Blurring the boundaries of public and private space – comparable to the design of malls, for example – influences the residents' everyday lives, mainly without their knowledge as interviews with staff members in both sites show. When analyzing biographical narrations of residents in the United States and Germany, it becomes obvious that the retirement communities use milieu-specific patterns of time use (especially leisure time), mode of activities, and use of space that differ among gender, biographical experiences, and nation (e.g., welfare regime).

HAKIN, RÉGIS* (*Université de Montréal (UdeM)*)

Services' Ruptures and Negotiations at the Front Doors of the Mental Health System

Services' Ruptures and Negotiations at the Front Doors of the Mental Health System

In the mental health systems' front line, numerous state agents (also called "street-level bureaucrats" – Lipsky, 1980) with different status (e.g. doctors, nurses, social workers) implement public policies and interact with persons in distress. At these system's front doors, some persons in distress who may arrive with members of their informal support network (e.g. family members, friends) can benefit from a comprehensive medical management while others are quickly sent back in the community. In certain cases, persons are sent back without services that meet their needs.

In a context of deinstitutionalization and austerity, many persons in distress live in the community but how can we understand such "services' ruptures" (i.e. situations where persons in distress are left to themselves or to an informal support network without neither privileged system's access nor adequate resources)?

I argue that we can study services' ruptures by focusing on the interactions and negotiations (Strauss, 1978, Allain, 2004) between the persons in distress and the system at system's front doors. By doing this, organizational and institutional contexts of the street-level bureaucrats' work have to be analyzed as much as the contexts of living and the informal support networks of the persons in distress.

I propose to combine relational ethnography (Desmond, 2014) and trajectory-networks perspective (White, 2016) to study the conditions of (in)accessibility of the mental health system and situations of services' ruptures.

Relational ethnography's starting points will be two front doors of Montreal's mental health system : a Psychiatric Emergency Service and a "Crisis Center". Semi-structured interviews (N=50) will be conducted with: persons in distress; members of informal support networks; and members of care teams. With these interviews, trajectory-networks of help-seeking steps in time and space will be reconstructed for a dozen of cases.

Negotiating the "Social License to Farm": Lessons in Civic Accountability and Legitimacy Process in New Zealand

As water pollution from agriculture continues to permeate New Zealand civic dialog, the process of "public" accountability and legitimacy in agri-environmental governance further intensifies. For example, in the media, we see stories of rivers being unswimmable, creating a threat to New Zealand's "clean green" image. Such narratives shape a tension in which the public accounts for farming through sometimes conflicting proxy's (i.e. can my kids swim in the water?, I want economic growth). To retain a "social license to farm", farmers are framed as needing to achieve both "good" environmental practice, while also remaining the country's economic "backbone". Neoliberal governance amplifies the seemingly opposing interests of farmers and non-farmer by often removing from civic debate the culpable force of institutions, markets, knowledge, and ideology. Further, surveys suggest that farmers remain distrusting of non-farmers, while displaying trust toward industry networks. This research wrestles with these dynamics by examining emerging networks that widen the process of retaining a "social license to farm" beyond typical partitions. It considers how networks of accountability take shape, how legitimization is maintained through networks, and decision-making process which may increase buy-in and participation across diverse networks (i.e. urban and rural populations). We pay particular attention to relationships between regulatory agencies, industries, and communities in this agri-governance process.

Explaining the Deterrence Gap in Employment Standards Enforcement

This paper seeks to explain the recent pattern of employment standards enforcement in Ontario, Canada. The analysis begins by demonstrating very limited use of deterrence measures in the context of a government policy which claimed a greater emphasis on proactive inspections and penalties for violators. Using both archival and interview data, we argue that the deterrence policy has been mediated through a number of competing political, economic, ideological and institutional factors, some of which are historical and some of which are emergent. While locating our analysis in a political economic framework which

recognizes the contradictory effects of neoliberal governance and globalization on enforcement politics, economic, ideologies and practices, we also seek a more grounded in depth understanding of the gap between policy and practice through an examination of the enforcement decisions and rationales of front-line inspectors and managers. Along with demonstrating substantial variation in inspector willingness to use different deterrence measures, we also identify shared rationales for limiting the use of deterrence measures crossing the inspectorate as a whole, grounded in both current Ministry policy and the longer existing institutional emphasis on individual claims and compliance over inspections and deterrence.

Who Makes War and Who Likes Peace? a Weberian Sociological Perspective on Wars in History and Today

The paper is a contribution from the perspective of Weberian sociology which starts from two assumptions: First, social actions are always guided by interests and by values; second, sociology has to focus on social actions. It will present three theses: (1) The widespread absolute confrontation between pacifism and political „realism“ is misleading. Peace is a universal human value, but striving for peace must also take into consideration other social values (according to an ethics of responsibility, against an absolute ethics of conviction; Weber). (2) There is a long-term trend toward peace which is supported by other processes of civilization, because peace is in the interest of the population at large, while the initiation of wars is mainly in the interest of leaders and elites (the famous thesis of Kant that democracy is the most important base for perpetual peace on earth). The long peace in Europe since 1945 is due not to European integration but to the establishment of democracies; (3) Many kinds of actions by political leaders (hatred speeches, distortion of information, arms build-up) prepare wars. In the paper, I will (1) develop a sociological-historical typology of wars which distinguishes them in terms of their motives and character; (2) show that large wars between states are on decline. But two new forms emerged: More local wars, connected to ethnic and religious cleavages; such war are more frequent in authoritarian political systems; wars of Western democracies (particularly the USA) against aggressive or threatening dictators; here, we must also include massive economic interests as factors leading to wars; (c) ethno-national wars for independence and presupposed threats from in- and outside (as in Israel, Africa); (3) investigate the warmongering actions of leaders in the present-day world.

The Forgotten Earth: World Religions and Worldlessness in the Legacy of the Axial Age/Moral Revolution

The rise and legacy of world religions out of what John Stuart-Glennie termed the moral revolution, and Karl Jaspers later called the axial age, has been marked by heightened ideas of transcendence. Yet ironically the world itself, in the literal sense of the actual earth, took on a diminished role as a central element of religious sensibility in the world religions, particularly in the Abrahamic religions. Given the issue today of ecological unsustainability, including massive die-offs of wildlife and ever-increasing global human population and consumption, the legacy of those world religions face the question I consider here: Can religion transcend the earth in the long run?

For aboriginal hunter-gatherer peoples of the past as well as today, as evident in ethnographic and archaeological records, the wild habitat is a common focus of reverential as well as practical attunement, a great teacher and source of wisdom, and central to religious life. With agriculture and civilization, the wild habitat begins to recede from a central place in religious belief, even as the domesticated environment and human interests become pronounced in state religions. In the place of the wild earth sacred history comes to the fore, signaling locations of human activity deemed sacred or significant, often centered in cities and humans.

With the Axial Age/Moral Revolution, comes the possibility of transcendence of the world per se. The axial ideal of transcendence connects to a larger ideal, manifest not only in the legacies of the world religions but in contemporary science and technology, of a philosophy of escape from the earth. I will show how ideas of axial transcendence, celebrated by scholars such as Jaspers and Bellah, nevertheless involve an unacknowledged tragic cost, the forgetting of the earth and its lessons and limits as central to what I have termed elsewhere, “sustainable wisdom.”

Transnational Faith-Based Engagement on Climate Change Governance

Religious actors have played an increasing role in transnational civil society activism on environmental governance, as evidenced by Pope Francis' encyclical

on ecological justice, and responses to it (including scientist, Jewish, Buddhist and Muslim leaders). The research discussed here includes participant-observation and interviews comprising “event ethnography” on COP22 (Marrakech, 2016), Parliament of the World's Religions (Salt Lake City, October 2015), and the Interfaith Summit on Climate Change (September 2014).

Climate change was one of 4 major themes at the Parliament, and two major faith-networks, plus numerous other faith groups, are operative in the civil society sector at the COP22 international negotiations. This researcher's active participation in these faith networks at each event, is compared also with observation of the Climate Action Network (CAN) at COP22. Frames, motivations, resources, meeting practices, efforts to engage in media relations, coalitions with other civil society sectors, and efforts to mobilize broader constituencies are all items of consideration. The faith-networks and CAN operated differently in most of these efforts. Religious groups do not attend to climate-related and sustainable development inequalities in the same ways. Similarly, faith-based actors do not uniformly identify and enact the role of “spirituality” in their engagements. Other civil society and government agents query what religions bring to the climate meetings, other than the potential mobilization of religious publics. In response, faith-based actors and organizations position themselves in a cosmopolitics that extends beyond the human sphere. This points to the different topographies of the social fields of environmental civil society and religiously-environmental civil society and their interactions on the political field. Faith groups such as Tzu Chi (Buddhist), ACT Alliance (Christian), and Islamic Relief operate across borders, making them important elements of transnational civil society.

Disability and Life Course from a Social Investment Perspective - Austerity Measures or 'Thicker' EU Social Citizenship?

This paper assesses how adequate social investment (SI) policies are as frameworks for promoting life-long Active Citizenship (opportunities for security, autonomy and influence) among persons with disabilities. The SI perspective has become a dominant justification for how social policy is to contribute to social and economic development in Europe, exemplified by the European Commission's 2013 SI Package. SI is mainly supply-oriented and focusing on the person's qualifications, skills or ‘human capital’, with a view to strengthening the person's ‘employability’. More rarely, SI policies address obstacles to employment related to health, work capacity, accessibility, discrimination or neglect. In contrast to recent SI literature from a life-course perspective (e.g. Kvist, 2013, 2014), in the European Pillar initiative the Commission explicitly addresses the situation of persons with disabilities at different stages of the life course. Yet, while the initiative to codify social rights and demand-side measures through the European Pillar is significant, we question whether it fully rectifies the limitations of SI. Combined, the EU SI policies and the European Pillar have considerable potential, but are unlikely to succeed unless they more sharply address the interaction between the person's capacity for reflection and action (‘agency’) and factors in the surrounding environment enabling or hampering such agency. Examining changes in spending allocated to disability-related social provisions and related policy outcomes in European countries, the paper identifies similarities and differences in how the 2008 financial crisis and ensuing fiscal consolidation measures have influenced their SI profiles related to persons with disabilities. Drawing on findings from life-course interviews with persons with disabilities in three age cohorts (born around 1950, 1970 and 1990) in nine European countries (N=217), we discuss how the Capability Approach may inform future codifications of the social investment perspective by the EU and the member states.

Welfare Policy Reforms, Citizenship and Social Movement Mobilization: A Comparative Case-Study of the Disability Movement in Germany, Norway and the UK

This paper examines the relationship between welfare policy reforms and the capacity for social movement mobilisation among disabled citizens. More specifically, we evaluate to what extent strong structuration theory (Stones, O'Reilly) and political opportunity theory (McAdam, Meyer, Tarrow) may inform our understanding of the relationship between welfare policy reforms and the capacity for social movement mobilisation among disabled citizens. For this purpose we draw on examples from country case studies of the disability movement in Germany, Norway and UK. Adopting a historical-comparative approach we examine the relations disabled people's organisations (DPOs)

have developed to public authorities and their capacity for collective voice and influencing public policy. We examine how the historical relations to the government and capacity for collective voice have shaped how DPOs have mobilised around the UN Convention on the Rights of Persons with Disabilities. While existing research has argued that the emerging human rights regime has created new opportunities for DPOs to side-step national authorities and mobilise at the EU and UN level, we examine how national policies influence the capacities of DPOs to take advantage of the new political opportunities. While Norway has been characterised by relatively benign relations between the government and DPOs and high degree of coordination among national DPOs, UK has been characterised by more adversarial relations between the government and DPOs and a more fragmented disability movement. Germany has represented an intermediary case between Norway and the UK, with phases of both cooperation and contention. This paper examines the social mechanisms behind the national differences. We argue that national disability policies have shaped not only the relationship between national authorities and the DPOs but also the capacity for collective action and social mobilisation among disabled people. The paper concludes by identifying implications for social movement theory and welfare policy research.

Consumer-Directed Care Policy in Korea: No Recognition, No Rewards for Carers' Task Difficulties and Work Experience

A consumer-directed care program is one type of privatization strategy that has been widely adopted by western welfare states. However, little is known about the East Asian consumer-directed programs and their consequences since these countries are relative newcomers in the social services field. This study aims to figure out how consumer-directed program affect the working conditions of care workers, and how it conceptualizes care labor in the Republic of Korea. To achieve this, the study reviewed care policy in Korea, and it then analyzed care workers' working condition and pay using 2007-2016 survey data from "the Occupation Labor Force Survey at Establishments" (a nationally representative sample).

In Korea, social services, such as long-term care and personal care for disabled people, were introduced in 2007 and has since expanded. Accordingly, the number of related workers has sharply increased over the last 10 years, and this sector accounts for 15% of all newly created jobs in the labor market. Most of these social services were originally adopted as consumer-directed program. In order to make this a competitive market from a zero-base, the government established regulations that made it easy to enter the care market; however, this led to a disordered market filled with small private institutions. In addition to this, the payment system for workers is designed as a single fixed price per service hour, which ignores differential work efforts such as the level of care difficulty, and workers' experience. The data analysis showed that care workers experience short and unstable working hours, and underpaid in comparison to other service workers. This implies that Korean public policy led to the devaluation of care labor in order to contain cost: it is in line with the feature of Developmental Welfare States that use welfare policy only as an instrument of economic development.

A New Empirical Test of Relative Risk Aversion Hypothesis By Bayes Model: Bernoulli Core Approach

The RRA (relative risk aversion) hypothesis proposed by Breen and Goldthorpe (1997) is one of the most influential rational choice theory that attempts to explain educational differentials among social origins of students. They formalized a probabilistic model and assumed that decision-making about advancement of higher education is motivated by the individual's preference to avoid downward social class mobility. Many empirical studies have tried to test the validity of the RRA hypothesis by statistical estimation of the effect of class origin on educational attainment (Davies et al 2002, Breen and Yaish 2006, Fujihara 2011;2012, Stocké 2007). However, many estimation models in previous studies contain serious misspecification error because of the over simplification of statistical models. Mathematically correct formula of advancement rate for higher education derived from B&G model cannot be represented by discrete choice model such as, binomial or multinomial logistic regression with maximum likelihood estimation. Therefore, all result of estimation by generalized linear models cannot be evidence for empirical test of RRA hypothesis.

Meanwhile, this paper implements a hierarchical Bayes MCMC estimation to test the RRA hypothesis correctly. We show that mathematical structure of the RRA hypothesis can be precisely expressed by hierarchical Bayes model. Using nationwide data, SSP 2015 and SSM 2015 in Japan, we show that 95% highest density intervals of posterior distribution of advancement rate for individuals from higher origin is greater than that of lower origin when assuming RRA hypothesis. Moreover, posterior distributions of theoretical parameters such as alpha, beta, and gamma that define the probability of reaching various social class, are all

estimated by MCMC. It reveals that staying higher education may increase risk of downward mobility for individuals from middle class origin.

Social Problems Engendered By the Removal of Dams

Japan is one of the "dam nations" in the world as thousands of concrete dams have been built in Japan since the 1950s. Given the age of these dams, debates about whether they should be repaired or removed have gathered momentum. As the rural population of Japan has been decreasing, local governments may be persuaded to remove the concrete dams in order to reduce the costs of maintenance. Dam removals are typically done to restore the flow of rivers, revitalize waterfront areas, and change the quality of human interaction with rivers. Although many of removed dams are small-scale dams, some are large-scale such as several dams on the Elwha River in Washington.

The Arase Dam, the only dam to be removed in Japan, was constructed in 1955 in the Kumamoto Prefecture; the removal process was initiated in 2012 and completed in 2016. Different opinions exist about the removal of this dam. Some claim that the removal project was necessary and successful, while others argue that it was unnecessary because electricity was generated from the dam in an environment-friendly manner. Arguments for and against the removal of dams tend to be complex and nuanced, which, in turn, complicates the decision-making processes. In case of Asare Dam, an important noteworthy social factor is that the people currently living in this region do not have knowledge about the nature of the landscape prior to the dam's construction.

Once a dam is removed, sand sediment collected in the dam lake begins to flow, which addresses the influence of the removal on river environment and the eco-system. Such natural factors must be monitored, but social aspects like community development after the removal also must be considered. In this paper, I seek to explore the social issues resulting from dam removals.

Limit of "Social Movement" and Its Relativization: In the Case of Late-Touraine Theory

This presentation addresses one of the session-organizer's questions: what is the "limits" in "the application of social movement concepts and tools to a specific context or case" and how to response to those. It discusses the concept of "social movement" (SM) itself.

There are two definition in SM studies. The first is the original definition that SM is the movement of society as a whole, Society's movement, which was firstly suggested by Stein (1850) assuming French Revolution and Socialist revolutions, and is succeeded by European social theorists like Touraine, Giddens. It is often useful for Interpretation approach which has interest to interpret and evaluate the meanings and significances of various practices from macro-historical perspective. But the normative definition is mainly based on histories and experiences of western societies, therefore it cannot be directly introduced in non-western societies.

The second is the now-dominant definition of SM as a kind of collective behavior / action directed to changes, which was developed in US, by Heberle, Vander-Zanden and collective behavior / action theorists. It is useful for Explanation approach which has interest to explain the causal mechanism of SM, like theories of Resource Mobilization, Political Opportunity, Framing... The definition is based on empirical object and it is only premise for explaining causal mechanisms, so there is no obstacle to directly apply itself to non-western.

Although the explanation approach based on the second definition of SM is dominant, now we see alt-right violent movements and crowd-like movements in the world, therefore interpretation approach to evaluate these should be needed more. Therefore, for application of interpretation approach to the non-western, we need to relativize the first definition in it.

In this presentation, Touraine's concepts can be relativized through comparative political theories like Welfare Regimes theory. This procedure could be applied to relativize critical theories.

HAMEL-ROY, LAURENCE* (*Université de Montréal*)

And then She Said "I Must Not Forget It's a Job"

The communication will present the results of our research on home care support workers (HCSWs) experience hired through *Chèque Emploi Service* (CES), a "cash-for-care" direct funding system in the province of Quebec (Canada). Based on 14 semi-structured interviews conducted with HCSWs in Montreal's greater metropolitan area, our inquiry aimed to understand how the reconfiguration of the Welfare State and of its depth and scale of action shapes employment conditions under the CES program. Adopting an inductive approach, our study

revealed that struggles faced by HCSWs to categorize and describe their labour "as a job" has substantial effects on the way they engage in "around the clock availability" and free labour while dealing with indeterminate/infinite task descriptions. Said otherwise, we will expose how subjective representations of work shapes the conditions of their precarity.

By providing home care users with "cash" rather than "services," direct funding involves a shift in the traditional role of home care users as they become both employers and beneficiaries of care. However, the scarcity of resources allocated through CES ultimately manifests itself as a framework structuring a transfer of responsibility for uncompensated care and services toward HCSWs. Faced with individuals' vulnerabilities, HCSWs involvement to compensate for breaches of services becomes a "personal" responsibility that draws on "natural" affectation of women to care - a situation crystallized by the fact that the workplace is in private homes. Drawing on HCWs' discourses - and looking at hesitations, reflexive thoughts and "surface contradictions" in speeches -, our communication will analyze and confront different narratives associated with "solidarity," "care," "services," "employment," "labour" and "exploitation," raising the need to rethink boundaries between caregiving as free and genuine, and care work as waged and impersonal. Extended excerpts of verbatim will be used through the presentation, giving sensitivity and complexity to our conclusions.

Perceived Social Status and Mental Health Among Adolescents

Increasing recognition that social status extends beyond more traditional measures of education, income, and occupation has led to greater research on other aspects of social status. This is particularly important for adolescents because the associations between such traditional measures and health are less consistent for this age group. The present study will examine the association between social status and mental health using multiple indicators of social status, namely parental education and two subjective measures (perception of the family's place within society, and perception of the adolescent's status within the school). Both subjective measures are slightly modified youth versions of the MacArthur Scale of Subjective Social Status. Data were derived from the 2015 Ontario Student Drug Use and Health Survey, a school-based survey of students in grades 7-12 in Ontario, Canada. This repeated cross-sectional survey of 10,426 students utilized a stratified two-stage cluster design. Results indicated that subjective indicators of social status were more strongly associated with mental health than parental education. It was also found that subjective indicators of social status sometimes varied in significance across mental health indicators, with perception of individual status within the school environment sometimes a stronger predictor than perception of family status. These findings highlight the complexity of the link between social status and health, as well as the need to examine diverse aspects of social status and health within research studies. Further research on subjective measures of social status may contribute to a greater understanding of the link between social status and health during adolescence.

Methodologies of Making Futures: The Different Types of Creativity in Constructing Diagnostic Concepts and Imaginary Scenarios

The aim of the paper is to compare and discuss the methodologies of the different kinds of future studies that focus on making diagnostic concepts or imaginary scenarios for the purpose of opening up for alternative futures.

The point of departure is an analysis of two traditions of futures studies that can be traced back to the emergence of sociology, namely diagnosis of the times (*Zeitdiagnose*) and sociology of the future (Beck & Bonss 2001; Urry 2016; Schulz 2016). In both traditions there are studies concerned with knowing the future and creating the future. In the case of diagnosis of the times, some studies are concerned with diagnosing the tendencies in the times, while others are concerned with constructing diagnostic concepts that grasps differently the possibilities of the conditions of the times (Hammershøj 2015, 2017). In the case of sociology of the future, some studies are concerned with building probable or possible scenarios, while others are concerned with building alternative or imaginary scenarios (Smedt, Borch & Fuller 2013; Kuzmanovic & Gaffney 2017).

My hypothesis is that the studies of the two traditions, which are concerned with creating futures, differ in that they use different types of creativity (Koesler 1964): creating a diagnostic concept consists in making a fusion of different elements, which results in a new idea, whereas building an imaginary scenario consists in confronting different elements, which results in a new expression. This sheds light on why imaginary scenario building is related to science fiction and why diagnostic concept construction is related to ideal types (Weber 1905).

The findings are, moreover, that the purpose of imaginary scenarios is to draw attention to the need for action and to drive action, whereas the purpose of diagnostic concepts is to take bearings and to guide action.

HAMMERSHOJ, LARS GEER* (*Aarhus University*)

The Academic Ethos of Shaping the Future: Cultivating a Sense of History and a Sense of Purpose

The aim of the paper is to inquire into the role of the university in shaping future society. In order to do so, it is necessary to clarify the present condition of the accelerating pace of societal change and to clarify the characteristic of research-based education. My hypothesis is that the more open the future is, the more need is there for cultivating a sense of history and a sense of purpose in order to understand, guide and drive change, and this is a central part of the academic ethos today.

The point of departure is that the acceleration of the pace of change is not mainly due to rapid knowledge production or exponential technological developments (Foray 2004; Brynjolfsson & McAfee 2014), but is due to a general 'crisis consciousness' in society, which can be traced back to the enlightenment and is constituted by the expectation that the future will be different from the past (Koselleck 1959). Today, this expectation appears to have been generalized in that it now concerns all parts of society and aspects of life (Beck 2016; Hammershøj 2017).

The academic ethos expresses the research approach characteristic of the university and consists in clarifying existing knowledge for the purpose of creating new knowledge (Humboldt 1809; Jaspers 1926). Today, however, academic ethos must also concern knowledge of change. This consists in understanding change by using a sense of history to identify the patterns of societal change and of guiding change by using a sense of purpose to help imagine alternative ways for the future by constructing diagnostic concepts and future scenarios.

Thus, the findings are that the role of the university in shaping future society is not to attempt to influence external forces of change, but to cultivate the 'crisis consciousness' that drives and makes possible change.

Economic Crisis and Populist Response: A Comparative Look at the Potential Threats to Democracy

This paper conceptualizes populism as opposite to liberal democracy. Both liberal democracy and populism can be defined in terms of their basic attitudes toward political liberalism and economic liberalism. Liberal democracy shows high trust on the function of civil and political rights as well as the market economy. In contrast, populism shows high distrust on the function of political liberty and the market competition. We can place such options as liberal egalitarianism and authoritarian market preference in-between these two diverging orientations. This paper is an attempt to show the main characteristics of the populist response to the current economic crisis by empirically comparing populism with liberal democracy and the other two orientations referred to above. For this purpose, the survey data (2007-2013) of parliamentarians and citizens in advanced and new democracies of seven countries (Germany, Sweden, Korea, Poland, Chile, Turkey, and South Africa) will be analyzed. Based on this analysis, this paper identifies the potential threats to democracy in such characteristics of populism today as the highly emotional mode of political confrontation, support of strong charismatic leader, high distrust on professional politicians, preference of the rule by experts than politicians, and a pessimistic view of the economic future.

Weber's Concept of Richtigkeitsrationalität and Rationality of Compathy: The Case of Filial Piety and Funeral Ritual Reform in China

Weber proposed different sets of ideal-typical conceptualization of rationality which have made great contributions to a social theory of rationality. Yet the limit of the Weberian paradigm is also clear as epitomized by the destructive consequences of instrumental (purposive) rationality prevailing in modern systems today. However, Weber kept the term '*Richtigkeitsrationalität*' in his 1913 article on the categories of interpretive sociology. Here '*richtig*' may mean 'correct or common' as widely shared, deeply rooted, and thus anticipatable. This paper attempts to go back to this concept, as an undifferentiated ground concept of rationality, to clarify where Weber's analytic work started from and explore what, despite his great contribution, we have lost because of his preoccupation with analytic clarity of the concepts at the cost of the profound significance of this ground concept. One key problem is the rationality of normative claims.

Habermas has attempted to solve this problem by his theory of communication and discursive testing. Another problem is related to emotion in general and compathy in particular. This paper will show how the issue of compathy is deeply built into Weber's concept of *Richtigkeitsrationalität* and how we can possibly deal with this issue from the perspective of rationality. For this purpose, this paper will examine the Chinese concept of *Qingli* relation (*Qing* means emotion or context, *Li* means reason) and explore its possible rationality by a case study of the funeral ritual reform policy taken by the Communist Party and the popular response to it from the ethical perspective of filial piety as a vivid example of compathy.

The Impossible Clinic: A Critical Sociology of Evidence-Based Medicine

In an interview with Michel Foucault titled "Questions of Method" (formally published as "The impossible prison"), Foucault spells out how he analysed the policy program and coordination of punishment and prisons. Ultimately he reminded readers that the panoptic prison and a disciplined society are impossible projects, and he explained how they persist. In this paper I take a similar objective, to show how clinical practice guidelines (CPGs) and their epistemological basis of evidence-based medicine (EBM) have a similar impossibility. This paper builds on earlier genealogical work that connects the emergence of the science of clinical epidemiology to the development and stabilization of CPGs in western medical training and practice. I explain the mechanisms by which CPGs and EBM are able to persist through an analysis of disciplinary decisions from provincial regulatory medical colleges across Canada. In each of Canada's ten provinces, there is a professional college of physicians and surgeons that is responsible for regulating the profession and practice of medicine. Under these incorporated legal responsibilities is the privilege to self-regulate and discipline its members, and every college has a list of endorsed guidelines. I constructed a sample of 261 disciplinary decisions from anglophone medical colleges across Canada between the years of 2011-2016, inclusively. The disciplinary decisions were analysed in relation to those guidelines endorsed by the medical college. I found that colleges were using their endorsed CPGs to normalize the discursive practice of clinical judgment. I conclude by explaining that the liberal governance strategy of deresponsibilisation is the mechanism that allows for the persistence of CPGs in EBM while being directly antithetical to the goals of evidence-based healthcare, thus making their objectives an impossibility.

Roots and Stems? Examining Field of Study Choices Among Northern and Rural Youth in Canada

Despite several decades of postsecondary expansion, new research suggests that students from northern and rural areas in Canada remain less likely to successfully transition into postsecondary education, and take longer to do so. While proximity to various institutions does account for some of these disparities, the parental socio-economic status and aspirations, demographics as well as the educational characteristics of youth within these regions also help explain these inequalities. Yet, we know considerably less about the challenges northern and rural youth may face in accessing particular fields of study, and more specifically, their likelihood of entering Science, Technology, Engineering and Mathematics (STEM)-related fields. Proximity may also have a considerable impact on one's choice of field or major, as many of Canada's larger universities and colleges, who offer considerably more program and degree options, tend to be concentrated in large, urban centres, and in the southern regions of Canada's provinces. This study draws on Cycles 1 to 6 of Statistics Canada's Youth in Transition Survey (YITS - Cohort A) to examine regional differences in accessing STEM-related fields at both the college and university levels, the extent to which certain socio-demographic groups within these regions may be underrepresented in STEM fields, and the relationship between these field choices and early workforce outcomes.

The Micro and Macro Conditions for Status Reproduction in China: The Role of Adolescent Non-Cognitive Traits and the Rural-Urban Divide

This paper aims to bridge two streams of literatures: the burgeoning researches in psychology and economics in examining the impacts of non-cognitive traits (NC for short) on various of personal outcomes and the long-

standing intergenerational status reproduction inquiries in sociology. Treating non-cognitive traits as a micro condition for status reproduction, we specifically investigate two questions: (1). whether parental social status affects individuals' status via his/her adolescent NC; and (2). if (1) is true, whether the mediating effect of NC is contingent on parental social status. Given the huge institutional and cultural differences, we further propose the rural-urban divide as a macro condition for status reproduction, and suggest that (3). the mediating and moderating effects of NC may well be embedded in the rural/urban macro context.

Using a recent nationally representative sample-China Labor-force Dynamics Survey (CLDS) in 2014, we use the seemingly unrelated regression model to investigate the relationships among parental status (measured with education and occupation), individual's status (measured with education, personal income and occupational status), and individual's adolescent NC (measured with a group of retrospective indicators for one of the major incentive-enhancing non-cognitive traits: conscientiousness).

Our analyses reveal several major findings: (1). adolescent conscientiousness is strongly associated with individual's achieve status; (2). over 35% of parental education's effects on respondent's education can be attributed to individual's adolescent conscientiousness; (3) the mediating effects of conscientiousness is contingent on parental status, but the pattern is different for urban and rural residents: (3a). for urban residents, the resource substitution hypothesis is supported, the positive effect of conscientiousness is stronger for children from lower status background; (3b) while for rural residents, the opposite is true, Matthew effect is at work, the beneficial effect of NC is exaggerated for higher status families.

Measuring Biological Age: How Biomarkers of Ageing Shape Ageing Futures

In the past decade, an increasing variety of organisations have been established whose only objective is the provision of biological, personalised age measurement (e.g. RealAge). Indeed, any cursory browse on the internet for 'age' would reveal that there are currently available a variety of tests to ascertain individuals' 'personalised age' (Moreira, 2016), from simple questionnaires to those using bio-molecular techniques such as telomere length measuring. But little is known about who uses these services, why they use them and what the ethical implications of such use are.

Through individual semi-structured interviews and focus group interviews with users, as well as semi-structured interviews with different practitioners employing biological age measurements in clinics and elsewhere, the paper explores the entanglements between health and age and between the standards of age measurements and the interlocutors' rationales for being measured.

By doing so, the paper asks how biomarkers of ageing and biological age measurements will form future regulations and standardisations of age (retirement age, welfare services, etc), how people will make sense of them and translate biological age into practice, as well as how the imaginaries of ageing and biology shape the ageing society.

The Association between Caregiver Burden and Affiliate Stigma Among Caregivers of Persons with Intractable Epilepsy

Objective: This study explored the relationship between affiliate stigma and the levels of burden experienced by family members caring for relatives with intractable (uncontrolled) epilepsy and examined how levels of burden may vary by patient age. Disability rates in this epilepsy population are high (~80%) with care typically provided by unpaid family members. While evidence of epilepsy stigma has been firmly established in literature, affiliate stigma experienced by these familial caregivers has not been examined. Caregivers may experience family stigma, i.e. discriminatory attitudes based on their being related to a person with a stigmatizing feature (Goffman 1963). Affiliate stigma occurs when that family member internalizes those negative societal views with resulting psychological responses (Mak and Cheung 2008).

Methods: This cross-sectional approach utilized a self-administered survey offered to caregivers of family members with confirmed diagnoses of intractable epilepsy in a southern U.S. state. Caregiver burden was measured using a 30-item index while affiliate stigma was assessed using a six-item scale. Four nested OLS regression models were estimated.

Results: Respondents (N=136) were predominantly White (83%), female (75%), and married (69%). The family members with epilepsy ranged in age from 2-82

years and were evenly split between males and females. Each OLS model yielded a positive and statistically significant association ($p < .001$) between perceived levels of caregiver burden and stigma. Additionally, the age of the family member with epilepsy moderated ($p < .05$) the effect.

Conclusion: Results from this study strongly support the argument that as levels of perceived stigma increase, perceptions of burden also increase. As well, the relationship between caregiver burden and affiliate stigma is stronger for caregivers of adults. Measuring caregiving activities in epilepsy across a stress continuum was unique in this study, providing a way to identify specific needs, which when met, may improve physical and mental health for caregivers.

North American Street Food at the Intersection of Culinary and Urban Policy Fields

This paper examines the spread of new, gourmet styles of street food in North America, in the form of food carts and trucks, through the lens of transnational fields of production and consumption. In particular, I place food carts and trucks at the intersection of two distinct but overlapping "fields": The first, the cultural field of food consumption, has been simultaneously shaped by globalization and culinary "desacralization," with the consequence that street food is increasingly viewed as an ideal object for gourmet food consumption. The second field, which might be understood as a symbolic field of city reputations, is in part organized by ideas about urban branding and the dynamics of inter-city competition. The growing cultural significance of food in North America has raised the profile of local food scenes to city "branding" efforts, and coupled with the celebration of street food as "foodie" worthy, this has resulted in the elevation of food carts and trucks as urban amenities that symbolically convey a city's "brand." The (quite literally) "mobile" form of the food cart/truck has become a mobile urban policy as well, offering cities a low-investment but highly visible and cultural valued form of urban food consumption that municipal leaders believe contributes to their city's symbolic capital as attractive destinations. In my analysis, I draw on the particular cases of Portland, Oregon, and Vancouver, British Columbia, though I make efforts to extend my argument to a broader set of North American cities.

HANSER, AMY* (University of British Columbia)

Public Bus As Urban Space

Drawing upon examples from North America, this paper will explore the public bus as a quintessential urban space, a space in which urban residents encounter social difference in close proximity. Drawing upon the ideas of scholars as varied as Georg Simmel, Iris Marion Young, Jane Jacobs, Lyn Lofland, and Robin Kelley, this paper will consider public bus as theatrical space, as a space where strangers encounter one another, and in particular as a space in which social difference is experienced in close proximity. Public buses are also social spaces that are transformed as they move through physical space of the city, as riders embark and disembark, and through time, as the rhythms of work, school and leisure all manifest themselves in the terms of numbers, composition and demeanor of bus riders. If city life embodies difference, as Iris Marion Young has argued, then the public bus offers an opportunity to consider how difference—strangers "being together"—is experienced in the most immediate and mundane ways.

HANSON, BARBARA* (York University)

Cybernetic Causality and Social Power

Models of power in social theory can be advanced by embracing holistic epistemology. Doing this requires first acknowledging that social theoretical activity is implicitly grounded in the habits of mechanism or summativity, the separation of wholes into parts and its inevitable extension to linear causality. The alternative of holism, looking at things in terms of their properties of interrelatedness, suggests ways to embrace ideas about power that have been suggested by authors like Foucault, Butler, Scott, and Dowding. In these works it is possible to detect struggle against the implicit divisive demands of mechanism while trying to portray something that is amorphous, fluid, explosive, dampening, happening at multiple levels, and non-linear. At the same time there is a kind of magnetic pull to issues of causality in the sense that talk about power drifts to the issue of this thing called power making good or bad things happen or having the capacity to make them happen. A shift to holistic epistemology allows possibilities in modelling power through the alternative of cybernetic causality. This construct has the ability to move, breathe, resist, explode, contain, in ways that power is experienced and described by social observers and can't be captured by mechanistic linear causality.

RC16-311.10

HANSON, BARBARA* (York University)

Theorizing Blame As a Relational Dynamic: Possibilities in Holism

Blame can be modelled as a dynamic in social theory in keeping with the suggestions of holistic epistemology. The attribution of cause and through this blame or responsibility is a form of interpretation inherited from monotheism. Mechanistic epistemology (separation into parts, linear causality) has been transported into current practices of social theoretical activity via modes of interpretation prevalent in European based education. These modes were forged in medieval times through the fusion of Aristotle's philosophy with Christian theology and passed on implicitly through church influence in European lineage schools and universities. Linear causality and mechanism therefore shape models of blame. Looking holistically instead allows seeing blaming as a dynamic that can work from the internal conversations of individual humans to global phenomena like markets and trading blocks. This is possible by importing the legal conception of persons into social theory. With this in place it is possible to see that blaming is fuelled by needs to reduce uncertainty, separation of ego from badness, desire for efficacy and a quest for righteousness.

The Changing Nature of Teacher's Professional Autonomy: Trends and Tensions in China's Policy Promotion of Educational Governance

For the past four years, educational governance has been one of the most essential ideologies of educational reform in China, which exerted an extensive and profound influence on school's autonomous running and teacher's acquisition of professional autonomy. However, there were practical difficulties when pushing forward reforming policies at a regional level and school level.

In this article, the author firstly discussed the core connotations of China's educational governance policy by expounding its vital significance to the modernization of governance and the intensional development of school, and then emphatically analyzed the changing nature of teacher's professional autonomy that influenced by the implementation of education reform. At this stage, the analytical framework of teacher's professional autonomy was designed and constructed.

Following, this research focused on teacher's professional autonomy of public elementary and secondary schools from a regional perspective, conducted empirical investigation in the central region of Henan Province which contained 3 urban areas, 3 county-level cities, 1 county and its villages and towns district. Self-edited questionnaire and unstructured interview outline that based on the analytical framework were adopted as research tools for the investigation. Finally, this research received 3467 valid questionnaires, altogether interviewed 29 persons of teachers, school leaders and staffs of education administrative department, and also visited 8 schools of different characteristics to collect cases concentrated on autonomy of teaching profession inside schools.

In the process of data analysis, AMOS21.0 and SPSS 20.0 softwares were used to analyze the influencing factors for teacher's acquisition and using of professional autonomy, and the current situation of autonomous degree of teacher profession was comprehensively described on the basis of data analysis. Based on the above research works, the author listed the existed cruxes that restrained teacher's professional autonomy and put forward the local guarantee system concerning the regional social environment and educational practice.

Problems and Countermeasures: A Study on the Influential Factor of University Teacher Academic Career Development

Although the proportion of female faculty in universities is getting higher, the ratio decreases when it comes to female faculty who own a high title of a technical post. The title can be seen as a symbol of the level of career development, which is a reflection of the status of female faculty' professional development. This study adopted quantitative analysis methodology and found that there are three factors constraining female faculty's career development: (1) the "de-gendering" tendency existed in the scientific research system; (2) marriage and giving birth to child had an impact on female faculty' career development; (3) "The age threshold" restricted the subsequent development of the female faculty. The study also recommends establishing a comprehensive long-term research development mechanism to improve the academic research environment. The specific methods include: setting up academic research funds for women faculty to support and encourage them; broadening the age limit in the application of various funds and awards considering the female faculty's physiological characteristics.

RC11-219.1HAQ, KAZI* (*University of Victoria*)PENNING, MARGARET (*University of Victoria*)*Social Determinants of Racial Disparities in Cognitive Impairment in Later Life in Canada*

Health inequalities have long been medicalized, obscuring the significant role that social factors play in causing these disparities. In recent years, however, increasing attention has been directed towards the importance of various 'Social Determinants of Health' (SDH). According to the World Health Organization (WHO), for example, the 'social conditions in which people are born, live, and work are the single most important determinants of one's health status' (CSDH, 2008), with the health disparities experienced by various groups in a society generally attributed to the unequal distribution of social and economic resources. Yet, despite growing recognition of the important role social factors play in influencing health, little remains known regarding whether and how social inequalities influence non-physical health outcomes such as cognitive impairment, particularly in the Canadian context. To address this gap, this study focused on the impact of racial disparities (white, non-white) on cognitive impairment among older adults in Canada and the extent to which these racial disparities operate through differences in socioeconomic and other resources. Data were drawn from the 2011 Canadian Community Health Survey. The study sample included 21,300 people aged 65 years or older. Multivariate regression analyses revealed that a racial gap in cognitive impairment does exist among older adults in Canada and that inequalities in education, income, food security and socially patterned behaviours (i.e., physical activity levels) represent major pathways through which these disparities operate. However, we were unable to show the effects of occupation and socially patterned behaviours like smoking and alcohol consumption on this gap. We conclude that the SDH approach helps us to see how health inequalities emanate from broader structural inequalities in society and therefore the need for policies directed at reducing social inequalities as a whole.

RC25-JS-45.3HAQUE, EVE* (*York University*)*Immigrant Language Training for Integration: Entrenching Linguistic and Social Inequalities*

Canadian census data reveals that in 2016 over 20% of the population had a non-official (that is not English or French) first language and that Canada admitted over 271,000 new immigrants, the highest level since 2010. These two facts dovetail in Canada's integration strategy which is based on a national multilevel program of immigrant language training.

The open advocacy of integration for immigrants is exemplified in political statements, such as those made by Jason Kenney (previous Minister Citizenship, Immigration and Multiculturalism, 2008-2013) where he comments on what integration means: "It means making sure that people who arrive in Canada are able as quickly as possible to have competency in one of our two official languages as a pathway to economic and social integration." This common framing of integration is reflected in how the state resources are allocated for processes of integration for newcomers. From 2005 on, the federal government tripled immigrant settlement funding and most of these funds were allocated for official language adult immigrant language training programs (mainly for English).

In this paper, I want to explore how program learners, teachers and administrators interviewed at 11 different immigrant language training programs across Ontario understand this imperative for 'integration' via language training. I want to argue that it is clear that the government's increased emphasis on official language training as the path to successful integration is in fact the commodification and narrowing of conceptions of linguistic interaction into an intimate concern of neoliberalizing self-responsibility. Specifically, couching the question of integration narrowly as one of official language proficiency belies the deeply racialized nature of the Canadian labour market as well as of citizenship and immigration policy.

RC06-134.3HARAGUS, MIHAELA* (*Babes-Bolyai University*)HARAGUS, PAUL-TEODOR (*Babes-Bolyai University*)*Dimensions of Intergenerational Solidarity in Romanian Transnational Families*

Combining a national survey on 1500 elder Romanian parents (60 plus) with migrant children with semi-structured interviews with some of these parents, we investigate how intergenerational solidarity is remodelled in the context of transnational families. In our endeavour we combine the solidarity paradigm, which guided most of the research of the dyad parent-adult child, with a care circulation approach, specific to transnational family literature. We investigate different forms of intergenerational solidarity – associational (common activities),

affectual (emotional closeness) and functional solidarity (exchange of support) – and factors that may limit or enhance intergenerational solidarity: needs and opportunities of parents and adult children, their family structure and the contextual-structural factors. Our investigation addresses at the same time the ways in which support is provided in transnational families: through direct provision with co-presence, direct provision at a distance, coordination, and delegation.

Our results show that intergenerational relations remain multidimensional and certain dimensions continue to be fulfilled through direct provision only, such as associational and affectual solidarity. Functional solidarity can additionally circulate across the family network, and associational solidarity becomes particularly important through its potential for other forms of intergenerational solidarity. Older parents and those with poor health are more likely to receive help and care, both in situations of co-presence, during migrant children's visits home, and from a distance. They are also less likely to travel themselves abroad and to help their migrant children in the destination countries, especially with childcare. The inexistence of other adult children in home country increases the exchange of practical intergenerational support, mothers are more likely to offer practical support in destination countries, while fathers are more likely to help from a distance. Coordination and delegation of help and care appears in connection with the parents' health, and involves mainly other family members.

RC06-146.4HARAGUS, PAUL-TEODOR* (*Babes-Bolyai University*)HARAGUS, MIHAELA (*Babes-Bolyai University*)*Economic Wellbeing and Flows of Intergenerational Support in Eastern Europe*

Family solidarity has different motivations and manifestations in different social strata, and the socioeconomic status influence the intensity of intergenerational solidarity. From the reciprocity and altruism approaches we know that working class families are more involved in intergenerational exchanges than the upper class families. We can approach downward intergenerational solidarity from the perspective of status reproduction: parents invest in their children through intergenerational transfers in order to avoid their downward social mobility. Consequently, working class parents offer less financial support to their adult children, compared with upper class parents. All approaches (altruism, reciprocity or status reproduction) argue a more intense transfer for instrumental support in families with lower socioeconomic status.

Our intention was to investigate how social mobility is supported through intergenerational relations. For this we used data from Generations and Gender Programme (GGP) Wave1, for several Eastern European countries, focusing on three forms of support provided to family members: financial, emotional and instrumental. We used a synthetic index of material wellbeing, combining income and expenditure approach: total household income, two indicators of the ability of household to make its ends meet, the evaluation of the household ability to overcome financial difficulties and the satisfaction with the housing.

Results show that intergenerational solidarity seems to function distinctly in different social strata. We showed that in higher status families there is more financial support to an adult child. In some countries higher status families are less likely to offer instrumental support to their descendants. This confirms the idea that persons with a high socioeconomic status offer less downward intergenerational instrumental support. Regarding upward intergenerational transfers, we showed that higher status families provide more financial and emotional support to their parents and less instrumental support.

RC30-546.1HARAYAMA, TETSU* (*Toyo University*)*Nurses' Professional Worlds, a Comparison in France and Japan*

The movement called « Nurses' Coordination », which appeared in France October 1988, was based on the demand of social recognition. We observed that the care of the vulnerable, practiced mainly by women, needed their appreciation.

In Japan, the arrival of this feminism was delayed with regard to the French situation and the philosophy expressed in "The second sex" (1949). However, today, in Japan, nurses' interruption of career has been questioned. Through two surveys conducted in 2008 and 2012, we could observe that nurses' feminism and their need of appreciation should adapt to the current policy of reorganization of health care. From this point of view, we could ask about the following development: « from project of the establishment to establishment of the project » (Cf. Mossé, Le lit de Procuste, 1997).

So, we could speak also about certain possibilities of "nurses of advanced practices", with diplomas by university at the level of master. These new practices, which could correspond to a new feminism, are considered as coordinating acts of caring patients in their complex life.

HARBUSCH, MARTIN* (*University of Kassel*)
 DELLWING, MICHAEL (*University of Kassel*)

Dramas of Medicalization in Everyday Social Network Life

The term 'mental health' has become in many ways a catch-all term, most notably in institutions such as criminal justice and education. Next to the continuing extension of psychiatric ascriptions in medicine, social work, schools and other state institutions, there is the individual self-ascription on social media platforms, where psychiatric categories have become popular tools for self-identification. This development has introduced psychiatric labels into a market of meaning that often bypasses powerful organizational structures.

The place of reproduction of psychiatric labeling has therefore expanded. While classical critical approaches often painted the diagnosed as the victims of powerful practices of others, the social market of self-diagnosis options makes users subject to a power structure of diagnostic ascriptions that is subtler: one that privileges continuous self-observation, self-labeling and, most importantly, constant efforts to socially control the interactions of the self and others in these interpretive ventures.

This presentation will discuss the expansion of the market for disease categories, using classical and contemporary critical work on psychiatry. We will use material from an empirical study in social networks to investigate individual dramatizations of the self through socially shared psychiatric discourse from "everyday social network life," extending the catch-all nature of the vocabulary even further.

HARDER, FRIEDERIKE* (*Goethe University Frankfurt*)

Work Intensification, Alienation and the Role of Emotions

In recent years, processes of marketization have changed the world of work fundamentally. Even in the field of professional work, professionals report about work intensification, time pressure and feelings of meaninglessness at work. Although the notion of alienation is used to describe those changes of working experiences, only few studies have focused on understanding feelings of alienation at work in the context of work intensification. To fill this gap, this paper looks on experiences of alienation in high-stress working conditions. It specifically aims at understanding the role of emotions in experiences of alienation.

To understand the nexus of work intensification, alienation and emotions, in this paper the interviews with senior physicians with management responsibility are analyzed. As part of a research project on meaningful work, we conducted 20 semi-structured narrative based interviews on the working experience and work orientations with senior physicians in different university clinics. Based on the analysis of these interviews, this paper answers the following questions: How can experiences of alienation be identified in qualitative interview material and what are their specifics? What is the difference between alienation and stress? What role do emotions play in the understanding of alienation processes? I show that feelings of alienation can be found in the field of alienation from self, alienation from work and alienation from others. In these three forms of alienation, the emotion of nostalgia plays a crucial role.

The paper offers deeper insights to the understanding of alienation in a changing world of work. Besides the empirical insights, theoretical questions about the construct of alienation are also highlighted.

HARINGTON, PHIL* (*University of Auckland*)

Resetting the Paradigm for Professions; Activists in the Lives' of Citizens.

Professions lost position in an age of managerialism and austerity. They were caught in narratives from above and below as self-interested, ineffective, elite, and slow to respond to increasing inequality. They were susceptible to attack for their privilege and capture, their inability to sustain or defend services in the face of a hollowing out of public provision, and they were noted as lethargic in responding to complaints, poor and flawed practice. More concerns arise when training and qualifications, research and innovation are confined to the academy and the distance from theory to practice protracted and peer leadership diffused. Ethics and data and analysis can be esoteric matters debated away from sunlight rather than energising the range of advocacy and claims for justice heard from the coal-face. Forms of employment and funding have reduced capacity for public engagement, networking and solidarity/mobilisation. This paper argues for a resetting of the professional paradigm by reasserting the notion of a vocation and the scope for ones work to make a difference. It highlights five elements about an occupational domain that might make professionalism more manifest and enduring; professions must reflect population diversity, should structure the inclusion of practice beyond an elite doyen, promote the scope for research and scholarship from all participants in the domain to inform the community, imagine new forms of employment and accessibility to their skills and services and heighten their voice in critical networks to ensure civic equity. It draws on

experience in Aotearoa New Zealand to highlight scope for practitioners to become conversant with indigeneity, civic agency and a progressive agenda.

Future of Accessible Hospitality in Finland

The aim of this study is to utilize accessibility and tourism expert informants from public, private and third sectors to gain insights to the future of accessible hospitality in Finland. More specifically, the aim is to discover what are the possibilities, challenges and critical actors needed in developing accessible hospitality. Accessible hospitality refers to a holistic approach, a broader understanding of accessibility; travelers' needs and wishes are taken into account regardless of travelers' background or personal characteristics, such as culture or subculture, social minority, sexual orientation, age or a special mental or physical need.

To gain expert information in order to provide future insights about accessible hospitality in Finland, we organize and conduct a Delphi study. The Delphi method is well used among future researchers. It has a few special characteristics: 1) it is based on anonymity, and thus the opinions of other members of the expert panel do not influence the opinions of a single member and 2) the method includes iterative rounds, which enable the members of the panel to reframe their opinion. The data for the research is gathered during autumn 2017 with two rounds of virtual expert panel. Data will be analyzed and results compiled during spring 2018. The paper will contribute to the discussions of inclusion in tourism by providing a viewpoint of futures studies.

Drawing the Unspeakable: Critical Reflections on the Ethics and Emotions of Conducting Arts-Based Research on Domestic Violence from a Feminist Perspective

This paper provides a critical discussion of the ethical issues arising from a recent project utilising arts based research in a women's refuge. Through a series of art workshops, the study explored the liminal identities of women living in a refuge through their relationship to objects (loved, lost, missed and hated objects). The project culminated in an art exhibition, titled 'Displaced'. Analysing reflexive logs written by the research team and interviews with research participants, we discuss experiences from the fieldwork in relation to feminist literature on research methods. We focus on the manifestation of emotion work during research on domestic violence, the nature of friendship with participants, the research as a 'gift' from participants to the researchers (Oakley, 2016), and power and vulnerability in the research process and the exhibition.

Intensive Grandparenting? Exploring the Changing Nature of Grandparenting in the UK

Although many grandparents provide regular care for their grandchildren, relatively little academic attention has been paid to the nature of contemporary grandparenting. Indeed, little is known regarding the practices currently employed by grandparents or the way in which grandparenting has changed over time. This paper explores whether the changing nature of parenting (particularly the intensification of parenting and the notion of children at risk) has influenced grandparents' narratives and practices. It does so by investigating the practices of grandparents in the UK who look after their grandchildren at least weekly. Employing one-to-one, photo-elicitation interviews, this study aims to shed light on whether the intensification of parenting has influenced the grandparenting role. The paper also explores emerging findings relating to the extent to which intensification of the grandparenting role has led to changes in grandparent-grandchild relations. In doing so, the paper contributes an increased understanding of the role and practices of contemporary grandparents in family life by engaging with and extending interdisciplinary academic debates on childhood, grandparenting, intensive parenting, doing and displaying families, and surveillance in family life.

RC02-66.4HARPER, ANTONY (TONY)* (*Benedictine University*)*Punctuated Equilibrium As a Mode of Episodic Change Characterizes the Macropattern of WORLD System Urbanization*

In 1972 Eldridge and Gould proposed a model of episodic change characterizing the process of speciation. Since that initial publication, significant evidence has accumulated in support of their proposal. It is the position of this paper that a similar pattern, although with very different underlying mechanisms, exists for the process of world system urbanization, and it will be shown that periods of rapid change in the rates of world-system urbanization punctuate periods of stasis. Further, it will be inferred that these periods of punctuation are the result of tipping points being exceeded during the previous periods of stasis. A preliminary math model of this process is presented which shows that the interaction of world system population, carrying capacity, and level of technology are capable of producing such punctuated patterns. These results suggest that this macropattern of urbanization in which stasis alternates with punctuation provide both a context in which to consider other world system processes and reciprocally can be a consequence of those processes. Chief among chief among these are Kondratieff cycles, cycles that have particular pertinence over the last several centuries. These cycles may act as potential ratchets in which the world-system is pushed toward some threshold, i.e. the aforementioned tipping points, that, when crossed, will result in a rapid improvement in the access to energy resources. This improved access to energy resources will among other things result in increased world-system urbanization.

RC28-510.3HARRIS, KEVAN* (*University of California-Los Angeles*)*Did the 1979 Iranian Revolution Matter? Social Mobility in Iran across Three Generations*

Do social revolutions alter social mobility? It is often assumed so, but our selection of historical cases is small to begin with. Drawing from the 2016 Iran Social Survey, a large, nationally representative survey (N=5005) conducted over phone from Tehran in November/December 2016, this paper adds another case to the literature on intergenerational social mobility in developing country contexts as well as a post-revolutionary context. For the case of the 1979 Iranian revolution, anecdotal accounts often claim that poorer families experienced a form of upward mobility via affirmative action in the years after the Iran-Iraq war (1980-88) through special access to education and employment quotas. Yet this claim has never been balanced against more common forms of transmission of status through family ties such as wealth or cultural capital. How did war-linked upward mobility fare against less politicized forms of status and class preservation in the Islamic Republic of Iran?

The Iran Social Survey included questions about war participation in combat and non-combat roles for respondents, spouses, or fathers. As a result, Iran Social Survey data allows us to estimate the social demographics of war veterans, including family size, educational levels of parents, and occupational and educational status of male and female children. To preview the findings: processes of war-linked upward mobility did exist for a subset of families in the survey, controlling for other factors. Yet the degree of mobility is modest compared to two other processes of status transmission across three generations: grandparents' land ownership and parents' class status. In sum, as with many revolutions and wars, mass mobilization left a legacy of "social leveling" in Iranian society but the effects varied alongside other powerful forms of social stratification and inequality.

RC09-198.4HARRIS, KEVAN* (*UCLA*)*Who Owns Iran? Trajectories of Ownership and Managerial Power in Public and Parastatal Sectors of the Islamic Republic*

As sociologists argue, the privatization of state-owned enterprises in developing countries has been a key arena of corruption and political exchange. Economists usually predict a benign outcome before the fact, but studies of Eastern Europe by Ivan Szelenyi and David Stark show how bureaucratic power in state administrations converts into economic power during economic transition. Given recent shifts in the region, Middle Eastern countries present a new site for testing and developing theories of corruption and the transformation of social status during rapid privatization. In Iran's case, the government agreed in 2015 to limit domestic enrichment of nuclear material in exchange for the elimination of international strictures on investment and financial flows into the country. With investors now able to return to the country, Iran's administration under President Hassan Rouhani undertook a transparency campaign to make financial information available on major domestic companies. Building from recent research on Egypt, Turkey, Lebanon, and Pakistan, this paper utilizes newly available government and corporate sources by drawing from a novel database

of financial and sociological information on Iran's top 250 companies across 22 sectors.

I ask two questions in the paper. First, how has the ownership structure of Iran's largest 250 firms changed over the past five years (2012-16), including acquisitions of shares in public companies by domestic pension funds, military and religious foundations, private domestic actors, and foreign direct investment from Europe and Asia? Second, what are the sociological backgrounds of Iran's corporate managerial class, and how does variation in managers' backgrounds differ across economic sectors? Overall, the paper assesses patterns as ownership and managerial control moves from public hands into more opaque, semi-state and grey market zones in order to compare with previous experiences of public sector liberalization in the Middle East, Latin America, East Asia, and Eastern Europe.

RC05-111.1HARRIS, SCARLET* (*University of Glasgow*)*Islamophobia, Racism and Anti-Racist Resistance in Two British Cities*

This paper will reflect on findings from my doctoral research, which considers organised responses to Islamophobia in two British cities: Manchester, in the North West of England, and Glasgow, Scotland's largest city. Specifically, the research explores how those engaging with Islamophobia as a social problem understand its relationship to racism, and how such understandings impact on strategies for challenging Islamophobia. The paper draws primarily on data from qualitative interviews with anti-racist activists, as well as individuals working in various community organisations, in both cities. Interview data is supplemented by reflections from a number of participant observations.

Crucially, the research attempts to situate current resistance to Islamophobia historically, exploring whether participants draw on local histories of anti-racist resistance to inform their current understandings and practices, and whether and how notions of 'Scottishness' and 'Britishness' circumscribe this. In doing so, the research connects discussions of Islamophobia and anti-racist organising. Furthermore, it extends them beyond England and into Scotland, where research on both Islamophobia and anti-racist resistance has been theoretically narrow and generally much more limited.

The essential aim of the paper is therefore to reflect on the ways in which understandings of Islamophobia and its relationship to racisms (past and present) shape contemporary challenges to it. The hope is that a critical and historically grounded account of this – particularly in the context of Scotland – might open up new resources for effective resistance and solidarity today.

RC52-870.4HARRIS, GITTE SOMMER* (*Aarhus University, Department of Political Science*)LARSEN, LARS THORUP (*Aarhus University*)*Knowledge, Status or Trust? Sources of Professional Authority in Denmark and the U.S.*

Authority is generally understood as legitimated power in the Weberian tradition, i.e. as something which is not entirely free from power, but at the same time is not backed by brute force. The key to understand authority in general, and professional authority in particular, is thus to assess these sources of legitimacy. Following the literature on professionalism, an obvious expectation will be that professional authority is based on what Paul Starr has called legitimate complexity, i.e. the implicit understanding that specialized expertise is required to understand and give advice on specific problems, and that a given professional group possess this type of expertise. Additionally, some scholars point towards social status and closure as well as trust in a profession's altruism and ethics as alternative bases. Typically, the literature on professions focuses on the role of expertise, closure and ethics in the establishment of professional groups and jurisdictions, which thereby ignores the question of how citizens actually evaluate professional advice and decide to accept or contest it. However, since authority is a relational phenomenon, i.e. established in the relationship between an advice given and the extent to which this advice is followed, research on professional authority must focus on exactly such evaluations. In this paper, we therefore use survey data and survey experiments conducted in representative samples from Denmark (N=1720) and the U.S. (N=1728). These surveys focus on how respondents in general evaluate different professional groups, as well as how they respond to concrete advice in a hypothetical vignette experiment. Further, the data allows for testing the impact of different factors, applying a range of individual level controls, including gender, social class, political values, authoritarian values, trust in science and previous interaction experience with professionals. Further, we use interview data to explore in-depth the ways in which such evaluations are constructed.

RC22-419.2HARTH, JONATHAN* (*Universität Witten/Herdecke*)OFNER, ULRIKE (*Witten/Herdecke University*)*Secular Buddhism in the Making. an Empirical Approach to the Challenges of Establishing a Secular Buddhist Group*

Currently, secular Buddhism is a worldwide trend. Both the representatives and the followers of secular Buddhism hope for a more natural, personalized and modern access to the Buddhist teachings (McMahan, 2008; 2012). At the same time, it implies a more or less implicit renouncement from traditional Buddhist schools. This is mainly due to the fact that traditional schools are regarded as (too) hierarchically organized and based on obsolete religious principles. Secular Buddhists, on the other hand, view everyone as equal and like to make decisions based on democratic ideals. In the end, the pragmatic approach of secular Buddhism aims at trying to become a better "whatever-they-already-are" (Rasheta, 2016).

The reformation of traditional Buddhism is mainly associated with Stephen Batchelor (2015; 2017). To him it is crucial to identify the basic insights of Buddhism which are relevant to the contemporary world of modern practitioners. At the same time, Batchelor insists that this project should remain open and flexible, not be the basis for a new orthodoxy. Secular Buddhism should solely focus on the four noble truths and the eightfold path (Fronsdal, 2016).

This contribution focusses on an empirical approach to the challenges in the foundation of such a secular group. The empirical data is part of the research project »Buddhism in the West« (Vogd/Harth, 2015) and consists of interviews with members of a group that is associated with Stephen Batchelor. The following points are of particular interest:

- Which criteria are selected for the renouncement of traditional Buddhist approaches?
- How do the members find a (commonly shared) practice that does not require a dedicated (authoritarian) teacher's role? How do they keep their practice together?
- Which aspects of the Dharma are selected and which group dynamics lead to a consensus about that?

RC22-409.1HARTH, JONATHAN* (*Universität Witten/Herdecke*)*"Crazy Wisdom" and Its Risky Polyvalence. Empirical Insights into the Didactics of Tibetan Buddhism*

The didactics of "crazy wisdom" are regarded as a means of transforming epistemic attitudes. As a special teaching style, it aims on the dissociation of ontological concepts of the student and produces a close bond with the teacher (Sharapan & Härkönen, 2017). At the same time, the students are left in uncertainty about how they should understand the ambiguous, polyvalent meaning of it.

The prominent case of the Tibetan teacher Sogyal Rinpoche makes it clear that crazy wisdom may lead to great difficulties on the part of the adepts (Bell, 2002). By referring to "crazy wisdom", a spiritual teacher can make all sorts of apparently dissonant or ruthless statements if this helps his student on the way to enlightenment. At the same time these masters stand above all criticism, for who understands what is going on in an enlightened spirit? Following the self-description of the Buddhist organization Rigpa, Sogyal Rinpoche, the (recently retired) head of this school, represents such a personality.

The empirical data presented here, is part of the research project »Buddhism in the West« (Vogd/Harth 2015) and provide insights to the difficulties of the concept of "crazy wisdom" which in this case lead to the multiple abuse of the teacher's power (Sperry & Littlefair, 2017). Two cases from our empirical data clarify the polyvalence of "crazy wisdom":

1) an interview with a novice will be used to reconstruct how the student's contact with the teaching methods is reflectively observed and integrated in her practice. Here, it becomes clear that the "crazy" actions are characterized by a specific state of in-between. 2) the doubting of this didactics will be further clarified by an interview with Rigpa drop-outs. Here, "crazy wisdom" is interpreted as an abuse of power, a faulty deception, and even as (physical and psychological) violence.

RC17-325.2HARTOSCH, KATJA* (*Institute for Employment Research (IAB)*)GOTTWALD, MARKUS* (*IAB*)*Performance Management and the Ethics of Office in Public Service*

The implementation of New Public Management (NPM) instruments into public agencies was a key aspect of the welfare state reforms in Europe in the late 90s and early 2000s. Amongst them, management by objectives (MBO) has become a widespread strategy for the governance of employment agencies. In Germany, the so-called "Hartz reforms" (2003-05) aimed at more effective, efficient, and less bureaucratic employment services. To accomplish this goal, the German Federal

Employment Agency and its subsidiary bodies have systematically integrated MBO and accounting into leadership and labour processes. Since then, every local employment agency has to achieve specified key figures. Recently, however, the German Federal Audit Office questioned this managerial model. The auditors alluded to MBO's potential to undermine social rights by rewarding target gaming or "creaming" strategies. This, in turn, would favour the provision of employment services to people that are easy to place with a job while disregarding the more disadvantaged. By this impulse from the organizational environment the discursive field about MBO and accounting has become an arena for debates about the prioritizing of different values in administrative behaviour and in organizational life. Based on semi-structured interviews conducted with employees in German Employment Agencies, this paper scans the different ways of submission, adaption, and resistance to management practices. Ethical issues in the provision of employment services could arise in consequence of orders to increase key figures. Thus, the paper asks what "office holding" means under the conditions of performance management, what kind of ethical foundations are virulent in decision making in frontline delivery of social policies, and what ethical and social potential could lie in a revitalization of an "ethics of office".

RC33-599.2HARTUNG, ANDREAS* (*University of Tuebingen*)HILLMERT, STEFFEN (*University of Tuebingen*)*Neighbourhood Composition and Educational Aspirations: Heterogeneity, Scaling, and Heterogeneous Scaling of Spatial Effects.*

A central idea of social sciences is that individuals are embedded in influential social contexts. Many relevant contexts can be expected to have spatial reference as far as the interrelationships between individuals are also characterised by physical distance between them.

Contextual effects can be *heterogeneous* in terms of a "classical" interaction; different groups can be differently exposed to or affected by the mechanisms that mediate particular contextual impacts.

Spatial dimension adds an additional challenge in terms of the *scaling* of contextual effects; In particular, research on the modifiable areal unit problem (MAUP) has shown that the definition of the area where the explanatory factors are measured typically affects the results, even when the definitions are relatively similar.

In addition there might be the combination of both challenges: *heterogeneity of scaled effects*. It implicates that group specific contextual effects are not varying constantly over the whole geographical scale of measurement but groups show different scale shapes.

The aim of this paper is to address these challenges using the example of the impact of social composition of the close living environment on young people's educational aspirations. In previous research, neighbourhood conditions have frequently been considered as among the main explanatory factors for educational outcomes.

We make use of ego-centred areas of different radii to measure contextual indicators on different scales and vary effects of the living environment with respect to individual characteristics such as social and migration background. For this purpose we utilise individual data of German Socio-economic Panel combined with georeferenced small-area context information on population's academic composition. We will present our aggregation approach and provide technical tools developed by our research group (aggind.ado).

We can observe clear associations between the quality of the neighbourhood and academic ambitions; however, only on the close range for non-immigrants from non-academic family background.

RC16-316.3HARVEY, RACHEL* (*Columbia University*)*Linking Micro and Macro in a Global Financial Market: An Alignment of the New Economic Sociology and the Hierarchy Theory of Money*

The New Economic Sociology has made great advances in challenging the traditional understanding of markets as abstract mechanisms for the exchange of products among anonymous buyers and sellers. It has shown how markets are constituted by actors, networks, institutions, sociocultural dynamics, and sociotechnical processes. Much of this work has focused, however, on the microstructures of markets or how specific markets are structured, produced, and reproduced. How these micro-dynamics align with broader structures in concrete and specific ways has been harder to trace. To address this issue this paper proposes aligning the insights of the new economic sociology with the hierarchy theory of money to show how the broader connections and interdependencies of the global financial system can be impacted by the micro-dynamics of specific markets. A case study of the 20th century global gold market is used to illustrate how these theories work together and the theoretical insights produced by their coupling.

A Tale of Youth and Institutions: Second Modernity in China and Brazil

Even though Ulrich Beck's theory on the Risk Society was developed in German specific context, the methodological cosmopolitanism inaugurates a framework that has been used worldwide, especially to understand the development of the emerging countries. However, it is necessary to problematize the insertion of each country in the modernization and individualization process according to the specificities of each context (Yan, 2010).

According to Beck & Grande (2010) "all paths of modernization are confronted with the problem of what kind and quality of insurance can be provided to enable individuals, groups, and classes to come to terms with the risks, insecurities, uncertainties and threats produced by social transformation". From this perspective, they develop three models built based on the contrasting role played by institutions in each context: 'statist model', 'societal model' and 'neoliberal model'. The multiple possibilities of modernization that coexist nowadays inaugurate the opportunity for the developing world to establish dialogue. This research focuses on a comparative study between China and Brazil on the trust the Youth nurtures for their institutions in both countries.

The data analyzed is part of the first Sino-Brazilian survey in Social Sciences "Jovens Universitários em um Mundo em Transformação: uma pesquisa sino-brasileira" (2016) that researched about the perceptions and values of young university students in both countries. This research will contribute not only to shed light on important issues experienced by the Youth and values they share (Dwyer, 2016; Nakano, Sposito, Chen, 2016), but also contribute to the scholarship on reflexive modernization and individualization processes from a developing world perspective.

HASEBE, MIKA* (*Meiji Gakuin University*)

Japanese Ability of Indo-Chinese Refugees and Their Social Networks with the Japanese Society

Japan had experienced to accept Indo-Chinese refugees since 1978 upon Cabinet approval. Since then, 11,319 people from Vietnam, Laos and Cambodia had been admitted to resettle in Japan. Of that number, quite a few people decided to live in Japan with permanent resident visa. And their community now includes pensioners who have lived Japan for 40 years, as well as the second and the third generation.

One previous research shows that their ability of Japanese reading and writing, especially for Kanji is highly related to their employment status, either regular or irregular employment. However, longer period of stay in Japan does not necessarily lead to their good command of Japanese. Then what does make difference in Japanese ability?

In language acquisition, there are several factors will make a difference in its result, such as motivation or educational experience of the learners, or the method of the learners take. In this research, however, I assume that learners having social networks with the host society will make differences in Japanese acquisition. Thus the aim of this presentation is to examine the role of social network with the Japanese society on acquiring Japanese.

The presentation will be on the data which is extracted from an on-going oral history collecting from Indo-Chinese refugees living in Kanagawa prefecture. Oral histories are mainly collected from the first generation and the second generation. The focus will be on their narratives on their way of language learning as well as their relation to the host society.

The presentation will conclude that especially for the younger second generation, the positive and proper ties with the host society will have a good effect on their educational and Japanese language attainment.

HASEGAWA, KOICHI* (*Tohoku University*)

What Is the Responsibility of Our Generation on Nuclear Waste Disposal Site

Every country which operates nuclear power plants agonizes over the consensus building on the location of final disposal sites for high-level radioactive nuclear wastes. Especially in earthquake-prone Japan, are there suitable sites? Japanese government has been stressing that our generation has to find and decide the suitable site as soon as possible. Putting off the decision is not permitted. The government has said the early decision is our urgent responsibility. But, is it right? What is the real responsibility of our generation? The radioactive waste disposal issue is definitely not a simple problem requiring a technological solution, as assumed by the supporters of nuclear energy. Basing on news clippings, documents and participant observations, a long year case study in

Rokkasho village where nuclear fuel recycling sites are located and analyzing the political reality after Fukushima nuclear accident, this paper reply to this question. Japan's nuclear waste policy is facing the dead-end. The policy line of the nuclear fuel cycle, reprocessing and plutonium use, has become clearly untenable. The recycling of nuclear fuel to extract plutonium and uranium resources by reprocessing has been criticized due to safely concerns, high costs and nuclear proliferation risks. A radical shift in Japan's reprocessing policy, the determination to stop the reprocessing project to avoid increasing the surplus plutonium, is being demanded at this very moment. The early determination to go forward to denuclearization following Germany and Taiwan is the real responsibility of our generation and the way to the real sustainable future.

HASS, BAT SHEVA* (*Hebrew University of Jerusalem*)

The Moslimas: Pushing the Limits of Dutchness and Processing the Religious Experience of Muslim Women in the Netherlands: Amsterdam in the Early 21st Century

This work is a case study focused on the Netherlands and the lives of its Muslim women. The Netherlands has specific accuracies, affected by the historical memory of the country as one of tolerance regarding divisions between different religious groups and historical events related to society and immigration. Combined with negative ideas in the Western hemisphere regarding Islam historically contributed to the development of a dichotomy between Dutch identity and Islam. This dichotomy renders the two identities irreconcilable, and comprises part of those born and raised Muslim in the Netherlands as well as ethnically Dutch converts to Islam. The emergence of Muslim communities in the Netherlands is the result of newly arrived groups of Muslim immigrants. The difficulty of reconciling Dutch and Muslim identities is due in part to the perception of Muslims as different, foreign, and as "the other". Through the stories of converted native Dutch this paper will emphasize the difficulty of reconciling two seemingly different identities embodied in one woman: A Dutch Muslim woman, ("Moslima"). This study focuses on the lives of Dutch Muslim women who chose to practice Islam which is often considered by the native Dutch population as a religion oppressive to women. How do these Dutch Muslim women build their identity in a way that it is both Dutch and Muslim? Do they mix Dutch parameters in their Muslim identity, while at the same time intersperse Islamic principles in their Dutch senses of self? This study argues that in the context of being Dutch and Muslim, these women express their agency, which is their ability to choose and act in social action. They push the limits of archetypal Dutch identity while simultaneously stretching the meaning of Islam to craft their own identity influenced by themes of immigration, belongingness, knowledge, gender, and more.

HASTINGS, AQUA* (*University of Newcastle*)

Conceptualisations of Healing in Traditional, Complementary and Alternative Medicine; An Outback Australian Study.

The value of Traditional Complementary and Alternative Medicine (TCAM) in providing accessible and culturally acceptable health care, especially in remote areas, has been recognised by the World Health Organisation. Worldwide, attitudes and beliefs govern people's access to TCAM more than affordability or validity. Nevertheless, little is known about what this means in specific settings. This study focuses on an Outback Australian town characterised by health inequalities and a diversity of sociocultural groups. A constructionist research approach and feminist theoretical framework have been used to understand the healing experiences of 30 TCAM providers. These in-depth interviews were analysed thematically. Theories of biomedical dominance have been applied to explain why some practices and experiences of healing are recognised and others overlooked in health care systems. Findings show that experiences of healing are contingent on the ideological, personal, social, cultural, political, geographical and cosmological factors that permeate daily life in the remote setting. These experiences lead to conceptualisations of healing that fall far outside of conventional notions found in public health models, and may explain the high prevalence of TCAM use in remote areas which are situated far from regulatory health care structures. Because the holistic premise of TCAM extends beyond the 'absence of disease', there is possibility that TCAM may provide novel paradigms and solutions that will broaden biomedical outlooks and offer culturally acceptable solutions to improve public health. This study aims to fill a gap in sociological investigation by enhancing understanding of the ways in which healing is conceptualised in a remote context. Use of feminist theories has added a multidimensional conceptual framework that enables recognition of marginalised experiences, thereby extending the parameters of academic concepts of health care and allowing new insights to emerge.

TG06-991.2HASTINGS, COLIN* (*York University*)*An IE Study of the Social Organization of Journalists' Work Practices*

I am a doctoral candidate in the Department of Sociology at York University in Toronto. My work focuses on the social implications of HIV criminalization in Canada. Under current Canadian Criminal Law, people living with HIV have a legal obligation to disclose their HIV-positive status before having sex that poses a "realistic possibility" of HIV transmission. Those who do not disclose their HIV-positive status can face criminal charges, most often for aggravated sexual assault, which carries a maximum punishment of life imprisonment.

For those invested in reducing HIV stigma and problematizing HIV criminalization it is of great concern that people often become familiar with and come to know about HIV criminalization by reading news coverage of criminal cases. My work adds to a trajectory of research that shows how news reports typically strip the complexity from HIV non-disclosure cases and regularly circulate stigmatizing representations of people living with HIV, especially people from African, Caribbean, and Black communities who have immigrated to Canada.

My dissertation project is a study of the social organization of mainstream news discourse of HIV criminalization in Canada. My ethnographic research tries to broaden understandings of how HIV criminalization is socially organized by situating journalists' work practices as part of the ruling relations that produce and sustain HIV criminalization in Canada. This means exploring how the work activities of journalists who produce news reports about HIV criminalization hook into the work of people in other settings (such as criminal law and public health) whose activities produce and reproduce the criminal-legal governance of HIV non-disclosure. By investigating the work activities that journalists actually do to process and coordinate texts from diverse genres, arenas, and actors into news reports my inquiry aims to enhance understandings of how HIV criminalization in Canada works, how it's put together.

RC40-703.3HATANAKA, MAKI* (*Sam Houston State University*)*Citizen-Consumers in Sustainability Transitions: A Case Study of Seikatsu Club Consumer Cooperative*

What roles can consumers play in fostering sustainability transitions? Much of current sustainability governance is characterized by instrumental and technical practices and thus, there is little room for ordinary citizens (e.g., producers and consumers) to meaningfully participate. As a result, the roles of consumers are often limited to the relatively passive role of "voting with their dollars" in the marketplace. This paper challenges the passive role of consumers in much of sustainability governance through a case study of the Seikatsu Club Consumer Cooperative (SCCC) in Japan. SCCC utilizes a citizen-based governance mechanism in which its members actively participate in building a sustainable agrifood system. A core belief of SCCC's governance system is "reciprocal responsibility." This is when producers and consumers both take responsibility for making changes in further sustainability. From a consumer perspective, this entails actively participating in all aspects of governance and making commitments to support farmers while they transition their practices. While the findings of this paper are limited to a single case study, they do indicate that robust forms of citizen consumerism are possible.

RC24-457.1HATAYAMA, YOSUKE* (*Waseda University*)*Credibility and Accessibility of Labelling Schemes: The Case of Global Coffee Supply Chains*

Labelling schemes, such as Fairtrade or Rainforest Alliance, already are indispensable to making global coffee supply chains sustainable. These private initiatives internalize negative externalities into the market and allow economic actor to protect natural and social environments not as a normatively regulated action but as a pursuit of added values or a risk management. From a sociological perspective, this is a shift from Parsons' "normative system" to Luhmann's "self-reference system," whether control of economic system depend not on moral commitment but on rationality of economic system itself. Because these market-based schemes included numerous stakeholders with diverse interests and values, they go beyond the limits of the social movements or governmental regulations.

However, global coffee supply chains face new difficulties, especially regarding credibility and accessibility. The Fairtrade Label Organization (FLO) is a typical case. Some coffee retailers and consumers believed that the FLO certification process was not transparent enough, so FLO needed to enhance its credibility by implementing ISO 65. However, the ISO standards were too high for many poor coffee farmers to maintain. In other words, added values like "eco" and "ethical" caused farmers additional costs. FLO's strategy for enhancing credibility, as a result, diminished the farmers' accessibility to fair trade.

In this presentation, I will consider such cases not as a problem of moral commitment but as a problem of rationality of economic system. Then, credibility and accessibility will be regarded as the new externalities, and governance will be to create a platform for promoting internalization it into the market.

RC18-337.4HATHAZY, PAUL* (*CONICET*)*Democratic Political Transition and Re-Securitization: A Comparative Analysis of Argentina and Chile*

In this presentation I comparatively analyze the process of re-securitization from National Security to Citizen security in post-authoritarian Argentina and Chile. Debunking simplifying narratives that assume a displacement of "national security" by "citizen security" rhetoric's, problems, policies and agencies in the national political arenas after the transition to democracy, here I show that the process is better described as complex combination of symbolic subordination of certain problems and a multiplicity of reconversion strategies of different agents in the new political arena, and in particular in the new space of relations structure around new security threat. I trace the evolution of the main categories from "national" to "citizen" security and their differential combinations in state policies and programs, as well as the reconversion strategies of main police forces in each case. I draw on documentary and interview data, analyzing the first decade after transition to democracy in each case.

RC24-450.1HAUFE, NADINE* (*Vienna University of Technology*)*Understanding Consumers Behaviour – a Further Step Towards Greener and Sustainable Consumption*

Every day millions of consumer decisions are made which have a worldwide impact. Despite the expansion of green consumption in western countries the negative impact of private consumption and purchasing behaviour of consumers on global working conditions, the consumption of resources and the supply of goods is great and continues to increase.

Individual consumption and the purchase of green products are influenced by many factors and show big variety between individuals, even within the same age, income and work status in the spatial scope. Understanding these differences is important for developing new green products, programs and policy concepts to promote a socially responsible and sustainable consumption.

Sociology assumes that it is possible to describe and explain behavioural differences with features of social inequality. Research into social stratification in modern societies has shown that the complexity of social activities cannot be explained by socio demographic and socio-economic variables alone. Attitudinal variables resp. lifestyle- and milieu-based approaches have thus finally been introduced in order to explain and understand individual behaviour and consumption more in depth, and to segment the population into meaningful (target) groups (e.g. market research). Although none of the approaches can claim absolute superiority, attitudinal based approaches show advantages in providing a step further towards greener and sustainable consumption.

This contribution explains theoretically why a differentiated view of consumers is important and gives an overview of various segmentation approaches. A case study in Vienna compares different approaches of segmentation and significance of attitudinal-based approaches for the explanation and understanding of green consumption in the field of residential energy consumption and mobility behaviour.

RC40-704.1HAUSLIK, DARCY* (*Washington State University*)*Prosumers, Activists, or Simply Hungry? A Qualitative Analysis of Dumpster Diving in Olympia, Washington*

It is widely known that consumption and production in late capitalism are increasingly problematic processes from the standpoints of ecological sustainability and social justice. Amidst seemingly intractable flaws in these interlocking systems, one promising trend is the rise of the 'prosumer'. Prosumption refers to a synthesis of production and consumption and is generating a model of capitalism marked by abundance rather than scarcity. However, few studies have examined prosumption among the food insecure. Research and public protest have drawn attention to two major shortcomings in the food system: food insecurity and food waste. While an apparent contradiction, modern consumer capitalism has produced a system wherein roughly 10% of the U.S. population is food insecure while more than 33% of all food produced annually is wasted. This paper looks at the complex rise of 'dumpster diver' as a prosumer identity poised to disrupt the wasteful tendencies of capitalism. Using interviews with 30 homeless or low-income dumpster divers supplemented with ethnographic field work, I analyze the strategies of discourse and boundary work infused with the practice of dumpster diving for food. Dumpster diving as a tool used by the

homeless and low-income population to alleviate immediate food insecurity has been infused with anti-capitalist rhetoric. I argue this radical rhetoric is ultimately used to preserve a sense of self-worth and belonging among an economically precarious group. Rather than ideology influencing discourse and, ultimately, practice, for some low-income groups the practice of dumpster diving precedes any strong ideological disposition regarding waste. The policy implications of understanding the alternative valuation needs that dumpster diving satisfies (i.e., self-sufficiency and self-worth), in addition to the supplemental calories provided, should influence our approach to alleviating both food waste and food insecurity while providing one of the simplest and most radical models of a prosumer.

Tin Runners: Intersections of Community, Politics and Sport Eight Years after "Kent State"

Kent State is a large historically regional university in northeast Ohio between Akron and Cleveland. Over the years and buoyed by 40,000 students on its main and multiple satellite campuses, Kent State had developed a national reach. Yet first option provided by a contemporary (2017) Google of "Kent State" is "Kent State shootings." The latter term references 4 May 1970 when four unarmed Kent State students were killed by Ohio National Guard troops during an on-campus Vietnam War protest. This juxtaposition serves to illustrate the historic staying power of explosive events which can, decades later, overwhelm contemporary accomplishment. The ongoing Kent State narrative came to life for me in 1978. Written using an autoethnographic approach, this paper explores, from the perspective of a student athlete visiting Kent eight years later for a varsity sports competition, interactions with teammates and local citizens struggling to come to terms with the protest legacy's violent conclusion. Flashpoint for this discussion was proposed construction of a new gymnasium on the site where several mortally wounded students fell. Consensus among the visiting athletes was that such development represented an affront to those people, but it was readily apparent that we (the visiting athletes) held different positions vis-à-vis those of most local citizens with whom we interacted. These conversations prompted me to take stock of my then athletic-focused life and raise multiple questions relevant to early 21st Century citizens. Among them: How and where should contemporary society remember contentious historic events, and people who participated in them? What role(s) could or should contemporary citizens assume in these debates? Are apolitical stances appropriate, or is the act of taking a stand a moral imperative? The paper also explores mediating variables of race and gender. Relevant music and photographic images from the 1970s enliven and support the textual narrative.

Metrics of Open Government in Mexican Fisheries

Metrics of Open Government in Mexican Fisheries

Given the failure of existing top-down policy solutions to reverse the deterioration of fisheries in Mexico, it is necessary to have measurements that assesses government-society relationship in the construction of public policies that promote a healthy marine environment, while ensuring the social welfare of fishers. This is part of a move to implement an open government perspective to fisheries management based on transparency and public participation.

This paper presents the use of metrics tools on Open Government in Mexican Fisheries. A first tool is the Transparency Index of Fisheries Policy, which monitors the progress on access to information on fisheries policy. It contains four indicators that assess the compliance with legal requirements on transparency, access information as service to users, quality and usefulness of the information for policy accountability, and adoption of best practices on open data on fisheries policy.

The second tool is the Index of Citizen Participation in Fisheries and Aquaculture. This index represents an x-ray of the state of citizen participation within the formal mechanisms of participation in Mexican public policy: the Fisheries and Aquaculture Councils. It is composed of variables that analyze the norms and the operation of the Councils based on good governance criteria: inclusion of actors, impact on the decision-making process, autonomy of the participation spaces and transparency and accountability.

The two tools were implemented together, as part of a strategy to promote transparency and citizen participation in the fisheries sector by civic organizations. As such, they test the premise that the act of measuring with specific governance metrics enhances civic society advocacy capabilities directed to influence governmental agencies in implementing a more inclusive and transparent public policies in natural resource management.

Bear Markets As Disasters: Re-Evaluating How People Actually Behave As Retirement Savers

Saving for retirement is a financial priority for many workers, a pursuit that ever more relies on ordinary individuals to make their own investment decisions and bear the brunt of market risk. The institutional shift away from employer-sponsored pensions to individual retirement accounts has made shareholders out of many who would not ordinarily invest in the stock market. Unlike designated brokerage accounts, retirement accounts represent an aspirational life phase after work has ceased and thus become loaded with emotional and symbolic value. Do market shocks therefore cause retirement savers to behave in unexpected ways? This study tests the effect of severe bear markets on aggregate 401(k) portfolio risk using interrupted time series analysis. I find that bear market events cause retirement savers to alter their 401(k) portfolios to more conservative allocations, which persist over prolonged periods— a finding that runs counter to varying predictions put forth by both economists and behavioral economists, for example rational action or loss aversion. Rather, this situates the risk response of retirement savers within the literatures on natural and manmade disasters. Following a disaster, norms of lasting conservatism serve to buttress society from future shocks. The unfortunate irony is that retirement savers, who often have long investment time horizons, actually do themselves a great disservice by buttressing— with greater risk comes greater expected return, and underinvestment in stocks to limit losses also curbs potential gains. The consequence is that severe bear markets can lead to an impending social problem years on: retirement unpreparedness and downward social mobility in old age due to inadequate savings. The practical rule of conservation that works well for many disaster scenarios, here creates an unfortunate discrepancy between the objective chances of retirement security and the subjective hopes of 401(k) savers trying to do what they think is right.

HAYES, ADAM* (*University of Wisconsin-Madison*)

The Active Construction of Passive Investors: Toward Robo Economicus

It is well-documented that the past few decades have marked an institutional shift in much of the capitalist world from a corporate doctrine of "retain and reinvest" to "downsize and divest." The reason has been largely attributed to rise of the shareholder in exercising power over a market for corporate control. Managers deemed incompetent are replaced, with the measure of fitness ever increasing short-term profits, manifest as increasing share price. This power has risen from so-called institutional investors, such as mutual funds and pensions, who seek to maximize return for their beneficiaries. The upshot has been a set of perverse incentives for corporate managers along with negative externalities that ripple through society. More recently, however, an abundance of empirical work in finance and economics has cast serious doubt on whether investors can actively "beat the market," especially after subtracting costs and fees. The result has been a trend toward passive, "indexed" investing, whereby investors seek to replicate an index of stocks, rather than try to beat it. Once a niche strategy, index funds are now one of the largest segments of the market, accumulating hundreds of billions of dollars in assets for this purpose. Meant to replicate the broader market, these funds have also grown to become the largest shareholders of companies in these indices. For example, six of the top ten shareholders of Apple, the world's largest company, are now index funds. These funds cannot sell shares to exit an investment, but can use their power to vote in board members who embody a retain and reinvest ideology. By exercising this power, however, this new breed of institutional investor may inadvertently come to influence the very indices they were meant to passively track, in a sense changing the very nature of indexing - a sort of passive performativity.

HAYES, LAUREN* (*Arizona State University*)

RAJKO, JESSICA (*Arizona State University*)

Towards an Aesthetics of Touch

In this paper we explore an interdisciplinary approach towards an aesthetics of touch. Research into the role of the body has become increasingly prevalent in fields ranging from philosophy of mind to human-computer interaction. At the same time, haptic technology has becoming ubiquitous within personalized devices and wearables. Despite this, touch remains largely under-explored within contemporary aesthetics. We firstly outline what might be gained from artistic practices that acknowledge a multisensory model of perception. Secondly, we discuss the difficulties of arriving at a standardized taxonomy for touch-based aesthetics and why this endeavor may not be fruitful. Finally, we outline an approach based on first-person felt experiences, drawing on creative practice

research involving computational technology within the fields of somatics, dance, and music. We propose an approach that is contextual or site-responsive, and improvisational, acknowledging the complex and dynamic relationships at play between bodies in an environment, and one that celebrates the different ways in which agents make sense of the world through embodied experiences that are socioculturally situated.

Cosmopolitan Dispositions As Meaning-Making Narratives in Transnational Situations

This paper takes up cosmopolitan narratives as cultural codes that justify and give meaning to transnational experiences. It is intended as a critique and corrective of many empirical approaches that operationalize cosmopolitanism as a form of cultural capital. The paper is based on the experiences narrated by French European (France, Belgium, Switzerland) and Italian migrants who have relocated transnationally to Morocco, a French colonial protectorate between 1912 and 1956. These 'lifestyle migrants,' most relocating to build a new or better lifestyle in a different culture, recognize their relative privilege in postcolonial space, and develop practices and dispositions that attempt to mediate the cultural and economic differences so as to optimize their reception in the receiving community. Cosmopolitan openness, a specific type of moral disposition towards the receiving community, helps migrants narrate their transnationalism in terms that emphasize their acquisition of appropriate, cosmopolitan cultural dispositions, as opposed to others, who do it wrong. Yet, nearly all respondents use these codes, which are organized in binary ways and discipline the 'expat' community. Data is drawn from 22 qualitative interviews conducted in French (n=16) and Italian (n=6) with lifestyle migrants in Marrakesh and Essaouira, conducted in the winter of 2017. This fieldwork illustrates the importance that European lifestyle migrants place on openness to cultural difference and of avoiding ethnocentric comportment as ways of making sense of and justifying their transnational relocations. Yet, these narratives contrast with other dispositions and narratives that present important continuities with colonial emplacement, and that contradict stated cosmopolitan aims.

Offshoring Retirement: Lifestyle Migration, Expressive Individualism and the Future of Aging

This paper draws on interviews with North American transnational retirement or lifestyle migrants in Cuenca, Ecuador, who seek out a lower income community in which to pursue culturally specific forms of 'successful' and 'active' aging. These dominant cultural forms of aging require time and money in order to achieve, leading a growing number of financially vulnerable North American 'baby boomers' to pursue their later life course in low income countries—many in Latin America. The pursuit of these cultural ideals is increasingly dependent on the coloniality of contemporary global society, and the embedded inequalities between Global North and Global South. While leisure travel has been central to cultural notions of aging in the sociological literature, less attention has so far been paid to relocations to areas of cultural difference. Moving to 'a different culture' is, however, a crucial aspect of North Americans' sense of risk-taking and adventure in Ecuador, and is tightly tied up with notions of successful aging. The paper is also attentive to the gender differences in narratives of adventure and cultural integration. Both men and women seek new, more 'expansive' horizons in Ecuador as a way to 'stay young,' and avoid aging in North American societies that devalue aging bodies and the experience and expertise of older workers, especially women. While North American lifestyle migrants often report positive experiences related to their relocations, their uprootedness is evident both in the risks of isolation to which they are exposed, and in their wanderlust for ever more transnational destinations, often pre-populated by small settlements of lifestyle migrants. Moreover, their condition in Latin American communities like Cuenca are marked by relative economic privilege and the symbolic power of their racialized whiteness, which shapes how their aging bodies are received and read in transnational contexts.

The Cultural Politics of Port Cities: Insights from Bristol and Rotterdam

Rotterdam and Bristol are roughly similar sized (by population) port cities in Europe with ethnically diverse populations associated with successive migration flows. Rotterdam has been experiencing waves of protest in relation to whether

aspects of its cultural traditions depict racial stereotypes (e.g. Zwarte Piet/Black Peter), occurring within the context of more visible signs of migration and an ongoing reluctance to accept its historical role in the transatlantic slave-trade. Despite this, Rotterdam has incorporated the musical and cultural diversity of its population (including migrants from Cape Verde, Antilles, Surinam, Turkey and Morocco) and has developed its reputation as a cosmopolitan city signalling the importance of cultural openness and ethnically diverse forms of creativity. Bristol, is also subjected to its own internal critique, often spearheaded by musicians and artists, regarding the city's refusal to formally apologise for its role in the transatlantic slave trade. To this day, heritage sites, street names and key city buildings retain their nominal links to this history. In spite of this history, Bristol developed a reputation for being a city at ease with its ethnic diversity and for producing culturally syncretic music as an outcome of the exchange of musical and cultural traditions and styles between diverse musicians. Our paper will take a closer comparative look at the two musical cities and offer some further analytical insights about the past and future role that music has played in transforming the dominant narratives of these port cities.

From Community Studies to Hometown Studies: Imagining Chinese Society Via Research Method

In the 1930s, Chinese sociologists imported community studies with functionalism for observing Chinese society systematically and theoretically. Native scholars adapted this method from Radcliffe-Brown, Robert Park, Bronislaw Malinowski and some other Western scholars. Some published works earned Chinese sociology an international reputation. As described by Maurice Freedman, before the World War II, beyond North America and Western Europe, 'China was the seat of the most flourishing sociology in the world'.

Nevertheless, some questions arise in the Chinese context when practicing this method. Even though community studies has been treated as a powerful way to draw a holistic picture of Chinese social system, there was no Chinese translation of 'community' at that time. And thus, looking for a Chinese equivalent of community became the first step to complete. Diverse significances and interpretations have been injected into the Chinese understanding of community and community studies, and 'village' finally was regarded as the most suitable research object for Chinese community studies. This approach is different from the traditions of urban sociology and social anthropology in community studies. More importantly, most scholars conducted community studies by telling stories of their hometowns; some even were lack of empirical fieldwork, and were in the form of novel.

This study would unfold the trajectory of conducting community studies in the Chinese context by arguing that method is not a transparent research device can be easily duplicated to anywhere. The adaptations of community studies in China not only reveals how native scholars imagining Chinese society via research method, but also implies the politics of research method in the field.

Losing Violence in Translation: Theorising Gender Violence Regimes.

This paper critically interrogates the concept of gender violence regime, and how welfare state regimes translate, or not, into gender violence regimes. We begin with clarification of concepts and meanings of welfare/gender system/order/regime, explaining why we focus on 'regime'. Despite the significance of violence, mainstream social sciences and social theory have often either avoided it or underestimated its importance (special issues *Current Sociology*, 61(2)2013; 64(4)2016 address such changes in theorising). Welfare state regime research (Esping-Andersen), including gender regimes, has generated different frames, reflecting debate on naming and framing the problem. They have often concluded that some welfare regimes are more women-friendly than others. However, empirical bases for these conclusions often exclude violence and anti-violence responses; welfare state regime research has thereby overlooked one of the most substantial, deep-rooted causes and consequences of gendered inequalities.

The paper utilises existing survey data to examine how changing welfare state regime typologies, developed by Esping-Andersen and taken further by feminist research, translate or not, into a gender violence typology: when violence is introduced, are previous results still valid? We draw on collective work within major research programmes (EUIFP6 "Coordination Action on Human Rights Violations" CAHRV 2004-2007; EUIFP6 "Quality in Gender+ Equality Policy in Europe" QUING 2006-2011; Swedish Research Council "Feminist Theorizings of Intersectionality, Transversal Dialogues and New Synergies" 2012-2017), and interpret their findings to theoretically address and develop typologies of welfare state regime and gender violence regime.

The paper takes up challenges in taking violence, especially violence against women, seriously by addressing changes in: 1) welfare state structuring; 2) the

place of violence in contemporary state regulation, gender relations, and their intersection; and 3) configurations of violence and responses thereto, including criminal justice system responses to violence against women. In sum, the paper critically considers the contribution of the concept of gender violence regime.

Revenge Pornography: Non-Consensual, Online, Contested

Facilitated by developments in technologies, non-consensual posting of sexually explicit visuals and texts of someone else for revenge, entertainment or political motives – so-called revenge pornography – has become a global phenomenon. Revenge porn is an urgent problem posted online very largely by men (c.90%), deploying discourses of masculinities, and directed against current partners, (ex-) friends of both victims and perpetrators, and people known to the victim. People seeking revenge may also set out to deter others from being sexually interested in their current or ex-partner. Sexually suggestive or explicit images and videos need not be of someone known to the poster; strangers and internet hackers may sometimes target celebrity victims. Revenge pornography appears in variety of online and offline locations and formats, including specific revenge porn sites, pornographic websites that allow the uploading of amateur images and videos, along with mainstream platforms, such as Facebook and Tumblr. The impact on victims is profound regarding physical and psychological health and well-being with reports of some taking their own life. This paper draws partly on discursive analysis of more than 12,000 texts accompanying explicit images posted on the largest revenge porn specific website, 'MyEx.com' (*Revenge Pornography*, Routledge, 2018). We show the complex ways in which perpetrators invoke, and deploy, gender- and sexuality-based discourses to blame and hurt the victim. We go on to present multi-dimensional sociological analysis of the phenomenon, considering alternative theoretical framings, e.g. gendered violence/abuse; cyberbullying; pornographization of media; digital dehumanization and normalization of online hate speech; homosocial exchange; imagined audiences; men's access to "more information" about and sexual evaluation of women; micro-techno-masculinities. These approaches inform what might be done to curb revenge porn, including legislative/policy frameworks, technological responses, awareness-raising, victim/survivor support, perpetrator re-education, and social movement, especially feminist, activism that contest the phenomenon and aim to make it unthinkable.

Coming Out of the Shadows: How the French Government Regulates Citizenship for Migrant Women in Polygynous Unions

Cynthia Joseph (2013, 2014) made significant contributions to scholarship on how migrant women shape their identities to negotiate the social, cultural, and political boundaries of dominant national discourses and structures in their receiving countries. Her research uncovered the marked and unmarked work in which migrant women engage to acquire citizenship as an interplay of structure and agency (Lamont and Molnar 2002).

This paper builds on Joseph's scholarship to examine the processes of visible and invisible boundary work that shape the inclusion and exclusion of migrant women in France who live or have lived in a polygynous union of one man and more than one wife (Pachucki, Pendergrass, and Lamont 2007). Drawing on 40 in-depth interviews with migrant women and men, representatives of organizations, activists, social workers, and government officials, this paper examines the interplay of state policy, gender hierarchies, sexual regulation, and individual agency involved in the boundary work that shapes or blocks pathways to citizenship and national belonging for migrant women in a polygynous family structure. By identifying the social processes at play in regulating this outlawed patriarchal family form, this analysis uncovers how state governance can provide autonomy to some migrant women, while pushing others further into the shadows outside the legible structures of society.

Negotiating the Tuxedo Wedding: The Division of Wedding Labor for Men in Same-Sex and Straight Marriages

The wedding industrial complex has long marketed the consumption of weddings based on heteronormative gender roles, expecting men to do little more wedding labor than sporting a tuxedo. In contrast, women have been

characterized as "bridezillas" who control every aspect of the "bride's day" and are expected to do all the emotional kinship labor. Research on the division of wedding labor confirms that conservative gender ideologies push heterosexual women to see weddings as being for women, not couples, and brides as the natural organizers of weddings (Humble, Zvonkovic, and Walker 2008; Sniezek 2005). In contrast, women who participate in same-sex weddings are more likely to resist heteronormativity and traditional gender roles (Fetner and Heath 2016). To date, research has not considered how men negotiate the division of wedding labor and the emotional kinship work that is entailed in straight and same-sex weddings. How do the gender strategies in the wedding division of labor differ among heterosexual and non-heterosexual men?

To answer this question, we draw on in-depth interviews with 23 men who participated in same-sex weddings and 23 men who participated in straight weddings. We find that negotiating the tuxedo wedding is a complex process shaped by men's social location and gender ideologies. Confirming previous research on straight couples, we find that heterosexual men generally rely on the bride to do emotional kinship labor and organize the big day. For same-sex couples, we find that gender ideology connects to power dynamics within the relationship, meaning that wedding labor falls on the shoulders of men who perform marginalized masculinities. We analyze what these findings mean for understanding the relationship between gender, race, class, and heteronormativity.
