This paper aims to introduce an incorporated comparison method into Chinese stagnation studies. Comparative historical scholars of Chinese stagnation have faced methodological *culs de sac*, but, they still adhere exclusively to the comparison method. I argue that a practical application of the comparison method seems to be misleading because the unconditional acceptance of the comparison method has led to the tendency to overlook multi-dimensional experiences in Chinese stagnation. The article is divided into two distinct sections. First, by problematizing the comparison method, this article attempts to debunk long-held problems hitherto neglected in Chinese stagnation studies. I introduce three types of comparison methods that have been widely used in Chinese stagnation studies and then disclose the drawbacks of each comparison-oriented approach. Second, as an alternative, I provide the incorporated comparison method not only to avoid Westernized historical standards in Chinese stagnation studies but also to deal with the dynamics between external impacts and China's responses to Chinese stagnation. This approach keeps the strong points of comparison methods by transforming the problems with them into advantages.

Meat As a Waning Symbol of Superiority of Modern Masculinity?!

Nothing emphasizes superiority by eating like the consumption of meat. Because eating meat means first of all to kill and then to incorporate. Thus, meat as food becomes a symbol of power (Fiddes 1991). Superiority refers also to the nutritional characteristics of meat since proteins stand for strength and capability. This adds up to the symbolic superiority of meat-eaters, which is ascribed mainly to men in modernity. Indeed, this not undisputed cliché (Fischer 2015) corresponds with the nutritional behavior in everyday life.

However, the consumption of meat stagnates on a high level in Western industrial countries like Germany (or even slightly decreases). With that said, one can observe an increasing vegetable and vegan mode of nutrition – mostly women but also men. Interest organizations like the "Vegetarier Bund Deutschland" (German vegetarian association) as well as vegetarian and vegan food marketing address men by means of bodily fitness and capability.

This raises the **question**, if masculinity still needs to be symbolized in nutrition by meat. Are there rather other means for this purpose today? The paper bases on the **assumption** that meat has become too problematic in regard to the environment and health. It is also no longer a means for differentiation as a rather cheap mass product in Western countries. Capability as the core of male gender role attribution (represented as male habit) can be represented by nutritional means beyond meat. Nevertheless, one can observe counter-trends in the media as well, emphasizing a carnivore nutritional life-style. To answer the main question, the paper will discuss the actual symbolic means of meat as food for the reproduction of masculinity based on historic development and current nutrition trends. It becomes apparent, that meat is not primary about superiority, but rather about symbolizing capability as the core of male gender role attribution.

Le Manque De Respect Des Droits De L'homme Dans Les Prisons Au Brésil

Le système pénitentiaire brésilien est régi par la loi n° 7210 de 1984. Ainsi, cette loi organise plus de 1400 institutions dans le pays. C'est une loi moderne, même si elle a plus de 30 ans et démocratique. Cependant, elle n'est pas obéi. Pour vérifier la raison de sa non-efficacité, trois commissions parlementaires d'enquête sur le système pénitentiaire brésilien ont été créées par la Chambre des députés depuis leur parution (entre 1993, 2008 et 2015). En raison de la dimension continentale du pays, il est impossible d'analyser l'ensemble du système pénitentiaire brésilien, mais, en se concentrant sur un seul état, en visitant plus de 10 institutions, en profondeur, on peut tirer des conclusions sur la situation de l'accès à la justice, la nourriture et la communication dans ce système, les soins de santé, l'éducation, le droit de visite des prisonniers. Et, en conclusion, on affirmé, en raison de la

corruption établie dans l'État brésilien et du manque de volonté politique des pouvoirs exécutive, législative et judiciaire, le système est en faillite et les prisons ne respectent pas les droits de l'homme des prisonniers et des fonctionnaires. Le système est basé uniquement sur la négociation («prisonisation») entre prisonniers et les directions institutionnelles.

Health Rumours and Global-Local Knowledge: Science, Nonsense and Resistance

Too often, an interest in health rumours stalls at a focus on their falseness and how they hinder health promotion or intervention efforts (Kaler, 2009). However, rumours that circulate about bodies and health are more than misinformation, falsehoods, or inconveniences. Such rumours are often politically and sociologically significant and can perhaps carry "moral truth" (Finnström, 2008). In this talk, I will trace two sets of health rumours circulating in sub-Saharan Africa, one in post-colonial northern Uganda and one in Swaziland in the context of HIV prevention. The rumours in Uganda centre around food provided as humanitarian aid causing various illnesses and body problems (Finnström, 2008; Branch, 2011), while in Swaziland, the disposal of the foreskin post-circumcision was the focus of rumours, also including one about health. I consider these rumours as sites of resistance to international humanitarian aid and to global health programming respectively. These health rumours, I argue, constitute critiques of, and resistance to the politics and biopolitics of aid and global health. As such they can be understood as counter-epistemologies (Kaler, 2009). While rumours are often looked to providing a lens on differences or indeed ignorance in 'other' cultures, they are also useful as a mirror, reflecting back to the global north some of the inconsistencies and assumptions of our international interventions. In reading health rumours as resistance, it is relevant to consider aid and global health as potential extensions of colonialism, and how their role in arbitrating authoritative knowledge contributes to their governance power. Vincanne Adams (2010) discussion of "Arbitrating Science, Non-Science, and Nonsense Through Health" and Amy Kaler's (2009) discussion of rumours about fertility as counter-epistemology contribute to such a reading of health rumours in relation to humanitarian and global health efforts.

Institutional Ethnography Texts Organizing Maternity Care in Northern Uganda: From Global Goals to Local Practices and Back Again

Drawing on a study of the social organization of maternity care and birth in northern Uganda, this talk traces the activation of two 'local' texts, a letter and a form. I identify their role in coordinating activities translocally on a micro-scale - between a rural health centre and patients' rural homes - as well as on a global scale - between global health paradigms formalized in the Millennium Development Goals and rural women's everyday experiences of care. I trace how despite global health norms around human rights, gender equity, and health care accessibility, a coercive approach to health care that developed in a remote rural northern Uganda setting can be traced via texts to the Millennium Development Goals. Consequences of the coercive approach include violence, barriers to health care, and added 'work' for women accessing care. Beyond a narrative of unexpected outcomes of well-intentioned interventions that is repeated in development circles, I suggest that poor outcomes are in fact predictable. Poor outcomes result from, among others, "vertical" implementation that places health outcomes on different issues or among different population groups in competition with each other, universal and technical approaches that ignore local social and political contexts, and framings of maternal health problems as primarily rooted in culture or tradition. Both the improvised local texts and the highly formalized international texts play a role in ruling relations. In trying to face in two directions at once, towards global health goals and patients, local health care providers fail both in particular ways. I suggest ways in which local social relations could be made more visible to global health governance, resulting in better translations of intentions to outcomes.

RUELLAND, ISABELLE* (*UQAM*)

La Participation Dans Les Réseaux Publics De Santé Et De Services Sociaux Pour Quel Projet De Démocratisation?

Contre une vision strictement scientifique ou bureaucratique de la recherche et de l'organisation publique des services sociaux et de santé qui amène son lot de division du travail, et du pouvoir décisionnel, de plus en plus de chercheurs, de gestionnaires, de professionnels et de destinataires de services proposent une vision participative de l'organisation. La participation au sein d'espaces institués

par la recherche ou par l'organisation de services permet de partager des savoirs et des affects. Elle ouvre des espaces de communication pouvant mener à l'expérimentation d'autres rapports à autrui ainsi que vers la construction d'un projet de démocratisation plus large. Par elles, les individus ont la possibilité de vivre des expériences révélant les tensions et les limites inhérentes à la hiérarchie de l'organisation. Dans les réseaux publics de santé et de services sociaux, c'est peut-être l'impossibilité de confronter de telles limites qui conduit à une instrumentalisation de l'idée de participation au sein de la recherche et de l'organisation des services, la réduisant, du même coup, à l'idée de consensus en petits groupes. Une telle instrumentalisation contribue à occulter les tensions inhérentes aux inégalités sociales ainsi qu'aux différences de pouvoirs, d'intérêts et de points de vue entre les individus de l'organisation. Comment en sommes-nous arrivés là? Quel éclairage la sociologie clinique peut-elle offrir aux individus qui cherchent tant bien que mal à « faire participer »? Qu'est-ce que cette sociologie a à gagner ou à perdre avec le « virage participatif »? Par un survol historique de ladite sociologie clinique, je cherche à saisir si, et si oui comment, ce champ permet de problématiser la « participation » vers une distribution du pouvoir au sein de la recherche et de l'organisation des services.

Problematizing Social Inequality of Power within Self-Management Mental Health Services in Brazil

Increasing attention to individuals and groups, networks and systems, processes and evolutions suggests an epistemological shift that not only veils the social reality of inequalities within organizations, but also “deconstructs” the notion of organization itself. The transition from an understanding of the organization in terms of structure and functions to a more fluid conception of organizational practices and processes present new challenges in understanding the links between the organization and the social relations of power today. In order to overcome this impasse, our recent research on the networks of mental health services in the city of Campinas of the State of São Paulo in Brazil is based on a return to the concrete for a critical sociology of organizations. Integrating users of mental health services into organizational analysis opens a new path in the study of the social relations of power. As such, studies such as Guattari's work at the Borde clinic help to create a critical approach to the relationship between organization and the social relations of power. My research is inspired by this approach which seems to be the most likely to inspire the study of the socio-political dimension of organization. It is a question of shifting the sociological issue between the institution and the organization to the political issue between practices, individuals and political process of subjectivation (Rancière 1998). This critical and micro-sociological orientation is helpful in understanding, from an open perspective, how organizational practices act on social relations of power. The notion of “roda” (circle in Portuguese) used by individuals involved in our fieldwork was our guide to interpreting the meaning of organizational process within self-management mental health services in Campinas. This paper will problematize this epistemological choice focusing on roda as a *modus operandi* of a collective project to democratize the Campinas mental health network.

Changing Psychological Contracts of Academics: A South African Case Study

In recent years, the psychological contract in higher education has become more complex and challenging. In an attempt to understand the ways in which new policies shape the psychological contracts in the higher education context, I set out in a qualitative study to gather data on how new managerial practices influence academics. The psychological contract deals with implicit reciprocal promises and obligations; there has been what can be described as a dualistic approach in the literature over which parties (employees and/or managers) should be included under the analytical rubric of the psychological contract. Given the rapidly changing nature of work and management at South African universities, the case study provides an opportunity to explore the ways in which a new managerial context influences the psychological contract of academics at a Durban based institution of higher education. New managerialism refers to the establishment of a managerial system that overrides the autonomy and expertise of employees including highly skilled professionals such as academics. It is designed around managerial practices that increases performativity in an uncritical way, usually by deskilling employees through scientific management principles. Managers rather than employees become the core of the organisation. In the higher education context, new managerial principles have been imported from the private sector to increase performativity levels of academics. It has fundamentally reshaped the education sector including the reshaping of the professional identity of academics and their role in the psychological contract. Key findings are articulated in four themes: Adapting to shifts in the nature of the employment relationship, Self-monitoring through performance management

systems, Construction of students as clients (and academics as service providers) and the creation of Managerial Elites.

Oportunidades Que Brinda La Sociabilidad Virtual a Los Colectivos Vulnerables

Esta comunicación pone en relación las reflexiones de nuestro equipo de investigación sobre el concepto de sociabilidad virtual con las dificultades comunicativas de colectivos vulnerables.

Las Tecnología de la Información y la Comunicación han generalizado la capacidad de establecer relaciones ininterrumpidas con los demás a través de artefactos conectados a Internet. El nuevo escenario ha transformado relaciones sociales y comportamientos individuales. Los planteamientos clásicos sobre los procesos de socialización están siendo reelaborados. Y la vida diaria, personal y laboral, de muchas personas ha cambiado radicalmente. Las relaciones personales y sociales líquidas, las identidades flexibles, las dinámicas diversas de las comunidades virtuales y todas las transformaciones que caracterizan lo que hemos denominado sociabilidad virtual afecta a cada vez más millones de personas. Sin embargo, en esta comunicación, reflexionamos sobre la influencia de la sociabilidad virtual en personas y colectivos vulnerables y hasta qué punto los nuevos escenarios suponen problemas y oportunidades no siempre adecuadamente identificados y afrontados.

Movimientos Ciudadanos: MICRO Fragmentaciones y Nuevas Configuraciones

Se aborda el análisis de algunos fenómenos que surgen en el contexto del panorama sociopolítico y tecnológico contemporáneo, articulados al neoliberalismo y al capitalismo voraz; entre los que se encuentran la transformación y reconfiguración de los movimientos sociales, que han pasado de la acción colectiva en el ámbito material e ideológico, a constituirse en movimientos sumamente fragmentados y específicos que incluso no requieren de la presencia física de los participantes ni de su lealtad absoluta y que al mismo tiempo son espacios abiertos que trascienden las fronteras y cuya membresía es fluida y muchas veces la suma de individualidades.

El trabajo se cuestiona finalmente la repercusión de esta micro fragmentación de los movimientos sociales en la composición y configuración de las sociedades del futuro y en el combate a la desigualdad, a la injusticia, a la pobreza y a la acumulación voraz de los recursos en unas cuantas manos.

From Precariat to Permanent. How South African Labour Broker Workers Mobilised the Workplace and the Law.

Like elsewhere in the world, labour broker workers in South Africa face a challenging environment, the legislative framework effectively excludes or curtails their rights while at the same time the traditional union movement subjects such workers to hostile indifference. Across the world, there has been rising public resistance to the conditions of precarious work, leading some countries to attempt to control some of the practices associated with labour broking. In 2015 the Labour Relations Act was amended to curtail the use of contract labour to work of a 'genuinely temporary nature' and ensure that labour broker workers become permanent after a period of 3 months. These changes in the legislation were largely ignored by the traditional labour movement and in their absence community advice offices have begun to fill the gap. This paper will document the work of the Casual Workers Advice Office (CWAO) and the Simunye Workers Forum based in Germiston, Gauteng. Since the amendments came into effect in 2015, CWAO has assisted over 8,000 workers to gain their new rights through the new legislation. Furthermore, it has also assisted workers to organise in their workplaces into forums or workplace councils under the banner which led to the formation of the Simunye Workers Forum. While other scholars of precarious labour have analysed non-unionised organising as a form of 'insurgent unionism' due to the way in which organising falls outside of the legislated labour relations framework, this paper takes a different point of departure. This paper analyses how the amendments to the LRA opened a space for contract workers to organise both within and outwith the labour relations framework. It analyses how labour broker workers have mobilised the law, setting new conditions under which precarious workers can continue to fight for their rights.

"Speaking like a Native"? Biographical Perspective on Language Performance of Migrant Students between Othering, Mimicry and Desire for Passing

By drawing on my research on educational biographies of migrant students enrolled in higher education in Germany, I discuss in my paper how the notion of "speaking like a native" is imbued with different societal, normative, hegemonic expectations that are encountered by migrant students not only with cognitive response of language performance, but with emotional ambivalences and negotiations of belonging. I focus on the clarification of these societal expectations and individual emotional responses by analyzing biographical, narrative interview sequences that indicate how the process of language performance consists of experiences of othering as well as of a desire of belonging to the hegemonic speaking culture. I use here the analytical concepts of mimicry and passing as concepts that help explaining the desire for a transformed language subjectivity as a contested performance in multilingual migration contexts.

Looking at Childhood Protection System through the Lens of Children's Life Trajectories

Based on life course perspective and empirical study "Social Trajectories of Childhood in contemporary Russia" we analyzed life events, turning points, and the role of childhood protection stakeholders (social care, NGOs, education, police and guardianship authorities) in children's lives. Children were recruited from families of two types: 1) officially registered as families with a risk of a threat to the life and health of the children; 2) families in a difficult life situation without a direct threat to the child. To collect data about children's life trajectories we used mixed methods, including qualitative interviews with children, their parents and social workers, drawing of timelines, eco-maps, quantitative instruments for evaluation of children's well-being and other. Data were collected on 100 children's life trajectories during March-August 2017. The study revealed a number of methodological limitations of application of life course perspective in research with children's participation. Some children were not prepared to discuss the life as a linear structure. Children with mild mental retardation and those who were absent from schools for years had much difficulties to work with concepts of "events", "turning points" etc. The majority of children had difficulties in recalling the timing of events. Despite the mentioned limitations, the study has collected the rich material showing significant differences in interpretation of life trajectories of children from all three perspectives (a child, a parent and a social care professional). Children's difficulties persisted across the life course through the progressive accumulation of behavioral problems, labeling, and unsolved family problems. Timely support from childhood protection system, NGOs and church played a positive role helping to neutralize the negative events in children's lives. This research was supported by the Russian Science Foundation (project № 16-18-10372).

The Role of Information Biases for Higher Education Enrollments Evidence from a Randomized Field Experiment.

Nowadays in Germany many school leavers from non-academic families obtain a university entrance qualification, yet first-generation students remain underrepresented at German universities. Instead, many opt for vocational education and training. Information biases are considered an important source of social inequality in post-secondary-education transitions, even among college-eligible school leavers. We analyze if providing additional (and correct) information on the costs of and returns to higher education, as well as funding opportunities increases the likelihood of college-eligible students from non-academic background to apply to and enroll in college. We use an experimental panel design with a randomly assigned 25-minute information treatment at Berlin (academic-track) schools. Our analyses confirm that biased information about the costs of and returns to HE contributes to social inequality in post-secondary transitions. First, biased information diverts college-eligible students from non-academic background from developing college-intentions. But while our information treatment leads to a short-term (3 months after treatment) "intention upgrading", it is not sufficient to change the application behavior of those students without initial college-intentions. Possibly the treatment took place too late in the school career (at the end of the penultimate year) when academic performance, learning motivation, and parental support cannot be quickly (and completely) revised. Second, biased information may divert also those students from non-academic background who had initial college-intentions from pursuing their plans and apply for higher education. The analyses show that our information treatment substantially increases the likelihood to apply and enroll to college directly after high school. Students with initial college-intentions from the control group (without treatment), however, partially catch up one year later. Besides differences between students with and without initial college-intentions, further analyses also reveal differences in the information treatment effect for men and women and for students with different parental educational aspirations and migration background.

Mapping Networks of Denial and the Spread of Climate Skepticism in Europe – Evidence From Germany

Climate Skepticism and denial have been regarded as a US American phenomenon. Perhaps the one situation symbolizing the utter denial of climate change came in February 2015. Oklahoma Senator and author of the bestseller *The Greatest Hoax: How the Global Warming Conspiracy Threatens Your Future* Jim Inhofe tossed a snowball to the Senates Floor to 'prove' that climate change is a hoax. Senator Inhofe's dramatic gesture not only got a lot of media attention but also set the stage for the next round in the ever more fierce controversy on climate politics in the US. The towering importance of conservative think tanks in creating the impression of scientific dissent and political dispute over the existence and the implications of anthropogenic climate change is well documented for the US. But also in Europe, self-appointed trailblazer in climate protection, climate skeptics are on the rise – not least due to the growing success of nationalist and climate sceptic parties in recent years like the democratic Unionist Party in the UK. With the latest electoral successes of right-wing party "Alternative for Germany" (AFD) a party made into the federal parliament that promises to abandon the decarbonizing the economy and to "remove the stigma of a pollutant from CO2" (AFD Manifesto 2016).

The rise of climate sceptic parties and their strategies to challenge scientific authority and the role of the media is beginning to influence climate skeptic action groups. The contribution outlines a conceptual framework for analyzing and provides some empirical evidence for mapping emerging networks of climate skepticism in Germany thus contributing to a better understanding of the prospects of climate skepticism and denial in Europe.

Millennials, Gender and Interfaith Dialogue in Italy

Aim of this paper is to discuss some aspects of the relationship between Millennials, gender, religion and interfaith dialogue, with a particular focus on Italy. The Millennial generation, driven by a need for change, can shape social, economic, political and cultural life, especially with regard to intercultural understanding. Even if, both in the Northern and Southern Mediterranean, young men and women are often the primary victims of fundamentalism, social instability and extremism, they are also key protagonists in terms of promoting intercultural

and interreligious dialogue. Alternative spaces in which women and men can be agents of peacemaking and peacebuilding are growing. Media technology has had a great impact on how to promote interfaith dialogue and Millennials, due to their peculiar characteristics, are key participants in this process.

Italy is a country where Catholicism, compared to other European countries, is still strong. However, we have witnessed a weakening of religious affiliation over the past 20 years and a growing trend toward personal spiritual inquiry. This trend is particularly strong among women. Italy is also a country deeply challenged by migration flows that needs intercultural and interfaith institutions and actors to confront growing challenges. In order to understand to what extent Millennials women and men support interfaith dialogue, a survey among university students on religiosity and interreligious dialogue is being carried out in a number of Italian Universities (more than 5,000 questionnaires have been collected). This survey is part of an ongoing interdisciplinary research project carried out within the "Framework Convention (FC) Gender and Religions". The FC, launched in 2016 by the University of Milano-Bicocca, is a confederation of 30 Italian Universities and nearly 25 Research Centers across Italy which banded together to study, using an interdisciplinary perspective, how contemporary processes of change are affecting religious identities for women and men.

The Political Institutionalization of Resource-Comparing Practices and the Emergence of a Politics of Energy Development (1950 - 1970)

When looking at recent developments in climate politics, it cannot be understood without a thorough study of the socio-political constitution of categories and concepts, such as climate, environment, resources, or energy. In this paper I seek to shed some light on the political institutionalization of resource-comparing practices and the emergence of a politics of energy development, which can be considered the precondition of today's political struggles.

Coal resources were for a long time considered one among other vital natural resources. Over the twentieth century, however, coal, petroleum, gas, and water power came to be seen as kinds of the same resource – 'energy'. This paper explores the emergence and consequences of this new category by examining the sites and practices in which different resources became comparable and compared as 'energies': electrification, vertical and horizontal integration of industries, as well as political regulation of natural resources. By studying the concrete case of 'energy resources' this paper also sheds light on the technical, statistical and organizational infrastructures under which resources can appear as being global.

This research draws primarily on archival documents of the World Energy Conference (WEC) from 1960 - 1980 as well as the UN technical assistance programme in the 1950s; both representing key cases for the socio-political construction of contested categories of today.

What Do Workers' Deserve? Depictions of Wages in Canadian Newspaper Editorials

Media coverage concerning wages, strikes and other labour issues helps to shape public debate about what constitutes fair and feasible wages. Our research follows the editorial coverage of wages in the *Globe and Mail* between 1970 and 2015 to ascertain how the depiction of wage entitlements evolved over this historical period in which real wages stagnated and economic inequality increased markedly. Using critical discourse analysis and framing theory our team has analyzed over 300 editorials over the 45-year time-period to ascertain trends in the editorial assessment of what constitutes appropriate and feasible wages in Canada. Our research suggests that editorial opinion has changed substantially over this time-period, reflecting a shifting perception of workers' entitlements.

Patrimonialism and a Literary Education: Exemplars in the Non-Rational Modes of Authority

'The Confucian,' Max Weber tells us, 'was a person of literary education, or more precisely, a bookish education, a man of the script and molded by it' (Weber 2003: 51). Weber contrasts these traditional, patrimonial attitudes with those of the Puritans, who 'rejected philosophic-literary education ... as a temporal vanity and as religiously dangerous. (For the Puritan, the Bible was a kind of middle-class law book and doctrine of enterprise)' (Weber 2003: 51). What difference does a literary education make to the creation of the kind of agent patrimonialism requires? Amy Olberding offers a hint: 'Where we look to the [Analects] as a

manual, the guidance it offers often consists in the recommendation that we seek to emulate notable others or, in the alternative, avoid emulating notorious others. ... Many of the text's more abstract moral recommendations, moreover, come to vivid life in the text, as the authors present us with narrative accounts depicting the text's various dramatic personae engaged in moral activity' (2012: 10). Both the *Analects* and the Bible features an exquisite combination of abstract ethical claim-making and rich narrative detail. So, the difference between the Confucian and the Puritan must be found in the way they approach these respective texts. When Puritans approach the Bible as a 'middle-class law book' they emphasize the abstract recommendations, whereas the Confucian emphasizes people and their stories; where the Puritan is oriented towards *rules*, the Confucian is oriented towards imitable *exemplars*. I argue that traditional modes of authority in general, and so patrimonial modes of authority in particular, are individuated by the role that exemplars play in moral cultivation and understanding. The pre-theoretical capacity to imitate exemplars not only helps explain the difference between the rational and non-rational modes of authority, but also traditionalism's relation to charismatic authority.

Opening the Black Box – the Creative Role of Environmental Expertise in Co-Designing Mining Technology

Development of environmental technologies usually happens in the context of their application. This means that it takes the form of what has been called "collective experimentation" by engaging non-scientific actors such as local people, authorities, or civil society organizations in scientific knowledge production.

Taking the case of developing less invasive and environmental friendly technologies for exploration and exploitation of so called critical raw materials in Germany, within this presentation we will focus on the role that expertise of environmental administrations plays within technology development. This expertise is a combination of different forms of knowledge: scientific and administrative knowledge as well as knowledge related to a specific place (local knowledge). It is actively integrated into processes of scientific knowledge production when it comes to permitting activities of research projects such as sampling, or testing of technologies and methods. This is a common practice and usually it is not assumed that administrative expertise strongly impact research results. We will request this assumption.

Decisions of experts in environmental administration who are not part of the respective research project shape not only the organizational structure (e.g. budget calculated for sampling) but also the content of research projects (e.g. taking up questions to the research agenda posed by experts from administration) and lead to rather unintended co-production of knowledge in projects of technology development. Thereby processes such as the definition of proximity or distance of environmental expertise and mining expertise or the identification of strategies in administration to deal with nonknowledge caused by research questions, come into play.

By relying on conceptual ideas from practice theory and organizational theory we will reveal mechanisms that underlie collective experimentation in which scientific and administrative environmental knowledge are brought together.

Migrant Bodies and Social Representations: A Theoretical Framework

Management of contemporary migration crises -especially those that, in the very last years, have been taking place in the Mediterranean context both from East and South- characterize for a high number of variables: as a matter of fact, very little information is available, especially in the early phases of any migration crisis, about the migrants' histories, juridical condition and actual needs. Even more blurred is their health condition: the objective problems in facing large masses' clinical risks, turn heavier due to the communication gaps among actors with different linguistic and cultural backgrounds.

One more cause of uncertainty is the interaction with hosting populations: very often natives show attitude of deep rejection and fear for their own safety and their families.

While it is quite clear that the deep reason of this hostility is essentially economic, most social representations of migrants openly refer to the bodily dimensions and involve two main domains: health and violence.

Health: rough displacement conditions, as well as accommodation in badly equipped centers, has often generated the belief that migrants and refugees are more likely to contract illness and generate epidemics, which might involve even local populations.

Violence: the idea that migrants and refugees stems from patriarchal, non-democratic and archaic cultures, generate the belief that they are more likely than natives to be responsible for violence deeds, especially against women.

This paper aims at describing the most common representations about bodily aspects of migration phenomena and comparing them with medical, epidemic and criminal data. Furthermore, systemic notions will be proposed, that might help tackling this gap of information in the management of migration crises.

RUZZEDDU, MASSIMILIANO* (*University Niccolo Cusano Rome*)

Occupations and Social Economy: Between Political Engagement and Economic Activity

While in the last decades the occupation of abandoned buildings was a mere political action, related to capitalism fight, in the very recent years, new kinds of occupations have happened, with a major economic characterization.

The main idea is to use the occupation to gather local workers (both high and low-qualified), that were expelled from the labor market, set-up networks to match skill and competencies, carry out training activities and, where possible, start new business.

For example, occupied buildings have often become spaces for coworking, with exchange of ideas and information.

Within this framework, the main goal of this paper will be to assess how this social evolution is reshaping the attitude of radical groups toward Globalization: while, traditionally, those groups characterized for an attitude of strong closure from outer groups (see No-global, N.I.M.B.Y. movements), it is possible to hypothesize that the need for producing income for themselves and their communities, might be yielding a Social Economy open to a global scope.

With this aim, I will analyze a case study: Officine Zero. This is a group of workers, both craftsmen and high qualified professional that have occupied a train workshop located downtown in Rome. They are using this space both for producing craftsmanship to be sold worldwide, and as a coworking place, where to start ethical business.

This paper will focus both on the organizational issue that characterize Officine Zero, which are quite peculiar and reflect both their adaptation to the current economic, global scenario and their own vision of the world.

Clinical Sociology and Social Practices of Religious Organizations and Communities: Integration Points

This paper focuses on the analysis of practices of Christian Orthodox Church organizations and communities using in the work with the most vulnerable groups and people in hard life conditions (homeless, migrants, unemployed, under-aged criminals, drug-addict people and etc.) For instance, Christian Orthodox communities of soberness were functioning in Russia since the end of 19th century. Nowadays programs of drug-addict rehabilitation, migrant adaptation, prevention of suicide, crisis female support, care for the elderly, palliative assistance and etc. are successfully being accomplished in Christian Orthodox centers. Moreover, in some authoritative international data research is pointed out that religiosity is the factor of positive influence on physical and mental health of a human and that traditional religions' approaches are highly effective in resolving rehabilitation issues [Koenig, 2004].

The following questions will be considered in this paper: (1) What kind of different confessional organizations social practices' experience might be useful for clinical sociologists in resolving aims of social therapy as on individual so on group levels, and in supporting people in hard life conditions? (2) What are the perspectives of realization co-projects both of clinical sociologists and representatives of different confessional organizations in the field of the mentioned activities? (3) How do clinical sociologists and representatives of religious organizations understand social justice in working out different programs aiming to reduce social tension, to minimize social inequalities in society, to improve the quality level of life and finally to humanize social relations? How does this understanding of justice correlate with fundamental principles of official social policy of liberal states and transit democracy societies?

Municipal Democracy in Russia: Modern-Day Challenges and Development Trends

This paper treats the issue related to the formation and development of local self-government in modern-day Russia. Consideration is given to objective and subjective reasons for reducing the effectiveness of current methods and practices in the development of municipal democracy. In particular, the article discusses the influence exerted by the authoritarian state-management paradigm on the execution of municipal reforms in modern-day Russia. Monitoring the development of the local government system in Russia and the Republic of Bashkortostan between 2003 and 2017 makes it possible to reveal tendencies towards state-controlled local self-government. This can be traced in institutional and legal as well as in financial and economic spheres. At present the absence of financial self-reliance in the development of the majority of Russia's municipal units hinders the use of the potential of local democracy to the full extent. Today's Western municipal technologies (participative management, direct election, self-organization of the population, etc.) are used under Russian conditions to the extent that they do not contradict the prevailing management paradigm. The globalization of international relations leads to rethinking the present-day theories and practices of local self-government in the developed countries that contributes to further non-determination and turbulence in the local self-government system of Russia. From this angle the article analyzes three trends in the development of local self-government in Russia.

Features of Germany's Participation in European Integration Processes

The theory and practice of developing integration are becoming very topical in modern conditions due to the growing complexity and inconsistency of the processes taking place in the European Union. In the processes of European integration at all its stages Germany's participation has always been very active. The article analyzes the main approaches to the study of the phenomenon of political leadership of the state in the theory of international relations. There is given the author's definition of the concept of "political leadership of the state". The main features of the political leadership of Germany in the EU at various stages of the development of European integration are identified. The main forms, quantitative and qualitative indicators of Germany's leadership in the modern EU have also been determined. The author has also identified the current trends in the development of German political leadership in the Eurointegration processes and determined the role of Germany in the crisis of European integration. The article describes the theoretical and methodological foundations of the study of the problem of political leadership of Germany in the European Union, examines the political leadership of the state in the theory of international relations, the concept of European integration as a methodological basis for the study of the problem of political leadership of Germany. In addition, the main stages and peculiarities of the evolution of the political role of Germany in the EU, the political prerequisites for the transformation of Germany into the "locomotive" of European integration, the features of the political leadership of Germany in the EU during the first and second chancellorship of Angela Merkel (2005-2013), modern trends in the development of the Germany's policy in the European Union (2013 — present time).

Eating Alone and Depressive Symptoms in Korea: Differential Effects According to Age

It has been recognized that *Honbop* (Eating Alone) is an emerging social phenomenon in Korea and reflects increased social isolation. In fact, having a meal alone could be considered a type of individual lifestyles or a matter of personal preference. On the other hand, it may indicate a lack of social relationships influencing psychological well-being especially in more collective socio-cultural contexts like Korea. We sought to examine associations between eating alone and depressive symptoms with the 2014 Korea National Health and

Nutrition Examination Survey(KNHANES), a nationally representative sample. The findings show that eating alone is positively associated with depressive symptoms. As the frequencies of having a meal alone a day increase, the level of depressive symptoms also increase. In addition, the effects of eating alone vary according to meal time among breakfast, lunch, and dinner. It appears that not only whether eating alone but also when to eat alone are associated with level of depressive symptoms. Significant interactions between eating alone and age are also detected, which shows that associations between eating alone and depressive symptoms differ by age. Eating alone is more deleterious for mental health as age increases. The findings of the study suggest that eating alone could be an indicator of social isolation, which is more critical for older adults.

² Centre for care research, NTNU Gjøvik

Digitalisation and the dark side of innovation

Ken Loach`s brilliant movie « I, Daniel Blake» illustrates the dark side of innovation, seen from the perspective of an elderly person. The same technological solution may be to the better for some and to the worse for others. This is the main topic in our paper. The authors work with service innovations in Norwegian municipalities, and the paper will present findings from our ongoing projects about the development of innovation.

Most Western countries have a growing elderly population and declining birth rates. Innovation is a buzzword in many White Papers. For elderly care, more use of volunteers and new technological solutions seem to be the main innovative grips in many countries. Public innovations are part of the political struggle in society, but because technological innovations are seen as improvements and non-political, the political consequences are seldom mentioned - and frail groups may be losers.

A branch within public service innovation theory is using a public service dominant logic (PSDL). Here, the user is recognized as an active co-producer of services (Osborne, Radnor & Nasi 2016). Developing digital services this way is quite contrary to the situation today where most digital services are introduced top-down. Thus, more user involvement can be an important step for reducing the number of Daniel Blake's in the future. The paper ends with a discussion of how a PSDL-approach can be to the better for the digital illiterate elderly, together with an acceptance of digitalisation as part of the political struggle in society.

Sexual Behaviour of Transgender: Empirical Reflections

Prelude: Transgender exhibit the full range of possible sexual orientations and interests including the potential for a lack of sexual attraction. Sexual behaviour and [gender roles](#) vary by culture, which has an effect on the place of [gender variant](#) people in that culture. In most cultures transsexuals are stigmatized and sexual activity is considered shameful, especially in cultures with rigid sex roles or strictures against non-heterosexual sex. **Reviews:** [McConahay SA & McConahay JB \(1977\)](#), Transgender have more heterosexual than homosexual experiences. [C C Ryan et al. \(1999\)](#), mental health care, stigma, lack of cultural sensitivity, unconscious and conscious reluctance to address sexuality may hamper effectiveness of care. [Minto et al., \(2003\)](#), People with non-normative sex development may identify as bisexual, lesbian, gay, heterosexual or any other sexuality. Regardless of partner preference, sexual difficulties are more common compared to general population norms. **Objectives:** To understand the sexual behavior of transgender, to know the orientation towards SRS and to find out the health complications related to the sexual behavior of transgender. **Design of the study:** Descriptive research design. **Methods of study:** FGD and Interview guide. **Findings:** Majority of transgender were seeking sex reassignment surgery for attracting and satisfying men. More than half of the transgender have involved in sex work for their livelihood. Around 75 percent of transgender have regular sexual intercourse with men i.e. customers including their partners and also infected by HIV/AIDS due to unprotected sex with multiple sexual partners. **Conclusion:** the sexual behavior of transgender, almost all transgender are engaged in sex work with multiple sexual partners. The behavior of sex with multiple sexual partners is contributing health issues like HIV/AIDS, Syphilis, gonorrhea, etc. So the sexual behavior of transgender is a risky one.

Inequalities in Higher Education in Nigeria: An Analysis of Public and Private Universities in Adamawa State

In Nigeria the goals of the Ministry of Education is access and quality at all levels of education in the country. This is to say that quality education must be provided to all Nigerian citizens at all levels irrespective of economic social cultural and political differences. For this reason the Federal Government declared free education for all its citizens at all levels of the educational system. Unfortunately however beyond this it has not done anything tangible to ensure these goals are achieved. For examples it has not been able to establish enough Public (government) schools to meet the demand of her huge population - Nigeria is about 180 millions. This led to the proliferations of private schools at all levels. What is more, it has also failed to fund the public schools to the level that high quality can be achieved. These problems are much more pronounced at the higher education level, where you have poorly funded less organised tuition free public tertiary institutions running side by side with well-funded and better organised very expensive private tertiary schools. Consequently, in Nigeria the rich are getting better quality education while the children of the poor are left with less quality education in the public schools and therefore better prepared to compete in job market. Inequalities in Nigeria social order are then perpetuated. In this paper we shall bring out the dynamics much more clearly and in more details with reference to two universities in Adamawa state; one public (Modibbo Adama University of Technology) and the other private (American University of Nigeria).

RC02-JS-48.1

SAAD-FILHO, ALFREDO* (*SOAS University of London*)

Marx 200: The Abiding Relevance of the Labour Theory of Value

Marxist political economy (MPE) is alive and well, and not just because of the habitual turn to Marx in response to any crisis of capitalism. Both through *Capital* and through the continuing evolution of Marxism, MPE offers unique, and uniquely valuable, insights that can illuminate the modalities of social and economic reproduction, and the relationships between (different aspects of) the economic and the non-economic. Marxism's presence has been felt through its own internal debates and debates with other approaches to political economy, and even through the influence on those reacting against Marxism. The key to the continuing relevance and analytical strengths of MPE lies in its capacity to provide a framework of analysis for unifying disparate insights and critiques of the contradictions of capitalism across the social sciences. The instrument for forging that unity remains Marx's theory of value (MTV). The potential of MTV to do so is examined and illustrated in this article with reference to two key concepts, the

value of labour power (VLP) and financialisation. They are explored and shown to have common as well different specificities in terms of key processes of commodification (C), commodity form (CF) and commodity calculation (CC) that are introduced and explained.

El Hirak Popular Del Rif Estrategias De Movilización y Resistencia

El Hirak Popular del Rif

Estrategias de movilización y resistencia

En comparación con las protestas anteriores de la «primavera árabe», la movi- lidad del Rif en el norte de Marruecos, con su icono Nasser zafafi, ha puesto en marcha estrategias de organización y de resistencia sin precedentes. A lo largo de los nuevos meses pasados los activistas mostraron gran capacidad y creatividad cuando protestan de manera pacífica y civilizada para exigir la justicia social y la dignidad, lo que impresionó a todo el mundo.

Era notable y significativa las formas espontáneas y nuevas de protesta que superaron fuertemente los mecanismos tradicionales de los partidos políticos y la sociedad civil y pusieron en marcha las llamadas para la organización de estas manifestaciones en los sitios de redes sociales. Los activistas del Hirak tuvieron gran éxito en la creación de una comunicación eficaz entre los espacios de las tecnologías de redes sociales y el mundo real de la protesta en las plazas públicas, lo que cristalizó una conciencia política aguda entre los jóvenes del Rif.

En el plano metodológico, además del análisis teórico vamos a confiar en el trabajo de campo directo en el corazón del Hirak a través de la observación y testimonios de los jóvenes activistas del Hirak. Hemos realizado frecuentes visitas y realizado entrevistas individuales en el dialecto rifino amazigh, eso, en varias áreas, incluyendo la ciudad de Alhucemas, Imzouren, Al Aroui, Tamsamane, ...

La hipótesis de este papel consiste en que la fuerza de la resistencia del Hirak contra la opresión violenta de las autoridades marroquíes reside en la legitimidad de las reivindicaciones, su espontaneidad, y la ausencia de una estructura de jerarquía y de cualquier tendencia hacia el liderazgo, por consecuencia todo esto ha dado una destacada presencia del Hirak en la esfera pública.

Making Women's Invisible Work Visible

Making Women's Invisible Work Visible

For many years, tremendous efforts have been invested in attempting to define what is meant by the term invisible work. Its scope has been expanded and refined to include unpaid care work and housework both in the private and public spheres. However, most research to date, however, has confined itself to one axis or another of invisible work (e.g. care work, housework, voluntarism). Based on nine group interviews -- eight of them including women from diverse social positions in Israel (religiosity, age, ethnicity, socio-economic status), and one group interview with Israeli men -- the current study explores first, a range of invisible work at home and in the workplace and the interpretations associated with this labor, by women and men. Second, it reveals how invisible work is seen as an obstacle to the equitable incorporation of women into the labor market.

The research rests on two theoretical premises. First, the examination of the creation and preservation of invisible work requires taking into account both the institutional-structural and the micro-interpretative levels. Exposing various interpretations is critical in comprehending what women think about their invisible labor and what influence they attribute to this work on various facets of their life. The second theoretical premise is that of intersectionality, since the perceptions and influence of invisible work on the status of women in the labor market may vary according to their different social positions.

The findings expose that although much variation exists among women from diverse social positions, the gendered patterns of invisible work cross along these social lines. We found that although the neo-liberal context puts much pressure and tension on women and men, interviewees hardly undermine the existing gendered and economic order, supported by the high value attributed in the Israeli society to motherhood and family.

SABBI, MATTHEW* (*University of Bayreuth*)

'I Only Need a Second Term': Young Councillors' Strategic Adaption to the Ambivalence of Everyday Local Politics

Young local councillors in Ghana often articulate somewhat 'alternative politics'. Vibrant, urban-educated, vocal and actively engaged with communal self-organizing, they aspire to amplify a voice for the youth that is absent in local politics. However, their optimism at once confronts the ambivalence of everyday

local politics—survival in the councils must prevail over any alternative vision of local politics. This ambivalence leads these young and inexperienced politicians to despair. Yet, most of them resort to 'survival politics'; a strategic adaption of their prefigured ideals to everyday political practices as they struggle at once to deal with the expectations from their electorates and everyday life in the local administration. Drawing on recent fieldwork from different local administrations in Ghana, this paper sheds light on why these young councillors must adapt to both the narrative and challenges faced by their 'old' colleagues albeit in an arena with young and largely inexperienced politicians. They attribute their despair and everyday tactics to barriers imposed by local elites, poor remuneration, and unrealistic demands from electorates. However, their optimism is not only unrealistic but also fails to link local political processes to regime preferences and interests that shape the very design of the local political space in which the councillors serve.

When Collaboration Stops and Vulnerability Takes Power: Intentions and Unexpected Outcomes in a Participatory Project of Visual Methods with Sex Workers in Ethiopia

When collaboration stops and vulnerability takes power: Intentions and unexpected outcomes in a participatory project of visual methods with sex workers in Ethiopia.

Ida Sabelis, Lorraine Nencil, Bisrate Markos

We will sue you if you dare publish our pictures! – we will not agree to have you, and the organization, and the project profit, and not us.^[1]

This sentence summarizes the feelings of a group of sex workers, members of a self-led sex workers organization in Addis Ababa, Ethiopia, some time after we finalized a participatory visual methods workshop. It expresses the feelings of this group with whom we were aiming to produce a photo exhibition about their daily lives. Until then, we assumed the project had gone relatively well. We present this case to reach fuller understanding of what went wrong. We review the steps we took, dig out our blind spots, and ultimately connect and confront our findings to question the assumptions of 'participatory visual methods' concerning their potential to empower and produce reflexive spaces. It will become clear that, while the methods were appreciated and enjoyed, the difficulties experienced were partly due to the high degree of (self) stigmatization and vulnerability the sex workers experienced in their lives. These daily lived experiences are entangled in the context and contingencies of sex work in Ethiopia, sex workers' position within the NGO world, and the objectives of our "participatory" project. Hence, in analysing what went wrong, we critically question, on the one hand the relationship between participatory visual methods, "empowerment" and stigmatization/marginalization; and on the other hand ethically consider which dimensions favour, and which impede visual methods in current day fieldwork studies.

Emerging Pattern of Leisure Among Scheduled Caste in India : a Case of Haryana.

The Leisure is essential for everybody, however every society is heterogeneous so the case of Indian society. There is a group of high caste, high class, lower caste and lower class, women, men, youth so and so forth. Traditional Hindu society in India is divided into numerous caste and sub caste numbering in thousands. These caste have traditionally been ranked in a ritual hierarchy. The upper castes at the top of hierarchy were the dominant castes. The scheduled castes at the bottom of the hierarchy can also be described as the marginal castes. These castes acted as menial workers, laborers, servants and watchmen. Lower castes leisure have been always neglected. The present paper tries to find out the types of leisure opportunities and constraints among the deprived section of the society. It is not only because of their economic constraints but also due to hierarchical division of the society. The pattern of leisure is deeply influenced by the social transformation, its social structure, economy, technology, cultural and political process in society. Now technology has brought improvement in the agriculture and industry. The print and electronic media emerged as a strong arm for diffusion and orchestration of information, cultural symbols and recreational packages of various kinds.

The political process of democratic participation set into motion among social groups such as scheduled castes, scheduled tribes and women groups. Its emergence as radically, though not wholly, distributed the traditional pattern of leisure and leisure institutions in society. Institutional form of culture to which leisure in the past was oriented, is now increasingly exposed to forces of what is known as mass culture or popular culture. This is happening in the urban setting of our society.

RC26-489.1SACCA, FLAMINIA* (*Università della Tuscia, Italy*)*Migrations and the Young Citizens: The Role of Educational Institutions*

Europe is facing a social, cultural, economic and political challenge due to the rise in migration flows. European Countries are dealing with the phenomenon through different approaches. For the Mediterranean Countries this is a relatively recent challenge that they feel is straining their capacities to adequately plan their refugees and migrants reception policies and to culturally absorb and accept the change. Educational institutions are a vital turning point in building the conditions for social integration, exchange and growth of a common sense of citizenship. This paper will focus on how the Italian educational system is succeeding or failing in contributing to acknowledge and appreciate the cultural differences and in building a common ground for the young and sometimes new Italian citizens of tomorrow.

RC25-474.5SACHDEVA, ASHOK* (*MATA JIJABAI GOVERNMENT GIRLS P. G. COLLEGE INDORE*)*Emerging Creative Trends in English Communication and the Need for Neologisms*

An incessant floods of Neologisms have swept in and the need is linked up to float a thought and invent an idea and communicate new concepts. Neologisms will be examined morphologically, etymologically, phonetically, semantically, contextually and to create, recreate, construct and reconstruct fresh contexts and also to suggest emerging future concepts. The creative writers, scholars, academicians, journalists and teachers are always on the lookout for new words, phrases and expressions to express and communicate new concepts, lend colour to their thoughts. Language, corpus-based but not corpus-bound, is a creative process with the immense potential to produce infinite number of words and sentences. A creatively geared writer can write different types of fiction, memoir, poetry, novel, non-fiction, science-fiction, lyrics, play, script, travelogue and romance, features, interviews, criticism and reviews for newspapers, magazines and journals that require plenty of imagination, observation and the innate ability to paint word-pictures out of anything under the sun. If there is a Wordsmith dwelling inside the confines of one's heart, that can be set free so as to engage the ingenious talents in creative writing either to use a liberal sprinkling of words or to use the imaginative power in order to make the work of art an enjoyable experience. An incessant torrential floods of Neologisms have swept in due to technological communication and intercultural development. The need for Neologisms is linked up to provide a hypothesis, float a thought and invent an idea. Old familiar words acquire new meanings that include many different structural word formation types, novel derivations, clippings, back formations and various compounding processes which exemplify a wide range of semantic/pragmatic phenomena such as metaphor, metonymy, euphemism, and eponymy.

RC55-902.4SACKMANN, REINHOLD* (*Martin-Luther-University Halle-Wittenberg*)*An Analytic Model for the Comparative Degree of "Eliteness" in Education Systems: Mechanisms, Inequality and Indicators*

Currently, the comparison between countries on the importance of separate elite education is rare and mainly qualitative and descriptive. The aim of the paper is to present an analytical model of elite formation and to suggest indicators to measure it. The empirical material used is on the one hand a cross-comparison of mechanisms of elite formation in different levels of education systems (preschool, elementary, secondary school, higher education), on the other hand a longitudinal quantitative analysis of elite formation in higher education in Germany and France.

In a parsimonious analytical model, the degree of eliteness is set by mechanisms of a) choosing an educational Institution; b) organisational formation of profiles; c) selecting a group of students and d) forming cohesive groups of students. Comparing the mechanisms reveals that the institutionalised form of selection is by far the most essential stratifying mechanism. State-authorised publicised indicators (of choice, selection, profile and cohesion) valorise procedures of single educational institutions to proceedings of education systems.

New forms of quantitative measurement of eliteness in education systems (e.g. Gini coefficient; regional disparities) are tested in the comparison of Germany and France. It is shown that elite stratification can concentrate high achievers either vertically (in organisations) or horizontally (in disciplines).

The results demonstrate that new models explaining and measuring inequality of separating the top decile in education systems add to our knowledge on stratification processes of societies.

RC08-172.5SACKMANN, REINHOLD* (*Martin-Luther-University Halle-Wittenberg*)*World Sociology at Its Making: The Reception of Weber 1920-1937 in Germany, the US and Japan*

The traditional history of sociology uses the concept of "national traditions" of sociology. The analysis of the presentation examines the alternative thesis that central ideas of "classical" sociology were coproduced in the early multinational translation process of texts and authors: Especially a higher degree of generalization is achieved by a certain type of recipients, called translators (people with knowledge in different languages and scientific traditions).

Material I used concentrates on the early reception of Max Weber in Germany, the US and Japan after his death in 1920.

Analysis of Lukács, Freyer, Mannheim, Mises, Walther and von Wiese reveals that a heated discussion on the fruitfulness of Weber's approach took place in the 1920s and early 1930s. Characteristic of the *German* discussion was that many criticised Weber's break with philosophy of history, his methodology and his probabilistic concept of society.

The debate in *American* shows by looking into Sorokin, Abel and Parsons that the latter two functioned as crucial translators of the Weberian way of thinking. Whereas Abel's path-breaking interpretation is nowadays forgotten, Parsons' "structure of social action" set the stage for canonizing "classic sociology" for post-war world sociology (ignoring American sociological traditions).

In analysing the work of Ōtsuka and Maruyama, one sees that in *Japan* a new reading set in of Weber as an author relevant for reflection on processes of catch up-modernisation. Already at this early stage, both universalisation of Western ways (Ōtsuka) and search for multiple ways to modernity (Maruyama), were spelled out. The lack of translators from Japanese into Western scientific languages delayed the world-wide perception of this Eastern reception of Weber.

Comparing the three cases, one can conclude that the "Weberian tradition" was formed in the 1920s and 1930s in a multi-national translation process, however distorted by power-relations.

RC31-564.8SACKMANN, ROSEMARIE* (*Forschungsinstitut Betriebliche Bildung*)*Financial Support for the Costs of Professional Recognition Procedures – a New Stepping Stone within the German Recognition Act*

The German labor market is highly regulated. Beside occupations with legally regulated access large parts of the labor are structured by the system of professional education with its strong emphasis on accredited vocational certificates. Within this culture migrants need the recognition of their professional qualifications. Thus, professional recognition is considered desirable for individuals (who can find better jobs with better payment), for companies (who can appreciate the qualifications of foreign applicants), and for the society as whole (because it fosters social integration).

In 2012 the German Recognition Act set the basis for the development of an encompassing support infrastructure for professional recognition procedures. Everyone holding a foreign formal vocational qualification has the right to get his/her qualifications accessed. The Recognition Act has been a success right from its beginning. However, Monitoring reports on the Recognition Act have shown that overall costs of recognition and a lack of financing opportunities may be a severe hindrance for recognition seekers. Particularly persons who work (below their level of qualification) to earn a living, often via casual jobs or other poorly paid employment, are in a problematic situation: In many such cases, their financial means are insufficient to pay for a procedure and all its associated costs, but as long as they earn a living, they can't apply for social funding.

In December 2016, a new instrument has been added to the Recognition Act: the recognition grant. The presentation offers a brief overview of the instruments of the Recognition Act, it describes the implementation of the new instrument and it reports on an evaluation which answers the question, if this instrument works. First findings (September 2017) show: It works to a remarkable degree.

RC32-591.2SADAMATSU, AYA* (*Keisen University*)*Migrant Domestic and Care Workers in Japan: Workers' Rights and Contradictions Migrant Domestic and Care Workers in Japan: Workers' Rights and Contradictions*

This paper aims to contribute to the examination of the rights of transnational migrant domestic and care workers in Japan. Dozens of female migrants began to work as housekeepers in the Japanese National Strategic Special Zones of Kanagawa prefecture, and the cities of Osaka and Tokyo in 2017 for the purpose of furthering the state's promotion of Japanese women's labor force participation. The female migrants' labor contracts are not direct employment, instead, housekeeping service companies hire them under the same conditions as those

of Japanese workers. More than two thousand care workers and migrant nursing care staff from South-East Asia work in Japan to compensate for the shortage of caregivers in the ultra-aging society. Most of these migrants are women. Although it is inevitable that Japanese society has to depend on female migrant domestic and care workers, their contracts are limited to short-term because of the government's immigration policy. These migrant workers enable Japanese families' and social reproduction to continue. However, they work in relatively harsh conditions in order to support their families economically and sometimes to repay pre-existing debt. Nonetheless, they have some opportunities to decide on their destination and to exercise their subjectivity. This study will analyze the motivation of migrant women's decisions to take on domestic and care work in Japan and also to clarify three contradictions of 'the equality of people who support each other' in the process of acquiring their autonomy.

Positive Indicators of Well-Being: The Child Protection Welfare Bureau (CPWB), Lahore

Positive indicators of well-being: The Child Protection Welfare Bureau (CPWB), Lahore

Lahore can be described as a "primate" city which translates as a city that is dominant, socially, economically and politically. Mumford (1937) writes of the city as a social institution and describes the concept of opportunities. It could well be the case that many rural migrants in the hope of a utopia of opportunities are met with a dystopic future instead, often to the extent that they find themselves begging. The obvious reason for migration would be for better prospects perhaps even to the extent of an envisaged "Lahore Dream", in line with the concept of an American Dream as espoused by James Truslow Adams. (Saeed, 2013)

Amongst those who beg, one can also find a number of children begging. The Child Welfare Bureau (CPWB) is an institution created by the Punjab government, to eliminate child beggary by helping destitute and neglected children with the co-operation of the police. It is, therefore, a formal response by the Punjab government to eliminate child beggary within the province. (The Nation, 2005) The pilot project began in Lahore and has since expanded throughout the Punjab.

This paper will explore conceptual and practical frameworks that are in place by the CPWB in Lahore in understanding children's well-being and will attempt to measure those indicators of well-being (Lippman et al, 2009) through a didactic approach of the perspectives of both those running the bureau and from a sample of fifteen 11-14 year old youths. The paper will therefore take into account various dimensions of children's well-being within society taking into account dimensions such as gender, class, race, ethnicity, caste, religious background.

Sex Change Surgery in Iran: Socio-Legal Policies and Practices

Paper abstract: Sex Change Surgery in Iran: Socio-legal Policies and practices

The first sex change surgery in Iran dates back to the 1930s, and was permitted under Islamic law by Ayatollah Khomeini's Islamic juristic legal opinion (fatwa) after the Iranian revolution in 1979. As a result, the legal change of name and gender in Iran occurs via a medico-judicial process. Despite its long practice, the flux of mainstream western (Anglophone) media coverage and literature on sex change surgery in Iran during post millennium period is heightened portraying sex change surgery as the product of Iranian state's sexism and homophobia.

In this paper, I show that such commentaries and publications involve significant misconceptions of sex change surgery in Iran, besides being misrepresentations of trans persons' bodily knowledge and experience. Based on the information I have collected through forty semi-structured interviews and other materials in Iran between 2014 and 2017, I argue that sex change surgery is not obligatory in Iran, contracting those who maintain that sex change surgery is forced on Iranian homosexuals. Moreover, I elucidate the divergent legal opinions on sex change among Islamic jurists in Iran and demonstrate how these have created space for different legal practices by judges and legal misrecognition of trans persons and non-recognition of transsexuality/sex change in most parts of the country. The lack of legislation has generated difficult and in some places impossible conditions for trans persons to undergo sex change surgery. Finally, I examine trans persons' experience of going through the process of transition in interaction with law, medicine and family in terms of; self-recognition; passing; and rebirth. This shows that transition does not happen at once or suddenly; rather it takes a long time and continues until or after the sex change surgery itself.

Latino Interstate Migration in the United States

Over the last several decades much attention has focused on the international movement of people from Latin America to the United States. Much less attention has focused on the migration of Latinos within the United States. There are important reasons to examine the interstate movement of Latinos in this country.

This paper examines the interstate migration of Latinos during the 2011-2015 period using the American Community Survey 2011-2015 5-Year Sample. The analysis is based on the estimated 874,126 Latinos who migrated across states during the previous year. The analysis aggregates individual-level data to estimate the number of Latino out-migrants and in-migrants for each of the 50 U.S. states and the District of Columbia. These data are used to compute the net-migration for each of these areas. Further analysis are conducted on the basis of nativity status to assess similarities and differences in migration patterns across U.S.-born and foreign-born Latinos.

The results show that 37 states experienced a net in-migration (more in-migrants than out-migrants) of Latinos during the 2011-2015 period. Texas (36,486) and Florida (30,975) experienced the greatest net in-migration levels. In contrast, of the 14 states experiencing a net out-migration (more out-migrants than in-migrants) of Latinos, California (-39,879) and New York (-27,948) sustained the highest levels of out-migration of Latinos. The results also show differences between native- and foreign-born Latinos. In particular, the number of states (23) experiencing net out-migration among foreign-born Latinos is larger than the number having net out-migration among U.S.-born Latinos.

The analysis also assesses the relationship between economic and political factors and the Latino net migration rates across the 50 states and the District of Columbia. The paper concludes with a discussion of the implications of the results for understanding the social and economic position of Latinos in the United States.

Kin Games? the Complicity of Universities in the Depoliticization of Health in Sport

Scholarship on the interconnections between sport, medicine and health has steadily grown in the sociology of sport and physical cultural studies in the past few decades such that there is now a (somewhat) defined body of knowledge on the interconnections between sport, medicine and health. *Scholars* from all across the world have turned their attention towards problematizing the commonplace assertion that 'sport is good for one's health' and contextualizing the sport-health paradox against a backdrop of larger politico-economic, historical and socio-cultural forces. This established and growing body of knowledge is very encouraging for our disciplinary area more broadly, and is also notable since most of the scholars who have contributed to this body of knowledge are situated in academic departments that are management-centric, performance-oriented and/or which prioritize the applied sport sciences. In these departments, it is not uncommon to see scholars who criticize the health-compromising nature of sport systems working down the hall from colleagues focused on transforming the human sporting body into (an ever better) performance machine. The technocratic reconstruction of university physical education departments into Kinesiology, Human Kinetics, Kinesiology and Health Sciences or whatever mutation or combination of like words, as well as the alignment with and ascendance of health promotion, is not a new phenomenon and many have written about the specialization of academic disciplines within Kinesiology, and the transformation of physical education departments into units that de-emphasize the philosophical, ethical, social and cultural study of sport. This paper continues in this vein by focusing on the tensions for researchers, instructors, and students, with specific attention to the Canadian university context, that arise around the de/politicization of health in sport in academic units that have embraced or are embracing "technicist [tendencies]" (Aronowitz & Giroux, 1985, p. 197, as cited in Macintosh & Whitson, 1990, p. 134).

Shifting Perceptions of Scientists and the Climate Change Debate in the United States

Debates about climate change in the United States have polarized the American public. Numerous studies have shown the increasing politicization of this issue, and in particular, skepticism about climate science among those with conservative ideological views. These trends appear to have eroded confidence in science more broadly, raising questions about the social role of scientists. Nonetheless, how Americans perceive scientists, and whether those views shape the climate debate, is less clear. Drawing upon data from two surveys, the national POLES survey and the Granite State Poll in New Hampshire, this study examines how Americans perceive scientists and climate change. These surveys questioned respondents about the way scientists develop findings and communicate them to the public. Results show that more than 40% of Americans believe that scientists sometimes adjust their findings to get the answers they want. A similar number also indicate

that scientists need to do a better job informing the public about their results. Regression analyses were then used to establish how views about the practice of science relate to climate beliefs. These models controlled for known predictors of climate-related beliefs (gender, age, and political ideology). Two dummy variables were created to determine whether beliefs about the integrity of scientists and science communication predict views about climate change. Results confirm that women, younger people, and those with liberal political views are more likely to believe climate change is occurring and is the result of human activities. However, individuals who believe scientists adjust their findings and those who think scientists need to improve their communication are less likely to think that climate change is caused mainly by human activities. These results suggest that debates about climate change may not only revolve around Americans' beliefs about climate science but also their views about scientists themselves and the practice of science.

The Science-Government-Stakeholder Interface and Access to Appropriate Expertise for Coastal Environmental Planning in Brazil

The rapidly changing marine environment is affecting coastal communities around the world. Declines in fisheries, new pollutants, and increasing ocean temperatures necessitate innovative environmental planning strategies. With its extensive coastline, Brazil is one of the countries grappling with these challenges. Brazilian policy makers have prioritized implementation of socially and environmentally sustainable coastal development alternatives. To achieve this objective, ensuring access to wide-ranging scientific expertise will be critical. Nonetheless, how social forces affect scientific engagement and the use of different data within planning and management efforts remains unclear. Drawing on insights from environmental sociology and the sociology of science, we investigate how different conceptions what are appropriate data and scientific expertise shape coastal development planning in Brazil.

Our project is an in-depth case study of the planning and management of a development activity often promoted as a socially and environmentally sustainable alternative for coastal communities, marine aquaculture (mariculture). Data consist of 62 interviews with public officials (marine resource, seafood safety, and public health), scientists, and growers in Santa Catarina, Brazil conducted in 2014-2015. Findings show key differences in the way social and institutional forces influence conceptions of what is appropriate scientific expertise and data during the planning of mariculture development versus its on-going management. At the outset, a government-university partnership formulated a production science-based rationale emphasizing the simplicity, sustainability, and economic benefits of mariculture, facilitating adoption of mariculture among coastal communities. However, once mariculture was well-established the production science emphasis deterred broader scientific engagement and constrained growers ability to access different expertise and understand more complex data related to myriad risks (economic and environmental), increasing their vulnerability. These asymmetries in the way science and scientists shaped the development process in Brazil suggest a need for additional sociological research investigating how the science-government-stakeholder interface shapes conceptions of appropriate expertise within environmental planning.

Still Leading the Way: The Development of Analytical Techniques in the Study of Educational Inequality

The purpose of this paper is to trace the contribution of the sociology of education to the study of educational inequality, which is a key contributor to, and consequence of social inequality. We build on our previous paper (Saha and Keeses, in Torres and Antikainen, *The International Handbook on the Sociology of Education*, 2003), and provide supportive evidence, that sociological researchers, who study education inequality in its various manifestations in society, continue to make a significant contribution to the development of sociological research methods, and in particular, methods of data analysis.

Our discussion focuses on a select few of the significant new analytical developments which are coming to dominate sociology. In particular, we argue that some of these analytical techniques have developed as a response to the unique challenges that are posed by research in education, and in particular research in classrooms and schools. Some of these techniques involve complex multivariate models, new scaling challenges, nested data, selection and tracking, multi-level effects and the availability of longitudinal data. They have also been facilitated by the emergence of more powerful computers and programs that have made possible the complex analysis of larger comparative data sets, which also demand new analytical techniques. As a result, we argue that sociological research in education inequality has been a major driving force for many of these important analytical developments which have now become part of general sociological analysis.

The Depressed Class of Elderly: Case Studies of Elderly Populace Among Lower Income Households

ABSTRACT

India is often interpreted as a country which is still influenced by the values of gerontocracy as well as joint family households. However, modernizing trends are affecting the nooks and corners of every part of the society, and India is not left behind. The present paper seeks to explore the domain of physical and mental well being of the elderly population among the lower income households in the country. The findings of the paper show that in lower income households, nuclear families values are gradually penetrating, which is transforming the elderly-family interactions. It is seen that the elderly population which were previously acknowledged as the head of the household or one of the major decision maker are gradually sidelined or excluded from the household affairs. Awareness of being excluded is often a primary reason behind the degrading physical and mental well being of the elderly populace. They are often treated as an unwanted liability, which will be relieved only with their deaths. Case studies of 50 elderly respondents have been taken to explore the physical and mental health of the elderly populace among the lower income households.

'Harmful' Cultural Practices in the Consultation Room: General Practitioners' Moral Views and Dealing with Issues of Gender and Culture.

General practitioners (GPs) are most likely the first health professionals migrant women turn to when seeking help with questions related to gender and culture. For instance, Dutch GPs receive requests to issue a virginity certificate. They may have female patients in their practice who are genitally cut and may wonder whether these women intend to have their daughters cut also, or suspect forced (child)marriage or honor related violence. In all these cases GPs have to decide on prevention and intervention.

We wanted to know what kind of so-called harmful cultural practices ('HCP's) GPs encounter in their consultation room, whether they experience moral conflicts (personal and professional) and how they balance personal and bioethical principles to make a decision.

In dealing with 'HCP'-related interventions medical ethical principles (autonomy, beneficence, non-maleficence, and justice), that should offer GPs moral guidance, are insufficient. For instance, an individualistic notion of the person that is presumed by the classical notion of autonomy does not match the women's socially embedded lives. In communities that practice female genital cutting the practice is not experienced as harming the body, but as perfecting it. Yet, how does this differ from European women's desire for a perfect vagina that makes them turn to cosmetic surgery? It is not clear how health workers should take into account the way migrant women themselves, based on their cultural backgrounds, give meaning to concepts like autonomy, harm, well-being or bodily integrity, especially when these run counter to Western medical beliefs.

Based on in-depth interviews with fourteen GPs in the Netherlands, we discuss how they dealt in their practice with the above-mentioned questions. In our discussion, we will also compare between 'HCP's that take migrant women as their object with Western 'HCP's, like anorexia and 'HCP's that take men as their object, like male circumcision.

Agriculture Policy and Farmers' Right: A Study in Odisha State, India

For centuries, agriculture is the main stay of Indian economy and as well primary source of livelihood of common masses. In past, agriculture was based on self consumption than commercialization. Since mid sixty, under Green Revolution, agriculture growth turned demand driven to market following modern technology, high yielding varieties of seeds and other know how. Since nineties, after liberalization, privatization and globalization process, the agriculture oriented more to export, food security, employment opportunities, etc. Some academic studies idealize such policy as sustainable to agriculture and paving way for eradication of poverty, inequality, promoting rural livelihood, maximizing benefits, etc. Some other studies perceived new agricultural policy as counterproductive to farmers' development. As it has caused loss of farmers own autonomy, self-reliant, self-dependant, using own indigenous knowledge, application of organic farming in production process, rising cost of cultivation, high indebtedness, tendency of suicide and overall agrarian crisis because of inability to cope up with new system and failure of marketing mechanism on

receiving value of their product. Over the years, many farmers organizations have staged demonstration and protested government agricultural policies and programs but apathy of state continues unabated without redressing their grievances. In light of this fact, a study has undertaken in backward eastern state Odisha of India which has witnessed above 1500 farmer suicide cases in last five years and their violation right relating to life, food, loan, livelihood, production, receiving remunerative price of their product etc are in dead end. The study follows structural approach of dialectical perspectives linking farmers' socio-economic conditions, agriculture pattern, irrigation facilities, per capita income, dependency nature on trader, money lender and supportive credit facilities, indebtedness, constraints of repayment, counseling by agriculture department and civil society organizations on adoption of modern method of agricultural application, etc to comprehend the issue in totality.

Local-Self Government, Democratic Decentralisation and Devolution of Power with Reference to Tribal Women's Participation in Village Panchayat

Unlike many of the modern nation states in the World, India has adopted the path of democratic decentralisation to realise the principles of equality, fraternity and prosperity. Especially, since 73rd Constitutional Amendment Act 1992 such process develops more people centric approach with incorporation of women participation in all development programmes say water, sanitation, health, education, child development, environment, etc under three tier Panchayati Raj system (PRIs) of local governance i.e. District, Block and Village level. A study of a village panchayat located in Scheduled Area of backward Sundargarh district, Odisha, India reveals that tribal women participate in any developmental activities as 'manipulative' rather than 'authentic' because of centralised bureaucratic system, influence of remote controlled political master and above all domination of patriarchal structure in socio-cultural system. Besides, tribal woman in village struggle for survival absorbs much of their time and energy that minimises their chance of participation. Of course, their active participation largely depends upon their belongingness of community, clan, educational attainment, income, employment opportunity, holding assets and position in local social structure which appears dismal. During panchayat election they are mobilised in pretext of gender justice to come out to public life as matter of right. But no policy, so far, guarantee their minimum subsistence round the year. Unless and until tribal women are independent of earning their livelihood and least or no dependant on their men folk, no policy of empowerment could ease the problems of their life. Hence, need for improvement of fabrics of human development system within which they live and survive, alertness tribal women, political will of the State, equity in grass root governance, social justice and holistic approach could ease the problem of tribal women life situation, otherwise, the women empowerment system, objectivity of democratic decentralisation and participation will be in dead lock.

State, Community and Social Movements in Eastern India

Social movements and protests in contemporary India is the reflection of socio-political instability, emerging voices of dissents and rising aspirations of the people. Contentious collective issues triggered many violent 'cycles of protests' which had shown enormous repercussions on almost all the spheres of public life, sometimes emanating complete breakdown of order. Volatile movements, sluggish nature of the state, and sometime proactive temperament of communities often aggravate the problem. The state cannot accommodate all the demands, often competing demands by communities. The relationship between the state, communities and social movements in various parts of India require comprehensive understanding of protests and movements through which one can assess the broader socio-political structures in various sites of India. The present paper makes an attempt to review various movement studies and their theoretical standpoints and tries to articulate the dynamics of existing relationship between the State, communities and social movements in eastern part of India. Further, it also tries to articulate the role of caste, class, gender and ethnicity in the process of mobilization.

(Im)Possibility of Sustainable Wellbeing in the Nordic Welfare State?

The Nordic welfare states are more equal societies than many others but their ecological footprint is too large, especially from the global perspective. Understandable all sorts of economic growth cannot be infinite on the finite

planet. Yet, the growth is presented as it would bring wellbeing for all. Indeed, the different political aims are contested continuously. However, environment or climate issues are too often handled as their own branch in the policy-making without the connection to welfare or wellbeing. A theory of human need gives a ground to examine the role of the institutions and communities when aiming at more sustainable welfare systems.

The paper scrutinizes the capacity of the welfare system to fulfill the needs of social assistance recipients in Finland. The means-tested and last-resort social assistance sets the minimum level for living standard. The theoretical framework bases on Max-Neef's categorization of needs. According to him, there are two categories: existential and axiological needs. The first one means needs like being, having, doing and interacting; latter refers to nine universal needs. As does Ian Gough, Max-Neef points out that the needs are universal but the satisfiers that fulfill the needs are culturally dependent.

According to the preliminary findings, it seems that the welfare services targeted the social assistance recipients emphasizes needs like *having, doing (existential) and subsistence (axiological)*. At the same time, it fails to support or fulfill the needs of the vulnerable groups as there is lack of understanding about the complexity of wellbeing in the welfare systems that restrain more sustainable alternatives to social policy. The eco-social transformation of the welfare system requires a better understanding about wellbeing. Then conflicts between social policy and climate objectives can be identified more accurately which gives a possibility to formulate legitimate pathways towards the more sustainable welfare state.

YLIKÄNNÖ, MINNA* (*Social Insurance Institution of Finland*)

From Universalisms to Universalism or Vice Versa? Finnish Social Assistance Reform and the Equality of Citizens

Nordic welfare states are characterized by strong emphasis on universalism with an idea of equality promotion as a character of the welfare systems. Universal social policies are found to be more effective than selective ones in creating equality and social trust among citizens, i.e. building social citizenship. Departing from the idea of British universalism that focuses mostly on the benefit system, the Scandinavian idea extends universalism to the policy outcomes by emphasizing the role of public services in diminishing poverty and increasing equality i.e. financial aid is not always enough to enable participation in the society. At the beginning of 2017, the social assistance was centralized to the Social Insurance Institution of Finland, which is against the current decentralization trend in Europe. In spite of the fact that the connection between social work and financial aid was disconnected, the reform was largely justified by the claim that it increases equality.

The paper scrutinizes which client groups were excluded and which advantaged and in what way, when the reform was implemented. Further, it asks how the reform revised universalism and an idea of social citizenship behind it.

The research material consists of data based on surveys targeted to municipal social workers, the management of municipal social services, social assistance receivers and the benefit handlers in the Social Insurance Institution of Finland.

Based on our empirical findings, people with cumulated social problems and need for social services are in more risk of exclusion than before the reform. There seems to be shift from "universalisms" to "universalism" in the Finnish welfare system. The reform has led to the increasing exclusion of the most vulnerable groups and increasing inequality among all clients. In the long term, this will erode social cohesion in the society.

Urban Community Formation in Central Tokyo: A Case Study of Chuo Ward

Since the late 1990s Japanese major cities have witnessed a shift from decline to growth of their population in the city center area. Among them, Chuo Ward in Tokyo experienced a particularly dramatic increase in its population. This study examines its impact and implications upon the local communities by analyzing the questionnaire surveys we conducted for the residents in high-rise condominiums and the surrounding areas. They reveals that the growth of population was mainly caused by relatively young adults who live in the condominiums and working as urban professionals. It also shows that their social class is significantly higher than the surrounding area in terms of the average income, occupation, and educational attainment. They seem to have a distinguished characteristics in consumption behavior, social and political consciousness, and the types of human networks they formed in their neighborhood. The author argues that this new trend of urban community formation is a significant part and parcel of contemporary urbanism which is driven by globally oriented neo-liberal state strategy. In the 1960s and 1970s, Japanese government contributed to form a relatively coherent and homogenous mass middle class society by its suburban public housing program. It has, however, in the last 20 years, shift her policy orientation to encourage more private condominium development in the city

center, which in turn created more class-divided urban landscape. The neo-liberal urban project is not limited to the buildings and urban forms, but people's mind and attitude toward themselves and the neighborhood community. In that sense, the new trend of urban living in the central core of Tokyo exemplifies a changing relationship between the statehood, built environment and urban community, and can be seen as an attempt by the state to create a society which is more in tune with the global neoliberalism.

SAITO, HIRO* (*Singapore Management University*)

The Limits of Transitional Justice

Today transitional justice has been institutionalized at the global level to address past violations of human rights. The globalization of transitional justice, however, contains a peculiar contradiction: although transitional justice typically addresses past human rights violations within a single country, the causes of these violations are often transnational. To understand how this contradiction of transitional justice developed, I first trace the historical evolution of transitional justice from the end of World War II to the early 2000s. Specifically, I argue that the contradiction was caused by the dominance of nationalism and imperialism. On the one hand, nationalism legitimates the division of the world into discrete nation-states. Given the persistence of nationalism in the theory and practice of transitional justice, transnationally caused injustices are delineated along national borders. On the other hand, imperialism legitimates a hierarchy of nation-states, allowing some nation-states to dominate others. Such hierarchical thinking has consistently influenced the theory and practice of transitional justice, shielding powerful nation-states from their shares of responsibility for transnationally caused historical injustices. To illustrate various ramifications of nationalism and imperialism in transitional justice, I then examine the so-called "comfort women" issue in South Korea as part and parcel of the chain of transnational historical injustices—the suffering of victims of Japan's past aggression and of atomic bombings and other atrocities by the Allied powers, to name but a few—interlocked across Asia-Pacific that remain unredressed to date. In conclusion, I explore how the contradiction of transitional justice as well as its ramifications might be resolved, or at least mitigated, in light of transnational and cosmopolitan approaches developed by Ulrich Beck, Nancy Fraser, and other theorists.

From Agrarian Crisis to Sustainable Agriculture: Case Studies from Telangana and Andhra Pradesh, India

Agrarian crisis is sweeping through the newly formed Telugu speaking states of Andhra Pradesh and Telangana with a number of farmers committing suicide due to crop failure and indebtedness. Small and marginal farmers of rain-fed areas are in a losing battle with agriculture as their material conditions keep deteriorating year on year. According to the National Sample Survey (NSS) data released in December, 2014 more than sixty percent of agrarian households in India are in debt trap ranging from 92.9% in Andhra to 17.5% in Assam.

In this scenario, it is pertinent to note that the benefits of highly extractive agriculture, which goes by the name of green revolution and based on 'high input technology' was cornered by the rich and affluent farmers operating in irrigated areas of Punjab, Haryana, Western Uttar Pradesh, Andhra, Tamilnadu and Karnataka. The poor and marginal farmers primarily in the vast rain-fed areas of India are the worst sufferers. Apart from the indebtedness, many farmers are unaware of the minimum support price and often, resort to distress sale to clear their loans which were obtained at exorbitant rates.

While the situation appears to be gloomy with thousands of farmers committing suicide in the Telugu speaking states and other parts of the country, there are ways to combat agrarian crisis. This paper aims to present evidence of sustainable agriculture practices with case studies from the states of Telangana and Andhra Pradesh in India. The farmers were able to overcome agrarian crisis to some extent by discarding neoliberal agrarian practices.

Japanese Expatriation in China Since the 1990s: Gender, Nationalism, and Changing Status As a Migrant

This presentation shows the diverse and changing nature of the Japanese expatriate community in China, mainly using collected life-story interviews of Japanese expatriates in Hong Kong and Shanghai.

Japanese companies have expanded operations into overseas markets and production bases since the 1970s, and it has pushed Japanese people in investment-led communities overseas [Glebe et al. 1999]. The tendency has accelerated since the 1990s, especially in Asia. Before the 1990s, Japanese companies were hesitant about localization, and they transferred predominantly male employees to overseas offices as management staff. It was difficult for local staff to be in-

involved in important decisions [Sonoda 2001], [Kopp, 1999], and expatriates and their families tended to focus on Japan rather than their host country [Trevor 1983], [White 1992].

However, along with the globalization of Japanese business in Asia, Japanese expatriation has changed. Dispatched male managers are still at the center of management, but there are also Japanese workers who move abroad by themselves, entrepreneurs and those who migrate to their spouse's country of origin. Their experiences and future prospects have become diverse, reflected by their different backgrounds, motivations, and positions among Japanese expatriates. In addition, the economic recession in Japan and the growth of Chinese and other Asian economies has changed the dominant position of Japanese companies.

I have conducted life-story interviews and field research in Hong Kong and Shanghai since 1996, when Japanese companies expanded their businesses there. In the presentation, I mainly discuss three points. 1) Has the gender imbalance of the Japanese expatriate community in Asia changed? 2) How has the competition between Japan and other Asian countries influenced the lives and thoughts of diverse Japanese expatriates: Have they become more cosmopolitan or transnational? 3) How do expatriates manage the increasing gap between their realities abroad and the ethnocentric ideas in Japan?

Have Working Women's Stressors Decreased Under the Policy of Promoting Women at Work?

Purpose Promoting women at work is a critical issue in Japanese society, and the Japanese government and corporations have made efforts to address it. Prior research identified two unique stressors for female Japanese corporation workers: work-family conflict and workplace discrimination, which also prevented women from being promoted. This study aimed to examine if such stressors still exist and identify additional stressors for working women.

Method I conducted one-to-one semi-structured interviews from October 2016 to March 2017 with working women (five managers and six professionals in corporations) aged between 30's and 50's, as this age bracket is associated with stressors such as responsibilities at work, childcare, elderly care, and sickness. Information on current job, position, career history, faced work stressors, and coping strategies was collected.

Results No interviewees mentioned a discriminatory work climate. Three stressors were identified: work-family conflict, pressure to succeed as female manager, and difficulties to maintain good relationship with partners. Work-family conflict was observed among interviewees with children under 18 years old. However, the impact of this conflict depended on the workplace. Supervisor's understanding, family-friendly climate, and flexible work arrangements through IT helped working mothers to cope with work-family conflict. Women managers reported often facing pressure to be successful. In addition to heavy workloads, female managers needed to produce high-quality work to obtain positive evaluations and succeed, otherwise companies may hesitate to promote more women. Some female managers reported difficulties to maintain a good relationship with their partners because of lacking time to spend with them. They also mentioned that if promoted to higher positions, their partners would have mixed feelings because the wife's social status might be higher than the husband's.

Conclusion Working women face stressors in relation to promotion to higher positions and their private lives. Interviews need to continue to increase the limited sample size.

SAKAMOTO, CRISTINA* (*The University of Chicago*)

Global Forms, Local Contents: Cultural Expressions and Cosmopolitanism in American Cities

How does cultural diversity relate to amenities and industry structures in major American cities? Are we becoming more cosmopolitan? In this dissertation, I explore the global and local dynamics relating to the growth of cosmopolitanism and industries in cities. More than just the influence of corporations and foreign investments, globalization develops faster as people participate in this process in their everyday life, by consuming ideas produced somewhere else, and by exporting their own. Immigrants are the most active participants of globalization, as they express their cultures in the form of businesses, arts, community activities, social media, and more, which locals notice, discover, participate in, and enjoy. Thus, people may become cosmopolitans by exposure without traveling too far. Cities with more diverse populations tend also to attract more diverse industries and amenities, in order to cater to different tastes. So, does diversity attract diversity? While this may be seen primarily as a result of large populations, preliminary results show that foreigners tend to concentrate in areas of high diversity, lower crime, and high industry diversity. Some ethnicities also tend to concentrate around ethnicities of similar culture or close countries of origins, while others tend to assimilate with other more distant cultures when they migrate. There are different trends concerning different ethnic groups in the way they concentrate in American cities. Using data science and mapping methods, and

the American Census' data, I analyze how cosmopolitan cities attract migrants and industries. American cities have shifted from manufacturing and retail towards health, education, and professional and technical services, as the influences of globalization, automation, and the internet grow.

Suicide and Face: Suicides and Society in Japan from Goffman's Point of View

In 1998, the number of people who committed suicide in Japan increased 1.35 times from the previous year. The high-rate of suicide continued for the next 14 years. This study analyzes this trend in terms of personal faces. The term "face" was developed by Erving Goffman as a sociological concept; it is a key term in his studies. Although Goffman did not research suicides, he was influenced by the sociology of Émile Durkheim, author of *Le Suicide*. Today, suicide is apt to be discussed in terms of solidarity, integration, or social capital. These perspectives arise under the influence of Durkheim's *Le Suicide*, written in the 19th century, and a valid question is whether these perspectives are currently relevant. According to Christian Baudelot and Roger Estabiet, trends in suicides changed in the 20th century. Contrary to Durkheim's conclusion that excessive individualism increases suicides, Baudelot and Estabiet found that a type of individualism (creative individualism) developed in the 20th century and had the power to suppress suicide rates. Their study suggests that the framework of *Le Suicide* is not entirely applicable to contemporary suicide. This suggestion is very interesting and important, but these authors did not clarify the influence of social relationships on suicide rates. This study examines suicide through Goffman's perspective, using it to clarify society's influence on individuals. Goffman's use of the term "face" is very important. This study suggests that contemporary suicide can be seen as a "face-loss" problem. From this point of view, the rapid increase of suicides in Japan can be related to its delayed transition to a gender-equal society: today, the faces of young people are seen as problematic.

Community Perceptions of Local Knowledge for Community-Based Flood Risk Management: The Case of 'Zamakolo' in Malawi

In the developing world, community-based disaster risk reduction (CB-DRR) presents a well-established approach for reducing vulnerabilities of rural communities. CB-DRR interventions have emerged as a way to foster community participation, create empowerment and integrate local perspectives. The premise that local knowledge (LK) constitutes an important determinant of community resilience to disasters has been increasingly promoted in scholarly work and international policy arenas. However, despite the 'promise of inclusion' of CB-DRR, realities from the ground imply that participation, and consequently, inclusion of LK, is often limited. In addition, existing literature is largely focused on the documentation of LK, without a deeper understanding of how communities, as creators, holders and users of this knowledge perceive its usefulness for disaster risk reduction. This paper explores the realities of LK in community-based flood risk management (CB-FRM) in the Lower Shire Valley, the most vulnerable region affected by annual flooding in Malawi. Through a thematic analysis of a series of focus group discussions, key informant interviews and field visits in 12 rural communities (conducted April 2016-September 2017), the study explores the prominence of LK in existing approaches for dealing with flood risk. The results indicate a vast array of methods, embedded in the local tradition, understandable by community members and not requiring any formal educational or external support. However, participants also reported a perceived decrease in the role of LK, driven primarily by climate change and environmental degradation, which threatens its future use. Accordingly, participants expressed a general preference towards the type of "modern" CB-FRM approaches, introduced by external organisations, that do not explicitly integrate LK. Overall, experiences from Malawi suggest the need for a system for documenting and preserving LK, better integration of LK into the work of development partners, and finally, rethinking how communities' confidence into their own capacities could be increased.

Mobilization through Emotional Labor: How to Do "Good" Emotional Labor

I will try to show some aspects of emotional labor supported by the neo-liberalism in contemporary Japanese society.

When the idea of Emotional labor was invented in 1980' at the U.S., a lot of scholars have criticized new style of alienation by using this idea. Then, this idea mainly focused on mental exhaustion, considering that the structure of works had become under the service industry. So, a lot of human labor had become emotional labor, so, many people feel fatigue to do emotional labor.

Since the 1980', many theoretical and empirical studies have been proceeded to find out the effects of alienation in the emotional labor. Some research emphasized some negative incidents influenced emotional labor, others suggested some positive factors relieved workers.

Among them, some concepts (length, supervision, gender, autonomy,) have been discussed around the positive/negative aspects of emotional labor. However, these studies have slightly considered the social changes around the emotional labor today. So, I will try to show them by analyzing neo-liberal state in 2000' Japanese society.

At first, almost all of works become emotional labor, and people become to be mobilized to be a "good" emotional workers. A lot of industries have become automation, or shifted overseas. Moreover, manually emotional labors have done by the lower-class, or foreign workers.

So, people want to get more high communication skill not only at the company but at the schools to get good job, social status, and recognition. Then, some activities, books, and Japanese traditions are praised as a source.

Secondly, AI has been a tool of the "good emotional labor". Some companies use AI robots as emotional workers directly, and other companies use them as supporting tools for predicting clients' hearts.

Through them, I will show why people will do emotional labor.

Complementary and Alternative Medicine: Theories of Marginality and Precarity

Complementary and alternative medicine (CAM) practitioners have long been regarded theoretically as occupying a position of marginality in Western healthcare, particularly in face of the power of the medical profession. The contours of this marginality, based in part on the exercise of professional self-interests, are outlined in this paper from a neo-Weberian perspective as they have developed in particular socio-historical circumstances. Here it is acknowledged that there are differences in the standing of specific CAM therapies, ranging from subjugated medical incorporation to total exclusion, and that their situation has been subject to change over time and variability across different socio-political milieus. CAM has not been analysed as yet, though, in terms of the interlinked precarious position that some constituent groups of its practitioners can be seen to occupy. With illustrative reference primarily to Britain in the context of other Western societies, this paper also considers in novel fashion how far CAM therapists fulfil aspects of precariousness alongside parallel members of a putative precariat working in health and other public and private services – such as low pay, short-term contractual positions and high rates of part-time employment. In so doing, it further examines theoretically and empirically how far CAM practitioners might develop a common consciousness as recent neo-Marxist theorists on the precariat have suggested – as part of a new class of workers involved in regime challenge and change.

The Reverse Politics of Professionalisation in Britain and Russia: A Counterposed Volte-Face By the State

This paper explores the varied relationship between professions and the state over time and place from a neo-Weberian perspective. In this respect, in Britain there has been a volte-face in state policy over the professions in general and medicine in particular since the 1970s/1980s. From being an untouchable and much extolled group, professions became subject to attack following the counter culture and the main political parties in a neo-liberal society thenceforth sought to rein in their independent self-regulatory powers. This was particularly the case in relation to medicine following a series of scandals in medical care, most significantly involving the serial killing Dr Harold Shipman. Perversely, a reverse policy volte-face took place in a parallel time period in Russia where professions had been politically disestablished by the state as class enemies under a socialist regime up to the 1970s/1980s. Since that time there have been attempts to re-establish professionalisation, not least in medicine, following glasnost, perestroika and the deconstruction of the Soviet Union. The political backdrop to these counterposed changes in the two societies concerned is highlighted in this paper, accentuating that trends in professionalisation in medicine and elsewhere involve more than just assessments of the technical expertise involved in knowledge work as they are managed in different ways in different social-political contexts based on diverse conceptions of legitimated power and justice.

As a postscript it is intriguing to note that both of the state policy directions in British and Russian medicine have recently stalled to some degree for diverse political reasons, related in part to the willingness of the state to fully take the respective reforms forward.

Seamless Inclusion. a Study of Best Practices from Integration Educations in Canada and Finland

How can integration educations facilitate the more seamless inclusion of migrants into working life and civil society? At present this process is time-consuming and many migrants assert that they lack opportunities of fully participating in society before having completed years of language studies resulting in an atrophying of professional skills and feelings of frustration. This paper discusses our forthcoming comparative study of integration educations as organized by two vocational schools in Finland and a LINC program in Canada. The aim of the study is to identify best practices of inclusion of refugees and migrants in the labor market and civil society of the receiving countries. Our paper will discuss key contested terms such as diversity, inclusion and integration, how these concepts are defined and shaped by the institutional structures within both societies, and how these in turn frame the planning and implementation of integration educations in the partner vocational schools. Our assertion is that supporting students' own interests and competences should become central points of departure in the realization of integration educations, as well as in the creation of contacts with the labor market and civil society. Our data consists of background documents and preliminary interviews with teachers, planners and support staff involved in integration programs.

Transnational Bonding: Social Ties and Resources Among Filipino Families

This paper discusses the significance of social resources in the lives of both Filipino labor migrants in Finland and their family members in the Philippines. Social resources are framed in terms of social networks and ties providing both social and economic support for the families. These resources can encompass the exchange of information, guidance and emotional support, for example. The paper illustrates how different kinds of resources are interwoven in the migrants' networks. Furthermore, it shows how and by whom these resources are transformed into useful forms of capital or remain as constraints in the actors' lives. By taking the actors in both the sending and receiving states into account, it is possible to obtain a clearer picture of how resources, networks and forms of capital shape the migrants' settlement into their new surroundings without forgetting those in the home country. The paper argues that transnational activities work as supportive, bonding resources particularly during the early settlement period for the migrants and the ones left behind. However, the significance of the informal social support cannot be fully grasped without taking into consideration the formal social protection, such as the social security systems of both countries.

The Feasibility of Obtaining Valid Inferences from Nonprobability Surveys

Survey data collection costs have risen to a point where many survey researchers are abandoning large, expensive probability-based samples in favor of less expensive nonprobability samples. The empirical literature suggests this strategy may be unwise for many reasons, among them probability samples tend to outperform nonprobability samples on accuracy when assessed against population benchmarks. Nevertheless, the attractive cost properties and convenience of nonprobability samples suggest they are here to stay. In this talk, we present recent empirical research on the strengths and weaknesses of nonprobability samples for survey inference. We present results from various

sources of probability and nonprobability data and attempt to establish some middle ground between these two sampling streams.

How Do Rationality and Empathy Deal with "Well-Being" and "Well-Dying" in Organ Transplant and Life-Prolonging Medication?

Weber's typological theory of means-end rational, value-rational, affectional, and tradition has so far been taught as major sociological theory at university education. However, present behavioral economics and evolutionary psychology teach us that means-end rational decision is also based on heuristics and emotion which have innately been constructed in human evolution. If we looked at various aspects of our life and death in secular and religious lives, we would know the interactive boundary between rationality and empathy.

In this paper I will first illustrate the brief history of organ transplantation and its current condition in Japan, in which most Japanese people hardly recognized the medical and legal definition of brain death and felt conflicted over donating families' living organ and staying with dying family until they stop breathing and suffer cardiac arrest. Medical experts and mass media revealingly tried to convince the public about the means-end rationality of altruistic organ donation. However, a few Japanese religions opposed organ transplantation from their religious perspectives. The second example is life-prolonging treatment relying on artificial breathing and nutrition by gastrostomy tube and central vein infusion at hospital and nursing care home for the elderly. Increasing longevity in Japan may cause a rise in anxiety among Japanese people, as they are getting more worried about taking care of their elder parents, exhausting own living expense in their 80s and 90s, and suffering from dementia. Recently, the concept of dignified death and national death have been discussed among ordinary people who begin to prepare in advance for the directive of medication and funeral in the end of their life time. "Well-dying" could be an important topic in both private and public sphere, involving rational and empathic decision and interaction among concerned people in Japan.

Older People and Data Quality in Surveys. Does Measurement Error Increase with Age and Deterioration of Cognitive Abilities?

In an aging society, the availability of good quality survey data is key. In particular, longitudinal surveys of older people are very powerful research resources to study social inequalities and monitor older people's health conditions. It is not surprising that a number of longitudinal surveys of older people has been conducted in recent decades, both in the U.S. and in Europe. The relevance of these surveys is undisputed. However, there are very few studies that systematically assessed data quality in longitudinal surveys of older people (Kalwij, 2010; Gaertner et al., 2015).

This paper aims to evaluate the quality of the survey data in the Survey for Health and Retirement in Europe (SHARE). We draw on Lynn and Lugtig (2016)' theoretical framework to assess the effect of aging, and in particular, of changes in respondent cognitive functions, on a number of indicators of measurement error, including heaping and don't know answers. Our working hypothesis is that aging is associated with poor reporting. Controlling for age and educational level, we expect to find a positive relationship between a deterioration in cognitive functioning (measured with two indicators of short term and long term memory and mathematical skills) and the occurrence of heaping and don't know answers.

We use Wave 1, 2, 4 and 5 of SHARE data. We intend to employ a set of multilevel models and, in particular, to use growth curve models (GCM) which are appropriate statistical techniques to model change in a dynamic framework. Results from a preliminary analysis have shown that the relationship between aging, cognitive functions and survey data quality and quite complex. E.g. For heaping, cognitive skills do not seem to play a role whereas for don't answers they seem to have a negative impact.

The Social Actor: A Critical Appraisal of the Palestinian Context and Its Challenges

There is no doubt that the arrogance and political violence Palestinians are forced to endure is unmistakably one of the most pronounced and harrowing experiences of the 21st century. Numerous forms of psychological damage to Palestinians are perpetrated against this population under Israeli occupation and colonialism.

he colonial context generates psychological and political repercussions that create a fertile environment for psychological disorders and mental illness that

are expressed, in the most severe cases, through anger, rebellion, and tension. The environment of violence rebounds on Palestinian society in the absence of an inclusive liberal vision.

Accurate psychological diagnosis is ineffective since it is devoid of the value of cultural and national content. Deciding the treatment for psychiatric patients is impossible because the policies and practices of Israeli colonialism continue, and therefore, the causes and factors leading to the mental disorder, as well as the problems and challenges Palestinians face, are not included in the appraisal of their cases. Moreover, psychosocial and traumatic conditions and adaptation are measured solely by exaggerated quantitative digital statistics. Psychological trauma, behavioral and emotional disorders are unable to respond to the techniques associated with Western diagnosis and treatment.

This article is based on a critical vision that attempts to highlight the importance of the social actor in the Palestinian context as a whole. It includes basic ideas about the author's understanding and expectations of all the aspects associated with the role and profession of the social actor, as a transforming mechanism of issues in the Palestinian context.

If we accept that Palestinian society is vulnerable to psychological setbacks, its recovery, according to Fanon (1972) lies in the resistance against the colonizer.

Keywords: Mental illness in Palestinians; Detrimental social factors in Palestine; effects of Israeli colonialism on Palestinian mental health

Efectos De La Apertura Comercial Sobre La Distribución Del Ingreso y El Crecimiento Económico En México, 1990-2016

El modelo de crecimiento liderado por exportaciones, implementado en México como respuesta a la crisis de la deuda de la década de los ochenta, tendría que catalogarse como un modelo exitoso, ya que durante el periodo de 1995-2016, los acuerdos comerciales firmados por nuestro país se multiplicaron, las exportaciones crecieron a una tasa promedio anual de 7.64%; y actualmente éstas representan una tercera parte del PIB. Sin embargo, este éxito no se refleja en un sólido crecimiento de la actividad económica de nuestro país, que a su vez incentive mejores niveles salariales y una distribución más equitativa del ingreso; además de que se da en un contexto de déficit crónico en la balanza de cuenta corriente.

En este trabajo se analizan las causas del fenómeno antes descrito, un exitoso modelo exportador con un pobre desempeño económico de largo plazo, y se explica que esta paradoja es resultado de la forma en que la economía mexicana se insertó en las cadenas globales de valor, y que el deterioro de la participación de los salarios en el producto, provocado por un modelo de *crecimiento dirigido por beneficios* (profit-led growth), condiciona un lento crecimiento del producto y, en consecuencia, una mayor desigualdad del ingreso.

Enclosing Beauty and Privileges: Disputes over the Production of Exclusive Urban Spaces in Bogotá, Colombia

Over fifty years a group of upper class residents in Bogotá have organized and relied on their association to create a beautiful and secured neighborhood surrounded by nature and principles of good taste and high standards of living. The production of such an exclusive space with zero levels of criminality and violence contrasts with the 60 years of armed conflict that Colombia endured until the recently signed peace agreement and with decades of strikingly high rates of homicides. The traditional founders of this model see it a civic and moral legacy that they are willing to defend with determination against the city hall and newcomers that do not share their codes of manners. The previous city administration, though, considered it an unviable privatized pattern of dwelling that should be intervened since it reproduced privileges, an unequal enjoyment of space, and the exclusion of others. In this paper we will discuss how these disputes and tensions over of the meaning and uses of urban space pose many dilemmas to face the democratic principles of justice and equity that should prevail while facing the limits of the city growth.

Driving Forces of Social Institutions on Climate Change Policy Support in Iran

Previous research has examined the role of individuals' beliefs, knowledge, the NEP, etc. on climate change policy support (Takizi, 2015), but comparative work on social institutions has remained largely understudied. To address this gap, the present study resorts to institutional theory to investigate the impact of societal institutions on climate change policy support. Our empirical context is Iran. The Iranian government has launched a national strategic plan aimed to adapt and mitigate the risks of climate change as the country is increasingly facing multiple environmental challenges. In certain areas such as the Golestan and Ghazvin provinces, people are experiencing water shortages and desertification. As such, the government has been trying to gain local people's support for its climate change program; yet, applying a top-down (Command and Control) policy has not yielded positive results (Ebrahimkhani, 2016). In our study, we used a mixed method approach. We carried out semi-structured qualitative interviews with 26 people to explore the major social factors that shape people's behaviors. We also collected quantitative data from 240 people selected randomly. Interviews and data collection were carried out in 2017. Our comparative findings show that while personal factors (e.g., environmental knowledge, personal efficiency and information resources) and government institutions do not play a significant role in shaping people's behaviors, the institutions of religion and family in both province do generate support for climate change policy. The results of the study suggest that to make an effective agency-structure relationship (Giddens, 1984) in Iran, policy makers should consider the structural factors like religion and family to encourage climate change policy support.

SALLAWAY-COSTELLO, JAKE* (*Birmingham City University*)

Meat As a Material of Food Activism: An Ethnographic Investigation of the Relationship between the Consumer and the Consumed.

Facilitating social interaction, integration and even empowerment, food is a commodity of community (Vivero-Pol, 2017). Public health nutrition research typically focuses on either the consumer or the consumed; the intricate relationships between the individual, their dietary practices and the food they eat is seldom explored. Further considering the role of food premises, equipment and transport, the diet is a complex entanglement of physical materiality and social phenomena.

Community, Culture and Meat Consumption is a doctoral research study investigating the cultural meanings of meat consumption. This highly immersive ethnography saw the researcher spend a year of fieldwork with the Birmingham Foodie Community; a network of food activists across the West Midlands (United Kingdom) working to address the social and environmental injustices of the global food system. From what initially appeared to the researcher to be a small group of engaged activists emerged a fast-growing community; a busy assemblage of thousands of individuals, premises, foodstuffs and community facilities. Physical materials were central to the sense of social inclusion, perceptions of authority in volunteering work and questions concerning the "ownership" of both the material assets and the community as a whole. It became apparent that the community was not merely a social network, but a unique entanglement of people, food and the many material resources that brought the two together. The researcher felt a strong sense of community membership and belonging, challenging the perceived dichotomy of materialism and inclusion.

This paper will examine the critical role of materiality in the Birmingham Foodie Community, with a focus on the function of territoriality and perceptions of ownership in the third sector. The value of food, and meat in particular, as a commodity of community will be explored in relation to the complex sociocultural meanings of the diet.

SALLING OLESEN, HENNING* (*Roskilde University*)

Professional Identification, Social Responsibility and Democracy

The paper will consider the historical relevance of the notion of profession in a post industrial society and discuss a possible new constitution of professions, with a particular view to dynamic factors of new work domains (e.g. human services) and changes in the specific nature of work (technological shifts).

Taking for granted that the privileges and power of professionals based in closure and monopolized skills are being undermined the concordat with the rest of society will have to change if professionals should play a key role in future labor relations and knowledge based work. The vision of the paper is a new professionalism, in which the particular specialist knowledge and skills are executed on the basis of the professional identification and social responsibility, and in an interactive and more democratic relation with clients/users. The question raised is if and how professionals can identify with such a new professionalism and how they could reconfigure specialized knowledge and develop democratic (dialogic, social) competences to build such a new legitimacy of professionalism.

In order to illuminate this general question the paper will explore the subjective aspects of professional work and professional practice on microlevel: How is professionalism based in the identifications of individual professionals? How are the responsibilities of professions (re)negotiated in everyday life of professionals? How are enactments of responsibility embedded in everyday practice and inter-

twined with knowledge – the formal and political responsibilities of professionals with their specific knowledge?

The paper will draw on empirical research of learning and identity processes of individuals in several professions which are in a process of societal change (general medical practitioners, nurses, engineers, teachers, priests). Wherever possible it will draw attention to the importance of gender relations

SALLING OLESEN, HENNING* (*Roskilde University*)

Psycho-Societal Interpretations in Life History Research

The paper will present a development of life history research in education and learning research, in which psycho-societal interpretations play a key role. The horizon of the approach is the lifelong subjective engagement in intended as well as unintended learning, in formal education as well as in everyday life. The paper will describe the reasons for adopting and developing life history approaches by summarizing how a political and practical engagement in adult education and learning led to a critique of the horizon of academic pedagogy. In order to understand learning and education from the perspective of learners the need for empirical studies in the situation and life experiences emerged, and the tradition of (auto)biographical research offered a proven experience for a societal understanding of learning processes.

Life histories represent lived lives past, present and anticipated future. As such they are interpretations of individuals' experiences of the way in which societal dynamics take place in the individual body and mind, either told by the individual him/herself or by another biographer. The Life History approach at Roskilde University was developing from interpreting autobiographical and later certain other forms of language interactive material as moments of life history, i.e. it is basically a hermeneutic approach. The paper will present two different ways of handling biographies and life histories, and then go deeper into the epistemological and methodological aspects of psycho-societal interpretation. The psycho-societal interpretation of biographical accounts aims at breaking the theoretical and empirical dichotomy of the social and the psychic, both in the interpretation of learning processes and more generally in the theoretical understandings of language, body and mind. Finally it presents examples how such interpretations organized by the concept of (life) experience can illuminate professional and vocational identity building as well as adult learning in general.

SALLING WEBER, SØREN* (*Roskilde University, RUC*)

Professionals' Experiences Integrating Workers with Mental Health Problems on the Danish Labour Market

Mental health problems are apparently a persistent barrier for labour market participation. However, an increasing political-economical pressure to activate workers and ensure labour market participation in the Danish welfare state aligns with users' appeals for inclusion in a strong call for contextualized and non-dogmatic understanding of the relation between labour and mental health problems. This paper analyses what welfare professionals' experiences integrating people diagnosed with mental health problems on the Danish labour market means for their understanding of the interplay between wage labour and mental health problems.

I draw on biographical and thematic interviews from an ongoing investigation of professionals' work with the method Individual Placement and Support in the Danish welfare system, which I construe as an extreme case of the societal attempt to integrate people with a diagnosis on the ordinary labour market.

Theory of Hartmut Rosa and Claus Offe is used to conceptualize the tensions in the work between socio-cultural acceleration of the differentiated welfare institutions, the socio-political attempts to activate the workers and the incessant changes needed in the conduct of life when participating on the labour market. The concepts of experience ('erfahrung') and biographical learning ('biographicität') are employed to show how the professionals process these contradictions.

The analysis focuses on the paradox that the activation of the 'workers' further convolutes the relations between the 'user', 'client', 'citizen' or 'patient' and the various professionals. This, in turn, generates learning potentials for a changed, contextualized understanding of participation in wage labour with a psychiatric diagnosis. However, in spite of an increasing suspicion that mental unrest is socially co-determined and mediated, the inter-professional collaboration is anchored in an individualized psychiatric diagnosis. I discuss what this means for the learning outcomes of the involved professionals.

The 'Welcome Student-Refugees Program': An Analysis of the Interviews

The Vrije Universiteit Brussel developed 'The Welcome Student-Refugee' in 2015-2016 as a response to the great arrival of refugees. Its main purpose is

to help recognized refugees start or proceed their studies at the university. It allows them to start a regular university programme by applying on a separate online registration application. In the academic year (2016-2017), 45 recognized refugees started a bachelor or a master's course at VUB: 40 Masters and 5 Bachelors. The majority follow the courses in English (41/45). The VUB desired to have an idea of the main difficulties these students encountered during their first semester at VUB. Therefore, Dr. Mohamad Salman (Head of the program) and Dr. Florian Trauner started a small investigation in collaboration with five students (political sciences and teacher training). They created a main questionnaire which would be used to conduct interviews with every refugee student that started his/her studies at VUB this year. The 45 students were contacted from February until May 2017. Although the number of respondents is small (13), it can give an idea of the challenges these refugee students encountered during their first semester at the university. This paper gives a summary of the social, financial and administrative difficulties based on the input of the interviews. Each refugee student is different and encountered different complications, nevertheless, some challenges are general for a big part of the interviewees or for all of them.

Back to the Basics? Labour Rights Institutions and Associational Power in Cambodian Labour Strategies

The analysis of new power resources has made an encouraging contribution to the understanding of possibilities of labour revitalization, particularly in the context of the Global North and middle income countries with relatively strong institutions. However, in labour-intensive industries such as the garment sector, globalization has implied the transfer of production away from these countries, into contexts where low salaries are guaranteed by weak legal and institutional frameworks.

This paper contributes to the discussion on labour strategies by examining the potential and limitations of new power resources in a low-income context characterized by a weak rule of law, namely Cambodia. Based on interview data collected during 13 months of fieldwork, the paper shows how Cambodian unions have successfully used institutional and societal power resources to build strategies that draw on innovative regulatory institutions such as the Labour Arbitration Council, buyer's social responsibility commitments and mobilize international networks to pressure employers. These resources were also used in the 2014 minimum wage campaign that led to unprecedented salary gains for Cambodian garment workers. However, this show of union power triggered an important judicial and political backlash by the government, risking to undo labour's newly built power. The paper suggests that a more careful analysis is needed to assess the replaceability of labour's traditional power resources, structural and associational power. Associational power – understood as political leverage – emerges as a key resource to guarantee the sustainability of pro-labour institutions and their impact. Furthermore, it draws attention to the potentially negative impact that private regulation can have on labour movements, if it promotes a depoliticized conception of labour rights that downplays the centrality of trade union rights and labour's political role.

SALMIVAARA, ANNA* (*University of Helsinki*)

Defending Labour and Land. Challenges in Finding Common Ground in Cambodia.

Alliances between trade unions and other social movements would be essential to resist neoliberal hegemony and oppose policies that prioritize the needs of corporations over the well-being of citizens. This paper contributes to the discussion about these alliances by examining the case of Cambodian civil society, where joint mobilization between trade unions, social movements and the political opposition in the aftermath of the 2013 national elections brought unprecedented gains to workers. However, this alliance was unique and short-lived, which is what the paper aims at understanding, drawing attention to the compartmentalized understandings of land grabs and labour rights violation, as aspects of neoliberalism.

Based on interviews conducted during 13 months of ethnographically oriented fieldwork in Cambodia, the paper focuses on the relationship between labour and land rights movements, pointing to the importance of understanding labour struggles as political. Social movement unionism has been largely absent in Cambodia, and for the most part, unions are characterized by industry-focus and male-bias. The paper points to the authoritarian political context, but also to certain tendencies of labour's international allies, in contributing to this situation. The focus of labour strategies has shifted outside the country, to international buyers, which contributes to a separate understanding of the forces behind land grabs and violations of labour rights in garment factories. Similar tendencies of compartmentalized understandings are also present at the global level, between labour and environmentalist advocacy groups. While the business and human rights agenda might provide a platform for bringing together movements that defend workers and natural resources against the interests of multinational companies, wide political framing of the problems is central.

Studying the Content and Construction of Ethical Lives in the Context of Affluent Society. a Case of (im)Moderation in Everyday Food Consumption

Foodways reveal fundamental aspects of us as humans, including our attitudes towards and relationships with others and the environment as well as the most pivotal individual, social and ecological problems of our time. This paper provides preliminary insights from a study that explores how people who do not necessarily identify as religious and who live in diverse or secular societies construct their identities in relation to and in cooperation with other people and the non-human world, by taking foodways as a starting point. The study starts from the premise that even in non-religious settings, as “secular spiritual disciplines” (Grummet, 2014:4), foodways constitute a sphere of everyday life where meanings, significance, purpose and order are constructed and maintained. In everyday food consumption, we are constantly invited to pose the question of how to lead an ethically sound life in the midst of culture characterized by excess and waste. They thus provide a window into analysing how the question of how much is enough is posed and dealt with in today's affluent world. The study focuses in particular on the virtue of moderation: What is considered as adequate, suitable, sufficient or reasonable with regard to food consumption in an affluent society? By doing so, the paper provides food for thought into theoretical reflection on ordinary ethical conduct and lived (non)religion in the secular contexts.

The Double Movement's Continuum

Karl Polanyi's double movement continues to provide a useful concept for understanding different forces in the organisation of capitalism, even though he himself was relatively pessimistic about the successes of the countermovement. In reality, outcomes appear more varied and often less apocalyptic than Polanyi envisioned. To better understand the limits and potential for transforming capitalism, I argue that portraying the double movement as a stark dichotomy between market representatives and its countermovement may not be very helpful. Instead, the double movement is often a continuum from pro-market fundamentalists, to more liberal market representatives, to actors that are only marginally critical of market society, to the fiercest anti-capitalist critics. To understand (the lack of) transformation, it is important to acknowledge the varieties and interactions within and between actors on the different sides.

Starting from my research on large-scale land acquisition in the Global South, yet also discussing many other expressions of market society, I argue that to explain outcomes we have to particularly include the (potential) impact of 'extreme' forces on both sides of the continuum – i.e. market fundamentalists and anti-capitalist critics. These forces may often not accomplish their aims, yet due to their vocal presence they may pull outcomes towards more or less equal distribution. In a strict sense, Marx's and Hayek's hopes may not have become realities, yet they have strongly influenced past and current realities of capitalism. With Hayekian thinking having the upper hand in recent decades, transformation will accordingly only come from fierce opposition able to persuade large parts of the continuum of letting capitalism work for the many and not for the few. This opposition, I furthermore argue, needs continuous attention, because countering capitalism will probably always remain ambiguous and unfinished – yet we may nevertheless accomplish fairer outcomes than we currently do.

Influence of the Alcohol Industry on the Overall Reform of the Law on Alcohol in Finland

This is a qualitative study whose objectives were first, to find **why the initial alcohol laws were changed** in Finland to the proposed ones which will instead lead to an increase in the sale and consumption of alcohol and second, **what means were used by the alcohol industry to make the change possible**. To explore these objectives, the following were the two **research questions** of the study: (1) why were the initial alcohol laws changed to the proposed ones which will instead lead to an increase in the sale and consumption of alcohol? and (2) what means were used by the alcohol industry to make the change possible? To answer these research questions, the data collected for this study was divided into primary and secondary data. **Primary data** was collected through **interviews** with experts who had participated in the preparation of the Alcohol Act namely: politicians, civil servants, researchers and industry actors. The experts were selected on grounds that as members of the parliament or senior officials, they had first-hand knowledge of the influence of the alcohol industry on the overall reform of the law on alcohol in Finland. The **data was analyzed** through qualitatively **content** and **thematic analyses** since the two are often used interchangeably. The findings revealed that the original purpose of changing the law on alcohol in Finland was to modernize it because the existing law was too old and had been amended many times. On the other hand, the findings revealed that there were two strategies used by the alcohol industry to lobby for the change in the proposed law. They were active public information lobbying campaign, and personal lobbying contacts with members of parliament (MPs) and other politicians who had positive attitude towards the alcohol industry.

Foreign-Born Scholars in the UK and Their Integration into the Host Country: Comparative Analysis of the Experience of German and Russian Scientists

Increasing internationalization of science is accompanied by the rising level of transnational cooperation and intensified academic migration and spatial mobility. Movement from one place and position to the other is considered not only a desirable but almost a necessary element of an academic career and is typically associated with higher scientific productivity and impact. As a result, science and higher education system in the research-leading nations such as United States and United Kingdom accommodate much greater number of scholars from different regions across the world, and scientific community becomes much more heterogeneous in terms of cultural and ethnic background of its members. But under the pressure of the dominant discourse on scientific mobility as a highly valuable experience indispensable for the realization of one's professional ambitions, the process of adaptation and integration of foreign-born scientists in the new academic environment is assumed to be smooth and unproblematic. In contrast, existing research reports that immigrant researchers encounter a variety of tensions and difficulties in moving and integrating into the host country. Studies also reveal that scientists of non-European origin generally experience more stress and hardships in migration to another country, but tend to explain it by reference to language and cultural distance between the host and home country. Thus, there is a lack of systematic and comparative analysis of the migration experience of European and non-European scholars in English-speaking destination countries. Our paper seeks to fill this gap by exploring the narratives of German and Russian scientists who live and work in the UK: we characterize and compare the difficulties they face, both in everyday life and professional activities, identify key similarities and differences, and address the question of the role of the home and host country context in shaping their migrant experience.

Is Every Job Good Enough for Moving Abroad? Motivations and Desires of German Highly-Skilled in the British Labour Market.

It is not surprising that reasons behind labour mobility may vary across individuals (e.g., for some, higher salary or unemployment in the country of origin would stimulate relocation, while, for others, a desire for occupational mobility). This paper explores the meaning of work for the highly-skilled Germans employed in Britain focusing more explicitly on attributes contributing to job satisfaction/dissatisfaction, the role of work in person life as well as workers' expectation at the workplace. Using in-depth interviews with these migrants provides a unique

case, not only because the majority of the participants had a job-on-job transition, but also because many were contemplating several employment proposals. Analysis indicates that the prospects of a satisfying and exciting job which allows self-realisation was the primary attribute of a desired job. These findings provide support for the relevance of the postmaterialistic values for explaining labour mobility of the highly-skilled. The analysis highlights the interplay between several attributes in the desired workplace abroad, such as direct economic benefits, general atmosphere at the workplace, relations with co-workers and geographic location. Exploring labour migration through the lenses of the sociology of work, contributes to the classical labour migration framework, as it allows taking into account various aspects of job quality beyond pure direct financial rewards which play role in evaluation of jobs abroad.

Foodbanks and Tafeln: Faith-Based and Secular Institutions of Food Provision for People in Need in Germany, the UK and the Republic of Ireland

In our talk, we will present major findings from our research project that compares different European welfare models on various levels. In this project, we assume that welfare state regimes are rooted in religious traditions and therefore develop different 'cultures of poverty'. Based on qualitative data, we analyse worldviews of people depending on social support in various national contexts.

Our paper will have a look at the impact of religious concepts of poor relief on different levels: a) general semantics of welfare, b) the implementation and appropriation of these ideas on an institutional level in faith-based as well as secular organisations, and c) on how deprived and impoverished individuals perceive their living conditions and options within these structural circumstances. Our explanation starts at the institutional meso-level, using interviews (group discussions, biographical and expert interviews) we conducted at foodbanks in the UK, the Republic of Ireland and Germany in order to make our presentation more vivid. Based on these considerations about the general logic of different foodbank systems, we then also investigate how the users of the foodbanks deal with these structural defaults. We show how different and yet entwined the two perspectives on neediness are and reflect on the general understandings behind it of how poor relief should be designed, on semantics of deserving and undeserving poverty, etc.

Irish Travellers: The Identity Construction of an Indigenous Ethnic Minority within the Irish Society

Irish Travellers are a minority of about 30,000 people (Census 2016) in the Irish Society, which became only recently acknowledged as an indigenous ethnic group. However, until today, many Irish travellers live in deprived conditions and are socially excluded from many services and parts of the Irish society. They experience individual and institutional racism and are affected by higher rates of unemployment than the Irish majority, e.g. by health inequalities and low educational attainment (Irish Traveller Movement Report 2014). For centuries, travellers were an essential part of the rural economy in Ireland before they were forced to settle in the second half of the 20th century.

In my presentation, I will analyse the identity construction of Irish travellers based on qualitative data collected in different sites in Ireland. The main reference of the travellers' identity is still the binary drawn between travelling vs. settled people. I will reconstruct different aspects and dimensions of this binary and discuss their implications and consequences. A special focus will be laid on the boundaries between travelling and settled life, on the difficulties of living on its threshold and especially on the possibilities and consequences of a 'crossing of the boundary'. Additionally, I will discuss the problems of a minority to keep and transform traditions in changing life conditions.

Post-Calais As Translation of Institutional Violence: Assessing the Mechanisms of Reception and Relocation of Migrants from Calais

The national policies in regard to the management of migration within the EU context, often reveal the State as repressive and selective, as much as absent. Omission as an option is itself a form of Institutional Violence, one that, in result of its diffuse nature which involves the actions of institutions and agents at the service of the State, is not always perceptible to those who "construct" it, but also to those who "resist" to it. Calais represents a strong case of Institutional Violence,

as much for the absence of a full response to the problem, as for the dynamics of "resistance" of local civil society and migrants in suppressing the State's deliberate absence. In structural violence, inequalities emerge from society's stratification at the economic, social and political level. Several elements facilitate society's legitimization of these inequalities. The socio-economic hurdles and terrorism events in Europe, for instance, have been easing the path for a strong nexus between migration and security. By the same token, the nexus between security and migration legitimizes several forms of institutional violence, both against migrants and native citizens. This paper focuses on the mechanisms of resettlement of Calais, implemented by the French government after the camp's dismantling in October 2016, and how those translate a language of institutional violence. The narratives of relocated migrants in Paris are very relevant, since our approach is more agency-based than structure-oriented. In parallel, we analyze the role of civil society, often ignored by the media, and how it has responded in more or less spontaneous ways, to the absence of the State in providing for migrants. Thirdly, we explore the rationale underneath the French behavior, trying to explain the apparent paradox of a driving-country of asylum and migration policies in the EU, which acts weakly though vis-à-vis the United Kingdom.

RAMALHO, JOSE RICARDO* (Federal University of Rio de Janeiro)

Addressing the Complex Challenges of Globalisation: Union Strategies in the Shipping and Automotive Industries

In the context of globalisation, both the shipping and automotive industries have outsourced and off-shored production. In the case of shipping, this has meant registering vessels with 'flags of convenience' and outsourcing/off-shoring labour supply via the use of third party crewing agencies. In the case of the automotive sector, it has involved the relocation of factories to new areas of production such as Mexico and Brazil, in Latin America, with the implementation of flexible labour relations and low wages.

This poses challenges for trade unions seeking to protect workers and stave off the associated downward pressures on employment terms and conditions.

This paper explores the response of the ITF and national trade unions (representing seafarers in both the developed and developing world) to changes in employment practices within shipping. In parallel, it considers the implementation of International Framework Agreements (IFAs) across the automotive industry and the responses of trade unions in Brazil to downward pressures on terms and conditions in this kind of industry. In doing so, it sheds light on the discussion of the political success of such strategies in securing worker protection and in maintaining the capacity of trade unions to successfully negotiate workers' demands.

Unemployment and Life Course Parenting in Nigeria: Implications for Traditional African Social Security

The phenomenon of unemployment and its effects are not the same in every society. In most African countries and in Nigeria in particular, parents are responsible for the cost of education and/or skill acquisitions of their children, not only for the children to be independent of their parents in future, but for the children to be able to take care of their parents when they are too old or incapacitated to work. However, the rate of youth unemployment in Nigeria (42.24% or about 38.2 million) is making parenting a life course, a situation of 'till death do us part'. This study adopts both qualitative and quantitative methods of data collection. The qualitative method uses in-depth interviews, while the quantitative involves the use of structured questionnaire. The respondents are stratified along parents and unemployed youth in Lagos State, Nigeria. Secondary data from National Population Commission and National Bureau of Statistics were used for the rate of unemployment. The result shows that parenting is a continuum as parents are not only investing in the training of their children, the investment continues even after graduation and skill acquisition, even at adulthood. Parents also take huge financial responsibility in the marriage ceremony of their children and continue to assist the family after marriage, due to unemployment. The supposed independence of the children of their parents are becoming unachievable and the pay-back period, the expected traditional social security, has become a mirage. The paper suggests adequate social policy measures, which include: adequate provisions of social facilities, improvement in educational curriculum, affordable housing scheme, free health care facilities for the aged, unemployment allowances, educational loan, skill acquisitions, diversification of the economy among others.

RC17-325.5SANAGUSTIN-FONS, VICTORIA* (*University of Zaragoza*)SAGAHON, FRANCISCO (*University of Guanajuato*)*Model of Social and Institutional Innovation. a Reflection from the Theory of Moral Agency and the New Institutionalism in Sociology*

In this research, a reflection is made on how public administrations, considered as the instruments for the application of public policies, are increasing their transparent behaviour according to certain indicators. We propose a model of socio-institutional innovation for the implementation of a participatory and open government; also an effective control of agency problems in public organizations, aimed at individual and social empowerment by harnessing the generalization of information and communication technologies, social networks and incidental organizations.

For this and considering that during the last two decades have been applied management logic to public management, a theoretical review of the concepts used since the new institutionalism in sociology is done together with the description of secondary data and testimonies corroborating the theoretical hypotheses, structuring this communication in three parts; firstly, the thesis on the how and why of transparency and accountability in Spain is proposed, starting with the promulgation of Law 19/2013 on Transparency, Access to Public Information and Good Governance, which responds to a citizenship increasingly interested and concerned to eliminate corruption, socially trusted and with greater use of information and knowledge. Then, as a questioning of the above, in the day to day of certain organizations, we reflect on the problem of moral agency in public entities. Finally, a model of innovation is proposed taking elements of the different theories mainly those that come from reflections such as du Gay (2013, 2017) and Du Gay & Lopdrup-Hjorth (2014) about post-bureaucratic 'Public Management perspective and Organizational and State Phobia.

RC21-392.2SANCHES, TAÍSA* (*Pontifical Catholic University Rio de Janeiro*)*Housing and Citizenship: From Discrimination to Recognition.*

What is the difference between living in a place and feeling recognized there? How does this affect people's social relations? How does this affect their access to rights? These fundamental questions mark the lives of those who on a daily basis must deal with issues of recognition within the urban environment. The aim of this paper is to analyse how individual trajectories involving access to housing affect the way in which they recognize themselves as citizens and how they decide to get involved into political activism regarding housing.

Using Dubet's (2013) work on discrimination I will attempt to understand how the lack of access to housing can be understood as a form of injustice and what this means for individuals who undergo such deprivation in everyday life. To develop an understanding of the ways in which individuals respond to spatial inequalities and discrimination against their neighbourhoods is to demonstrate how space is vital for struggles for recognition. Place in this sense is important not merely in terms of the idea of home, but as a space for bringing social conflicts out into the open.

The experiences of the individuals who suffer different types of discrimination are the focus of Dubet's (2013) work. The author explores experiences that people who suffer discrimination share, such as indifference, banalisation and dissociation. Regarding the experience on dissociation, the author argues that discrimination has an impact on people's reflexivity: self-understanding and self-recognition become difficult in the face of the different kinds of injustice that are a part of everyday life. The aim of this work is to discuss the validity of this argument, using Honneth's (2003) work on recognition as a contrast, considering that discrimination regarding housing sometimes lead to involvement into activism.

RC47-794.5SANCHES, TAÍSA* (*Pontifical Catholic University Rio de Janeiro*)*Housing Struggles: Integration, Recognition and Political Activism*

The aim of this paper is to explore possibilities for understanding social movements, particularly those related to housing. It will analyse how housing can influence political action of individuals and how it affects the way these individuals recognize themselves as citizens. This will be done by engaging two different concepts – recognition (Honneth, 2003) and integration (Paugam, 2015). In doing this, I will shed a light on how housing and neighbourhood relations may affect the way citizens come together to act publicly in search of more justice, specifically in relation to public policies and urban democracy. The discussion will be followed by an attempt to connect these issues to perspectives related to urban studies.

Literature on urban sociology tends to portray the experience of living in a city as an "experience of encounter". (MCDONALD, 1999: 45). Lefebvre (1991), for example, proposes that having the right to the city means participating in the decisions and the social life that go on within it. Space appears as a key factor that may encourage democratic participation, for which integration is essential. For Paugam (2015), integration can only be achieved when individuals' rights are

secured by laws or normative ties. For instance, weak citizenship ties may take material form as the absence of documents proving legal belonging to a city. The importance of having rights secured by institutions is also one of the major issues in Honneth's (2003) work. By exploring experiences of disrespect, he offers a new form of interpreting how they can unfold in social tensions that lead to conflict. Using both perspectives is an attempt to understand how individual experiences on housing could lead to collective action.

EL SHADDAI FELLOWSHIP: A Public Sphere

Esmeralda F. Sanchez, PhD

President, PASCHR

This paper discusses the El Shaddai Fellowship as a public sphere. It uses phenomenological ethnography utilizing participant-observant, storytelling, in-depth interview, and triangulation. Highlights of the findings are as follows: fellowship which started with only 12 people increases rapidly which reaches now in the national level up to 2 million members. The regular fellowship which is held every Saturday afternoon from 4p.m.-9pm attracted more Filipinos to engage in this gathering for it changes their outlook and attitude in life. Consequently, their changing lives made them live in harmony with God, with themselves, fellowmen and hopefully with the whole environment. The fellowship starts with the praise and worship songs, sharing of the members' living testimony in living the gospel, praying the holy rosary, celebration of the highest form of worship, the Holy Mass, praise and worship for Healing Message normally delivers by the founder of the movement, finally, the Healing Message. Attendees come to this fellowship primarily for the healing message, the source of their knowledge of God where they develop the virtues of faith, hope, and love. Faith and hope in all the challenges that they face in their everyday life but above all the love for God and others are most important in this public sphere. El Shaddai's fellowship public sphere uses radio, television, and internet. These means of communication reach people world-wide. Listeners over the radio give feedback to the radio announcers, request for prayers, consult their doubts and concerns in life. Those who use the internet, email their concerns and those watching television listens and follow the activities going on in the ground. In conclusion, El Shaddai Fellowship is an important public sphere for many Filipinos.

Keywords: El Shaddai, Fellowship, public sphere

RC30-547.4SANCHEZ, FABIO* (*Universidade Federal de Sao Carlos*)*Unprotected Labour and New Fields of Conflict: New Political Subjects in Public Spaces in Brazil?*

This work aims to examine the non-wage based labour relations and understand its implications for the State and Society. These kinds of labour relations have been referred to as "informal" or "non typical". In this sense, they have been viewed academically and politically as lacking or unviable. However, if it is true that from the perspective of the traditional labour institutions (Unions, State, and the juridical forms of labour regulation) these labour relations are aliens and cannot be characterized but for absence of the key attributes that traditionally have defined labour, in the context of political and economical changes that took place in the past decades, these labour relations are an important part of the accumulation model and have generated new fields of conflict and have been trying to get politically organized, building identity and pushing forward with their agenda. This work proposes to study social movements and organizations which represent unprotected workers - those who are not in the condition that they are employees and cannot be properly considered unemployed. Workers that are exercising gainful activities with work relationships that don't include the contractual relationships of employment (wage) - and the role they play in public spaces for the world of work in Brazil. It is intended to delineate the public invisibility of these workers, the (institutional, political and academic) discourse around these empty sociological subjects, public policies and regulatory frameworks built for these people in the last decade and the trials and possibilities of construction of new political figures and rights. We try to understand the emergence of this new reality and the development of new political subjects with their own agendas and identities. However, although these labour relations and its workers are not informal, they still not recognized in their relation with the State as having rights.

RC18-336.2SANCHEZ, PHOEBE ZOE MARIA* (*University of the Philippines Cebu*)*Philippine's Duterte Administration in His Anti-Drugs War, Anti-Muslim War and Anti-Communist War*

Duplicities rule. First, Duterte called for peace, so the left sat in the peace process but the armed forces continue their attacks at communities. He said he is anti-corruption but dictator Pres. Marcos of the 1970s was given a hero's

burial. He called to protect communities but orders the killing of the poor and the bombing of Lumads (natives). He said he will stop casualization of labor, but sustained Art. 106-109 of the labor code that allows business to employ flexible labor and justified it through a department order. When rido, a cultural dispute in Muslim society took place, he elevated it to ISIS and had aerial bombings even beyond the Marawi City where rido took place. He said land will be redistributed to the farmers, but subjected land reform to the concurrence of landlords in congress. He said government is anti-destructive mining but sustains massive mining.

Thousands of deaths sustain as the war in Marawi and the ever bolder anti-drugs war, killing particularly thousands of poor civilians and youths continue.

Six civil society political leaders and members were murdered at Guihulngan City, Negros Oriental from July 24, 2017 to Sept. 8, 2017. Hence, Mr. Leboy Tecson, Vice-Chair of PAMALAKAYA (fisherfolk organization), was murdered July 24, 2017, Mr. Danilo Salazar and Rene Faburada of PISTON (drivers' organization) were murdered July 28 and August 4, 2017 respectively, Barangay Captain Leodegario Benero, Jr. of Barangay Hinakpan, Guihulngan City murdered August 17, 2017, Mr. Oscar Asildo of Bagong Alyansang Makabayan (BAYAN) (New Nationalist Alliance), was murdered August 30, 2017 and Mr. Luardo Yac of KAUGMAON-KMP (national peasants' movement) was murdered in Sept. 8, 2017. Hence, this paper shall look into the spate of killings and wars that the Duterte administration is engaging amid the socio-political, cultural and economic backdrop of Philippine society.

SANCHEZ ANTELO, VICTORIA* (*Universidad Nacional de Tres de Febrero - PICT2977/CUIT30685256068*)

Temporal Reconfiguration and Social Change: Time Flexibility and Acceleration As New Normative Order. Polydrug Users' Perspective.

This work analyzes temporal dimensions that modulate senses and practices of polydrug users of psychoactive substances (PS) in the Metropolitan Area of Buenos Aires, Argentina. The emphasis is placed on the various conceptions of time and temporal reconfigurations within the framework of reflective modernization. Social changes that have put everyday activities in tension and whose most outstanding attribute is the process of acceleration and social time flexibility.

From 29 in-depth interviews to poly drug users (legal and illegal) of middle sectors, analysis emerges that their practices require a special attention on the uses of the times to denote a flexible subjectivity that allows them to consume without being consumerist, to take drugs without being addicted.

There are a set of implicit rules, classifications and temporal hierarchies that are socially shared. Not sharing them, or not complying with the current social-temporal rules, makes the offender's behavior suspicious, and therefore deviant or problematic. Criteria based on hierarchical temporalities (employment vs. leisure), divided into watertight compartments (from Monday to Friday vs. Saturday and Sunday) and sequential (do not recognize simultaneity of practices) are used to define problematic consumption.

From the perspective of drug users we assume that time is a classifier of practices as normal/adequate and deviant/inadequate. But their everyday experience shows that there is a temporal reconfiguration in terms of time flexibility and acceleration. Thus it is worth asking: In this context of social change, are redefined the ways of classify as problematic or non-problematic the drug use?

VÁSQUEZ, OSCAR IVÁN (*Facultad de Ciencias de la Administración Universidad del Valle*)

Beyond Enterprise: Organizations and Meta-Organizations As a Form of Collective Action in Colombia. 1950-2015

Since its inception, organization studies in Colombia have assumed enterprises, firms, and corporations in the productive economic sectors as its units of analysis par excellence. So far, the research made have contributed to a deeper understanding of the managerial and administrative dimension of this particular type of organizations. However, the theoretical and methodological approaches embedded in the managerial thought have diverted attention from the broader organizational phenomena. From an empiric perspective, the current organization's typology (for-profit, not-for-profit, public /state sector) set rigid boundaries not allowing the appraisal of those features pointing to the fluid and adaptive nature of contemporary organizational entities. Such characteristics make of organizations and meta-organizations social actors in their own right able to meet economic, social and political needs. This paper, drawing on a sociological theoretical approach, presents an analytical and empirical map of organizations and meta-organizations in Colombia in the time span of 1950-2015 and studies their role as actors in collective action. Using an historic-document analysis, it identifies a wide array of existing organizations and establishes their field of action –economic activities; social goods and services provision; politics

and culture; socio-demographic groups; and civic organizations. Furthermore, it characterizes types of meta-organizations assessing the differential power they can exert from their social and political location. Not surprisingly, the meta-organizations with greater influence in the economic and the political are those that originate in the economic activities: Chambers of Commerce, Associations of merchants, professional associations, guilds, and unions. Finally, the paper concludes that in the Colombian context meta-organizations play a strategic role as social actor in collective action. The success or failure achieving the goals of such actions mirror the capacity of exercising economic, social and political power by the individual organizations composing the meta-organizations.

De-Constructing Arab Youth Stereotypes: Youth Street Sociability's and Violence in North Africa

De-constructing Arab Youth Stereotypes: Youth Street Sociability's and violence in North Africa

Jose Sánchez García (JOVIS – UdL)

sanchezgarciajose@gmail.com

In the multiple generalised exclusion of young people in Arab countries the economic situation is not the main factor in this exclusion: in fact, marginalisation from social and political life is its most striking dimension. The frustration and lack of life chances produced not only by limited employment opportunities but above all by exclusion from political and civic processes dominate the lives of young people in the Arab Mediterranean countries (Silver, 2007).

In these contexts, youth in North Africa are producing a very dynamic peer groups associations. A good example is the increasing presence of many football fan associations in North Africa. For young people in these cities, becoming a supporter is a "modus vivendi". In societies with few possibilities to construct a collective identity through other cultural artefacts, being a fan of any of these clubs or play rap, mahragan and electric chaaby is a key factor in defining a "we" in relation to adult society. All these young cultural manifestations could be a double generational gap -facing the State and parental cultures at same time- and a way to take benefit from their marginalized social position.

However, adult hegemonic discourses in Arab countries try to confront these kinds of young initiatives according to their view of their potential danger to wider society and of the representation of young people as a "problem" (Swedenburg, 2012). Accordingly, the communication will explore the behaviours and conducts related to violence (victim or perpetrator) through an analysis of the data obtained on this issue from a European Project entitled SAHWA to challenge classical theoretical perspectives in gangs to apply in youth streets association in North Africa.

The Role of the Citizen in the Political System: Access to Information and Political Participation in Mexico.

In Mexico, the political alternation of the year 2000 resulted in an opening of the political system that has allowed a greater involvement of citizens in it. The first opening of the system was the creation of laws on access to government information from 2003. The laws of transparency and access to information that have been created and reformed since 2003 have been the demand of citizens to know what his government does and does not do. Under the basic premise of "more information, greater political participation", the opening of information from public entities was thought to encourage political participation by citizens in the same electoral processes. After 13 years of entry into force of the government transparency system, we can analyze whether citizens have been motivated to participate politically or the information and transparency themselves are not sufficient tools to empower the citizens of a country. The main question of this work is: does free access to government information imply greater political participation of citizens? This paper aims to show the current state of citizen participation in the Mexican political system through the correlation of government information transparency with political participation in the four federal electoral processes from 2003 to 2015.

In the end, it is intended to show if what we have in Mexico are more participative citizens or if, on the contrary, there are still disinterested citizens of the public affairs of our country. Even when citizen participation in electoral processes is not a sufficient condition to speak of participatory citizens, it is a minimal condition that exists and does so overwhelmingly.

Contribuciones Contra La Violencia En Niños De Educación Básica En México

Actualmente la violencia es uno de los grandes problemas en México, mucho se ha hablado de las conductas aprendidas en el entorno familiar, en los medios e incluso en las escuelas. Sin embargo, la concientización de este problema en la sociedad mexicana es una tarea difícil de emprender, debido a que es multifactorial y se ha incrementado en la niñez el bullying refiriéndose en este sentido a todas las formas de actitudes agresivas, intencionadas y repetidas, que ocurren sin motivación evidente, adoptadas por uno o más estudiantes contra otro u otros.

Como antecedente el estudio elaborado por el Consejo Ciudadano para la Seguridad Pública y Justicia dos ciudades de Guanajuato se encuentran entre las 50 con mayores índices de violencia en el México; Celaya ocupa el lugar 38 y Guanajuato capital el sitio 43 (periódico am, 2015). Los datos anteriores manifiestan una preocupación en las instituciones educativas por la creación de programas que atiendan al sector infantil considerando que la educación es la alternativa para la reflexión y el reforzamiento de valores que incidan en una cultura de la paz.

Esta investigación es de carácter cualitativo, descriptivo, exploratorio y experimental, derivada de los casos reportados cada vez con mayor frecuencia de acoso escolar en el Estado de Guanajuato, México. Se muestran los resultados obtenidos en un pilotaje a través de la estructuración de talleres en un centro de estudios federal con alumnos de primero y segundo año del nivel básico con un total de 265 educandos, a través de dinámicas lúdicas y representación gráfica, los cuales reflejaron que un 37% de estos estudiantes presentan violencia familiar y psicológica lo cuál indica que en su entorno directo formativo las actitudes de abuso y conflicto están presentes desde su primer infancia.

SÁNCHEZ-BARRÍA, FELIPE* (*Pontificia Universidad Católica de Chile*)

La No-Violencia Para Combatir La Violencia. Las Experiencias De Organización y Resistencia En Chile Durante La Dictadura De Pinochet.

Este trabajo explora la relación entre la represión estatal bajo un régimen autoritario y la capacidad de organización colectiva de la sociedad civil, en particular de los familiares de víctimas de violaciones a los Derechos Humanos, los estudiantes, y los sectores populares. Para lo anterior se examina el caso de Chile durante los años de la dictadura de Pinochet (1973-1989). Se observa que durante los periodos de aumento de la represión, los niveles de protesta no desciende de forma importante, sino que modifican tanto el repertorio de la protesta como el contenido del discurso de la movilización. En este sentido, las formas de acción colectiva que más destacan en momentos de alta violencia estatal son las huelgas de hambres colectivas llevadas a cabo por los familiares de víctimas de violaciones a los DD.HH, los "sittings" masivos al interior de las universidades, y masivas "Marchas por la Vida" organizadas por organizaciones populares cristianas. Cada una de estas acciones se caracterizaron por ser formas no-violentas de protesta, lo cual estaba directamente vinculado al rechazo de cualquier forma de violencia, independientemente de su procedencia. En tal sentido, durante este periodo no sólo se reclamó por la represión estatal, sino también por la actividad terrorista del Frente Patriótico Manuel Rodríguez (FPMR) la guerrilla urbana ligada al Partido Comunista de Chile nacida a fines de 1983. El éxito en términos de convocatoria de estas acciones, se debió a la existencia de una extensa red de organizaciones sociales, que otorgaron la posibilidad de experiencias de aprendizaje de auto-gestión y participación colectiva. En suma, este trabajo examina una experiencia socio-histórica reciente para contribuir a la discusión entre experiencias de organización y participación, y repertorios de acción colectiva, en el contexto de un régimen autoritario con alta capacidad represiva.

SANCHEZ-FLORES, MONICA* (*Thompson Rivers University*)

Transactional Autopoiesis: A Pragmatist Lens on Maturana's and Luhmann's Theories of Language.

It has been proposed that the Dewyan notion of transaction ought to be reconstructed in light of the theory of autopoiesis (McReynolds, 2017). This theory was originally developed by biologists Humberto Maturana and Francisco Varela, and later embraced by sociologist Niklas Luhmann. I argue that looking at transaction through the lens of autopoiesis allows for a clearer definition of

the processes whereby the knower and the known are mutually constitutive of one another, and I focus on the realm of language. According to Maturana and Varela, living systems are organizationally closed and structurally coupled to their environment at the same time (synchronically). Their closure allows them to react to outside triggers on the basis of their inner constitution; their coupling permits what can be interpreted as co-constitutive transaction. In this paper, I explain Maturana's theory of linguistic autopoiesis and how it converges with Luhmann's theory of language where social systems are construed as a nexus of communications, autonomous from conscious direction. I criticize his functionalist interpretation, but also rescue his explanation of the production of meaning in demotic (descriptive) language structures, most legitimate in modern communication—but not the only language structure that humans use. Maturana says that human beings distinctively create a separate domain of language (organizationally closed) that is structurally coupled and sustained autopoietically by a complex network of human physiology, experience, habits, and emotion. Thus language can be seen as a system that displays growth in a transactional autopoietic co-constitutive relationship with human beings and their environment.

SANDAKER, SOLVE* (*County Governor of Oslo and Akershus*)

Government and Financing Arrangements Concerning Education and Elderly Care in Switzerland and Norway. A Comparison of Welfare Solutions and Levels in Relation to Local and Central Administration and Democracy.

Government and financing Social welfare and education have roots in earlier history of religion and political movements. In what way are the different solutions in the two countries a result of earlier history? Are the levels of compensation and the overall solutions, good and just outcomes for the people who are dependent upon them? How good and effective are the public and private bodies involved in the governing and supporting systems? Are the half-direct democracy in Switzerland and the representative democracy in Norway important in determining the outcomes?

Are the outcomes and experiences useful also for the further international society?

Education In Switzerland is education largely the responsibility of the Cantons and the municipalities, although there have been taken steps for coordinating education on a national level. In Norway, the content of the education system is mostly a state responsibility, but the allocation of resources to the primary and lower secondary schools is a task for the municipalities. The counties are running most of the upper secondary schools in Norway, but their freedom of acting are limited by strict national rules.

Elderly care In Switzerland, the pension system is mostly private, so Swiss inhabitants will often have to save to their pension in private bodies although in an organized way. Financing their older days is to a high degree a responsibility for the individual, so the situation for the elderly is a result of their priorities and earlier situation. In Norway, the situation for the elderly is mainly a public responsibility. Never the less it is resulting in differing levels of welfare because of earlier income and years in working life. As the number of older people is rising steep, there are consequences for the pensions in the future.

Queering Aging Futures

This paper explores the potential for cultural gerontology to extend its ideas of diversity in aging experiences by opening space to rethink conceptions of successful aging futures. We propose a 'queering' of aging futures that disrupts the ways that expectations of a good later life and happy aging are seen to adhere to some bodies and subjectivities over others. Drawing on feminist, queer, and crip theories, we build on existing critiques of 'successful aging' to interrogate the assumptions of heteronormativity, able-bodiedness and able-mindedness that shape the dividing lines between success and failure in aging, and which inform attempts to 'repair' damaged futures. Conclusions suggest that recognizing diversity in successful aging futures is important in shaping responses to the challenges of aging societies, and presents an opportunity for critical cultural gerontology to join with its theoretical allies in imagining more inclusive alternatives.

RC15-293.6SANDERS, CAROLINE* (*University of Manchester*)NAHAR, PAPREEN (*University of Manchester*)SMALL, NICOLA (*University of Manchester*)HODGSON, DAMIAN (*University of Manchester*)*Constructing and De-Constructing Patient Experience Via Big Data and Small Data*

Sociologists have increasingly offered critical reflections on the ways in which patient experience is shared in digital formats, and commodified and harnessed as forms of usable data. Some have commented on the methodological issues and potential for such Big Data sources to be used for new social research insights. However, there has been a steady and growing interest in the routine use of such data to inform service improvement underpinned by policy goals to enhance the quality and safety of healthcare services. Existing sociological research has considered some of the tensions inherent in drawing upon Big Data sources to generate in-depth insights regarding patient experience that has traditionally been researched within sociology using in-depth qualitative and interpretative methodologies. However, there has been a lack of research focused on the construction and deconstruction of patient experience data in terms of how it is generated and analysed to create new knowledge on patient experience within specific healthcare contexts.

In this paper, we draw on qualitative research conducted as part of a project to develop and evaluate new digital tools, in order to critically reflect on the construction and deconstruction of digital knowledge on patient experience within four service delivery areas for people with long-term conditions. Computer scientists developed text mining programmes within the wider project for analysing large volumes of free text comments within the NHS Trusts. Responses to these new methods were also considered within the qualitative research.

The findings highlight the scope and limitations of applying a Big Data approach that was perceived to have value at higher levels in large organisations. There was a perceived need to generate and use Small Data based on interactive and highly contextual mechanisms in order to generate more meaningful (and useful) data.

RC43-731.5SANDLIE, HANS CHRISTIAN* (*University College of Oslo and Akershus*)SANTIAGO, ANNA MARIA (*Michigan State University*)NORDVIK, VIGGO (*University College of Oslo and Akershus*)*Family Structure and Sibling Effects on Timing of Nest Leaving*

Leaving the parental home to start an independent household is considered an important life event in the transition to adulthood. This life event is characterized by diversity in timing. Existing literature indicate that one factor influencing this diversity in age of nest leaving is family structure. In this paper, we add this literature by exploring the effects of siblings. We study the correlation between sibling position and timing of nest leaving. In addition, we examine whether individual household formation vary by gender of both the individual at risk and nest leaving and siblings.

The analyses are based on data from public registry data. We apply a dynamic life course perspective and OLS regression modelling to trace patterns of independent household formation using a sample of Norwegian women and men born between 1956 and 1996 (N=721,827 for women and N=850 783 for men) during the period between 1994 and 2014 when these individuals were between the ages of 16 and 38 years.

Preliminary findings suggest that individual household formation among Norwegian young adults correlates with characteristics of family structure and siblings: leaving the nest and forming an independent household increase if they share the nest with siblings. However, we find no effect of sibling position or gender.

RC29-527.2SANDOVAL ROBAYO, MARY LUZ* (*Universidad de Caldas*)*Factores Obstructivos Del Avance Electoral De La Nueva Izquierda En Colombia***Factores obstructivos del avance electoral de la nueva izquierda en Colombia**

Colombia no hizo parte del denominado "giro a la izquierda" en América Latina (1998-2010) junto con México y Perú. La presente ponencia busca dar una respuesta a la pregunta ¿cuáles fueron los obstáculos que han impedido a la izquierda democrática colombiana avanzar como lo hicieron en su momento las izquierdas del llamado "giro a la izquierda" en el resto de América Latina? Su propósito es explicar las causas tanto estructurales como agenciales que impidieron el ascenso de la nueva izquierda colombiana al poder presidencial de forma inmediata, luego de haber llegado tres veces seguidas al poder subnacional de la ciudad de Bogotá, como sí sucedió en países del giro como Brasil y Uruguay.

Se entienden como causas macroestructurales aquellas arraigadas en la historia nacional y que lograron generar patrones de dependencia (*path dependence*) difíciles de revertir y como causas agenciales, aquellas que dependen de la voluntad de los propios grupos de izquierda. Además, busca testear varios de los presupuestos de las teorías del giro a la izquierda a propósito de los procesos de paz con las guerrillas.

RC24-444.14SANE, NEETA* (*University of Mumbai*)NARGUDE, PRASHANT (*Department of Sociology, University of Mumbai, Maharashtra, India*)*Rethinking of Jaitapur Nuclear Power Project: An Social and Ethical Issues***ABSTRACT**

India is constantly facing the problem of electricity storage. In fact there is great necessity of energy production as the demand for energy is increasing day by day in the state of Maharashtra along with other states in India. At present there are some proposed nuclear power plants, which the Indian government is thinking about. Jaitapur Nuclear Power Project is one of them, which is proposed at Jaitapur village of Rajapur, taluka in Ratnagiri district of Maharashtra state. As a contribution to the growing public debate about nuclear power development, this paper offers a set of insights into the social, environmental and ethical aspects of nuclear power development. The Paper also provides the basic idea about the nature of nuclear power. Finally, the criterion for evaluating sustainability is suggested by the authors who will help in rational decision-making and to ensure better good of all.

RC27-500.1SANFELICE, GUSTAVO* (*University Feevale*)DIEDER, JANAINA ANDRETTA (*Feevale University*)MACHADO DE SOUZA, FRANCIELI (*Feevale UNIVERSITY*)KUHN JUNIOR, NORBERTO (*Feevale University*)*The PRE-Coverage of the Folha De São Paulo Newspaper of the Olympic Games Rio/2016*

Sporting events in Brazil made possible the "so-called" decade of the sport. From 2007, starting with the Pan American Games in Rio, then the Soccer World Cup in Brazil/2014, until the Olympic Games (OG) in Rio de Janeiro/2016. Brazil was on the international media agenda due to the coverage of the events mentioned above. Millions and sometimes billions of people around the world were following the Olympic Games via the press. The Olympic Games in Rio 2016 alone had a 3.5 billion of viewers (half of the global population) who watched at least a minute of the Olympic events (Source: COI, 2016). This research aimed to analyze the coverage of covers of the Folha de São Paulo/Brazil newspaper about the pre-Olympic Games Rio/2016 period. This is a qualitative and descriptive study, having as corpus the covers of the Folha de São Paulo newspaper from July 1st to August 4th, 2016 (representing the pre-event period until its opening date). The analysis was performed using the Content Analysis of Bardin (2011). The qualitatively analyzed data formed five categories: "Cultural Aspects"; "Event Costs"; "Organization of the Event"; "Athletes training/sports performance" and "Political and Social Issues." We concluded that during the pre-event the Folha de São Paulo newspaper emphasized aspects related to public money and organization and preparation for the event, for instance, security plan, financing of the games and problems with the Olympic Village.

RC38-679.2SANGALLI, LUCAS* (*PUCRS*)*The Social Construction of Belonging in the Life of Haitian Migrants in Brazil: The Case of Alain and His Family*

In my paper, I will discuss the case study of a family that migrated from Haiti to Brazil. I will focus on the biographical case reconstruction of the older son, I call him Alain, whose dislocation process from the Haitian countryside to Southern Brazil came with changing positions in various social figurations. The case represents a type in my sample of Haitian migrants where the attachment to religious and ethno-national constructions of belonging increased during the process of migration. These belongings played an important role in determining Alain's recurrent attempts to return to Haiti in order to fulfill a religious prophecy about his life.

This study is a part of my PhD thesis on the life stories of migrants in Brazil and their constructions of belonging. It is the continuation of the research initiated during my Master degree in Social Sciences. It is theoretically grounded in the Sociology of Knowledge (Peter L. Berger / Thomas Luckmann) and Figurational Sociology (Norbert Elias). With the help of biographical case reconstructions (after Gabriele Rosenthal), I investigate the life history and life story of migrants within

the social figurations of their families and different milieus, in different local and national settings.

Ontological Politics and Medical Maternity Care in Germany – Prenatal Decision Making from a Praxeographic Approach

Annemarie Mol argues that medical knowledge production in health care is a form of ontological politics because the production of facts is shaped within the practices of health care itself (Mol 1999). In my talk I will illustrate in which way medical maternity care in Germany is a form of ontological politics. In Germany, maternity care is performed almost exclusively by obstetricians. Check-ups and ultrasound examinations are directed at detecting risks or jeopardized health in pregnant woman and fetuses as early as possible in otherwise healthy pregnancies. From the point of medical ethics it is argued that the offer of diagnostic testing helps women to make better and more informed choices about their future life as parents. In my talk I would like to highlight how the offer of prenatal testing procedures is embedded in the routine processes of medical maternity care and ultrasound examinations. Drawing on praxeographic perspectives and empirically based on participant observation of maternity care and ultrasound examinations in obstetricians' offices I want to call into question that more choice is a source of empowerment and freedom. I will explore *how* the assumption of informed consent and autonomous decision making is framed in the routine practices of maternity care and how "choice" comes to represent a specific form of ontological government. I will also discuss Annemarie Mol's (2008) suggestion to switch from a "logic of choice" to a "logic of care" and how this approach might be more in accordance with how prenatal decisions are actually made.

SÄNGER, EVA* (Goethe University Frankfurt)

Showing Sonograms Around. Visuality, Affect and Prenatal Sociality

According to Arjun Appadurai (2003) the meaning of an artifact is inscribed in its use and its trajectory and not in the artifact itself. Pregnant women in Germany as well as in other countries where ultrasound screenings are common show prenatal sonograms around, glue them in prenatal baby-diaries or circulate them via Facebook. Even if these visual artifacts stem from medical screenings they count as pictures of a baby-to-be. Showing them around is commonly supposed to create pleasure. In my talk I argue that the sonogram does not evoke pleasure naturally but facilitates highly gendered norms of prenatal parental behavior and is part of practices that constitute prenatal communities. My talk is based on ethnographic observation of ultrasound screenings in medical maternity care and interviews with pregnant women gathered in the ethnographic study "Enacting Pregnancy. The Role of the Sonogram in Prenatal Diagnosis", funded by the German Research Foundation (DFG). Drawing on praxeographic perspectives I want to highlight how in the practices of showing and circulating sonograms forms of prenatal sociality are constituted through the display of emotion and affect. I will show in which way the "visual persuasiveness" (Burri 2012) of the sonogram as a visual artifact is performed within these practices and which affect norms regulate the kind of emotions that count as legitimate for pregnant mothers and fathers-to-be and for their significant others in Germany.

SANJAKDAR, FIDA* (Monash University)

Beyond the Classroom: The Role of Controversy and Real World Ethics in Education

Current issues such as extremism, racism, marriage equality, violence against women and civil rights, are seeped with underlying issues of a controversial and ethical nature. Various global geo-political processes of these issues have perpetuated violence against minority communities worldwide and have fuelled racism, nationalism and xenophobia. Such issues and their associated geo-political reactions and processes, have also increasingly found their way in our classrooms reshaping curriculum content, teacher pedagogies and student learning. Ongoing debate in educational discourse that students, as democratic citizens in the twenty-first century, must be prepared to deal with 'real-life' issues, has seen a demand in educative responses to enhance the relevance of teaching about controversy in schools. However, despite research supporting the value of teaching controversial issues as a way to promote critical thinking, the teaching of controversial issues and real world ethics in many Australian classrooms is shrouded in controversy and public concern because these issues can become eclipsed by comingling concepts of values and morals. This paper reports on data from a recent project exploring secondary school Humanities and Social Science teachers' perspectives about the intersections between teaching controversial issues and creating new thinking in education for democracy, civic citizenship,

understanding human rights and real world ethics. Using interview data, this paper presents insights into teacher's beliefs about their role in teaching about controversial issues as well as the role of school and other institutional power relations to promote in students a deeper understanding of their social world. Classroom teaching observation notes also presented in this paper, demonstrate how teachers use effective pedagogies to mobilise their students in the powerful role of disrupting fear, ignorance and prejudice embedded in controversial issues. Essentially, this paper invites discussions about the hard curriculum, pedagogical and ethical challenges that confront our schools and teachers today.

How Transdisciplinary Teams, Participatory-Based Research, and Community Engagement Work to Improve Outcomes and Build Local Capacity for Hazard Resilience

Recent research has demonstrated many benefits of engaging community members and interest groups in the conduct of research and the development of interventions to improve local conditions and build community capacity. The Institute for Sustainable Communities at Texas A&M University has brought together a transdisciplinary group of researchers from landscape architecture, urban planning, public health, engineering, sociology, marine sciences and geosciences in conjunction with community engagement staff to collect and synthesize data and co-learn with communities about flooding risk, toxic exposure, and climate change impacts. The work is focused on two socially vulnerable and Environmental Justice neighborhoods in inner-city Houston, Texas; both neighborhoods are low-income and majority minority, and both are located near the highly industrialized Houston Ship Channel.

Since 2014 there have been several participatory action research projects conducted with local community organizations and high school students including: 1) a storm-water infrastructure assessment that incorporates citizen science data collection, 2) an urban landscape design project to improve community resilience to hazards, 3) sampling of standing surface water and within-home samples assessing for polycyclic aromatic hydrocarbons and heavy metals, 4) a community health survey, and 5) participatory GIS to identify flooding issues. Findings from these endeavors revealed a population that is at particular risk of health impacts from exposure to hazardous substances and natural disasters, including Hurricane Harvey in 2017 and the na-tech impacts from the resultant chemical releases. All aspects of these were co-led and organized with local residents and local advocacy groups and stakeholders. This presentation will discuss how using the knowledge of residents within local areas strengthens every step of hazard, climate change, and public health research and best practices and insights into conducting this type of disaster research. We will also discuss the importance of transdisciplinary research and engagement teams to address hazard issues.

SANSON, DAVID* (Ecole Normale Supérieure (ENS) - Lyon)

"Balancing the 'Gig Economy' Spirit? How Local Labor Unions Cope with Workforce Atomization & Entrepreneurial Culture"

Amongst numerous disruptions, the usually-called "gig-economy" strikingly reinforced the development of individualized working relationships. This is particularly salient in traditional industries, where "up-to-date" managerial instruments deeply affect the well-established social order, based on power of collectives and the prevalence of unions in social contestation. In this study, we highlight some consequences of new forms of appraisal developed in a factory after a recent merger. We focus on the reshaping of power-resistance relationships, shedding light on the processes through which performance reviews restrain collective contestations from traditionally mobilized and unionized workers, while enhancing individual commitment and "consent" at work.

We therefore question factory workforces' modalities of "fighting", while unions, collectives and solidarities have been deeply affected by these individual assessments. We focus on the varied and differentiated nature of *conflictualities* and labor movements, all the more ambiguous as they react to new types of domination, challenging local unions in their traditional ability to lead and canalize mobilizations. This presentation will draw on an ethnography conducted since 2014 in a French industrial company, "working-class bastion" with historically well-established "politicized" unions. Our data consist in 67 interviews with a broad panel of employees, numerous observations and diverse archive documents.

The study suggests how, behind a rhetoric of freedom and autonomy, the competitive context leads to a "constrained compliance" containing collective actions

through workforce atomization and the slow erosion of solidarity. We also study the "gig-economy" spirit simultaneously endorsed by management promoting flexibility and producing consent by shaping workers as *entrepreneurial selves*, acculturated to individual reading grids of organizational reality, thereby delegitimizing conflicts, social demands or protests. We therefore analyze the differentiated forms of resistance they can collectively oppose to these constraints, to understand whether unions can still mobilize and unify dispersed workers, so as to produce effective counter-speeches channeling fragmented complaints against management.

SANSON, DAVID* (*Ecole Normale Supérieure (ENS) - Lyon*)

"Convertir Les Travailleurs En « Entrepreneurs » Individuels : (re)Penser Les Actions Collectives à l'Aune Des Logiques d'Autonomisation Du Personnel"

Parmi les nombreuses évolutions qui traversent les mondes du travail, l'essor de « zones grises » entre indépendance et salariat a profondément renforcé l'individualisation des relations professionnelles. Ceci est particulièrement frappant au sein même d'industries traditionnelles, où la diffusion de dispositifs managériaux « modernisés » affecte profondément les collectifs salariés habituellement solidaires et « mobilisés ». Nous montrerons les conséquences de l'enchevêtrement entre formes salariales usuelles et logiques d'autonomie dans une usine où, à la suite d'une récente fusion, le recours à de nouvelles pratiques d'évaluation favorise leur « hybridation ».

Nous nous intéresserons alors à la recomposition des logiques et des modalités de résistance au travail des populations ouvrières, jusqu'alors portées par une présence syndicale forte et « politisée ». Nous interrogerons tout particulièrement la nature variée et différenciée des *conflictualités* actuelles sur le site, au répertoire d'autant plus hétérogène qu'elles agissent en réaction à des formes de domination nouvelles. Cette présentation s'appuiera sur une étude ethnographique menée depuis 2014 dans une usine pétrochimique d'une grande entreprise française – « bastion protestataire » historique – composée de 67 entités avec un large panel de salariés, de nombreuses observations, et d'un vaste corpus documentaire.

Tout en abordant la singularité de notre enquête (terrain « familier » où notre père est ouvrier militant CGT), nous montrerons comment l'atomisation des collectifs et l'*autonomisation* des salariés, dans un contexte concurrentiel individualisé, tend à éroder leurs réseaux traditionnels de défense et de solidarité face à la direction. Nous étudierons également comment les nouveaux dispositifs d'évaluation des performances contribuent à l'acculturation des travailleurs – incités à développer un *ethos gestionnaire* en devenant de véritables « entrepreneurs » indépendants, responsables et flexibles, acteurs de leur carrière – tout en discréditant ainsi les actions et les revendications collectives. Nous tâcherons alors de saisir les logiques et les modes d'actions différenciés des contestations que ces derniers peuvent aujourd'hui collectivement opposer au sein de cette nouvelle configuration imposée.

Neighborhood Contexts Associated with Internalizing Behaviors of Latino and African American Youth: Evidence from Denver, Colorado

National and local studies in the United States report that more than one in five children exhibit behavioral health problems falling in the borderline or clinical range. Previous studies have focused on exposure to interpersonal and community violence as antecedents to such problems; more recent literature has focused on other neighborhood factors that might lead to the development of internalizing behavioral problems (depression, anxiety and PTSD) – among the most common behavioral health problems during childhood. These studies find that children residing in neighborhoods of concentrated disadvantage, limited institutional resources, high fractions of unsafe or poor-quality housing, and high levels of social disorder are more likely to experience childhood depression; anxiety; and PTSD. Yet, numerous questions remain as to the magnitude and mechanisms of purported neighborhood effects and the extent to which they might vary by ethnicity.

In this paper, data from a natural experiment in Denver (CO) are used to assess the relationships between neighborhood contexts and internalizing behaviors for a sample of 600 Latino and African American youth aged 7 to 18 who spent a significant part of childhood residing in subsidized housing. We use instrumental variables and accelerated failure time (AFT) models with frailties to estimate variations in the timing of internalizing behaviors diagnoses during childhood.

Findings suggest that 10% of all youth were diagnosed with internalizing behaviors after initial random assignment to neighborhood. Accelerated failure time models show that several dimensions of the neighborhood—safety, socioeconomic status, nativity, and residential instability—were strongly predictive of the acceleration or delay in being diagnosed with one or more internalizing be-

haviors. Results differ markedly by ethnicity with models being most predictive for African American youth.

Poder y Resistencia En La Convivencia Intercultural De Estudiantes Universitarios

Las universidades representan un espacio importante de convivencia, en estas las expresiones de aceptación o rechazo al diferente se expresan con mayor claridad. Indiscutiblemente son espacios permeados por el proceso globalizador que se caracterizan por la convergencia de individuos de diversas localidades, regiones y nacionalidades, es decir, estudiantes provenientes de diferentes culturas. Debido a ello cada contexto escolar es distinto y tiene sus propias particularidades, es el caso del campus III de la Universidad Autónoma de Chiapas, ubicado en la ciudad de San Cristóbal de Las Casas, Chiapas, en donde se imparten licenciaturas del área de las ciencias sociales y al que en función de su ubicación acuden para formarse estudiantes indígenas (provenientes, en su mayoría, de comunidades que corresponden a diversas regiones del estado) y estudiantes no indígenas procedentes de diversas regiones del estado, del país y en algunos casos estudiantes extranjeros. Debido a la variedad de estudiantes presentes en las aulas y la particular convivencia que se da entre ellos, pretendemos conocer: ¿En qué circunstancias se da la convivencia entre estudiantes? y ¿De qué manera el origen de los estudiantes determina el ejercicio de poder y resistencia al interior de las aulas?

El objetivo de esta ponencia es dar a conocer desde la experiencia vivida de los jóvenes de la universidad, su experiencia de convivencia en contextos multiculturales para establecer, si la universidad es un espacio que promueve o limita los procesos de desarrollo multi o intercultural, indispensable para generar la convivencia respetuosa de los individuos sociales contemporáneos.

Para realizar la investigación se utiliza una metodología de corte cualitativo basada fundamentalmente en entrevistas en profundidad, lo cual permitirá conocer desde la voz de los estudiantes, cuáles son las estrategias de convivencia, poder y resistencia utilizadas al convertirse en estudiantes universitarios chiapanecos.

SANTINELE MARTINO, ALAN* (*McMaster University*)

The Erotic Habitus of Adults with Intellectual Disabilities in Ontario, Canada.

The intersection of disability and sexuality remains a taboo topic (Shakespeare 2014). Along with this taboo, a limited body of literature specifically addresses the sexual desires and interests of people with intellectual disabilities as well as how they make sense of and reflect on their own position as sexual actors. This paper investigates the romantic and sexual experiences of adults with intellectual disabilities in Ontario, Canada, by putting into conversation theories from the sociology of sexualities, sociology of culture, and critical disability studies. It uses a sexual fields analytic framework (Green 2014) to explore the consequences of sexual stratification on the experiences of people with intellectual disabilities. More specifically, this paper demonstrates how a lack of access to opportunities for sexual exploration, experimentation, and relationships, accompanied by the devaluation and invisibility of their sexuality, has an impact on the erotic habitus of people with intellectual disabilities, including their willingness and ability to auspiciously "play the field." Drawing on in-depth interviews with adults with intellectual disabilities, this paper examines the consequences of disenfranchising the rights of adults with intellectual disabilities on their desire to be active sexual actors within sexual fields, strategies and choices for sexual partners, and sexual practices. Examining these questions as well as language will shed light on the stratification that takes place due to erotic habitus, the common habitus of individuals with intellectual disabilities, and how their erotic habitus affects their sexual practices.

SANTOS, HERMILIO* (*Pontifical Catholic University of Rio Grande do Sul*)

On Relevance, Experience and Knowledge: A Schutzian Perspective to Biographical Research

This presentation aims to discuss the main contribution of the sociology of Alfred Schutz for the interpretative biographical research. Schutz handles with biography at least in two different ways: as a manner to investigate the "because" motives for one's action and as a way to exemplify his theoretical considerations. The first step will be to discuss the biographical experience as a key aspect to understand the motivation for action. It will be argued that for Schutz, biography

is not exclusively an individual life' trajectory, but results of both individual and social experiences, synthesized on the individual relevance systems, which are embedded by the relevance systems of the community in which one has been socialized. In the second step the paper verifies how Schutz deals with his own biographical experiences to discuss theoretical and empirical aspects of his sociology. Examples of the first kind of use of biography by Schutz are, for instance, "The Stranger" and "The Homecomer", which will be considered in this paper. The third step will be dedicated to establish a dialogue with some of the most influential approaches in the biographical research field, as those proposed by Daniel Bertaux, by Bernard Lahire and by Gabriele Rosenthal, pointing out their advantages and limitations from a Schutzian analytical perspective.

The Social Construction of 'Vagrants' in Brazilian Prisons of Ilha Grande

Much has been written about violence in prisons in Brazil. There is a consensus among those who study the Brazilian penitentiary system on the distance between laws, norms and rules and ongoing practices. This research is based on interviews with former prison guards who worked in prisons in Ilha Grande, Rio de Janeiro. The starting point of this work is the distinction made by a former prison guard between the 'vagrants' and the 'brave' prisoners. It will be also examined the presence of the term 'vagrant' in laws criminal anthropology, and in the memories left by political prisoners. From the data collected, it will be highlighted the presence of a punitive culture focused on social groups that are mostly black and live in poor conditions.

Corporate Strategy and Territory: Modalities of Territorial Embeddedness in the Volkswagen's Gpn in Brazil

The paper is aimed at discussing the territorial embeddedness of the operation of a German- origin transnational corporation (TNC) in two Brazilian localities. Based on Global Production Networks (GPN) and Varieties of Capitalism (VoC) approaches, it analyzes the social and political conditions for Volkswagen's corporate strategy, which combines elements of its original institutional setting of a Coordinated Market Economy to the organizational and institutional variations in the TNC coordination capacity under greenfield (Sul Fluminense) and brownfield (ABC paulista) conditions, within a Hierarchical Market Economy (EMH), Brazil. We analyze the interactions between the GPN key economic actor, Volkswagen, and the economic and non-economic actors performing on a regional scale between 1996 and 2014. We typify these relationships based on the effects of the exercise of corporate, institutional, and collective modalities of power. Partial results support an interpretation of non-economic social action as economically relevant, with levels of influence and roles of collective actors significantly divergent as regards the establishment of Volkswagen's corporate strategy and the GPN architecture. Notwithstanding, multi-scalar, state and trade union actors are recognized as key drivers in framing both dimensions. In the article, we employ the comparative method, and mobilize primary and secondary data on the corporation and on both regions, focusing on semi-structured interviews with managers, public officials and trade unionists, as well as public statistics and official documents.

Work-Life Balance in Large Law Firms: A Case Study on Young Female and Male Lawyers

Work-life balance had become a major topic of research on organization studies and professions and also an aspect of concern to managers and directors. The combination of these two aspects had resulted in several discussions and conferences and opened a public debate in several countries around the world. The new generations of female and male lawyers are entering professional life with more awareness and information and so is particular relevant to know how they experience their transition. Do they understand work-life balance as a problem? What kind of strategies they develop in order to gain control on their life's? Are they opened to the idea of sacrificing their private life's in order to achieve professional goals? Young female and young male have different opinions about the subject?

To answer these questions, we developed nineteen biographical interviews with both men and women, all from large law firms with ages between 24 and 32 years old. We focus our analysis on emotions, the words and expressions they

use to describe the entrance in the profession, the socialization process and the expectations about being lawyers or moving out in the near future. In order to capture the richness of the testimonies we use breaking point events like having a child and/or getting married to explore the links between private and professional life.

The Portuguese case has some interest to the global community, although it's a small country in the European Union as several large law firms, some of them global law firms. These firms work in a global context in particular with Portuguese speaking countries or regions in Africa and Asia (Macau) and Brazil.

Power, Politics, and the Distribution of Aid in Puerto Rico: Understanding Emergency Response in the Wake of Hurricane Maria

On September 20, 2017, Puerto Rico was directly impacted and devastated by hurricane Maria; the 10th strongest hurricane ever recorded. As it is the case of other Small Island Developing States, Puerto Rico has most of its infrastructure and a significant portion of its population located in coastal areas, is highly susceptible to disasters and climate change, has a limited resource base, and imports over 75% of the products consumed. In addition, for more than a century Puerto Rico has been a territory of the United States and has undergone a paradoxical process of assisted development. Although great advancements have been achieved, the island is confronting its longest and most profound economic crisis with over \$74 billion in public debt, and a resulting unprecedented wave of emigration. The effects of the profound economic crisis translate into, a deteriorated public infrastructure, reduced and impoverished basic services, and increasing fissures in the local social fabric. Therefore, Puerto Rico was in a socially produced condition of vulnerability when the hurricane occurred and the catastrophic results of the event are often not surprising to residents and authorities. This paper presents the findings of quick response research in Puerto Rico after hurricane Maria that sought to explore and contextualize the immediate response of authorities at all levels and citizens to meet basic and emerging needs. Developing a framework to understand the social, political, economic, and cultural forces that mediate disaster response decisions is vital to elicit the effective coordination of emergency response, the dissemination of culturally informed messages, and the distribution of aid and relief in disaster situations.

Fossil Fuel Divestment, Higher Education Institutions, and the Corporate Community: Corporate Influence on Institutional Environmental Policy

Climate change campaigners have made a strong moral and financial case for universities and other institutional investors to divest from fossil fuels, even though the argument remains contested. Reflecting the ambiguity of whether divestment would concur with trustees' fiduciary mandate or would contravene it, several higher education institutions have divested from fossil fuels whereas others have decided not to. This paper develops a structural perspective of divestment decisions among higher education institutions in the United States. Building on studies showing that the embeddedness of colleges and universities within a web of interlocking corporate directorates impacts on policy decisions through various mechanisms, we analyze how these board-level connections with the corporate community influences institutional decisions to divest or not. Using social network analysis tools, we map out the patterns of corporate connections maintained by college and university board members and trustees, with special attention to connections with the fossil fuel industry. Analysis uses quadratic assignment procedure regression to determine how the structural embeddedness of higher education boards within the intercorporate network affects the probability and level of divestment commitment by universities and colleges based in the United States. This analysis will shed light on some of the mechanisms of corporate influence in higher education, and on institutional-level environmental policy.

Whose Marriage Is More Resistant to the Risk of Divorce in Turkey: Self-Choice Marriages or Family-Choice Marriages?

Although during the last 10 years, the number of marriages has decreased by 6 percent, almost 97 percent of women still marry by age 50 with a slight delay the timing of the marriage. Analysis on the basis of marriage cohorts from pooled data set puts forward that self-choice marriages are on the rise and family-choice marriages are on the decrease significantly in Turkey. On the other hand, number of divorces has increased by 41 percent during the last 10 years. The study focuses on marital stability in Turkey, and asks the question on which type of marriage is much more resistant, self-choice marriage or family-choice marriage, to the risk of divorce. Analyses suggest that family-choice marriages are less resistant to the risk of divorce compared to self-choice marriage. Our finding confirms Goode's classic thesis about the social diffusion of divorce. Divorce in Turkey appears to be getting much more frequent event among couples in lower segments of the society. In this regard, the risk of divorce is 1.5 times higher among couples married with family decision as opposed to couples married with self-choice under the control of all possible covariates. The higher risk of divorce may be related with the (1) the duration between söz kesme (positive response of the female's family with a small celebration) and nikah (official marriage at the registry office) is shorter; (2) the contact between prospective couples is limited in family-choice marriages than the frequency of contact observed in self-choice marriages. Furthermore, as literature points out that the conflicts on marital issues between couples in family-choice marriages are significantly higher than the couples in self-choice marriages, as we found higher emotional violence against women in family-choice marriages. All these factors seem to be negative impacts on the marital stability of couples in arranged marriages.

The Experience of Youth Transition in Disadvantaged Sectors: Vulnerability and Social Exclusion in Urban Mexico

This paper develops a twofold argument: a theoretical reflection and an empirical exploration of the processes of social exclusion in the transition of young people to adulthood. On the one hand, I discuss the possibility of thinking about youth transition beyond a normative perspective, focusing on the lived experience of this period of the life course; that is, the "experience of transition". In order to develop and operationalize this concept some preliminary levels of analysis are identified, pointing out the relevance of some meso-escenarios of interaction like the family, the neighborhood, or the school. On the other hand, and based on this theoretical framework, I explore the experience of youth transition in disadvantaged sectors of urban Mexico City. This exploration focuses on vulnerability to social exclusion and three different sources of risk for contemporary youths: transitional, biographical and societal risks. Drawing on an extensive corpus of semi-structured interviews with disadvantaged young people and from a biographical perspective, I analyze the unfolding of a process of cumulative disadvantages in the transition to adulthood.

SARBU, MIHAI* (*University of Ottawa*)

Defining the Transition to a Post-Carbon Economy: Complexity, Urgency, and Effective Action.

The transition to a post-carbon economy is generally conceived as gradual and linear: It is assumed that the green energy sector will continue to develop until it will eliminate the use of fossil fuels, and that any eventual obstacles along this way will be manageable. However, the emissions of greenhouse gases continue to grow, and recent research indicates that keeping the global temperature increase below 2°C, as stipulated by the Paris Agreement, is unlikely. We may need to change many of our social and economic arrangements, while at the same time facing the increasingly serious consequences of climate change. For these reasons, I think it is unrealistic to envision a gradual and uncomplicated transition to a post-oil era. I will therefore analyze this transition using a theoretical framework based on *complexity*, with the purpose of defining what could inspire our society to abandon the comforts offered by fossil fuels, and muster the courage to deal with an uncertain future.

Using a framework based on complexity could allow us to better understand how entities that function on different timescales influence one another, which can be useful when analyzing the interactions between natural systems and man-made ones. Also, by using the concept of *threshold*, complexity theory can help us understand the transitions between different system configurations; these transitions can be characterized by periods of nonlinear behavior, when small stimuli can lead to very large effects—something that can be relevant in the context of climate change.

The urgency to act effectively on these matters cannot be emphasized strongly enough, and the social dynamics that could help our society transition to a post-carbon economy are likely to be defined outside the current structural arrangements defined by economic growth—in the domains of morals and culture.

The Multiple Justice Dimensions of Low-Carbon Energy Transitions: Towards a Comprehensive Approach

Transitions to low-carbon systems entail environmental benefits through emission reduction. Socioeconomic aspects of sustainability demand further essential characteristics of sustainability transitions: equity, access and affordability. We derive these dimensions by mapping existing framings of justice that comprise variants of distribution, recognition and procedure on to the specificities of energy justice. Equity concerns distributional justice through allocation, access targets universal inclusion through coverage, and affordability attends to justice-in-practice through logistical feasibility. To examine the interplay of these dimensions in recent low-carbon transitions scholarship, we study how they are addressed in the case of solar uptake in Portugal, whose high solar potential complements its impressive hydropower and wind energy profile. Our treatment seeks to capture the breadth and depth of relevant scientific outputs with significance for these aspects of energy justice. We bring forth how the agency of actor networks interfaces with resistance within the energy sector, and how the regional political economy drives its trajectory, drawing on multiple types of sources. This task shows what specification of pertinent attributes remains pending in recent social science research. We then analyse what these shortcomings in addressing energy justice concerns within such a case imply for researchers' approaches to cases of low-carbon transitions in general. Based on apparent relevance in the energy sectoral context studied, we abstract out numerous sub-factors of equity, access and affordability that must be addressed to enhance scientific contribution to sustainability transitions. Pointing out some common forms of slippage between low-carbon transitions and sustainability transitions, we conclude by arguing for social scientists to help ensure that socioeconomic aspects of sustainability receive sufficient play in informing emergent understandings of low-carbon transitions. The weight of this responsibility is magnified by prevalent inattention to the socioeconomic sub-factors we identify as being energy justice-relevant in the prominent instance of Portuguese solar uptake.

Role of Existing Identities and Networks in Anti-Dam Movements Built in Conflict Settings: The Case of Dersim in Turkey

In line with the liberalization of energy markets, the 2000s witnessed the vigorous promotion of hydroelectric dams and plants by the Turkish state across the rivers of Turkey. The 2000s has also been a period of heightened struggle for recognition by the historically marginalized and discriminated Alevis and Kurds - the largest religious and ethnic minorities of Turkey respectively. This novel policy of hydropower production undertaken by private companies and regulated by the state prompted a number of grassroots resistance movements by predominantly rural communities diverse in terms of ethnic, religious and political identities. One such site of resistance is Dersim (officially renamed as Tunceli in 1935, followed by the bloody suppression of a local Alevi Kurdish uprising against the newly established republic in 1938). There is a strong tradition of leftist thought and political action in Dersim, dating back to the 1970s. While Alevism was not the focus of political struggle back then, with the emergence of identity politics and the rise of political Islam in Turkey in the 1990s, there has been a revival of Alevism as a cultural and religious identity. Dersim is currently a major center of democratic opposition to the Turkish state, and the area also hosts a number of active Marxist-Leninist and Maoist armed groups. In view of the long-contested relationship between the Dersimis and the Turkish state, this paper explores the role of existing social and political identities and networks in Dersim in the building of the current movement against dams, both discursively and materially, and in what ways, the anti-dam resistance (re)shapes the relationship between the Dersimis and the state. The research is based on a fieldwork with an ethnographic approach, involving semi-structured interviews with the participants of the anti-dam resistance, as well as the study of texts produced by the movement.

RC31-560.6SARIKAKIS, KATHARINE* (*Vienna University*)BELINSKAYA, YULIA (*University of Vienna*)KORBIEL, IZABELA (*Vienna University*)MANTOVANELI, WAGNER (*University of Vienna*)*Refugees Shaping Communicative Spaces in Institutions: The Case of the Open Learning Initiative at the University of Vienna*

One important dimension of power in institutions is control, a central problem in Sociology since its beginnings. Institutions, according to Berger and Luckmann (1966:72), "by the very fact of their existence, control human conduct by setting up predefined patterns of conduct, which channel it in one direction as against the many other directions that would theoretically be possible". Refugees are forced to interact with 'fortified borders' of institutions *ad hoc*, finding hurdles in the process of 'home making'. We explore refugees' efforts to redefine the future, their personal and community aspirations and their role on the constitution of dialogical institutional spaces in society through the case of two Higher Education programmes to prepare these groups for University study. We draw upon refugee and forced migration studies and history "from below" (Elie, 2014:30; Sigona, 2014). The problem that control imposes from an institutional point of view to a history from below is directly associated with creating communicative spaces in which this control is negotiated. Our case to observe the ways in which these communicative spaces may emerge from an institutional approach is the Open Learning Initiative (OLive) at the University of Vienna, Austria, a programme designed to receive refugees from all nationalities who have an interest in pursuing and/or continuing tertiary education. Our question proposed is, then, how, besides the intrinsic control characteristic of institutions, a communicative space could emerge to make the refugee voice effectively heard? For this matter, the paper assesses/examines documents produced inside the programme where both the teachers and refugees register their experiences on a regular basis and in a systematic way so that the symbolic dimension can be identified, compared and scrutinized against the institutional boundaries imposed.

RC15-282.23SARKAR, TANNISTHA* (*University of Calcutta*)*Work Environment of Nurses in a Metropolitan and Suburban Hospital - a Comparative Study in West Bengal*

Patient satisfaction and outcome with healthcare settings depends on nursing care. The nurses encounter varied occupational hazards specific to their work settings which pose obstacles in performing their duties. Also, workplace violence is a growing problem in healthcare settings in India and has a direct relationship to stress, decreased work productivity and quality of patient care (Gates, et al., 2014: 65). There is a great deal of differences in the work settings of Metropolitan hospitals and suburban hospitals, in terms of infrastructure, environment, manpower, medical staff, financial aids or salary systems and in the way workplace violence is addressed. This working atmosphere plays a crucial role, although may not be the sole factor, in determining how much effort a nurse can give in caring for and helping patients to recuperate. Since nurses are tasked with identifying these problems and controlling them, their job satisfaction is important to address these problems and improve patient outcomes. The purpose of this paper is to study and investigate the factors that might act as hindrances for nurses in fulfilling their responsibilities.

This study will utilise a comparative explorative methodology. Nurses will be divided into two groups, one belonging to the Metropolitan hospital (Kolkata, West Bengal, India, ~ 14.3 million population) and the other to the Suburban hospital (Katwa, West Bengal, India, ~ 1 million population). Therefore it will be appropriate to use the stratified random sampling for conducting the study. Data for this research will be collected using the survey method involving the use of questionnaires having both close ended and open ended questions that will elicit the required answers from the respondents.

RC13-259.2SARMA, PRANJAL* (*Department of Sociology, Dibrugarh University, Assam, India*)*Leisure Opportunities and the Aged Folks of Dimasa Tribe : A Sociological Analysis*

'Leisure' generally involves any pleasurable activity related to free time. Leisure activity of the aged Dimasa tribe is the focus area of this paper. The 'Dimasa Tribe' belongs to Kachari family of the Indo-Mongoloid group. They are mainly the inhabitants of Dima Hasao District of Assam.

We have interviewed 75 aged folk (age 60 and above), 25 each from three Dimasa villages- Purana Hajong (traditional village), Khejurbond (modern village) and Donzenraji (industrialized village); three 'Gaon Bura's (village head man) of the respective villages and 25 leaders of the community. A total of 103 respon-

dents have been taken into consideration and an analysis is drawn by using different sociological perspectives of aging.

The major findings are:

1. The elderly have comparatively more free time in Dimasa Society then the youth and adult. Ways of spending leisure time are different in the three villages- traditional, modern and industrial.
2. Different leisure activities among the aged were found in terms of gender, life cycle, changing nature of leisure and its varying roles in social change and class patterns.
3. Playing games, singing, playing the flute and drum, basket making, etc by aged men and child rearing, cooking, weaving etc by aged women are some of the leisure activities.
4. Different religious, cultural dimensions along with structural aspects of Dimasa society have tremendous influence on leisure and its activities.
5. Consumer culture and capitalism have influenced the Leisure activities.
6. In the traditional village the aged are more integrated into the family and community life than the modern and industrialized
7. The prestige, form and nature of leisure of the aged is influenced by their advisory and contributory role, their kind of control and their previous status.
8. Sociological interpretation on leisure activities can be drawn from multiplicity of sociological approaches of aging.

RC13-259.5SARMA, PRANJAL* (*Department of Sociology, Dibrugarh University, Assam, India*)BHATTACHARYYA, IPSITA (*DHSK Commerce College, Dibrugarh, Assam, India*)*Leisure Opportunities for the Aged in Missionaries of Charity (MOC) (Mother Teresa), Tinsukia, Assam, India*

Missionaries of Charity(MOC) (Mother Teresa) Tinsukia is a charity home under MOC Calcutta which was established in 1950 by Saint Mother Teresa, one of the 20th century's greatest humanitarian with the aim to provide 'wholehearted free service to the poorest of the poor'. The organization has 4,500 members who run different charity centres, orphanages, nursing homes etc. for the aged, the poor and the homeless, sick children, abandoned children, and so on regardless of their religion.

MOC Centre at Tinsukia, Assam is one such home where especially thirty five aged (60 years and above) are residing. Few of them are mentally sick, blind, physically challenged as well. All of them were poor homeless people rescued from the streets.

This paper highlights the leisure opportunities for the aged residing in MOC Tinsukia home. We have interviewed the thirty five aged, seven sisters, two Doctors, one Trainer, five Numbers of staff of MOC, Tinsukia and fifteen local leaders and senior citizens. Altogether there were sixty five numbers of respondents. Secondary sources are also used.

Major finding are:

1. Majority of respondents opined that they get lot of leisure time in the MOC home as they get satisfactory care and support.
2. In the morning and evening, they participate in prayers and do physical exercise under the guidance of a trainer.
3. At 3 or 4 pm they go for walks.
4. Gossiping, reading, playing games, watching TV, singing, playing and listening to music, drawing, cleaning their campus, etc are their leisure time activities.
5. Two respondents were found to be completely bed ridden and they pass their time in bed.
6. In a few cases psychological counseling and guidance by expert are offered as they have aggressive behavior and abnormal activities like throwing water in and around.
7. Some of them also assist the staff of MOC.

RC34-613.6SARNOWSKA, JUSTYNA* (*SWPS University*)*Socialization Role of International Migration in School-to-Work Transition*

The main goal of the paper is to explain based on socialization framework what is the role of international migration in school-to-work transition and entering the adulthood.

School-to-work transition is more and more dynamic and time-consuming process (Furlong 1992, Hodkinson 1996). There is a life stadium in individual's

career path (Hillmert 2002). People transit from school to work in various ways looking for own identity and influenced by macro socio-economic environments (Brzinsky-Fay 2007). Occupational stabilization is a key factor of the traditional understood adulthood (Settersen 2007).

After EU enlargement in 2004, many young Poles got the possibility of free movement within the EU. Migration became an integral part of the entering the adulthood process named as a *rite of passage into adulthood* (Eade et al. 2007). There is a lack of literature connected effect of migration in school to work transition after return of young migrants to Poland as country of origin. Most studies concentrate on motives and socio-economic decision-making determinants to move as well as economic and social integration aboard.

The main theoretical framework is based reflexivity socialization coined by Margaret Archer (2015) as the element of the social change. Socialization is understood as *long-life* and *long-wide* process connected with taking in the same time more and more complex social roles.

The paper seeks to answer two research questions:

1. What is the role of international migration by the first job abroad in entering the adulthood?
2. How does the socio-demographic profile of migrants determine school-to-work transition?

The study is based on Qualitative Longitudinal Study (QLS) (Neale&Flowerdew 2003, Adam 2008, McLeod&Thomson 2009). By QLS the study uses time as school-to-work transition as well as entering the adulthood explanatory variable. During two waves of the research, 44 semi-structured interviews with 30 university graduates were conducted. Research participants experienced migration in school-to-work transition.

SARRIS, NIKOS* (*National Centre for Social Research*)

The Role of NGOs and Civil Society in the Refugee Crisis: A Case Study of Lesbos in Greece

Local and municipal authorities, independently or in cooperation with other public agencies and non-governmental organizations are involved in migrant integration providing a large array of social services in the area of health, education, and social and child care. Regarding migration matters, municipalities played a very important role in the heightening migration and refugee crisis over the course of 2015 and in the beginning of 2016. During this period, Greece became a transit country for over 1,000,000 million migrants and refugees reaching the country through the Aegean islands.

Lesbos is one of the several Greek islands that function as the main gateway to Europe for migrants and refugees that are looking for a better life. The period between the summer of 2015 and early 2016 was the peak for crossings, with almost 500,000 arrivals to Lesbos, the most common point of arrival. Humanitarian aid organizations, both governmental and non-governmental, have worked to provide this basic assistance at many points on the path from the landing beaches. The contribution of NGOs and the collaboration with local authorities was of crucial importance.

The paper examines the role of NGOs, the ad hoc grassroots organizations and civil society during the 2015 refugee crisis. It outlines the evolution of humanitarian response, which started with various spontaneous initiatives and the cooperation with NGOs and international organizations in the provision of humanitarian services. It also discusses the anxiety of the local society considering that the presence of unregistered NGOs is more disruptive than useful. Overall, this paper will attempt to answer the main critical questions of how top-down and bottom-up models can co-exist in the implementation of public policies at a local level.

SASAJIMA, HIDEAKI* (*Osaka City University*)

States' Interventions and the Transformation of Urban Art Worlds: Comparative Studies of Western European, North American, and East Asian Cases

How do states affect urban social networks of the arts? This paper focuses on the organizational and institutional transformations of art production, distribution, and consumption from the 1960s to the 1980s, a time when welfare states actively promoted the arts. Existing studies such as those by White and White, Becker, and Bourdieu have respectively examined institutional transformations of the arts. Although these studies have made critical contributions to understanding the structural changes of art production, they focus mainly on the differences between premodern and modern society in Western countries, or as White and White described it, the transition from "academy system" to "dealer-critic system." Yet few studies examine structural transformations in the twentieth century.

The greatest factor changing the art world in the twentieth century was an expansion of global primary and secondary art markets, but states' interventions, such as promotion by subsidies or censorship, are also critical. In particular, after WW II, welfare states that developed in Western European, North American, and East Asian countries implemented various cultural policies to promote the

social welfare of their people and national prestige. Cities were the main sites for such interventions. Central and local governments constructed museums and subsidized artists and non-profit art organizations in urban areas. My question concerns the relationship between such state interventions and the organizations and institutions for the arts in cities.

In order to pursue the research question, I compare three visual art worlds in London, New York, and Tokyo during the postwar period. In particular, I select case studies from the 1960s to the 1980s because they represent a highly important period for welfare states' initiation of cultural policies and the establishment of their cultural bases. Utilizing mainly primary and secondary sources, I examine the historical contours of urban art worlds.

Bodies on the Spot. Commercialization and Performative Rationalization Among Italian Runners

This paper addresses the interface between sport and fitness, considering that commercialization has worked in two directions: while competitive, professional sport is becoming a global media phenomenon, with increasingly global and yet fragmented audiences, ordinary sport practice is being individualized in the Global North and shaped by the logic of therapeutic leisure. The latter has given way to the diffusion of a variety of active leisure activities aiming at providing individual consumers meaningful experiences of body transformation as well as health and fitness Apps apparently extending consumers' self-surveillance capacities. Based on semi-structured interviews with runners in two Italian cities, from the North and the South of the country, we explore how running practices and relevant Apps function as commercial disciplinary body techniques. Looking at runners' fitness and sport scripts and exploring how they use Apps to assist in training, we show that these devices take on some of the functions previously carried out by trainers, both further individualizing sporting and fitness practices, and allowing for the construction of relevant online communities. We analyze the variety of fitness and sport scripts collected on the backdrop of the broader discourse on active leisure, and consider how these interface with commercialization and market culture. We further discuss the emotional code which are deployed by runners in managing their running practices and illustrate their increasingly rationalized modes of relation with their bodies. The paper proposes that spectacularizing and individualizing self-surveillance are the staple of running practices as monitored through running Apps, and shows how gamification of practice situates running at the crossroad of fitness and sport practice colluding towards the increasing performative rationalization of active leisure consumers.

The Crisis of National Liberation Nationalism in South Africa: The Response of the National Union of Metal Workers (NUMSA) and the Role of Worker Education

Abstract

The Crisis of National Liberation Nationalism in South Africa: The Response of the National Union of Metal Workers (NUMSA) and the Role of Worker Education

In the post-apartheid period national liberation nationalism has degenerated. Since 1996 it was neoliberalised and of late has become increasingly authoritarian. While it continues deep globalization, it is linked to massive state level corruption and a new resource nationalism. In popular rhetoric the latter is referred to as 'radical economic transformation'. At the same time, the squeeze on labour has induced greater precarity, high structural unemployment, retrenchments in the context of industrial restructuring and widening income inequality. The Marikana Massacre of platinum mine workers in 2012 was a turning point for the national liberation alliance in South Africa. It has fed into the split of the largest and most militant labour federation in South Africa, COSATU, but has also given rise to the 'NUMSA Moment'. This refers to the decisions taken by the National Union of Metal Workers (NUMSA), one the largest unions in South Africa with over 300 000 members, to withdraw from the ANC-led Alliance, withdraw support for the African National Congress in the 2014 elections and work towards building a movement for socialism and workers party. These historic decisions were couched in the language of renewing revolutionary nationalism. This paper explores the understandings of the NUMSA Moment, its political significance, its

commitments to alternatives for South Africa and its limits by also drawing on a survey done of leading NUMSA shop stewards and worker leaders involved in a social theory course taught for six years at the University of Witwatersrand. This social theory course continues a tradition of radical worker education in South Africa and had its own consequences for shaping the 'NUMSA Moment' as a conjunctural shift in class politics.

SATO, AKIHIKO* (*Kwansei Gakuin University*)

Discourse Analysis of Drug-Induced Sufferings in Japan

"Drug-induced sufferings (DISs)" is a term to refer to medical, pharmaceutical, and social problems in Japan. The original Japanese word is "Yakugai" which refers to serious troubles caused by medicines or any other medical materials such as Thalidomide, Quinofom, blood products contaminated with HIV. The word "DISs" became popular and has been used in mass media since 1970s, whereas the meaning of it is still ambiguous. Such ambiguity sometimes causes troubles even today especially when discussing advocacy for victims of DISs.

The purpose of the paper is analyzing the discourses of DISs to clarify the historical change of the meanings of it and prove the contemporary meaning along with people's usage of the word. The paper adopted Discourse Analysis that has developed in UK (e.g., Potter and Wetherell 1987) in order to analyze almost all DISs discourses that can be found in the news papers and magazines, the academic journals, the minutes of the National Diet, the books that discussed about DISs, and the autobiographies by victims.

The result was that four interpretative repertoires were identified: Causality repertoire, Responsibility repertoire, Structuralism repertoire, and Solidarity repertoire. People including medical doctors, lawyers, journalists and even sociologists have used the first three repertoires to construct their temporal versions of DISs, depending on the contexts. The victims of DISs have also used these three repertoires to describe their experiences, however only victims have used the last repertoire to express how they have been suffering from social exclusion.

We can well understand with these four repertoires the reason why and the process whereby the debates and the institutions on DISs in Japan have been organized. The existence of them indicates that DISs are not just impairments and physical troubles caused by the adverse reactions, but social sufferings with social exclusion and disability.

Mind the Gap between Rational Choice Theory and Social Theory: Toward a Meta Rational Choice Theory

I propose a new theoretical framework to bridge the gap between rational choice theory and social theory. Rational choice theory is a strong tool with which to study social phenomena focusing on the macro-micro linkage. However, it does not dominate sociology; its influence in sociology is rather limited. One of the reasons for this, I would argue, is that rational choice theory has not adequately dealt with meaning and reflexivity, important concepts in social theory, which is influential in sociology. Rational choice theory assumes that actors choose alternatives that they believe will realize their goals. What is important in this assumption is that their goals are given. Actors are not assumed to change their goals. However, people sometimes reflect the meaning of their goals and find new goals. A textbook example is the creation of the concept of "sustainable development." When people enjoyed economic development by exploiting natural resources, their goal was just to pursue the development. However, once they began to realize that such development will damage the natural environments, they reflected the goal, tried to make a balance between economic development and ecology, invented the concept of sustainable development as their new goal, and have been trying to realize it. Rational choice theory has not seriously considered this process of changing goals via reflexivity. I proposed a mechanism in which actors move from backward-looking to forward looking rationality (Sato 2016) and a theory that assumes that agents find a new goal in agent-based models, which represents a process from forward-looking rationality to reflexivity (Sato 2017). I will propose a more general theory that deals with the triangular move from backward-looking rationality to forward-looking rationality to reflexivity. Finally, I will argue that the new theory will make rational choice theory more vibrant in sociology.

International Organizations and Domestic Climate Change Policy Networks in Australia, Finland, India, Japan, Sweden and the United States

Addressing the problem of climate change requires international collaboration. International organizations – scientific organizations, environmental NGOs and the United Nations – have long strived to create global norms on reduction of greenhouse gas emissions. In this paper, we argue that an important channel through which these global norms affect national policy processes are connections of collaboration and information exchange between international organizations and national climate change policy networks.

We use methods of social network analysis on organization-level survey data from Australia, Finland, India, Japan, Sweden and the US. The respondents include the roughly 100 most important organizations in climate change politics in each country. We analyze measures of collaboration, information exchange, influence and policy opinions, focusing on the role of international organizations in each national policy network.

The results show that international organizations, especially those that are known for providing scientific information and policy advice, have influence on domestic climate change policies. The effects of international organizations on national organizations are twofold: First, the information obtained from international organizations affects the policy preferences of national organizations. Second, national organizations gain more reputational power in the network by having ties with international organizations, especially with those that do not have ties with other national organizations. This distribution process of information from international organizations to domestic policy domains can be seen as a mechanism which brings about global convergence on climate change policy ideas.

However, we show that there is also a homophily effect: domestic organizations tend to form ties with international organizations based on their existing policy preferences. As a result, the information from international organizations is filtered through domestic organizations in the network. This is one likely reason bringing about the national differences in climate change policy.

Milieus, Demonstration and Party Support: Why Is Anti-Nuclear Public Opinion Represented Poorly in Japanese Policy-Making?

Following the Fukushima nuclear accident, Japanese citizens have called for nuclear energy to be phased out in the country. In fact, over 60 percent of the population has expressed support for the immediate abolishment of nuclear power plants or, at least, for shutting down a significant number of power plants. As a result, the country has witnessed an upsurge in anti-nuclear social movements. The results of the recently concluded elections, however, do not reflect the growing anti-nuclear stance. In fact, the ruling government regards nuclear energy as a core source of energy. In this research, we seek to address this contradiction—a majority public opinion against the use of nuclear energy, on the one hand, and the ruling government's continued backing of nuclear energy on the other.

To this end, we analyzed the data gathered from a 2017 survey of twenty-thousand residents of the Greater Tokyo Metropolitan area.

Our analysis is divided into three steps. First, we classify respondents "milieus" based on their attitude toward nuclear power plants, social status and lifestyle. Second, we examine the relationship between the milieu and their support to the political party. Third, we also examine the relationship between the milieu and their stance toward the anti-nuclear movement. We found that middle-class residents with a liberal ideology tend to support anti-nuclear demonstrations but do not actively identify with a political party. In contrast, the so-called conservatives do not participate in or support the demonstration. They also support the ruling parties regardless of the latter's stance toward nuclear energy. They are also discouraged from expressing their political views publicly by the organizations they are affiliated to.

There is a structural conflict between the rapidly changed public opinions crossing over the traditional ideological cleavage (liberal and conservative) and the conventional constellations of the political parties.

Social Influences in Parental Decisions to Give Prescription Drugs to Healthy Children

One third of *Nature* magazine's readers would feel pressure to give their children prescription stimulant drugs (e.g., Methylphenidate) if classmates were taking such drugs to enhance their school performance (Maher 2008).

In the ethical and societal debate, opponents and advocates of such so-called "Cognitive Enhancement" (CE) discuss the benefits and challenges associated with this practice. Advocates argue that using CE can solve social problems, as poor schooling and bad teaching can threaten children's mental health by exposing them to stress or restricting their intellectual and emotional potential. Opponents of CE stress the dangers of such medically supported solutions to social problems. Potential stigmatization, coercion processes, unknown medical effectiveness, and side effects might negatively impact children's mental health, e.g. by exposing them and their vulnerable brains to the risk of addiction, depression, or anxiety.

Parents are important stakeholders in the decision to medicate their children. However, little is known about how parents make decisions for or against giving CE-drugs to their children and how their proximate and distal social environment influences their decisions. We currently conduct a series of experiments using vignettes that explore social influences. These experiments examine different mechanisms of social influence (e.g. social control, moral evaluations, and imitation) as well as moderating influences of the source of the information (peers or media). In our presentation, we will also discuss the social implications of our results.

Rankings and the Rise of the Logic of Quantification

This paper examines how rankings contribute to the rise of a "logic of quantification" in higher education. Drawing on an intensive qualitative study of universities in South Korea, we show how the growing influence of rankings paved the way for the development of new ways of conceptualizing how these schools should be managed and the types of outcomes they should produce. We identify six processes through which this quantification logic has become dominant and, importantly, entrenched itself in organizational structure and process. This entrenchment, we argue, buffers these organizations from future challenges to the now dominant logic. We conclude by discussing the implications for these findings in settings beyond Korea and in realms other than higher education.

"Popular" and "Citizens" Movements in East Central Europe. the Case of Romania

Since early 2010 democratically held elections have generated new political majorities and relatively stable governments in East Central Europe. Hungary, Poland and Romania are among the countries in the region that follow this path. However, a number of authors have pointed out that against this apparently democratic change illiberal civil societies and public policies have actually developed. This paper tries to assess what is the impact of the newly emerged social movements. It starts with a review of the political process theory and explores to what extent a paradigm shift from contention to convention has been occurred in the former communist countries. Whereas the governments have had to balance between being domestically responsive and internationally responsible, civil societies have become more divergent and a certain polarization between left-wing (occupy) and right-wing (populist) movements has occurred as well,

Environmental Justice Vs Livelihood Justice: A Case Study of Forest Land Grab Movement in Tribal Belts of Nashik District, Maharashtra

In India, the construction of environmentally good has been vastly based on the rules and regulations influenced by the colonial forest and nature related laws. However, the change has observed in the recent legislations like Forest Act of 2006, which grants recognition to the rights of traditional forest dwelling communities. But still, what the policy based environmental values consider may not be contestant to the idea of environment justice but it surely hampers the livelihood justice of the rural poor. The forest land grab movement started in the late 1970s by the *Kisan Sabha*, a leftist party, in the tribal belt of Nashik district has been considered as issue of encroachment of forest land and a matter of environmental harm. The movement on the other hand opened up livelihood securities to them. Present paper, based on field work and cases, analyses the paradox of justice on the lines of protection from environmental harm on one hand and securing livelihoods of the tribal poor. The 'justice' involved in environmental justice oscillates between the rights and needs of the local marginal sections and policy based conceptions of environmentally good. The paper also sees the possibilities of inclusionary participatory interventions.

"They Wanted Wages in Cash, We Wanted Wages in Foodgrain": Women's 'Other' Issues While Working in Rural Employment Programmes in India

In India, women workers working in earlier EGS (Employment Guarantee Scheme) or present MGNREGS (Mahatma Gandhi National Rural Employment Guarantee Scheme) are equally needy; they earn similar wages and do similar manual work like the men working with them. These are the programmes known for gender sensitized outlook and framework. However, women workers have different survival strategies to mitigate famine. Their perspectives, their aspirations are always different than the male workers. This paper is based on field work data from Nashik, Maharashtra and explores the forms of discrimination based on gender, age, region and its implications on the marginalized from the marginal sections. The paper narrates the different livelihood and survival strategies of the women workers. The discrimination they face while working on the schemes and their abilities and inabilities to fight the discrimination involved in the wage based poverty reduction programmes are also analyzed in the paper.

Attitudes of Women's NGO Members Towards Gender (In)Equality

Men and women have traditionally been subjected to unequal social roles in almost every society. In addition, their attitudes and behaviors in most cases are expected differently. Women are usually expected to be weak, kind, naive, emotional, sensitive, and dependent while men are generally expected to be strong, rude, rational, and independent. Those expected attitudes and behaviors mostly become gender stereotypes that in turn hinder gender equality in society. The purpose of the present study is to investigate what women's NGO members in Turkey think about gender roles. In doing so, the study utilizes a survey having a Gender (In)Equality Index with almost 1000 women from over 200 women's NGOs in Turkey. The study analyzes the factors affecting the attitudes of women on gender (in)equality. This research is a part of a research project titled "Evaluation of Women's Policy in Turkey from the Perspective of Women's Associations" which has been supported by the Coordination Office for Scientific Research Projects of Social Sciences University of Ankara.

Gender Double Standards in Turkey

We have different rules guiding men's and women's sexual behavior. In addition, their attitudes and behaviors in most cases are judged differently. Women are usually stigmatized for engaging in any sexual activity outside of marriage, whereas for men such behavior is expected and even rewarded. Social construction of masculinity and femininity plays an important role in these understandings, and both females and males learn how to behave in society within the cultural norms of masculinity and femininity. Elements of masculinity and femininity are commonly set up as binary opposites, and people's sexual behaviors have clear gender stereotypes. For example, men are usually expected sexually active, aggressive and independent whereas women are taught to be passive and dependent throughout lifelong socialization process. The purpose of the present study is to investigate gender differences in the use of double standards in ethical judgements about virginity and premarital sex. The study investigates if people are more critical towards women's sexual behavior. Also, the study analyzes how the gender of the respondents along with other variables such as education and religiosity would influence the gender double standards. The study utilizes a nationally representative survey conducted by Social Sciences University of Ankara in 2015.

Things Matter: Landscapes of Education As Spheres of Influence

Research in linguistic landscapes of education or schools (Brown, 2005, 2012) is a relatively recent development. The research is best described as transdisciplinary, operating in the margins of multiple disciplines, namely sociolinguistics, educational studies and geography. My research focuses on mediated interaction between various landscape participants who not only experience the landscape as recipients, but also as shape it as active agents.

As landscapes schoolscape are not merely static institutional spaces where education takes place. They not only are, but also do; they are processes that shape people and in turn are shaped by people. On one hand, they reflect the top-down socializing processes of education and language policies. On the other hand, they are shaped by bottom-up processes, namely by the landscape participants who have the potential to shape the environment that shapes them. One key aspect of my research is to evaluate the role of landscape participants in shaping the learning environment.

Evident from the issued items, the results of my research conducted in a school unit in Finland indicate that the use of language differs between the landscape participants. Similarly to external participants, students use more languages than the institutional participants whose use of language reflects the top-down education and language policies. Furthermore, the use of language by students varies considerably on different levels of education. There is a clear shift from high use of Finnish on the primary level to high use of English on the secondary level. Nevertheless, while the students are able to participate, the institutional participants dominate the educational landscape. Moreover, student participation declines on the secondary level, indicating that students become more passive as they grow older, further emphasizing the role of the institution in the landscape.

SAVUL, GUVEN* (CONFEDERATION OF TURKISH TRADE UNIONS (TÜRK-İŞ))

The Economy Politics of Robotization and Digitization: The Myth of Industry 4.0

Industry 4.0 as a brand new concept has been discussed in different milieus effecting the world of labour for seven years. Especially, the employer associations claim that the digital and the robotic technologies have the capacity to transform the working relations and production patterns within the scope of the concept of Industry 4.0. The rooted companies of the mode of capitalist production are racing each other to take a leading position in order to benefit from the prospective outcomes of the concept of Industry 4.0.

Industry 4.0 as a concept containing different sub-components in itself deserves to be analysed by the researchers who are interested in the sociology of work and the recent developments in the world of labour. Since the concept of Industry 4.0 can cause a new destructive gale of unemployment and more de-regulated labour market, it should be taken into account by the labour sociologists. So, the EU institutions, the labour organisations such as the ITUC, the ETUC etc. contribute to the concept as well. The claim that the ICT based production processes have become more crystalized for forty years and that they are distinguished from the previous technological developments are two focal discussion topics revolving around the concept. Particularly the question such as "Can the robots appropriate the jobs of mankind?" and the other fundamental ones regarding the working principles of working life are raised within the concept of Industry 4.0. Following the beginning of the practices categorized under the concept of Industry 4.0, the job opportunities will be limited in labour market.

This paper will analyse the concept of Industry 4.0 with a critical perspective. Following the brief information about the general framework of the concept, its prospective outcomes will be assessed in term of the world of labour and organized labour movement.

SAWARD, MICHAEL* (University of Warwick)

Democratic Design: Modelling Political Futures

Democracy's potential futures can be modelled in a manner closely informed by design thinking. Methodologically innovative and interdisciplinary, this task takes the bearings of democracy's shaping and attends – contextually and reflexively – to its reshaping.

By exploring democracy as a critical design challenge rather than a received set of institutions, 'Democratic Design' both builds on and departs from received wisdom, not least democratic theory's tendency to 'silo thinking' and downplaying the importance of temporality. The core question of democratic design is: now and in the future, what combination of institutions, sequenced in what order, at what levels of a polity, may maximise a distinctive combination of democratic principles? At the idea's heart is detailed consideration of a set of key design and modelling concepts, notably: *enactment of principles*, such as equality and freedom; institutions, from city councils to citizens juries, as *assemblages of action and value*; *system and sub-system boundaries*, such as central and local government interactions; *hybrid and mixed systems*, for example ones that combine direct, representative and deliberative devices; and the different *incentive effects* arising from ordering institutions. This work will enable responses to practical design questions, such as how can we tailor democracy in the face of distinctive governance challenges such as climate change?

An innovative focus on a design paradigm promises to bridge the theory-empirical divide, draw flexibly on different models (by actively modelling, e.g. mixing and matching practices belonging to supposedly separate 'models'), and create new avenues for rethinking democracy in a pluralistic and fast-changing political

world. The paper will draw on a range of resources including social anthropology of design (Appadurai, *The Future as Cultural Fact*), design studies (e.g. Cross, *Design Thinking*), and the author's own earlier work on democracy (e.g. 'Enacting democracy', in *Political Studies* 2003).

SAWCHUK, DANA* (Wilfrid Laurier University)

Older Women's Reading(s) of Women's Magazines

Older women in Canada are often faced with challenges relating to both ageism and sexism, along with a resulting social, economic, and cultural marginalization. In our media-saturated culture, moreover, how we view and treat older women is related in part to how we see them represented in the mass media. On this note, women's magazines have been critiqued for conveying an anti-aging message through their images, stories, and advertisements. Cognizant of the rich scholarly tradition of content analyses exploring such media representations, this paper reports on a study that begins from a different vantage point – the magazine reader herself. We already know what scholars argue about representations of older women in magazines, but what do older women who read these magazines for non-academic purposes think? And, especially significant given that magazine portrayals are argued to influence not only how others see older women but also how they see themselves, how important are magazines and magazine reading to older women in the first place? Based on semi-structured interviews with Canadian women over the age of 55, this paper explores when, how, and why these women read women's magazines, and what they think of the representations of aging these media forms contain. Initial interviews reveal that, although these readers are clearly aware of certain problematic messages about aging contained in the magazines, this awareness interacts with the readers' instrumental and escapist uses of magazines in complicated and sometimes unexpected ways. The findings are discussed in the context of the broader empirical, theoretical, and methodological characteristics that have informed previous studies of women's magazines and magazine reading.

Mind the Gap: Gap Years Abroad As a Form of Socio-Structural Differentiation

In the last decades, taking a gap year after completing secondary education has become increasingly popular in Germany, and everywhere in the Western world. Before starting to work or continuing to tertiary education, an increasing number of young people decide to take a year off for doing something which does not relate directly to their future careers. Beside activities in their home country, it is common to go abroad. The activities available are numerous: Spending a year as an au pair in Canada, doing work and travel in the Australian outback, volunteering at a rural school in Ecuador, doing an internship at a UK based company, taking a language course in France or backpacking in Southeast Asia are among the most popular activities. Even though these activities all take place abroad, there are considerable differences between them: While it is rather cheap to work as an au pair, traveling through Asia for a year requires the availability of considerable financial resources. Additionally, for some volunteering assignments or internships, there are competitive selection processes. As a consequence, the different transnational activities differ in their social selectivity. Based on the premises of Bourdieu's socio-cultural class theory, the research develops assumptions about the social selectivity of different transnational gap year activities and offers first empirical evidence on the processes of social differentiation and the making of symbolic boundaries through different transnational activities.

SETTLES, BARBARA (University of Delaware)

Work-Family Reconciliation in Global Contexts

Significant social changes in societies have led to the intersection of gender, work and family becoming a hotbed of argumentation. Critical of biological and/or functional approaches, feminists have identified the ideological construction of the 'breadwinner-homemaker family' with its accompanying gender role constructs as particularly oppressive to women. This view has been exported by feminists to non-Western parts of the world where social unrest, the incorporation of large numbers of women into the workforce, and the revival of fundamentalist movements have re-focused attention on the role of women and men in families and societies.

Thus, concurrently, globalization has led to multiple ideological and economic constructs and models being available to individuals. Social policies have not kept up with these ideological and economic transformations. In general, most

social and economic policies that focus on these issues specifically address keeping women in the labor force while discounting their roles in families. This paper will address the discourses on families, gender, and work environments and will provide some policy examples from Western and non-Western contexts.

SAZONOVA, POLINA* (*Goethe University Frankfurt am Main*)

Work-Life Balance through the Prism of Biography: A Case of Russian Middle-Class Women

In contemporary society, built on the idea of labor, the individuals' lives, and especially women's lives, have become the crossroads of work and family, career and care, income and household, and can, therefore, be regarded as an arena for balance or imbalance in the life tasks set by the individual. The collapse of the Soviet Union and further transformations in the economic and the social spheres influence everyday life of Russian families and the repertoire of typical women biographies. The break of the state-sponsored gender contract of 'the working mother' forced women to form more independent strategies that would allow combining paid labor with family-related duties and mothering. This affected to a greater extent middle-class women, who study longer and set more ambitious career goals. The research draws on the combination of the structural-functionalist and biographical research methods and aimed at finding a social typology of reproducible biographical patterns of a combination of public and private self-realization, which depend on the pre-given circumstances (including institutional frameworks and cultural stereotypes), but also can be indirectly attributed to the self-management of biography. Empirical evidence for the research is the analysis of the biographical interviews that were conducted in 2015-2017 in the middle-sized Russian cities of Tomsk, Novosibirsk, Krasnoyarsk, and Irkutsk.

SCALIA, VINCENZO* (*UNIVERSITY OF WINCHESTER*)

I Have Been Working a LONG Time. the Justification of Violence By Italian Police

Italian public opinion has grown more and more aware of police abuses, particularly about those ones committed against young "alternative" youths, women, migrants, political activists. This paper will discuss the case of Federico Aldrovandi, a young man beaten to death by four police officers in 2005. In describing the declarations of the policeman made during the trials, I will analyse the Italian police culture through two main theoretical focus: the isolation culture proposed by Robert Reiner and the strategies of denial worked out by Stanley Cohen. I will show how Italian police culture is shaped by these two aspects, which must be set within the specific Italian social and historical background which enhances the authoritarian structure and functions of police, so that any attempt to reform is vain and makes police forces refuse the idea that they are accountable to public opinion. As I will develop my point, I will argue that there exist two models of policing: the Nordic one, which is typical of Northern European and Anglo Saxon countries, and the ethic one, which is typical of Continental Europe and Latin American countries. Whereas the former model is more community oriented, but in the end will follow the classed based and racist input of mainstream public opinion, the latter model relies on a top-bottom structure, which sees citizens as subjects to be governed and directed in the name of superior state ethics. I will conclude by arguing the necessity of creating a new model of policing, focused on diversity, as well as on the equality of citizens.

Dis-Embodied Habitus in a Disabling Field: A Tentative Framework for Thinking about the Complexity of Disability, Symbolic Violence and Ableism

Long running structure/agency debates have been complicated by ideas of embodied agency, highlighting both the structural disadvantage faced by those with non-normative bodies and the impact of dis-embodied habitus on identity, agency and social power. Drawing on examples from disability research this paper outlines a tentative framework for rethinking the links between social oppression and embodied experience and bringing together the, often disparate, research on disability undertaken across disability studies and medical sociology. Bourdieu's concepts of habitus, hexis, and symbolic violence are the starting point for exploring the impact of non-normative bodies on embodied agency. If, as Bourdieu suggests, dispositions which shape habitus are embodied and physically realised through the ways we pre-consciously display our habitus, then the body is the materialisation of class and taste. This is where the personal combines with the social and becomes visible. It is also where bodies which do not conform to the norms of the field, or are unable to perform the expected hexis become visible. For those with non-normative bodies the seemingly most natural features of embodiment may themselves be rendered unnatural. I further

argue that the tacit assumption of the pre-eminence of scientific knowledge and biomedicine results in symbolic power, and has led to an unthinking acceptance of the medicalisation of bodies, with attempts to normalise disabled people accepted as rational. Symbolic power becomes symbolic violence when those who have bodies which do not fit these norms unknowingly accept their place of subordination in their failure to meet them. This in turn impacts on identity, agency and the accumulation of capital and social power. Dis-embodied habitus and symbolic violence can help explain some of the ways in which disabled people are systematically disadvantaged at the individual, institutional and structural levels.

SCANU, EMILIANO* (*Sociology Departement, Laval University*)

Climate Change and Urban Transformations: Towards a "Climatisation" of the City?

The quantitative and qualitative growth of urban climate actions represents probably one of the most concrete and promising efforts in the global fight against climate change. What is interesting about this phenomenon is not only its contribution to a resilient and low-carbon society, but also its reflexive impacts on the city itself. In fact, the climate issue is increasingly being institutionalized within urban planning and governance, and it is consequently transforming urban spaces and societies. In other words, the climate is changing, the city too. Starting from these considerations, this paper offers theoretical and empirical insights in order to understand the transformations taking place in cities and metropolises engaged in the fight against climate change. The results are based on field research in Canada and Italy, as well as on the extensive literature on cities and climate change. First, the paper situates urban climate action in a framework which combines a constructivist perspective on ecological issues with urban studies interested in governance and planning. Second, it develops a typology to grasp the nature and scope of current urban climate actions. Finally, the paper argues that a "climatisation" of the city is underway, and sketches the contours of the transformations and the implications it involves. Besides wanting to improve sociological understanding of urban climate action, this paper wishes to shed some light on how and why contemporary societies are being reconfigured in a context of global environmental change.

SCHACHTNER, CHRISTINA* (*University of Klagenfurt*)

Digital Counterpublics. Femal Arab Network Actors As Producers of Critical Discourses

This lecture is about the discursive practices of female network actors and bloggers from the Middle East. The discourses which they initiate are a reaction to antagonisms in societies which see themselves as homogenous and closed. In such societies, gender is a key heteronormative category of order which does not only draw a clear dividing line between men and women but which also exploits this dividing line to define the boundaries of the public and the private as well as the distribution of human rights. The network actors' discourses are critical of the public sphere as defined by the ruling powers. They can be understood as counterpublics, which typically originate in groups whose positions and interests are marginalized or oppressed. They do not only expose social antagonisms but also address political alternatives, signalling the possibilities for new conceptual spaces. The political sphere does not have a fixed location in the online discourses which were analysed but rather a wandering existence, turning up in various digital networks and blogs (Mouffe 2007).

The protagonists of these critical discourses are young women between the ages of 21 and 27 who were interviewed as part of the study "Communicative publics in cyberspace". The lecture takes empirical data from the study to explore answers to the following questions:

1. What features are typical of the network actors and bloggers' critical discourses?
2. Which structural conditions do they arise from?
3. What does the visionary substance of these discourses consist of?

Digital media are seen as the main instances and instruments for initiating, shaping and disseminating discourses, the contents and forms of which are not unaffected by the chosen medium. It would therefore also be interesting to ascertain whether cyberspace would be a suitable space for a "subversive remapping" (Roth 2013) of social order from a feminist perspective.

RC38-668.1SCHAEFER, MIRIAM* (*Georg-August-University Goettingen*)HAAS, MARITA* (*Vienna Technical University*)***Biographical Research in the Context of Organizational Research: How Biographical Experiences and Narrations Interrelate with the Organization.***

People are involved in organizations in diverse ways and in different phases of life. These are public institutions of socialization, such as schools, professional organizations in the economic, academic or public sectors, but also organizations of religious groups or associations for leisure activities. Individual trajectories, in this context, underlay the social and institutional setting of organizations.

Vice versa, individual biographies influence organizations in various ways: People enter organizations with a specific biographical background: their specific history related to their individual – biographical and professional – experiences. We argue that organizational members interact with each other related to their specific biographical background and the experiences they made in the course of their life. Only through the course of a biography, are we able to understand what led to the involvement of attitudes and opinions that organizational members use in their daily interaction with others. We thus state that organizational members co-construct organizational decisions on the basis of their biographical experiences. On the other hand, (career) trajectories are subject to social and institutional settings and co-constructed through existing structures, processes and master narratives of organizations.

The police is an example of a strongly hierarchical organization. Careers in the police follow an established path, and yet are very different. Careers in academia, are as well structured but subject to informal networks and personal mentoring with senior supervisors.

On the basis of these two different research fields, we will discuss how biographical experiences can widen and/or limit occupational careers in hierarchically structured settings, and how experiences in the police or in academia structure biographies. We will further show that being part of a certain professional field and organization does not influence biographies in a one-sided way, but that certain biographical opportunities can only be realized within a setting that fits to the biographical structure.

RC20-370.1SCHAFFER, FRANKA* (*Department of Sociology, FernUniversität in Hagen*)***There Is No Such Thing As Practice Theorie without Comparative Sociology***

The intended talk affiliates on the call for discussing theoretical and methodological issues. Initial point is the fitting accuracy of methodological consequences in theories of practice with comparative sociology. The theoretical approach of social practices has been enjoying great popularity for several years, offers a new perspective on the social, but is still reduced on routines of practices. That could be treated with a strong consolidation of comparison within sociologies of practice. The talk centres the concept of practice within a discourse oriented poststructural materialism with its methodological consequences for doing sociology and discuss especially the practice-theoretical principle of a necessary comparative analysis by recommend first findings produced by the method of practice-theoretical filmanalysis with the methodological focus on moving body-object-associations. During the argumentation I will show how to overcome the ongoing limitation on routines within theories of practice by focusing on the special dynamics of practice in their own quality of enforcement and by methodologically controlled comparison of associations and interplays of different phases of formations of practices. The benefit of the analytical framework will be exemplified on a comparison between initial *Yippie* practices of protest during the *Chicago Festival of Life 1968* and a same same but different formation of practices of protest in the 1980s during the so called *Neue Deutsche Welle*, also known as 'german new wave'. Concentrating on the novel elements and different associations of specific formations of practices of protest respective music helps to carve out the continuous dynamic of transformation of practice to stay effective. These examples will show the synergetic cooperation of practice theory and comparative sociology by switching not only different timeframes, but geographical and social fields of practice for comparative sociological research as well.

TG08-1011.2SCHAFFER, FRANKA* (*Institut of Sociology FernUniversität Hagen*)***"Throwing a Bunch of Banana Peels All over Chicago" - on the Relationship of Affective Artifacts in Outrageous Yippie Tactics of Moving Protest from a Practice-Theoretical Perspective.***

The intended talk highlights the question, how we can investigate the relationship between artifacts and emotions by introducing an ongoing research project on the relationship of affective discourses and practices of moving protest forms and will present first findings related to the affective dimension of artifacts. From the initial assumption, that not only terrorist destruction of restaurants, discos and airports seem to be activating the emotional carrier of artifacts but also the symbolic emergence of artifacts during different formations of protest cause emotions, enlarge protest and initiate social change, the unfinished discussion of the affective and respective emotion in sociological theory will be addressed. I argue for an active and positive connotation of the decentering of the subject, like in an discourse-analytically informed sociology of practice which borrows ontologically from Massumi, whose concept of the affective applies empirically in the tradition of Grossberg and Clough. That will be tested against a sociology of protest by borrowing from Stäheli's concept of the collective. The *Chicago Festival of Life 1968* gives the example how to do a practice-theoretical sequential filmanalysis with the methodological focus on artefacts and their careers from unimpressive to impassioning elements of protest practice. Transformations often occur when conflicting artefacts, with deviating symbolic content, are integrated into practices and transform the social sense or the logic of practice. With the recommended research design one needn't with the subject in focus throw the affect and subsequently the emotion as such overboard as well, but could rather implement the affective turn in a way that it refers to the discontinuity of the subject and conceives physicalness and materiality in general as constituting moments of sociality.

RC07-148.2SCHAFFER, SCOTT* (*The University of Western Ontario*)***Theses on a Speculative Sociology***

This paper represents an intervention into a recently burgeoning field of study — namely that of speculative sociology (cf. Wilkie, Savransky, and Rosengarten 2017; Wilkie, Michael, and Plummer-Fernandez 2014; Cordero 2013, 2016, 2017a, 2017b, *inter alia*). While one of the original intents of sociology was, according to Auguste Comte, the *prevision* of dramatic forms of social change in order to attempt to stave them off (Comte 2000), the professionalisation — perhaps even the *industrialisation* — of academic sociology in the ensuing two centuries has in the main led sociologist and social theorists away from the prescriptive and prognosticatory aspects of the endeavour that are in many ways baked into our intellectual DNA.

While the versions of speculative sociology proffered by Cordero and Wilkie are grounded in the Marxist conception of the moment of crisis, I wish to contribute a version that is rooted in the moment of *the normal* — that is, founded upon the assumption that the situation from which we engage in speculation will, barring some kind of crisis, continue unabated into the future, and thus needs to be the rooting moment for speculation.

The form of speculative sociology I propose here is rooted in the critical works of Marxism and the Frankfurt School, as well as anticolonial, postcolonial, and decolonial critical theory. It takes seriously the work done on public sociology, ranging from Bourdieu's public interventions to Burawoy's theoretical contributions to our understanding of the work of sociology. This paper seeks to develop an anticipatory analysis of the future of extant social problems, and to develop a normatively-grounded framework for their evaluation and for developing solutions to these problems *in the here and now* so as to stave off their manifestation as crisis.

RC02-JS-44.6SCHAIGORODSKY, EMILIA* (*National Scientific and Research Council- Universidad Nacional de Villa María, Córdoba, Argentina*)***Elites' Perception of Inequality: The Case of the Province of Córdoba, Argentina******Elites' perception of inequality: the case of the province of Córdoba, Argentina***

This proposal aims to show the first results of an ongoing research (part of a future doctoral dissertation) about the economic elite in the province of Córdoba, Argentina. Its main goal is to characterize the practices of local businessmen nucleated in the chambers of commerce and industry (Cámara de Comercio de Córdoba and Unión Industrial de Córdoba, respectively).

In this instance, we will analyze the perception of the local elite about social inequality and the economic policies taken upon by the government. The events in Argentina and the region in the last couple of years are useful to study elites in the way proposed in the session. Since the end of 2015 Argentina has seen an abrupt shift in the tendencies of the government, with the ascent of a new political coalition (Cambiamos) that brought upon a change from a populist economic policy centered in "redistribution" to an open-market policy. This scenario has been characterized as many analysts as a "CEOcracy", on which members of the economic elite have pressured to limit public policies aimed at reducing social inequality and have increased their voicing of opinions and interests in public and sectoral issues.

This context is a privileged opportunity to look at the way the perception of elites regarding inequality unfolds, particularly in regions like Latinamerica, typically marked by strong socioeconomic disparities. To reach this goal we will analyze public allocutions and the content of dissertations given in the cited bussinesmen organizations on which the researcher took part from 2015 to present times. With this work, we pretend to make a contribution to the discussion in the session taking into account that local expressions of elites in different countries are key to understanding changes that exceed national borders.

Reflexiones Sobre La Investigación Comparativa De La "Desigualdad Mirada Desde Arriba"

Nos proponemos mostrar reflexiones pertenecientes a una investigación en curso[1] respecto de la elite económica en Córdoba, Argentina. Aquí nos interrogaremos sobre los alcances y limitaciones del empleo de herramientas del estudio de la desigualdad para dar cuenta de sus particularidades en la indagación de "la desigualdad mirada desde arriba".

El punto de partida será el trabajo presentado en un evento científico auspiciado por la red INCASI[2] donde se discutieron las implicancias del empleo de instrumentos cualitativos y cuantitativos en la construcción de objetos de investigación en torno al polo más alto de la distribución de recursos de diversa índole. Allí, se observó, desde el estudio de Benza y Heredia (2012) sobre las clases altas de Buenos Aires, la dificultad de homologar la estructura social de dicha provincia a Argentina en su totalidad, y la necesidad de construir caracterizaciones en diversas localizaciones de los sectores privilegiados.

En esta instancia, proponemos contrastar los resultados de dichas autoras con la Provincia de Córdoba y Argentina en su conjunto desde tres fuentes de datos: Encuesta Permanente de Hogares, Censo de población y los resultados del Programa de Investigación sobre la Sociedad Argentina Contemporánea. Luego, se intentará establecer comparaciones con trabajos de autores de otros países a fines de ahondar más profundamente en los alcances de estudios sobre clases altas. Para ello se tomará un primer punto de lectura en Espinoza (2010) y Espinoza y Barozet (2013) para el caso chileno, y luego se buscarán otras líneas de contacto. Se espera que estos pasos hacia un análisis en Latinoamérica permitan luego realizar comparaciones con otras regiones como la Unión Europea.

How Classroom Composition Impacts Alienation from Learning Among Different Student Groups: A Study of Secondary Schools in Luxembourg and the Swiss Canton of Berne

School alienation, and alienation from learning in particular, appears to be a major cause of deviant behaviour in school, school failure and even school drop-out. Research indicates that students of low social origin and boys show a higher level of alienation, while students with an immigrant background are less alienated from learning. This paper aims at analysing how classroom composition impacts alienation from learning and differences in alienation from learning along the axis of gender, immigrant background and social origin. While the education systems in Luxembourg and Switzerland are both externally differentiated (several parallel secondary school tracks), and thus, prone to educational inequalities, they differ in their school landscapes: Luxembourgish secondary schools are characterised by homogeneous classrooms regarding different school tracks or levels are more common, more integrative schools and, thus, heterogeneous classrooms, are common in the Swiss canton of Bern. Based on conceptual considerations on the role of classroom contexts, we will study the impact of classroom composition regarding the proportion of low-social origin students, immigrants and boys on alienation from learning among certain groups. We will distinguish between vulnerable immigrants, immigrants with a privileged social origin and non-migrants of low and high social origin. Analyses are based on quantitative panel data gathered in the framework of the international mixed-method project SASAL – School Alienation in Switzerland and Luxembourg. To analyse the outlined research issues, multilevel models will be employed allowing to separate individual level from context level mechanisms. Preliminary findings show that alienation from learning is lower in classrooms with a higher proportion of immigrants and higher in classroom with a higher proportion of students of low social origin.

The Concept of Values of Education and Its Role in the Reproduction of Educational Inequalities

While rational theories on educational inequalities focus on expected utilities and perceived benefits of education in regard to (monetary) labour market outcomes and status attainment, our concept of values of education tries to broaden this view. Based on the Social Production Function (SPF) theory by Lindenberg and colleagues (Lindenberg, 1986; Ormel et al., 1999), we developed a concept and measuring instrument of "Values of Education". Central are perceptions of how schooling contributes to the production of stimulation, comfort, status, behavioural confirmation, and affection as instrumental goals. Objectives of our paper include I) introducing and theorising the concept and the dimensions of value of education, II) an empirical validation of the measuring instrument, and III) an inquiry into how values of education contribute to the reproduction of inequalities considering social origin, gender and immigrant background. Empirical analyses are based on panel data of the international project SASAL – School Alienation in Switzerland and Luxembourg. This study – carried out between 2015 and 2018 – follows Swiss and Luxembourgish school students from grade 7 to grade 9 in secondary school. Results indicate that the "Value of Education" measure appears to be a valid measure across different groups of students. The five instrumental goals outlined by Lindenberg and colleagues are easily identifiable in the data. Comfort and status seem to be strongly related and cannot be separated from each other. While comfort/status and affection do not differ along the axes of inequality outlined before, there are gender differences in stimulation, and class differences in behavioural confirmation to be noted in both the Swiss and the Luxembourgish sample. Regarding outcomes, stimulation shows a negative correlation with school deviance.

When I Disliked My Choice of Topic

During the research for my M.A. thesis entitled "Being Jewish (and) in Love" for which I interviewed young Jewish adults about their "dating stories", I suddenly found myself seriously disliking my choice of topic. I had set out to analyse dating as an embodied gendered and racialized process of orientation, guided by the question "[w]hat difference [it makes] "what" or "who" we are oriented towards in the very direction of our desire" (Ahmed 2006:1). Through a reconstructive and sequential analysis of the dating narratives I thus retraced the course of action during the search for a partner to have sex with and/or live, dwell, and share your body and life with, towards understanding how an embodied 'being Jewish' is constructed in the process. However, I had turned a blind eye on my 'being German' and a non-Jewish researcher. Did I continue a legacy of a dubious 'scientific interest' in 'Jewish bodies' as unequal 'other' in German society – exercising the "conquering gaze" (Haraway 1991: 188) of a German who studies Jews to know what and who they are, what they do and with whom they do it? I remembered Elie Wiesel's (1979:241) observation on the violence inherent in modes of knowing in relation to Shoah survivors: "What do they feel when you tell them their story? When you claim to know more about it than they?" How could I bridge the chasm between "this woman who is writing about others, making them vulnerable" and those who are "more likely to be the ethnographized"? And "[w] hat, as she blithely goes about her privilege of doing research, is the story she isn't willing to tell" (Behar 1996:27; 20)? In my contribution, I will try to tell this story.

RC38-JS-3.9

SCHAUM, INA* (*Goethe University Frankfurt*)

'Being Jewish', 'Being German' and Being in Love

Intersectionality enhances constant alertness and sensibility to (new) omissions and exclusions within modes of knowing in relation to embodied categories of difference (Lutz 2001; 2014). Next to being a tool for (narrative) analysis, intersectionality can be practiced as creative and critical methodology of feminist analysis and the production of accountable theory (Davis 2014). Within my research about 'Jewish dating', intersectionality as critical analytic perspective and methodology allowed me to complicate and deconstruct the assumption of essentialized and distinct realms of 'Jewish' and 'non-Jewish' experiences of love, and instead lay the focus on the constant shift of boundaries, of relations of proximity and distance and ongoing processes of what I term biographical conversion(s). I use the term 'conversion' to denote the constant boundary crossing between difference and commonality; not in a conventional sense of (religious) status change, but as a narrative and biographical process of positioning and negotiation of unequal distributions of mobility, visibility and vulnerability. Moreover, a biographical strategy of conversion may manifest as appropriation (the desire to be Jewish), as denial or suppression of guilt or as strategy to overcome the past of Nazi violence.

In my contribution to the session, I will delineate how my interview partners and I engaged in dialogic/performative interviews in which stories were co-produced in a "complex choreography in spaces between teller and listener, speaker and setting" (Kohler Riessman 2008: 105) and which I link to the dialogic analysis of interaction as Lutz and Davis (2005: 241-242) propose it. This embodied co-construction is linked to the topic of my biographical research: gendered relational life and intimacy – and the shifting gulf between 'being Jewish' and 'being German' as complex axis of difference, itself comprised of the intersection of religion, culture, ethnicity, 'race', and cultural/social memory related to the Shoah.

Migrants' Access to (transnational) Social Protection and Its Consequences for Social Inequalities

Transnational social protection has received more attention within migration research as well as within social policy and welfare studies. Based on a comparative three-year project TRANSWEL (2015-2018, <https://transwel.org/>) I will discuss results from qualitative fieldwork of EU citizens moving within the EU in terms of securing their (transnational) social security and resulting social inequalities. Starting out from the assumption that social inequalities are (re-) produced in any kind of migration, the case of EU internal migration is considered specifically important in terms of citizenship within a multilevel governance of the EU. Comparing four EU country pairs (Hungary-Austria/E. Scheibelhofer, Poland-UK/E. Carmel, Bulgaria-Germany/A. Amelina, Estonia-Sweden/A. Runfors) in a mixed methods approach we analysed the implications of 'free movement' in terms of social inequalities. We found that educational backgrounds and employment situations per se are not as decisive for whether EU migrants access social benefits (we focused on the areas of family, unemployment, health and pension) but that patterns are more complex leading to specific kinds of stratification induced by inclusion and exclusion from (transnational) systems of social protection. Our interpretative analysis brought specifics of the country pairs to the fore. Also we see that attitudes towards welfare state provisions, self-perceptions, experiences of discrimination, and barriers resulting from multi-level regime within the EU and the nation-states are decisive for the resulting inequality experiences in respect to accessing social protection transnationally.

Educating the Male Other. Pedagogy As a Means for Restrictive Asylum Politics.

Focussing on the Austrian context, this paper analyses how the mode of pedagogy is used to introduce new restrictive asylum laws and the role that images of problematic foreign masculinity play therein. Rather than being outright punitive, these measures draw upon a discourse of the problematically archaic refugee in need of training and instruction of alleged "Austrian values" such as gender equality or LGBT-rights. This discourse was used to introduce new compulsory measures such as "value courses" that refugees have to attend or otherwise they face cuts in social benefits. Drawing upon postcolonial and intersectional approaches and integrating them with theories of critical migration studies, this paper discusses the contradictions that occur when emancipatory, feminist knowledge and pedagogy is integrated in compulsory and restrictive refugee politics in the name of educating the problematic male other.

RC38-JS-3.8

SCHEIBELHOFER, PAUL* (University of Innsbruck)

Precarious Masculinity in the Context of Refugee Migration.

Not just since the „long summer of migration“ of 2015, dominant representations of male refugees in Europe have centered around imageries of an archaic, dangerous and deceitful hyper male. While these depictions are useful for legitimizing anti-immigrant politics, they say little about the actual life of male refugees. But also opposing depictions of male refugees as passive victims of their circumstances are stereotypical in nature. Employing an intersectional approach, this paper analyses the complex and contradictory processes of constructing masculinity in the context of refugee migration. The paper presents the biographical analysis of a male refugee who travelled from Syria to Austria in the course of three years. Integrating critical masculinity studies and migration studies, the analysis shows how the young men's experiences of social marginalization and institutionalised exclusion have both masculinizing and emasculating effects. But the analysis also shows moments of resistance to marginalization, practices of "caring masculinity" and solidarity across social boundaries. The intersectional biographical analysis thus not only documents how multiple social hierarchies interact to create a precarious masculinity in the context of refugee migration, but also how this situation is navigated, confronted and subverted.

"Ambassadors of Involved Fatherhood": Exploring Online and Offline Discursive Practices in the North American Dad Blogger Community

Over the past eight years, a growing number of men have created online parenting blogs where they write about their experiences of fatherhood. Known now as "dad bloggers," this group has expanded into a cross-continent social network of fathers who interact regularly on the Internet and meet annually at a conference called the "Dad 2.0 Summit." Despite increasing membership and media publicity, academic researchers have paid scant attention to dad bloggers. The purpose of this paper is to address this gap by closely examining the North American dad bloggers group. I am guided by questions about how and why this online community has developed. More specifically, I am interested in exploring and understanding the collective interests and intentions of these fathers. To do so, I am involved in an ongoing "virtual ethnography" (Hine 2000, 2015) and make use of three types of data – a sample of blog posts, field notes from annual conferences, and interviews with bloggers themselves. Based on a qualitative analysis, I highlight three discursive practices that speak to the shared goals of the group. First, dad bloggers wish to further establish and enlarge a supportive community of involved fathers. Second, they produce counter-discourses aimed at correcting misrepresentations of fatherhood in popular culture. Third, many use digital media to engage in social and political debates, particularly surrounding issues of gender, work, and family. In closing, I discuss how dad bloggers operate as a "tiny public" (Fine 2012) and the ways in which they are redefining aspects of fathering both on and offline.

"Was This Review Helpful to You?" Creation and Re-Creation of Value through Measurement

In our contribution we want to tackle the question how valuation and measurement procedures are intertwined, in order to gain more detailed insight into the entanglement of value and measure. What happens to value in the course of measuring? We argue that measurement is always an act of value creation and re-creation, insofar as it rests on the assertion that something is potentially of value or valuable: Measurement always presupposes that something is, in principle, relevant. This creation and re-creation of value, however, does not yet say anything about the actual value it refers to, it asserts *that* something has value, but not, *which* value it has.

This is evident for example regarding the multiplicity of evaluation and measurement procedures in the peer review system in science. The quantification of citations through impact factors and other indices, the further evaluation of impact factors concerning their correlation with other performance metrics establish chains of measurements, where it becomes more and more obscure which value they actually express. Hence it is only through the concrete practices of evaluation and measurement that this value becomes fully conceptualized.

We conclude that value is created and re-created through the actual practices of measurement and discuss possible discrepancies, e.g. a hegemony of measurement over value in the depicted phenomena in peer reviewing in science. We finally reason that there is a considerable value diffusion through a multiplication of measurements and evaluation procedures insofar as these operations ceaselessly re-create, transform and modify values, which remain in constant flux and are steadily overthrown, while at the same time they set up, claim, and configure more and more values, whose reference measure become increasingly obscure.

Subjective Well-Being Differentials and the Decision of Migrants of Different Origin to Stay in the Host-Country: Evidence from Germany

Studies which try to explain return migration are rare, especially using utility function framework. This might be due to the large variety of factors that shape the utility of return migration. This study proposes subjective well-being (SWB) differentials between migrants living in the host country and the mean SWB in their country of origin as a way of capturing the utility function of re-migration. Using data from the German Socio Economic Panel (SOEP) and the World Database of Happiness (among others), a sample of 9.712 migrants between the years 1998 until 2015, coming from 81 countries (overall 32.003 observations), is studied. The analysis is carried out in two steps: first, SWB differentials are calculated and their systematic variation across the countries of origin are explored in a

comparative setting. Then, these SWB differentials are used as a proxy of utility gains to predict intentions for a permanent stay in Germany using a three level random intercept logit model (migrant-country-year) and controlling for a wide array of individual level and country level variables (income, education, age, GDP in country of origin, and more). The results indicate that the estimated SWB differentials perform in accordance with the utility-based theory. The proxy for utility is a strong predictor of intentions to permanently stay in Germany before and after a multitude of control variables on the individual and country level was included. The existence of a significant contextual effect is evidence that utility of living in Germany is linked to the country of origin and further shape a migrant's intention to permanently stay. The results suggest that return-migration can be conceptualized with a utility framework and subjective well-being differentials are an appropriate way of capturing the utility function at work.

Underpaid Boss: Gender, Power-Status Combinations, and the Association between Under-Reward and Depression

Under-reward is associated with depression—but is that association contingent upon power at work? As Hegtvædt and Parris (2014) assert: "Research on 'moderating factors' has made inroads, but falls short of the types of structural situations involving differences in power, status, and legitimacy..." (p. 120). In his call for greater theoretical integration, Turner (2007, p. 290) sharpens this point: "How does justice intersect with power and status dynamics, as well as expectation states associated with power and status?" Our paper address this basic call for new analyses, blending diverse theoretical traditions related to distributive justice, reward expectation states, status, and gender. Our analyses of data from the 2005 Work, Stress, and Health study reveal that the link between under-reward and depression depends on the ways that job authority combines with other forms of work-related status: income, skill, autonomy, decision-latitude, and demands. Moreover, these power-status combinations manifest only among women. We first document a significant two-way interaction for job authority such that under-reward is more strongly associated with depression among women with higher levels of job authority. We then demonstrate that this observed two-way interaction effect is significantly stronger when other forms of status are higher. These patterns are observed net of sex composition of the occupation, interpersonal conflict, and work-nonwork interference. Our findings provide new insights about the gendered ways that workplace power intersects with other forms of workplace status to shape the association between under-reward and depression. In doing so, we speak to diverse theoretical traditions related to distributive justice, and extend the scope of reward expectation states theory. Our efforts also dovetail with recent interest in the gendered implications of the status-power nexus and mental health inequalities.

SCHIERMER, BJØRN* (*Oslo University*)

Durkheim on Imitation – from Holism to Interactionism

The paper has a double aim. On the one hand, I seek to demonstrate the explanatory potential lying dormant in the late Durkheim's theory of the relation between the social and the material in religious experience; on the other hand, I want to show that the concept of imitation plays an all-important role in this relation.

I take as my point of departure the debate between Durkheim and Gabriel Tarde. I seek to show that Durkheim's strong reaction to Tarde – inseparable from his attempt to circumscribe the new science of sociology – leads him into a radical and untenable holist position. His insistence on the social *sui generis* leads him to overemphasize the "exteriority" of the social and its "constraining" character, which, conversely, leads him to marginalize collectivity and "decollectivize" both the social and the individual. He ends up with a sole individual facing a normative "societal" structure; i.e. a typical schism between actor and structure.

Yet, as I will demonstrate, the interactionist turn of the late work also implies a reconfiguration of the role of imitation. Here it enters the work in a modified and positive shape, in the form of a dynamic of collective entrainment which now takes center stage. The concept of imitation thus plays a crucial role in Durkheim's theorizing of religious experience; it helps to account for the very coming into being of the sacred object.

The last part of the paper seek to investigate the empirical potentials of this template in the present context, it seek to generalize and extend it to new cultural areas and it discusses why Durkheim (largely) overlooked this potential.

RC19-349.4

SCHILLIGER, SARAH* (*Institute of Social Sciences, University of Basel*)

(Self-)Organizing of Migrant Live-in Care Workers in Switzerland

Due to privatization of care services, changing migration patterns and transformations in the gender regime, the home care market in Switzerland has expanded in recent years. In private households of elderly people in need of care, a highly gendered and racialized low-wage sector has emerged. Especially around the clock care is increasingly organized by transnational for-profit agencies. Women from Eastern European countries work as live-ins and regularly commute between their family back home and their workplace in a Swiss household. Their work is characterized by low wages, long working hours and blurring boundaries between work and non-work.

Despite political and trade union efforts to regulate this labor sector, there is a general difficulty to enforce legislations in private households due to strong power hierarchies and lack of controls. In my paper, I ask about the possibilities and challenges of the politicization of commercialized care work through migrant (self-)organizing. Taking the example of the network Respekt@vpod in the city of Basel (Switzerland), I investigate how migrant care workers' empowerment can succeed despite a situation of social isolation, limited citizenship and insufficient institutional support by conventional unions. I therefore identify different enabling factors: a) 'sociabilities' and (virtual) networks within migrant communities; b) 'space/place-making activities' in sites like churches and public places; c) strategic law suits and practices to raise legal consciousness; and d) successful collaboration between migrant networks and trade unions at eye level. Based on my empirical work, I draw the conclusion that the private sphere is more and more contested by the commercialization of care work and the emergence of for-profit care agencies. This development is also caused by the fact that it is easier for the concerned workers to organize themselves and claim their rights when facing a care agency rather than a private employer.

SCHILLIGER, SARAH* (*Institute of Social Sciences, University of Basel*)

Urban Citizenship Struggles As Transformative Politics

In liberal democracies, access to fundamental social and political rights is strongly linked to national belonging. This results in a stratification of rights according to legal status as well in (partial) exclusion of certain populations from political and social participation. As a result, 'sans-papiers' (illegalized migrants) are particularly deprived of the fundamental 'right to have rights' (Arendt). In recent years, non-citizen migrants and refugees got involved in practices of claim-making, even when lacking formal citizenship status. Various examples of 'urban citizenship' such as the 'sanctuary cities' movements in Canada and the US show possibilities of cities to challenge not only the nation-states' ability to draw and uphold national boundaries, but also the fundamental meanings of citizenship. A multitude of European movements and initiatives have been inspired by such engagements in citizenship movements. Due to the rising presence of refugees in European cities, the concept of urban citizenship has become more relevant.

In Germany and Switzerland, the 'Solidarity City' network is imagining cities as spaces where no one can be deported and where everyone has access to education, health care and possibilities to participate actively in the cities' cultural and political life. In my presentation, I will discuss the possibilities and potential pitfalls of the concept of urban citizenship by examining how urban protests and activist practices can transform the city's material structure and redefine boundaries, membership and rights at the municipal level. Empirical examples of initiatives within the 'Solidarity City' network in Berne (Switzerland) will be illustrated to show the strengths and limitations of urban citizenship struggles, in particular regarding illegalized migrants. While the possibilities to bypass restrictive immigration law are limited so far, new political spaces have been created in which variously excluded groups of urban inhabitants empower themselves and create new understandings of belonging and citizenship.

SCHILLING, HANNAH* (*Humboldt University Berlin*)

Beyond Informality – Young Call Box Workers and Smartphone Traders in Abidjan and Their Making of Livelihoods.

Mobile phones are devices of crucial importance to young dwellers in urban Africa (Matlon 2014; Archambault 2012), and are interesting starting points from which to study relations of debt and credit in the making of urban livelihoods - and are constitutive part in new urban work arrangements that the digital transformation give rise to worldwide. This paper looks at ways in which young men in Abidjan utilize mobile phones to make a living in the city, on the basis of participant observations and in-depth interviews with young call box workers and smart phone traders in two popular neighborhoods in Abidjan. The sale of airtime and mobile phones constitutes for young Abidjanese men a way to navigate core social spaces of urban life – such as households, the street, and the nightlife. In the fabrication of their relationships to other dwellers, these earnings gain different

meanings, depending on the politics of value at stake, and the moral economies in play (Guyer 2004; 2012). At the same time, the young men's practices represent important nodes in an infrastructure of communication that constitutes the backbone of a growing global market (Cheneau-Loquay 2012).

The study of mobile phone economies reveals thus dynamics in cities in which consumption emerges as a privileged site for the fabrication of self and society and the role of labour gets more and more labile (Comaroff/Comaroff 2000). 'Dealing with credit', then, becomes a daily condition for making urban livelihoods - a condition captured by social policies and urban development programs, with social costs that need to be assessed carefully (i.e. Ferguson 2015). These new forms of income generation also urge us to rethink African urban labor markets beyond the divide in informal and formal work.

RC44-749.1

SCHILLING, HANNAH* (Humboldt University Berlin)

Dealing with Credits, Gambling with Data: Digital Piracy in Abidjan, Cote d'Ivoire and Its Potential for Urban Labor Struggles in Digital Capitalism.

The spread of new information technologies is praised as tool for development, centered in urban hubs worldwide. The digital transformation produces work arrangements that are characterized by their temporariness and ambivalent work status (Nachtwey/Staab, 2016). Scholars in African urbanism stress the creative appropriation of these technological devices by the population in informal activities (Cheneau-Loquay 2012). This paper goes beyond a discussion of the inventiveness of "the African dweller" and uses recent debates on the gig economy (Scholz, 2016) as lenses to understand the political economy of these new forms of informalized work. Starting from here, this paper problematizes the potential for struggles that popular digital economies in cities give rise to, on the basis of an empirical case study of practices of young dwellers in mobile phone economies in Abidjan, Cote d'Ivoire. It suggests the notion of piracy (Simone 2006) to embed these "workers'" mundane practices in the political economy of digital capitalism. To what extent does their reassembling of materials and resources illustrate forms of "quiet encroachment" (Bayat, 2010) and an appropriation of these infrastructures (Hentschel/Angelo, 2015)?

At the one hand, the phone credit sellers, online scammers and smartphone traders in Abidjan rely upon the multiplication of ID's and recycling of numbers and data, which can be understood as techniques to re-insert themselves in circuits of wealth by hijacking logics of capital and conventions of work and exchange (Newell, 2012; König, 2014). At the same time, these 'workers' enable through their practices an infrastructure for ICT firms to diffuse their services and devices. These capitalize on the precarious workers' labor and capital and make use of their social infrastructure as dwellers to increase benefits (Mann/Meagher, 2016). To reveal this tension is an important step to understanding workers' struggles that take place beyond registers of legal rights and formal organization.

"... Do Not Try to be Anything Other Than What You Are": Tactics of Authentication and Denaturalization in the Construction of Digital Identities on Facebook

Bucholtz and Hall[1] in their article on identity and interaction outline three different „tactics of intersubjectivity“: adequation and difference; authentication and denaturalization; authorization and illegitimation. The paper discusses how these tactics are applied in the process of digital identity construction on Facebook.

Social network sites have become increasingly important public spheres where identity constructions take place. Identities on these sites are intersubjectively and dynamically constructed with the help of content provided by the profile owner, his or her social network and the system itself.

The analysis is based on data coming from a representative survey, whereby more than 600 Hungarian teenagers were asked about their social media use. As part of the survey, students' FB profile pictures were also collected resulting in a pool of 359 profile pictures. A smaller portion of the pictures also includes self-comments and comments by others.

The choice of the profile picture and the potential self-comment, together with the comments it received from others construct digitally, visually, linguistically and intersubjectively the identity presented for the audience of this public sphere. The paper presents multimodal analysis of some of these pictures focusing on tactics of authentication and denaturalization. It looks at a number of contextualization cues, like location, clothes, body posture, gaze, etc. indexing different aspects of identity and studies how these identities and confirmed or challenged by onlookers. It also looks at statistically significant differences among different user groups, focusing especially on gender, ethnicity and class, to answer the question: how the degree of freedom and agency in constructing one's identity is dependent on the wider social structure and its unequal distribution of power. It is concluded that offline inequalities re-appear in the online world.

SCHLERKA, SEBASTIAN* (Bielefeld Graduate School in History and Sociology, Bielefeld University)

Secularization As Struggle

This paper aims at presenting a new approach on secularization that is applicable in empirical research and avoids the historical teleology of most classical secularization theory. These goals are achieved by basing the approach on Bourdieu's theory of practice and treating secularization as the result of struggle.

Regarding the meanings of the term secularization, Casanova speaks of differentiation, privatization, and marginalization. These meanings can be understood as dimensions of secularization. From a critical assessment of secularization as well as desecularization approaches from all three dimensions (Luhmann, Habermas, Luckmann, Casanova, Thomas, and Riesebrodt) I have developed two aspects for each dimension. Differentiation can mean the autonomy of religious actors as well as the expansivity of religious worldviews to other fields than the religious. Privatization not only refers to the public-private dichotomy, but also to the individualization of religious beliefs. And marginalization can be the result either of societal change or of competition by non-religious actors.

Looking more closely, one notices that all these meanings of secularization describe aspects of religious praxis. In Bourdieu, which praxis counts as legitimately religious is always the object of struggle, with each actor trying to impose his own praxis as legitimate. Speaking in theoretical terms, it is the religious field's *nomos*. Since, as Luhmann states, speaking of secularization only makes sense in the context of the relation between religion and non-religion, in order to return to secularization we have to get back to non-religion. Non-religious actors have their own ideas of what religion ought to be, and they try to impose their view on religious actors. Building on Wohlrab-Sahr, Asad and Luhmann, we can define these non-religious ideas of religion as secularism. Secularization, then, can be defined as the (forced or deliberate) adaptation of religious actors to secularism. Put differently, secularization is the result of struggles.

"I Would Not Have Done It on My Own." Peer Experiences in Cross-Border Group Mobilities

Cross-border mobilities taking place in the context of German vocational educational training (VET) are largely dominated by group mobilities which represent a unique peer setting: They imply a transfer of existing peer groups from one context (VET) to a new setting and make mobility a shared experience.

This work examines the implication of this specific setting on old and new peer relations, on individual development and on the mobility experience itself. Starting from an action-theoretical approach that looks at how young people engage with the structures and actors they face in their biographical maneuvering (Pohl et al. 2011; Coffey/Farrugia 2013), we examine their individual perceptions of, and responses to group mobilities as structural element within mobility programmes, and to peers that shape their mobility experience. The empirical basis for this contribution is provided by the HORIZON 2020-funded research project MOVE that looks at youth mobility in Europe via a multi-methods approach. Data has been analysed from qualitative, problem-centered interviews with mobile German apprentices (the subsample comprising 16 interviews) and will be critically discussed against the backdrop of a wider picture (altogether 206 interviews in six mobility fields and six countries).

Empirical evidence reveals intensive peer experiences due to the extreme spatial and timely closeness with accompanying peers. While the group element is reflected as decisive inducing moment for VET mobilities and contributes to positive experiences abroad (e.g. through prevention of homesickness, reduction of anxiety), it lowers agentic behavior and has a hindering effect on maturing due to the shared coping and the delegation of developmental tasks (Havighurst 1972, Fend 1998). Moreover, the interviews suggest displacement effects on the development of peer relations to youth in the host country. This ambivalent fostering as well as hindering character of group mobilities becomes even more visible in comparison across countries and mobility fields.

Intersectionality Mapping, Children's Agency, and Rebellion Against Parents

This paper uses intersectionality mapping to retrospectively explore children's agency in the context of rebellions against parents, using a sample from the USA.

Children's marginalization has long been recognized in childhood studies, but only recently has this marginalization been considered from an intersectionality theory approach (Konstantoni & Emejulu, 2017; Rodo-de-Zarate, 2017). Children's lack of power by age exists alongside other areas of marginalization and privilege, and multiple inequalities intertwine to shape children's trajectories (Choo & Ferree, 2010). Intersectionality theory provides a useful framework in which to situate how contexts of marginalization and privilege shape children's experiences of agency in their families, and recent work on children's agency notes that it is not separate from the relational/interdependent contexts of children's lives (Esser, Baader, Betz, & Hungerland, 2016).

To get at these dynamics, we present our methods, preliminary analyses, and lessons learned from a portion of our study of children's rebellion against parents, drawing on 40+ qualitative interviews with adults looking back on actual and desired childhood rebellions against parents. We conceptualize rebellion as "repeated cases of opposition to the rules, values, norms, or established power of one's parents or guardians (either overt or covert) before age eighteen."

We utilize a "relief map" created for the interviews to capture how the time periods related to rebellions and the control participants felt they had over their lives connected to eight social categories of age, race/ethnicity, education, income, sex/gender, religion, sexual orientation, and nationality. The relief map enables multiple categories of difference to be considered quickly, and gives a sense of their relative importance. We have modified Rodo-de-Zarate's (2017) intersectionality tool; she mapped social categories alongside geographic locations, while we map social categories alongside time periods related to rebellions.

Adaptive Governance in Portugal: Breaking New Ground in Stakeholder Engagement

The challenge of climate adaptation has brought to the fore governance hurdles that have long plagued public institutions and policies. Lack of cross-sectoral communication, ineffective implementation, and weak engagement of citizens are some of the most critical, which have been recurrently highlighted in policy reports. This paper discusses the results of two projects that contributed to launch a climate-induced institutional change in Portugal, over the last seven years.

From 2010 to 2014, "Change" initiated a process of adaptive governance in three coastal areas vulnerable to the impacts of climate change. This project engaged public officers across the national, regional and local scales, in a combined effort to envision future scenarios (2025, 2050, and 2100) and develop adaptation strategies. "Change" involved a series of focus groups discussions and workshops where regional and municipal officers interacted with the coastal communities at large, including local businesses, non-governmental organisations and fishermen.

In 2015-2016, the project ClimAdaPT.Local pioneered the creation of Municipal Adaptation Strategies in Portugal, in close collaboration with 26 municipalities across the country. The project aimed to increase the capacity of these municipalities to incorporate adaptation measures into their planning instruments. Multiple methodologies were developed, including an innovative strategy for the engagement of local stakeholders.

Both research projects involved an interdisciplinary team from the University of Lisbon, combining the approach of natural and social sciences. This paper will discuss how "Change" and ClimAdaPT.Local have broken new ground in stakeholder engagement, contributing for a shift in how institutions cooperate and manage the territory.

Educational Selectivity and Immigrants' Labor Market Performance in Germany

Having experienced ongoing immigration since the early 1960ies, Germany yields an important case for the investigation of labor market incorporation of immigrants'. Thus, a large body of research examined ethnic inequalities in the labor market integration of immigrants'. In the German context it was often assumed that immigrants' were negatively selected in terms of their human capital. We want to investigate this assumption and raise the question how educational selectivity on an individual level affects immigrants' integration into the German labor market. Based on arguments which specify how selectivity might translate into migrants' labor market performance - for example via individual differences in motivation, skills and competences or (cultural) resources - we empirically examine this relationship. Combining data from the IAB-SOEP Migration Sample with international data on educational attainment distributions from 1950 to 2010 in 146 countries (Barro/Lee 2012) we create a measure of immigrants' relative level of educational attainment. This index captures the individual position in the educational distribution of the country of origin. Based on previous analyses with cross-sectional data on different Western European destination countries we expect the following results: First, immigrants' who came to Germany are mostly positive selected in terms of education. Second, regarding occupational status, immigrants' profit from a favorable position in the educational distribution of the country of origin. Analyses on longitudinal data with detailed information about the German labor market should enable us to gain further insights into how the positive effect of educational selectivity on labor market outcomes is influenced by labor market characteristics.

Global Modernity and Its Repercussion

This paper proposes the concept of global modernity, presented in a recent book (Global Modernity. A Conceptual Sketch, Palgrave Macmillan 2014), for mapping both recent historical trends and anticipated future developments that will in all likelihood profoundly affect the living conditions and life chances of human beings around the world. Starting from the observation that the past four decades or so have seen what arguably amounts to the greatest and most dramatic transformation in human history, and showing that the social and technological conditions to which this transformation has given rise provide the springboard for even more radical change, I will outline some of the theoretical and practical challenges this entails. On the theoretical plane, I argue that we need to transcend the confines of methodological nationalism and epistemological conservatism that mislead us by tying our representations of society to a past which has been surpassed by the realities of globalization. If we are to come to terms with these realities, we have to build a genuinely global sociology that treats the whole world as a singular social system, rather than a multitude of relatively self-contained societies (conveniently equated with nation-states) with the capacity to shape their own destinies independently of the others. That has never been a realistic assumption for the Global South, but has now also become untenable for the erstwhile leaders of modernity in the West. On the practical plane, I will explore three realms of change - those of world order; work and social policy; and our biological constitution - to show that and how orientation to the past may prove not only unconstructive, but misleading when thinking about policy responses for tackling the challenges they present.

The Role of Sexual Moral Panics in the Emergence of Right Wing Populist Movements in Europe

Since the mass protests against the "marriage for all" in France in 2013 it has become clear that the politization of sexuality is one of the central features of emerging right wing populist groups and parties in Europe. Especially protests against sexual diversity and sex education present significant mobilizing factors for new conservative social movements. In the new right wing sexual politics, as I would call it, the notion of the endangered and vulnerable child is used for a specific kind of affective politics that builds on the force of sexual moral panics. My argument in this presentation is that sexual moral panics have become an important mobilizing tool for right wing populist discourses and movements. The focus of my analysis will be sexual moral panics around the 'endangered child' and sexuality. Right wing sexual politics try to defend conservative values and heteronormative hegemony. Whereas in Eastern Europe liberal values are equated with neoliberalism and are rejected on this ground, in Western Europe conservative groups also argue for an exclusively heterosexual marriage with respect to identity and the social order albeit without the anti-liberal twist. Apart from specific regional differences we can observe that the new right wing sexual politics succeeds in forging new alliances between different right wing groups and fractions. In my presentation I will primarily focus on right wing populist movements in Germany and their relation to sexual moral panics. For my case study I use the notion of moral panics in order to delineate a specific form of affective politics. In my conclusion I shall discuss the potentials and problems of this concept with respect to how we can understand the current success of right wing populist discourses.

RC03-73.3SCHMITZ, SARAH* (*Goethe University Frankfurt*)*Characteristics of Solidarity within the Commons*

Practices and theoretical approaches of Commons can be described as strong related to „Communities of Solidarity“. I define Commons as an approach in which goods are used and administered in community ownership. Although the economic character is highlighted often, I argue that Commons base on solidary practices, which differ fundamentally from capitalist modes of socialization and can be seen in three aspects:

1. Transformation of private property to community property. Through this „Commoning- Process“ resources and goods become Commons, which have no longer the character of market goods. Commons offers access to the goods for every member of the community, apart socio-economic status, race or gender.
2. User rights are not based on the monetary resources, but on the needs of the community. These rights are defined in basic-democratic decision making processes.
3. Dissolution of capitalist individualization by constructing Commons as spaces for solidary interaction and social responsibility. This differs fundamentally from anonymous market exchanges in which people are only united by modes of indifference and completion.

Although Commons can be defined as an approach to solidary practice, I would like to name two critical points:

First, the purview of this solidarity practice must be illuminated. At present, the focus of Commons is on Commoning of goods and resources, but less on Commoning of different forms of labor (wage and reproductive labor). How, for example, could the labor power – which is central for capitalist structures – be communicated and labor processes created in solidarity?

In addition, I consider it important to take these aspects into account in order to make the practice of solidarity permanent and not to become a neo-liberal form of the adoption of state services by communities. Solidarity is not just a side-effect of Commons, but of great importance to experience alternative form of socialization beyond modern-capitalist structures.

RC48-813.5SCHMITZ, SARAH* (*Goethe University Frankfurt*)*Commons As Spaces for Social, Cultural and Political Actions*

In recent years the approach of Commons gained a strong growth. In a grand plurality many practical and theoretical projects emerged, trying to implement a social practice which is based on collaborative actions, need satisfaction for all and differs fundamentally from capitalist modes of socialization. In Western societies Commons can also be defined as an answer to the deconstruction of welfare state structures. People react to this policies not only with loud critique and demonstrations, but also by working on and implementing new forms of economic and social practices. The basic idea of Commons is the transformation of private property into community property. By this every member of the community has access to the Commons. Underneath this economic practice of using resources and goods for physical and psychological need satisfaction, lie multiple forms of social practices and interactions.

Commons are more than just a practices of sharing resources and goods. Commons offer opportunities for alternative forms of socialization. This means that it can less be described as a social movement, but a form of collaborative action, which tries to overcome the economic, cultural and social structures of capitalism.

Commons over a space or maybe spaces for more than just access to resources. They over spaces for social interaction, democratic participation and reflection. My interest lies in analyzing these spaces as important institutions, which have to be created, reproduced and defend towards capitalist enclosure not by state institutions but by social interactions of the Community members. Because of this spaces Commons (as a theoretical and practical approach) have got potential for implementing new or different forms of society, which base on solidarity and equality.

RC01-49.5SCHNEIDER, OLIVIA* (*Military Academy at the ETH Zurich*)MOEHLECKE DE BASEGGIO, EVA (*Military Academy at the ETH Zurich*)SCURRELL, JENNIFER VICTORIA (*Military Academy at the ETH Zurich*)*Effects of Social Media on the Communication Model and Legitimacy of the Swiss Armed Forces*

In a democracy, political processes and decisions need transparency which can be realized by communication. It is also a prime means to gain legitimacy, reputation and trust (Deverell et al. 2014). In recent decades there has been a change in communication behaviour and models.

Therefore the Military Academy at the ETH Zurich is analyzing the social media behaviour and impact of the Swiss Armed Forces by using the method of qualitatively oriented quantifying content analysis. Three different models are analyzed:

The old public administration (OPM) provides information about government decisions without protectorate or preferential treatment. Citizens get relevant information by top-down and one-way communication in order to align the government with its citizens (Brainard & Mc Nutt 2010).

The New Public Management (NPM) seeks marketization and outsourcing of core services like in the private sector (Möltgen & Pipke 2009). Perception and impression count more than objective facts. Citizens are considered as costumers. The aim of the NPM is to work on its particular brand and its reputation. The focus is on single demands and individual interests. Thereby the public administration endangers democratic values like transparency and impartiality.

The New Public Service (NPS) does no longer rely on reputation but is oriented towards participation, collaboration and deliberation. The citizens should be supported in articulating their common interests in a pluralistic society. By facilitating participation, democracy and a responsible government are fostered. Citizens discuss common values cooperatively to find answers for relevant problems of the public interest (Robinson 2015). As a result democratic legitimacy of political processes increases. The armed forces should be open for public deliberation. Social media provide a chance for this as they facilitate information and participation simultaneously.

RC35-636.8SCHNEIDERHAN, ERIK* (*University of Toronto*)*Transaction and the Crowd*

With the increasing reliance of society on the internet as a way to organize social relations, sociologists are (re)focusing their attention on the crowd as a unit of analysis. Big data collection techniques and ever more sophisticated statistical analysis make it possible to look at how enormous groups of individuals relate to one another. However, social theory has not kept pace with these empirical and technical developments. In this paper, I draw on Dewey and Bentley's (1949) concept of *transaction* to engage in (re)theorizing the crowd. I show how thinking of the crowd as a *transaction* shifts the focus from interactions between individuals to mutually constitutive relations that are reciprocal and ongoing, part of a social "stew pot" (Sullivan, 2001). I then use the case of internet crowdfunding to put these ideas to work, asking how a transactional theory of the crowd might get us to think differently. The paper concludes with a general discussion of the generative potential of *transactional theory* for sociological inquiry.

RC20-370.5SCHNEIJDERBERG, CHRISTIAN* (*University of Kassel*)*Analytical Framework for Researching Doctoral Education and Training Based on a Comparison of the Australian, German and US Models*

Comparative studies about doctoral education and training mostly focus on disciplinary differences within a country or on analyzing cross-country commonalities and differences on the policy level. A common challenge faced by comparative studies of doctoral education and training is the methodological approach due to empirical diversity, and, as a consequence, analytical depth of results. Accordingly, despite the many studies we know little about effects and mechanisms determining the outcomes of doctoral education and training, as for example the ongoing debates about completion, attrition or drop-out, and time-to-degree show.

In the presentation it is argued that a better understanding of the design of doctoral education is the key to better understand the complex interrelationships of individual and structuring features. Based on a comparative case study of the three distinct types of the Australian, German, and US models of doctoral education and training an analytical framework was generated, composed of seven characteristics: 1) admission and recruitment, 2) primary status, 3) study load (differentiating between curriculum and tailored courses), 4) work/study obligations, 5) completion requirements, 6) quality (evaluation and assessment), and 7) future employment and career. The analytical framework can be used as a multidimensional grid for the study of determinants and outcomes of doctoral education and training.

RC52-870.5SCHNELL, CHRISTIANE* (*Institute of Social Research at the Goethe University Frankfurt*)*Professional Authority and Corporate Capitalism*

The paper addresses the question of the rise and fall of professional authority with regard to corporate capitalism. Corporate capitalism isn't a new phenomenon, but during the last decades, in the shade of globalization, digitalization and financialization, the power of international corporate groups

has risen enormously. Hence, it will be examined how professional knowledge and judgement relates to this environment. Beyond the aspects previously debated with regard to the relation between professions and organizations, huge corporations operate on the basis of a multi-level technocracy. Professionals have to deal with the logics of business administration, quantification and close monitoring, which further aggregate over the diverse organizational levels of large companies. Resulting from my empirical work on professionalism within such structures (e.g. media, banking, pharmaceutical industries) the effect of corporate capitalism on professional authority and in how far professionalism might still act as a counterbalance and systematic critique of technocracy will be discussed.

RC57-922.2

SCHÖBER, ANNA* (*Alpen Adria University Klagenfurt*)

Doubles for Everyone: Transit Characters As Tactics for Involving the Public in Dutch Documentaries Since the 1960s.

This paper investigates the appearance of transit characters such as tramps, taxi drivers or urban passers-by in documentaries produced by Dutch filmmakers since the 1960s. It analyses these figures in their function for the public as kinds of doppelgangers, to re-direct affect and attention and to stimulate interest in and reflection about social and geographical milieus far from everyday reality for most viewers.

The paper locates these "everybody" figures in a genealogy and historical iconology of visual figurations addressing and involving the audience and constituting public authority that takes account of the *longue durée* of such visual figurations as well as of the specific transformation and forms of appearance of these figures that has emerged in postmodern, globalised societies since the 1960s. In doing so, it focuses in particular on the role these figures assume in constituting authenticity and in convincing and in persuading the spectator and in popularising visual research and social and anthropological knowledge as well as political positions. It identifies the particularity of the Dutch documentary tradition in this respect, but also shows that these films and the "facefeite" (*visagéfite*) images they present are part of transformations happening on a transnational and increasingly globalised scale. In addition, the transmedia transitions of such everybody figures – for example between film and photography or film and the internet – are also an issue. These questions will be approached by combining a genealogical discourse-analysis methodology with iconological visual-studies and film-studies methodologies. Finally, the "everybodies" appearing in Dutch documentaries since the 1960s are investigated as figurations stirring the public, political imagination and providing an experimental site for the interlacing of similarities and singularities in respect to contemporary practices of lived democracy.

SCHÖGER, LAURA ISABEL* (*University of Würzburg*)

Stress Level Along Professional Groups and Educational Indicators

There are different types of stressors. Eustress is positive stress that is motivating and improves one's performance while distress is negative stress that causes anxiety, decreases one's performance and can lead to mental and physical problems (Hurrelmann 2010).

Stressors can be stressful life events as well as chronic strain (e.g. familial and job strain). A central area of human life in which both positive and negative stress can affect a person's health over a long period of time is the working world (Siegrist 1996). Stressors at work can be the employment relationship (e.g. temporary contracts, more than one employer), the positioning and amount of working hours (e.g. work at weekends) and the workplace (e.g. outside the private area) (Garhammer 2003).

The contribution describes the stress level along professional groups and educational indicators. Depending on the level of education, people select themselves in professions with different health chances and risks. While a higher level of education is associated with occupational stress and a lack of physical activity of 'office workers', professions that don't require a degree are associated with noise and pollution, as well as accident risks and health-related shift work (Beyer 2002). The contribution deals with the question whether jobs that require or jobs that don't require a higher level of education are generally characterized by greater stress levels by using data from the National Educational Panel Study (NEPS^[1]; starting cohorts 6: Adults (SC6)).

[1] NEPS collects longitudinal data on education processes and competency developments in Germany.

SCHÖPF, CAROLINE* (*Hong Kong Baptist University, Max Weber Foundation*)

The Terminological Division between 'expatriates' and 'migrants': Sorting Migrants By Skill and Form of Employment or By Race and Nationality?

Even though the term 'expatriate' or 'expat' enjoys frequent popular usage, there is a lack of sociological research on the groups identified by it, and an ever greater scarcity of attempts to critically investigate and deconstruct what this term is signifying. This study uses in-depth interviews and fieldwork to analyze how the terms 'expat' or 'expatriate' are adopted, assigned and negotiated in Hong Kong by receiving society members as well as highly educated migrants of various ethnicity from Western and South Asian countries. It is found that interviewees profess to use the term in color-blind, meritocratic ways to signify attributes such as white-color or professional employment, high amounts of education and expertise, temporary mobility, positive, enriching impacts to receiving societies and an absence of associated social problems. However, in reality, race and nationality, along with class, tend to strongly pattern categorizations, individuals associated with the Global South being frequently categorized as 'ethnic minorities' or 'immigrants,' while those linked to the Global North are being viewed as 'expats'. White migrants, even those who are low-skilled, unemployed or come from a society with a lower level of development than Hong Kong, report being automatically categorized as 'expats.' Highly skilled, professionally employed migrants of color hailing from Western and non-Western societies tell of shifting, situational categorizations that depend on factors such as their perceived social class or enactment of Western cultural capital, the individuals they are accompanied by, and the venue or even city quarter they happen to be in. I argue that a conceptual division between and separate study of 'immigrants' and 'expatriates,' or 'migration' and 'mobility,' may obscure and reify deep inequalities based on racialization and nationality, and that there is much to gain from a systematic comparison of the migration experiences of those labeled 'expatriates' with those labeled '(im)migrants.'

RC05-119.3

SCHÖPF, CAROLINE* (*Hong Kong Baptist University*)

Unequal Racialization and Divergent Career Outcomes of Skilled Migrants in Postcolonial Hong Kong

Scholars have called for an increased focus on racialization processes that channel migrants towards divergent social positions in receiving societies, creating highly paid 'expats' on the one hand and de-skilled, discriminated 'immigrants' on the other. This study investigates the mechanisms that structure the career outcomes of differently racialized migrants in Hong Kong. 34 in-depth interviews were conducted with university educated migrants from South Asian and Western countries racialized as South Asian, Black and White as well as receiving society colleagues and superiors. Migrants were asked to provide detailed information on pre- and post-migration employment spells, including increased and decreased valuation and utilization of skills, and obstacles and facilitating factors to career success. Racialization as 'White,' Western nationality or possession of Western cultural capital is found to connect to career advantages and upward occupational mobility. Such migrants have the choice to utilize existing skill sets in well-paying jobs linking regional production sites with Western markets, in globalized industries following Western standards, or to convert their real or ascribed 'native' cultural capital into craved 'Western' goods or services. Their Whiteness is strategically displayed by employers to signify 'authentic Western' expertise and cosmopolitanism. Their career success is aided by the ease of networking with influential co-ethnics and by receiving society members' familiarity with and affinity to Western culture in racially stratified, postcolonial Hong Kong. Conversely, migrants who do not possess Whiteness, Western nationality or Western cultural capital face subsequently more career obstacles, devaluation and discounting of human and cultural capital, racial discrimination, networking difficulties and pressure to acculturate, and often experience downward occupational mobility. These mechanisms can channel individuals with same amounts of human capital towards substantially different careers. The findings show how ongoing coloniality, economic structures in the world system and global cultural stratification contribute to divergent socioeconomic outcomes for unequally racialized migrants.

SCHORCH, MARÉN* (*University of Siegen*)

MUELLER, CLAUDIA (*University of Siegen*)

There Is No Such Thing As "the Elderly": Results and Reflections of Three Co-Design Research Projects with Elderly Participants from a Socio-Technical Point of View.

In our contribution, we present and reflect findings from our long-term experiences in co-designing ICT and sensor technology for and with elderly people. We will particularly refer to three projects ("City Quarter", "TOPI" and "Cognitive Village") that were realized in the context of designing supportive technologies for the well-being and staying independent as long as possible (ageing at home), carried out from our research team of socio-informatics at the University of Siegen (Germany) during the last five years. Our research approach is based on qualitative methods of sociology (mainly ethnography, participant observation, interviews, photos etc.) as well as Participatory design (e.g. Crabtree 1998). An important aspect of all the projects is our long-term engagement with

the elderly participants, our support for the appropriation of the technologies and the implementation in the everyday life and homes of the participants. In our reflections, we would like to emphasize issues around the underlying images of age/ageing that have impacts on the visioning, design, implementation and appropriation of technologies in IT design projects, for instance the multi-faceted and *dynamic* aspects of ageing (age as a "transition" stage) and the discrepancies between imposed images of ageing (for instance by institutions, organizations, but also funding agencies etc.) versus the self-images of elderly people. This is especially important due to the high diversity of elderly people in respect to their life styles, experiences, socio-economic and educational backgrounds and interests in engaging with new technologies that is often overlooked. Thus, we aim to foster visibility and thus critical reflection and deconstruction of images of ageing which explicitly and implicitly contour IT design projects embedded in societal discourses on the micro, meso- and macro level.

SCHORCH, MARÉN* (*University of Siegen*)

"Exactly What They Need...": Ethnography in Informal Care Settings.

In my contribution, "culture" refers not to a different ethnic group or national context, but to the setting of informal caregiving and the challenges that came along with doing ethnography in such a context and with elderly informal caregivers. I will present and reflect insights from my own ethnographic experience in ten families in a rural area in Germany that I carried out over more than a year in a completed research project. The challenges of the project were multifaceted and not only expected due to the intimate character of caregiving in the homes of the people, but also largely connected with the given framework of the research funding agency (their political interest in the topic) as well as the expectations and claims of the participants (the caregivers) and other involved project partners (from other disciplines and professional care institutions). Generally, the most challenging part was building up a relationship and maintain it with the elderly informal caregivers who were often long-term caregivers for their sick spouse with dementia, Alzheimer's or Parkinson's disease for at least four, mainly ten years. Most of them were 24/7 caregivers, under a lot of timely, emotional and psychological stress. The misbalance between this situation and our claim to carry out ethnography in this setting created ethical issues that accompanied me up until now. Along with this goes the experience of death and dealing with it (which stimulated a revisit of the work of Glaser/Strauss 1967). That is also interrelated with the more methodological question of the status of involvement and applied social research. Last, but not least, I would like to share experiences in respect to the different involved researchers, their personalities, individual skills, but also aspects such as seniority principle that caused a lot of trouble in the beginning of our project.

Old People and Suicide: An Empirical Study in France

Over the last century life expectancy in France has greatly increased and large numbers of people live well into their 90s. But this increase in longevity often includes a long period of ill health or physical impairment during which it becomes difficult or impossible to maintain previously normal physical, mental and social activity, this may be accompanied by a feeling of exhaustion, social isolation or estrangement. Under these circumstances many old people resort to suicide, in France in 2012 1868 people took this way out (39.84% of suicides in that year).

This paper will discuss the results of a study on old people and suicide which began in 2015. We have carried out 50 interviews with health-care professionals and members of the families of old people who have committed suicide. We have also taken part in training courses and observed meetings on suicide prevention. I will present the results of the interviews carried out with family members and with one old person who has survived two suicide attempts. The situations vary, not only by the diversity of the acts, but also with respect to the ways in which families react to suicide threats and attempts. We will examine the narratives by which families try to explain the suicide and the ways in which they situate this act in the person's life seen as a whole. It would seem that being surrounded by family and community (or not) is not a sufficient explanation of suicide in the aged. Many of the people concerned were not socially isolated. Our interviews suggest that the incapacity to conform to social norms of beauty and activity is at least as important as an explicative factor.

Legal Discrimination within Integration Policies? Paradigm of Activation and Educational and Work Experiences of Female Refugees in Germany

Activating integration policies with the paradigm of being challenging but also supportive have been enforced in several European countries. The Integration Act for forced migrants, introduced in Germany in 2016, is based on this principle. Before the law came into force, accepted refugees in Germany received a residence permit for three years and afterwards - when the protection reasons continued to exist - a permanent residence permit. Due to the paradigm of activation, today a permanent residence permit is only granted if refugees have sufficient German language skills and are able to secure most of their own livelihood.

The study addresses the question whether for female compared to male refugees it is on average more challenging to meet the new requirements. We give empirical evidence about gender differences in educational and employment participation as well as in language skills. The used data is based on qualitative interviews with 123 and quantitative Interviews with 4.800 adult forced migrants who came to Germany between 2013 and 2016. Theoretically, our study refers to concepts of legal discrimination and civic stratification.

Due to human rights violations, women have often been excluded from education or paid work in their home countries. In Germany their labor market participation is on average lower than the male one's and working conditions are more often precarious. Thus we argue that female refugees have on average a higher risk to fulfill the new requirements for a permanent residence permit only together with a partner, only later or not at all. Their chances to move up within the hierarchy of the civic stratification are lower. To prevent the assumed legal discrimination within activating integration policies, it is very important to support female refugees during their integration process. Our findings indicate that currently gender inequalities in Germany rather seem to be proceeded.

ROESSEL, JOERG* (*University of Zurich*)

Transnational Spaces and Linguistic Capital

The ongoing transnationalization of societies has changed the social conditions of migrants and non-migrants alike. For both groups research demonstrates the existence of social relations and exchanges beyond the country of residence. However, for migrants, there is an ongoing debate about the relationship between processes of integration and especially acculturation into host societies and the maintenance of networks into home countries. It has even been assumed that transnational relations undermine the integration into host societies. In contrast, in empirical research about non-migrants the prevalence of transnational social relations and exchanges was usually discussed as a form of transnational social and cultural capital, attributed to elites or higher classes, enabling them to profit from the processes of transnationalization and Europeanization.

In our paper we want to test both assumptions with respect to linguistic capital, as one form of transnational cultural capital, in Switzerland. On the one hand we study the determinants of linguistic capital in general (languages spoken) and on the other hand of Swiss-specific linguistic capital. Thus, we capture on the one hand the acculturation of migrants in Switzerland and on the other we are able to study language proficiency as an indicator of transnational linguistic capital, which is often attributed to upper-middle class and elite persons. We mainly focus on different transnational relations and experiences as determinants of linguistic proficiency. Our main assumption with respect to Swiss-specific capital is, that relations to countries where national languages of Switzerland are spoken, should increase linguistic capital, relations to other countries should have a negative effect on linguistic proficiency. Thereby, we are able to test if and which transnational networks and experiences (a) have a negative effect on migrants' linguistic acculturation in their host country (Swiss-specific linguistic capital) and (b) have a positive effect on transnational linguistic capital in general.

Civil Society, Social Innovations and the Coping with Demographic Change. Three Case Studies of German Shrinking Rural Communities

In several countries around the world, rural areas are confronted with major shifts in the composition of the population. Most of all aging and the population decline in rural communities are the consequences, which often lead to a reduction of social infrastructure, a lack of communal finances and a restructuring of local administrative institutions. These phenomena are evident in many modern societies like Canada, the United States of America, Germany or even Japan.

The central question of my presentation is:

How do rural communities cope with the consequences of demographic change, and which possibilities do the civil society have to reform, restructure or redesign lost local institutions?

To answer these questions, I will present results from a research project that focusses on coping with demographic change in different small shrinking villages in Germany. With ethnographic case studies, the project examines promoting and inhibiting strategies and factors to empower civil society actors.

The members of civil society react in different way to cope with demographic challenges in the three observed villages. In one case, they had to deal with the closure of the last primary school, which led to a restructuring of the local landscape of associations to become more powerful in future challenges and to keep the attractiveness of the village. In another case, the local mayor established a group of retirees to support local municipal tasks. Moreover, in the third case, local associations had to deal with a decreasing number of memberships. For this reason, they initiated corporations with associations in surrounding villages to continue together the associations work.

With these three case studies, my presentation describes promoting and inhibiting factors how social innovations initiated by civil society actors can help to cope with the consequences of demographic change and to reform rural communities for future challenges.

A Framework for Solidarity in the Achievement of Social and Civil Rights

Over the last decade we have experienced both an economic and social crisis, involving a crisis of transnational solidarity in Europe, along with mistrust of institutions and rising antidemocratic and populist movements. However, we have also seen increasing civil society and citizens' initiatives acting in solidarity, helping people to manage difficult living conditions, cover their basic needs or guarantee their social rights. The Horizon2020 research project *SOLIDUS -Solidarity in European Societies: Empowerment, Social Justice and Citizenship (2015-2018)* analyses these solidarity actions by the citizenship in different social spheres (i.e. employment, housing, health, education and civic engagement). In the present paper, we will discuss solidarity within the framework of a theory of justice and ethical commitment. Reviewing the debates between Habermas and Rawls on guaranteeing civil rights and liberties, we will discuss the basic moral foundations that lie behind the analysis of these solidarity initiatives. Whereas Habermas argues that Rawls focuses on the political nature of justice and equity as a mechanism to understand pluralism in current societies, Rawls' concept of moral subject involves equitable collaboration between citizens who are politically autonomous. Similarly, Rawls emphasizes the political dimension that Habermas' conceptualization has in his analysis of justice and equity, although he states that it is a mistake to subordinate citizens' wellbeing to their involvement in public life. Beyond this normative theoretical discussion this paper will also discuss a framework of analysis for grassroots organizing, social movements and subpolitics (approaching authors such as Beck, Tilly, Ganz or Touraine) and their contribution to understanding paths to strengthen civil rights from below.

SCHUCHARDT, AGNETHA* (*Freie Universität Berlin*)

Social Resilience of Emergency Responders

In order to deal with disasters, emergency responders have to be capable of acting and prepared at all times. This quality is closely related to the concept of resilience that covers the abilities to withstand adverseness and to recover more quickly from disasters (Cutter, Burton & Emrich 2010; Adger 2000; Berke and Campanella 2006; Norris et al. 2008). Resilience is influenced by several multifaceted factors. In this contribution, we want to highlight social factors promoting the resilience of both professional and voluntary emergency responders working in aid organizations that play a major role in disaster management. Focusing on emergency responders, we conducted both a qualitative and a quantitative study and inquired about social (and psychological) resources that are important for coping with negative experiences from different disaster situations.

While the results of the quantitative study are still pending, the qualitative, semi-structured interviews with over 25 experts as well as professional and voluntary fire and rescue, police, and ambulance services were interpreted (using a qualitative content analysis; Mayring 2010) and showed that social support within the organization, a person's social network and former experiences are useful resources. Emotional support from within the organization seems to be one of the most valuable resources and several emergency responders reported that they avoid sharing negative emotions with their families – unless their families are part of the aid organization as well. Moreover, many organizations offer either informal or formal preventive programs or follow-up care. Access and acceptance of such programs vary greatly.

The data serve as a starting point for the improvement or development of education and training tools for emergency responders. Furthermore, we want to propose guidelines for the development of more resilient emergency management policies.

SCHUCHARDT, AGNETHA* (*Freie Universität Berlin*)

The Social Production Function Theory for the Analysis of Subjective Well Being

The Social Production Function Theory (Lindenberg 1996; Esser 1999; Ormel et al. 1999) connects the achievement of universal needs of all humans (social and physical) with an increase in subjective well being (Diener et al. 1993). For this end, instrumental needs have to be fulfilled through different activities and resources. Comfort and stimulation are instrumental goals that are necessary for physical subjective well being whereas status, affection and behavioral confirmation promote social well being. Activities leading to these goals and respective resources can be substituted according to costs and benefits (Nieboer and Lindenberg 2002).

The substitution of the sub-dimensions of well being was tested in a qualitative study with voluntary emergency responders. This target group was chosen because their commitment is not based on payment while they have to bear immense burdens. The research question was: Why do voluntary emergency responders accept decreases in their subjective well being while doing their work? The results from semi-structured interviews (analyzed with the qualitative content analysis; Mayring 2010) showed that decreases in some instrumental goals were accepted for an increase through the fulfillment of other goals. These results offer interesting insights into the interconnections of the sub-dimensions of subjective well being. Negative effects on its social component include a lack of understanding for the importance of their work from both society and social networks of the emergency responders, resulting in a lack of appreciation. Moreover, conflicts within the aid organization cause extreme stress. But all these factors can be accepted by emergency responders – even impairments in their physical well being such as a lack of sleep or injuries – as long as stimulation (fun and excitement during missions), behavioral confirmation (doing the right thing and giving something back to the community) and affect (friendships within the aid organization) are guaranteed.

Current Trends and Future Challenges of the Austrian Universities of Applied Sciences

As in most European countries, the higher education system of Austria is characterized by a binary system consisting of Universities and Universities of Applied Sciences (UAS). The ideal type distinction between the two links the older Universities with the unity of research and teaching, with basic research and with a general scientific orientation, while practice orientation, applied research and a focus on professional education are ascribed to the much younger Universities of Applied Sciences. However, the developments of the last decades led to a situation that corresponds with this notion only to a certain extent. In fact, the dynamic changes experienced in both sectors create the necessity to re-evaluate their individual profiles and the binary divide.

This background of blurring boundaries between the two sectors was the starting point for a series of interlinked foresight studies on the perspectives and challenges of the Austrian Universities of Applied Sciences. The contribution presents main results of these studies and discusses them in conjunction with the outcomes of the process 'Future University' launched by the Federal Ministry of Science, Research and Economy of Austria in 2016. More precisely, the contribution includes

- a basic description of the higher education landscape in Austria;
- selected results of a literature-based analysis focusing on the trends that affect the Austrian UAS and the environment in which they have to act;
- main results of a delphi study which aimed at identifying those future developments that the most relevant actors and stakeholders of the Austrian UAS sector considered as probable; (probable futures) and those developments that they considered as preferable (preferred futures);
- a short summary of three explorative scenarios which integrated the individual results of the aforementioned research steps, as well as an evaluation of their validity in the light of the most recent political developments.

Business Management in Africa and the Arab Countries: Global Standards and Local Practices

The academic literature on enterprises in Africa and the Arab countries has focused on local management and governance considerations as obstacles to development. This negative and pessimistic view of societies in Africa and

the Arab countries deserves to be carefully re-examined and this is the object of the investigations that we propose to carry out within the framework of the ManaGlobal research project. In this project, we study a sample of industrial and commercial plants operating in five countries: the United Arab Emirates, Morocco, Senegal, Ghana and Cameroon. These plants are either subsidiaries of western multinationals, local companies or subsidiaries of a local group in the process of South-South internationalization. Our main question is: How can each of these establishments be particularly profitable and have exceptionally rapid growth?

To explain this quantifiable dependent variable, we develop in-depth qualitative analyses that highlight the gap between globalized management standards as taught and prescribed in business schools, head offices and consulting firms, which tend to impose a Western way of doing business everywhere, and the most effective ways and means of doing business in each of the countries studied.

This research project aims to anticipate evolutions in progress. This is achieved through cooperations between junior and senior researchers from the various countries concerned and a team of European researchers. This cooperation takes place mainly during doctoral seminars organized in the partner countries. Focusing on the ethnographic approach to business practices, these seminars aim to promote endogenous and diversified management research and teaching, which is an alternative to the dominant model imported from the USA.

Communication, Media, Technology, and Global Social Change

The acceleration of social change, linked to technological innovations, is now a global phenomenon. Technology influences the direction and the forms of global change. Capitalism and competition contribute to the development of new technologies and their global spread.

Technology permits to act upon the social and physical environment and to solve problems. As Moore (1972: 5) wrote: "(Technology is) the application of knowledge to the achievement of particular goals or to the solution of particular problems." It includes physical objects (e.g. a smartphone); a way of doing something (e.g. communicating by written language); and, an organization of practices (e.g. housing loans) (Massey 2012: 139). According to Rudi Volti (2001: 6, 11), technology is "a system based on the application of knowledge, manifested in physical objects and organizational forms, for the attainment of specific goals (...). (It is) not just material artifacts (but includes) human skills, organizational patterns, and attitudes."

Technology is created, supplied, adapted, used, and affects the life of people. They use these resources, possess skills, and understand this cultural element. If one regards computers and the Internet, one recognizes that this technology has meant new manners of interactions that are adapted to the interests of its users.

Technology signifies to apply scientific knowledge to solve specific problems. Technological advances such as automobiles, airplanes, radio, television, cellular phones, and computers have brought major changes to world societies. In fact, 20th century technology has fundamentally changed the way people meet, interact, learn, work, play, and travel.

A New Empirical Object for Relational-Processual Sociology: Elite Multigenerational Enterprise Families

This presentation will apply processual and relational frameworks to better understand an understudied yet empirically important and theoretical revealing social formation, namely elite multigenerational enterprise families (EMEFs). In most countries, business ventures owned and operated by families play a substantial role in formal economy. The families behind these businesses, however, represent a small portion of the total family population. And an even smaller one, which we refer to as elite and multigenerational, owns assets valued at over \$100 million or employs over 1,000 direct employees in the second generation or later. When viewed from multiple theoretical standpoints, EMEFs stand out because they embody seemingly contradictory and paradoxical features. From a neomaxian perspective, they are structurally geared towards the freedom from commodified labor (Gorz 2011, Fridman 2017), while expecting the next generation to engage in commodified labor within the family business. From the viewpoint of neofunctionalist theory, they merge two institutional spheres typically considered separate, namely kinship and formal organizational structure (Swedberg 1998, Abrutyn 2014, Schluchter 1981). Finally, EMEFs point forward to voluntaristic principles of contemporary "liquid" modernity (e.g.

Bauman 2013 or Giddens 1990, while pointing backward to principles of duty and obligation. While these theoretical perspectives feature the paradoxical and contradictory features of EMEFs, they are not able to illuminate how an EMEF is reproduced despite these features. In our presentation, we show how a relational sociology based on tenets such as the "primacy of process" (Emirbayer 1997) and "co-determinism" (Depelteau 2008) can play an invaluable role in rendering EMEFs comprehensible and theoretically tractable as critical actors in contemporary capitalist economies and societies. It is only by analyzing EMEFs as constantly reproduced configurations of relations (Desmond 2014) that we can understand how they transcend these tensions and become stable social entities in a social world full of flux and instability.

Age, Gender, and Care-Dependency – What Makes Us Vulnerable in Crisis Situations

Many studies have found that older individuals are more likely to suffer adverse physical consequences from natural disasters (Cherniack 2008). One explanation can be found in their worsening health constitution, which leads to an increased need for care or help in daily life as they age (Schneekloth 2005). In Germany, for example, half of all care-dependent people living in private households were above 80 years of age (Heusinger et al. 2014). Within this group, women outnumber men (Statistisches Bundesamt 2015:10) and are disadvantaged in many ways, i.e. they need to seek formal help more often (ZQP 2013a: 88), as they usually live alone (BMFSFJ 2001: 123). Therefore, the elderly, and especially elderly women, are already in a very precarious situation and vulnerable in everyday life. This vulnerability increases in extreme situations such as disasters. At the same time, these people may have developed resilience strategies, which could help them to cope with disasters.

This presentation displays empirical results from the research project KOPHIS (Strengthening the context of people in need of care and/or help), which analyzes, amongst other things, the needs and resources of care-dependent people both in daily life and in a disaster scenario. Three different surveys were conducted: 1) qualitative and 2) quantitative interviews with people in need in the region "Willich" in North Rhine-Westphalia, Germany, as well as 3) a quantitative representative poll of 2000 German citizens. In combining the results, we explore the interrelation of age, gender, and the need for care as well as how these aspects relate to coping with and preparation for disasters. Furthermore, we are able to show what the interviewees requested from different actors and how milieu may correlate with the above aspects.

Mobilization and Politics during Neoliberal and Postneoliberal Times

Is social change a result from politics? Is it an embedded property of society itself? Which is the role played on it by social mobilization? This paper aims to analyze these questions from a theoretical perspective, but illustrated by an empirical consideration of a case, namely the Argentinian events from 1989 to the present. What happened in Argentina during those years is quite a laboratory for social and political studies, as the consequence of neoliberal policies on the increase of unemployment, poverty and indigence rates. Due its complexity during that period, we are to state the mutual imbrication between political and social. Within social mobilization, empirical research shows how labor mobilization descends from 1993, being replaced, since 1996, by the unemployed. During 2001 and 2002 a huge economic crisis derived in social and political effects, including the mobilization of unemployed and urban middle classes. People questioned political institutions and society experienced a process of weakening of its structural patterns. Nonetheless, most citizens renewed their expectations on political system and during 2003 almost 80% of the authorized population voted in the elections. Since then, political order was rebuilt and social and economic indicators went better. Nevertheless, social mobilization did not decrease. We'll try to explain why this happened, establishing the connections between social mobilization and political action, underlying the way in which social structural conditions and agency potential are mutually implied, including class, social mobilization and politics. We will focus on protest cycles during the period and consider both the possible connections between social mobilization and political participation of social movements on one hand and between the first and elections, on the other. Empirical basis is built upon secondary data taken from a data basis of social protest events from our own research group and other data from colleagues' research writings.

Homeless Dually Diagnosed Veterans' Service Preferences: Do Needs Explain Wants?

Consumer preferences are a key influence on help-seeking behavior, but may be discordant with clinical need. We analyze the service preferences of formerly homeless Veterans diagnosed with substance abuse and psychiatric problems, after enrollment in a 9-month randomized trial of peer support and living in a VA-supported housing program. Prior research suggests that service preferences will reflect self-assessed treatment needs and personal resources, but may not concur with clinically assessed need. We test these predictions at baseline (N=167), mid-project (N=151), and final follow-up (N=141). At each time, preferences for alcohol, drug, and mental and physical health treatment were associated independently with indicators of self-assessed problem severity, and often with recent symptoms of dual diagnosis, but the experience of mental health problems in the last 30 days independent of substance abuse problems tended to reduce interest in receiving help for alcohol and drug problems. Clinician assessment of Veteran need for services at baseline predicted interest in treatment for help with alcohol problems at the final follow-up, but otherwise was not associated with treatment interests. Higher levels of current social support also predicted more interest in alcohol and drug treatment, but were not associated independently with interest in treatment for mental health or physical health problems. Sociodemographic characteristics were not associated independently with interest in treatment for the health problems. The roles of social support and mental health further help identify those amenable to treatment and those needing special efforts to encourage treatment or to find alternatives to socially-oriented treatment.

What Is a Child? Concepts of Children's Ontological Status in the German Political Debate about Children's Constitutional Rights

After full ratification of the UNCRC there is an ongoing debate on the legal anchoring of children's rights in the German constitution. An in-depth analysis of the debates around this topic show, that the ontological status of children is an important discourse either supporting children's constitutional rights or rejecting their rights. Both parties are recurring on concepts of children and childhood. Discussing the contents of children's constitutional rights - following the UNCRC conception of provision, participation and protection, there is a focus on child protection as an constitutional right which leads to discussions about a collision of children's and parents rights.

My work analyses the political debates about children's constitutional rights an tries to show a historical development in the discourses on children and childhood as well as their status as family members. The material consists of minutes of the debates in the German Parliament and other written documents in the context of these debates. Concluding these discourses I discuss several Options of anchoring children's rights in the German constitution and the differing consequences.

Labour and the Political Economy of EU Peripheralisation: The Case of EU-Ukraine Deep and Comprehensive Free Trade Area (DCFTA)

European integration through a unified-but-structurally-asymmetrical free market has been reshaping work, employment and social reproduction in Europe's core and peripheries. It is doubtless the nature of integration has reshaped property rights and class relations, strengthening the power of capital vis-à-vis labour, and allowing core EU economies to achieve politically sensitive reforms via seemingly 'natural' changes in product markets and labour mobility associated with EU fundamental freedoms. The benefits of Europeanisation accruing to the ruling class have gone hand-in-hand with the greater subordination of labour and commodification of social reproduction, especially in the acceding or adjoining regions. In this sense, the **widening** of the EU has proceeded by means of the **deepening** of the specific social form of production and crisis tendencies of capital resting on the constitutionalisation of uneven-and-combined labour across Europe. While this makes the EU politically fragile, it makes coherent labour solidarities and alternatives formidable nonetheless, as right- and left-wing euro-scepticism demonstrate.

The EU-Ukraine DCFTA agreement is designed to accomplished the next phase of such harmonising laws, norms and regulations in trade. These are meant extensively to reshape the regulation of labour, land and property, setting in motion changes in the social constitution of Ukrainian production. By constitutionalising the *externalisation of economic governance* the expansion of EU's frontiers of capital deepens the operation of the law of value in the core of the EU while securing the fealty Ukraine as Europe's periphery. The latter become that external engine that is both dependent on the core for the protection of capital gains and whose dependence facilitates accumulation in the core. This process of *European peripheralisation*, labour (its spatial, social and technical unity-in-segmentation) represents not only the core of the explanation for uneven-and-combined European capitalism, but a renewed political attempt to stay the multiplying crisis tendencies of European capitalism.

Public Opinion and Morality Policy: Lessons from Canada and the United States

The relation between public opinion and public policy remains in dispute over whether or not there is any impact and, if so, to what extent. Conclusions vary, depending on researchers' disciplinary perspective and methodological approach as well as on the subject matter of the issues studied (e.g., Achen and Bartels 2016; Burstein 1998; 2014; Erikson, MacKuen, and Stimson 2002; Erikson and Wlezien 2012; Page and Shapiro 1992). We examine the possible role of public opinion in affecting policy by comparing the life histories of eight parallel issues in Canada and the United States. Issues selected all involve morality policies and include abortion, capital punishment, gun control, marijuana legalization, physician-assisted suicide, pornography, same-sex relations, and same-sex marriage. Because of the moral content of these issues, they are expected to be highly salient, easy to understand, resistant to compromise, and tied to collective action. When they enter the policy arena, they are typically associated with high levels of conflict. Particular issues are selected because their attributes could be expected to make public opinion about them a significant factor in explaining how they are processed by the political system. Our research aims at answering three questions: To what extent does public opinion involving moral conflicts affect the trajectory of issues, from the time they emerge to their possible resolution? Does the evolution of issues over time affect how and when public opinion reacts? How does the national setting have an impact on the relevance of public opinion?

To Post or Not to Post, That Is the (Research) Question: Representing Volunteer Tourism Experiences on Social Media

This paper will draw upon two qualitative research studies (one completed and one in-progress) which chronicle the various ways British and Singaporean undergraduate students visually represent their international volunteer experiences to a public audience on Facebook and Instagram. Through a thematic analysis of photo-elicitation interviews and visual content uploaded to social media, and drawing on multiple theoretical re-articulations of Urry's (1990) 'Tourist Gaze,' this paper will elucidate the framing decisions volunteers faced at the moment of snapshotting and during the album editing process, including debates over which images were discarded and why.

Taken together, these research projects seek to answer the following research question: How have the informal protocols which govern international volunteers' self-presentations online changed over time, and in response to what broader cultural influences (for example, public backlash against the 'shock effect' imagery utilised within charitable aid campaigns; or viral blog posts, opinion pieces and YouTube videos created to mock or disparage international volunteering)?

In short, study participants took measures to avoid 'stereotypical' volunteer photography (including selfies and portraits of emaciated children), determined not to perpetuate the voyeurism and paternalism they associated with 'voluntourism.' Overall, participants appeared to err on the side of caution, striving toward an uncontroversial or innocuous documentation of their time overseas, and opting instead for 'touristy' photography which exemplified the 'family gaze' (Haldrup & Larsen, 2003), the 'romantic gaze' (Urry & Larsen, 2011), and the 'gutsy gaze' (Schwarz, 2016). In charting the rise of cautionary and sceptical stances within volunteer tourism practice, my scholarship elucidates the dynamic social context in which international volunteers operate, as well as how they police themselves online in response.

Protección De Datos Personales En Salud En Argentina. Derechos y Desafíos En La Era De La Información Digital

En este artículo analizamos los derechos vinculados a la protección de datos personales en salud en Argentina, sus contextos, desafíos y horizontes necesarios de aplicación en su relación con el avance de las tecnologías de información. Para ello se analiza la legislación vigente y entrevistas a responsables del área en el ámbito público y privado de salud.

Si bien la generación y administración de datos de la ciudadanía en los Estados Nación es parte constitutiva de éstos, de las lógicas y estrategias de gobernabilidad y de los dispositivos de control social; en las últimas décadas se ha asistido a una transformación del paradigma de la información. Las nuevas tecnologías han integrado al mundo en redes globales de instrumentalidad, un mundo interdependiente, dando origen a una nueva lógica espacial dominante del poder.

En la legislación argentina en la actualidad, el concepto de protección de datos puede definirse como el amparo debido a los ciudadanos contra la posible utilización de sus datos personales por terceros, en forma no autorizada, para confeccionar una información que, identificable con él, afecte su entorno personal, social o profesional, en los límites de su intimidad; o como la protección de los derechos fundamentales y libertades de los ciudadanos contra una singular forma de agresión: el almacenamiento de datos personales y su posterior cesión.

En el país existen iniciativas recientes respecto del control de datos en salud, es por ello que es relevante desarrollar un análisis crítico del camino que emprenden. En el área de salud esto es especialmente sensible ya que se presentan problemáticas asociadas a situaciones de discriminación -laboral, social-, estigmatización, vulneración de derechos, entre otros.

Es necesario tener en cuenta que las Nuevas Tecnologías de Información y Comunicación no solo permiten trasladar información sino también tomar acciones en función de ellas.

SCHWENKEN, HELEN* (*University of Osnabrück*)

Gender Knowledge in the Labour Market Inclusion of Skilled Female Refugees in Germany

The paper asks for the normative foundations of labour market inclusion projects for skilled female refugees in Germany. It hypothesizes that often less a traditional understanding of gender roles amongst refugees is the barrier to their adequate labour market inclusion, but indeed a traditional gender knowledge on the side of German institutions and career advisers.

After the institutionalized refugee reception and civil society's 'welcome culture', labour market integration currently dominates refugee reception efforts. Besides projects designated to refugees in general, many target female refugees. Some have been designed for women migrants before (e.g. 'Stark im Beruf') and began including female refugees, others are tailored for female refugees (e.g. 'Perspektiven für weibliche Flüchtlinge - PerF-W'). Some are also directed towards skilled refugees (e.g. 'MySkills' or 'ValiKom' on recognition of informal skills; the gender-specific coaching project 'Betriebliches Mentoring für qualifizierte geflüchtete Frauen').

The existence of this plethora of gender-specific projects indicates that state and non-state actors are well aware that gender-specific efforts are necessary to promote equal opportunities for female refugees. It is equally important to critically assess these labour market inclusion measures. This paper therefore assesses the normative foundations of such projects. Despite the focus on gender equality, especially skilled female refugees and mothers are placed in low-skill and feminized sectors and experience a devaluation of their skills. The question is why. The paper does not presume bad intentions, but the unintentional effects of deeply-rooted gender knowledge (Dölling; Wetterer) that implicitly drives counseling and placement processes. Gendered norms might be understood as part of cultural capital. 'Assessing it' (as mentioned in the CfP) is not only 'difficult', but more complex given its tacitness.

The paper is based on expert and participant interviews and documents from an ongoing research project on the gendered labour market inclusion of refugees.

Photographs in Discourse: The Functions of the School According to Senior High School Students

How do young people understand the functions of the school today? Such question has guided the investigation 'The school and the configurations of contemporaneity: The voice of senior high school and elementary school students' (MCTI/CNPq/Universal 14/2014), which was carried out from 2015 to 2017 in the state of Rio Grande do Sul, Brazil. This paper aims to discuss

the results of a research involving the production of photographic images by students attending the last grade of High School. From studies by Sibilia (2012) and Masschelein & Simons (2014), the theoretical framework of this investigation includes the notion of discourse (FOUCAULT, 2002; 2012; 2015) besides the theory of photography (BARTHES, 1984; DUBOIS, 2012) and its potentialities in social and human sciences. The methodological design comprehends focus groups and photo elicitation (TORRE; MURPHY, 2015; BANKS, 2009; BANKS, 2001), from a qualitative perspective. The focus groups consisted of 55 students from two schools. In one of the meetings, after debating on the functions of the school, the students were asked to produce photographs with captions explaining the functions of the school today. From the enunciative visibilities and possibilities enabled by Foucauldian discourse analysis, the results have evidenced that the school performs pedagogical, political and social functions in contemporaneity, according to the young students. Although discipline and both time and space norms restrict the students' capacities, they still mention the possibilities of expression and the meetings enabled by the school. The library and other living spaces were also pointed out as teaching and learning environments, and articulations between pedagogical and social functions by means of friendship were highlighted. The participants think it is important to provide hearing spaces to the students at school, and their creative, argumentative and questioning potential should be considered.

Political Subjects at the Border: Rethinking Democracy from the Perspective of Migration

Debates about the crisis of representation and post-democracy are calling for attempts to develop new concepts of democracy. Furthermore, the national form of democratic regimes does increasingly not correspond with transnational forms of the social in the context of globalization and the diversification of local communities in the Global North. This paper argues to rethink concepts of democracy from the perspective of migration, and therefore from the structural margins and borders of contemporary societies. It develops a post-migratory theory of democracy that draws on the political interventions of non-citizens by articulating theoretical approaches of radical democracy with empirical research on the political organizing of migratory youth.

Theoretically, this paper refers to approaches of radical democracy by Jacques Rancière, Etienne Balibar, Ernesto Laclau and Chantal Mouffe. According to these approaches, democracy is not identified with the national institutions of representative democracy. Democracy is understood as an always-contested process, in which democratization should be understood as an infinite challenge. This allows for a theoretical reflection, which conceives those fighting for equality and freedom as political subjects regardless of their citizenship status. Thereby, the perspectives, demands, and desires expressed in migratory struggles prove to be decisive for the actualization of democracy. Empirically, the paper draws upon research on the organizing of migratory youth with precarious legal status in the US and Germany. Building on document analyses, participant observations and qualitative interviews, it perceives their fight against deportations and for a right to stay as practices of democracy.

By combining approaches of radical democracy as an analytical prism with the perspectives of migratory youth, this paper aims to contribute to current debates about democracy, political participation and social justice. Whereas illegalized migrants are excluded from national citizenship, their struggles actualize the radical meaning of citizenship and democracy and are therefore instructive for its reconceptualization.

SCHWIERTZ, HELGE* (*University of Osnabrück*)

The Radical Democracy of Migratory Youth Organizing for a Right to Stay

Since anti-migrant movements, parties and governments are on the rise in Europe and the US, migratory struggles are playing a crucial role as never before. This paper analyzes self-organized struggles, in which migrants organize themselves according to their specific positions in migration regimes to fight for their right to stay and social inclusion. I argue that these self-organizations are crucial for contesting dominant migration regimes, but also for pointing to new forms of democracy.

The paper draws on my research on grass roots organizations of migrant youth with precarious legal status in the US and Germany. Accompanying their movements since 2012, I conducted document analyses, participant observations and qualitative interviews. By combining two case studies, I investigate the different and common aspects as well as specific challenges of their initiatives. Their self-organization creates relatively safe and autonomous spaces and facilitates processes of empowerment. In practices of political intervention, they furthermore create strategies of political subjectification as well as self-representation in public spaces and discourses for making their claims heard. Whereas the groups in Germany work closely together with non-migrant allies from anti-racist move-

ments, the groups in the US are more independent. However, through their work on criminalization, the intersections with movements of queer folks and people of color have been focused recently.

Referring to approaches of critical citizenship studies and radical democracy, I argue that these self-organizations of migrant youth challenge the anti-migrant hegemony in both countries by becoming political subjects despite their lack of formal citizenship. I describe their political interventions as radical democratic practices that combine rather invisible politics of organizing with visible politics of public interventions. The challenge of the movements is to advance both, short-term improvements in the precarious situation of their communities as well as social justice in the long run.

Children As Storytellers. Migrant Narratives in Primary Schools

This presentation discusses the results of a research aiming to promote children's narratives of personal and family memories in intercultural ed multilingual classrooms, in collaboration with an adult expert in the use of facilitation, to enhance dialogic intercultural learning. The learning activities observed are part of the SHARMED (Shared Memories and Dialogue) project, funded by the Erasmus+ programme of the European Union and coordinated by the University of Modena and Reggio Emilia (Italy) in partnership with University of Suffolk (UK) and University of Jena (Germany).

The methodology of SHARMED is centred around Project-Based Workshops (PBWs), applying dialogic teaching to engage children in extended narratives originating from memories elicited by visual materials. As storytellers, migrant-background learners are given a voice, towards their inclusion in the educational context. Dialogic teaching is based on the acknowledgment that children are active participants in constructing social practices (James, Jenks & Prout, 1998; Baraldi & Iervese, 2014), creating conditions in which all participants can contribute, mutually encouraging each other to participate actively (Mercer & Littleton, 2007).

The presentation focuses on children's narrative concerning experiences of migration and inclusion in the English education system, in particular with concern to the interrelation of language adaptation and participation in the education system. The promotion of children's narratives support a phenomenological description of their life-world. The discussion will develop around the main themes emerging from children's narratives: 1) the ambiguous status of native language vis-a-vis the language of education and peer-relationship; 2) dynamics of marginalisation based on system's expectation of failure, and children's rejection of sch categorisation through active participation in peer-groups; 3) the multicultural classroom as a social space where migrant (and non-migrant) children become agents of cultural hybridization and social. The presentation concludes by asking how far these narrated experiences challenge hegemonic representations of children as inhabiting spaces of marginality in society.

SCOTT, ALAN* (*University of New England*)

Prodigal Offspring: Sociology and Organisation Studies

Academic disciplines are defined not primarily by their object, but by their (theoretical and methodological) approach to that object, and by their claim to a monopoly over it. Even where that monopoly claim has been highly successful, it remains contestable. For example, economics, perhaps in this respect the most successful social science, finds its object – the economy – contested by political economists and economic sociologists. Whereas economics has successfully marginalized potential competitors, sociology has remained a broad church. Attempts to impose theoretical and methodological order on the discipline – e.g. the current efforts of rational choice theorists within the German Sociological Association – have met with resistance, and eventually failed. Moreover, sociology has never really reached consensus on what its object is; 'society', 'social facts', 'social action' where the classical options, with the list growing over time (social networks, rational action, actor networks, etc.). Thus, while we can speak of 'heterodox economics' there is insufficient orthodoxy to speak of 'heterodox sociology'.

This has an obverse side. Precisely because of the weakness of its monopolistic claims, sociology has been very productive in spawning new disciplinary fields, which, rather than remaining within sociology's weak gravitational pull, successfully establish themselves as separate disciplines or 'studies'. Criminology, industrial relations, urban studies, and Organisation Studies are the most obvious examples.

In light of this, this paper will address two questions: (i) what happens to these new fields when they break free of the parent discipline, and to the parent discipline when they do? (ii) If one effect on the 'offspring' is a loss of disciplinary orientation (as the rationale for this special issue suggests) what, if anything, has contemporary sociology to offer OS as a potential source of reorientation?

SCOTT, ALEXANDRA* (*The University of Edinburgh*)

Cross Border Law Enforcement: Transgovernmental Counterdrug Cooperation in Central Asia.

About a quarter of the heroin produced in Afghanistan travels north to Central Asia and the Russian Federation along the Northern trafficking route. Intelligence agencies in the region are starting to update their strategies to put more emphasis on collaboration in order to adapt to the growing trend of the proliferation of transnational crime. As a result, new international regional policing organisations are emerging. Using semi-structured interviews with officials from Central Asia Regional Information and Coordination Centre (CARICC), UN Office on Drugs and Crime (UNODC), former national law enforcement personnel and former Interpol officials, I try to gain a sense of the topic from the perspective of those directly involved with decision-making, transgovernmental cooperation and coordination of the law-enforcement response. Legal differences, lack of trust, lack of cooperative leadership and lack of knowledge about the other jurisdiction can hinder transgovernmental and transnational law-enforcement cooperation. On top of the abovementioned difficulties, the existing dynamics in the region show certain political tensions with regard to maintaining control over the northern trafficking route. The preliminary analysis of findings around cooperation over drug control in Central Asia, shows that even the necessity for common interests in anti-drug security cooperation among the regional states is not enough to overcome sociopolitical volatility in the region.

SCOTT, BERNARD* (*International Center for Sociocybernetics Studies, Bonn*)

Sociocybernetic Understandings of Cultural Transmissions and Transformations

This paper uses sociocybernetic concepts to address issues concerning cultural transformations and transformations. Here, by "culture" is meant the attitudes and values, often tacit, of a particular collective or community as expressed in individual behaviours, interactions and productions of "artefacts" in the broadest sense (for example, encompassing spoken and written texts and other symbolic forms and found or constructed concrete objects) It is intended to be distinguished from "social institutions" that are explicitly constructed to guide and control said behaviours and interactions.

Topics addressed include:

- Conceptions and definitions of "culture".
- Relations between culture and "personality" and other individual differences.
- Interactions between different cultures, including studies and commentaries on what some authorities refer to as the "clash of civilisations" and others as "intercultural conversations".
- Culture and exposure and susceptibility to "counterknowledge" (pseudohistory, pseudoscience, pseudomedicine).
- Attempts by self and others to change culturally transmitted attitudes and behaviour (for example: counterterrorism, rehabilitation of criminals, alienation and problems of mental health).
- Reference to case studies of cultural transmissions and transformations, including 'gender politics' and 'spiritual politics' and the role of 'power'.
- Reflections on and critical appraisals of the culture of the sociocybernetics community itself and its similarities and differences with other disciplinary groupings and "communities of practice".

Understanding Embodiment, Consumption and Taste in the Context of Everyday Sexual Practices

In our past work (Jackson and Scott 2010) we have engaged in a feminist re working of interactionism in order to develop an understanding of everyday sexual practices. More recently we have explored what it would mean to take a practice theoretic approach, making a comparison between sexual practices and practices relating to food and eating (Jackson and Scott 2017), and have further explored questions of embodiment and consumption (Scott 2017). In this paper we will continue the focus on sexual practices, as they relate to everyday embodied consumption, through an exploration of the ways in which habitus and cultural and social capital interplay with gender, generation and sexuality to shape consumption and taste. We will discuss the ways in which habits, routines and practices come together to produce sexual scenarios through the relationship between ideas about the exotic erotic and more prosaic sexual interactions. We will explore the tensions between established routines and the pressure of expectations, especially as this relates to gender and generation, before going on to discuss the social dimensions of the development of sexual

tastes and how these lead to the appreciation of particular settings, objects and practices as an integral part of our everyday sexuality. We take Warde's (2010) understanding of acquisition, appropriation and appreciation as a starting point for the development of research to better embrace the multi-dimensionality of sex, bodies and consumption as historically, socially and culturally located. We will address the following question: how are the differences between the classic signifiers of the erotic and the actual tastes of sexual actors in negotiation with sexual partners played out in a specific contexts?

Overcoming the Trauma of Mass Violence: Museum of the History of Polish Jews and Its Attempt to Bring One Thousand Years of Polish-Jewish History out from the Shadow of Holocaust

The paper analyzes the ways in which the creators of the main exposition of the Museum of the History of Polish Jews in Warsaw (POLIN), opened in 2014, tried to impact collective memory about Polish-Jewish relations, deeply marked by the images of XX-th century cases of mass violence. The author describes three originating from this tension targets of the Museum's main message, which are: 1) bringing one hundred years of Polish-Jewish history out from the shadow of Holocaust; 2) presenting the main actors of Museum's exhibition not as "Jews from Poland" or "Jews, who once lived in Poland", but as truly "Polish Jews", who have unique Polish-Jewish identity, which can't be simply reduced just to Polishness or Jewishness; 3) showing a balanced vision of Polish-Jewish relations, which was compared by one of the authors of the exposition to a "marriage of convenience" and which contains both episodes of violence and peaceful, fertile cohabitation, not favoring any of these aspects of the image. The paper provides also a wider background to all of these targets, by showing the beliefs and the stereotypes – common among Poles, Jews and other nations – creators of the exposition wanted to deal with: e.g. a stereotype of a "Pole-antisemite" linked with wrongful image of "Polish death camps", or, on the contrary, a belief that as it comes to Polish-Jewish relations during the World War II Poles have nothing to feel guilt about (still surprisingly popular among Poles, as the results of contemporary researches show).

Digital Labour, Commodification and Expropriations Processes: Contributions from the Sociology of Bodies and Emotions

The expansion of phenomena linking work and new media has resulted in, among other the emergence of debates that cut across different knowledge areas. In this context, the notion of digital labour has revitalised discussions around the connexion between metamorphosis of labour relationships and everyday life of subjects.

Digital labour studies have encompassed a variety of definitions and problem areas, including the understanding of value creation, alienation, and audiences in social networks (Fuchs and Sandoval, 2015). The complexity of the debate is related to the heterogeneity of work experiences that entail diverse labour organisation arrangements, different work environments, and a wide array of contractual relationships, among others. The mere existence of these work positions/workers suggest questions about the impact of digitalisation of human activity, that is, the social consequences associated to the connections between digital media technologies and emerging forms of labour. In this sense, the "digital revolution" applied to the "world of work" has influenced both value assessments as well as the transformation of valorisation processes through which the individual is connected to the informational context.

Addressing questions emerging from those insights, this paper **explores some contributions of the sociology of the body/emotions to understand practices associated with digital labour**. To do this, (i) explores theoretical debates around the definition of digital labour; (ii) develops arguments from the perspective of sociology of bodies and emotions, which allow understanding in what sense the technological mediation linked to the expansion of ICTs constitutes a reconfiguration of "the policies of the senses" (look, see, observe, touch, etc.); (iii) analyses cases of workers in ICT industries (based on testimonies and records of virtual ethnography) that allow us to connect their daily experience with certain mechanisms of expropriation and commodification of the vitality of bodies.

From Anti-Development to Rural Development: The Challenge of Economic Transformation in the Former Labour Reserves of Ghana and South Africa

This paper evaluates a challenge for rural development in Northern Ghana and the Eastern Cape of South Africa, drawing on fieldwork conducted by the authors in both regions in 2015 and 2016 respectively. Both regions are among the poorest in their respective countries, and both have been the focus of state efforts at rural development. However, both regions share a history that presents an obstacle to contemporary rural development efforts. Both were historically labour sending areas for the mining sectors which were central to the 20th century economies of the two countries. To establish these areas as 'labour reserves', both were subjected to 'anti-development' policies in the colonial and apartheid eras that aimed to undermine non-wage sources of income in order to ensure a steady supply of migrant labourers. As such, the rural economies of both places have long historic ties to the urban labour market. In the contemporary period, the urban labour market has become more precarious and unstable, increasing the importance of the rural area as a source of informal social protection. Rural land also serves as a resource which can facilitate successful urban migration. This dual role of the rural areas as a safety net and a springboard has important implications for potential rural development strategies. Any efforts that do not recognize, and protect, this key role of land in rural livelihoods are destined to face problems.

Land, Labour, and Capital in South Africa and China: Rural and Urban Struggles in the Post-Apartheid and Hukou-Reform Periods

This paper explores a paradox in the political economies of China and South Africa. In both countries, rural residents have become increasingly dependent on migration for wage labour over the past few decades, as the volume and stability of rural non-wage sources of income have declined. However, at the same time conflict over rural land has become more acute, despite its decreasing material value in rural residents' livelihoods. This paper presents an analysis of the changing relationship between land, labour, and capital in both countries to explain this paradox. It argues that, while the accumulation regimes of the mid-20th century privileged urban capital and workers over rural dwellers, in the contemporary period, the precaritization of urban labour has eliminated the functionality of rural production for urban capital accumulation. Restrictions on rural to urban mobility have been relaxed or removed, but rural areas have become resources that rural residents use in order to access the precarious urban wage market. This link between rural and urban livelihoods also has important implications for the connections between rural and urban political struggles in both countries.

Capital Punishment and the Emotional Public Sphere in Twentieth-Century Britain

Capital Punishment and the Emotional Public Sphere in Twentieth-Century Britain

Lizzie Seal, Senior Lecturer in Criminology, University of Sussex

The death penalty provokes strong emotions. As a highly symbolically rich punishment, it is a focus for the expression of emotions in relation to crime and punishment, as well as wider issues related to identity, order and the state of society. High profile capital crimes are cultural 'talking points' through which shared public emotion is demonstrated. As the public sphere expanded in mid twentieth-century Britain, the expression of emotion was reconfigured, with greater acceptability of the public expression of emotion (Langhamer, 2012). Capital punishment was one of the issues around which this reconfiguration took place. Certain capital cases were constitutive of the emotional public sphere - the emotional life of the nation.

In 1950s Britain, the hangings of Derek Bentley and Ruth Ellis were intensely emotional public events. These cases reveal grounds for public expression of empathy with the condemned, particularly in relation to class and gender. Crucially, perceptions of injustice were also highly significant to public reactions. There were, however, other cases with potentially similar grounds for controversy but which received very little public attention. Through analysing archival sources such as newspapers, letters and case file material, this chapter will examine the conditions for, and limits of, the expression of emotions such as empathy in the public sphere. In particular, it will explore the relevance of 'race' and nationality to the emotional public sphere around the death penalty.

RC22-412.5SEALY, THOMAS* (*University of Bristol*)***Religion, Culture and the Double Stranger: British Converts to Islam and Dynamics of Belonging***

As has been documented in a number of studies, converts to Islam very often face discrimination and ethnicization from both majority society and born Muslims. As a result, these studies suggest that British converts to Islam are conceived as 'bridge builders' and as existing in 'liminal' space or a 'third space' of hybridity. Yet these frameworks leave converts out-of-place and positioned as *double strange*. Drawing on narrative interviews with British converts to Islam this paper argues that such conceptions do very little to understand their experiences as Muslims and as British, instead confining them to the existing terms of the debates, and as such leaves them in something of a conceptual wilderness. Taking Simmel's *Stranger* as a starting point, I argue that converts, who both explicitly and implicitly draw a line between 'religion' and 'culture' with regard to Islam and Muslims, offer a challenge and different perspective on what these terms can mean in Britain today and thereby contribute to discussions of identity and belonging. This divide is contentious, complex, and problematic. Nevertheless, by taking the culture-religion divide as a prism through which to explore ideas and aspects of identity and belonging, moves can be made towards viewing converts in-place. The divide suggests the need to put the religious at the centre and it is in this way that varying horizons of ways of being can be brought into conversation. In this paper I trace the various lines of this religion-culture divide to explore how British converts to Islam do and do not relate to Islam, Muslim communities and wider society. This involves consideration of the dynamic interplay between the personal and the social, as well as, importantly, the Divine.

RC52-867.1SEDDON, EMMA* (*Newcastle University*)***Translation: The Deprofessionalization of a Female-Dominated 'Emerging Profession'***

Translators work within the language industry, defined as the sector dedicated to facilitating written and oral multilingual communication. Translation plays a major role in the circulation of cultural and economic capital necessary in a globalized world. Translators are largely female (70%) and work on a freelance (74%), part-time (60%) basis. Translation work has been called an "emerging profession" by the European Commission, the largest employer of translators in the EU. Translators face threats from 'non-professionals' and the emergence of translation software and machine translation. But do translators fit into the category of 'professional' in the first place? Is this an occupation facing deprofessionalization before it has even earned the label of 'profession'? This paper will use the theoretical framework of the assemblage to question the relevance of definitions of profession in researching translators as a (professional) group. It will then focus on how assemblage can provide a new theoretical angle to explore the impact of looming deprofessionalization and the female-dominated nature of the industry on the (professional) identities of translators.

RC28-520.1SEEHUUS, SARA* (*Oslo and Akershus University College of Applied Sciences*)***Social Class Background and Gendered Educational Choices***

Conceptualizing social class in terms of both vertical and horizontal class divisions, the present study investigates how the impact of gender on educational choice varies by social class and whether certain class fractions are more gender-typical or -atypical in their choices than others. Higher education in large parts of the western world remains horizontally segregated by gender, despite the fact that the gender gap in educational attainment has been reversed. Previous research has shown that higher education is also segregated by social class. Within the research field of gendered educational choices the interaction between gender and social class background has received little attention, even though sociological theory gives reason to expect that individuals from lower social backgrounds are more likely to make gender-typical choices than individuals from higher social backgrounds. Furthermore, studies that do examine the relationship between gender and social class background has mainly focused on the vertical dimension of social class. By employing a Bourdieu-inspired class scheme that defines class both in terms of volume and composition of capital, and by analyzing Norwegian register data for birth cohorts 1987-1992, this paper examines the relationship between social class background and gender-typical and -atypical choices of higher education. Preliminary results show that focusing solely on the vertical dimension of social class background can conceal how the impact of gender on educational choice may vary within classes.

RC06-136.2SEERY, ANNABELLE* (*Université de Montréal*)***Family-Work Balance in Low-Income Couples in Quebec***

Quebec (Canada) is perceived, at least in North America, as a "paradise for families". Its family policy, currently articulated mostly around two main programs implemented since the mid-1990s, the Québec Parental Insurance Plan (RQAP), and the Network of Childcare Centres (CPE), is often given as an example. Despite these programs, the issue of family-work balance is still at the heart of many parents' lives, especially mothers and even more mothers in low-income couples. Our presentation aims to highlight the specific realities of couples of parents with precarious socio-economic status in terms of family-work balance. From a qualitative study based on 30 semi-directed interviews with heterosexual low-income parents in Quebec, we will show that their socioeconomic status is an additional obstacle to reconciliation between the different spheres of their lives. Their situation on the labor market appears to retain their use of the main programs of Québec's family policy. We will particularly highlight the consequences of occupational segregation as well as gender expectations on parents generally, but especially on mothers.

RC55-904.1SEEWANN, LENA* (*University of Vienna*)FRITSCH, NINA-SOPHIE (*Institute for Sociology and Social Research*)RIEDERER, BERNHARD (*Vienna Institute of Demography, Austrian Academy of Sciences*)***Singles in the City: A Comparison of Vienna Five Years before and after the Crisis Year 2008***

Since the 1970s new forms of living arrangements, non-conventional modes of cohabitation and alternative family forms emerged (e.g. non-marital partnerships, couples living apart together). In line with that, the number of singles and individuals living alone are rising - especially in urban areas. Theoretical debates attribute this development to changing social values as well as new economic insecurities (Hradil 2003). Therefore, our main research question is: What types of singles are prevalent in Vienna and which changes can be observed within the last decades? Our data consists of a large representative survey conducted in Vienna in 1995, 2003, 2008 and 2013 (8,400 respondents in each wave), thus spanning a period of several years before and after the crisis in 2008. Vienna is a dynamic city that grows older and younger at the same time as it becomes an increasingly international metropolis.

In a first step we want to disentangle and clarify commonly used definitions of singles (e.g. referring to individuals living alone vs. individuals not having a partner nor children). We contrast different types of singles and describe them alongside important characteristics such as gender, education and age. Besides describing size and composition of these types, we want to highlight differences and dynamics within the last 20 years. In a second step we are interested in the impact of the economic crisis on quality of life. We examine trends in the satisfaction with living conditions, use of the city's cultural and leisure facilities, subjective assessments of several dimensions of life satisfactions as well as changes in income and poverty risk. First results indicate, that in single households, women

face higher risks of living below the poverty line or in manifest poverty (e.g. 29% of women over 60 years who are living alone vs. 13% of men in the same group).

Gender Variations across Cultures

This paper is concerned with gender expressions in relatively small scale, sub-national ethnicities. These peoples represent a major focus of strain in the processes of national development and consolidation and a concomitant decolonization of these processes. Gender and ethnicity are two major intersecting variables. In the world of primary socialization gender is a transformative process.. Ordinary expectations are that it will be the only process of transformation. Individual experiences will blend with variations in the normative complexes in a particular society. Ethnographic evidence indicates that in every socio-cultural system some people do not find a fit with ordinary expectations, or in some instances ordinary expectations are inadequate. The same material also indicates the known range of culturally based gender paradigms, some of which fit the western binary, many of which do not, either because they use a different binary or are not binary at all. Historic ethnography also documents the impact of western oriented colonialism in distorting indigenous concepts of gender and gendered activities. My approach here is broadly comparative, based on an analysis of secondary sources. Much cross cultural research tends to be based on statistical analysis. Such an approach reduces each culture to a check box, and in that way reduces examination of culture details. It is not enough to simply say that the Bugis people of Sulawesi recognize five genders, and so put them into the multiple gender box. Bugis gender constructs are much more complex (and also simpler) than that. Part of our problem may rest in our understanding of the relationships among the parts of culture and the behavioral models they create. Another part may rest in the Western gender biases that promote a colonialist orientation to gender constructs.

Gender Panic, Gender Policy

Using diverse theories and methods the 13 chapters of original research in this collection explore gender panic and policy in the United States as well as in Argentina, Australia, Belarus, Japan, Russia, Sweden, and subnational populations. Authors consider a range of issues including the place of women in the military and of transwomen in women's colleges, the meaning of learning to play the traditional female role in order to develop a contemporary heteronormative romantic relationship, the difficulties of fairly accommodating non-binary people in traditionally gendered settings and the problem of implementing a gender-neutral rape law in a prison system that is structurally gendered. Gendered policies pertaining, particularly, to women and their fertility as a result of panics over low birthrates are explored as are issues pertaining to the validation of and problems with binary gender categories in elite sports. The impact of UN gender equality initiatives including LGBT equality on nation-states is also examined. The volume is divided into three parts: Tradition, Women, and the Place of Reproduction; Questioning the Gender Binary; and Policing Gender: Rules, Regulations, and Laws. An introduction identifies dominant themes and provides a summary of each chapter.

Toward a Gendered and Intersectional Sociology of Development

The sociology of development has begun to incorporate gendered perspectives, but is not fully transformed. Gender scholarship is characterized by intersectional perspectives, but its gender, race and class focus is less useful in the development context. In this paper I begin to develop and illustrate a mature gendered and intersectional sociology of development. I explain the concepts and draw examples from my own work and that of others.

A gendered perspective takes into account that both individual lives and social systems are gendered. In various cultures women and men play different roles whether by custom or by choice. At the same time, the structures within which they interact make assumptions, allocate resources, award status and control behavior in ways that reflect gendered norms and ideology. Examples relevant to development include allocation of parenting duties and inheritance rules. An intersectional perspective takes into account how various attributes interact with gender. For example options open to an urban woman with a secondary school education differ from those open to a rural woman with a primary school education and those options impact not only the woman, but also her family members and, if they are representative, tell us something about their communities.

What western gender scholars know about how corporations, universities and metropolitan communities are gendered may be less applicable to market stalls

in unincorporated urban settlements or *harambe* schools in rural villages. The gender/race/class intersectional paradigm is not always broad enough for development work and may not include the most relevant attributes. For example ethnicity or religion may be critical in racially homogeneous populations, sexuality or gender identity may be more salient than gender per se in contexts where gender is not considered binary and status may be measured in ways that do not map to socioeconomic class.

Native Finns, Finnish Somali and Finnish Swedes – Group Formation in Interaction

The Finnish Somali arrived in Finland in the 1990s as the biggest influx of refugees at time. In 2016, there were about 7000 Somali citizens and almost 20 000 (less than 1 % of the general population) Somali speaking people in Finland, making them the fourth largest foreign language speaking population and the biggest African, Muslim and Refugee immigrant group. Despite the group size, the Finnish Somali are at the bottom of the so-called ethnic hierarchy in Finland, which indicates a relatively high exclusion from the social life of the Finnish majority population (Liebkind, 2000). On the other side of the spectrum is the relatively privileged Finnish Swede minority (5.4 percent of the population), who's share of elite positions in Finnish society is twice as high as the general population (Ruostetsaari, 2015). It is officially a language minority, although it meets the four major criteria of ethnicity, i.e. self-identification of ethnicity, language, social structure and ancestry (Allardt & Starck, 1981). Group size, political power, race, ethnicity, language and class are variables which contribute to patterns of intergroup behaviour, making the Finnish Swedes and Finnish Somali salient cases for studying how socially constructed categories of differentiation interact to create a social hierarchy in a national context.

We apply the Imitation Game (IG) approach in which participants, via typed questions and answers, intend to distinguish group members from pretending non-group members. By focusing on the participants' interactive methods of distinguishing group membership, the Imitation Game sheds light onto processes of group formation and maintenance (Arminen et al. 2017). This paper presents the preliminary analysis of two IG experiments organized in Helsinki with 40 native Finns, 20 Finnish Somali and 20 Finnish Swedes.

The Native Finns and the Finnish Somali – Imitation Game Experiments

The Finnish Somali arrived in Finland in the 1990s as the biggest influx of refugees at time. In 2016, there were about 7000 Somali citizens and almost 20 000 Somali speaking people in Finland, making them the fourth largest foreign language speaking population and the biggest African, Muslim and Refugee immigrant group. Despite the group size, the Finnish Somali are at the bottom of the so-called ethnic hierarchy in Finland, which indicates a relatively high exclusion from the social life of the Finnish majority population (Liebkind, 2000), making them a salient topic for the study of group relations. We apply the Imitation Game (IG) approach in which participants, via typed questions and answers, intend to distinguish group members from pretending non-group members. Current IG analysis is based on the notion of interactional expertise: The ability to grasp the conceptual structure of another's social world, which comes out as an ability to speak fluently the language spoken in the social world (Collins & Evans 2014). Successful pretending in the Imitation Game is therefore considered to reflect a high amount of interactional expertise. Interactional expertise is gained through cultural immersion in the social world of another. Therefore, the ability to pretend another social group in the imitation game is a proxy for the open or closed character of the group. IG experiments (Collins & Evans, 2014) have supported this argument, and shown that minority populations are better at understanding and reproducing the discourse of the majority populations than the other way around. This paper presents the preliminary analysis of two IG experiments organized in Helsinki with 20 native Finnish participants and 20 Finnish Somali participants.

: Divided Loyalties: Migrants, Refugees, and Fragmented Labor Markets in Post-Apartheid South Africa

Since the end of apartheid, democratic South Africa has generally welcomed refugees; the post-apartheid government has allowed those fleeing conflict and persecution to live freely in South Africa's cities, to use public services like hospitals and schools, and to work. But when urban unemployment rates often reach 25 percent, asylum-seekers compete with South Africa's citizens, often

finding themselves pushed into precarious and underpaid employment. Based on ethnographic fieldwork in Cape Town, this paper explores the resources on which asylum-seekers draw, the opportunities they find, and the tensions they confront at work. How have refugees entered the local labor market – which is already deeply divided, and where urban unemployment rates already hover around 25 percent? In the context of recent outbreaks of xenophobic violence, how have South Africa's unions responded to growing tensions between South African workers and foreign migrants/refugees?

The Marginalization of Local Communities in Oil Projects in Chad

Oil extraction requires the participation of many stakeholders with divergent interests sometimes. It's the case of oil extraction project in Chad for over a decade for which the common aim for the parties was the use of oil rents to end poverty. This study intend to seize the different stakes facing the stakeholders involving in those extractive projects, namely the state, the corporations and local communities and others stakeholders through the stakeholder theory. This last theory refers to any group or individual who can affect or is affected by the achievement of the corporation's objectives.

We use the content analysis methodology to review the data collected via the interviews of the main oil projects actors views, the reports related to the projects, and some field observations in Chad tree oil corporations namely ExxonMobil, China National Petroleum Corporation and Glencore in Chad

We find that the strategic approach of the corporations toward others actors has resulted into unequal treatment of stakeholders and the marginalization of the resourced-based communities in the project participation and sharing of oil benefits. Those findings question the effectiveness of the growing role of the private sector participating into the energy nexus sustainable development in the oil producing area.

Ideological Debates over Municipal Soundscapes: The Case of Mandarin Chinese Station Announcements on Trains in Singapore

The Singapore government, since independence, has steadfastly attempted to maintain the appearance of equality for each of its three official 'mother tongue' languages (Mandarin Chinese, Malay, and Tamil) while positioning English as a neutral language for inter-ethnic and international communication. In keeping with this ideology, signs in train stations were only in English until 1991, when, after a great deal of parliamentary and public debate, all four official languages began to appear on municipal signs in train stations and other public places. Onboard the trains, station names were announced only in what is widely regarded as 'English' (a controversial characterization since various languages are actually represented in the station names themselves). But in 2012, SMRT Corporation, a public transit operator partially owned by the Singapore government, began broadcasting station announcements in Mandarin Chinese in addition to 'English'. This change resulted in a fierce debate in newspapers and online forums, with many non-Chinese Singaporeans reporting that the move left them feeling deeply alienated and Singaporeans of all ethnicities questioning the motives of SMRT and government officials. SMRT defended its actions, claiming that this was just a temporary trial aimed at assisting elderly Singaporean passengers that understand little English. This explanation, however, failed to assuage the concerns of many Singaporeans that feel their sense of belonging in their home country is threatened by a recent influx of Chinese PRC immigrants, who they accuse the government and SMRT of pandering to. In this talk, the presenter will deconstruct this debate, examining letters to newspapers and online forum posts, highlighting the ideological positions of Singaporeans disgruntled over the government's shift in recent years from the cultivation of an imagined national community to encouraging Singaporeans to conceptualize the city state as a global city serving as a cross-roads for a larger global imagined community.

How Was the Cooperative Relationship in Trench Warfare Brought about? A Sociological Analysis of Equilibrium in Repeated Game

The cooperative relationship called "the Live-and-Let-Live System" which existed in trench warfare in World War I has been understood, especially by Axelrod, as Nash equilibrium of TFT strategy pair in repeated PD game. But, the actual interaction described by Axelrod himself contains truth inconvenient to this popular understanding. That is, there had been occasional attacks by snipers and artillery as well as retaliations, and, nevertheless, these retaliations

had been effectively controlled and the escalation did not driven further. This contradicts the property of TFT Nash equilibrium, because, under the equilibrium, no defection (attack) should occur and, if it ever occurs, an unlimited chain of retaliations should arise.

This problem has been investigated as "noise problem" in evolutionary game. Axelrod has shown that revised strategies "Generosity TFT" and "Contribution TFT" which incorporate flexible response to noise (mistaken defection) are advantageous. However, analysis by evolutionary games is not appropriate for the co-operative relationship in trench warfare, since it was born by players' deliberate choice,

In this presentation, we investigate this cooperative relationship analytically focusing on player's subjective choice logic in repeated PD game. As a result, we show; (1) When disturbing noise occurs under a sufficiently high discount rate, the expected payoff of simple TFT strategy decreases and becomes lower than that of revised TFT strategies incorporating tolerance or contrition; (2) The superiority of those revised strategies is based, not on a mechanical application of Nash equilibrium, but on the subjective reason for keeping on those strategies; (3) And exchanges of "message" through individual choice of "moves" by both sides during the interaction play an important function for keeping the cooperative relationship.

These show that a certain cooperative relationship in trench warfare should be understood as a sociological relationship, not just as a mechanical application of game theory.

Sexual Harassment in Intercollegiate Football Teams in Japan: Ethnography of Female Workers

Sexual harassment has been a topic of special interest to social scientists. Based on my previous study (PhD dissertation 2016), this study, first, compares three ethnographies in intercollegiate football teams in Japan to show the sexual harassment that women working as "manējā" (Unlike the English word "manager", these *manējās* are usually female students who assist the team) experience daily. As an ethnographer, I employed participant observation, interviews and questionnaire survey.

Here I found that *manējās* are unaware of the sexual harassment or pretending that she hasn't noticed it. *Manējās* are pressure to socialize with the male players, and in fact it strengthened and maintained the dominant power of the male players. To analyze this phenomenon, I look at the similarity between the club activity system and "membership-based employment" system in Japan.

The Japanese style of regular employment is one under which there are no limits on the duties, hours, or location of work and the employment contracts rarely include detailed job descriptions. In contrast to the style seen in other countries, where the duties, hours, and location are ordinarily limited known as "job-based employment." Because even the intercollegiate varsity teams won't require try-outs, students need no skill to join the team, so as *manējā* positions. The gender binary notions, "boys=players" "girls= *manējās*", plus heterosexual norm make the positions vulnerable to sexual harassment.

In this particular paper however, I attempt to reexamine the method of my data collection of the above study by applying Institutional Ethnography. As a newcomer to Institutional Ethnography, by reviewing the way of my data collection - i.e. how I approached to my "objects" of my investigation, for example, I intend to show that these *manējās* actual lived experience and activities are embedded in the institutional relations.

The Impact of Geographical Indications on the Relationships between Producers and Agri-Food Corporations: A Case of Powdered Green Tea in Japan

In recent years, a number of Asian countries have introduced new legislation on geographical indications (GIs), coinciding with an increasing adoption of trade agreements and a more general tendency toward market liberalization. Following this trend, Japan also introduced the Geographical Indication Act in 2015 based on corresponding European Union schemes of Geographical Indication. This act promises the revitalization of declining local agriculture and rural communities, the support of traditional practices and food cultures and the increase of exports of local traditional agri-food products. This legislation is also likely to affect the relationships between agricultural producers of GI products and agri-food corporations that purchase, process, sell and occasionally export those products. This raises the question of how the systematization of the GI policies will impact existing relations of power between these actors, will it lead to more equal or democratic relations, or rather shift the balance in favor of one party?

Employing the case of powdered green tea or "Matcha" produced in Nishio City, Prefecture of Aichi in Japan, the paper probes the manner in which GI systems influence this relationship and whether these systems contribute to processes of democratization. The relevance of the case rests on the fact that, on the one hand,

local aging, small-scale green tea leave farm operators and their cooperatives face the consequences of the agricultural crisis and, on the other, transnational agri-food corporations produce powdered green tea for food industries and the international market. In an era in which "Matcha" Latte is a globally consumed commodity in ubiquitous Starbucks' coffee shops, the paper discusses what potential roles the newly introduced GI system in Japan can play as a tool for the development and democratization of agriculture and heritage food.

To Relate Is to Constitute, Not Just Cause: Bringing Relations Back to Social Science Methodology

In the paper I outline two major understandings of "relational approaches" in the social sciences, which I refer to as "inter-actionalism" and "trans-actionalism" with reference to Dewey and Bentley's distinction between three understandings of social action (self-action, inter-action, trans-action). I argue that the major difference between these understandings is not in their emphasis on the centrality of social relations in making sense of social phenomena but in their implicit understanding of the *form* of those relations. In addition to outlining the major differences between those two understandings I also discuss possible dialogue between them and illustrate it with examples from sociology as well as political science and governance. I argue that the major difference between interactionalism and trans-actionalism is that the former sees the *form* of social relations to be *causal* in nature, whereas the latter sees them in terms of *constitution*. By bringing out this distinction between causation and constitution (and their interconnection) that leads back to at least Immanuel Kant, and articulating the methodological consequences of causal and constitutive theorizing/explanation I aim to clarify in a concise vocabulary the core of deep relational or trans-actional version of relational sociology (promoted among others by Emirbayer, Dépelteau, and the author of the current paper) and put forth some concrete guidelines for conducting trans-actional empirical research. I also argue that even though trans-actional approach might not be necessary for untangling every social problem, it is of special relevance for approaching hyper-complex problems (often referred to as "wicked problems") that we ever increasingly encounter in our everyday political scene.

Crimes Against Elderly and Social Justice Implication: A Study

Prelude: Crimes and Violence against elderly are increasing in contemporary Indian Society due to dis integration of joint family structure and negligence of children in family. They are faced with alienation, marginalization, deprivation, discrimination, exclusion and atrocities in the form of torture both physical and mental. A recent survey conducted in metropolitan cities reveals that only 23% crime gets reported and out of which 72% gets registered. **Objectives:** 1.To study the circumstance led to the crimes against elderly 2. To expose the nature of crimes committed against elderly 3.To highlight the role of GOs and NGOs in prevention and control crime against elderly.4.To suggest programmes of justice to the elderly with appropriate care and support.**Methodology:** Qualitative Research methodology is adopted and focus to group discussion and case study were conducted to collect primary data. **Area of study:**Coimbatore District in Tamil Nadu and certain cluster of panchayats in Pollachi Block. **Research Design:**Descriptive Design.**Findings:** Elderly persons lived in nuclear families which is vulnerable to crime and violence against them. Intolerance of young towards old sparked violence. Generation gap further intensified the intolerance that led to atrocities against elderly. The elders were subject to ill-treatment in the form of wounding feelings through usage of rubbish and filthy words. The senior citizens had been put to mental agony due to disrespect by young in families. Government welfare schemes are not reaching the elderly people. NGOs are providing care and support to the senior citizens through hospice. **Conclusion:** The elderly people are needed a dignified life with justice. Obviously this necessitates a collective action by GOs, NGOs to provide care and support so as to protect social justice in contemporary Indian Society.

LGBT and Human Rights Violations: Some Reflections

LGBT stands for Lesbians, Gays, Bisexuals and Transgender. LGBT has become a widely accepted designation for minorities based on sexual and gender orientation. It has helped very much in bringing sexual minorities under one umbrella to fight against the atrocities, harassments and human rights violations. LGBT, as a social minority group, are suffering from various forms of socio-economic and cultural injustice. In the labour market, majority of LGBT continue to hide their sexual orientation or to endure harassment out of fear of losing their job. This discrimination not only denies LGBT equal access

to key social goods, such as employment, health care, education and housing, but it also marginalizes and makes them one of the vulnerable groups who are at risk of becoming socially excluded. **Review:** Mason (2001) observes that violence in the inter-locked systems of gender and sexual identity is not bound by the immediate injury due to the act of violence. As Mason argues, violence is partially contingent on the 'visibility' of the transgressed sexual subject. That is, since people are normatively 'presumed heterosexual', only those who indicate otherwise (through their clothing, behaviour, speech etc.) are vulnerable to direct violence. **Design of the study:** Descriptive research design. **Findings:** Among the LGBT people transgender are facing more violence than other categories because of their visible gender identity. They do face atrocities and human rights violations frequently which affect their dignity and honour in social life. **Conclusion:** All over the world the sexual minorities experience dehumanizing in the aspects of their sex and gender. They face extreme forms of violence and harassments for none of their mistake. They need care and support from all concerned for their dignified place in society.

Mooc and Inequality in Society: The Chance to Overcome Inequality or Transfer It into Online Environment

There are different and at the same time opposite points of view about massive open online courses (MOOCs). Some researchers believe that MOOC is a way to break national borders and expand democracy among developing countries as well as a means to overcome inequality [Jewitt, 2017]. Since this is an open source of knowledge for everyone despite race, gender, socio-economic status, educational background etc. Nevertheless studies have shown that the majority of MOOC participants are citizens of developed countries with higher education [Hansen, Reich, 2015; Kizilcec et al., 2017]. That is why other researchers consider MOOC as a means of supporting and increasing inequality in society. In our research, we determine firstly whether MOOC participants have an equal chance of successfully completing the course, and secondly, to what extent achievements of MOOC students may be predicted at the start of the course (when researcher has only survey data on socio-demographic, psychological characteristics of students and data on reasons for choosing the course). We use clickstream and survey data gathered from participants of MOOCs offered by National Research University Higher School of Economics on the National Open Education Platform from 2015 to 2017. The results of our research show that students have unequal chances of successfully completing the MOOC at the start of the course.

Labour Market Inequalities: Self-Employed Professionals in Europe and Latin America

Labour market inequalities: self-employed professionals in Europe and Latin America

Renata Semenza, Simone Sarti (University of Milan)

The paper focuses on the conditions of self-employed professionals, both in the European and Latin American labour markets, whose increase is linked to the expansion of on-demand service economy. Moving from a critic to the insider-outsider theory, this group of high-skilled self-employed, expression of post-industrial work, can be considered halfway between market and hierarchy and between strategies of HR internalization and outsourcing.

The research question, dealing with social inequalities, is whether the conditions of self-employed professionals (namely “self-employers without employees” – “cuenta propia profesionales” with a high level of education and working in the qualified service sectors) are comparable than that of employees and whether the two contexts (specifically Italy and Argentina) have similar trends. From a comparative perspective we use social indicators coming from the Labour Force Survey (ISTAT for Italy; INDEC-EPH- ODSA-EDSA for Argentina). The paper presents empirical evidence related to income (as objective variable) and perception of the quality of work (as subjective variable) to measure how these two aspects -economic performance and job satisfaction- change with respect to the employment characteristics (independent variable), namely self-employed or wage-worker. Despite limitations due to comparative problems in the job classifications, the analysis seems to highlight differences in the proliferation of independent professionals in the two national contexts, arising from the dissimilar degree of expansion of the service economy and the outsourcing of specialized skills that, in Latin America is at an early stage. Moreover, in one case they retain a high level status, while in Europe there is a process of impoverishment, precarization and weak social protections.

SEMI, GIOVANNI* (*Università di Torino*)

HOME As Rent. Platform Economy, Short-TERM Rentals and the Commodification of Housing in Contemporary Italy.

The commodification of housing has always been considered a specific problematic in early sociological analysis, especially central in Engels analysis of ‘the housing question’. While the Twentieth Century had a major role in decommoifying housing via the provision of public estates for mass citizens, thus creating specific national equilibriums (also known as ‘postwar social contracts’), the neoliberal turn that started in the late Seventies and the recent development of the so-called ‘platform economy’ dramatically alters post WWII equilibriums.

In order to provide a deep analysis of the shift towards homes as real estate, we will select a specific case-study allowing to take into account the financialization of housing through platform economy: the Italian way to Airbnb and similar home rental providers. Drawing on the peculiar nexus between homeownership, social stratification and generations, our aim is to sketch the longstanding historical process that put actual middle-class households in condition to use their estates as income providers. After 2007, both global financial straits and economic recessive and fiscal policies pushed Italian households to embrace the sharing ideology becoming home renters. Relying on a fieldwork started in 2013 in several Italian cities we will provide a detailed, qualitative analysis of the nexus between class, housing and the shaping of new social inequalities.

RC21-397.5

SEMI, GIOVANNI* (*Università di Torino*)

TONETTA, MARTA* (*University of Turin, University of Milan La Statale, Italy*)

‘Gentrification? I’m Absolutely Pro!’ Homeownership, Middle Class Attitudes and Short-Term Rentals.

Platform economy is rapidly changing the shape of the urban fabric and its emergence parallel to the last financial crisis shed a light on the relationship between capitalism and urban transformations. In order to grasp the nexus between gentrification and platform economy, we look at the motives of the supporters of such transformations, namely the ‘shrenters’ via Airbnb and similar platforms. Investigating the life histories of urban households renting out their properties, we are able to detect some of the strategies that enable middle classes to: use rent as income, maintain a stable class identity in time of relative deprivation, foster further urban inequalities via the ideology of sharing. The data we rely on are qualitative and based on an ongoing fieldwork in Italian cities on lower middle classes started in 2017. A special place will be accorded to homeownership as both an ideology and a class tool that made possible the political construction of Italian middle classes and their pro-gentrification attitude.

SENDA, YUKIKO* (*Tohoku-Gakuin University*)

Changes in the Family Life Course in Japan from a Birth Cohort Perspective

Fewer children, and the concept that “the husband works and the wife stays home,” are the characteristics of the modern family. Generally, along with the disappearance of gender division of labor, diversity in the family life course, such as dual-career couples with or without children, singlehood, and so on, increases according to the social conditions of each country.

This study investigates if this is also true for Japan from the viewpoint of birth cohorts per the National Census, Vital Statistics, and National Fertility Survey. Standardization of the family life course is seen in women of the 1950s birth

cohort. The women of the 1960s birth cohort show a decrease in childbearing rate due to their delaying marriage. Among women of the 1970s birth cohort, a decrease in the incidence of marriage and an increase in the number of couples without children occur. The 1980s birth cohort reveals a new tendency in the timing of marriage and childbearing. Although these women marry even later in life, the cumulative rates of both marriage and childbirth are not lower than those of the 1970s cohort.

The practice of gender division of labor in the workplace, and the positive perception toward it in general, still exists in Japan. Instead of breaking it, the younger cohort finds various solutions to counter it. Some women choose to stay single and show that they have no family responsibilities in order to obtain better opportunities in the workplace, while others choose to continue working but move to “mommy track,” or quit working after becoming a mother in order to balance work and family.

What are the characteristics of the diversity of the family life course in harmony with the division of labor by gender? The answer to this question will contribute to increasing the well-being of people.

RC06-137.3

SENDA, YUKIKO* (*Tohoku-Gakuin University*)

The Barriers of Gender-Equal Work-Family Reconciliation in Japan

The increase of women with a high educational background is one of the drivers in the increase of their workforce participation and breaks the ideology of the gender division of labor. It brings about the legislation of work-family balance in policy and promotes men's participation in domestic duties, which actualizes a gender-equal society.

This study investigates whether this is also true for Japan per government statistics, surveys, and notices. They show the following: the labor participation of the productive female population increases; the female workforce utilization is polarizing among workplaces; the work hours of regular employees are quite long, especially in their 20s and 30s; singlehood increases while childbearing decreases; more women view their life course pattern as “to marry, to have a child, but to continue working”; the ratio of woman continuing to work before and after their first childbirth rises after 2010; half of all people are affirmative of the gender division of labor, even today; and the government is actively helping women balance work and family but is negative about helping men to do so.

In summary, the ideology of gender division of labor by both policy makers and the general public as well as the long hours of work are the two main barriers that interact with each other to actualize a gender-equal work-family reconciliation in Japan. To access better opportunities, employees have to show their eagerness by working long hours, while there is no establishment of measures to cut long work hours on the policy side. Additionally, the work-family reconciliation policies are mostly directed at and utilized by women. Wives often spontaneously give up promotions, move to a “mommy track”, or quit working entirely after childbirth to balance their work and family because they give priority to their husbands’ career formation.

Recognition and Accessing Legality: Discrimination, System Avoidance and Legal Cynicism across the European Roma Experience

Research on access to justice generally focuses on the availability of institutions to address legal needs. This paper instead investigates when individuals avoid law as a mechanism for redress — precisely because they do not believe legal institutions are fair or effective. We draw on a unique survey of 30,000 Roma and non-Roma households across twelve Central and Eastern European countries. We find that Romani individuals living in towns where discriminatory stereotypes are more prevalent are more likely to be cynical and pessimistic about legality. Importantly, this legal cynicism has broad effects for inequality, since this cynicism reduces Romani willingness to engage with state institutions more broadly. Taken together, these findings demonstrate that experiences of discrimination may undermine confidence in legal institutions for stigmatized communities (cf. Lamont et al 2016). By training our lens on how discrimination can shape minority communities’ engagement with legal institutions, we elaborate a cognitive sociology of access to justice.

Power Relations in the Welfare State: Mechanisms of Power in Caseworker-Client Interactions

Following Michael Lipsky's well known argument that policy is made in the daily encounters between frontline workers and citizens, a growing body of research emphasises that actors and organisations delivering social and labour market policy play a crucial role in welfare state politics. Our paper examines the role of the professional group of caseworkers in the context of activation policies in Germany. Building on the theoretical perspective of street-level bureaucracy, we point out that relations between caseworkers and clients are characterised by a structural power asymmetry, resulting from the fact that welfare agencies provide services which citizens cannot obtain elsewhere. Based on that assumption, our paper explores how caseworkers interpret their relations with clients and what resources they develop in the process of policy delivery. Empirically, the analysis draws on qualitative data (interviews and group discussions) collected in three local employment agencies in Germany.

The findings show that in the context of activation policies, it is essential for caseworkers to achieve client compliance. In order to keep control of the work situation and to bring client behaviour in line with requirements, caseworkers regard coercive and disciplinary elements as an important element of their work. However, strategies relying on persuasion play an equally prominent role in frontline interactions. Caseworkers in particular refer to building relationships of trust as a strategic instrument in overcoming possible barriers to information exchange and cooperation in caseworker-client interactions. Motivating the client to become a *trust-giver* in the caseworker-client relationship may help frontline workers to steer the client and to consolidate the structural power asymmetry between street-level bureaucrats and their clients. We conclude that caseworkers in welfare agencies use power in different ways. Apart from coercion, persuasive strategies such as trust building are mechanisms of power in caseworker-client relations.

A Disabled Child at Home: Looking into the Possibilities and Challenges in Parental Caring of the Children with Intellectual and Developmental Disabilities (PwIDDS)

Birth of a child in a family is usually associated with happiness and joy. It strengthens the bond between spouses and also with other members in the family. However a child born with Intellectual and Developmental Disabilities (PwIDDS) subverts this equation and the parent of the child lapses into mental agony, pain and trauma leading to a lifelong process of anxieties, tension and grief. The question that haunts the parents day and night is the responsibility and well being of the child in their absence ie who will take care of this child after their death. It is in this context my paper will explore the initiation of a residential project named "Swapnaneer" in the vicinities of Kolkata. Located at Langalberia Gram Panchayat, District 24 Parganas, West Bengal this residential project is a dream nest to many who seek to provide lifelong support to the children born with PwIDDS. "Swapnaneer" is based on the concept of "Community Living" towards providing lifelong shelter and care, economic support and developmental opportunities for PwIDDS even after the demise of their parents. The objective of my paper will be to look into this exemplary model and analyse how this concept can be made viable in terms of association amongst families, civil society and the State. The paper questions the role of the states in the era of globalisation and tries to find out how far these local initiatives can act as an alternative to the states failures in meeting the responsibility to provide basic resources and welfare services to the vulnerable citizens.

Gender Dysphoria and the Politics of Difference: Re(locating) Marginalization of the Trans Persons in Urban Kolkata, India.

Social discrimination based on gender is an age old phenomenon in the socio cultural milieu of South Asian countries. In a country where sex is considered as a taboo, and heteronormativity the order of the society, non confirming gender identity persons have been a victim of constant attack, leading to humiliation, deprivation of basic human dignity that leads to violence and gross human rights violation. By borrowing from the narrations of the real lives of the transpersons in Urban Kolkata, this paper tries to address the conceptions concerning sex and gender identity in South Asia. It also explores a broader understanding of violence which is not limited to the understanding of direct physical assault but also involves the whole paraphernalia of a larger socio cultural practise that promotes day to day violence towards these people who are non confirming to the accepted notion of the gender binary. The paper tries to arrive at the fact that contrary to the politics of difference, attempts have been made to bring them back into the main flow of the society. The author draws attention to the drawbacks that prevent to bring the transpersons into the main stream and questions the role of the State towards these vulnerable communities. Reflecting on the recent changes that have taken place in the legal framework of the country (NALSA Judgement 2014 and Protection of Trans(person) Bill, 2016) the author tries to grasp a holistic

notion of human rights and social justice cutting across intersectionality, time, space, caste, class and geographical location.

Japanese Job-Hunting Event "Shukatsu" Makes a Female Student Woman; Female University Students' Future Visions for "Marriage and Child-Rearing" and the Choice of Their Jobs

The purpose of this presentation is to examine how Japanese life event for job-hunting affect female university students' future visions and the choice of their jobs. Since 1980s, female university students can get managerial jobs; however, the number of women holding managerial jobs has not increased. In 2016, Japan ranks 118th for economic participation and opportunity on a global inequality ranking report. Japanese women are expected to marry, produce babies, and over see the household.

Some studies on the job-hunting process point out that female university students choose secretary jobs. However, previous research overlooks how the activities affect their own future vision and the choice of their jobs during the job-hunting process. Therefore, this study investigated the mechanism of the choice of their jobs through interviews.

The mechanism is as below. First, they choose managerial jobs and don't imagine their future to be doing housework and child-rearing. Second, in job fairs, some recruiters of personnel inform them a secretary job, on which they can continue working. And, they guess their own future vision, in which they work and do housework and child-rearing or work hard.

In result, they must choose either a secretary job or a managerial job during the job-hunting process. This choice is difficult for some students because they acknowledge they have to give up their career in Japan when they get married. In sum, female university students are compelled to decide either sacrificing their career over marriage and child-rearing or a single life during the job-hunting process in Japan.

"a Woman's Voice on the Phone Matters": Gendered Nature of Worklife in Logistic Sector in Turkey

Transport and logistics have been mentioned among the male dominated industries in all over the world. However, the global increase in the ratio of women in labor market and paid work influences the logistic sector and women has begun to make significant inroads to this sector. On the other hand, literature on the gender composition of employment in the logistics sector clearly shows the persistence of disadvantageous position of women compared to their male colleagues in terms of career opportunities, payment and salaries and building business networks. This presentation is based on a field research hold with female employees from different departments and positions and employers in logistic firms in Turkey. Focusing on the Turkish logistics sector which is barely discussed in the literature on the subject, our research shows that, it is not only the overall increase of the number of women in the general work force, but also the need for employees in customer services and sales open up more career opportunities for women as the logistic firms are emergingly institutionalized, prioritize customer relations and preserving/increasing global connections. In addition to confirming the constant inequality between men and women in the sector in terms of opportunities for higher managerial positions and network building, the results of our research suggest that as the emotional labor is inextricably linked to the logistics work, firms tend to employ more women and women are expected carry on traditional gender roles in workplace. Drawing from the results of our research, this presentation will discuss the place of emotional labour in gendered nature of worklife, women's strategies of balancing family and work life, and the tension between the growing number of women and women's disadvantageous position through the logistics sector in Turkey.

Understanding the Shrinking Social and Economic Rights of Persons with Disabilities through the Lens of Citizenship

Social and economic rights are being jeopardised in times of neoliberalism and austerity. The erosion of the welfare state affects a wide range of citizens and has a particularly negative impact on the lives of persons with disabilities. Scholarship has documented these impacts and highlighted that the present situation is at odds with the formal recognition of persons with disabilities as 'full citizens'. The situation varies across countries but changes are palpable even in Sweden,

a country known for its generous and universal welfare benefit system (Esping-Andersen 1990).

However, the historical processes through which persons with disabilities, like other previously excluded groups, have obtained 'full citizenship rights' in the first place and the arguments put forward by disability rights activists to protect their shrinking social and economic rights have received less attention in the literature.

This paper suggests that citizenship theory offers a useful lens to consider these aspects. Drawing upon T.H. Marshall (1950) who conceptualised citizenship as a 'developing institution' in a context of social and material inequalities, it analyses the changes relative to the social and economic rights of persons with disabilities. Although the state is the only authority that can formally decide upon citizenship, Cohen (2009) argued that citizenship is informed by competing doctrines of liberalism, democracy and administrative rationality. This paper suggests that, as a democratic movement, disability rights activism participates in (re-)shaping the contours of citizenship. Drawing upon the content analysis of a selection of historical and contemporary claims of Swedish disability rights activists, the paper shows how the citizenship for persons with disabilities is being (re-)imagined through their claims. It concludes that citizenship theory enables gaining a deeper understanding of the societal issues at stake in questions relative to the social and economic rights of persons with disabilities in contemporary society.

Educational Mobility Experiences of Mapuche Indigenous People, Who Are First Generation University Students

My research is centred on how social mobility transitions impact on the racial and class cultures of Mapuche indigenous people in Chile with higher education, and how these affect their identities. My methodological goal is to examine the role of social mobility discourses of the Mapuche (indigenous people), producing narratives of inequalities legitimisation and ethnic discrimination.

For that reason, the methodological perspective is qualitative and I am focusing on the university and works experience of my interviewees. I conducted 40 life histories. The sample were women and men that identify as Mapuche people between 21 and 59 years old and were the first generation that attended university.

Mapuche population is characterized as a disadvantaged group, because since the period of the Spanish conquest, indigenous groups in Chile have faced economic, social, territorial, cultural inequalities, positioning unequal to the rest of the population. Moreover, the proportion of indigenous people who complete their higher education is less than a third of the proportion of non-indigenous people in the same situation (INE, 2002). However, an emergent group of Mapuche population have experienced social mobility, thanks to integration policies for indigenous population from the 1990s until now. Nevertheless, preliminary data suggest that they deal with class tensions, ethnic boundaries and racism.

The data suggest that there is a re-signification of Mapuche identity, as the interviewees are trying to construct or find a new identity from a non-traditional Mapuche position, because they are the first generation who attend university. On the other hand, the data suggest that migration play an important role related to the identity formation, because according the place they born, grew up and how their trajectories were developing, their identities and experiences are changing in terms of authenticity, discrimination, class identification, gender relation and their relation with the Mapuche culture.

A Qualitative Study of Ethnocentrism and Nationalism Among Sunni and Shiite Kurds of Iran

The present study aims at investigating the relationship between ethnocentrism and religion among Iranian Kurds. The research methodology is qualitative and the data was obtained via in-depth interviews. Grounded theory was used for analyzing the findings. Based on qualitative-purposive sampling method and the theoretical saturation criterion, 31 Sunni and Shiite Kurdish residents of different cities of Kermanshah province were interviewed and their perception and interpretation of ethnocentrism, and its relationship with their religion were investigated and analyzed.

The collected data were categorized into 53 basic concepts, 14 major categories and eventually 2 core categories. The data infers Shiite and Sunni interviewees had some similarities and differences in their understanding of ethnicity, religion and Iranian nationality. The major categories in which Sunni Kurds expressed their ideas include integrated Kurdish identity, dissatisfaction with government, secular interpretation of religion, preference of ethnicity to religion, alienation to the Iranian identity, self-determination right, and the role of ethnic elites. While Shiite Kurds expressed their ideas by the words and concepts categorized into 7 categories, including Kurdish ethnic identity, Iranian national identity, dissatisfaction with government, compatibility of religion and ethnicity, emphasis on the cultural rights of Kurdish ethnicity, secular interpretation of religion, and the lack of historical consciousness of Kurds. Accordingly, "secular Kurdish nationalism"

was inferred as the core category for explaining Sunni Kurds interviewees' understanding of the issue, while "cultural ethnocentrism" was suggested for that of Shiite Kurds.

A comparison of different categories obtained for the two interviewed groups, Shiites and Sunnis, revealed that they show similarity in two categories "dissatisfaction with government" and "secular interpretation of religion", however, in other cases such as their interpretation of Kurdish identity, Iranian identity, and the relationship between religion and ethnicity they show major differences. These similarities and differences are illustrated and discussed in the paper.

SERBULO, LEANNE* (*Portland State University*)

(Put your) Hands up, Don't Shoot! Exploring the Social Dynamics of Police Shootings in Portland, Oregon 1992-2017

The protest movement that emerged in response to the deaths of Michael Brown, Eric Garner, Sandra Bland, Philando Castile, and others focused international attention on police shootings in the U.S. Despite the contemporary primacy of this issue, there is a surprising dearth of information about the size, scope, impacts, and policy outcomes of police-involved shootings, due in part, to a lack of reliable data reporting by local and national police agencies. Portland, Oregon has seen its share of police-involved shootings and subsequent movements advocating for police reform and accountability. The city is currently under a federal consent decree for systematically violating the rights of mentally ill residents. In 1992, Portland Copwatch, a grassroots organization that was founded in response to the police shooting of a 12 year old hostage named Nathan Thomas, began compiling a database of all police-involved shootings in the city. This study uses information from Portland Copwatch database supplemented with data collected from local newspapers to explore the social dynamics of police shootings in Portland from 1992-2017. The research will examine whether African American, mentally ill, and people perceived to be homeless are disproportionately likely to be shot by the police. It will also look at which types of calls and encounters led to police use of deadly force and will explore how community responses to police shootings and/or policy changes impacted law enforcement's use of force in ensuing years.

Los Exámenes De Control De Confianza y Las Consecuencias No Deseadas De La Depuración Policial En México

Hace casi dos décadas que el problema de los altos índices de homicidios, desaparecidos y víctimas de delitos violentos en México, ha ido en aumento. En muchos de esos crímenes se han visto involucrados miembros de las fuerzas policíacas de los tres niveles de gobierno, lo que provocó que se desarrollaran políticas para contar con policías "confiables". Se crearon centros de evaluación y control de confianza, en todas las entidades federativas, con el fin de evaluar a los policías y determinar si eran aptos para el desempeño de sus funciones. Lo anterior implicó el inicio de un proceso de depuración en las policías mexicanas y la creación de un filtro para formar parte de las fuerzas de seguridad pública. A casi una década de la implementación de dicha política, se hace un recuento de los alcances, las limitaciones y las problemáticas que ha traído la creación de un sistema para depurar a las policías y reclutar a aquellos con las capacidades necesarias para el ejercicio de sus funciones. Las hipótesis de trabajo que aquí se formulan apuntan a que la implementación de los centros de control de confianza al no ir acompañadas de un fortalecimiento de las instancias del régimen disciplinario de las instituciones policíacas han generado violaciones sistemáticas a los derechos humanos de los policías, así como la generación de nuevos procesos discrecionales de despido de policías. Por otro lado, se discute también como los sistemas de mejora institucional siguen estando centrados en la vigilancia, castigo certificación de los individuos pero no en las instituciones.

Differentials in Men and Women's Perception and Justification of Gender-Based Violence in West African States.

Many acts of domestic violence are gender-based, with significant ramifications for both children and adults in the household or family. Domestic violence can be defined as intentional, interpersonal violence, whether actual or threatened, which involves any one of a combination of acts such as: verbal abuse, physical assault/abuse, forced sex/sexual abuse, economic deprivation, psychological/emotional abuse (torture), or even spiritual abuse. Such violence is typically directed toward women and girls (and less often against men and boys) and

very often results in harm or injuries, or even death of the victim. Prevalence of gender-based violence can be influenced by wider social contexts such as race, nation, ethnicity, religion, education, socioeconomic class and age factors. The form and extent of justification of gender-based violence among men and women can vary within and between these sub-groupings. Using the DHS data from 2007 to 2008 for four West African countries, we performed a comparative analysis to determine differences between men and women's perception of gender based violence, and the relative contributions of social contextual factors such as family, as well as wider regional factors, to such attitudes. Multiple logistic regression analysis that was performed (using SAS 9.4 software) on a sample of 69,761 observations. Preliminary results indicate significant differences in the effects of social context on how men and women perceived and justified gender based violence. Some larger regional factors were also shown to have strong predictive values for perceptions of gender-based violence.

What Is New in Professions Theory? Contributions from Actor Perspective(s)

The impact of neo-liberal and New Public Management (NPM) health reforms on medical profession has undergone comprehensive changes. Although the underlying reasons are similar across western countries, concerning the Portuguese case the outcomes diverge, particularly due the influence of medical profession on shaping professional practices and regulatory mechanisms. In Portugal, doctor's influence on state regulation seems to counter the dynamics that have been described in sociology of professions, which points out the increasing criticism of medical autonomy, the growing managerial control over medical authority and the state regulation of medical procedures. Doctors have succeeded in developing strategies to protected their professional position in the workplace, by reconfiguring their jurisdictions and influencing organizational structures and decision-making processes.

The purpose is to provide a comprehensive explanation of how NPM health reforms impact on micro-level relationships on health organisations, namely the interplaying of doctors with other health professions, managers and patients. New questions arise concerning the understanding of how cooperation between different health professions is construct as they work together in the best interest of patients. As teamwork is a network of semi-independent professionals who tend to represent their professional organisations and groups, the impact of managerialism in healthcare may not improve the situation and brings new challenges to sociology of professions. Research on professions tends to analyse tension/cooperation problems among health professions ignoring the fact that multi-professional cooperation as the same character as mono-professional cooperation, to preserve collegiality through co-existence. This idea challenges the three stands on professions theory: service ideal, discretionary power and professional dominance. My argument is that these three stands allow us only to explain part of the tensions/cooperation problems and that professionals are strongly influenced but not determinate by their professional logics. The actor perspective offers a useful interpretation in understanding individuals' cooperation problems among health multi-professional teamwork.

"Europe Was a Party": A Theoretical Approach to Core-Periphery Political Relations in the Aftermath of the European Union (EU) Crisis

The relationship between core and periphery areas in Europe has changed since the 2008 economic and political crisis. In this study we present a new theoretical approach with the purpose of describing a political framework for the connections among the different areas in the EU. We argue that the EU is divided into five political areas: the Core area (France, Germany, Belgium, Netherlands and Austria), the South area (Portugal, Spain, Italy and Greece), the West area (United Kingdom and Ireland), the East area (Poland, Hungary, Romania, Latvia, Lithuania, Estonia, Czech Republic and Slovenia) and the North area (Norway, Finland, Sweden and Denmark). In doing so, we have selected a political movement for each area that is representative of the changes in the liberal democracies in the EU: the French *Front National* (National Front) for the Core area; the Spanish *Unidos Podemos* (Together We Can) for the South area; for the West area we have not selected a political party but a political movement, such as *Brexit*; the Polish *Prawo i Sprawiedliwość* (Law and Justice) for the East area; and the Swedish *Perussuomalaiset* (Finns Party) for the North area. We explain how the different political changes in these areas have modified the reality of the situation in the EU. As a consequence of that we conclude that the EU will not be a political entity unless there is a substantial change in the political differences between core and periphery.

Anticrime Protests in Mexico: Emotions, Repertoires and Social Organizations

Criminal violence in Mexico has been on the rise in the last decade. In reaction to it, civil society has taken many actions, street protests being one of them. Anticrime protests do not challenge authorities only, but armed criminals also. When victims are found, and reported by the press, it is not easy to tell who was the perpetrator of violence, civilians or public servants, which authorities are colluded with criminals, and which are not. It is also hard to tell if the victims of violence were innocent bystanders or gang members fighting among themselves for markets, weapons, money or drugs. Therefore, anticrime protests, face steeper collective action problems that the ones studied by the sociology of collective action, protests, and social movements. They have to overcome the fear, the spiral of silence, additional risks and framing uncertainties related with the diagnosis of the situation, the extent of organized crime, corruption, and the labelling of victims as "collateral damage" or as straightforward "criminals". In order to investigate the amount of anticrime protests and the tactics they use, I created a novel database of anticrime protests in Mexico between 2007 and 2014. According to my data, in this period there were 2,170 anticrime protests in Mexico. Only 106 of those protests were violent. Furthermore, I classified 39 different types of collective performances grouped into four major tactics: symbolic, violent, disruptive and conventional. Most of the violent protests were related to the 43 students who suffered forced disappearance on September 26th, 2014, in Ayotzinapa, Guerrero. Through multivariate regression models I test the determinants of anticrime protests' tactics in Mexico. My findings contribute to the literature on repertoires of collective action, resource mobilization and anticrime protests.

Mujeres Migrantes y Violencia Estructural: Las Historias Laborales De Migrantes Mexicanas En Los Ángeles California.

Los migrantes en Estados Unidos es uno de los grupos más vulnerables en aquel país. Ellos se enfrentan a condiciones precarias en la esfera laboral, de vivienda y en el acceso a servicios. Por ejemplo, en el área laboral se ha visto que los trabajadores migrantes enfrentan un mayor riesgo que los trabajadores "nativos" a sufrir accidentes y lesiones, esto como resultado de recursos políticos y económicos escasos, barreras idiomáticas, diferencias culturales y condiciones laborales precarias. Las mujeres migrantes se encuentran en un contexto especialmente adverso y vulnerable, ya que frecuentemente enfrentan discriminación por razones de género, en adición a la condición de ser migrantes. En este trabajo presento las narrativas personales de tres mujeres migrantes mexicanas que viven en Los Ángeles, California con un estatus migratorio precario y que han sufrido accidentes y/o lesiones laborales. El objetivo es evidenciar la violencia estructural que ellas sufren como resultado de la intersección de sus identidades como mujeres y migrantes con un estatus migratorio precario. Las participantes fueron entrevistadas para sus narrativas posteriormente ser analizadas cualitativamente desde una perspectiva fenomenológica interpretativa (IPA por sus siglas en inglés). Primeros resultados muestran la estrecha relación que existe entre condiciones económicas estructurales, condiciones laborales precarias y la violencia a la que las mujeres migrantes se encuentran sometidas en sus vidas cotidianas. El estudio resulta crucial para entender como la violencia estructural basada en jerarquías de clase, raza, género y estatus migratorio se traduce en sufrimiento y enfermedad entre las mujeres migrantes. El conocer los efectos que las condiciones de trabajo y de vida tienen en la salud de los y las migrantes es fundamental desde una perspectiva de justicia social y un primer paso para mejorar dichas condiciones y por lo tanto impactar el bienestar del grupo.

SERRANO-SANCHEZ, ANGEL* (Universidad de Guanajuato)

Occupational Injury and Experiences of Suffering Among Latino and Latina Immigrants in Los Angeles, California and Returnee Migrants in Mexico.

The International Labor Organization (ILO) calculates that as a result of occupational accidents 220,000 deaths occur every year. In the United States, immigrant workers in general face higher risk than native workers for occupational injuries and illnesses as a result of scarce political and economic resources, language barriers, cultural differences and poor working conditions. Immigrants commonly have the most dangerous occupations and perform the riskiest tasks, and due to language difficulties and discrimination, they may receive inadequate safety training. Occupational injuries are disproportionately present among the Latino immigrant population: In 2002, the average occupational injury rate

among immigrant Latino workers in non-agricultural occupations was 12.2 per 100 full-time workers, compared to 7.1 injuries per 100 full-time workers in the U.S. population. In this work, I explore how Latino immigrant everyday lives and employment trajectories are affected by injury and disability in a context characterized by high vulnerability. The theoretical framework of social suffering and concepts such as structural violence and structural vulnerability are used to analyze the links among migration, health and employment. Based on the study of personal narratives, I propose a qualitative analysis to understand the effects of occupational injuries on participants' lives. Latino and Latina immigrants living in California and returnee migrants in Mexico who have experienced severe work related injuries in the United States participate in this study. Participants' narratives show a direct relationship among economic crisis, precarious working conditions and occupational accidents. Their personal narratives also give testimony that suffering is a salient part of their everyday lives. The study of the relation among employment, health and migration is crucial to understand how health inequalities are reinforced and become embodied in the form of suffering and disease at a time that hate sentiments against migrant populations seem to be increasing worldwide.

SERRANO-VELARDE, KATHIA* (Heidelberg University)

Bringing Organizations Back into the Study of Education

The paper contributes to the special issue by identifying new areas for the study of organizations in sociology: The Study of Education has much to gain from an organizational perspective on learning processes. Whereas most sociological research dealing with education issues emphasize the importance of classroom, cohorts, or educational districts in the making and unmaking of educational trajectories, little is known about organizational effects on individual learning strategies. This is especially the case for situations of so-called informal learning – that is, learning beyond traditional educational settings such as schools or universities. The paper addresses this gap by providing a theoretical and empirical account of the informality of learning situations in the framework of the German voluntary service. Our aim is to make the organization “reappear” as a critical unit of analysis in our sociological understanding of lifelong learning and secondary socialization.

By analyzing how and to what extent informal learning is structured by organizational factors, we explore both the social mechanisms behind the individual learning experience and the way organizations deal with learners. To access the complexity and plurality of informal learning environments and their impact on individual learning, we opted for a mixed methods design combining two types of qualitative data sets: First, we sampled twenty narrative interviews with German voluntary service participants. The interviews elicit information on the expectation framework of volunteers, typical learning situations in the host organization, and their contact to the wider organizational context (colleagues, superiors, and patients/clients). This database helped us to identify systematic variations in the organization's impact on the individual capacity to recognize and take advantage of learning opportunities. Second, we performed a multi-site ethnography in two types of organizations: hospitals and care centers for people with disabilities.

Black Feminist Thought: The Need for an African Feminist Standpoint

Kimberle Crenshaw's proposition of intersectionality during the 1980s laid the foundation for understanding the concurrent analysis of multiple, intersecting sources of oppression and relative privilege within black feminist scholarship. Based on Crenshaw's intersectionality framework, Patricia Hill Collins (1989) emphasized the interplay of race and gender to explain the standpoint (experiences) of black women. This paper seeks to build on Colin's claim by introducing the element of culture as a significant factor for understanding the oppression and relative privilege of black women in addition to race and gender. Drawing on some cultural practices of West Africans, I will demonstrate the value of culture as a powerful concept that deepens the understanding of the experiences of black women in different spatial contexts. The rationale for what I call the *African Feminist Standpoint* is to highlight the need to consider the intragroup variations about the intersecting sources of oppression and relative privilege of black women based on a transnational perspective. The study contributes to advancing the debate of Black Feminist Thought by demonstrating the value of culture as an important factor that should be given attention when articulating the standpoint of black women, especially those in Africa or Africans in the diaspora.

Agrarian Crisis and Suicides in Post-Liberalized Era: The Case of Indian Punjab

Punjab state is known in India for its agriculture and hardworking peasantry, largely constituted of Jatt Sikhs. Green revolution of late 1960's through 1980's gave a major boost to agricultural production and brought radical transformation in the agrarian structure. Erstwhile peasants were transformed to farmers and subsistence agriculture suddenly was usurped by the market. Since early 1990's, the beginning of liberal era, Punjab agriculture was suddenly further opened up to the vicissitude of global market. With the linking of Punjab agriculture to global market, the already strained agrarian relations in rural Punjab came under fresh strain. The present investigation was envisioned in the light of frequent suicides occurring in rural Punjab. The data on 100 households was collected from five villages, namely, Bhutal Khurd and Chottian from the Sangrur District and Bhundarh, Chowke and Jethuke from the district of Bathinda. Both quantitative and qualitative analysis has been carried out for the empirical evidence on the phenomenon of suicides. Many factors acting as catalysts towards suicide came to light during the investigation. These factors varied in their intensity across cases and every single case was affected with many factors simultaneously. Majority of the cases had portrayed a very complex picture with multiple interrelated, interacting stressors acting upon the situation. Two basis for their classification emerged-a) Sphere of life affected by the stressor i.e economic, psychological, demography and social; b) intensity i.e dominant role played by the factor, whether it acted as the primary, secondary or tertiary factor. Perspectives were derived after analyzing the collected data and practical solutions have been suggested to contain the epidemic.

SETIA, GUNJAN* (Bhag Singh Khalsa College for Women, Kala Tibba, Abohar)

Marginalization and Alienation of 'Tillers of Land' in Post-Globalized Era, Seeking Resilience through Participatory Democracy: The Case of Rural Suicides in Punjab (India)

Karl Marx wrote about alienation of the proletariat from the production process, from the means of production, from the finished product, and eventually from ones' own being. This is the highest stage of alienation where the work done is perceived to be meaningless by the worker, and he feels incapacitated in meeting his needs. In the present analysis of suicide by 'tillers of land' i.e. Farmers, agriculture labour, land tenants can partially be explained with the Marxist theory of alienation whereby farmers have lost the autonomy of what and how much to produce on their own lands in the post globalized, liberalized era. The present investigation delved into the varied forms of inconveniences faced by the farming community which had led to the spurt of suicides and marginalization across two badly hit Districts of Bathinda and Sangrur. In the absence of alternative social and emotional support systems, the pressure of unfriendly market forces pushed the farmers to the wall and a stage came when they found themselves helpless and defeated by the impersonal market forces. The net outcome is heavy indebtedness leading to depression and family quarrels. The failure of governance is not limited to the excess burdening of the farming community. It is compounded with the failure of important social services mainly government education system and health services. In due course of time the youth found itself lost in the quagmire. Under such appalling conditions participatory democracy has been sorted as a way out and practical suggestions have been put forward to contain this social epidemic and empower rurality.

SETIA, SUSHANT* (Panjab University, Chandigarh)

Impediments of Sustainability and Alternatives for Inclusive Development of Workers in the Urban Informal Sector (A Case Study of Street Vendors in Chandigarh, India): A Human Rights Perspective

Massive rural to urban influx in developing countries due to push factors has forced the mushrooming of slums which usually lack basic amenities and indulgence of masses in low paying, exploitative and unhealthy jobs. Informal sector employment comprises of self employment and wage employment which usually lack secured contracts, registration, worker benefits or social protection. The present study focuses on the human rights violation and the hindrances in inclusion of this very informal sector into the urban sphere. Two occupational groups have been selected for the present investigation a) Fruit and vegetable vendors, as they have the longest working hours and deal with perishable goods b) 'Chai walas' who are considered the cornerstone of historical and cultural heritage of India. Chandigarh being the first

planned city of post-colonial India has been selected for the present study. Economic feasibility, living and working conditions of the target group, their awareness regarding rights and the social status of street vendors has been gauged using detailed interview schedule, personal observations and mobilizing secondary sources. The findings have been analyzed using the prism of available legal framework in India, safeguarding street vendors with special reference to the implementation of Street Vendors Act, 2014. Various facets of human rights infringement of the target group like violation of their right to livelihood, right to health, right to rest, leisure, social rights etc have been discussed and practical solutions for their inclusion have been put forward.

Towards Sustainable and Inclusive Development of Workers in the Urban Informal Sector (A Case Study of Street Vendors in Chandigarh, India): Impediments and Alternatives

Sustainability is essentially the relationship between the environment and society which involve physical aspects as well as ethical attitudes. A mass level rural to urban influx in developing countries due to push factors has forced the mushrooming of slums which usually lack basic amenities and indulgence of masses in low paying, exploitative and unhealthy jobs. The present study focuses on the hindrances in the inclusion of this very informal sector into the urban sphere. Two occupational groups have been selected for the present investigation a) Fruit and vegetable vendors, as they have the longest working hours and deal with perishable goods b) 'Chai walas' who are considered the cornerstone of historical and cultural heritage of India. Chandigarh being the first planned city of post-colonial India has been selected for the present study. Economic feasibility, living and working conditions of the target group, their awareness regarding rights and the social status of street vendors has been gauged using detailed interview schedule, personal observations and mobilizing secondary sources. The findings have been analyzed using the prism of available legal framework in India, safeguarding street vendors with special reference to the implementation of Street Vendors Act, 2014. Various facets of human rights infringement of the target group have been discussed and practical solutions for their inclusion have been put forward.

The Effect of City-Level Changes in Home Prices upon the Well-Being of Older Americans

This study investigates how economic changes consequent to the Great Recession of 2007-08 impacted the well-being of older Americans. Using the first two waves of the National Social Life, Health, and Aging Project (NSHAP), I study whether changes in metropolitan statistical area (MSA) median home prices are associated with changes in an index of sadness. I furthermore study whether and to what extent these effects are mediated by changes in older persons' total household assets. I find that declines in MSA-level median home prices are linked with rising levels of sadness, and that this effect is not mediated by personal financial losses. My results thus imply that contextual economic declines have potent effects upon older persons' well-being, independent of the impact of their own personal financial losses. My results suggest that in efforts to protect older persons from economic shocks, it is worthwhile to focus on the effective provision of services, the availability of amenities, and the strength of social support within the cities in which older persons live. Perhaps even more important than helping older persons safeguard their wealth is maintaining the quality and the safety nets of the cities in which they reside.

Curating Violence: An Interdisciplinary Reflection on Race and Violence in South African Student Protests

During 2016 South African university campuses experienced two student campaigns, #FeesMustFall and #DecoloniseTheCurriculum when staff and students witnessed, and were subjected to particularly racialized forms of violence and rationalizations of violence (Settler and Haugaa Engh). In the face of securitization of university campuses countrywide, ordinary mediums of teaching and learning, public gathering and commentary proved inadequate because of policing and surveillance. Through reflecting on the production of memorials and performances on our campus, I propose to interrogate the meaning of the aesthetic, as well as the relation to, and commentary on the context within which it is produced (Benjamin, Bourriaud, Lippard).

Drawing on the work of Mbembe, Fanon, Arendt, and Spivak we reflect on the ways that violence, often religiously sanctioned, can be understood and explained in contexts of protest, upheaval and social disruption. In an interdisciplinary effort, I reflect on how a group scholars from religion, drama and visual arts sought to not simply think together about what this meant epistemologically and ideolog-

ically, but also explore how curating violence raises pedagogical challenges and opportunities in a context of repression.

Through an interdisciplinary analysis, I propose to interrogate how the black body, violence, the context and the viewer were aligned to produce a public pedagogy on physical and representational violence. In this regard I will reflect on three curatorial moments that enabled a collective reflection on violence, resistance and the racialized self, that opened possibilities for a kind of public classroom where discussion about, as well as the articulation and critique violence is possible, and productive.

The Indigenous As Seductive and Disruptive: A Theoretical Revision

In the context of Southern Africa, the history of religions has been closely tied to the classification of the indigenous as an explanatory category. Chidester (1996, 2014) along with King (1999) and Masuzawa (2005), have argued that the classification and manufacturing of religion in the postcolony relied on imperial ideas of the indigenous. Scholars such as Rattansi (1994), Mignolo (1999), Lugones (2008) and Maldonado-Torres (2007), respectively, point to the limits of postcolonial approaches, the crisis of canon, and the need to theorise decoloniality. Both postcolonial and decolonial scholarship draw on the indigenous to both disrupt hegemonic knowledge regimes, as well as a way to bolster anti-colonial movements and discourses.

Thus, I propose to explore what happens when the indigenous uncouples itself from not just from traditional taxonomies of religion, but also the methods of knowledge production. The particular manifestations of the indigenous that I explore are the recent uses of spirit possession among young, queer activists during protests related to decolonizing the university curriculum in South Africa, and public discourses related to the recognition of indigenous healers, and their healing practices. In these contexts, the idea of the indigenous relies (1) on the body as a site of knowledge production, (2) spirit invocation and possession as a mode of discernment and resistance, (3) the demand for recognition of indigenous healing practices while resisting being regulated by the postcolonial state. In centering the indigenous through embodied practices of social resistance, these activists produce a register that expels heteronormative patriarchy and white feminists, ultimately privileging their indigenous ways of knowing and being largely unaffected by hegemonic modes and methods self-expression. The indigenous as a religious category thus emerges as a necessary container and catalyst of resistance, recovery and self-authoring in postcolonial South Africa.

SETTLES, BARBARA* (University of Delaware)

Vulnerable Families: Understanding the Legacy of Property Rights, Spoiled Water Quality, Poverty, and Lax Regulation of Big Coal, Petroleum and Chemicals for Families in West Central Appalachia, USA

This review and analysis focuses on personal and public responses to the impact of powerful companies, legal regulation favoring development of resources, and nostalgia for a way of life in western Appalachia, USA with specific examples drawn from Ohio, Kentucky, and West Virginia. A brief overview of the role of extraction and federal land and mining claims preferences and lack of enforcement in mining safety and will put these issues into context. Poverty in a region of low opportunity plays a role in how families respond to extraction options and proposals in terms of concepts of home and sentiment. Current mountain top removal for coal and fracking for gas and oil ventures are built on an extension of long standing public attitudes and legal policies favoring extraction. Chemical plants have also taken advantage of the lax legal climate. Jobs in impoverished areas are a high priority. The traditional coal-mining jobs that guaranteed a good family wage and did not require postsecondary education have shrunk to a minor influence in the region, but the myth of its potential return still holds political and familial attention. Many families have strong ties to localities and communities and when they migrate to find jobs, it is often seen as a temporary measure. Higher education may be seen as a mixed blessing, because it often leads to mobility away from the region. Family and community research in the region suggest that support for change and reform may be developing, but that the powerful corporations, normative traditions and legal structures remain important as barriers to family health and well-being. For the families living in these areas few will get enough from licensing and royalties to make a move or send children to college and improve their lives.

Ethnic Classroom Composition and Minority Language Use Among Classmates: Do Peers Affect Students' Educational Achievement?

International large-scale assessment studies commonly report an achievement gap between immigrant and majority students. These ethnic disadvantages are often linked to minority language use. The main argument here is that students who frequently use the minority language are less exposed to the language of instruction, which might hamper the acquisition of proficiency in that language and ultimately impede their educational achievement. While minority language use within families has repeatedly been shown to affect immigrant students' educational achievement, the role of other contexts, such as the school environment, is still unclear. Ethnically segregated classrooms are assumed to provide additional opportunities to use the minority language which might negatively affect students' language-related achievement, and, thus, reinforce existing ethnic inequalities. At the same time, students' who have ample contact to their minority language in school should profit from this exposure and acquire higher levels of proficiency in the minority language. In the light of research suggesting favorable effects of bilingual language proficiency on educational achievement, a higher proportion of minority language students in classroom, thus, might counteract ethnic inequalities.

The present contribution addresses suchlike arguments and examines the relationship between ethno-lingual classroom composition and immigrant students' language-related achievements. We employ multilevel models using data from a sample of ninth grade students of the German National Educational Panel Study to estimate ethno-lingual composition effects on students' German reading comprehension and their minority language proficiency. Our findings indicate that the proportion of minority language students in classroom is negatively related to students' German reading comprehension, yet the effect is small. Hence, influences of ethno-lingual classroom composition do not seem to reinforce the achievement gap between ethnic minority and majority students to a substantial degree. However, the ethno-lingual classroom composition positively correlates with minority language proficiency, which might foster their educational achievement and reduce ethnic inequalities.

Immigrant Students' Transition to Higher Education in Germany

In most societies, immigrant students often attain lower educational outcomes than their majority peers. However, previous findings indicate that once students achieve certificates that allow them to enter higher education, immigrant students are more inclined to enroll in college than majority students. In this contribution we aim to identify the factors that underlie suchlike ethnic inequalities at the transition from secondary education to higher education in Germany.

Emanating from a rational choice approach, we argue that immigrant students evaluate the outcomes of higher education more favorable than those of vocational training. More precisely, immigrant students expect higher benefits of college degrees, as a result of their parents' high aspiration for intergenerational upward mobility. Furthermore, they may be less familiar with the German system of vocational training and underestimate the labor market prospects that are linked to vocational degrees. Another argument suggests that immigrant students are more confident when assessing the probability to successfully achieve a college degree. As immigrant students often face additional difficulties in the school system, those who have successfully overcome the hurdles in secondary education tend to be more optimistic about their educational capacities.

Using a sample of 4,838 high school graduates who have participated in the German National Educational Panel Study, we employ logistic regression models to analyze whether the transition rates to higher education differ between ethnic minority and majority students. The findings indicate that Turkish students enter college significantly more when compared to majority students and other immigrant groups. Using the KHB decomposition method, we find that differences in parents' educational aspirations, expected returns from higher education, and probability of success largely account for Turkish students' higher transition rates. Turkish students and their parents do not seem to evaluate college degrees more favorable than other ethnic groups, but rather significantly underrate vocational certificates.

SEVANEN, ERKKI* (University of Eastern Finland)

Intellectual and Creative Work and Its Economic and Political Restraints in Contemporary Societies

What is nowadays characteristic of intellectual and creative professions? As Sheila Slaughter and Gary Rhodes (2009) remark, their degree of freedom is on the decrease. "Intellectual and creative professions" mean here academic research work, higher education, and creative arts. Their autonomy is, particularly, restricted by two interlaced processes: *the marketisation of societies* and *the transformation of welfare states into competitive states*.

The former process has meant a demand that the entire society has to function in the same way as capitalist enterprises traditionally functioned. The laws of

capitalism have, thereby, increasingly spread into the areas of science, education and art.

In the current world, the states strive to be more competitive than the other states, and to promote the competitiveness of "domestic" enterprises by scientific research, innovation policy and technological development work. Likewise, they shape their national social systems as attractive locations of operation for business and investors. Here it is the task of art to produce positive images of the domestic economic life and its "dynamics", but in this politics art is also in itself seen as a source of innovation, economic growth and competitiveness. Furthermore, in order to promote their own attraction, several metropolises and cities elaborate on their systems of cultural services.

Thus, today artistic supply has, partly, changed into a special sort of entertainment, brand-constructing and tourist attraction. This supply can, like all art, offer "consumers" fresh insights into society and even change their ways of thinking, but it can hardly contribute to fundamental social changes. If artists want to achieve a more radical social role, they should try to practise their profession on a non-profit basis or, by their art, to promote radical social movements' goals. To be sure, the latter alternative is largely excluded in countries exercising authoritarian (China) or semi-authoritarian politics (Russia, Turkey).

The Dialectics of Utopian and Dystopian Impulses in Contemporary Culture, in Particular, in Finnish Contemporary Art

Along the triumph of the neoliberalist politics and the collapse of the socialist world system, art seems to have increasingly lost the critical and utopian perspective that had been characteristic of it since the early 19th century or even since the 18th century's Enlightenment culture. A conclusion like this has, for example, come up in the first edition of Luc Boltanski and Éve Chiapello's *Le nouvel esprit du capitalisme* (1999) which stated that in the 1980s and 1990s the critique on capitalism was heading for a deadlock and also changing into a marginal phenomenon in societies.

Later we have, like Boltanski and Chiapello, witnessed the rise of the critical social movements that do not accept the contemporary world order dominated by the neoliberalist politics. To them belong, among others, the leftist World Social Forum and different, usually fundamentalist or neo-nationalist, globalization-critical networks that have elaborated on alternatives to the current world order. Thus, our era is not void of *Utopias* and utopian impulses.

The situation in contemporary art is, however, slightly different. As Don DeLillo's and Michel Houellebecq's novels, Pussy Riot's political-artistic activism and Ai Weiwei's works indicate, contemporary art may be critical of neoliberal capitalism and authoritarian regimes, but it does not usually offer clear-cut alternatives to them. This is also true of Finnish contemporary art of which this presentation offers an appraisal. Questions concerning contemporary capitalism, gender inequality and ecological themes occur rather regularly in it. Although Finnish community art and design in its different manifestations produce solutions to practical social problems, at a general level Finnish contemporary art does not usually contain explicit alternatives to the current societal order. Rather it shows what sorts of social and ecological risks or pathologies the current societal order includes. In this sense, a dystopian mood is common in it.

Linking Housing Trajectories and the Transition to Adulthood Among Canadian Young Adults

Housing is the largest source of wealth for Canadian families, and homeownership is a major milestone in the housing trajectories of individuals, particularly for young adults. Although recognized as an important step in the life course, few studies integrate housing trajectories with the transition to adulthood. In this paper, we seek to rectify the lack of housing demography research in Canada with a study of transitions out of the parental home and into homeownership among 18-35 year olds in Canada. We analyze three waves of the Canadian General Social Survey (GSS), from 2001, 2006, and 2011. We first use these data to describe the living situations of young adults in Canada over a decade, focusing on homeownership. We then use logistic regression models to predict the likelihood of leaving the parental home and of homeownership. The findings show that although the proportion of young adults leaving the parental home has decreased since 2001, homeownership among young adults has actually increased across all three waves and all regions. We find that leaving the parental home and homeownership are intimately tied to other adult transitions in education, employment, relationships, and parenthood, as well as family background and the socioeconomic context surrounding young adults at the time. Our results also suggest there is growing socioeconomic and demographic distinction between young adults who are able to move out of their parental home and into homeownership and those who remain in the parental home, with important repercussions on lifetime wealth inequalities. As the first

Canadian study to explore young adults' housing trajectories and the transition to adulthood since 2007, this research provides important understanding of the connections between housing and other life course transitions within a rapidly changing housing market.

Parental Leave for Fathers to Strengthen Families: Trailblazing Sweden and Japan; Reluctant Ireland and USA

Granting employment leave has become one of the primary policy and program efforts by governments and businesses to increase fathers' family involvement and reduce work family conflict. Most advanced capitalistic high income nations have some form of employment leave available to parents in conjunction with childbirth and early child care but options vary by nation, gender, type, and funding. Most East Asian, Western and East European capitalist nations now offer some paid leave, on the birth of a child, as part of their modern social care infrastructures. Parental leave is widely understood to be an important part of the tool-kit for running a modern state but development and implementation varies a great deal. The United States of America (USA) and English-speaking welfare states, like Ireland, lag behind Sweden and Japan, among others, in the provision and individualization of well-paid parental leave and related program to promote work family balance and gender equality. The trail blazing and generous options in Sweden, a Nordic welfare state, and Japan, an East Asian Welfare State underscore underdevelopment of leave options in Ireland and USA. Lack of paid employment leave options related to birth of a child for USA fathers beyond vacation, sick, and personal days are in line with Irish fathers' options and for fathers in the majority of low income nations. Most research on long standing Swedish and Japanese social policies and programs indicate a profound positive effects on fathering and in turn families. Documentation of vast socio-economic and public health benefits of parents taking leave for children, themselves, families, employers, and societies is a clarion call for further development of leave options. Historical, cultural, economic, and geographical factors have all contributed to the USA and Ireland falling behind almost all other advanced capitalistic countries nations in the development of nationwide paid leave.

Collusion of Interests Led By Developer: A Case Study of Rural Urbanization in China

The urbanization process in contemporary China is largely characterized by the development of rural land on the periphery of cities. As rural land in China is 'collective-owned', it must be expropriated by the state for urban development, so that the 'land use right' can be sold to developers. This process yields huge 'land revenue' for the government, and therefore is widely recognized to be driven by it, with developers acting as participant or colluder.

This study examines the development in Chenjiapu, a mountainous village on the northwest border of Beijing. The Great Wall nearby and its proximity to Beijing makes it a potential site for residential tourism. The case reveals that contrary to prevalent belief, the developer's role in the development process may be dominant, rather than secondary. Through investment in local welfare and gestures of good will, the developer 'hijacks' the township government and village committee, who become active supporters of the project; the village committee negotiate with villagers on behalf of the developer, crediting themselves with the aforementioned welfare, thus sustaining the trust and support of villagers; and the economic boost brought by the project is crucial to the promotion of township government bureaucrats. This three-way power game results in a mutually-beneficial collusion with the developer in lead, who smoothly obtains a larger profit with lower management costs. The villagers are excluded from the development process for lack of power and resources, and their interest are impaired by the conscious or unconscious collusion.

Single Parents in the Transformation Period: The Results of Qualitative Research in Kazakhstan

The growing prevalence of single parents makes it necessary to examine this alternative family forms and to study its strengths and weaknesses. According to experts, scientists, politicians and representatives of public associations, this trend has great impact on society. On the loss of the central role of the nuclear family in the changing world, the transformations in the families of the Western

world and their consequences for people and the well-being of children raised in single parents' families, studies were conducted, various data were analyzed and extensive literature published. Stand out post-Soviet countries of Central Asia, in spite of the uniqueness of each of these countries (Kazakhstan, Kyrgyzstan, Tajikistan, Turkmenistan, and Uzbekistan) they share a common Soviet past, the subsequent and ongoing transformation period. The former countries of the Soviet Union are still in transitional period, which affects the social well-being of the population and their life as a whole. Studies conducted in the Central Asian republics testify to the negative impact of the transformation on the satisfaction of the population of these countries. The collapse of the Soviet Union led to various changes and consequences, not only in the political, economic and social spheres of independent Kazakhstan, but also in the sphere of family-marriage relations. For the study of the former Soviet Union, including Central Asia, around the world set up research institutes and centers, but still do not have enough knowledge and first-hand information about the various aspects of life in this region. One of these little-studied topics is the situation, the socioeconomic status of single parents in the countries of Central Asia. This paper presents the results of study conducted by qualitative method, to study the life of single-parent families, their survival strategies and challenges faced by single parents in the biggest city of Kazakhstan – Almaty.

Social Well-Being of Kazakhstan's Children: Results of Sociological Research

During the years of independence of Kazakhstan (former Soviet country), a national model for the protection of children's rights has been formed, based on institutional and legislative levels in accordance with international standards. International and domestic experts on children's rights note that Kazakhstan has made progress in ensuring the rights of children, their economic, legal and social well-being. However, international researchers point to the existing problems in the field of child protection: Despite impressive economic growth rates and a simultaneous increase in the overall quality of life in Kazakhstan over the past 15 years, children are a still vulnerable group. The researchers note the need for further comprehensive monitoring of the well-being of children, that further efforts should be aimed at expanding the set of indicators, in order to provide more information about the quality of services and their results for children. A number of results of the study conducted by the Center for the Study of Public Opinion are presented in this paper. The study showed: the majority of Kazakhstani children (85%) noted high marks (8-10) of happiness, the average value of happiness rating is 8.8 points out of 10. Children aged 8-12, children living in villages and children brought up in families with two parents feel happier. At the same time, it was revealed that the majority of children (58%) are experiencing, as they think, a problem, something worries them.

Drives and Deterrence Influencing Entrepreneurial Intention: A Perception of University Students in Bangladesh

The employment situation of youth is globally characterized by high unemployment, underemployment and lower quality jobs. These aspects contribute to the risk of social unrest, detachment from labor market and loss of faith in social progress. In the context of Bangladesh, the unemployment rate of the age group of 15 to 29 with tertiary education is the highest. To facilitate the engagement of the growing number of young job seekers, entrepreneurship has gained attention. Entrepreneurship is a significant component of development concerns as it provides innovation, creates new employment opportunities, and leads to increased economic and social wealth in the country. Latest focus of research is on university graduates with the aim to predict their entrepreneurial behaviors in the future. The literature reveals that most of the studies in Bangladesh focused on the problems and prospects of young entrepreneurs but very few researches have been done to address the youth intention to become entrepreneur. Therefore, this study will uncover the perception of university students regarding the drives and deterrence influencing their entrepreneurial intention. To conduct the research the primary data was collected from 400 final year undergraduate students using non-probability purposive sampling technique through self-administered questionnaire. The drives and deterrence were reduced using a multivariate statistical technique like Factor Analysis. The analysis identified the significant factors which motivates as well as demotivates the entrepreneurial intention and categorized them accordingly. This paper will facilitate the policy makers, educational institutions and researchers by suggesting several implementable strategies in major areas for the promotion of entrepreneurship in developing counties like Bangladesh.

A Sociological Analysis of the Doctor-Patient Relationship (A qualitative study in the city of Ahvaz, Iran)

Doctor-patient relationship is one of the most controversial kinds of social relationships. Despite the universal unity about this concept in general, there is a lot of discrepancy in this field, which differentiates the societies from each other. This research has been carried out with the objective of analyzing doctor-patient relationship from the patients' point of view with the approach of "grounded theory". The data has been collected through semi-structured interviews with 21 patients in obstetricians' offices in Ahvaz and also observations of the procedures of medical consultation in those doctors' offices and has later on been analyzed using the subjective encoding method. Based on the analysis under taken in this open and pivotal encoding, five categories, i.e. "multiple visits", "limitation of time", "high patient load", "lack of readiness of patients" and "avoidant behavior of the doctors" have been achieved as reasoning conditions of "non-cooperative and treatment-oriented relationship" that has been recognized as dominant communication pattern between doctor and patient in the scope of the current research. Intervening conditions also, have been analyzed in a larger scope in the form of culture, mental models, awareness and financial supporting actions among which "education" played a very significant role. The patients facing pivotal category regarding contextual and intervening conditions generally adopt approaches such as "compatibility", "tolerance", "self-help" and "conflict" that each of those behavioral strategies, have special consequences for patient most important of which are "medical errors", "financial and mental damages", despondency from cooperation" and "self-medication" and if nothing is done for improving this relationship, the production and reproduction cycle of an unequal relationship will survive. Since the multiple-visit phenomenon is increasing, especially in obstetricians' offices, more researches need to be done in this field because according to findings of this research it has drastic effects on doctor-patient relationship and the patients' performance.

SHAFFER, JONATHAN* (*Boston University*)

A Crisis of Care: Noncommunicable Diseases and the Biopolitics of Exclusion

The world is failing to adequately address noncommunicable diseases (NCDs), particularly amongst the world's poorest populations. In 2013 in low-income countries, NCDs killed eight million people before they turned sixteen years old. The World Economic Forum projects that NCDs will cause more than \$21.3 trillion dollars of economic losses on low-income countries over the next twenty years. NCDs account for 70% of the total burden of disease globally. Yet, despite well-evidenced, cost effective interventions, financing for the care, treatment, and prevention of NCDs amongst the poor accounts for less than 1% of all development assistance for health. What is causing this political blockage?

This paper uses mixed methods including archival-historical research at the World Health Organization (WHO), citation network analysis, expert interviews, and a large survey of global health practitioners to shed light on this important empirical puzzle. I trace the historical emergence of the NCD category in the public health literature and discourse, demonstrate how NCDs are framed and discussed by policy experts and global health practitioners today, and finally, show evidence of the political effects of this historically constructed framing.

It is my argument that key shifts in the structure of the scholarly NCD citation network correspond with important changes in NCDs framing from global health practitioners and leaders at the WHO and other governing bodies. This narrow, scientifically-driven framing has limited the political opportunities that NCDs advocates have had in mobilizing new financing for these important global health problems. Drawing on a biopolitical theoretical framework, these findings could provide insights into why relatively little new policy or new financing have followed from high-level United Nations and WHO political action in recent years.

SHAHROKH, THEA* (*Coventry University*)

A Search for Social Justice: Finding Belonging in the Textured Lives of Young Migrants

Young people aged 16-25 with migration-related life experience in South Africa hold complex identities. Their identities are entangled with their past, present and their future and contingent on their gender, race, nationality, age, sexuality and more. These social markers position them in relation to others, within power relations that structure society and that entrench some people at the centre, and others at the margins. These systems constrain the freedom, agency and dignity

of young people who have experienced displacement, relocation, and movement within their lives. These constraints are reflected in how these young people are included, or made 'other', in processes of belonging.

This paper draws on research in South Africa which employs a participatory and creative approach grounded in a critical ethnographic inquiry to allow young people to narrate their own identities and reflections on belonging. The creation of counter-narratives by diverse young people with migration-related experience disrupts assumptions about who they are and how belonging plays out in their lives. Significantly, belonging is articulated through everyday experiences that are textured with the multiple identities that these young people embody. Young people's identities are found to be entangled with their sense of belonging, both are fluid, and both interact with unequal structures and distributions of power. This research shows that recognising complexity in the construction of belonging by and for young people can inform new pathways of change for social justice.

Hearing the multi-textured voices of disadvantaged young people sheds light on the infrastructures that construct boundaries of inclusion. Further research is needed to deepen this analysis and to build strategies to dismantle exclusionary systems. This includes exploring possibilities for new kinds of solidarities that recognise situated experience and work to identify shared struggles to address inequalities. In turn, new forms of belonging, across social divides, may become possible.

Eulogizing the Military Role While Using Social Media in Pakistan (2013-17)

Normally military is considered as a conservative institution, depending on the conventional means of communication, but social media has accelerated the process of flow of information. In case of a post-colonial state like Pakistan, where maintaining secrecy and releasing very limited information has been an established policy, but in recent years, military has very successfully utilized social media to not only develop its image but to undermine civilian supremacy in the country. Because of this use of social media, at certain moments, country experienced political instability and regional conflicts. Excessive use of social media by military increased the Civil-Military gulf. Social Media was occasionally used as a tool to undermine the civilian supremacy.

This paper while focusing on the increasing use of social media by military since 2013 to influence public opinion will also discuss the effects and fallout of such excessive usage by military.

Perpetual Conflict in South Asia: Causes, Challenges and Way Forward

Unfortunately after seven decades of independence, Pakistan and India have remained at loggerheads and have not been able to resolve their conflicts. This has made South Asia as one of the most dangerous regions in the world. Both the countries have nuclear arsenals which further increases the risk factor.

In Pakistan there is a vivid difference of opinion in the Civil-Military leadership about India-Pakistan relations. Civilian leadership wants a peaceful resolution of conflict between both countries so that military's influence may be brought under control. But, military leadership has been very rigid in its policy and never agrees to any concession offered to India. This difference of opinion has not only promoted conflict in South Asia, but Pakistan has experience political instability and military coups.

This paper will focus on the nature of conflict between India and Pakistan and how difference of opinion between civil and military leadership has further promoted the conflict. Paper will also discuss the various attempts by civilian governments to normalize such relations and such attempts were sabotage by the military.

Married Working Women-Identification of Challenges and Strategies to Overcome Hurdles: A Study on Urban Women Workers of Dhaka City.

Women's increasing financial contribution became vital for economic development of the country and economic contribution to the family. Keeping this in mind Bangladeshi women obtain much attention to enhance their socio-economic condition and empowerment level. Though much attention is given on various aspect of developing women in society, not much has been done to support the married working women in urban areas of Bangladesh. Married working women in Dhaka city are intertwined in a social system that requires them to handle both family and work responsibility with special care and caution. This group of women faces various challenges that become a hurdle in their further advancement. The studies and initiatives in Bangladesh are heavily focused on rural women and haven't focused on providing solutions to this sector. The current study besides filling the current literature gap will also provide a solution to address their challenges. Thus the aim of the paper is to identify the intensity of different challenges and provide suggestions towards the women, the family members and the organization the women works in. In order to serve the objective, primary data has been collected from 200 married working women employed in various sectors of Dhaka city using purposive sampling method. Different challenges that will become part of the questionnaire have been identified from intensive investigation of existing literature. KMO test has been done before conducting factor analysis and the result is more than 0.6. Factor analysis has been done to identify factors. It has been observed that some factors are more significant as challenges. Suggestions have been provided on the basis of the results. This paper will help policy makers of different sectors of the society. These suggestions if properly implemented will help in utilizing the full potential of these working women ultimately positively impacting the society.

Shifting Class: Experiencing Labour Market Transitions and Downward Mobility

In the current context of economic restructuring and downsizing, many workers find themselves forced to move either between jobs, often of a precarious nature, or between periods of employment and unemployment and/or social assistance. This transition in workers' position in, and attachment to, the labour market clearly points to employment instability, insecurity and precarity, a shift that is compounded by downward mobility, often both individual and intergenerational. These dynamics have implications for individuals' class position and identity under neo-liberal capitalism. Drawing on qualitative in-depth interviews with workers in the Guelph and Wellington Region of Ontario, Canada, this paper focuses on the lived experiences and challenges of employment precarity and downward social mobility faced by workers undergoing labour market transitions since the 2008 economic crisis. It locates these changes in the context of transformations in the local economy set within the broader global economy. The paper examines transition pathways and processes, as well as different dimensions of individual agency in shaping outcomes. It also analyzes workers' understanding of social class both structurally and subjectively, as well as their changing perceptions of their own class status and identity flowing from labour market transitions and deepening precariousness. Finally, workers' struggle to maintain a middle-class status and identity is addressed. This paper contributes to our sociological understanding of work and social stratification under contemporary capitalism by bringing together scholarly literature on labour market transitions and precariousness, social mobility, and class identity to couch the analysis of the everyday lived experiences and decisions of workers struggling within broader structures and forces.

Are Information Campaigns Able to Influence the Social Acceptance of the German Energy Transition?

The transition of the German energy system towards a more sustainable energy system has already been decided by the German parliament. This decision is a necessary requirement to reach the EU's 2030 goals for climate and energy. However, in a socio-technical system such as the energy system, a "top-down" initiated transition process requires social acceptance, in particular for the installation of new energy infrastructure. To this extent, it is important to investigate measures that can be used to influence the social acceptance of energy transition among the citizens. In our study, we focus primarily on the role of information campaigns in influencing the social acceptance among the German population.

For the examination of this issue, we designed an experimental survey on the basis of the Elaboration-Likelihood Model of persuasion (ELM) of [Petty & Cacioppo, 1986] and administered it to a representative sample of the German population. In our quantitative study, we examine the influence of a large number of factors on the acceptance of energy technologies. For example, we study the influence of arguments for and against electricity generating technologies (coal power plants, gas power plants, offshore wind power plants, offshore wind power plants, solar parks, and biomass power plants) on the social acceptance of the technologies. The arguments used in our survey were developed by an interdisciplinary research team at the Forschungszentrum Jülich and scaled according to their persuasiveness in a previous study. The data is still to be analyzed in autumn 2017. A paper will be available by March 2018.

Careless Responding: Rates and Reactions in a Quota Sample and a Voluntary Opt-in Sample

In recent years, internet based surveys have become a popular survey mode in social science. However, this survey mode is prone to careless responding (CR), the tendency to respond to a survey item by ignoring the item's content. CR might lead to incorrect factor structures as well as to attenuate associations between survey items such that type II errors may occur. Therefore, several detection methods for CR have been proposed and examined. However, the issue of CR has mainly been discussed among psychologists concerned about serious threats to data quality, when questionnaires are internet based and when the sample consists of college students who participate in exchange for a course credit or for remuneration. In this paper, we examine rates of CR based on two different samples utilizing different detection methods. First, we use a quota sample (with remuneration), a central data source for internet based surveys in sociological and political research. Second, we include a voluntary opt-in panel (without remuneration). The experimental setting in both samples allows us examining respondents' reactions to the detection methods.

Mapping the Occupational Health and Safety Challenges Arising from Employment-Related Geographical Mobility (E-RGM) Among Canadian Seafarers on the Great Lakes and St Lawrence River

Shipping on the Great Lakes and St. Lawrence Seaway connects the trade between Canada, the US and the world. Meanwhile, these and other seafarers have to live and work with different scales of employment-related geographical mobility, including intra-provincial commuting movement every 6-12 weeks from home to port and vice versa, as well as domestic and international transport movement on a 24/7 basis between Canadian and the US ports (Cresswell et al. 2016). Based on twenty in-depth semi-structured interviews, this research examines how E-RGM and the related regulatory frameworks may create health and safety challenges for these Canadian seafarers. The regulatory frameworks involve multi-level international and federal legal sources, including international maritime conventions, the *Canada Shipping Act*, *Canada Labour Code* and *Maritime Occupational Health and Safety Regulations*, implemented by various agencies, including the Flag State (Canada), the Port State (the US) and authorized third parties, such as Classification Societies.

Their high-level of mobility makes ships a working environment temporarily disconnected from land-based society and services. The findings indicate that as a result of this disconnection, seafarers have to sacrifice to a certain extent their individual rights to ensure the overall safety of the ship. In addition, high-level E-RGM increases workloads on ships. Seafarers are not only required to navigate safely in narrow seaways, locks and canals between the lakes, but are also responsible for cargo discharging, and obliged to control and manage potential pollutants on board. Long working hours, shift works and the motion of ships can cause significant fatigue for the crew. Fatigue is reported to be a prominent cause of accidents and injuries among seafarers. Finally, new technologies are speeding up cargo operation in ports and strict security measures have reduced the chance for seafarers to take shore breaks, which further intensifies the isolation and fatigue suffered by seafarers.

RC47-795.2SHANAAH, SADI* (*Aarhus University*)***Motivation for Countering an Extremist Social Movement: The Case of British Muslims' Activism Against Islamist Extremists***

British Muslims have led a number of activities with the purpose of countering Islamist extremism. These activities represent a relatively rare instance of mobilisation and activism against what can be termed an extremist social movement. However, the social and political context, in which this activism takes place, is complex and arguably not conducive to counter-extremism mobilisation. To name but a few factors, British Muslims feel little efficacy and their primary grievances are less connected to Islamist extremism than to the reaction to it by the state, the media and some segments of the non-Muslim population. In this context of many factors speaking against "community-based" counter-extremism, why would many British Muslims still engage in countering Islamist extremists? This paper investigates the individual motivations of British Muslims for activism aimed at countering Islamist extremists. As the point of departure, it uses the theories developed in the collective action, social movement and social psychology literature and it extends them to the understudied case of activism against an extremist movement or groups, as the classical literature is overwhelmingly focused on the collective action against the state, authorities or another non-violent movement. The paper primarily draws on data collected in 20-30 semi-structured interviews with British Muslim counter-extremism activists and a survey of 800 British Muslims (both being conducted at the time of writing this abstract).

RC18-346.8SHARIFI, MOHAMMAD* (*Jawaharlal Nehru university*)***Nation, Religion and Social Conflict*****Key word:** social identity, conflict, nationalism, religion

Religion and nation are the two controversial terms, both can be seen as the process identification as well as the basis for conflict and harmony among social groups. In some respect nation as traditional notion of self-determination is essentially the right of a people to determine their destiny and to govern their own affairs to fulfill the sense of pride and self-esteem. However religion is also what people were inspired by, it involved idea it has never been abstract, it animate individuals, communities and nations. In history of human kind both nationalism and religion have always contribute to conflict, off course that social conflict is the outcome of multi domination factors which always include the political and social identities. The centrality of national and religious identification into the social conflict illustrated that struggle over territory, power, and resource has always been taken place under the shadow of nation or religion. To an extend the struggle over identity can also take a similar meaning as the struggle over power and resources, both nation and religion as collective identity for social group plays a pivotal role in creating social conflict. According to sociologists and social psychologists; the ethno-national groups always categorizing themselves from the other who are consider as outsider, the intimacy in-group develop hatred toward out-group, and it is very common among the nationalist and other social groups who have the similar identity. The attempt of this paper is to look that how nationalism and religion cause and create conflict among social groups and what is the role of social identity from sociological and social psychological stand point.

RC21-JS-19.1SHARMA, CHHAVI* (*IIT Bombay*)***Biography of Mumbai City through Its Taxi Drivers***

Mumbai city has been written about as a cosmopolitan city, as a melting pot that has people from all walks of life, from different parts of the country to access better prospects of economic upward mobility for themselves and for the generations to come next along with simultaneous assertions of Maratha identity from past few decades. It has been written about extensively in terms of housing, its slums, its religious diversity, being the manufacturing hub to becoming the commercial capital, hub of Indian (Hindi) cinema, having an underbelly of smuggling and other criminal activities, etc.

My effort is to present biography of the Mumbai city through the narratives of taxi drivers who have been associated with taxi trade of the city that started in 1909. Taxi drivers of the city have mostly been migrants to the city, who moved from small remotely situated villages to a large metropolitan city that's ever expanding and have left an indelible mark on making of this city.

Drawing from interviews of taxi drivers detailing their lives as taxi drivers in the city and their constant touch with their native places in the rural hinterlands of the country along with interviews of their leader and archival material this paper would want to show the transformation of the city through the change of key practices- structural and operational of this century old taxi trade. Taxi that's both simultaneously symbolic and operational necessity of the city shall allow me to show how the macro makings of the city change the everyday at a micro, rather an individual level. It shall be an endeavor to make a biography of Mumbai

through biography of its quintessential taxi and taxi drivers and the reciprocity of this process.

RC13-254.9SHARMA, NAINA* (*University of Rajasthan*)***Parks and Livability: Exploration of Leisure Time Activities***

Leisure is an important contributing factor in increasing livability. The free dictionary defines livable as suitable to live in. Research has found positive relationship between availability of leisure activities and enhancement of Livability. Well developed public spaces like parks are not only a tangible reflection of the quality of life of the community but also provide identity for citizens and are a major factor in the perception of quality of life in a given community. Parks and recreation services are often cited as one of the most important factors in surveys of how livable communities are. Parks provide gathering places for families and social groups, as well as for individuals of all ages and economic status, regardless of their ability to pay for access. The present paper explores the relationship between the park goers of central park (a public park in Jaipur) and the enhancement of livability for them. The Central park came into existence 12 years ago and attracts people from all parts of the city. The park functions not only as the lung of jaipur but also provides a place for interaction for the citizens.

RC13-250.3SHARMA, ONIMA* (*D.A.V. (PG) College, Dehradun; Uttarakhand*)PAL, ARCHANA (*DAV (PG) College Dehradun, Uttarakhand*)***Leisure in the 'less Known World': A Study of Leisure and Recreation Among the Van Gujjar Tribes of India***

Van Gujjars are a pastoral semi nomadic community, practicing transhumance and are inhabitants of the Himalayan belt, stretching from Kashmir to the border between India and Nepal. Van Gujjars are most marginalized, non literate, not very well known pastoralists. Life for them is all about survival and perpetual movement.

Each culture has an impact on its society's leisure influencing to some degree what people do in their leisure time, which leisure activities take priority over others and how much time and money people spend in different leisure activities. The usual definitions of leisure are not adequate to explain the nature and experience of leisure and recreation of the tribes. Tribal people do not make the same sharp distinction between work and leisure that more technologically advanced societies do. The effects of modernization and globalization has blurred the already ambiguous boundaries between work and leisure. These forces are causing an overall commercialization of leisure, which denies access of leisure facilities to the money poor. The present study aims to understand the meaning and purpose of leisure to the Van Gujjars. It also attempts to examine the Van Gujjars value systems in general, with their relationships to leisure beliefs, attitudes and behaviours. The study is based on qualitative research with the use of both primary and secondary data and a combination of purposive and snowball sampling method. A sample size of twenty five 'deras' (households) living in Rajaji National Park, Uttarakhand (India) has been used for the study. It was seen in the study that whatever the Van Gujjars do, whatever they have and whatever they earn for their livelihood is within the ambit of the forest they live in. They are technologically cut off in this globalized world and are isolated from the mainstream culture of the land.

RC13-260.5SHARMA, PRIYANKA* (*Pearl Academy*)***Digital Jewellery: Innovation in Contemporary Leisure Activities***

Leisure is necessary part of our lives and as its gives us an opportunity to develop sense of freedom, creativity, and satisfaction and also builds our skills and self-confidence. People involve themselves in different satisfying leisure activities. Jewellery is a universal form of adornment and jewellery made from shells, stone and bones survives from prehistoric times. From early times it was worn as a personal adornment or protection from the dangers of life or as a mark of status or rank but finally giving a sense of achievement and indirectly evidences role of jewelry for leisure. Technology has been enhanced spectacularly since the human kind made it and there is a paradigm shift in the way people spend their leisure time. One of the sizzling technological waves for leisure is "Digital Jewellery". Digital Jewelry gives the power of computers in a compact trendy wearable device. Whether it is checking mails or chatting with friends while relaxing in bath tub or having video call while jogging or connecting pendant pen drive to listen favourite music, recent innovations in digital jewellery gives you a playful environment for leisure activities. This paper presents how digital jewellery is emerging as one of the sizzling fashion trend for leisure activities. This study is mainly based on secondary collections from research papers, articles, journals and reports of reputable institutions and trend update from offline and online resources. This paper presents how the significance of jewellery has changed with time especially with the impact of technology. It also discusses the wide variety of inventions and

design concepts explored by different companies and manufacturers in recent times for shrinking the computers to wearable devices. The paper concludes with suggestions for use of digital jewellery and its advantages for leisure activities.

Political Economy of Resource Allocation: Emerging Issues of Sanitation in Urbanising Himalaya

Unequal allocation of municipal services and services maintenance resources in urbanizing Himalaya, resultant scenario of insanitation, people's deprivation of basic civic amenities including adequate quantity of potable drinking water and the Himalayan state in a paradox- pledge for a Swachh Bharat on the one hand and dwindling municipal services on the other. The qualitative transformation in the society therefore remains a far cry. This is substantiated by the fact that 52.1 rural and 7.5 percent urbanites by choice go for open defecation. Since most part of Himalayan region is rural and limitedly urbanized the problem is acute. While Himalaya is a perennial source of water to the people of plains the people in Himalaya suffer from acute scarcity of water, a key component in sanitation practices.

The paper stresses upon the need for comprehensive incisive strategies vis-à-vis sanitation in urbanizing Himalayan region. A workable strategy has to be formulated keeping in view the social structure and political economy of resource allocation. The underlying rationale of the proposed is to resolve the multiple unresolved paradoxes between increasing wealth of nation-state and declining state services, increasing sanitation needs of fast growing populations, especially in the urban areas and declining capacities of the municipal corporations to meet the unmet sanitation needs.

This paper, based on empirical study of Shimla city in north-west Himalaya argues that mountains have historically been the source of forest wealth and water to the peoples of plains but political expediency and political economy of the state its own urban structures have suffered on account of resource constraints. While the increasing population- both the permanent residents and floating population-tourists, labour force etc. considerably adversely affect the services, the unequal distribution of resources among different classes of population leave deep rooted perpetual effect on municipal services.

RC57-925.4

SHARMA, SATISH* (CORDIA INSTITUTES)

Visual Expressions: Culture Structure and Social Consciousness

Visual expressions with iconographic and stylistic representation reflect upon culture, social structure and a specific type of structure of consciousness. The perpetual representation of icons and styles in visual expressions along with culture and social structure, the three mutually inclusive and exclusive concepts suggest a dialectical relationship between the three. An understanding of the nature of dialectics, their relationship and operation is understandable through systematic analysis and interpretation of visuals as text and method in the given historical time and space context. The underlying assumption being the simultaneity of dialectical mutual influences reinforces reproduction of cultural and structural values resulting in indoctrination of specific structure of social consciousness. The historical and sociological causality of mutual influences reveal definitive role of economic and political structure on the nature and type of visual expressions.

This paper, while examining Indian art as a case study finds it is unique with deep rooted religious contents and values, which is neither accidental nor a representation of people's true consciousness. The similar is also the case of art elsewhere in the world. The fact, perhaps, remains art and visual forms are consciously and rationally designed as strategy to maintain *status-quo* to govern and manage all diversities and adversities. The combine of culture, structure and social consciousness have not only kept the Hindu icons, cultural symbols and form of ritual practices alive, the latter in turn has survived Hinduism till date despite the emergence of other religions and religious faiths all through the history. Given the historically dialectical nature of the relationship, objective analysis with appropriate theoretical and methodological tools is a challenging task. It is further compounded, with emerging diverse forms, quality of materials, vast geographic locale of their existence, and lack of archives with consistent historical records.

SHARMA, SHALINI* (PUNJAB AGRICULTURAL UNIVERSITY, LUDHIANA, PUNJAB)

Farmers' Suicides in Punjab: an Individual Act or a Social Fact?

Farmers' suicide has become a painful reality being witnessed haplessly by majority with no sure solution in sight. In spite of various state sponsored relief measures, suicides have continued unabated, since its onset in the neo-liberal phase. There has been disintegration between agriculture and agriculturist, a discontinuity between farmers' actual experiences and their normative expectations in rural Punjab. According to National Crime Records Bureau (NCRB)

thirty two farmers committed suicide everyday in 2013 which went up to 34 per day in 2014 & further it went up to 35 in 2015. Durkheimian theory suggests that the decision to commit suicide is irreducible to individual act and be viewed as a manifestation of social conditions. Though many agriculturally developed cotton growing states are reeling under this menace, the present paper focused on Punjab with a specific objective to gauge the chronology and overlapping of social events which had caused the present agrarian crisis. For this, study relied upon primary and secondary sources of data procured from NCRB reports, reports of ADRTC of ISEC, and studies conducted by the department of Economics and Sociology, PAU, Ludhiana. Primary data were collected through personal interview from victim's families. The study found that the post 1980s farm profitability not only declined but became negative. Number of factors like faulty political populism policies, raised aspiration level of farm families, incommensurate expenditure pattern, changing work culture and absentee farming with wide spread drug abuse, poor quality of education and health services & weather variability, has made agriculture nonviable especially, for marginal and small farmer who constitute more than three forth of farmers' suicides. The study substantiates the need to revisit Durkheimian orientation to better understand the social fact of farmers' suicides by eschewing economic and physiological reductionism in the light of the 'sui generis' trait of society.

SHARMA, UMESH* (University of Toronto)

Culture(s), Childhood(s), and Right(s): Theorizing the Right to Education in (Post)Colonial India

The purpose of this paper is to explore 'The Right of Children to Free and Compulsory Education (RTE) Act (2009)' of the Government of India—which introduced the provision of mandatory elementary education for all Indian youth between 6 and 14 years of age—by situating it within a broader socio-historical context. With marginal adjustments (most notably those involving the prescribed age of formal education), the preceding amendment had its antecedent in Article 45 of the Constitution of India (1949)—specifically, in the provision that within a period of ten years of the commencement of the constitution, the newly conceived nation-state would provide free and compulsory education for all children until 14 years of age. In momentarily bracketing issues pertaining to 'practicality' as such—namely, the role of a public system of education in spurring economic growth, in manufacturing a 'literate' populace which possesses a common national identity grounded in a shared set of cultural ethos, while simultaneously providing an institutional mechanism through which an increasingly complex society is to be 'sorted'—this paper seeks to evaluate the socio-cultural implications of a universalist exhortation to education couched within a liberal-democratic discourse of 'rights' and 'equality'. It specifically pivots upon examining the question of the offer of mass standardized institutional compulsory elementary education from the vantage of three perspectives: (1) The institutional legacy of colonization and the postcolonial predicament; (2) Variegated expressions of social relations between adult and child across space and time; (3) The relationship/relevance of culture to the devising of educational institutions and/or practices. In meditating specifically on the themes of childhood, coloniality and rights, and therein, contributing to key areas of inquiry within the fields of the sociology of childhood and education, it aims to examine the complexities inherent in devising educational policy within a (post)colonial globalized context.

EROKHOVA, NATALIA (People's Friendship University of Russia)

Jürgen Habermas and Russian Philosophers-Theologians: Dialogue through the Century

Russian philosophers-theologians criticized the criterial foundations of the sociology of religion in the era of the emergence of sociology as a science. They opposed the idea of socialism. Their counter-arguments turned out to be prophetic and the scenario of the development of the socialist society, which they predicted, was fully realized. However, their thoughts were not heard by European and by Soviet scientists especially. Platform of scientific atheism won, and it formed the methodological atheism of the sociology of religion.

A century has passed and Jürgen Habermas had to address again the analysis of the two worldview positions of secular and religious societies in his works. Authors are not going to find out the reasons prompting Jürgen Habermas to return to this analysis. In this presentation, the authors will try to compare the opinion of Russian scientists of the early of the 20th century and the modern scholar of the early of the 21st century Jürgen Habermas' approach, who is recognized as the world leader in this field of research. The purpose of such a comparative analysis is to understand how the views of the 21st century correlate with the theological platform of the vision of social reality proposed by Russian philosophers-theologians in the early of the 20th century.

Activation Policies and Job Quality Among Lone Mothers in the UK

Since the 1990s across Europe and North America, there has been an increased policy focus on encouraging lone mothers to work. At present, in the United Kingdom, lone parents with children over the age of five can only get financial assistance if they agree to engage in job search and can receive financial penalties if they do not do so. Activation strategies for lone mothers are often justified with the statement that employment will improve the lives of mothers and children. However, these policies may not have fully accounted for the types of jobs these mothers obtain. Using data from Understanding Society, a longitudinal survey of around 40,000 households in the United Kingdom, this article will assess how activation policies have changed the quality of employment of lone mothers with children. We build on the current literature by moving beyond overall employment rates to consider both between- and within-work instability. Additionally, to ensure that differences in employment quality are due to activation and not unobserved individual characteristics, we use a modeling strategy that combines propensity score matching with difference-in-difference estimation. Initial results suggest that activation policies do lead to increases in employment. However, mothers also report lower job satisfaction.

NOLLERT, MICHAEL* (*University of Fribourg*)

Between Religious and National Identity: (Re-)Converts to Islam in Switzerland

Conversion (adoption of a new faith) and re-conversion (re-embrace of one's own neglected faith) as two facets of "spiritual transformation" (Paloutzian, 2005) also imply a reshuffling of the one's social identities (Travisano 1970; Gooren 2010). Hence, (re-)converts are often assumed to lose their loyalty to the nation-state (Moosavi 2013). In extreme cases, they even break democratic rules and favor a universal theocracy (Phares 2007).

Whilst the linkage between religion and nationalism at the macro-level is well-researched (see e.g. Brubaker, 2012; Byrnes 2005; Deol 2003; Kunovich 2006; Mavrogordatos 2003; Rieffer 2003), research on the microdynamics of this relationship is relatively new (see e.g. Hopkins 2007; Jensen 2008; Özyürek 2014) and under-researched.

Addressing this deficit, we apply the method of *reconstruction of narrative identity* (Lucius-Hoene & Deppermann, 2004) to analyze the autobiographies of a selected number of Swiss (re-)converts to Islam. Of special interest is thereby to understand how such an identity transformation affects the sense of belonging to a nation-state characterized by several cross-cutting cleavages. Four autobiographic narratives illustrate the variety of relationships between religious and national identity: Hamit, a second-generation migrant from Turkey, and Urs, a Swiss national, both adopt an orthodox reading of Islam and prefer the global Umma to their respective national identity. Vincent, a Swiss national and convert to Islam, manages to espouse his social identities as a Muslim and as a Swiss. Selma, a marriage migrant, suddenly decides to observe Islamic codex, including wearing of hijab, in order to underscore her national pride as Syrian/Arab woman.

Comparing narratives of (re-)converts the study shows how biographical background, the kind of Islam one has (re-)embraced and social networks interact to shape the individual's post-(re-)conversion national identity. The study also discusses the similarities and the differences between converts and re-converts to Islam regarding their national identity.

Reflections of Canada's Eugenical Past: Contemporary Accounts of Structural Violence(s) Against Persons with Disabilities

This paper explores Canada's eugenical legacy, and draws on accounts of social murder and social apartheid as relevant to the rights experiences of persons with disabilities in Canada. These accounts are reminiscent of the evidence of widespread institutional violence and structural violence against persons with disabilities in Canada. Its underlying legal questions are also reminiscent of public health law's dark history, including the Supreme Court of the United States' decision in *Buck v Bell* (1927) upholding a Virginia law that authorized the involuntary sterilization of "feeble minded" persons. The law was found to serve the public's health because "[t]hree generations of imbeciles are enough." This paper adopts a broad understanding of the State's eugenical authority beyond coercive sterilization. It also attends to the eugenical impact of neoliberal policies, oppressive living and working conditions, barriers to health care or disability supports, and the trauma caused by the (interlocking) operation of ableism, sanism, racism and poverty. The paper will offer four examples to

illustrate the lingering of Canada's eugenical past: immigration decisions about the inadmissibility of persons with disabilities including expectations of their "excessive demand" on health or social services, the police killings of racialized persons with (mental health) disabilities, Canada's failure to adequately respond to the opioid epidemic, and the exacerbation of the Indigenous suicide crisis on- and off-reserve by the defunding of the Aboriginal Healing Foundation. While the term "eugenics" is largely absent from current public discourse, the legacy of Canada's eugenical history persists.

Implications of Task Type on Emergence of Social Structures

Task types are organized in four categories: 1) Generate ideas and/or plans; 2) Choose right answers or issue discussion; 3) Negotiate conflicts of viewpoint or interest; 4) Execute tasks and resolve conflicts of power. Traditional studies of emergence of social structures have focused on tasks with the assignment for the group to select the right answers to a task (e.g. Lost on the Moon). These exercises result in a truncated pattern of behaviors in terms of cognitive behaviors, organizing behaviors, and status behaviors/cues. Our work has focused on a task that has no correct response and the group is to arrive at consensus on an action. Participants are asked to respond to a scenario that posits the group is in a bunker during a violent, war-like event. There are people outside who want to come in and there is no way to determine whether they are friend or foe. Each participant is asked to make an individual decision with rationale. The group is then asked to reach consensus and a rationale for their decision. We examine the levels of cognitive behaviors, the emergence of organization and related organizing behaviors, and the sequence of the emergence of hierarchical structures (particularly status cues). Initial studies indicate that the level of differentiated behavior within the group is stronger and more varied. The nature of the path to task sequences appear to become richer and more varied.

Birds of a Feather Flock Together? Own-Group Concentration and Immigrants' Life Satisfaction in the UK, 2009-2016

The local living environment matters for an individual's life satisfaction, and this is particularly so for immigrants living in the host country. While socioeconomic factors have commonly been examined at various aggregated levels, cultural coherence between an individual immigrant and the environments he or she lives in has drawn less scholarly attention. This study thus aims to contribute to the literature on the importance of cultural coherence between individuals and the local environment in life satisfaction. With focuses on ethnicity and religion, this study aims to address the following research question: To what extent does the match between an immigrant's characteristic and the composition of the local environment influence the immigrant's life satisfaction?

Data were drawn from Understanding Society: the UK Household Longitudinal Study (UKHLS) (waves 1 to 6) between 2009 and 2016. Using the individual identifier, each individual case is directly linked to the geographic area of Local Authority (LA) in each wave. Ethnic and religious compositions of the LA level are thus computed by weighting corresponding frequencies using the cross-sectional weight variable in each wave. Multilevel modelling is used in the analysis, with time-varying observations nested in individuals, which are in turn, nested in the LA. Preliminary findings show that in the dimension of ethnicity, Black immigrants' life satisfaction increases, and Indian immigrants' life satisfaction decrease with the percentages of their own-ethnic groups at the LA level. Regarding religion, religious composition seems to matter only for Christians, who feel significantly more satisfied with their lives when living in Christian-dominant LAs. This may be because ethnic boundaries are more important than religious boundaries for immigrants from African and South Asian regions, while religious boundaries are more important than ethnic boundaries for immigrants from Christianity-dominant regions.

Living to Coach? or Coaching to Live? the Commodification of Youth Sport

Sports fields, open grass, and gravel areas, once occupied by children at play, are now part of a space that can be described as the 'youth sport industrial com-

plex'. In this space, the child-centered activity of random sports play has been replaced by an adult-centered, rule-bound, and organized system of training that comes with a hefty price tag; what we refer to as professional youth coaching. Even within organized youth sport, the role of coaches has shifted. In order to justify the hefty price tag, coaches are now forced to focus on filling rosters, recruitment of athletes, winning at all costs, and maximizing profits which detracts from the emphasis on young athlete development, respect for the game, and sportsmanship. In fact, one could argue that youth coaches have become collectors of talent instead of developers of talent. Further, in a space once filled by community based recreation programs, private for-profit commercialized entities have risen to create a place in which parents can fulfill their need for vicarious competition and winning. This autoethnographic study analyzes over 25 years of coaching in youth soccer in the United States and delineates the shift from, what the lead researcher observes to be, player-centered coaching to a profit-centered coaching model based on selling deception and false hope. As such, the paper navigates the lead researcher's attempt to make meaning of his own personal biography within the historical and contemporary context that has seen shifting patterns in the landscape of youth coaching. Additionally, using Norbert Elias' ideas of figurations as a framework, the research explores a new currency of power and shifting chains of interdependencies in the coach/player, coach/parent, parent/player, and parent/parent relationships and examines the effects that these changes have had, and still have, on the traditional teaching and mentoring role of the youth coaches.

The Contradictions of 'Entitlement': Elite Common Sense about Merit and Moral Worth

This paper draws on 50 in-depth interviews with affluent and wealthy New York parents to look at how they talk about "diversity," especially in relation to their children. I compare the diversity talk of white to African-American and Indian-American interviewees, looking especially at how they think about their children's schools and other social environments. Both parents of color and white parents see "exposure" to a range of social others as serving two functions: to help children situate themselves in the world and recognize their advantages, which is a moral imperative, and to help them get ahead in a cosmopolitan world, which is an instrumental one. But white parents tend to talk in general terms about "diversity" (implicitly conflating race and class in their portrayals of social others). Parents of color talk in more nuanced (though varying) ways about helping their children navigate the relationship between race and class. The paper reflects on the implications of these differences for the social reproduction of privilege and privileged identities.

Boko Haram Insurgency and Internal Displacement in North-Eastern Nigeria: An Assessment of Humanitarian Responses in a Challenging Environment

Since the onset of insurgent activities by the Nigerian grown terrorist group known as *Boko Haram* in 2009, the North-East of Nigeria has been seriously devastated by the insurgency. By 2014, the insurgency had reached its peak with an estimated 2 million people displaced from their towns and villages, in addition to tens of thousands of deaths. Public infrastructure particularly schools and hospitals as well as civilian dwellings were destroyed across the region. Livelihood activities including farming and commerce were disrupted. However, beginning from the second half of 2015, the insurgency was gradually contained and *Boko Haram* was pushed out of large territories it had hitherto controlled. Yet, *Boko Haram* remains largely undefeated despite claims to the contrary by the Nigerian government and the huge and foreboding humanitarian crisis created by the insurgency is still ongoing. It is considered as one of the greatest prevailing humanitarian crises in the world today. In Borno State, the epicentre of the insurgency, hundreds of thousands of people are still in officially designated Internally Displaced Camps, informal camps and host communities. These Internally Displaced Persons (IDPs) including widowed women and children orphaned by the conflict, are largely catered for by international humanitarian Non-Governmental Organizations (NGOs) and agencies of the United Nations, in collaboration with local and federal emergency relief agencies. Despite the efforts of both the local and international humanitarian agencies, many of the internally displaced people are still exposed to debilitating hunger and disease conditions. The paper assesses the key factors affecting the effectiveness of the humanitarian agencies within the context of global and local level challenges including shortfalls in global financing of humanitarian activities. Local specific factors, in particular, the prevailing warped public opinion about international NGOs in the North-East and poor governance are also interrogated.

Anti-Neoliberal Protest and Neoliberal Outcomes: The Appropriation and Translation of the Tents Protest By the Trajtenberg Committee

This article examines the ways in which the Trajtenberg Committee report diagnosed the causes underlying the 2011 protest (tents protest) in Israel, the identity of its carriers, and the policy instruments it suggested to address the protesters' claims. We use a critical discourse analysis method to disclose the policy paradigm – the construction of social problems, target population and policy instruments – that was used to give meaning to the demands of the protesters and to translate them into policy proposals (agenda setting). Our argument is that the Trajtenberg Committee appropriated the rhetoric of the protest, but it translated this rhetoric into policy proposals through a combination of a neoliberal economic and social policy that was softened at its margins with insights of the social investment model – a European policy heartening the development of human capital in the context of knowledge economy. We further suggest that the Trajtenberg Committee's report reconstructed the Israeli hegemonic project in the neo-liberal era. Our analysis combines insights from the ideational turn in institutional analysis and the literature on the outcomes of social movements. This combination makes it possible to understand a. How social movements' outcomes may contradict the protesters' motivations; and b. how the knowledge and discourse deployed by state agents (underpinned by policy paradigms) play a central role in the dilution of the protesters' demands and their demobilization.

Submissive Resistance: An Empirical Study on Student Movements of Peking University Post-1989

Student movements have persisted in mainland China since the 1989 protest, especially in elite universities, contrary to the lack of studies. The participants' repertoire, mobilization, and interaction with authorities have vastly changed. Prevalent theories emphasizing organizing capacity, resource mobilization, or professional leadership would indicate a step-up in their scale and tension, for the past score in China has seen turbulent transition, rising resent and dissent, less pervasive control over students, and new interspace and instrumentality for resistance facilitated by social media and mobile technologies; yet the reality proves otherwise.

This study observes 11 appreciable collective actions from 1996 to 2014 among students of Peking University, a top-tier university in China and the origin of the Tiananmen Prodemocracy Movement. These actions were generally limited within the campus, not public and widespread; their themes self-interested, not value-oriented; the agents' mobilization fragmented, not extensive; the interest subjects isolated, not integrated; usually ended in compromise between students and authorities (the University); and were fraught with anonymous mechanism. These characteristics of **submissive resistance** were non-existent in the 80s.

I propose the concept '**cognitive restraint**' to illustrate the aforementioned characteristics of student movements in China, as a counterpoint to the political process model. Agents, cognizant of the high cost of action and their vulnerability to the state and authorities, curtail certain repertoire or themes of resistance to reduce action and discourse into the dominant institutional field, in hope of obtaining legality and averting suppression. After the reverberant bloodshed, state not only inhibits action, but also affects agents' volition, cognition and expectation. Such institutional structure creates irresolute participants. "Bring the state back in" would shed light on the vicissitudes of student movements in non-democracies, where civil society is undeveloped, liberty is lacking, and hegemonic political system and severe social control could easily eliminates perceptible, autonomous, organized force.

Doing Disability Right: A Socio-Legal Comparison of Brazil, Iceland, Ireland, and the United States.

The United Nations Convention on the Rights of Persons with Disabilities (UNCRPD) is a treaty adopted in 2006 to address human rights for persons with disabilities. The UNCRPD advances discussions of disability by recognizing social barriers faced by persons with disabilities (PWD), highlighting needs for justice

overlooked in previous human rights treaties. This paper examines efforts of four states in advancing rights of PWD. It selects two countries whose national governments have ratified the UNCRPD, Iceland and Brazil, and two countries whose national governments have not ratified the UNCRPD, Ireland and the USA, to examine whether "ratification matters" in reaching the Convention's goals. These countries share similarities and differences that may influence human rights advancement, as well as UNCRPD decoupling. This study contrasts UNCRPD implementation with concurrent national disability laws, human development index (HDI) ranking, social welfare approaches, and population characteristics. In addition to the rights outlined in the UNCRPD, each country has laws that vary in their enforcement of equal access, anti-discrimination, and other rights for PWD that are outlined in the Convention. The variation in socioeconomic, legal, social welfare, and population characteristics of each of the countries creates noteworthy differences in the human rights status for PWD, as outlined by the UNCRPD. This paper examines how countries take a human rights-based, inclusive equality approach, and highlights areas where researchers, governments, international organizations, and individuals can focus efforts to improve the lives of persons with disabilities and enhance human rights outlined in the UNCRPD.

Country	Welfare State Type	UNCRPD Status	Human Development (Rank)	De-Index	Population Diversity
United States of America	Liberal	Signatory	0.920 (11)		Diverse
Ireland	Christian Democrat-Liberal	Signatory	0.923 (8)		Limited
Iceland	Social Democrat	Convention Ratified	0.921 (9)		Limited
Brazil	Christian Democrat-Social	Convention & Protocol Ratified	0.754 (79)		Diverse

The Disability Tax: A Novel Tool for Supporting the Implementation of the UN Convention on the Rights of Persons with Disabilities

The Disability Tax is a model that addresses impairment-related and socially-driven burdens for persons with disabilities, which in turn can create barriers to full participation in society. People with disabilities (PWD) face hidden burdens, existing in addition to the challenges faced by their non-disabled peers, which can tax their interlinked material, social, internal and health resources. As a theoretical and operational model, the Disability Tax situates disability in social structures and can be employed to make comparisons across societies and disabilities, or within a subset of disabilities. It allows for broad and specific examinations of how societies and individuals deal with disability, and ways it may affect health trajectories. The Resource Wheel is at the center of the Disability Tax. Depending on how a social structure creates barriers to an individual's ability to fully access and use linked resources, the wheel can function proactively or cease to function. This paper highlights the ways that the Disability Tax relates to the UN Convention on the Rights of Persons with Disabilities, how it can be used as a tool to support the realization of the human rights outlined in the treaty. It also discusses ways that the model can be used in cross-sectional or longitudinal, qualitative and quantitative studies by researchers, NGOs, Disabled People's Organizations (DPOs), and governments to highlight barriers, health disparities, and areas for improvement. The Disability Tax model can also be used as an educational and self-assessment tool for PWD and their families to identify taxed resources to then be addressed through individual effort, support services, and/or advocacy. Pilot research demonstrated that each one unit increase in the Disability Tax burden decreased subjective life expectancy by nearly six years, indicating both a profound hidden burden faced by PWD, and the utility of the model as a comprehensive tool.

Reflections on the Changing Dynamics of Youth Disadvantage and Social Exclusion: The Legacy of Andy Furlong

This paper reflects on the legacy of Professor Andy Furlong on the field of youth studies and in particular, his contribution to how we understand youth exclusion. The paper looks at the breadth of Andy's contribution but also reflects on some of the detail. In particular the paper, will reflect on the concept of the 'epistemological fallacy' of late modernity first published in the classic text, *Young People and Social Change* authored with Andy's long-standing colleague Fred Cartmel (initially in 1997); a book which even today remains core reading on many youth degree programmes. In particular, the paper explores the continued utility of the concept in helping us to unravel the increasingly complex relationship between social structures and young people's agency and decision-making in determining contemporary youth life experiences. At a time of increased anxiety

around the prospects of the current younger generation and amidst serious economic and social challenges, and growing inequalities in countries such as the UK, these issues are ever more pressing. The paper revisits the concept of 'epistemological fallacy', assessing its strengths and potential weaknesses in the context of growing intra-generational and inter-generational inequalities. The paper concludes with some reflections on Andy's wider contribution to the field of youth studies.

SHILOVA, VALENTINA* (Institute of Sociology Russian Academy of Sciences)

Communicative Practices of Rural Youth in Russia in the Light of «Cellular De-Urbanization»

In the last ten years in Russia demographers noted a massive outflow of young people from rural areas in order to obtain an education and search for a highly paid and prestigious job (in the Russian Far North figures reach 70% of the youth cohort). At the same time, prone to trends about a healthy life in nature, urban youth leaves megacities, with the aim of finding other life reasons in rural areas. We can observe counter migration flows and differently directed life vectors «from village to city» and «from town to village». Of course, the flows of rural youth to the city exceed the flows of returning youth and urban youth moving to the countryside, but the existence of the second allows us to speak (by analogy with the theory of Professor N. E. Pokrovsky of the «cellular globalization» of Russia) about «cellular de-urbanization».

In our opinion, «cellular de-urbanization» in Russia is firmly connected with the labor market and professional trajectories of young people.

The data obtained during the survey on Russian employment on a representative national sample in 2015 allowed us to compare the individual communicative practices of rural and urban youth in the labor market and sphere of leisure, check a number of hypotheses and draw the following conclusions: the professional employment of rural residents implies less autonomy in the formation of the pace of work, the content of labor, the quality of the product or service, requires a lesser degree of creativity and communication skills. Communicative practices of rural youth in the search for work are based on interpersonal communication and informal contacts, the Internet and recruiting agencies are practically not involved. Leisure of rural youth is connected to work on the ground and recreational practices in nature.

The after-Effects of Gwangju Incidence after 37 Years: An Analysis of in-Depth Interviews of Those Who Experienced It

Thirty-seven years have passed since the Gwangju Democratic Movement occurred in May, 1980. At that time many innocent students and citizens were cruelly beaten and/or shot to death by the army of their own nation. Even though the citizens of Gwangju have regained the damaged reputation as 'commie' later, the trauma of the terrible experience of being attacked by their own soldiers were very severe. This paper tries to show the after-effects of those people who observed and/or experienced the May massacre at Gwangju, Korea in 1980 by analyzing their biographies based on in-depth interviews of them in accordance with their life-course. The theoretical perspective to be used is Ulrich Beck's theory of emancipatory catastrophism and the three conceptual lenses of violation of the sacred norms, anthropological shocks and catharsis or cosmopolitan morality. Meaning work through which they redefine the situation and themselves will also be analyzed, since meaning work might be able to lead them to cosmopolitan morality, not apocalyptic catastrophism.

Outsourcing of Death Treatment Under Modernization ; Comparative Studies for Funeral Ceremony

Conducting funeral ceremonies has been one of the most important and sacred rituals in collective life. Corpses have been treated either as something sacred or something impure since the pre-historical period.

In this paper I argue that the interaction orders of life and death which funeral ceremonies reveal have been transforming rapidly in modern society and this means the mutual help function of community life has been weakened and reciprocity has been outsourced to the market in the modernization process.

The sociological approaches to studying funeral ceremonies are not so many. Mitford (1963) criticized the commercialization of American funerals. Harbenstein and Lamers (1994) argued that funeral customs are strongly resistant to change, and when change does come, it comes slowly. I emphasize that transformation is "not" so slow under modernization.. I will make this clear with both quantitative and qualitative surveys.

Senshu University conducted research surveys in seven countries of East and Southeast Asia. The results show that the higher a country's GDP is the lower attendance rate of neighbors is. In countries which have a lower Infant Mortality Rate, people also tend not to take part in neighbor's funerals. This means the funerals are carried out by neighbors only in underdeveloped countries.

I conducted participant observations and interviews in seven countries, Uganda, Mongolia, Vietnam, China, France, USA and Japan. I found that funerals are commercialized in the developed countries and that the traditional styles are lost. The funeral services moved away from local communities, relatives and even family members, with the funeral industries taking their place. And communities are losing mutual help function.

Each country had diverse funeral rituals in the past. Now the funeral is rapidly transforming due to modernization with what looks like the outsourcing of death treatment from the family and community.

SHIMIZU, CHIHIRO* (*Nihon University*)

The Changing "Face of the City": Homogenization and Accumulation of Amenities

A city has various faces, and those faces change along with the era. The various faces include a young face when a city has just been born by development and the like, a lively and radiant maturing face, and face that has matured with the passage of time but now features many wrinkles. So by what is it that these faces are differentiated from one another? What is the face of the city composed of? Our faces are composed of a contour, eyes, a nose, a mouth, ears and hair. The contour of a city is defined by the things that it is born with, like the shape of that city and the neighboring cities, and nature, such as the sea, mountains and the river that flows through the city.

In this study, I set out from the similarity and heterogeneity of the amenities for the whole of Japan with individual data from the "Yellow Pages" to clarify how to be able to classify these in types of faces of cities. Moreover, based on such a classification, I clarify empirically what kinds of faces the regions where population has been accumulating have by superimposing the small region data (500 meter mesh) of the national census. In other words, I will show what kinds of cities have popular faces.

Based on the above analysis, I estimate by the framework of hedonic theory the extent of the effects that such an accumulation of population has on pushing up land prices. That is, the purpose of this study is to measure the economic value accompanying the accumulation of amenities through the above series of analyses.

Practice without Faith As Leisure: Analyzing Multiple Dimensions of Religiosity and Those Effects on Happiness in Japan

In the sociology of religion, it is often reported that individual's religiosity is positively associated with subjective well-being in Western societies. In the case of Japan, where its religiosity is characterized by "believing without belonging" as its religious cultural context and "behaving without believing" as the consequence of secularization, the positive association between membership of religious organization (or religious denomination) and happiness are not confirmed. However, by analyzing survey data, we can still observe a positive effect of customary religious behavior on happiness, such as doing the first visit to the shrine after the new year (Hatsu-môde), participating local festival, and visiting ancestors grave on the equinoctial week. The effect maintains its consistency even if controlling the variables for sex, age, education, household income and social capital. When considering individual's happiness, it seems rather customary behaviors are important than being a member of institutional religions.

In this paper, we attempt to disentangle the multiple dimension of religiosity within Japanese people and to examine the mechanism of customary religious behaviors effecting on happiness. We look at (1) structural changes in individual's religiosity which took place in Japan after 1970's through analyzing the data of "Survey of Japanese Value Orientation" which had been conducted by NHK since 1973 to 2008, and (2) the characteristics of religiosity which are highly shared by today's younger generation in secular-rational Japan. After looking at these overviews, the main question of this paper is (3) what dimensions of religiosity are positively associated with individual's happiness. To examine this, we conducted the other survey with randomly chosen 1,200 samples.

Our results imply that customary religious behaviors are accepted by individuals as leisure mediated by their social capital. These behaviors are positively associated with trusts and membership of voluntary organizations, and function to increase its effects on happiness.

The Roles for Geographical Indication in Strategic Alliances of Small-Scale Food Processors: A Case Study of Natural Cheese in Japan

The purpose of this study is to clarify how Geographical Indication (GI) plays roles in strategic alliances of small-scale food processors. The study focuses on regionally typical natural cheese in Japan and two systems of GI, the local foundation's GI and the Japan GI of central government.

Dairy farming is one of the most important agricultural sectors in Japan, especially the northern area, but has faced difficult problems (e.g. unintended decrease in domestic production, tariff elimination in the foreseeable future) for the last one decade. On the other hand, high quality cheese manufactured by rural companies or dairy farmers has attracted much attention of consumers.

At the beginning, cheese producers tried to build the co-brand with the help of the local foundation's GI, the aims of which are to develop food sanitation management and identify a product's geographical origin. However, only a few relatively large processors have remained in the partnership because it could not give the majority clear economic benefits. In 2015, these large members organized the another strategic alliance in the form of joint maturing and bargaining of cheese on the Japan GI, deriving from EU's Protected Geographical Indication (PGI). This alliance has made it possible to stabilize product quality and prevent opportunity loss, as well as certify regional typicity of product. As a result, widespread types of producers in the region are joining it.

Directions for strategic alliances basically depend on GI selected by food processors, so it can be said that GI leads to smooth and well-ordered collective coordination among members joining a alliance. Successful alliances on GI strengthen small rural companies' competitive position in markets, and contribute to sustainable rural development.

Searching for the Balance between Paid and Domestic Work: Cases from Less-Developed Countries

The globalising economy has forced both men and women to seek and engage in paid work outside the home. This is not only the trend in developed countries, but can also be observed in the rural areas of less-developed countries. These areas have been included in global value chains in recent decades; while discussions on the relationship between work and family tend to focus on the former setting. In less-developed countries, the increasing opportunities for engagement with paid work will (or even now) require concern over issues related to work and family balance that developed countries have already experienced.

This paper is based on qualitative research into the experiences of female workers, those who produce the handicrafts that are ordered by a Japanese transnational retail and manufacturing company, in the rural areas of two less-developed countries—Kyrgyzstan and Laos. Women generally take responsibility for most domestic work, such as child rearing, care of elderly parents, and housework. The introduction of paid work in rural communities is gradually, and certainly, changing the previously blurred boundary between work and family in the process of involving women in global value chains. The strategies of women/families for managing paid and domestic work reveal both the possibilities and limitations of business activities as a development approach, which international donors have been promoting under international initiatives such as the Sustainable Development Goals. Findings derived from case studies in the two countries suggest that issues related to the intersection between work and family spheres affects people in less-developed countries; as well as those in developed countries. Finally, this paper concludes by discussing the necessity to be aware of the socio-cultural consequences that the development approach using business activities might cause.

TG06-987.2

SHIMODA, YUKIMI* (*University of Tsukuba*)

Whose Knowledge Support Development Programs?

International donors have conducted various development activities in less-developed countries. Their activities have been formed within their institution's policies (and national policies in the case of bilateral donors), and these often closely resonate with global development initiatives. Looking at donor documents, these programs seem to be smoothly implemented, and often support the creation of so-called good practices. However, in practice, development activities are supported and implemented by the accumulated hands-on knowledge and significant effort of development practitioners. Their struggles and efforts in bringing about and adjusting development programs in local contexts are rarely documented in donors' reports or in the development literature, as these generally focus on the outputs and effectiveness of programs. Also, in the field of technical cooperation, practitioners often act as a kind of mediator, linking the

programs designed by the organisations they belong to, and local stakeholders in recipient countries.

This paper explores the experience of highly mobile development practitioners from Japan, who regularly or temporarily work for organisations (e.g. aid agencies, consulting firms) that deal with various issues in less-developed countries. The data were collected through semi-structured interviews, which were mainly conducted face-to-face during the subjects' temporary return to Japan, or sometimes by telephone or Skype. I also followed some of their activities through social media. Following their mobile working lives between Japan and recipient countries within their career trajectories, this paper aims to reveal the ways in which they have accumulated and utilised (or not utilised) the rich experience and knowledge they have gained when working as practitioners who must carry out activities within the limited timeframe of each program. Finally, this paper highlights the importance of the accumulated knowledge of individual practitioners; a process that is usually unseen behind "good practices" and the trend of strongly emphasising recipient ownership of programs.

A Neoliberal Government Approaching to Universalistic Social Policy? Institutions, Social Movements, and Political Mediation in the Development of South Korean Childcare Policy

With the transformation of the welfare states during the past few decades, there is growing recognition that the expansion and retreat of the welfare systems cannot be fully explained as a result of political competition between the left and the right (Haeusermann 2010; Schmidt and Thatcher 2013; Schnyder and Jackson 2013). In this context, the question of finding the key to welfare politics in East Asian societies, where class-based political cleavages have not developed, draws particular attention. South Korea is an interesting case in this regard because after the democratic transition in 1987, there is considerable continuity in the progress of welfare expenditure and institutions both under liberal and conservative governments. This study explores why the government and the ruling party have steadily expanded childcare policy and moved toward universalism since the late 2000s, when the conservative forces took control of both the administration and the legislature. Childcare policy is one of the fastest growing social policy areas in Korea over the past decade. The liberal Roh Moo-Hyun government (2003-2007) has laid the institutional basis and started to expand its budget. Interestingly, however, the childcare policy has continued to develop under the following conservative governments and is approaching to universalistic concept. The Lee Myung-Bak government (2008-2012) pushed forward with neo-liberal reforms in economic and labor policies, but in the childcare sector, it introduced free childcare policy and a limited childcare allowance. The Park Geun-Hye government (2013-2016) extended these systems to all income strata. Why did this happen? In addition to institutional factors such as the presidential system (Estevez-Ave and Kim, 2014) and the state bureaucracy (Goodman and Peng, 1996), we analyze the processes and impacts of the interaction between social movements, stakeholders, and institutional political actors on the basis of the political mediation model (Amenta 2006; Amenta et al. 2005).

How Do Young Precariats Make Their Voices Heard? Strategies, Symbolic Practices, and the Impact of South Korean Youth Movements

Today, the youth are experiencing with particular intensity the problems of precarity in many aspects including income, employment, housing, and welfare. However, they greatly lack the financial, organizational, and political resources for drawing public attention to their suffering and claims. Therefore, what strategies, action methods, and symbolic practices may help them overcome such limitations is a crucial question for social movements of the young precarious people. South Korea has a very high level of income and job insecurity, limited social security provisions, weak working-class organizations and left-wing parties. In this sense, Korea is a case where the precarity and political weakness of the youth are particularly salient. What attracts scholarly attention is, however, that over the past few years, the youth movement has been able to draw great media attention and to influence public policy far more successfully than in the past. This study attempts to establish the factors that explain such movement impacts by investigating selected youth movement organizations such as the Youth Union, the Part-time Workers' Union, the Slug Union for Housing Welfare, and the Korea Youth Confederation. These SMOs not only attracted great attention from mainstream media, but also achieved immediate policy shifts of the government and corporations, or even became an actor influencing policy formation within the governance bodies of local governments including Seoul Metropolitan City. By combining the cultural approaches and the political mediation model in social

movement research, this study analyzes the varieties and temporal changes in the relationship between the strategies and discursive repertoire of the SMOs, on the one side, and the media coverage and policy change of local governments, on the other side. We expect this research will contribute to finding an effective way in which the precarious youth themselves can influence public discourse and public policy.

Protecting Socially Vulnerable People in Japan, the World's Most Aged Society: Focusing on Multi-Generational Co-Residence

Japan is the world's most aged society. According to the 2016 report of the Statistics Bureau of Japan, people aged 65 and over make up 27.3 percent of Japan's population. The generational gap between the working-age population and the old-age retired population has been expanding rapidly. In particular, the number of those who have never been married has increased. Consequently, the number of those who have not formed a family has grown. However, the family has traditionally provided basic livelihood security to the people of Japan. In this study, I discuss how to reposition intergenerational relations, which have formed the basis of various social systems in Japan.

The data I will analyze for this study are from the Comprehensive Survey of People's Living for Japan. I will occasionally present comparative figures from those of the Luxembourg Income Study in the early 2010s.

According to our preliminary analyses of the Japanese data, we discovered that co-residency has had more impact on poverty prevention than that of social security benefits. The observed poverty rate for three-generation families containing elderly members whose children act as the head of household is 12.0 percent. However, supposing the elderly do not live with a younger generation of family, the hypothetical poverty rate is 67.5 percent. Similarly, supposing that there are no social security benefits paid, the corresponding figure became 14.0 percent.

Thus, we have confirmed the significance of intergenerational co-residence with regard to the prevention of economic hardship for the elderly. Similar situations can be found in single-mother families and with single-adult children. We argue that there is an urgent need to re-design the social system so that basic livelihood security can be guaranteed for all. This can be accomplished by transforming the basic framework of intergenerational relations in Japan.

RC28-510.2

SHIRAHASE, SAWAKO* (*University of Tokyo*)

Transmitting Social Advantages to the Next Generation: Focusing on Educational Advantages in the Multigenerational Perspective

The pattern of intergenerational mobility has been at the center of social stratification studies, and recently active discussions have been held about the importance of both parent-child and grandchild-grandparent relations in examining social stratification (Mare 2011; Mare and Maralani 2006; Song and Mare 2015; Lawrence and Breen 2016). I will examine the impact of the educational attainment of grandparents and parents on the probability of children from those families receiving higher education in Japan.

The main data I have analyzed for this study are from the 2015 National Survey of Social Stratification and Social Mobility (hereafter, 2015 SSM survey). The survey is nationally represented and cross-sectional. It has been conducted every ten years since 1955, and this is the seventh one. The respondents of the 2015 SSM survey are aged between 20 and 79, and the sample size of the survey is 7,817. The survey provides information on the educational attainment of the respondents as well as of their parents and their children.

We obtained two important findings based on our primary analyses. First, the coefficient of grandparents' education is smaller for children of the younger cohort than for that of the older one. Second, the effect of grandparents' education is indirect on children from the younger cohort. The gross effect of grandparents' education has been statistically significant overall, but it becomes indirect through parents' education on children of the younger cohort.

Thus, the mechanism in multigenerational relationships has changed over time, and the critical point in multigenerational relations appears to have been during the mid-1970s. This is when the total fertility rate fell below the replacement rate in Japan. I will further discuss whether the pattern of multigenerational relations in transmitting social advantage in Japan is different from that of other societies.

Intermediaries in the Creation of a Market Order in Cross-Border Labour Exchanges

The paper attempts to theorize cross-border labour markets from an economic sociological perspective. Cross-border labour markets are seen as facing the

same sets of coordination problems as do nationally bounded markets in creating a market order. Yet crossing borders generates unique sets of uncertainties specific to *labour* markets, which I argue, in many cases are addressed by delegating employment responsibilities to private intermediaries. Thus, private intermediaries take on many of the employment risks specifically posed by cross-border labour. These include risks posed by the irregularity of labour mobility and/or employment contracts, uncertainties surrounding skill matches across nationally bounded educational and training contexts, and uncertainties concerning the cultural integration and work commitment of foreign labour. Drawing on two sets of empirical research, the first about cross-border temporary staffing and the second about illegal labour exchanges in the form of human trafficking, the analysis focusses on the practices of market actors in addressing the uncertainties common to market exchanges in general, and those specific to contemporary cross-border labour markets.

The Transformation of Conservative Gender Regimes

This paper discusses the relevance of Walby's varieties of public gender regimes for understanding the transformation of conservative welfare states, which according to her comparisons, are either historically lagging (a case of incomplete transformation of domestic gender regime) or hybrids, located somewhere along the continuum of liberal and social-democratic types. Neither understanding is sufficiently adequate for capturing change, since classification as a domestic gender regimes ignores the advancement of women in the public sphere, while the latter tends to assume that reproductive labour has either migrated to the market economy as paid labour or become socialized. The paper approaches a re-conceptualization by looking at the intersection of commodification/decommodification of the paid employment of women with the familization/defamilization of their unpaid domestic and care labour. The analysis yields a more nuanced understanding of the transformation of conservative gender regimes and suggests alternatives to the dominant role of the state or the market in the social organization of care.

Hermeneutic Phenomenology: An Approach to Understand Oldest-Old

Oldest –old (90 + years) are the vulnerable segment among aged and this segment lived long years and experienced all sorts of life patterns. Reduced mobility, susceptible to illness, disability, multiple health problems, dependency, loneliness, frustration, increased spirituality are commonly seen among these segments.

Hermeneutic Phenomenology is both a philosophy and a methodology which is used to understand and analyse the meaning of everyday life. It focused on human actions, activities and interactions and it explains how these human actions, activities and interactions are interpreted by various people.

The study concentrated on how oldest –old lived and also to know their interpretations of their experiences of daily living. Study also focused on everyday activities of their life and its impact on their health and wellbeing. Study tried to find some adoptive mechanisms initiated and followed by the respondents

Only women were included in the present study because of feminization of ageing. Respondents who have crossed 90 years were taken for the study. By using latest voter list respondents were selected. Through face to face interview, data has been obtained.

Some of the respondents were not happy about their longevity. Majority of the respondents unfolded their old memories and they felt that, olden days were good. Inclination towards spirituality was commonly seen among respondents. Everyday life pattern of the respondents in core issues were more or less same for majority of the respondents. They also revealed their special needs which can be taken for policy recommendations. Study revealed their past life pattern and they face lot of challenges in everyday life they find it difficult to face present fast changing life.

Mobility and Career Opportunities in a Globalized Academic Market: Evidences from Russia

The study examines researchers' mobility and migration, including "brain drain" and "brain circulation". The mobility is considered as one of the most important driver of research career on academic and nonacademic labor markets. As an

empirical source we used data from the study of Russian doctorate holders (project "Monitoring of the Labor Market for Highly Qualified R&D Personnel", that is Russian part of the international project "Careers of Doctorate Holders" (CDH). The rates of domestic (intrasectoral and intersectoral) mobility of Russian researchers are relatively low: two-thirds of employees have not changed their workplace over the past 10 years. Intersectoral mobility is not the same for different types of organizations: the greatest outflow occurs from the research institutes. Special attention is paid on the international mobility of Russian researchers: 15.8% of all surveyed doctorate holders had experience in studying or working abroad for three months or more. Mobile researchers are mostly men (63.4%) and are from Moscow and St. Petersburg. Mobility rates of Russian doctorate holders are compared with those obtained in the international project "Careers of Doctorate Holders". The results indicate that the main trends inherent in the Russian academic labour market are similar to those in the European and global labour markets. The findings of study indicates that mobile Russian researchers are more demanded in the national labor market, and are also involved in the "synchronous mobility", when the scientist can have multiple affiliations and work simultaneously in several countries. Participation in international mobility significantly increases the publication activity of a scientist.

How Do Networks of Mutual Aid Extinguish Poverty in Russia: Intergenerational Perspective

Due to current economic crisis, the supply of resources that State can targetably spend on social transfers, diminishes. Targeting is disturbed, transactions are often directed to categories rather than households. Furthermore, the information about population incomes (judgments about who falls under the definition of poverty are based on this information) are often fictitious due to the shadowiness of labor activity. State can select the only operational definition of poverty, based on economic poverty measure. Networks, however, support families in need without taking into account their degree of recognition as such by the State. This paper departs from the assumption that actual wellbeing lies in the possibility of both social capital accumulation and inclusion in the social networks that provide 'collective survival', rather than in income level.

The objective of this contribution is to describe the patterns of extinguishing poverty by addressing reciprocal exchanges within social networks. Study provides explanatory models of legitimization of getting aid in the intergenerational perspective. Related to the general purpose, the main tasks to be accomplished could be confined to: (a) determine composition of resources, that circulate within the network of mutual aid and heterogeneous composition of donors and recipients; (b) determine differences in mobilization of networks to conquer poverty of its members depending on their age and causes of becoming poor (c) determine how does young adults and seniors legitimize eligibility for getting assistance. Thus, by presenting the qualitative descriptive model of exchange practices within contrasting age groups, this study gets a relatively novel picture of "web of reciprocity" that accompanies the daily life of the poor.

Sharing Economy in Russia. Sociological Analysis of Emerging Communities

Over the past decade we observed the enormous rise of alternative forms of organizing economy such as sharing economy. Terrains of the phenomena which are widely discussed are peer-to-peer accommodation and transportation, on-demand services, collaborative finance. Since origins of sharing economy activities can be traced back to foundation of eBay and Craigslist as marketplaces where buyers and sellers meet to recirculate goods, by 2010 platforms amounted to some thousands, provided goods and services from clothes-swap to peer-to-peer banking services. While ones argue that sharing economy address anti-capitalist rhetoric and strive for inventing novel means of resource allocation, others assume that this "label is either strategically or unwittingly employed to expand the market" (Widlok 2016, p.193). Thus, sharing economy is quite contradictory in its fundamental reasoning and remains undertheorised, since the focal point of interest was switched to technological composition of Web platforms, attempts to set legislative agenda, assessing market size and presence of collaborative consumption platforms and estimating revenues generated by platforms. Present contribution conceptualize sharing economy as non-commercial organization of exchange, brought in existence by digital platforms, where users which are strangers to one another organize peer-to-peer networks, thereby creating a community in which no one knows each other by name, but has the right to invest their resources and use the resources of others. General and specific features of formation of social communication were specified by comparing two cases of sharing economy platforms in Russia: darudar (sharing goods) and timebank (sharing time and services). What is the motivation underlying participation in

sharing economy activities? How is egalitarian idea of sharing is contested: are sharing practices of wealthy and deprived categories of participants demarcated? Thus, by presenting the qualitative descriptive model of exchange practices within two community, this study gets a relatively novel picture of sharing economy functioning in Russia.

SHOJI, KOKICHI* (*University of Tokyo*)

Proposing a New Social Theory to Counter "the New Normal"

There is a view that regards global realities such as "Brexit", the Trump Administration, etc. as 'the new normal'. This view comes from considerations that these are not simply accidental, but might be becoming normal, because they have the backgrounds of events such as terrorist attacks, massive refugees, and others. North Korea's development of nuclear missiles also has similar roots that extend back to the past five centuries.

Since the end of the 15th century, European big powers launched campaigns to conquer the world, colonized almost all of it, and created an order of dominance, the modern world system. The United States and Japan joined this order by the late 19th century. Struggling against this order, however, colonized and subordinate peoples in Latin America, Asia and Africa began movements for independence and nation building and succeeded by the end of the last century. In this post-colonial world, some newly emerging nations such as China, India, Brazil and South Africa have achieved substantial economic development and now exercise influences in world politics. While the colonialist rule of the world by the ex-imperialist powers has been overturned, a new world order dominated by the main newly-emerging nations has been being formed. The spread of terrorism and North Korea's reckless development of nuclear missiles are results of the failures of ex-imperialist powers in dealing with problems in the aftermath.

Since the late 20th century, the "ontological turn" has been being proposed in and out of anthropology as a way to look again at nature, human beings and society from the standpoint of peoples' own ontology and perspectives. Similar movements might be proposed on much higher levels in China, India and others, because they have their own histories of civilization. Contemporary social theories should be re-built and be created again from their very bases.

RC16-299.3

SHOJI, KOKICHI* (*University of Tokyo*)

Social Theory to Synthesize Problems, History, Structures, Meanings, Strategies and Subjects of Our Contemporary Society

Our most serious *problems* are the possibility of an incidental explosion of nuclear missiles and the frequent attacks of terrorism. Both are problems that have been passed on as unsolved from the 20th to the 21st century. Inquiring into *their history*, they set in relief the failures in dealing with problems of ex-colonialist global rule. Terrorist attacks have come about from the failures in dealing with conditions in the Middle East. The possible incidental explosion of nuclear missiles is a result of the Japanese and American imperialist rule.

Meanwhile, world *structures* have been evolving into ones led by the newly emerging powers such as China, India, Brazil and South Africa. No one can deny the possibility of a near future when the increasing newly-emerging nations will form a hegemony in both the economic and political worlds. The *meanings* are clear. The colonial rule of the world has been overturned, and the "advanced" nations have no other way than to obey the "grammars" of a new world.

Japan was defeated not only by Western imperialist powers but also by Asian national liberation struggles. The only way for Japan to make progress is to keep an accurate recognition of history, apologize to neighbor nations for regaining trust and take concrete actions to establish peace in East Asia and the world. This should be the only presumable *strategy*. The Japanese sovereign people, as the *subjects*, should do their best to invite North Korea into negotiations.

In this presentation, I will try to create a new social theory to synthesize these six key elements; thereby aiming toward a new global society overcoming the old order of global dominance, based on civilization potentials of the newly emerging nations such as China and India, using the "ontological turn" as a fulcrum to gain a new perspective.

'Children of a Common Mother': Strengthening Health Workforce Migration to Australia and Canada

This cross-national, sector-specific comparative sociological study aims to make an empirical and theoretical contribution to the field of health workforce governance research. Improved governance is essential for countries to work towards achievement of Universal Health Coverage, yet developed countries still rely on skilled migrant health professionals. This cross-national study examines

the processes and mechanisms used to attract, integrate and retain migrant health professionals and pathways used by migrant doctors, dentists and nurses to work in underserved sectors. Qualitative interviews in aged care and rural sectors were undertaken with key informants and migrant health professionals who were either a doctor, dentist, or registered nurse. Canada, too, competes for migrant health professionals through comparable permanent, temporary and study pathways from near identical source countries. This paper compares and contrasts Australian and Canadian migration policies as they affect migrant health professionals as a basis for strengthening workforce migration to Australia and Canada.

The Challenges of Islamic Feminism Among Muslim Women in Israel

This study examines the development of a new feminist discourse among Islamic women in Israel and the challenges it poses in Muslim society. The pioneer research conducted in this context is the first to reveal the religious feminist school of thought, that promulgates its ideas among Muslim women in Israel, describing the challenges inherent in a feminine religious awakening of this type and proposing coping methods accordingly.

Development of feminist discourse among Muslim women is dependent on nationwide political, social and religious conditions. In Israel, it is taking shape under the dual control of the Israeli hegemony and patriarchal-religious leaders. The study examines the challenges encountered by these feminists women, in the shadow of the Israeli hegemony and the Islamic patriarchal leaders. Critical Feminist interpretation of religious texts conflicts with the patriarchal version. The Islamic religious activism these women espouse came about following a long period of collusion between the Islamic religious patriarchy and the Israeli establishment to control Sharia law, thereby entrapping women and depriving them of their civil rights.

Based on the qualitative paradigm and semi-structured interviews with ten of the organization's male and female activists, the study revealed that the Feminist Islamic "dialect" addresses several repression structures: (1) State institutions, such as Israel's Knesset (Parliament). (2) Muslim patriarchal religious politicization that entrench patriarchal control. (3) There is an alliance between State officials and patriarchal and religious establishment gatekeepers, such as Islamic Movement clerics, Sharia court judges.

Menace of Child Abuse in India

Child abuse cuts across boundaries of geography, race, class, religion and culture. It may occurs anywhere. Perpetrators include parents, family members, teachers, caretakers, law enforcement authorities and other children. Some children are particularly vulnerable because of gender, race, ethnic origin, disability or social status. And no country is immune, whether rich or poor. The consequences of abuse can be devastating even children who survive must cope with terrible physical and emotional scars.

Research on Child Abuse is indeed a neglected area. The Constitution of India mandates the state under Article 39 to ensure that "Children are not abused and are protected against exploitation and against moral and material abandonment". Unfortunately, the children in India are subjected to various forms of abuse. The World Health Organization (WHO) defines child abuse and child maltreatment as "all forms of physical and/or emotional ill-treatment, sexual abuse, neglect or negligent treatment or commercial or other exploitation, resulting in actual or potential harm to the child's health, survival, development or dignity in the context of a relationship of responsibility, trust or power. The problem of child abuse is a clear replica of human rights violation and is a matter of worst forms of "child exploitation and abuse". India records 19% of the world children and 1/3rd of the country's population i.e. 440 million children are below 18 years and nearly 40% of the children are in need of care and protection and out of this 1,51,59,950 total children between 6 and 14 years leaving in Madhya Pradesh Of these, 19.63 lakh children never attended any educational institute while other 5.13 lakh dropped out at different levels. Present paper is based on secondary data. It will discuss problems and solutions for victim's rehabilitation.

RC32-576.9SHRIVASTAVA, PRITANSHU* (*Bar council of India*)SHRIVASTAVA, DEEPTI (*Govt. Girls Autonomous College Bhopal*)SHRIVASTAVA, BHAVNA (*Government Girls college Bhopal*)*Socio-Psychological Problems of Women Prisoners in Indian Prisons*

The UN Standard Minimum Rules for treatment of prisoners adopted more than 53 years ago, did not draw sufficient attention to women's particular needs. However, with the increase of the women prisoner population worldwide, the necessity to bring more clarity to considerations, which should apply to the treatment of Female prisoners, has acquired importance and urgency. Though, these rules and principles contain only a handful of provisions specifically directed to women and girl prisoners.

In recent decades, the number of women under criminal justice supervision has increased dramatically. As against 11094 women detained in the Indian prisons during 2001, there are 17930 women prisoners in 2015, indicating a 61.61 % increase in women prison population over the year 2001 in 2015. Innocent accompanied children are also leaving with these women prisoners. These women facing several problems. Women offenders typically come from economically and socially disadvantaged segments of society. Typically, they are young, unemployed, have low levels of education, and have dependent children. Many have histories of alcohol and substance abuse. A high proportion of women offenders have experienced violence or sexual abuse before incarceration.

Present Paper is based on some problems faced by women prisoners

Methodology: Present Study is an Empirical study. Women Prisoner Of five Indian states are included as the universe of this study to make sample most effective at national level viz. Uttar-Pradesh, Andhra Pradesh And Bihar, Maharashtra and West Bengal. State Selection is based on Subject to the maximum number of women prisoners.

RC16-299.4SHRIWISE, AMANDA* (*University of Oxford*)*Field Theory and Welfare State Regimes: Moving Beyond the Domestic*

A key challenge in both social theory and social policy research is to revise theoretical and conceptual tools designed for use within a national context for appropriate use in transnational and global research. To contribute to this broader project, this paper explores how field theory might expand our understanding of why and how welfare state regimes operate beyond their domestic borders. In particular, it explores the degree to which field theory helps to explain: (i) the relationship between social policy and foreign policy; and (ii) state involvement in welfare provision beyond the domestic domain, with a particular focus on foreign aid dedicated toward welfare. In so doing, I argue that dominant understandings of welfare state regimes perceive the state and its behavior as a product of power resources, enabling particular types of capital accumulation, with insufficient attention given to the power *relations* that underpin the 'meta-field' of the state. This gap in theory becomes apparent when trying to explain the external behavior of national welfare state regimes in a global context. Using foreign aid dedicated toward welfare as an example, the paper then illustrates how a field approach contributes to a more nuanced and thorough understanding of the transnational nature of welfare state regimes by illuminating: (i) how national welfare state regimes extend their approaches toward welfare in the global space/sphere; and (ii) how they have contributed to the emergence of a global field of welfare provision and distribution.

RC09-195.4SHRIWISE, AMANDA* (*University of Oxford*)BRUZELIUS, CECILIA* (*Department of Social Policy and Intervention, University of Oxford*)*The European 'Migrant Crisis' and Shifting Geographies of Official Development Assistance*

In recent years, European countries have received asylum-seekers on a scale not seen since World War II. Concurrently, an increasing amount of Official Development Assistance (ODA) from European countries has been directed 'inwards' to cover costs of accommodating asylum seekers and refugees in country. In this paper, we examine how ODA channelling and flows have changed in relation to the arrival of large numbers of refugees and asylum seekers in Europe and explore the implications of this 'inward' turn of ODA for development theory and practice. We argue, first, that a 'people-centred' approach to development (as opposed an economic-growth/modernisation approach) is the primary way of understanding 'development' in relation to refugees and asylum seekers entering Europe. Thus, development assistance spent in donor countries to accommodate refugees is also understood as a form of transnational social

protection. To assess this argument, we use mixed methods, examining changes in the form and flows of ODA by sector in key donor-recipient relationships in the four European countries with the strongest inward turn of ODA – Germany, Sweden, the Netherlands, and Italy – from 2010 to 2015. Second, we consider to what, if any extent the challenge to long standing geographic divisions between 'developed' and 'developing' countries brought by this inward turn of ODA has led to change, or a 'post-colonial turn', within in development institutions themselves by examining changes to ODA channelling in the same four country cases.

RC15-288.12SHUEY, KIM* (*University of Western Ontario*)WILLSON, ANDREA (*University of Western Ontario*)HACKSHAW, TRAVIS (*University of Western Ontario*)*The Association of Parents' Health and the Health of Their Children in Early Adulthood*

To date, the majority of social science research on health has focused on the individual life course and has only implicitly addressed the intergenerational transmission of health inequality. At the same time, research on processes of intergenerational transmission has focused largely on class mobility, while often overlooking the persistence of poor health across generations. In this research, we examine potential explanations that have been identified in multiple literatures for health persistence across generations within families, including the role of childhood disadvantage, the role of poor childhood health, and low educational attainment. Our analysis utilizes data from the U.S. National Longitudinal Study of Adolescent to Adult Health, a longitudinal study of a nationally representative sample of adolescents in grades 7-12 in the United States during the 1994-95 school year who were age 24-32 in the latest wave of available data. Information on the family context, including socioeconomic status and health, also was collected from a parent during the first wave of the survey. We use multivariate models to examine multiple indicators of childhood socioeconomic disadvantage and health across adolescence and early adulthood with a focus on intergenerational continuity in poor health within families. Results from preliminary bivariate analysis indicate that parents' poor health significantly increases the likelihood that their children will report poor health in early adulthood: 15% of parents who reported fair/poor health in Wave 1 have children who report fair/poor health in their early adulthood, compared to approximately 9% of parents who reported good or better health during their offspring's childhood ($p < .001$). Our ongoing research will examine the extent to which the intergenerational transmission of health operates through childhood socioeconomic status and health and educational attainment.

RC14-279.7SHUKLA, MAHESH* (*Govt. TRS College For Excellence, Rewa (M.P.) India 486001*)*The Challenges of Suicide and the Problems of Intra-Family Communication : A Study from Rewa Division, Madhya Pradesh, India*

The sociological studies and its formulations on suicide have attracted the attention of scholars since Durkheim wrote about it. His study has opened the ways not only new sociological formulations, but also suggested a new methodology to approach this problem. The present paper is based upon an empirical study conducted in the Rewa division of Madhya Pradesh, India. The data were collected through an interview- schedule (n=600) administered on the respondents-mainly the family-members. These families were identified with the assistance of police department and hospitals. The main findings of the paper like: (i) the cases of suicides were found to be more in the non- tribal areas than in the tribal areas; (ii) women (aged 20-40 years) committed more suicides than men; (iii) adolescents have also become the victims of suicide; (iv) several cases of suicide could have been prevented (v) ways and means are suggested to prevent the cases of suicide attempts in future.

RC23-440.1SHUKLA, RAHUL* (*Indian Institute of Technology Guwahati*)*Sustainable and Socio-Technological Systems in Biofuels Production in Central India*

Biofuels are not only promised with ecological sustainability, energy security and accessibility, and better economic returns for small farmers but also promoted as a "scientific" way of doing agriculture and managing the land. However, such promotions and promises need to be understood that a non-commercial crop—Jatropha Curcas—constructed into a commodity through the National Mission on Biodiesel in India; and traversed and expanded in networks between state policies, corporate influence, farmers' interests, regional aspirations, and the technological accessibility. Following sociology of science and

technology perspectives, an attempt has been made to identify and understand the presence of socio-technological conditions responsible for different or even contradictory trajectories of Jatropha cultivation and biofuel production in India. What are the local agricultural practices and knowledge; and, whether techno-scientific interventions, in the name of scientific way of doing agriculture, are contributing to sustainability in ecological and economic dimensions. An extended field study was conducted at two blocks in Chhattisgarh – one is located in an Adivasi region and another in an industrial region. Data were collected through a combination of literature review, discussions, key informant interviews, and personal observation. An attempt is made to understand the impediments and risks involved in the cultivation of biofuels and its implications emanating from the cultivation.

Multiculturalist or Assimilationist Education: A Comparison of Contact Theory and Social Identity Theory in Israeli Arab-Jewish Integrated Schools

We compare the predictions of contact theory with those of social identity theory (SIT) as pertaining to intergroup contact between Jews and Arabs in multicultural and assimilationist schools. We propose that in accordance with the scope conditions suggested by contact theory, multicultural schools ought to promote interethnic friendships by comparison to assimilationist schools where scope conditions are not met. According to SIT, multicultural schools in which ethnic identity is constantly acknowledged and therefore salient, ought to hinder interethnic friendships. We collected and analyzed student networks in 61 integrated classrooms, estimated the extent to which Arabs and Jews prefer ethnic homophily over inter-ethnic friendships, and compared homophily in multicultural and assimilationist schools. We analyzed the data using graph-level segregation and homophily indices and Exponential Random Graph (ERG) models. Contrary to expectations, findings reveal a minor degree of homophily in assimilationist schools and a much larger degree of homophily in multicultural schools, results that are robust to various methods of analysis and alternative explanations. Our results challenge the assumptions that multicultural education is conducive to intergroup contact. The policy implications of these findings are discussed.

LGBT Sexualities and Migration

My paper will focus on LGBT sexualities and migration. It is based on research done with Poles who arrived into the UK within the recent time. Poles migrate from a rather nationalistic and religious context, where particular versions of gender and sexuality are promoted and as a result many sexual rights are not accessible including the possibility to register a same-sex civil partnership or to adopt a child by same-sex couples. Moreover, homophobia is still prevalent and such 'sexual context' is also influenced by the state and the Catholic Church. However, the lesbian and gay movement is actively working to change this situation. Poles migrate to a context which is more secular and where some sexual rights mentioned above are accessible and where religious institutions have lesser impact on sexual policy making even though homophobia is still prevalent to some extent. Therefore, it is interesting to look at how this migration influences views of Poles and how they experience a new sexual environment in the UK. The research showed that for many straight Poles migration to the UK provided an opportunity to observe different sexual arrangements that provoked reflection and in some cases led to progressive changes in views on lesbian and gay sexualities. Some saw sexuality context in Poland as taboo and restrictive, whilst in the UK it was considered to be an openly discussed area of social life and this was appreciated. Moreover, some gay Poles gained an opportunity to 'come out' once in the UK and live their sexuality out in the open.

Fracking, Gas Liquids and Global Production of Plastics: Implications for Theorizing Political Ecology

Currently, the U.S. and Canada are the world's top two producers of unconventional (fracked) gas and oil. But despite growing opposition to fracking operations sparked by increasing evidence that it is destructive to the environment and threatens both human health and human rights, and the growing evidence of similar threats from plastics production, the connection between fracking and plastics production remains obscure. In this paper, I examine this connection to

refine the meso levels of two competing theories: the theory of the treadmill of production, and the theory of ecological modernization.

Treadmill of production theorists Schnaiberg, Pellow and Gould (2015) argue that competition within the global capitalist economic system forces continual increases in the production of goods, which entails continual increases in both withdrawals of natural resources, and pollution and wastes. Ecological modernization theorists Mol and Spaargaren (2009) argue that highly developed industrial economies will prosper by adopting new industrial practices, such as "industrial symbiosis," in which the byproducts from one industry are supplied to another industry instead of being discarded as wastes.

Examining the role of gas liquids in global supply chains helps to contextualize and focus both theories. Before being refined, fracked "wet" gas contains gas liquids including propane, butane and ethane, the gas liquid most commonly used to produce plastics. The abundance of inexpensive ethane has fueled global investment in plastics production. These developments suggest that there is, at the least a close alliance between the gas and oil and plastics industries (or at most, that they are actually the same industry), rather than competing industries. It also suggests that the industrial use of byproducts does not always result in environmental protection: it can also be used to stimulate production of environmentally destructive materials.

ASLAM, SYEDA KHIZRA (*GC University, Faisalabad*)

Gendered Violence and Health across the Life-Course: A Psychological and Social Perspective in Pakistan

This paper will discuss gender-based violence on the basis of empirical findings from the data of 2015 from different communities of Pakistan, its power on the health and happiness of women that can aggravate mental health problems. The results show that across the life-course, women who suffer from the pain of violence have weaker health rather than those who do not. Violence takes the shape of an independent variable where there is a chance that either a person is continuing to commit violent acts or is a victim of violence. In Pakistan, it is estimated that from 60 to 90% of women have suffered from some kind of gender violence in their lifetime. Prevention of domestic violence is therefore, a priority for improving women's health. This paper will also speak of the psychological developments and methods that are a factor to the 'power imperative' and its playacting in women violence. The psychological, social, and cultural influences controlling this conduct will be evaluated. Earlier life experiences and exposures will be focused, avoidance, shame and control variables, inflicting pain on others, longing for affection and safety without violent control, will be considered in healing efforts. The development and implementation of interventions that bring up and cover social support can be beneficial to women who have been subjected to domestic violence. Feminist geographers' arguments will be taken to understand that violence has notably been suffered; an individual has undergone it in person, so is profoundly and intensely personal. The truth is that the gendered violence is ingrained in patriarchal power relations. Violence, is given its 'own material reality: it simply exists'. This paper intends to present the effectiveness of psychological and sociological measures and focuses for prevention of gender-based domestic violence incidents within the country. 'What Went Wrong'? How to rectify?

A New World – New Working Practices - New Actors in the Labour Market - Labour and De-Urbanization

Industrial civilization as a civilization of labour is a thing of the past, the question is, which society is replacing the labour society. The attitude towards labour, the sphere of labour and its professional structure are changing. Polarization in the sphere of labour demonstrates the emergence of new social groups that implement labour practices that are in demand by post-industrial civilization. The alignment of forces in the labour market, habitual life stereotypes that have evolved over the centuries are changing, new life styles are formed in conditions when life loses the character of labour-centeredness. The focus of the article is the trajectory of changes in the nature of the labour of modern man.

Languaging to Trigger Change: Second-Order Intercultural Conversations with Urban Youth of Maya Descent

The paper presents an applied research project that looks into whether the Maya language can become an identity factor and not a mere epiphenomenon for the urban youth of Maya descent, but not Maya speakers, inhabitants of a marginal urban area in southeastern Mexico, against the entropic tendency towards the Maya language loss in the urban environment. Our starting point is Maturana's (1989, 1990) idea that through languaging and emotioning human worlds are built and maintained; our lives are intertwined in interactional networks, therefore we only exist as human beings through conversations we hold with other human beings.

Firstly, we explore how the lifeways of the urban youth of Maya descent are constructed through communicational interactions within the family, including the intergenerational memory transmission, and with other members of their personal networks. The second step corresponds to the second-order intercultural conversations, whose participants (the young men and women and the researchers) reflect on the role of languaging and emotioning within the personal interactional networks in shaping their attitudes and representations of the Maya language and culture. These conversations are seen as potential triggers of changes in their attitudes and representations.

We also maintain that for the changes to be sustainable, the rest of the local society, viewed as a cultural multiverse (Krotz, 2003, 2004), is to recognize Maya speakers as legitimate others (Maturana, 1990); therefore the non-Maya groups are also to engage, so that the structural coupling between different parts of the multiverse can be ensured. Our role as researchers, then, is not that of external observers, but of co-producers of the cultural multiverse, who through languaging and emotioning, participate in intercultural dialogues and seek to contribute to a broader acceptance and respect towards the minorized language and its speakers.

Academic Profession Hubris or Hybrid - the Case in Finnish Universities.

The academic profession is changing because of internal and external pressures, such as the influence of the global economic recession. Due to the requirements for more efficiency and also the invasion of managerial practices from private-sector to public-sector organisations, academics are increasingly more managed inside their organisations – universities. Traditionally, professional values have been confronted with managerial ones; to professionals, managerial values and practices have meant increasing the amount of control and emphasizing accountability, profitability and efficiency, for example. However, recent research is emphasizing the hybrid model, where professional and managerial values and principles come together. In our paper, we are considering if the academic profession is changing towards being a hybrid profession. In this study, we have a survey data from a Nordic project, focusing on the effects of management reforms in the Nordic countries. The Finnish data includes responses from 956 senior academics. The initial data analysis implies that in Finnish Universities there are hybrid models of coordination, authority, and values. Academics' attitudes towards performance evaluation are quite positive, for instance. This study is important when aiming to understand the nature of the academic work in changing and unpredictable environment, as well as the academic professionals adapting to those changes in contemporary universities. Moreover, we need more knowledge on what the managerial values and practices actually mean and how they emerge in universities and how academics could be managed well inside their working organisation – in the university.

PEECK-HO, CATHARINA* (*Leibniz Universität Hannover, Christian-Albrechts Universität zu Kiel*)

A Researcher's Intentions – Nuancing the Question of Outsider-Insider Relationships in Social Movement Research.

Methodological debates on social movement research deal with ethical dimensions and tensions of outsider-insider relationships in a certain way: researchers frequently feel a sense of solidarity with the goals of the movements they research. Social movements, considering the risks associated with political dissent, may expect or even demand such affinities with its ideas. Consequently, decisions relating to research design and methodological approaches are considerably linked to the political beliefs and intentions of the researcher(s). We propose to include them as research strategies into a self-reflexive approach to the question of insider-outsider relationships in social movement research.

Insider relationships range between a position of "Outside but Along-Side" (Haiven & Khasnabish 2015) and potential role conflicts arising when members of a group conduct research on the very same (e.g. Corbin Dwyer & Buckle 2009). Outsiders are less affected by role conflict but may lack trustworthiness from the

point of view of the social movement. Researchers navigate this highly contested field that touches on basic normative and theoretical assumptions of social scientific research. We draw on our empirical research on anarchist activists in the Netherlands and Germany, as well as on Muslim women activists in Britain, to show in what way research on social movements is influenced by the intentions researchers bring to their work. Our examples, guided by feminist theory and methodology, present different methodological programs as a result of our specific positions towards the groups. In the analysis, the poles of insider and outsider positioning do not appear to be mutually exclusive, but as a dialectic ambivalence that ought to be actively handled. We thereby go beyond ways of approaching the topic as a question of choosing (quantitative and qualitative) methods and the understanding of a specific process involved in the interaction of researchers' social positions and research projects.

The Construction of Cultural Heritage in Migration Societies: Symbolic Boundaries and the Production of Trust

This paper explores the production of trust in processes of symbolic and ethnic boundary making in German migration society. More specifically, it will be argued that a conceptualization of cultural heritage as an array of situated practices of (e)valuation (Lamont 2012) can serve as a fulcrum through which specific modes of the production of trust, such as collective and materialized imaginations of the past or processes of ethnicization, can be studied.

Cultural heritage is an arena of negotiations and struggles over resources, belonging and recognition. As a strategy of cultural production actors employ and reconstitute cultural repertoires of evaluation and, thereby, produce symbolic boundaries. As such, it is a production of history in relation to an (ethnic) group. Reconstructing processes of how specific groups generate value of cultural objects, places and practices can, firstly, open up new perspectives on ethnic membership formations in nationally constituted societies. Secondly, such an understanding of 'cultural heritage as a resource' challenges dominant grasps on the role of culture by institutionalized actors like nation states, the EU or UNESCO: a critical-deconstructive perspective uncovers a diversity of logics of (e)valuation; from productions of history in the everyday using the language of heritage, via its use as symbolic capital or the heritage industry.

This paper will be based on the research program and design of an empirical research project titled: "Cultural Heritage in Ethnoheterogeneous Societies". It aims to contribute to the debate on alternative, situated and relational notions of trust (Garfinkel) by bringing them in conversation with a critical understanding of cultural heritage as a form of sense-making and a provision/appropriation of shared values and norms in everyday life. Just as symbolic and ethnic boundaries, trust becomes more or less relevant or takes differing forms depending on social conditions and situational contexts.

STOCK, INKA* (*Bielefeld University*)

Unpacking the Social and Spatial Mobility Nexus: Migrants' Mobility Trajectories and Their Perceptions of Social Positions

The migration literature often assumes cross border mobility as a strategy to improve life chances and social positions. Quantitative studies predominately focus on the social position and mobility of migrants either in the country of origin or in the receiving country. These approaches presume that migrants' social positions can be described in (inter-)national stratification systems. However, such a view neglects the possibility that migrants may position themselves transnationally in multiple, and sometimes also ambiguous ways, as qualitative research has shown (e.g. Nieswand 2011; Voicu & Vasile, 2013).

In our presentation we address migrants' own interpretation and sense-making of their social mobility trajectories. We also link this to the development of dynamic criteria for assessing social position across national boundaries. We draw attention to multiple subjective frames of reference for self-positioning (economic, social, political and cultural), which often span national borders.

Drawing on mixed-methods data from a large scale sample on migrants (n=5.000) from the Socio-Economic Panel (SOEP) in Germany and a nested subsample of 30 qualitative interviews with migrants in different ascribed social positions, we will present findings on the role of different heterogeneities (gender, legal status, migration experience) for the subjective perception of migrants' own position and changes over time. Particular attention will be given to the role of transnational social comparisons in respondents' accounts of their social position in order to assess their views on the nexus of social and geographical mobility. We link these findings with a quantitative analysis of migrants' social mobility trajectories before and after migration. Our data lead to a preliminary assessment of social position as a multifaceted concept beyond working position, income, and prestige. It includes social and emotional dimensions as well as ideas about the own life course.

RC01-39.5SIGRI, UNSAL* (*Baskent University*)VAROGLU, KADIR (*Baskent University*)*Professionalism Journey of the Turkish Military before and after the July 15 Attempted Coup*

The Turkish Military has faced a tough mission of reducing its size while increasing its effectiveness and transitioning from a citizen army to a professional one by reducing the number of conscripts and bringing partially "contractual soldiers system" in recent years. The military has started to recruit professionals in limited numbers for years and informed the public about the benefits of contractual soldiering, but so far it did not go well because of the hard working conditions in military and counter-terrorism efforts of military. Turkey has experienced, for the first time in the Republic's history, a coup attempt by a religious community, known as the Fetullahist Terrorist Organization (FETÖ), who secretly flourished in the cadres of the Turkish Armed Forces (TAF). This attempt also damaged institutional reputation, affected the TSK's combat effectiveness, and created problems in filling critical posts and finding new professional soldiers as well. The military is now trying to find personnel in a competitive marketplace and has to emulate the techniques used by private sector firms. Intensive counter-terrorism efforts of Turkish military made working environment tough for years. The situation with the attempted coup after July 15 made it even harder to repair bad reputation of the military and surely, the institution has to recognize that thousands of young people no longer wait in line to join the army and the military needs and must modify its organizational culture preserving its own core values. The implications of July 15 attempted coup are much bigger than just Turkish domestic politics. Turkish military will continue to fulfill its international engagements while implementing democratic norms at home while restructuring itself with crucial and immediate reforms focusing not only the tangible factors but also dealing seriously with intangibles like "organizational culture, values and organizational politics".

RC03-72.3SIHTO, TIINA* (*University of Jyväskylä*)*Ideals of Old Age - Constructing Ageing and Care in Local Strategy Documents*

Care is currently one of the central issues of social policy. Due to ageing of population the need for care is rising, whilst it is expected that formal care services will in the future be available only for those who are the oldest and the frailest. Both care research and care policy are facing the question of what should be done to the widening care gap, and where lies the responsibility for patching up the gap.

In Finland the practical level of care policy takes place primarily at the local level. Currently municipalities have the responsibility for care provision. Consequently, it is essential to do analysis of care policy not only at the national, but also at the local level, and reflect on how the changes taking place at the local level are similar and different to those taking place at the national level.

The focus of my analysis is on how ageing and care are constructed in Finnish local level strategy documents. My data consists of documents that have been published between the years 2008 and 2016. Through the viewpoint of discourse analysis, the aim is to explore what kind of reality of ageing and care is constructed in these local strategy documents, and how this reality constructed in the local strategy documents plays part in the shaping of local care policy.

The preliminary analysis shows how in local strategies, the provider and organizer of care is first and foremost the ageing individual who, via self-care, leads active, independent and autonomous life. If the ageing person has any care needs, the needed care is provided by family, next of kin and community. The role of public sector and welfare state is constructed as diminishing and secondary in the local strategies.

RC33-608.5SIINO, MARIANNA* (*University of Enna "Kore"*)*From Representation to Attitude: A Quali-Quantitative Approach to the Detection of the Attitudes about the Representation of Bullying at School*

The paper describes the process of building an attitude detection tool, starting from item identification to recomposition and synthesis. A combined use of both qualitative and quantitative approaches is proposed: a qualitative research aimed to bring out the representations of the phenomenon and the main meaning dimensions according to which the items to be inserted in an attitude detection scale are built; a quantitative step envisaged the implementation of the Rasch model to calibrate the above-mentioned tool.

This paper, specifically, analyzes representations and attitudes of the teachers on bullying. The latent concept is the level of non-involvement perceived by the teachers in relation to bullying at school and the consequent relevance attributed

to their own role regarding the possibility of "concrete intervention". The data collection was carried out in some secondary schools in a Southern Italian city and was repeated ten years later.

It starts from the assumption that the teacher's response to bullying at school unfold into several levels: from *representation*, which defines the substance and creates around the phenomenon a "patina" of common sense, to *attitude* towards the phenomenon, that is mediated by that in relation to the representations circulating on it, to the *propositional attitude*, that evaluates the possible interventions to be put into practice, to the acting *behavior*, which is a concrete expression of how the representations are rooted and a expression of the "stabilized" attitude in relation to bullying at school.

The paper highlights how recognizing specific attitudes (micro level) strongly linked to a representation of a phenomenon (macro level) requires, on the one hand, a quantitative approach that identifies the process that connects representations and attitudes, and on the other, a longitudinal approach that shows how the evolution of the social representations of a phenomenon causes the change of the attitude itself.

RC57-JS-28.6SIINO, MARIANNA* (*University of Enna "Kore"*)*The Power of the Image: The Narration of Life Experience between Creativity and Reflexivity*

The paper aims to highlight the potentialities of self-expression through images, particularly when dealing with "sensitive" topics and when the verbal communication or introspective ability of the target group is compromised. More specifically, this paper reports the results of a research project carried out in a Southern Italian city about the perception of family roles, forms of relationship between the sexes, and how violence is experienced within the family.

The target group was made up of Muslim young men and women living in Palermo. In most cases, they had been living in the hosting community for a short and were in a permanent "emergency" situation regarding job, housing and sometimes even health. Since they had considerable difficulties to understand or speak Italian, I decided to frame the data collection within a visual sociology perspective.

The use of collage or drawing/painting was the tool through which the migrants unconsciously conveyed their emotions. When the product was ready, a verbal setting was created with the aim to understand its content, allowing the author to become more conscious of his/her emotions. As such, the most interesting aspect of using the collage technique is not the aesthetic quality of the work, but the great evoking value actualised by the author in his/her choice of different images and their particular and unique combination. All of this becomes a small window on the author's personality and life experiences. Through the collage technique participants were able to "delegate" to images the expression of their deep emotions without directly putting themselves on the line, except for the crucial moment of their choice or when creating the drawing.

The visual method triggers, starting from the first creative choice, a reflective process that facilitates the expression of emotions and the narration of life experiences, even in case of "painful" biographies.

RC04-87.1SIKORA, JOANNA* (*Australian National University*)EVANS, MARIAH (*University of Nevada, Reno*)KELLEY, JONATHAN (*University of Nevada, Reno*)*Benefits of Scholarly Culture: Comparative Evidence from over 40 Societies over 50 Years*

This presentation reviews the scholarship devoted to the theory of scholarly culture which stems from the critique of Bourdieu and explicates why coming from a book-oriented family benefits children's educational attainment, achievement and occupational standing. A growing body of evidence supports the proposition that book-oriented socialization, indicated by home library size, equips youth with competencies, skills and knowledge that are valued in formal education and by employers across the world and over time. This presentation reviews evidence supporting the theory from the World Inequality database, comprising mostly ISSP surveys, PISA surveys and PIAAC surveys for over 40 societies going back in time to 1950s. Scholarly culture enhances various forms of cognitive assets over individual life, in particular, adult literacy, numeracy and technological problem solving. Parental libraries boost adult skills in these areas net of the effects of adult education, occupation and parental schooling. The advantageous effects are loglinear, with greatest gains for the most disadvantaged although they tend to decay with age. Scholarly culture benefits equally and directly men and women and these benefits accrue in different economic systems and historical settings. We finish with the discussion of whether electronic forms of literacy are likely to wipe out the universal advantages of bookish upbringing.

RC28-514.19SIKORA, JOANNA* (*Australian National University*)PITT, DAVID (*Macquarie University*)*Gendered Returns to the Study of High Level Mathematics and English for the Australian Tertiary Admission Rank*

To enter a university program of their choice most applicants in Australia need an Australian Tertiary Admission Rank (ATAR) calculated by the Universities Admission Centre from a variety of inputs, including Year 12 high stakes tests. This study combines the NSW Education Standards Authority administrative records for 46,000 students in New South Wales (NSW) who completed secondary education in 2011 with the data for the same cohort from the Longitudinal Survey of Australian Youth. We demonstrate how students' individual choices interact with their institutional contexts to reproduce horizontal gender segregation in field-of-study specializations.

We focus on a previously unexamined stratification mechanism: ATAR-related returns to the study of advanced mathematics and advanced English courses taken towards the end of secondary education. First, we find, when holding prior achievement in mathematics constant, that girls boost their university entry rank (ATAR) more than boys by studying advanced mathematics in Year 12. However, the relative gain they obtain through the study of advanced mathematics over their same-sex peers in lower level courses is four times smaller than the advantage of boys over their peers. Using rational choice and vocational identity theories we propose two explanations of this pattern and discuss its potential to effectively discourage high-achieving girls from opting for higher level mathematics. Second, we examine the gendered patterns of ATAR returns to the study of basic and advanced English courses. The paper closes with two discussions. The first concerns the potential that within-gender differentials in ATAR returns to the study of advanced mathematics and English contribute to the reproduction of gender segregation at university.

The second reviews the reasons why understanding gendered returns to ATAR-related secondary study is impossible without the use of administrative data, which, in turn, on its own, is insufficient to consider the full range of sociologically relevant factors.

RC34-627.4SILHOUETTE-DERCOURT, VIRGINIE* (*Université Paris XIII, CEPN, Centre Marc Bloch Berlin*)*Cosmopolitanism from below ? Immigrant Female Youth in French Banlieue As Powerful Agent of Change of Beauty Practices and Consumption*

Immigrants today constitute a growing share of Metropolitan youth in Western Europe and are helping to transform cities like Paris into world-cities. In a period of massive flows of transmigration, consumption and material culture become vehicles for the exchange of meaning between groups. They also perform, affirm, and manage the conception of the self in relation to others. For young adults with migrant background, the act of consuming is particularly important for beauty products. This is to be expected insofar as these products contribute strongly to "identity performance" across the intersectionality of the self's experience of gender, race, and class.

The objective of this paper is to understand how young female migrant consumers living in French Banlieues are adjusting to these changes. Based on ethnographic interviews conducted with second-generation female youth and their mothers, it examines this particular dimension of the adaptation process. In today's post-modern, globalized world, consumption has become an increasingly important medium through which society communicates. Everyday objects such as beauty products are embedded in a system of meaning that immigrant youth manipulate to express who they are. In turn, these immigrant female youth are transforming mainstream consumption in unexpected ways. This can be traced to their « in-between » identities that straddle two cultures--the surrounding culture and the culture of their parents. This double role (as European citizens and as global citizens connected to far-reaching diasporic networks) makes them powerful agents of change. It is argued that this new form of cosmopolitanism builds on the practices of the local, the everyday and the familiar. It nonetheless imbues a politics of hope that stretches the boundaries of the everyday in a variety of political directions. It is driven by the exigencies of exclusion rather than by the privileges of inclusion (Appadurai, 2011, p. 32)

RC27-499.1SILK, MICHAEL (*Bournemouth University*)JACKSON, DAN (*Bournemouth University*)PULLEN, EMMA* (*Bournemouth University*)*Trivialisation, Fetishization and New Modes of Sexualisation: The (re-)Constitution of the Paralympic Athlete*

This presentation draws on early findings from a large-scale, multi-methodological, project that focuses on the media production and consumption of the Paralympic Games and the impact this has on addressing current political challenges of equality for, and representation of, disability. The findings are drawn from an integrative methodological approach that combined elite media para-sport production interviewing, multiple and theoretically informed textual readings of Channel 4's (the UK's Paralympic broadcaster) Rio 2016 Paralympic broadcast content, focus group discussions and in-depth interviews with the general public, document analysis, and, analysis of archival materials and footage. In the context of the rapid commercialisation of the Paralympic games and the power of corporate media in constructing social realities, our analysis explores the ways in which neoliberal inclusionary strategies manifest specific forms of representation and whether such representations provide sites of empowerment for everyday people living with disabilities. In so doing, we contribute to ongoing theoretical debates (and media practice) around mediasports celebrated and idealized embodiments of neoliberal economies: healthy, fit, sexual, hetero-normative, and attractive bodies (Andrews, 2006; Miller, 2001). With the antithesis being the pathologisation of ageing, death & disability (Turner, 1988), our discussion focuses on the increased hyper-commercialisation and hyper-visibility of disability—via Paralympic coverage—and is suggestive of movement in the representation of disability. Indeed, previous research conducted has highlighted the ubiquity of the 'supercrip' or 'superhuman', representing the para-athlete as the self-made hero, technologically productive / functional, but largely asexual, accommodated within limited modes of neoliberal regimes. Our data however, suggest a nuanced shift in these dominant narratives, especially around the increasing sexualisation, eroticisation and devised bodily aesthetics of the para-athlete. We suggest this shift has important implications for representing alternative modes of embodiment and empowerment, understanding para-sport narratives as sites of resistance, and with respect to the 'boundaries' of neoliberal inclusionary practices.

RC01-31.4SILLITTI, NICOLAS* (*Indiana University*)*Aprendiendo a Ser Ciudadano. Notas Sobre Los Manuales Escolares Para Conscriptos En Argentina (1910-1940)*

En 1909, el Consejo Nacional de Educación de la Argentina, por entonces presidido por José María Ramos Mejía, decidió otorgarle renovado impulso a la educación en los cuarteles. A partir de los años siguientes, textos especialmente dedicados a la alfabetización de los conscriptos fueron publicados y distribuidos entre los reclutas. Además, desde entonces, se designaron más maestros, se delinearon nuevos planes de estudio y el trabajo de los inspectores fue jerarquizado.

Esta ponencia se propone analizar, a través de los manuales, relatos oficiales y materiales gráficos, los discursos y prácticas que constituyeron ese universo educativo. Una mirada cercana a la sociabilidad en las escuelas militares durante la primera mitad del siglo veinte, se sostendrá, es fundamental para comprender el despliegue del proyecto nacionalizador de las clases dominantes tanto como sus reappropriaciones por parte de sectores subalternos.

La escuela ha sido una institución fundamental en la constitución de imaginarios sociales respecto del temprano siglo veinte en la Argentina. La alfabetización juvenil fue concebida como una función del del servicio militar obligatorio e integrada a un plan educativo que incluía campañas en fábricas y cárceles. No obstante, hasta el momento, los vínculos entre escuela y ejército ha recibido escasa atención por parte de la historiografía. Este trabajo se propone indagar en dichos vínculos con el objeto de repensar las relaciones entre Fuerzas Armadas, hegemonía y sociedad en los albores el siglo xx argentino.

TG04-974.4SILVA, DEREK* (*King's University College at Western University*)*A New Politics of Terror: The Making of Radicalization and the Casting Away of Islam*

In particular, this study engages with theories of governmentality, literature within critical policing studies and the othering paradigm traced back to the work of Edward Said, to explore the global diffusion of radicalization discourses across three Western liberal democracies – the United States, United Kingdom, and Canada – from 1969 to the present. More specifically, utilizing critical discourse and case study analysis of over 10,000 documents, I explore how social institutions of law, politics, media, and science conceptualize radicalization and investigate the material practices of risk, security, and policing for which such discourses give rise. Following the analysis of thousands of publicly available governmental and non-governmental documents, this study finds that not only has radicalization become a dominant framework for understanding terrorism, but that modern discursive labeling mechanisms associated with preemption disproportionately affect certain cultural and ethnic minorities. The data illustrate this trend across social institutions in all three countries. The findings also highlight how notions of risk and security are increasingly embedded in the daily lives of citizens through discourses of radicalization in order to more efficiently govern the threat of

terrorism. The study therefore broadens sociological and criminological debates on processes of social exclusion, social control, and cultural change in the context of terrorism and highlights some of the ways in which social distance is constructed and represented in the public sphere.

SILVA, KALINGA* (*International Centre for Ethnic Studies*)

Ethnicity As a Prism for Conceptualizing Social Injustice in Sri Lanka

Ethnicity and nationalism have become the grand narrative of inequality and social injustice displacing social class, caste and gender in Sri Lanka. This can be seen as an outcome of colonial encounter and anti-colonial struggles, state-led development and democratization combined with identity politics. Processes of social inequalities resulting from neoliberal globalization as well as failures of the welfare state are increasingly understood in ethnonationalist terms where one group's gain is typically understood as a loss for the other group. Using the same logic widespread poverty in one's own ethnic community is readily attributed to unfair appropriations by privileged layers in a different ethnic group deploying social capital, political power and a variety of other means. While nationalist politics and rhetoric have in fact served to undermine the welfare state, particularly when it comes to ethnic minorities and marginal social groups, ethnic mobilizations have only served to conceal the larger processes of social polarization driven by neoliberal globalization.

This paper examines the role of ethnicity in conceptualizing social injustice in post-war Sri Lanka, with a focus on Northern and Eastern regions. The paper will use qualitative information gathered as part of a strategic social assessment conducted by the International Centre for Ethnic Studies in selected communities in the Northeast region. Even though the war ended in May 2009, the affected people continue to use the ethnonationalist framework in conceptualizing their existential problems and grievances. One outcome of this situation is that it has taken away the drive and energy of the people and their agency so much so that they do not respond to incentive structures and market signals in the way they are expected to within the neoliberal policies and programs. This, in turn, highlights the need to transcend the ethnonationalist prism in promoting social justice in South Asia.

MOZINE, AUGUSTO (*Universidade Vila Velha*)

The Solid Waste Management Policy of the City of Vitória, Espírito Santo-Brazil: An Analysis from the Perspective of Political Ecology and Citizen Participation

It discusses the regulations promoted by the "National Solid Waste Policy" according to its reflections on the local environmental role of Brazilian's cities. In this context, this article proposes a critique of the environmental approach presented in Law nr. 10.305 published in 2010 under the prism of Political Ecology, from the analysis of the institutional tools of the policy in relation to the question of sustainability in an ecocentric perspective, from the environmental paradigm put forward by the Federal Constitution which declares as a fundamental right the Environment Ecologically Balanced for all generations. Thus, based on an exploratory research of documentary nature, it discusses: the reduction of solid waste production; environmental education focusing on public measures to control this unbridled and growing production; the creation of reverse logistics rules imposed on manufacturers and suppliers; as well as the implementation of eco-efficient measures for the shared management of irregular waste, under the prism of citizen participation. Thus, it is verified that after more than 07 years of the effective publication of the National Solid Waste Policy, Brazil shows little evolution in relation to the policy that it created, leading the Public Administration to a managerial collapse averse to environmental management efficient. In the case of the City of Vitória, in the state of Espírito Santo, Brazil, this scenario is materialized in the establishment of a Metropolitan Plan for Solid Waste Management and a Municipal Plan for Selective Collection, which results in the appropriate treatment in terms of recycling only 180 tons of waste per month. In this context, considering the universe of 11,000 tons of municipal solid waste produced in the city of Vitória, it is clear the unsustainability of the current practice of this policy and the need to expand its management tools in an administrative and participatory scale.

Emotion and Interest in Marriage and Domestic Power: Some Results of a Research in Portugal

Having as a framework the reality of household and family relations, this paper focus on the marriage as part and as strategy in the process of reproduction and eventual social mobility. In marriage, to a greater or lesser degree or in a more latent or manifest manner, two elements have been present in various types of societies: emotion and interest. Connected is another phenomenon that is even less openly recognized than the emotion-interest binomial: domestic power. This has been increasingly institutionalized over time and subject to the norms and prescriptions of the moral, religious and/ or state order.

This presentation is based on the project "Gender Inequalities: between the laws and social practices", which considered for analysis both a survey with 800 people, from rural and urban areas, and with diverse age groups, education levels and occupations, and 20 semi-structured interviews, in the Portuguese context. After a brief initial reflection on marriage and its components – emotion and interest – the motivations and the resources, the importance attached, then domestic power will be subject of analysis based on data collected. It will be revealed the marriage property regime, the value of the spouses before marriage's assets, the division on decision's making by sex on certain matters (e.g. children's activity, purchase of home or car, place of vacation), the organization of money, types of relationships with the spouse, forms of communication and types of initiatives by sex. Finally, some conclusions will be presented in the light of the mentioned problem.

ENGELMANN, WILSON (*Universidade do Vale do Rio dos Sinos*)

What Do We Eat? What Are We Going to Eat? New Challenges in Terms of Technological and Scientific Advances in Food Production

Advances in techno science focused on food production have fostered a race among investors in this field, in view of future markets, especially in relation to the use of transgenics and nanotechnologies. New proposals and possibilities for increasing productivity, as well as the promise that hunger can be decimated from the planet, are undoubtedly an attractive discourse that ends up co-opting several sectors of society and making it difficult and / or delaying the elaboration of a normalization and regularization about what is produced and how it is produced. Due to the advertisement made for these new foods, a fertile social imaginary has been created in front of this "new world". Transgenic foods and the use of nanotechnology in food production, which results in foods called nanofoods, are the spearhead of this modernization of food production, as they seem to be able to solve numerous problems in this field, creating a new conception of food and modernity in the field of food supply. Based on the results of the research "Nanotechnologies applied to food and biofuels: recognizing the essential elements for the development of risk indicators and regulatory frameworks that protect health and the environment" (Projeto Nanobiotech / CAPES / 2009), developed in from 2009 to 2014, this communication discusses what lies behind this wave of optimism and the challenges that are posed to the social sciences, including the Law, in the face of these innovations in the food field, to the new conceptions of the future that and the contradictions that accompany these achievements, as well as the fact that we do not yet have regulatory frameworks for food products from nanotechnology, which makes the population vulnerable to the possible negative effects they may have on human health and the environment.

Teaching in Ufrgs's Law School: A Gender-Specific Analysis

This study examines teaching profiles and practices in a law school from a gender perspective inside the Brazilian educational context, using the case of one of the highest-ranked Brazilian law schools - UFRGS - as the object of analysis. This case was chosen based on the school's quality and on the recent expansion of the school (2012 - 2017) that allowed more women to get in, both as students and as professors. Brazilian law schools encompass two fields from Bourdieu's theory - the juridical and the academic -, since the faculties are majorly composed not only by full-time faculty members, but also by professionals working within the legal world. Both the juridical and the academic fields, according to Raewyn Connell (2006), are determined by a gender regime. The gender regime defines the way in which gender fundamentally determines any workplace dynamic. The main hypothesis of the study is that men occupy the positions of power and are also able to teach the main courses because they can slide easier between the two fields (juridical and academic). Women, however, must focus on one field to achieve a similar position and equivalent faculty participation. The fieldwork employs a quantitative and a qualitative approach, using secondary data about the law course, taken from the Federal University of Rio Grande do Sul (UFRGS). In line with the sources, the main aspects analyzed are the power positions, the academic qualification and the research area of the faculty.

RC03-68.2SILVER, DANIEL* (*University of Toronto*)KEIDAR, NOGA* (*University of Toronto*)*City Building As a Boundary Object: Lessons from Toronto's Public-Art Ecosystem*

The growth of public art has emerged dramatically in the last century, and particularly through the 1980s with the entry of Percentage for Art ordinances in many cities. Today, thought public art is identified with different values, like community building, enhancing the aesthetics of the built-environment and more (Cartiere & Zebracki, 2016), its integration into policy frameworks across the globe is seen mainly as an economic tool to compete to attract business and capital (Speight, 2016; Saukkonen, 2013). However, in practice "city building" is a heterogeneous process, and the operation that takes place during the production of public-art involves multiple stakeholders, who embrace different sets of perspectives and professional tools. Instead of assuming that aesthetic, social and cultural values, are being washed-out and trumped by economic logic alone, we suggest analyzing public-art as a Boundary Object (Star and Griesemer, 1989; Leigh-Star, 2011), an entity which is plastic enough to be used independently by different parties, while maintaining a common identity among them. We explore Toronto's public-art ecosystem by using 30 interviews and two focus-groups with main players, including public-art officers, planners, city councilors, developers, not-for-profit stakeholders, artists, architects, art consultants, and the public itself – who are all operating together to produce public-art in the city. By mapping their positions regarding the way public-art should be operated and the way they translate their perspectives to one another, we show how stakeholders with diverging interests and perspectives operate together without necessarily reaching a consensus.

RC07-157.1SILVER, DANIEL* (*University of Manchester*)*How Everyday Radicalism and Contemporary Municipalism Can Create More Democratic Futures*

The need for radical democracy to transform the political economy and urban governance feels as urgent as it does distant. Recent scholarship and activism has located the 'everyday' as a prime site of radical politics. This is a critical sociological perspective of the everyday, in which the social becomes integral to political struggle. Pre-figurative politics imagine the future through practising it in the present in order to advance change. It holds much potential for providing immediate improvements in peoples' lives and a shift towards a more just society through re-invigorating the imagination of radical democracy. The promise has not been fully realised.

This paper aims to explore the potential of pre-figurative politics through articulating the concept of 'everyday radicalism' and how this can be connected with with contemporary forms of radical municipalist public policy and institutions. Drawing on an action research project with a women's group in Manchester, England, the paper will argue for democratisation of the concept and practice of pre-figurative politics by opening it up to include DIY social action. It will argue that evidence of alternative practices can be connected to democratic institutions through the development of a more radical form of evaluation alongside contemporary innovations in municipalism. It is hoped that this can contribute towards the aim of creating a new political purpose for sociology (Back and Puwar, 2012).

RC03-78.4SILVERMAN, EMILY* (*Hebrew University of Jerusalem*)SHMARYAHU-YESHURUN, Yael (*Ben-Gurion University of the Negev, Israel*)*Urban Kibbutz: A Framework for Social Sustainability in Rapidly Urbanizing Countries?*

The term 'urban kibbutz' describes a phenomenon in which young adults, searching for a meaningful way of life, commit themselves to living communally in a disadvantaged urban neighborhood. Seeing themselves as catalysts for social justice, they share an ideological mission to reduce social gaps through work in education, environment, arts and social services. There are over 200 of these communities today in Israel, with about 11,000 members and children, and differing levels of ideological, economic and social collaboration. Under what conditions might this practice contribute to sustainable urbanism in other countries? This paper reviews the characteristics of the urban kibbutz and the factors correlated with their social impact and stability. We then present new findings about the role of the municipality and the state, identifying four key avenues of support: land allocation and land-use planning; mediation with local populations; fundraising, employment and leadership training; and housing policy that reduces the risk of displacement from gentrification. Adaptations of the urban kibbutz framework may be appropriate in rapidly urbanizing countries with national civic youth service and a communitarian or nation-building orientation.

RC06-141.1SILVERSTEIN, MERRIL* (*Syracuse University*)BENGTON, VERN (*University of Southern California*)*Intergenerational Transmission of Religiosity and Social Values over Historical Time*

This paper examines variation in the strength with which religiosity and social values are transmitted across family generations as a function of historical time, cohort membership, and age, as well as change in family structure. Using data from the Longitudinal Study of Generations, we examine more than 3,000 intergenerational dyads consisting of parents and children surveyed between 1971 and 2016 to discover whether rates of transmission have declined across time and between three cohorts of generational pairs. An important explanatory variable is whether parent-child relationships are biological or step. Religiosity is measured in terms of beliefs, attendance, and denomination. Social values are measured as those representing individualism and collectivism. Multilevel models are used to predict variation in parent-child correlations based on time varying metrics, and differences between cohort pairings and bio-step type of relationship. The analysis expands our understanding of whether intergenerational continuity in fundamental value systems has weakened, and offers possible explanations for this trend.

RC32-581.4SIMOES, SOLANGE* (*Eastern Michigan University*)*What Does Feminism Mean to You? Are You a Feminist? Brazilian Activists Defining Feminism, Gender Inequality, and Women's Empowerment*

We look into the various ways activists from a wide range of civil society organizations and state agencies define feminism, see themselves as feminists or not, and perceive gender inequality. The paper draws on two surveys of representative samples of delegates – representing trade unions, political parties; environmental, black and indigenous NGOs and LGBT and women's and feminist organizations – to the III and IV National Conferences for Public Policies for Women organized in Brazil by the Special Secretariat for Policies for Women in 2011 and 2016. The conferences brought together delegates from all over the country – large metropolitan areas, small towns, farms and remote areas in the Amazon rain forest – representing civil society as well as the public sector, and elected through local and regional meetings that drew the participation of over 200,000 activists to draft the National Plans of Policies for Women. We analyze the answers to the surveys' open-ended as well as closed questions that probed into the ways the respondents defined feminism, their first contact with feminist ideas, and the space they saw for feminism within a wide range of social movements and civil society organizations as well as within the public sector. In addition to the descriptive analysis of the definitions of feminism by activists in a wide range of organizations, the paper also explores possible correlations and causality between those definitions of feminism and factors such as the activists' gender identity, sexual orientation, education, religion, age, race, marital status, number of children, work situation, class, political orientation, party affiliation, civic engagement and political activism in a very wide spectrum of political parties, trade unions, NGOs and social movements (black, indigenous, environmental, LGBT, religious, student). In sum, the paper explores links between activists' views of feminism and emerging intersectional locations for feminist praxis.

RC51-855.1SIMON, KARL-HEINZ* (*University of Kassel*)*A Brief View on Systems Approaches in Human Ecology*

In several conferences organized by the German Society for Human Ecology (DGHE) and in sessions in conferences of the Society for Human Ecology (SHE) different paradigms regarding knowledge integration and responsibilities are considered. There are several approaches, that can be organized in a system of system methods (Keys) having their roots in different scientific disciplines. Especially the social science context and the natural science context bring forth different views on the role of the observer. An important issue is whether the endeavour aims at systems engineering or systems intervention.

In Human Ecology, some „schemes“ are of influence, e.g. the POET-scheme (Population, Organization, Ecology, Technology) or the Steiner triangle (Environment, Society, Human Beings), with which the complexity of problem situations in human ecology could be handled. Other well-known approaches work with the System Dynamics methodology. In all these conceptions, the role of the observer is either ignored as an independent entity, included as an inherent part of the system, or conceptualized as an influential system component, e.g. on a meta-level, responsible for necessary differentiations, like, for example, the fundamental divide between system and environment.

We will start with the variety of system approaches and discuss how they are related to concepts of the observer and the challenges that second-order cybernetics is raising.

RC51-847.4

SIMON, KARL-HEINZ* (*University of Kassel*)

Dror on Actors and the Capacity to Govern

From the very beginning the role of the actor was an important concept in cybernetics. Whereas classical approaches, first-order cybernetics, kept up to externalize the actor, second-order cybernetics tries to include the actor into the (material or epistemic) feedback loops. In first-order cybernetics the definition and adjustment of goals in control behavior is not part of the control structure. Only the activities of an actor in changing the actuating variable (stellgröße) are included. Second-order cybernetics is based on a much broader picture of the interactions between problem, feedback loop, and goal-seeking processes. In social system theory the concept of the observer plays a similar role. Complexity is increased by introducing 2nd and 3rd order observers when trying to explain social situations.

The role of actors is an important issue in sustainability research and politics. Suggestions for agency alternate between appeal to individual, concerned people, and attempts to design new technical and social frameworks. Change agents, for example, are addressed as those to have the crucial influences on future strands of development. Up to now, these are conceptualized in a first-order mode, reflecting neither the origin of their ideas nor the function they have for adjusting social systems to changing framework conditions. A second-order perspective could contribute to approaching these questions in a wider perspective.

There is an important report, yet widely ignored, by Y Dror on the Capacity to Govern. Cybernetic theory and epistemology does not play an important role in his conceptions. However, it seems helpful to re-interpret some of his suggestions applying cybernetic concepts. Especially the differentiation of actors and their role in change processes will contribute to a better understanding of sustainability strategies.

SIMONA-MOUSSA, JEHANE* (*University of Neuchâtel*)

BRULÉ, GAËL* (*University of Neuchâtel*)

Measuring the Impacts of Resilience on the Level of Subjective Wellbeing of the Elderly in Switzerland.

People aged 60 or older are often considered as being economically and socially vulnerable. Most of them are out of the labour force and their economic resources (e.g. pensions, rents and cumulated wealth) are sometimes too scarce to maintain a good level of quality of life. In addition to this, many individuals experience a reduction in their social capital when they retire because they have fewer contacts with colleagues and friends. Consequently, a clear majority of this group experience more often feelings of loneliness, isolation or depression compared to those who are still active on the labour market. Therefore, resilience to possible negative life events, such as the death of a closely related person, the occurrence of a severe health problem or the onset of a disability status, is crucial to preserve a decent level of subjective wellbeing for these people.

This paper aims at identifying which resources (i.e. presence of a closely related person, family and friends, economic assets) allow people aged 60 or older to buffer the negative effects of a critical life event. This study provides insights on the resources that can be mobilised to overcome a negative event, and resilience is evaluated from the perspective of subjective wellbeing.

For the analyses, we use the Survey of Health, Ageing and Retirement in Europe (SHARE). Data are available since 2004, and six waves are currently at our disposal (2004, 2006, 2008, 2010, 2013 and 2015). Models are estimated for each individual, before and after the occurrence of a negative event, using fixed-effect regressions.

SIMONOVA, OLGA* (*National Research University - Higher School of economics*)

Capitalist Heart: Rationality, Emotion and Alienation in Late-Modern Societies

My main question is whether sociology of emotions can say anything new in understanding the ratio of rationality and emotionality in modern society? Do modern societies promote affective neutrality, thereby creating alienation of a person from his/her own feelings and from other people? How does he/she adapt? Is the demand to be rational in all spheres of life turned into irrationality and violations of social norms?

Based on the analysis of works on the sociology of emotions we can conclude that sociologists argue the rationality of thinking and action is impossible without emotions. Also in according to the values of capitalist society individuals restrain

their emotions in order to appear more rational, that is, reasonable, normal. This trend becomes dominant and widespread, what T. Parsons called "secular instrumental activism": individuals control their emotions in both the private and public spheres of society in accordance with a rational and utilitarian worldview. This is evidenced by numerous sociological works on emotion management in sphere of intimate relationships and public sphere of work (and other contexts such as science, sport, social protests etc.) where individuals combine rational choice and their emotions. That's why this kind of capitalism was called "emotional capitalism" (Ellouz, 2007).

Thus the sociology of emotions describes the modern man as permanently controlling in accordance with the instrumental rationality. It seems that alienation from feelings is brought up in modern man, who develops in turn adaptation behavior strategies. However, there is still the possibility of irrational reactions both at the level of individual individuals and at the level of society as a whole: in the form of crimes, protests, moral panics, rejection of important activities for society. So the one of the tasks of the sociology of emotions to research the social consequences of rationality based dispositions on human emotions.

SIMONOVA, OLGA* (*National Research University - Higher School of economics*)

T. Parsons on Fascist Movements: Lessons of Classic and the Contemporary Moment.

A small work written by Parsons more than 50 years ago about sociological aspects of fascist movements (Parsons, 1954) becomes actual and topical at the moment. There is reason to believe that today there are also conditions for the success of radical movements, and not only in Russia, but elsewhere in the world. In this paper Parsons tries to explain the success of fascist movements in Western Europe in the first third of the twentieth century, describing the rational and irrational aspects of the movements. Parsons explains the strong commitment of masses and elite groups to these movements by the combination of reactions to the development of industrial capitalism (and its consequences in the form of anomie, weakening traditions, exploitation, alienation and rationalization) and simultaneously to leftist movements, which led to the protection of the traditionalist and conservative political course, based on ideology of national superiority and hatred of others. Emotional reactions are also important here, which are often not always realized: fascist movements evoked a strong affective commitment, which is explained by the desire of ordinary people and elites to gain security, a normative support and a clear world image.

Parsons' analysis allows us to conduct many analogies with the modern world. The protection of the interests of capitalism and democracy can also be carried out in radical ways in modern risk societies. The uncertainty of the modern world and the resistance to globalization and westernization can generate strong conservative sentiments and, accordingly, new social associations, actionism, protests, social movements, based on the aspiration of the masses and elites to maintain social order in radical ways. Such sentiments and associations can arouse hatred not as an acute short feeling, but as a prolonged background mood, which can become quite strong in the pursuit of gaining social order and security.

SIMPSON, ALEXANDER* (*University of Brighton*)

Speed, Intelligence and Discipline: Embodied Strategies in Becoming the Market

Drawing on a three-year institutional ethnography of financial life in the City of London, this paper critically explores the performativity of market life to examine the way in which financial actors engage in a competitive struggle to embody and become the market. Entwining practice and symbolic power, the financial marketplace is a naturalising repetition of perceptions, aspirations and practices that impact on the body (Bourdieu, 1990; 1977a). The unending trial of market competition forms a naturalising force of economic progress and social development that ensures that the 'the most intelligent individuals' are 'continually selected', while weakness is punished. Placing the body at the centre of understanding financial life, individuals must control the unpredictabilities of the market by becoming 'at one' with its speed and flow. Those who succeed become part of a 'separate, sacred group' that ritualises their own exclusivity and adherence to the embedded values of the market (Bourdieu, 1996). Specifically, this manifests as a common internalisation and embodiment of a ruling system of market capital; *speed, intelligence and discipline*. Exploring each of these in turn, this paper follows Fiske (1993) by investigating the impact financial institutions have on the body. It is at the level of the body where social life is turned into lived experience and institutional culture is crystallised into a set of embodied practices. In the context of the City of London, the process of becoming enables market actors to fine tune their skills in order to hone in on and control the rapid fluctuations of the market in the pursuit of profits. This comes together to uphold the integrity of the market and engenders an internalised 'way of being' in which market actors share an 'inherent' ability to 'feel the market' as a 'basic connection rooted in their souls'.

Polish Youths' Motivations for Military Service

The new wave of discussions about relationship between military and society has started in Poland since suspending conscription and introduction of professional military service only. One of the two main issues was to have enough reserve troops for wartime mobilization. The second one is the problem of possible emergence of military "caste" and focuses on establishing the links between society and military. The main topic of our presentation is the attitude towards different forms of military service and military training among Polish youths. The presentation will be based on the surveys conducted by or done for the Military Office of Social Research (Military Center for Civic Education), including representative research of university level students (N=2000) and other representative or all-population research projects on youths, including military training participants. The results coming from these studies show that factors determining interest in military service are difficult to identify. Traditional variables used for describing place in the social structure are only partly useful in predicting interest in military service. Traditional set of values composed of patriotism, conservatism and hierarchy are weak predictors of military service interest too. The hypothesis is we may face another set of motivations pushing young people towards some forms of military service. In our paper we will test two different ones: career orientation hypothesis and adventure orientation hypothesis.

SINGER, BRIAN* (*Glendon College, York University*)

Populism and the Separation of Knowledge and Power

Ernesto Laclau in his book *On Populist Reason* claims that a proper comprehension of populism provides a key to the intelligibility of democracy. And yet populism appears to trouble democracy. This is not so much a matter of its content (the claim to represent those who see their concerns as derided by an established elite) as a matter of form resulting from the torsion of characteristics central to democracy's symbolic order. Drawing loosely from Claude Lefort this torsion can be examined under four rubrics: the division of political representation between representatives and represented; the institutionalization of internal conflict; the separation of power from law and knowledge; and "the dissolution of the markers of certitude." Most analysis of populism concentrate on the first two rubrics: the populist leader seeks to close the division between representatives and represented by claiming to embody "the people," as constituted through the externalization of internal political debate. In addition, there is considerable discussion of populism's attempt to reduce the separation of the law from power as it seeks to overcome the limits placed by the former on the exercise of the latter. Much less has been written about the separation of power and knowledge, and the problem of uncertainty. With the campaign and election of Donald Trump, however, we are now faced with a "post-truth" world, and what Naomi Klein calls the "shock doctrine." Having established this theoretical framework, I wish to turn to a brief look at the relation of power to knowledge. Does it make sense to speak of "populist reason"? Does Trumpian populism have a relation to any form of knowledge beyond expressions of indifference or hostility? Can Trumpian populism be described as post-modern? Can we speak here of an "ideology"? And what are we to make of the resort to "conspiracy theories"?

Securing, Leveraging and Sustaining POWER for Street Vendors of India

While street vendors have always been there providing goods and services to millions at an affordable rate on their doorsteps since time immemorial, erosion of the rural livelihood base, growing informalization and unabated urbanization suddenly increased their numbers in Indian cities in the 1990s. Despite the fact that these workers contribute significantly to the urban economy, they have faced and often continue to experience humiliation, continual harassment, confiscations and sudden evictions. It became imperative to advocate for their rights through the formulation of appropriate policies, the enactment of relevant laws, and the provision of adequate social protection benefits. The National Association of Street Vendors of India (NASVI) played a pivotal and catalytic role in transforming street vendors from non-entities to a formidable force to reckon with. Using the theoretical framework of power resources and capabilities, the paper aims to reflect on the process of this transformation. This paper is based on existing published works on the street vendors' movement in India, a series of key informant interviews and a national consultation with stakeholders, the paper

demonstrates that innovative organisational structures, distributive leadership approaches, and the holistic understanding of the need of the vendors brought various social actors together which, in turn, developed associational power. A series of studies, media campaigns and advocacy activities advanced discursive power with the help of framing and learning capabilities which have helped to positively frame issues related to street vendors in the psyche of the public in general and policy makers in particular. Thus, increasing associational and societal power paved the path for establishing institutional power in the form of national policies such as the Street Vendors Act 2014. The paper sums key lessons learnt from NASVI's journey.

Challenging Hegemonic Cultural Tradition of Ghurchari in Haryana

CHALLENGING HEGEMONIC CULTURAL TRADITION OF GHURCHARI IN HARYANA

Bhup Singh, Associate Prof, Sociology, D.G.C., Gurugram
Kathoupinishad describe the meaning of chariot and in marriage bridegroom riding female horse. The use of female horse not only suggests patriarchal intention to domesticate the wife but also control the women. On the commencement of the Indian constitution they become equal Indian, equal citizen in all aspects of life. They become aware of self respects, dignity and their rights enshrined in the Indian constitution. The upper castes or greater Indians still treat them as lesser Indians and expect them to stay at bottom of the society. Recent caste conflicts on marriage ritual of ghurchari i.e. Dalit groom and family member seriously injured during ghurchari (Jatu Luhari 2002) upper caste men prevented dalit groom from riding elephant, (2011), killed in (2013) (Devsar) upper caste men beat dalit groom and stopped him to perform ghurchari (2013, Ratera) upper caste youth barred dalit groom from carrying out ritual of Ghurchari (Sanjarwas, Ch. Dadri), violence broken out in village Sangha, Karnal after upper caste youth prevented dalit youth from performing ghurchari (2017) etc. clearly reflects social position of lesser Indian in India.

For present study, 5 atrocity cases i.e. Jatu Luhari, Ratera, Devsar, Sanjarwas, Sangha were selected and 100 respondents were selected on basis of their relationship with family and involvement in protest movement. Data was collected through interview schedule focusing on knowing social base of hegemonic power, protest ideology, role of police and social organization in these cases.

After data analysis we can say that mostly such atrocities are committed in Rajput dominated village not in Jat/Ahirs/Brahmin dominated village. Role of other castes, influential people, police, administration is selectively biased toward lesser Indians.

Key words: Lesser Indian, Ghurchari, Hegemony, Protest Ideology

Social Consumption of Alcohol As Leisure Activity and Its Role in Social Networking of Lesser Indians

SOCIAL CONSUMPTION OF ALCOHOL AS LEISURE ACTIVITY AND ITS ROLE IN SOCIAL NETWORKING OF LESSER INDIANS

Bhup Singh, Associate Professor, Sociology, D.G.C. Gurgaon, Haryana

Leisure time in leisure activity is generally characterized by liberation from constraints associated with job, domestic work and social obligations. Due to emergence of affluent middle class among lesser Indians who are beneficiaries of welfare policies of successive governments, social consumption of alcohol has increased since last decade among lesser Indians. Like other social bonding activities, social consumption of alcohol is leisure activity which helps networking, mentalising and socialisation lesser Indians with social issues and literature related to them to counter the onslaught of hegemonic forces and reconstruct their world view about themselves and society.

This study was planned to find social consumption of alcohol as a leisure activity and how this promotes social bonding, networking, and assertion among lesser Indians. 100 core members of various organizations of lesser Indian working in Rohtak were selected on the basis of their continuation for at least one year in such leisure activities. The data was collected through interview schedule and participatory observation on leisure time, consumption pattern, initiation, frequency, brand, reciprocal expenditure and interaction pattern during this period.

After data analysis it can be said that social consumption of alcohol as leisure activity has positive impact as other social bonding activity. Members of these groups feel more engaged, trusted and relaxed. No health problems were reported among these members. R.C., Black Dog, Teacher's Choice etc. are most favourable brands. Curiosity and peer group pressure was reason for initiation. Subaltern thinkers i.e. Lord Buddha, Guru Ravi Das, Saint Kabir, Jyotiba Phule, Dr. B.R. Ambedkar, Manyawar Kanshi Ram etc. are part of discussion.

Key words : *Leisure, Social Networking, Assertion, Lesser Indian, Social Bonding*

Socio-Psychological Intervention in the Life of Cannabis sativa Users in Kashmir: A Study of Attitudinal Change

Socio-Psychological Intervention in the Life of Cannabis Sativa Users in Kashmir: A Study of Attitudinal Change

BHUPINDER SINGH¹ & IRFAN AHMAD WANI²

DEPARTMENT OF PSYCHOLOGY, BARKATULLAH UNIVERSITY BHOPAL. (M.P.) INDIA

Abstract

The present study tries to analyse how often social factors are responsible to manipulate the cannabis usage among Kashmiri youth. What are the causes in accord with society that lead the youth to its usage? Is it because of the sluggish attitude of their parents, family members and other societal ties? How often society takes it as serious concern? Has the usage of cannabis become a social acceptance in the Kashmiri culture? Are social agencies working towards providing a safe and suitable environment for the youth? Has the cultivation of cannabis sativa in Kashmir triggered an explosion of drug users? Is the rise due to emotional instability or social rejection faced by youth? The study explores the effectiveness of socio-psychological intervention in changing the attitude of cannabis users. The sample (n=20) was taken from the Drug De-addiction & Rehabilitation Centre, Police Control Room, Srinagar Kashmir, India. The Pre and Post test was used for analysing the data on a single experimental group. The results indicate that the experimental group showed significant differences on the social and family relationship dimensions before and after the application of intervention program. It can be concluded that socio-psychological intervention can be used as an effective tool in bringing about attitudinal change in the life of cannabis users.

Dalit Assertion and the Question of Land Acquisition: A Case Study of Malwa Region of Punjab

In Indian society, land is not only an asset providing economic gains but also pride, prestige and power. Those who are landless are not only dependent on the landlords for living nevertheless face oppression and atrocities much often from upper caste landlords. According to the Socio Economic and Caste Census 2011 Punjab has the highest Percentage (36.74%) of Scheduled caste households in the country. Punjab has 45.34% landless households where as national percentage is nearly 22%. In recent years Punjab, particularly the malwa region of the state, has witnessed political mobilization of this marginalized section of the society i.e small marginal peasants and agriculture labor. For equitable growth of all sections of society the government intervened at the policy level by introducing land reforms in the form of – abolition of intermediaries, tenancy reforms, fixing ceiling on land holdings, consolidation of land holdings and distributing surplus land to landless households and reserving land for the dalits in the common village land. This paper tries to explore that how land ownership changed the socio-economic status of the dalits of malwa region of Punjab and the difficulties faced by them. This paper is divided into five sections; the first section is about the introduction. Second section deals with the socioeconomic profile of the dalits. The third section deals with the types of restrictions and difficulties faced by dalits for acquiring land share and feeling of self esteem, respect and economic gains associated with land. In the Fourth section, the role of various peasant movements and organizations and how effective they have been in all these years, also state's stand will be analyzed. The fifth and final section of the paper concluded the facts and findings.

Participation of Schedule Castes in Panchayat: Field Study of a District in Uttar Pradesh

Abstract

In decentralized states of developing countries with large rural populations, local governance plays a key role in deciding policies that, in turn, affect well-being. But, despite its key role in governing resources within villages, community participation (especially of traditional caste based communities) in local governance decision making is yet a big concern. Prior research on decentralization in various states of India suggests that the social identities play a key role in deciding village polity and local affairs. But little is known about caste based social networks and their impact on participation in local governance (attending open meeting in villages). Over the time, with introduction of reservation based decentralized institutions of panchayati raj (PRIs) have attempted to give a new power

position to vulnerable groups such as women and schedule castes (SCs). Here, I use unique data from a novel mixed-method field experiment on seven villages (N=135 HHs) across seven villages in Allahabad district of Uttar Pradesh, India. This study comes up with quantitative evidence that though participation of SCs has improved (attendance in open meetings) yet active participation (giving suggestions in meetings) remains a concern for the lower caste groups. Additionally, it also assesses the caste based social positions shaping and controlling the social networks and, in turn, how these networks shape the local polity and community engagement. In these villages, households with larger networks significantly shape the local polity and local politicians use these network holders to their favour during elections. The narratives and statistics suggest that social disparities of caste and occupation work through social networks. Reservation based system of local governance has given rise to the inter-caste tie-ups leveraging local politicians and doing a marginal favour to SC communities as whole.

Globalization, Gender and New Media: A Study of Facebook Users in a Developing Country

Globalization is a process which is transforming developing as well as developed societies of the world in last few decades. The new communication technologies play an important role in facilitating the process of globalization. The modern mass media have also been globalized by adopting new communication technologies. The new media differ from the modern mass media in two ways: firstly, it is based on computer and internet and enables the user to interact with other persons located in any other part of the planet earth in comparison to limited time and space dimension of modern mass media. Secondly, new media is global in nature and connects people on the principle of network. In this sense globalization and new media are interrelated. New media has been emerged as an important force transforming the people of the different societies in a variety of ways. Women, who have been dominated by the patriarchal structure and cultural milieu, are now exposed to the new media (also known as social media) in last two decades. The smart phone and other computer and internet based devices have revolutionized the social, economic and cultural sphere of women's life in the recent past. The exposure of the women to new media has empowered them to a great extent and now they are able to take their own decisions and express themselves in the wider society through different forums like, Facebook, Twitter and other social networking websites easily available to them through their smart phone/laptop/desktop/i-pad etc. The present paper makes an attempt to understand the role of social networking websites in the empowerment of the women in India. The paper is based on an exploratory study of the patterns of interaction of the women on the Facebook.

Socially Just Teacher Education: Talis, a Way Forward

Teacher education in India is a rather young field, so this transitional phase is experiencing variety of new endeavours which fading soon. Result of developments and changes in last century, during colonial rule and post republic era, left various imprints on teacher education system throughout the country. Variability in the structure and function of teacher education in India poses a problem for the countrywide quality teacher education development process in the country.

Teaching and Learning International Survey (TALIS) suggestions and conclusions along with directed research study can help in providing a common framework for teacher education in India. Suggestive measures and comparative understanding of the 2 cycles of TALIS, which was conducted in 2008 and 2013, together can enhance understanding about teacher education system, its nature and development.

A common teacher education system aimed at developing a quality infrastructure with better functioning to raise level of teacher education programme in the country. Composition of an alternative holistic approach may create barrier for individuality or regional diversity, therefore it seems a need of time for a common modal for teacher education enshrined with principle of equity and inclusion. The research is undertaken to ensure inclusion of regional and nativist voices with their beliefs, practices and socio-cultural-historical context which provide separate identity to a culture and its people.

The proposed study is mixed method in nature that includes voices of not less than 300 participants from the field of teacher education, both at beneficiary and facilitator level. Questionnaire, interview and focused group in a sequential manner is collected. TALIS suggestions along with field analysed data will be compared and combined to reach some understanding with pragmatic approach. To deal with policies, planning it deals with secondary data, literature and different policy framework of teacher education. The study is suggestive in nature.

Communication, Rural Development and Technology: A Sociological Viewpoint

Improving quality of life and achieving desirable socio-economic well being of the people is the main objective of rural development. It becomes more and more pertinent with reference to the people living in isolated and remote rural areas. This process is strengthened by the effective use of communication technologies and imparting knowledge to the farmers at grass roots level. Hence, the agency of change for rural development is communication and technology. The key of agricultural development lies in the mind, heart and hands of farmers. It is the modern technology, which opens the door to innovative and productive agriculture. A steady flow of accurate, understandable, factual information to the farmers is most feasible way to bring development and well being. Effective communication system plays important role in the growth of agriculture. This can be possible by using channels of communication such as newspaper, radio, television, cable, internet, mobile etc. Thus media exposure has become one of the important indicators of modernization and brings rural development.

This paper argues that the effort to this end is possible through communication and it act as an agency for change. Imparting new agricultural knowledge requires channels of such agencies for effective communication to the farmers at grass-roots level. Further, it focuses on how mass-communication should be used and utilized for rural development. For better agricultural output effective use of media and communication is essential. On the basis of exploratory and descriptive analysis the paper further argues that knowledge explosion can bring rural development, which is possible through mass media and technology. Besides this other effective and significant ideas pertaining to new agricultural technologies must reach at grass-roots level for use of the farmers.

Key words: Communication, Development, Knowledge expansion

SINGH, VIRENDRA PAL* (Centre for Globalization and Development Studies, IIDS, University of Allahabad=211002)

Globalization and the Emergence of New Communication System and Culture: A Conceptual Framework

Globalization is closely linked with mass media communication which itself is transforming with the integration of various modes of communication into an interactive network. The formation of a hypertext and meta-language integrate into the same system the written, oral, and audio-visual modalities of human communication. The integration of text, images, and sounds in the same system, interacting from multiple points, in chosen time (real or delayed) along a global network, in conditions of open and affordable access, does fundamentally change the character of communication. Thus the emergence of a new (electronic) communication system characterized by its global reach, its integration of all communication media and its potential interactivity is changing our culture. One of the major components of new communication system, the mass media communication, structured around television which resulted into globalization and decentralization of mass media communications interplaying with culture and social behavior. It has transformed the media and helped in evolution of multi-media system in the 1990s. With advent of internet, different systems of communication organized around computer networking and the surprising, spontaneous development of new kinds of virtual communities. The merger of these two communication systems has far reaching consequences for the structure and culture of contemporary societies and the culture of real virtuality is now emerging whose contents, dynamics and significance have to be understood in context of developed and developing societies. In what ways this transformation is taking place in contemporary Indian Society is the major focus of the paper.

*Distribution, Acquisition and Reclamation of Land and Sustained People's Protests and New Alliances in Rural West Bengal, India***Distribution, Acquisition and Reclamation of Land and Sustained People's Protests and New Alliances in Rural West Bengal, India**

Since late colonial period the agrarian society of West Bengal, India has been replete with sustained people's protests against land alienation, land concentration, and land acquisition on the one hand and for land reforms and distribution and land reclamation on the other. In the process it has borne witness to the outburst of several radical and reformative peasant movements over the decades. Significantly a vast segment of these people's movements have got transformed and now has developed alliances with state machineries, political parties, and civil society organizations having interface with caste, religion, regionalism, and linguistic etc identities. With the increasing migration of rural labour force

to the nonagricultural sector and in urban areas, fast expansion of education, road, transport, mass and social media, ICTs, etc in the rural areas the need and possibilities of new alliances both at the grass roots and with the wider society have emerged to be very explicit. These altogether have brought a new variety of emancipatory and transformative politics at grass roots. Hence against the backdrop this paper will examine the 1) roles of the populist politics in shaping new alliances for political movements in contemporary West Bengal, 2) the emerging nature of intersectionality between caste, class, gender, ethnicity, nationality etc identities in the process of realignment of rural forces, 3) emergence of new discourses, issues and practices generated out of new patterns of resistance, interactionality and alliances in this society, 4) forms of connectivity of these rural movements with the related local, regional, global movements.

Saffronizing India: A Study of Hindutva from a Social Psychological Standpoint

The purpose of this project is to analyze how Hindutva organizations construct images of in-group and out-group. I argue that understanding the construction of these group images can guide us to understand how symbolic boundaries are drawn between these groups. The theoretical framework for this project has been drawn from the Social Identity Approach as well as boundary research. I use case studies of two Hindutva organizations—Rastriya Swayamsevak Sangh (RSS) and Viswa Hindu Parishad (VHP). Hindutva organizations are those which believe in Hindutva ideology—uniting Hindus and establishing India as a Hindu nation. I use Qualitative Content Analysis method to analyze the contents of these organizations' websites. I find that both the in-group and the out-group are portrayed as homogeneous. Moreover, the image of the in-group is drawn as superior, tolerant, and compassionate, while the out-group image is cast in a negative, "inhumanized" light. The out-group is perceived as a threat to Hindus and Hinduism. Finally, I find that symbolic boundaries are drawn between the in-group and the out-group on the basis of morality and national culture.

The Anti-Racist Turn in the Struggles Against Violence in Brazil

Brazil is one of the most violent countries in the world. Facing different forms of violence, social movements denounce, protest and propose ways to understand the frames of violence and modifies them. This paper focuses on *anti-racist turn* in social struggles against violence, conducted by black and youth social movements, family members of victims of violence, but also incorporated by a part of the sociological and legal literature. This study points to changes in interpretations of the phenomena of violence and social control - in particular, homicides and incarceration - where the racial approach emerges progressively in articulation with the class approach. The methodology is based on two strategies: a) review of recent literature; b) case analysis of great social mobilization against violence, using interviews with human rights activists, public officials, as well as press material. The *anti-racist turn* means a change in classic terms of sociological interpretation, combining the racial dimension with the class analysis. It points to the inclusion of new bibliographies in Brazilian studies, intensifying the theoretical South-South dialogue and dialogue with black American intellectuals. Points also to the connection of Brazilian social movements with international anti-racist movements and the critique of punishment.

Russian World Cup-2018 and Corporate Power.

The paper investigates the corporate interests and strategies in promoting and organizing FIFA World Cup-2018 in Russia. Sport is viewed from the perspective of business that is, built on the logic of capitalism, and its impact on everyday social life and including sport and leisure consumption. The paper focuses on corporate sponsorship, advertising campaigns and political lobbying, to highlight the logic of capitalist monopolies within the global sport industry, specifically sport mega-events. Increasingly leisure time, both globally and in Russia, influenced by the media, corporations and the governments who seek revenues from the consumption of sport both in terms of participation and spectatorship. The main corporate sponsors of Russian sport are oil and gas companies (Gasprom, Lukoil, etc), metal companies (Severstal, Norilsky Nikel, etc), and financial and banking structures (Sberbank, VTB24, etc). Many of these corporations are deeply embedded in Russian political power, lobbying their business interests resulting in a tendency to merge state and corporate business interests. The sport industry, including football, is a rapidly growing sector of Russian business especially as sport becomes more global. This paper concerns the global developments and changes in geopolitics, focusing on the rising confrontation of the West with Russia. Following the recent global financial crisis there has been a tendency

to locate international sport mega-events, particularly football tournaments, in countries with developing economies that often lack the power of financial capital, like BRICS states (China 2008 Olympics, Brazil 2016 Olympics, Russian 2014 Winter Olympics, South African 2010 FIFA World Cup, Brazil 2014 FIFA World Cup, India 2017 U-17 FIFA World Cup, Russia 2018 FIFA World Cup, etc). Despite the social inequalities within hosting states and even admitting the social value of developing sport facilities for mega-events, corporations use their power to subjugate sport to business interests.

Sociology and Power: Analyzing the Destiny of Nikolay Andreev, Who Bridges Pre-Revolutionary and Soviet Traditions.

The Russian experience of the 1917 Revolutions and radical reshaping of the political landscape sharply influenced the trajectory of sociology as a discipline and biographies of Russian sociologists. Some like P. Sorokin went abroad, some like N. Kondratiev died in prison, but others made their career in soviet academic milieu. This paper presents an analysis of early soviet sociology opposed to conventional wisdom about the first Soviet decades. A recent surprising archival discovery provides new material for deepening and reconstructing the knowledge on initial stage of sociological tradition in the USSR Investigating the biography of Nikolay Andreev demonstrates that employing Marxist thought seriously and systematically in Soviet sociology was hard and risky road. Educated at Heidelberg University during the early 1900s he was among the founders of Russian sociological society in 1916. Although he was an active member of Russian Social-Democratic Party in combat against Tsarist power, after 1917 he broke with political life and focused on academic career that was not free from political pressure. During 1920-1940 Nikolay Andreev had given sociological lectures in various Universities of Leningrad. His publications were devoted mainly to the topics of sociological theory (particularly crossroads of history and sociology), problems of culture, religion and rural society in Russia. He suggested the original justification of the method of historical materialism and introduced on its basis the main problems of sociology. My paper will offer an account in rethinking the development of sociology in Soviet society.

The "Frankfurt School" of Biographical Research – Theoretical Reflections on Reconstructive Research Methodology

Grounded in phenomenology, symbolic interactionism, ethnomethodology and hermeneutics, the biographical research approach was developed as an alternative to a positivistic research tradition that was basically interested in measuring social phenomena and the testing of hypotheses in the sense of a logic of subsuming data under preconceived theory.

In contrast, the biographical research approach made it possible to gain access to social life worlds and social phenomena through the reconstruction of narratives of experiences. It opened up a new theoretical and methodological way to research social micro, meso and macro structures as embedded in biographies and thus learn about the effects of societal structures on the lives of individuals. Additionally, the biographical research methods need to be understood as a part of a larger research stream of a reconstructive research tradition. A basic assumption of the reconstructive tradition is that it is possible to find traces of broader social phenomena already in a single case study. Methodologically, this means that a single case study has to be researched in its 'wholeness' in order to reconstruct the intermingling of agency and social structures.

The emergence of reconstructive research logics in the social sciences goes back to the Frankfurt School and to Adorno's critique of positivism as a social-scientific research approach. Adorno underlined the importance of analytical interpretation in order to go beneath the surface of phenomena. The reconstructive research tradition was developed further in Frankfurt in the 1980s and 1990s by Ulrich Oevermann, who integrated central concepts from Adorno's thought into what he termed "objective hermeneutics", which has also strongly influenced the methodological debate about biographical research.

In my paper I will discuss and reflect on the theoretical influence of the "Frankfurt School" for the methodological debate in reconstructive biographical research.

Gender and Migration – Sexism and Racism: A Closer Look at Right-Wing Populist Dynamics in Germany

In the German federal election of September 2017 a new party, the (far) right-wing populist Alternative for Germany (AfD), made its way to the Bundestag, the

German National Parliament. Electoral studies have shown that the AfD is largely supported by German men. On the other hand, there is no one charismatic male leader. Instead, several women have 'successfully' shaped and still shape the public image of this right wing party (Berbair et al. 2012). At the same time, regarding the programmatic dimension, the AfD uses "(anti-)gender" (Hark/Villa 2015, Kuhar/Paternotte 2017; Villa 2017, Siri 2015) rhetoric, stances, and campaigning as "symbolic glue" (Kovats/Poim 2015) to link heterogeneous ideological positions, reaching from economic neoliberalism, outright neo-nazism, fundamentalist catholicism and protestantism, and racist islamophobia as well as national conservatism. All these different ideologies are part of the mélange of the AfD's program, and while they seem to have little in common at the first sight, we will argue that '(anti-)gender' works as their shared ideological space.

In our presentation we include quantitative as well as qualitative data from different elections in Germany. We argue that the AfD is – much in contrast to the dominant media narrative – not a protest-party, whose basis are the working poor, and globalization losers. On the contrary, data shows that cultural aspects, such as precisely anti-gender and anti-migration rhetoric, aesthetics, and promised policies are highly relevant. Comparing speeches and party platforms we will also discuss how gender and migration are interwoven in the powerful construction of a migrant "other", i.e. the "Arab Man".

SIRRIYEH, ALA* (*University of Liverpool*)

Saving By Drowning: The Politics of Compassion in Asylum Policy Discourse

There has been extensive discussion of the now all too familiar hostile attitudes expressed towards undesired migrants and refugees in many societies that receive them (Wazana, 2004; Anderson, 2013; Chavez, 2013; Jones et al, 2017). In this paper, it is maintained that in the context of the rise of a cultural and political script of humanitarianism (Berlant, 2004; Fassin, 2005; Ticktin, 2014) a discourse of compassion has also been present in political debates about 'undesired immigrants' and refugees. It is argued that a discourse of compassion has been used by both implementers and opponents of restrictive immigration and asylum policies, often building on the colonial origins of the use of this discourse in reference to racialised others. In doing so, these voices on both sides of the debate have grounded compassion within a relationship of power disparity, control and subjugation. However, there is also evidence of possibilities for alternative engagements with compassion that are grounded in solidarity, and which offer more promising modes of responding to, and resisting, suffering and social injustice. This paper draws on the case of the European, and specifically the UK response, to Syrian refugees discussed in my book *Immigration and Asylum Policy: The Politics of Compassion* (in press 2018), to explore the role of compassion and its relationship to other emotions in asylum and immigration policy discourse. It examines how these manifest in compassionate refusals (justifying deterrence through compassion), compassionate resistance (resisting immigration controls), and resistance to compassion (excluding people from being recognised as deserving subjects of compassion).

Child Brides or Child Labor in a Worst Form?

The early and/or forced marriage of girls under 18 is an important problem that persists around the world and there is increasing attention to the harms that children experience as a result of it. Civil society groups have brought attention to the sexual, psychological, and physical abuse, loss of education, and health impacts that child brides experience. To date, however, scholars and activists have tended to overlook one important aspect of child marriage: labor. Child brides may be expected to perform household, agricultural, and/or other types of work and to care for disabled and older people in the home. Yet because of gendered notions of work and rigid ideas about what counts as formal, informal, and domestic labor, these activities have been seen as the "natural responsibilities" of girls and wives.

In this paper, we argue that child marriage should be understood, in part, as an exploitative form of child labor. We describe the types and conditions of labor that commonly occur in child marriage and assess the usefulness of current international laws, including slavery and trafficking laws such as the United Nations Trafficking Protocol, in adequately addressing the forced labor of child brides. We also make the case that child marriage should be addressed by the International Labour Organization (ILO) as one of the worst forms of child labor and we suggest a legal mechanism, the ILO Convention No.182 (known as the Worst Forms of Child Labor Convention) as one possible way to help to raise awareness in families and across societies about the harms of child marriage and provide for criminal and civil sanctions as tools to combat it.

WG01-938.1SISODIA, MADHU* (*Dav Pg College (BHU)*)*Role of New Communication Technologies in Transformation of Socio-Cultural Milieu: A Study in a Religious Town of India*

Globalization refers to widening, deepening and speeding up of worldwide interconnectedness in all aspects of contemporary social life. Mass media communication had been considered as one of the important variable for the modernization of traditional societies. However, the very notion of modernity is under challenge today. There are two sets of scholars on this issue. One set of scholars are those who hold the view that the project of the modernity is over and beginning of a new epoch of globalization is under process. On the other hand, there are scholars who are of the view that the modernity is not over. Instead it is now transforming itself into a high order. They conceptualize the new stage as *late modernity* or *high modernity* and new communication technologies (NCTs) are at the heart of globalization process. These new communication technologies, based on satellite technology and computer processing technologies facilitate 24/7 connectivity to the users at the planetary level and thus has blurred the time-space dimension and thereby transforming the socio-cultural milieu of both the developing and the developed societies. This proposes to undertake an empirical study to explore the role of NCTs in transformation of socio-cultural milieu of the developing society like India. If globalization is a process of transformation of modernity into a higher order through NCTs, it is important to examine its role in the transformation of socio-cultural milieu of these societies. The present paper is on the changes taking place in the life of the post-graduate girl students (N=50) in the religious town of Varanasi when they are exposed to modern mass media and gadgets of NCTs like smart phone, tablets, i-pads empowered with internet.

RC52-866.3SISODIA, MADHU* (*DAV PG COLLEGE (BHU), VARANASI, INDIA*)*Social Background of Women Police Professionals in a Developing Country*

The growth of professions in India has been a product of modern university education and British system of justice and administration. Indian police force was organized on modern line during the colonial period in order to rule over the local population. Even after independence (in 1947), the structure of police profession has not much changed. The entry of women in police service was neither legally nor socially approved. However, with the growth of modern education among the women and feminist movement, the entry of women at different levels has not only legally been permitted but also gets social approval to some extent. In the last three decades, the number of women in police profession has been increased significantly. This proposes to undertake an empirical study on the social background of women police professionals in a developing country like India. The present paper is based on an empirical study of women serving as police professional in Allahabad and Kanpur. The study is focused on their social background, role performance, working conditions and patterns of adjustment at work and home. The study reveals that there is a direct relationship between the caste and rank order of the women police professionals. They have been a victim of gender discrimination not only at their work place but also outside it. They also have certain problems of role adjustment not only at their work place but also in their family life.

RC22-407.3SITHARAMAN, SUDHA* (*Pondicherry University*)*Antinomies of Religious Freedom: Some Implications of the Debates on Triple Talaq in India*

In India matters concerning family such as marriage, divorce, maintenance, inheritance, succession, adoption and guardianship are governed by personal laws, that arguably fit the dominant emphasis of contemporary Indian secularism, namely, the accommodation of religious diversity and guarantees cultural autonomy, particularly, the right to religious freedom, especially for minority religious communities. The paper is an attempt to unsettle the assumption — so ubiquitous in popular and academic circles — that religious freedom is easily recognized and understood, and that the only problem lies in its incomplete realization. The plea is not for an improved definition of religious freedom but to grasp the ways in which this seemingly obvious and neutral right has yielded mutually contradictory and often discriminatory results. Taking the case of unilateral divorce (*triple talaq*) that elicited several protracted episodes of contestation challenging the practice among women's groups, legal entities, religious forces within Muslim communities, the mainstream media as well as the present government, requiring them to deploy arguments for religious freedom. The conundrum over the idea of religious freedom compels us to raise questions on where and how to draw the boundary between religion and secular, which in turn has consequences for the definition and distribution of the fundamental rights and freedoms of citizens and subjects. What is missing when religious freedom is imagined exclusively through the language of liberal rights as a set of

discrete freedoms claimed by individuals or groups from an assumedly neutral and secular state? What claims can and cannot be made regarding religion, personhood, and freedom? In seeking answers to these questions, I shall attempt to show that religious freedom is not a singular, stable principle existing outside of history but is an inescapably context-bound, polyvalent concept unfolding itself within the divergent histories in differing political orders.

RC44-754.4SIU, KAXTON* (*Hong Kong Polytechnic University*)*Labor and Domination: Worker Control in a Chinese Factory*

China's export-led manufacturing model has been built on extensive exploitation of its migrant workforce under a despotic labor regime, but the methods of control have shifted considerably during the past decade and a half. This article examines new modes of domination over Chinese factory workers, based on fieldwork conducted while the author was living with workers at a foreign-invested garment factory in southern China. The article shows how mechanisms to control the workers are embedded today not only in directly coercive practices but also in a new shop floor culture with affective personal ties and implicit bargaining in wage systems. Against the scholarly literature of management controls that emphasizes rupture and discontinuity between labor regimes, this article argues that China's emerging labor regime, here referred to as "conciliatory despotism," inherits despotic features of the labor regime exercised in the 1990s but adds new normative measures of soft control that seek to conciliate worker resentments. This hybrid form of management control represents a stage in China's evolving labor-management relations in which workers possess more implicit power and can push management into greater concessions than previously.

RC31-554.7SIVOPLYASOVA, SVETLANA* (*Institute of Sociopolitical Researches, RAS*)RYAZANTSEV, SERGEY (*ISPR RAS; MGIMO-University*)*Russian Women at the International Marriage Market*

Migration flows in modern Russia became widespread after the collapse of the Soviet Union. At that time, a multitude of people began consider of moving to another country. International migration took various shapes, such as labour migration, educational migration, family reunification etc. Numerous Russian women were involved in marriage migration that became one of the most characteristic features of the post-Soviet era.

At first, the high volume of marriage migration was stipulated by the fact that it was regarded as the simplest way of emigration from the country. Nowadays the reasons for moving are different. Women tend to move to their husband-foreigner for love, for inability to create a family in their country and so on. As a whole, over the last 26 years, marriage migration from Russia has seen various reasons that formed several stages. Each of the stages is characterised by a particular attitude to Russian wives abroad. In this regard, there seemed to appear the specific difficulties in adaptation and integration of Russian women in a foreign society.

Up to now, several sustainable directions of marriage emigration from Russia have been formed: North-American, Near East, European, and Asian.

This research is to be empirical. It will be devoted to analysing the scales of the marriage migration from Russia, defining its stages, examining basic directions, revealing the reasons for the marriage migration. It also focuses on detecting the main issues of adaptation and integration of women in a receiving society based on cases-studies. Thus, the research is aimed at outlining a quite full picture of the place and role of Russian women at the international marriage market.

RC41-716.4SIVOPLYASOVA, SVETLANA* (*Moscow Aviation Institute (National Research University)*)SIGAREVA, EVGENIA (*Institute of Sociopolitical Researches RAS*)*The Influence of a Religious Socialization of People on Fertility in Modern Russia*

Modern Russia is a unique space for an investigation of the influence of the factor of religiousness on demographic processes. It connects with some reasons. First, mass atheistic worldview connecting with the communist ideology has changed to forming a primary and second religious socialization trending to increase. Second, the state system of the Russian Federation promotes a space-saving dense residence of certain ethnoses practicing various religions in different regions of the country. It explains a mixed picture of a religious diversity and fertility. Third, increasing role of religious organizations in the sphere of demographic development is one of manifestations of growing influence of a religious factor on fertility in modern Russia. Leaders of religious organizations appear on television, in print, go on the air to talk about problem of abortions, spreading of families with many children, tradition family values. All these

circumstances form background of increasing influence of religion on fertility and quicken a scientific interest in this theme.

This research deals with both investigating of theoretical notions of the correlation of religious convictions and reproductive behaviour and empirical data on changing of parameters of fertility depending on the level of religious socialization. It also focuses on detecting the factors testifying to the modification of general indicators of religiousness of Russian population, to the importance of interrelation fertility and religiousness, to the transformation of reproductive behaviour depending on a religious self-identification. An important result of this research will be working out a typology of Russian regions depending on the level of intercommunication of religious socialisation and fertility.

SKÄRNER, ANETTE* (*University of Gothenburg, department of social work*)

Changing Relationships – Changing Life: The Role of Friendship during Recovery from Problematic Drug Use

Departing from a social network perspective this paper highlights the role of social relationships for recovery and mental health. Drawing on qualitative interviews with 50 Swedish long term drug users, the paper explores how friendship relations evolve during periods of drug use as well as during the recovery process. The analysis is guided by a social interactionist perspective. From this point of view, recovery processes can be seen as renegotiations of identity, which take place through interaction with those persons the individual encounters. The analysis shows that the transition from a subcultural drug context into a life without drugs presents a substantial psychological and social challenge. Absence as well as presence of friends is of the utmost importance when dealing with the insecure and marginalized situation that tends to take place when leaving the 'drug world', i.e. without fully having reclaimed anything old or established anything new. Compared to kinship relations, friendships can be described as more voluntary and more open to individual negotiation. If main bonds are in the 'drug world', non using friends may serve as valuable social capital for recovery and provide links to 'ordinary life'. Subsequently, close friendships in the social context of drugs may constitute problematic links leading to relapse. Furthermore, the paper emphasizes the consequences of drug use in Sweden being strongly associated with stigma. Recovery processes are thus complicated by stigmatization processes, i.e. by creating social barriers that shape the perception and responses of 'non using others' as well as by reinforcing a sense of shame, insecurity and low self-esteem of the (former) drug using persons. In other words, a classic catch-22 dilemma: in order to accessing a new life their past has to be hidden – but doing that is a constant reminder of the very identity they wish to abandon.

Cannabis Use Amongst Elite University Athletes

Cannabis, the arcane yet widely enjoyed resinous psychoactive plant, is presently undergoing a period of legal resurgence throughout North America. Eight states in the U.S. have passed bills to legalize recreational cannabis in the last five years, and in the summer of 2018 the recreational use of cannabis will be legal in Canada nationwide. Cannabis is the most popularly used illicit drug in Canada, and the most recent surveys indicate that university athletes in North America use cannabis. However, these studies go no further than to show that elite university athletes do, indeed, consume cannabis. Presently, the prohibition of cannabis in sports is due to its legal status. Cannabis' illegality puts its use in conflict with the 'spirit of sport', as defined by the World Anti-Doping Agency (WADA). However, the rapidly changing legality of cannabis is now calling into question this rationale for its prohibition from sport. Many professional athletes such as Ross Rebagliati and Ricky Williams have advocated for the use of cannabis

in various capacities within sport, however it remains to be seen whether the current policies regarding cannabis use will change within sport.

This presentation will discuss the cannabis use of elite Canadian university athletes. *How do elite university athletes incorporate cannabis into their athletic lives? How do elite university athletes negotiate the stigmas associated with cannabis use and the perceived benefits of consumption? How will the changes of federal legislation (The Cannabis Act) impact the cannabis use of university athletes.* Through qualitative interviews with several elite university athletes these questions will be answered and the emerging discourse of cannabis in sport will be directed through the athlete's perspective.

Legal Pressures on Civil Society: Emerging Strategies in Freedom of Information Activism in Russia

The political pressures on a number of NGOs in Russia during the last two decades have been described as "civilized oppression" of civil society organizations by the state (Daucé 2014), meaning that there has been a decline of direct violence against activists with a simultaneous increase in legal and administrative prosecution of organized activity. Some of the most prominent examples of legislation aimed specifically at NGOs include the so-called "foreign agents law" from 2012 and the law on "undesired organizations" from 2015, targeting foreign-funded Russian NGOs as well as their foreign donors. A crucial element of the self-conception and the basis of the legitimacy of NGOs in the eyes of the broader public lies in their accountability and contribution to the common good. By classifying some NGOs as "foreign agents", the Russian legislator denounces such organizations as providing their services for money to a foreign constituency.

In the presentation, I will discuss the findings of two interview-based case studies of Russian NGOs, active in the field of freedom of information both in the digital space and offline, that have to cope with the aftermath of the "foreign agents" law and the law on "undesired organizations". I will explore (1) the diverging survival and adjustment strategies the organizations are following in order to maintain their activities; (2) the logics of applying the restrictive laws in the face of the organizational specifics of the Russian court system; (3) and finally, some of the broader implications for freedom of information activism in Russia.

JOBST, SOLVEJG* (*Western Norway University of Applied Sciences*)

Migration and Inequality: Object Constructions in the Field of Social Science

The current debate concerning issues of the integration or non-integration of immigrants into the education system shows a marked reluctance to question the cultural and social embedding of scientific practice. However, overcoming this reluctance is essential for assessing the role played by science in the construction of relations of domination and subordination between different forms of cultural capital. Drawing on theory of symbolic violence (TSV) (Bourdieu & Passeron 1973; Bourdieu 1988) and critical race theory (CRT) (Matsuda 1991; Yosso 2005), the present study discusses the role of social construction of the hierarchy of values among forms of cultural capital in migration research. It employs a systematic content analysis of four selected journals in the social sciences to examine whether and to what extent symbolic and (origin-)specific cultural capital are discussed and what specific relation is established between both forms of cultural capital.

SKROBANEK, JAN* (*University of Bergen*)

Subculture Is Dead! Long Live Subculture!

Since Yinger's (1960) ground-breaking discussion of contra culture and subculture the concept of subculture has been the target of critique ranging from the "blurring of meaning" to the "empirical uselessness" of the concept. Against the background of critiques on the concept and the so-called post-subcultural turn (Bennett 2011) new concepts have emerged like scenes (Silver et al. 2010), neo-tribes (Bennett 1999) or resistance cultures (Johansson & Lalander 2012). Against the backdrop of the continuing controversy regarding the usefulness, or not, of these concepts the contribution reports findings of an effort to assess the spectrum of subculture, scene and/or neo-tribe orientations and practises among young people in the urban Kanton of Zurich area, Switzerland. Based on a representative quantitative study the results indicate that in reference to all three analytical frameworks orientations and practises can be found among the young. These findings illustrate the continuation of subcultural but also the emergence of new, individualised and reflexive youth orientations and practices like scenes and neo-tribes.

RC25-475.1SLADE, NATALIE* (*Massey University*)*Deconstructing 'Refugeeness': A Critical Analysis of Mediated Discourses and Refugee (self)Representation in New Zealand*

A certain reality about who a refugee is has been produced and reproduced through political, humanitarian and media discourses, creating a stereotypical or universal sense of 'refugeeness' – an idea of what a genuine refugee should look like. In a Foucauldian sense, these discourses are deeply embedded within powerful relations of knowledge production and language, in which particular world-views and 'truths' are constructed. These discourses do not merely reflect reality but construct a reality, a form of knowledge and power that ignores the multiple experiences of those being represented. However, meaning is not infinitely fixed and dominant discourses can be deconstructed and challenged by individual actors, resulting in multiple contested realities. Refugees may be labelled and shaped by discursive practices, but they are also capable of restructuring those practices, using their power and agency to dispute and transform stereotypes. Drawing on media analysis and interviews with people from refugee backgrounds in New Zealand, this presentation reflects on the dominant discursive constructions of refugees in the New Zealand mainstream news media, and the various ways people from refugee backgrounds experience, contest, negotiate and transform these discourses, creating space for the construction of their own identities in the process.

RC06-137.5SLANY, KRYSZYNA* (*Uniwersytet Jagielloński, Gołębia 24, 31007 Kraków Poland*)RATECKA, ANNA (*Jagiellonian University*)*Gender Equality in Polish Families – Practices, Generational Shifts and Unfinished Gender Revolution*

Based upon the results of a representative survey conducted in Poland in 2015 we will demonstrate the relations between the realities of labor market, work conditions and gender equality in contemporary Polish families and its impact on quality of life of men and women in families.

Using the concept of gender revolution (por Goldscheider et al. 2015) we will discuss continuity and change in Polish families as far as the reconciliation of work-life balance is concerned and the adoption of gender equal practices in Polish families in the context of post-transformation economy.

We will portray the "ordinary family" in the context of neoliberal character and the semi-peripheral position of Polish economy, the unstable working conditions and welfare policies oriented towards maintaining traditional gender order, as well as cultural context especially strong impact of the Catholic Church. We will do so by using intersectional approach, which considers the diverse factors influencing Polish families including place of residence, level of education, income, respondent age, having children, etc.

In our presentation we will focus on the following topics:

- The progress of gender revolution in Polish families.
- The economic resources allocation and its impact on the gender equality and power balance in families.
- Strategies of Polish families aimed at reconciliation of work and family life.
- Generational shifts and the change in the division of domestic tasks in families.

The research was realized in the GEQ Project, financed from Norway Grants.

Goldscheider, F. et al. 2015. The Gender Revolution: A Framework for Understanding Changing Family and Demographic Behavior. *Population and Development Review* 41, s. 207–239.

RC48-801.3SLAVINA, ANNA* (*University of Toronto*)BRYM, ROBERT (*Department of Sociology, University of Toronto*)*Demonstrating in the Internet Age: A Test of Castells' Theory*

In his highly influential work, Manuel Castells holds that demonstrators in the Internet Age tend to be young, unemployed, underemployed and/or students who are well connected to civic associations, use digital communications media often, are highly aggrieved economically and politically, and think of themselves as global citizens. Using data from the World Values Survey (2005-14), we estimate a generalized hierarchical linear model to test these generalizations. We find that some predictors of demonstrating behave as Castells leads us to expect while others do not. Furthermore, we show that the ways in which grievances get translated into demonstrating depend on a country's level of economic inequality and its citizens' sense that they enjoy strong democratic institutions. We draw two conclusions: (1) National context affects demonstrating, both independently and in connection with individual-level variables—a fact that Castells largely ignores. (2) The number of demonstrators with the characteristics identified by Castells

may be increasing, but their prevalence is not sufficient to warrant Castells' claim that they predominate in the Internet era.

RC31-554.11SLAVNIC, ZORAN* (*Linköping University*)URBAN, SUSANNE (*Linköping University*)*Meandering Rides of the Swedish Taxi Industry: Flourishing Entrepreneurship or Ethnic Segmentation?***Abstract**

Purpose: The study of the interplay between changes in policies, rules and regulations that have altered ethnic composition and incomes in the Swedish taxi industry since deregulation in the 1990s.

Design/methodology/approach: This is a mixed methods study, combining the qualitative interviews, scrutiny of relevant policy documents and statistical data of the Swedish population between 1992 and 2012. The analysis uses a mixed embeddedness perspective to show how the changed regulations resulted in new openings/closings in opportunities for individuals operating in the sector and how the proportion of immigrants in the sector, increased continuously between 1992 and 2012.

Findings:

- Policy changes have altered ethnic composition and incomes in the Swedish taxi sector
- Income differences between foreign-born and Swedish-born are decreasing
- It occurs however in the context of a general trend of lower wages within the sector
- New jobs are created, but these are low paid jobs with harsh working conditions.

Originality/value: What makes this paper original is the use of the mixed-method approach, combining the analyses of economic and ethnic changes in the sector with internal and external institutional changes in rules and regulations, which exemplify the essence of the mixed embeddedness concept. Additionally the quantitative part of the study uses register data - tax registers and population registers that includes entire population and is administered by Statistics Sweden in a database for REMESO.

RC04-83.4SLAVNIC, ZORAN* (*Linköping University*)*Qualitative Data Preservation and Re-Use in Sweden – Neoliberal Courses, Forces and Discourses*

The discourse of openness has proved to be very powerful instrument for promoting the new research policies and (neoliberal) reforms of the higher education in all so-called advanced economies. It has triggered positive democracy- transparency- and accountability-related associations when used in the context of politics, fair resource distribution when used in the sphere of public service, and free access to information and knowledge when used in the field of science and higher education.

At the same time, international research shows that of university's autonomy is increasingly being attacked, reduced and marginalized by the same policies. Non-academic (power) instances impose new, for the academy so far unknown, criteria such as 'accountability' 'performance', 'quality assurance', 'good practices'. They also impose ideas about what a good research is, which scientific method is to be prioritized and what the good data is. The process of de-professionalization and proletarianization of the academic profession is increasingly affecting the academy. All this obviously does not have much in common with the above described open access discourse.

The purpose of this paper is to show to what extent and in which way all this applies to Sweden. Courses, forces and discourses of the national research infrastructure development policy in general, and qualitative data preservation policy in particular are described and discussed. The preliminary results show that actual policy documents generally focus on competition rather than exchange. There is an obvious trend towards marketization and privatization of basic research. Regarding the policy related to preservation and re-use of qualitative data, the qualitative research community has been completely excluded from the policy creation and implementation, qualitative data has been treated essentially in the neo-positivist way, i.e. as if it is quantitative data and the whole process has been characterized by complete absence of any academic debate on these issues.

RC54-891.2SLESINGEROVA, EVA* (*Goethe University Frankfurt*)*Bodies As Libraries of Bioparts/ Sociology of the Body Meets Life Engineering*

Human bodies are treated at the level of molecules, genes, DNA, and cells in the current biotechnological context. The focus of life science research has shifted from genome description, DNA mapping, and DNA sequencing to active

and profound reprogramming, making synthetic life on the genetic and molecular levels. At the same time, our bodies exist in liminal spaces between biology and technology. Bodies on both the material and symbolical levels embody the current cultural and social trend in which biology becomes technological and technology becomes biological. The body is seen as a kind of library filled with various bio-devices, body-like entities, biobricks, and synthetically fabricated genetic parts. Taking advantage of the analytical approaches of contemporary anthropology and the sociology of life and the body, the presentation shows the outcomes and results of fieldwork conducted in biological and IVF laboratories in the Czech Republic where the various technologies of molecular biology are used. The paper particularly focuses on life engineering technologies such as repairing DNA, CRISP/cas9, and PGD. The views, perspectives, and attitudes of scientists and laboratory technicians will be analyzed and presented with special regard for the concepts of body and embodiment.

TG04-985.4

SLESINGEROVA, EVA* (*Goethe University Frankfurt*)

In Risk We Trust/ Life Engineering - Among Uncertainty, Hope, and Hype

The focus of contemporary life science research has shifted from genome description, DNA mapping, and DNA sequencing to active and profound reprogramming, making synthetic life on the genetic and molecular levels. Taking analytical inspiration from the contemporary sociological view of risk and uncertainty, the presentation shows the outcomes and results of ethnographical research conducted in scientific (biological, biochemical) and IVF laboratories in the Czech Republic. The fieldwork is related to the social context in which the various technologies of molecular biology and life engineering are used. The paper focuses on technologies such as repairing DNA, using parts of DNA as tools for treatment, and CRISP/cas9. The views, perspectives, and attitudes of scientists and laboratory technicians will be analyzed and presented with special regard for the concepts of risk and hope. An analysis of media coverage and concrete laws will present the broader context. The paper concentrates mainly on the following questions: How do scientists tackle issues of risk, responsibility, and hope? How do they deal with the public's expectations? How do they cope with the stress of the marketization of biotechnological treatments? How do they interact with hype and media coverage?

Losing Legitimacy? Social Partnership, Irish Millennials and a Turning Political Tide

Ireland incurred widespread social, economic and political costs in the recent global crisis (Ó Riain, 2014). Irish millennials face unemployment, precarious work and migration, with younger people and new hires most affected (Healy, 2015). Considering the historical alliance of labour, employers and the Irish state since the 1960s (Allen, 1997), social partnership (corporatism) should have ameliorated privations, but it didn't. To explain why, this paper explores the dynamics of social partnership as a mechanism for institutionalising progressive social movements.

Social partnership included trade unions, business, community and voluntary sector representatives in national policy formation (Allen, 1997; Collins and Cradden, 2001). It may be interpreted as a 'positive sum game' (Hardiman, 2008) and 'joint problem solving' (O'Donnell and O'Riordan, 2000), however, critical appraisals regard social partnership as a strategy of co-option (Murphy, 2009), legitimising institutional approaches that discourage dissent and oppositional politics (Moran, 2010). The critiques of corporatism intersect with analyses of the 'flexible developmental state' (Ó Riain, 2000), 'competition state' (Kirby and Murphy, 2008), and 'neoliberal state' (Allen, 2007).

Generation What (GW) survey findings and secondary research illuminate impacts of youth unemployment and precarious work, juxtaposed against a decline in trade union membership. The GW online survey of 32,000 18-34 year olds in post-recession Ireland reveals distrust of institutions, particularly the state, political system and trade unions, and low levels of engagement in social and political organisations. This paper assesses GW data and whether it indicates a loss of legitimacy for key institutions and, contradictorily, the labour movement. GW attitudes to individualism and solidarity also raise questions about collective action and future forms of politics. Does the GW data suggest the emergence of 'subpolitics' a form of 'direct politics' entailing the 'global self-organisation of non-state politics...with the potential to mobilise all areas of society' (Beck, 2009, p. 95)?

The Corrib Gas Conflict: More Than a 'David and Goliath' Type Battle

Located offshore Ireland, Corrib gas has become a byword for controversy, environmental damage and repression. Drawing on original data gathered between 2009-2017, this case study of the Corrib gas project illuminates environmental and social impacts of oil companies' activities in northwest Ireland.

Tracing the evolution of the Corrib gas conflict, this paper examines interconnections between the gas consortium and Irish state, problematizing a fragmented approach to environmental impact assessment and planning processes, which exacerbated tensions between oil companies and the community in which the project was located. Concerned with environmental, health and safety risks, resistance to the project grew from a 'loose network' within a rural community through to national and international levels (Garavan, 2007). Environmental impacts of the project include contamination of the regional water supply, imposition of a large industrial development in a rural area, damage to Special Protected Areas and Special Areas of Conservation (Siggins, 2010; Slevin, 2016), and a recent 'technical' error which resulted in €400,000 worth of gas being flared (Siggins, 2017).

Social consequences span multiple levels of analysis and include deployment of ideological and state coercive resources, violent actions undertaken by Shell's private security company (Barrington, 2010; Flood, 2009), and a myriad of physical, psychological and financial damage inflicted on people living in the region (Garavan *et al.* 2006; Slevin, 2016). As revealed in this paper, the Corrib gas conflict is more than a 'David and Goliath' type battle – it is a phenomenon that raises pressing questions about Ireland's socio-economic composition, its relationship with the environment, the state and its 'structural interdependence' with multinational corporations (Harman, 2009, p. 110).

Material Artifacts and Contentious Politics. Methodological Sketches of Visual Study on Protest Movements

The main aim of my speech is to put forward methodological issues and results of the ongoing research project titled „Objects of Protest. Material Cultures of Contemporary Social Movements”, which is focused on the materiality of contentious politics and performances on the street after 2008 (Tarrow, Tilly 2015; Tilly 2008). Especially I would like to condise the visual ethnography (Collier 2001; Juris, Khasnabish 2016) – its legal, cognitive and theoretical advantages or limitations - in the area of social movements sociology (Della Porta 2014; Doerr, Mattoni, Teune 2013; Philipps 2012). In the research project there is employed the definition of material artifacts not only as representations of political ideology or identity, but as a part of the social mobilization processes too (Johnston 2009; 2014).

The first stage of the project was focused on the systemic mapping and interpreting the material cultures of street protests in Warsaw, Brussels, Berlin and London in the years 2008-2017 – the empirical ground for observing material objects of protest was based on press-photos of major agencies (N=600) (Koopmans, Rucht 2002). This mapping process of first stage is deepening by ethnographic observations of protest campaigns in the mentioned capital cities (nationalist, feminist and anti-austerity protests). A single act of street protest is considered as a complex medium, which was expressed by Charles Tilly (2006) as a „WUNC display” – where the public impact of demonstration is based on the accurate use of bodily, material and visual components. Material artifacts are taking part in diverse forms of protest communications – as a material interaction with the police, as an expression of political aesthetics and movements symbols (Sartwell 2010), and also part of visual communication (Fahlenbrach 2016) with its impact on diagnostic, prognostic and motivational framing of protest (Snow, Benford 1988).

SLY, JONATHAN* (*University of Leicester*)

Rethinking Football Hooliganism from an International Perspective: The Case Study of England and Russia

The World Cup summer of 2018 seems an appropriate place to revisit the issue of football fan violence in sport. Despite being a topic which has received plentiful academic commentary throughout the social sciences, recent events in the 21st century illuminate ever-broadening gaps within the predominantly Western European based literature which require further sociological exploration. Hooliganism is a global phenomenon that can be seen to mutate and adapt alongside changes related to both the sport of football and to the particular societies in which the game is played. This research looks at the development of contemporary hooligan cultures in the countries of England and Russia, and uses the case study of the spectator violence at the UEFA European Championship tournament in France in 2016 to demonstrate what can happen when two extremely different but high-profile fan subcultures collide on the international stage. The English and Russian case not only highlights the potential problem of sports fan violence at International Mega-Events, but also illustrates how key differences can form between football hooligan subcultures globally. This paper uses observational data from the Euro 2016 tournament and the Russian and English domestic leagues, interviews with English and Russian hooligans, and secondary data analysis of mainstream and internet media coverage of football

hooliganism in both nations, to explore issues such as differences in contemporary hooligan identities, the impact of internet technologies on hooligan cultures, the role of nationalism, and the dissimilar ideological frameworks that hooligan groups create in order to legitimise their sports-related violence. Ultimately, this project aims to add to academic literature on this topic, to challenge the commonly held assumptions within the social sciences that hooligan cultures are the same globally, and to provide a rethinking of the use of the label 'football hooliganism' from an international perspective.

SMETS, PEER* (*Vrije Universiteit, Amsterdam*)

Stigmatized Homes and Communities. Gentrifiers' and Non-Gentrifiers' Struggle for a Liveable Neighbourhood in Amsterdam

Today, much attention has been paid to the role of gentrifiers in ethnic-mixed neighbourhoods, but much lesser extent to non-gentrifiers. This paper will look at both groups in the Transvaal neighbourhood in Amsterdam East, the Netherlands. In the Transvaal neighbourhood, the combination of state-led gentrification and drug-related activities has stigmatized parts of the neighbourhood as a home of drug traders and users. To avoid decline in the housing values, the gentrifiers urge the local government and police to solve the drug-related problems; whereas, the non-gentrifiers of non-Western background often refrain to do so. These non-gentrifiers have their own strategies to improve the livability of the neighbourhood, which differ from the gentrifiers' way of reclaiming the public space. The drugs-related activities and police response to these activities have effectively polarized the interaction between different ethnic groups in the neighbourhood, which also reinforce the mechanism of exclusion. Apart from the disparity, one could also see that some gentrifiers succeed in bridging the different groups of residents. In sum, this qualitative study will highlight the inclusion and exclusion mechanism of different kind of communities in the built environment of the neighbourhood.

SMIDOVA, IVA* (*Masaryk University, Faculty of Social Studies, Sociology Dpt.*)

Reproductive Loss in the Medicalised Post-Socialist Context

Advancements in assisted technologies do not necessarily bring critical reflection of the practices and their impact on everyday lives of actors involved. Based on a research project analysing very specific liminal events of reproductive loss in the Czech Republic, particularly perinatal loss, the presentation targets the gaps and clashes in competing sets of knowledge claiming their perspectives as overall truths in dealing with death at birth.

The paper reflects the Post-Socialist context of the Czech Republic with its advancement as well as negligence in various spheres of human life, and paternalist approach to dealing with death and practices at birth. The ongoing study (2017 – 2019) is based on document analysis and in-depth interviews with bereaved families as well as with health professionals, social workers, policy makers and NGO representatives involved in providing assistance in case of the "empty cradle" contraposing the glorification of the progress in reproductive biomedicine, biomedicalisation and commercialization of health and illness. Gender perspective is stressed in the analysis of power relations, symbolic violence and lack of institutionalized social responsibility of the health care and social service systems.

RC15-JS-72.6

SMIDOVA, IVA* (*Masaryk University, Faculty of Social Studies, Sociology Dpt.*)

The End at the Very Beginning: Perinatal Loss and Better Dying

Little is known about perinatal loss in the Czech Republic or in Post-Socialist countries more generally. The turn towards an "intimate death" is yet a rather experimental practice in maternity wards as institutions dealing with this liminal and often unexpected event. Institutionalised care for bereaved families or professional training for the healthcare staff is only emerging. One pilot perinatal hospice is being founded by a group of enthusiastic volunteers.

The efforts for better dying or dealing with stillborn children and obstacles (structural and cultural) these actors face are analysed in this work in progress presentation of an ongoing project (2017 – 2019) aiming at sociological reflection of perinatal loss in the Czech Republic. The "end at the very beginning" as a liminal experience can teach us also about more general approaches to death, dying (better dying) in other phases of human life and medicalisation of death, birth and other life events.

Reconciling Traditional Family Life and Individual Autonomy: The Case of Zimbabwean Male Migrants in South Africa

During the past two decades economic and political turmoil in Zimbabwe has led to a rise in the influx of Zimbabwean migrants to neighbouring South Africa. In this paper an attempt is made at shedding some light on transnational family life as seen through the eyes of Zimbabwean men involved in long-term skilled labor migration. The discussion is based on qualitative data collected among Zimbabwean men in their 30s and 40s who live as migrants in the inner-city area of Johannesburg, South Africa. The focus fell on how the research participants sustain generational ties and family life across transnational spaces and what impact their transnational migrant experiences have on their relationship with their wives/partners and children. Moreover, particular attention is paid to the way the participants structure their everyday lives in terms of 'here' (the country of destination, i.e., South Africa) and 'back home' (the country of origin, i.e., Zimbabwe). This 'bifocality' contributes not only to a sense of being anchored in two different geographical spaces but also embracing two different world views. On the one hand the male migrants emphasise maintaining a sense of self within the ambit of the family – particularly in an African context where families are traditionally embedded in the broader kinship network and where familial belonging and cohesion are essential. Here, repeated mention was made of the importance of traditional family values, meeting multiple family commitments and the significance of remittances. On the other hand transnational migration has created an environment – markedly in the host society – where these male migrants exercise autonomy. The participants' narratives provide a window into their lived realities as migrants with family ties across borders and paint a picture of the way in which they reconcile elements of the collectivist-individualist binary.

SMITH, DANIEL* (*Anglia Ruskin University*)

Stand-up Comedy after Abjection: New Left Hegemony and 'Millennial' Humour

British stand-up comedy, since the Alternative Comedy movement c.1979-1985, revolutionised stand-up by jettisoning traditional 'gag-driven' performance in favour of humour derived from an incongruity between 'the self' meeting 'society'. This revolution was an appropriation of Jewish-American stand-up, one whose humour arose from the cultural performance of abjection (Limon): an inability to assimilate to social and cultural values and expectations. British Alternative Comedy used the language of abjection for their New Left political rhetoric which opposed, politically and culturally, the dominant 'gag-driven' humour of mainstream British stand-up. This New Left sensibility has since been incorporated as the dominant representational mode of stand-up. Stand-up comedy, after abjection, is the performance of New Left hegemony: anti-racism, sexism, homophobia, green lifestyle politics alongside a 'checking' of material privileges. However, the demographic information on contemporary stand-up comedians shows them to be overwhelmingly young, white, male, middle-class and straight. At a time of rising material inequalities, demographic rifts and volatile identity politics, what does the humour of 'millennial men' tell us about the power their humour speaks to? Through an analysis of two 'millennial male' stand-up comedians and one double-act, this paper provides a sociology of the comedy art-work. The analysis is taken from, *Comedy & Critique: Stand-up comedy and the professional ethos of laughter*, a short book which seeks to provide a sociological theory of the stand-up as well as an analysis of comedic routines. The paper draws upon the literary theory of the Yale School and Russian Formalists as well as Maussian anthropology and Durkheimian sociology to provide an alternative sociological theory of art, culture and power in contemporary society. Through this lens one is able to historicise 'millennial humour' and decipher its peculiar mobilisation of cultural symbols and myths which transform their hegemonic subject positions into the art of evasion.

SMITH, DOROTHY* (*University of Victoria*)

Exploring Words As People's Practice

This presentation is to develop further a project given preliminary exposition in a paper published last year (2016). In exploring words as people's actual practices, we can discover something that people do in particular local settings and at particular times which generalises beyond the local particularities of the time and place in which they are uttered. In what people say or write, hear or read, we can find at least one important dimension of social organization as a local accomplishment. Conceptualising words as people's actual doings or practices proposes a direction of study into how words engage us, as practices, in ways that are quite ordinarily available to observation and description. I am interested in opening up a region for discovery that will be useful in learning how people are putting our worlds in common together in the ongoing of our everyday lives.

RC47-789.1SMITH, JACKIE* (*University of Pittsburgh*)GEMICI, BASAK (*University of Pittsburgh*)*Shifting Inter-Organizational Relations & Insider-Outsider Strategies in Transnational Environmental and Women's Activism*

Recent decades have seen dramatic changes in the global political economy, and these changes have been both shaped by and affect the activities and interventions of transnational activist networks. Activist framings of issues and the strategies they develop have changed over time based on both the escalation of conflicts over critical issues and activists' experiences engaging across geographical and other divides and working to affect global and national policies and practices. Drawing from a newly updated dataset of organizational records in the *Yearbook of International Organizations* (1983-2013), we examine patterns of transnational organizing around the highly polarized issues of women's rights and environmentalism to examine changes in how these different activist networks engage with inter-governmental organizations and with other international nongovernmental organizations during a period of heightened tensions and "critical balances" over the future directions of the international system. We identify three categories of TSMOs based on their connections to IGOs, which reflect their relative emphasis of insider or outsider strategies. *Multilateralists* are linked to a wide and diverse array of international agencies, while *pragmatists* are more specialized and selective in their ties. A third category of *isolationists* operates outside the formal inter-state arena, engaging an outsider strategy in relation to the inter-state system. Newer groups, and especially women's groups, were more likely than more established TSMOs to be isolationists, advancing their social change work outside the existing inter-state order. Yet many more recently founded TSMOs, especially environmental ones, are using insider strategies, maintaining ties to operational types of IGOs, specifically treaties and monitoring bodies. We interpret these changes in this population in light of the changing geopolitical, institutional, and social movement context.

RC47-782.1SMITH, JACKIE* (*University of Pittsburgh*)*Trends in Global Human Rights Advocacy: Critical balances between global, national, and local, policy and culture*

This presentation draws from research on transnational and local human rights advocacy over recent years, noting the expanding growth of local human rights initiatives that are shifting the balance between the global and the local as sites of human rights struggle. This localization of human rights also has implications for understandings of national politics and citizenship and for the role of institutional versus cultural change. These varied "critical balances" will be examined in light of concrete examples from local and national (U.S.) human rights cities organizing, and the relationships between these local struggles and the global human rights movement.

RC43-735.2SMITH, JANET* (*University of Illinois*)*Converting US Public Housing to Real Estate: At What Cost and Who Pays?*

Neighborhoods are real places where people live, work, and play. They also function as sites for launching policy interventions, providing a space to implement and study change—and hopefully improve things—over time. In this presentation, I examine current efforts in the US to promote economic and cultural diversity in public housing transformation through income mixing, as a means to reduce "neighborhood effects" associated with poverty. Even if with good intention, I argue these strategies are grounded in assumptions that continue to privilege homogeneity and specifically higher income spaces and people. The results are policies and programs (strategies) that restrict poor people when planning for intentional economically diverse neighborhoods, evident in how we redevelop public housing and integrate affordable housing into higher income development. Furthermore, I demonstrate how in these strategies these new "neighborhoods" function as critical urban commodities. As spaces that have always in some way mediated social reproduction and capitalism, this current period presents specific challenges for neighborhoods and their occupants, who are now both consumers and the consumed, as strategies intended to promote diversity create spaces that do both.

RC55-909.3SMITH, JONATHAN* (*Monash University*)LAUGHLAND-BOOÿ, JACQUELINE (*School of Social Sciences, Monash University*)MURPHY, JENIFER (*The University of Melbourne*)SKRBIS, ZLATKO (*Monash University*)*The Weight of Precarity: How Do Changing Experiences of Work, Study and Relationships Affect Young Australians' Risk of Developing a Mental Illness?*

Young jobseekers in post-industrial societies are entering labour markets via insecure employment, whilst also engaging in tertiary study to secure their long-term employability. As a result, precarity and the need for flexibility increasingly features in the lives of both lower and more middle-class youth. Larger numbers of young people are struggling to resolve the conflicting demands of work, education and social/family life. While research shows poor mental health outcomes of unemployed and underemployed youth, the psychological toll of a more generalised precarity is less well understood. To address this, we explored the predictors of psychological distress - a key indicator of mental illness - amongst the first cohort of Australian school-leavers to enter the labour market in the economically volatile years following the Global Financial Crisis. Our analysis pooled comparable survey data from two concurrent youth cohort studies - the Longitudinal Surveys of Australian Youth (LSAY09) and the Social Futures and Life Pathways (Our Lives) study - with a combined sample of 7,121 young Australians aged 20-22. Being engaged in casual rather than ongoing employment predicted higher odds of psychological distress for respondents who combined this work with university study. Social support, particularly from one's parents and best friend, but also from neighbours and friends in general, helped to counteract young people's distress levels. Certain groups of young people, such as including females, those from migrant backgrounds, and those with an alternative sexual orientation, showed higher levels of psychological distress. The results suggest that, without adequate support, the demands of a changing labour market may further compound the risk of mental illness amongst such groups.

RC07-150.1SMITH, JONATHAN* (*Monash University*)*Understanding Processes of Digital Inequality in Australian Society*

The concept of 'digital inequality' emphasises the potential for differences in individuals' internet access, skills, and usage practices to factor in the broader reproduction of social inequalities. Despite growing recognition of its significance, digital inequality has proven difficult to accurately and reliably measure. This has been in part due to the challenge of how to quantify the tangible outcomes of internet use in people's lives, as well as a lack of appropriate longitudinal data with which to explore changes in these outcomes over time. To address this, this project assessed digital inequality using a multidimensional index (the Digital Disruption Index) indicating how affected respondents would be if they were unable to use the internet in a range of life domains. The DDI was cross-validated with a representative general population from the Australian Survey of Social Attitudes (n=1,238) and a large Australian youth cohort from the longitudinal Our Lives study (n=2,090) which has been regularly surveyed between 2006 (age 12/13) and 2017 (age 23/24). Results indicate that being male, having less post-schooling education, and living rurally, are factors which consistently narrow the degree to which internet use is embedded in the lives of members of both samples. Further longitudinal analyses with the youth cohort show that late adoption of broadband, particularly in rural areas, has a long-term negative association with young people's digital embeddedness, even after controlling for their access and skill levels a decade later. These findings suggest that digital inequalities have complex and enduring consequences for both older and younger generations of Australians.

RC40-699.2SMITH, KIAH* (*U. Queensland*)LAWRENCE, GEOFFREY (*University of Queensland*)*Asian Agribusiness Investment and the Global Sugar Supply Chain: Insights for Food Regimes*

According to GRAIN, agribusiness expansion - increasing vertical and horizontal supply chain integration - has replaced agricultural land as the main focus for current and future financial investment into Australian agriculture. In this paper, we explore the intersection of finance and agribusiness strategic investments from Asia into the North Queensland sugar sector, thus contributing an empirical case study of the ways that agribusiness companies are positioning themselves to capitalize upon an increasingly financialised Third Food regime. The firms seek to profit by pursuing vertical integration of asset ownership (land, mills, transport, processing and manufacturing), commodity 'flexing' (sugar, fuel and

feed) and controlling commodity trading and marketing. Sugarcane production is of particular interest for its capacity to generate profits via both real asset trading (i.e. sugar), capital appreciation (land, infrastructure) and futures speculation.

In this paper, I illustrate the consolidation of economic power through an examination of the financial vehicles involved in three recent foreign acquisitions of sugarcane-producing land in North Queensland, Australia, since 2010: Wilmar (Singapore), COFCO (China) and Mitr Phol (Thailand). Each of these agribusinesses combines a mix of Northern and Southern finance actors, with varying logics to owning and managing assets in the sector, in Australia and overseas. Each company has also met with very different public perceptions of its impacts and responsibilities for the sector, surrounding communities, and environments. In keeping with a 'food regimes as methodology' approach, our research presents evidence of contradiction, crisis, historical conjuncture, identifiable moments and capital accumulation, and considers the role of the state, corporate-social movement contestation, and public/private regulation. By 'following the money' from parent companies to Australian subsidiaries, via joint ventures and direct investment, this case study also illustrates the deep reach of the agribusiness giants ADM, Bunge, Cargill and Dreyfus.

SMITH, KIAH* (U. Queensland)

Fair Food Utopias, Civil Society and the Sdgs in Australia

This paper aims to expand sociological scholarship around the theory and practice of 'food utopias': a concept coined to reflect how various actors are re-imagining what a better food system might look like, in light of multiple food, climate and economic crises. The study of 'utopias' aims not only to explore case studies of future 'visions' – such as those stemming from local food movements or alternative economics – but also uses action research to facilitate a more open dialogue between diverse stakeholders. Understanding the visions and activities of civic food actors around achieving the global SDGs (which themselves represent 'alternative futures') is crucial. Little research has explored this in Australia, despite the growing presence of a diverse 'Fair Food' movement.

This paper has two aims. First, I present a typology of the actors and activities that identify as part of the 'Fair Food' movement in Australia. Second, I describe a research agenda for action research with civic food networks in Brisbane, to consider how their visions and practices are associated with achieving the global Sustainable Development Goals. Within the SDGs, 'Zero Hunger' and civic participation are key themes, however little research has explored the intersection between local network priority setting and the concepts, policies and processes associated with the SDGs. A variety of methodological approaches is discussed. Finally, the paper presents preliminary insights into the capacity for diverse fair food actors (advocates, entrepreneurs, academics and policy makers) in South East Queensland to engage both conceptually and empirically with agenda-setting around the SDGs. *How are Fair Food actors in Brisbane (and beyond) re-imagining what a better food system might look like, in light of multiple food, climate and economic crises? How do these place-based narratives connect to global sustainability goals? What role can action research play in supporting their visions?*

Populism and Practical Utopianism: Sociological Investigations of Reactionary and Progressive Formations

Populism is a disruptive social force breaking established relations and re-articulating them in many ways that can go beyond conservative and liberal formations. However, they can take reactionary and progressive forms as well as generate radical centrist populism. Sociology needs a combination of old and new conceptual tools to explain these events, including elite theory. We are witnessing the rise and spread of a 'new authoritarianism', one that has undone and undoing the third wave of democratization. The paper explores the different strategies and tactical responses (especially in a digital context) in specific cases, including Trumpism, Brexit, Brazil, the Philippines and Thailand. Particular attention is also paid to the development of state structures designed to prevent left-progressive forms of populism from emerging and whether the state should be seen as a 'site of populist contestation'. This paper also explores the avenues available in the 21st Century for constructing progressive forms of populism that counter the appeal of rightist populist insurgencies in both developed and developing societies and regions. A progressive populism inevitably draws on the utopian tradition. Early utopianism constructed imaginative visions of social arrangements that directly addressed the problems of direct experience, from Thomas More through the Diggers to more contemporary movements such as deep ecology. Marxist strands of utopianism theoretically focused more on the division of labour between social classes although practical illustrations were much more than this, as with the political experiments of the Communards, early Soviets and factory councils. As a result, the radical-socialist antagonisms over utopian strategy have diminished the possibilities for a 'left populism', although the Corbyn phenomenon is potentially a useful exception. Such antagonisms need to be overcome socially rather than overcome either politically or economically.

As a conclusion, the paper offers a diagnosis and prognosis for both reactionary and progressive populism.

Musical Analysis, Modernity and Ambiguity: The Case of Wagner and the Tristan Chord

Studies of measurement and commensuration within sociology usually consider formal rankings and quantification. This paper broadens out the frame of reference to consider the more general problem of classification and calibration by experts and expert knowledge. The music of composer Richard Wagner, with its shifting tonal ambiguities and propensity for deferred resolution, has been seen as both a revolutionary milestone on the road towards musical modernity and as a dead end of Victorian romanticism. The paper traces how broader moral-philosophical and musicological discourses diversely locate Wagner on the path to modernity. It also explores this issue at the capillary level in the astoundingly diverse range of deeply technical analyses of the four notes of The Tristan Chord.

Wagner, Durkheim and the Search for Transcendence: A Study of the Bayreuth-Festival

The annual Bayreuth Wagner-Festival is perhaps the most famous and certainly the most controversial event in classical music history. On the one hand Wagner's music is associated with humanism and a quest for spiritual and aesthetic transcendence. He likened attending Bayreuth to a pilgrimage and many concertgoers have also used this religious analogy. Yet any easy acceptance of Bayreuth's mission is compromised by the taint of Wagner's anti-semitism and the festival's profound connections to National Socialism. Drawing on historical sources, field observations and interviews the paper first looks at the various ways that individuals and institutions have managed this deeply polluted legacy of evil while continuing to seek aesthetic transcendence. It goes on to identify a number of routine and profane threats to Bayreuth's attempts to capture the sacred.

SMITH, TOM W* (University of Chicago)

The Human Dimensions of Global Environmental Change across Time and Countries, 1993-2020

A scientific consensus accepts that global warming is occurring and that human activity notably contributes to climate change. Increasingly, it is recognized that the social sciences need to become deeply engaged in understanding the human dimension of global environmental change and crafting responses to climate change. Moreover, given the global nature of climate change, cross-national data are essential for studying this phenomenon. There are considerable cross-national and inter-regional differences in attitudes towards environmental issues in general and climate change in particular. Also, trend data are vital since both environmental conditions and public assessments of climate change are not static, but dynamic.

This paper examines 1) cross-national differences in environmental concerns in general and climate change in particular and considers regional and structural factors shaping the cross-national variation, 2) changes over time in attitudes towards climate change, and 3) individual-level correlates of concern about climate change. Data from the 1993-2010 International Social Survey Program Environment Studies and plans for the 2020 ISSP are utilized.

SMITH, TOM W* (University of Chicago)

Using the Total Survey Error Paradigm to Minimize Comparability Error in Cross-National and Cross-Cultural Surveys

Cross-national and cross-cultural research thus has not only great promise, but is an absolute necessity to understand contemporary human societies. To be useful comparative survey research needs to meet high scientific standards of reliability and validity and achieve functional equivalence across surveys. This is challenging because comparative survey research is a large-scale and complex endeavor that must be well-designed and well-executed to minimize error and maximize equivalence. This goal can be notably advanced by the application of the total survey error paradigm to cross-national/cultural survey research.

First, this paper examines the concept of total survey error, including interactions between the error components, its application when multiple surveys are involved, and comparison error across cross-national surveys. Second, obtaining

functional equivalence and similarity in cross-national surveys is discussed. Third, the challenges of doing cross-national surveys are considered and how combining traditional approaches for maximizing functional equivalence with the utilization of TSE can minimize comparison error and maximize comparative reliability and validity. Fourth, attention is given to minimizing comparison error in question wordings in general and the availability of on-line resources for developing and testing items to be used in cross-national surveys. Special attention is given to dealing with differences in language, structure, and culture. Fifth, issues relating to evaluating scales designed to measure constructs in comparative survey research are examined. Sixth, the combined use of the multi-level, multi-source approach and TSE in cross-national surveys is considered. Finally, the importance of documentation is discussed.

SMITH MAGUIRE, JENNIFER* (*University of Leicester School of Business*)

Civility and the New Rich: An Eliasian Perspective on Emerging Markets

The paper explores the contributions of Elias's concepts of established-outsider relations and modes of civility (1978; 1994; Elias & Scotson, 1994) for making sense of emerging markets. In particular, I am concerned with how an Eliasian perspective might illuminate the organisational and macro-marketing dynamics at play in the emergence of new, affluent markets. Recent decades have witnessed the arrival of new cadres of super-rich on the global stage. Emerging from disruptions and developments notably in Russia, the Middle East, Africa and Asia, the 'new, new rich' are essentialized in the Western popular imagination by such figures as the Chinese *tuhao* shopper who brings a robot to carry his luxury purchases, or the Russian oligarch's wife showing off her 70 carat diamond ring aboard her super yacht in Dubai. These media representations become important components of established-outsider tensions within the figuration of the global elite, as the established upper classes and their upper middle class aspirants interact with the nouveaux riches. I explore these dynamics through a media analysis, examining the ways in which the nouveaux riches are represented by and to the established elite. The analysis focuses on how the discourse of civility and notions of cultural legitimacy are mobilised to evaluate, categorize and (de) legitimate nouveau riche practices and groups as less civilised. The paper suggests that such media representations form part of a geo-politics of consumption and mediation shaping macro-organisational forms such as emerging markets.

Supporting Settlement: Balancing Obligations with 'Putting Australia First'

Social and political upheavals around the world have resulted in the displacement of the largest volume of people on record. These migrations present significant challenges for the international community with different nation states adopting a range of policy responses. Migration to Australia is achieved through the Migration Programme and the Humanitarian Programme. The Australian Government funds a range of services and supports to assist Humanitarian Programme arrivals' settlement in Australia. Among these is the Settlement Grants Program, which provides funding to organisations to support the settlement of humanitarian entrants and other eligible migrants in their first five years of life in Australia, with a focus on fostering social and economic participation, personal wellbeing, independence and community connectedness.

This paper draws on the findings of an evaluation of the Settlement Grants program. The evaluation was guided by six key questions relating to the program's appropriateness, effectiveness and efficiency, to assess whether it had achieved its intended outcomes. While there were some suggestions for improvements, there was a strong consensus among clients, service providers, policy makers and peak organisations that the Settlement Grants program fills an important role in the range of services it makes available to humanitarian and other eligible migrants.

This paper reflects on the evaluation findings to critically examine how they tally with recent shifts in political rhetoric on immigration to Australia, reflected in the Prime Minister's recent pronouncement about 'putting Australia first'. Subsequent political developments include a review of the skilled worker visa program and citizenship reform, including more stringent English language requirements. It will discuss how Australia's obligations under the United Nations Convention relating to the Status of Refugees mesh with 'putting Australia first'.

Lovers, Acquaintances and Strangers: The Relevance of Victim-Offender Relationships in the Attrition of Rape Cases in South Africa

In South Africa fewer than 20% of reported rape cases result in a prosecution. This paper reflects on the relevance of the victim defendant relationship in police investigations and case disposal decisions in South Africa and the definitional difficulties of categorising a relationship as "intimate". It draws on two empirical studies analysing discontinued police dockets at 8 rural and urban police stations and interviews with prosecutors, magistrates and traditional leaders. Teasing out the nature of the complainant's relationship to the accused and the relevance thereof can be problematic in practice, as well as methodologically fraught. The question of how well the complainant knew the perpetrator and assumptions made by the investigating officer about this relationship are two interlinked factors that make her credibility suspect. As such, one docket might contain a complainant's statement referring to the accused as an 'acquaintance', a witness statement referring to him as a 'friend' of the complainant, and speculation in the investigation diary that he was in fact her 'boyfriend'. Furthermore, much of the popular discourse, and some of the literature, equates 'acquaintance rape' and 'date rape', treating both as essentially resistant to policing or at least very difficult to prevent. Where the 'acquaintance' category includes men whom the complainant met just prior to the rape (those Estrich refers to as 'an almost but not perfect stranger'), or only knew by sight, as well as those with whom she may already have enjoyed a degree of intimacy, the category becomes a nonsensical catch-all. Collapsing these categories elides the extent of trust that might have existed in the relationship, the strategies that the perpetrator might have used to overcome resistance, and the pressures that the complainant would be subject to, either not to report or to withdraw the complaint.

Deciphering Union Environmental Politics: The 'Greening' of Energy Systems in the United States and Australia

A growing body of research suggests unions are performing important environmental roles particularly in relation to climate change. Union environmental politics, however, is rarely straightforward and can be contradictory and variant between unions and the workers they represent, within the same union depending upon the level of the union organisation and often the geographical locations in which they operate. Energy policy and clean energy technology transitions is one of the major areas where unions have often struggled to articulate a clear vision. This paper examines how energy unions in the United States and Australia have grappled with energy questions in the context of climate change concerns. Global warming and associated climate change have called into question the heavy use of fossil fuels in the stationary energy systems in both the US and Australia. Shifts in energy production have significant implications for workers and communities and trade unions have sought to speak on behalf of these workers, communities and the environment in different ways. When jobs are threatened or potentially boosted by energy policy changes union positions at the workplace level, have not always mirrored the union's position at the national and international level. Drawing upon union policy documents, media statements and reports, and selected interviews with union officials, the paper adopts a multi-level and multi-union analysis that examines union positions at the international, national and local levels and identifies the membership and politics of scale challenges they confront in articulating a unified position. The paper concludes that union environmental politics are likely to remain complex and contested domains within the union movement but government and industry efforts to decarbonise the energy system must involve unions and address the social justice issues unions raise if we are to be successful in tackling carbon lock-in.

Social Freedom, the Social Function of Property and Socialism: Revisiting a Classic Theme

Recently, in the tradition of Critical Theory the theme of socialism and its current perspectives have been taken up again, after a long silence. Hauke Brunkhorst, in a more sociological-legal approach, relates socialism with the question of the social function of property. Axel Honneth in turn has reconstructed the idea of socialism philosophically. The text, at first, analyzes the structuring central concepts of these two approaches looking for their contribution to a social theory of medium range in an intersubjective perspective. In a second moment, it discusses recent self-appointed socialist experiences in Latin America in the perspective proposed

by Brunkhorst and by Honneth, asking if they could contribute with an antidote to authoritarian tendencies of the recent experiences.

The Emancipatory Potential of Income Transfer and Political Participation in Contexts of Poverty and Violence

Autonomy and emancipation express the idea that individuals or social groups can choose for themselves how they want to conduct their lives. Both are at the root of central modern conceptions like subject, freedom, self-determination among others. Generally they, and especially their lack, are also part of the studies about democracy and citizenship, when they are qualified as protected, regulated, restricted etc. Autonomy and emancipation are also central in two important thematic complexes: social policies, especially the direct (cash) transfer of income, as well as political participation policies. Sometimes they are taken as a presupposition; in other cases they function as a goal to be achieved; they also can play as a regulative idea that, even distant, guides the social mobilization. Despite being present in public policies, as fighting flags of social movements and in social theories, there are a lack of studies that connect systematically these ideas. The paper analyzes the emancipatory potential of political participation and of direct transfer of income from the perspective of the biographical narrative of women. It will be analyzed in the political and economic perspective (associative involvement, job and income opportunities, access to policies and citizenship rights); it will also be analyzed in the perspective of private, interpersonal relations (possibility to create and realize the own life project, recognition vs. disrespect in family relations, community life). The research field is the *Morro da Cruz*, in Porto Alegre. This neighborhood has a long history of organization and political participation, and the region also has a high number of families awarded with direct income transfer, especially *Bolsa Família*. But it is also the scenario of very different forms of violence. The research will be theoretical oriented on the Critical Theory, especially the conception of radical democracy (Habermas) and recognition (Honneth).

A Study on the Factors Affecting the Satisfaction of Participation in Renewable Energy Source Cooperatives; Germany and Korea Case Study

Currently the financial crisis and various social problems are arising due to market fundamentalism. As an alternative model to the existing economic order, a social enterprise that links "social economy" and "regional development" has been proposed since the late 2000s. Social enterprises seek to solve diverse social problems in profitable activities in the blind spot where government, administrative agencies and markets cannot cope. Cooperative is one of the various types of social enterprise. Participating in cooperatives does not denote donating a small amount of money but instead it refers to investing a certain amount of money, voting on the operations of the company, and getting dividends when profits are generated. However, the perception that citizens directly participate in the generation of electricity through renewable energy sources in Korea is still poor. This study examines what factors are important for the successful operation of the renewable energy cooperatives, which are increasing every year under energy transition in Germany and two successful cooperatives in Korea. The study aims to do this through an empirical study focused on the governance aspect where governments, cooperations and civil societies interact.

The research design is based on a comparative case study in two countries, utilizing a questionnaire-based study. The implications of this study are presented by empirically analyzing the factors affecting the satisfaction of the cooperative.

The results of the survey show that the method of operation and investment profitability of the energy cooperative were significant factors affecting participation satisfaction as seen through multiple regression analysis not only from Germany but also Korea. This means that the energy cooperatives operate more transparently and democratically, and the more they meet their profits, the higher the satisfaction gained by their members. The cooperative is a form of corporation, but its public characteristics play an important role.

Potenciales y Paradojas De La Educación Superior Intercultural

La presente ponencia surge después de realizar trabajo de campo cualitativo a través de entrevistas estructuradas, observación, grupos focales y etnografía en dos universidades con enfoque intercultural ubicadas en el Estado de Quintana Roo, México entre los años 2015 y 2016.

En ella se muestra los objetivos que tiene la educación superior intercultural (ESI) como política pública para cerrar brechas de desigualdad entre la población no indígena e indígena, el fortalecimiento de las culturas originarias, crear un mundo más igualitario para los jóvenes indígenas y prepararlos mejor para la actividad laboral en ciudad o su comunidad. A esto le llamo potencialidades, pues se supone que los alumnos desarrollarían habilidades que les permitieran cumplir estas tareas después de haber cursado la ESI.

Sin embargo, cabe preguntarse si los objetivos con los que fueron creadas estas instituciones de educación superior se han alcanzado cuando los jóvenes estudiantes que han cursado esta modalidad generan una serie de paradojas o resultados no esperados como respuesta, por ejemplo, la configuración de identidades indígenas estratégicas utilizadas para obtener beneficios, un fortalecimiento institucional de la identidad indígena prehispánica y no contemporánea, el rechazo del retorno a la comunidad y la fuga de cerebros empobreciendo más las regiones entre otros.

Si bien la idea no es evaluar la política pública, sí es mostrar algunos resultados que no son generalizables pero que ponen en duda la eficiencia del enfoque superior intercultural en México.

Communicative Acts in Overcoming Gender Violence

Despite strong efforts to approach the scourge of violence against women and the progress achieved, latest data (WHO, 2017) place gender violence as the leading cause of death among women aged 15-44 worldwide; ahead of deaths from cancer, traffic accidents or wars. Research also shows the devastating consequences produced by this reality. Gender violence is a social problem and everybody needs to act against this phenomenon. Facing this reality, Puigvert (2016) proposes the existence of a language of desire and a language of ethics when it comes to speaking about violent and non-violent individuals. Under this framework, the current paper deepens on the analysis of communicative acts from two main aspects: on one hand, to focus on the type of language used by educational professionals and adults who interact with youth when they talk either about violent or right attitudes. On the other hand, to shed light on the effects that these types of language have on the reproduction or rejection of gender violence by teenagers. As language takes place through interactions and gender violence may happen in everyday interactions among people, specific communicative acts may permit or avoid such situations of violence. Language and social interactions prove to be key in approaching violence and can contribute to develop an effective prevention strategy. The analysis of communicative acts (those including non-verbal communication in addition to the verbal speech acts) embraces the

scheme of the present paper. The theoretical background, based on women's studies and sociolinguistics, departs from Puigvert's conceptual framework on language and gender violence in order to analyze concrete communicative acts for their use of language of desire vs language of ethics and their impact on gender violence rejection or reproduction among teenagers. The paper provides knowledge on the potential of using language to fight against gender violence.

Precarity and Industrial Transformation in Guangdong Province – a Methodological Exploration in Régulation

This paper examines the relationship between capitalism and precarity for workers in Guangdong province, China. I do this by taking a non-conventional view of precarity which attempts to capture the way that precarity is experienced, not simply in a particular moment of economic restructuring but as contingent effect of capitalist transformation and how workers attempt strategies to understand the change. Theoretically and methodologically I will combine the French Régulation School and Archer's Morphogenetic approach to elucidate both the economic foundations essential to the Guangdong economy from a Régulation perspective and the ways in which people understand and interpret those foundations. This paper will explore the methodological aspects of my research by linking two key concepts of French Régulation, first, Growth Regimes as distinctive configurations of economic structures that create a specific form of value accumulation. Second, Modes of Regulation as a type of Archerian agency embodying the ideas of Growth Regimes acting and reacting according to how individuals and groups interpret the embodiment. This paper then asks two questions firstly, how to research Modes of Regulation. Secondly, how to research the interaction between Growth Regimes and Modes of Regulation to demonstrate if the continuities/discontinuities between these concepts lead to precarity. I will answer these questions by expounding on a series of in-depth qualitative interviews and an extensive economic analysis effectively triangulating the lived experience of workers with the economic pillars of the region. Guangdong was chosen as the best place to conduct this research because of the accelerated and condensed change that has taken place there over the last 35+ years. Because of the pace of change it has magnified and condensed divergent strategies such that I am able to encounter a variety of disparate experiences in one relatively small geographical area further deepening the analysis.

SOMMER, BRANDON* (*International Institute of Social Studies*)

Precarity and Industrial Transformation in Guangdong Province – a Theoretical Exploration in Régulation

This paper aims to capture the way that precarity is experienced, not simply in a moment of economic restructuring but as a contingent effect of capitalist transformation and how workers attempt strategies to understand the change. I will draw on worker experience of industrial transformation in Guangdong as a case study. Theoretically and methodologically I will combine the French Régulation School and Archer's Morphogenetic approach to elucidate both the economic foundations essential to the Guangdong economy from a Régulation perspective and the ways in which workers understand and interpret those foundations. As a leading school in understanding transformations in Capitalism, the French Regulation School offers a solid platform to begin to understand the economic foundations of Guangdong but its theory of agency is not fully developed which restricts its ability to elucidate potential synergies for individual and collective social action. This paper will explore the theoretical aspects of my research by further developing the concept of agency by introducing the Morphogenetic Approach as a compatible and useful theory of structure and agency to link two key concepts of French Régulation, first, Growth Regimes as distinctive configurations of economic structures that create a specific form of value accumulation. Second, Modes of Regulation as a type of Archerian agency embodying the ideas of Growth Regimes acting and reacting according to how individuals and groups interpret the embodiment. This paper then asks two questions; firstly, what is a Mode of Regulation and how does it work. Secondly, what is the relationship between Growth Regimes and Modes of Regulation and does the continuities/discontinuities between these concepts help to explain precarity. As a mostly theoretical paper I will draw on the case study only to offer illustrative examples to make the concepts sharper.

SOMMER, MATTHIAS* (*TU Chemnitz*)

"You've Got a Match" – Selection Processes in Web-Based Environments

According to Max Weber "any type of order governing social action [...] leaves room for a process of selection". Interaction orders contain a form of social structure in which certain types of behaviour are preferential while other types are neglected. The paper focuses on processes of selection within everyday encounters in web-based environments. It asks how interaction orders can be understood in which someone chooses one person over another online. Therefor different 'web-based stages' are analysed and contrasted, i.e. distant carpooling services, social as well as dating applications, and career-oriented social networking sites. The problem to match people can be understood as a problem of relevance: 'Web-based stages' institutionalize specific systems of relevance (Alfred Schutz) and thereby 1) determine what characteristics are important within selection processes. 2) They transform individual characteristics into typical social roles and 3) function as specific schemes of interpretation in which individual actors can align their motivational relevance with other persons. The focus of the paper is on the interplay between individual orientation and symbolic/mediatized environments. First, it reconstructs the formal structures and mediatized constructions of different 'web-based stages' and their different techniques of social management. Second, the different possibilities for individual action within these environments will be analysed. Here the focus is on the possibilities of self-presentation and self-objectification in web-based encounters. While in face-to-face-situations processes of selection often rely on the co-bodily presence of the person choosing and the person getting selected, in web-based encounters persons need to invest a lot of time to give themselves a semiotic and symbolic character. The increase of the meaning of indirectness in modern selection processes will be theorized and the problem of the unequal distribution of knowledge within selection processes discussed.

Happiness, Life Satisfaction, and Social Network in Korea and China

Happiness and life satisfaction are two representative indicators of general well-being. It has been much studied how those subjective well-being measures are associated with objective structural features, one of which is social network. The general assumption is that the wider the network the better the subjective well-being. However, the relevant literature has frequently tested the relationship between network and well-being using convenient measures of network such as number of daily contact and number of membership in voluntary associations. Therefore, we are left with an unresolved question concerning how specifically social network is related to subjective well-being.

The present study thus examines this relationship by three distinct measures of social network comparing two different countries, South Korea and China, to check the sensitivity of the relationship cross-nationally. Specifically, I use (1) name generator, the oldest and most popular network generator fitted to capture strong ties around an ego; (2) position generator, the measure of social resources embedded in occupational network; and (3) the MOS (Medical Outcomes Study) social support variable that, in short, counts number of reliable friends and close relatives when in need. The former two are general social network measures while the last is an indicator of social support.

The empirical analyses show that (1) all three network measures are significantly and invariably associated with both happiness and life satisfaction in Korea and, however, (2) only number of social support ties is related to happiness and life satisfaction in China. That is, neither name nor position generator is related to any of the two well-being measures in China. In conclusion, the results inform that social support is more robustly related to subjective well-being than general social network measures. Further, it is likely that cross-national variation exists in the degree of interrelationship between objective network structure and supportive ties.

From Conflict to Convergence, --Olympic Nationalism Discourse in China--

This paper aimed to challenge China's internet analysis's that focus on empowerment or took the perspective of technology determinism. I take discourse conflict between online criticism and state-oriented mainstream media as example, to indicate that online discourse's nationalistic characteristics made it easy to be converged to mainstream media discourse.

As internet supplied a platform for alternative voices in China, and first years of 2010 witnessed many cases of online public opinion's surveillance towards China's political power, many scholar tend to expect on the empowerment for

grassroots. However, by analyzing the nationalistic online and media discourse during Olympics of London games and Rio games, I argue that even in climax of optimism in 2012, nationalism made online discourse easily convergent to mainstream media discourse.

Olympics are "regularly recurred celebration of a coherent set of values, beliefs and symbols". Also for both KMT regime and CCP regime, nationalism is used for legitimate China's regime. Thus, regularly recurring nationalism discourse during Olympics, is a good example for chronological analysis to explore the changing of media environment in China.

By analyzing most commented and retweeted SNS post and mainstream state-oriented media discourse during 2012 London games period and 2016 Rio games, and also series policy of "media convergence" and "internet+" during 2014 to 2015, I argue besides the policy intervention for China's media, nationalistic characteristic of online discourse is also a reason made it easy to converged to mainstream media discourse.

How China's Media Are Researched in Japan?

As an important neighbor country and a rising power, China has been a main research object for area studies researcher in Japan. As a part of social process, China's media communication came up for debate in Japanese China research.

By detected 38 academic articles on 6 main Japanese journals on mass communication or China area studies, from 2000 to 2017, I argue most of such studies took either the perspective of communication technology as agency of social change, or the perspective of social context as filter, in "the technology-context scheme". When the concept of "power" is mentioned in such research, it is about either the government's political power of censorship, or technological empowerment for the people. That means China's media is seen as either object or subject of political "power".

Meanwhile, according to Japanese researcher of political communication, OISHI yutaka, the relationship between media and power can be categorized into 4 types. The first of them is that media could either be interfered by political power or play a role of the fourth estate, which is frequently mentioned in China's media research. The second type is that media do possess a power of selecting issues from thousands of them to report. The third type means that media reporting can evoke public opinions or "power up" one kind of public opinion. And the last type is that media can construct collective memories and hold the power of defining news issues by framing. The last 3 types of relationship between media and power are almost left unmentioned in China's media research in Japan.

This situation is a consequence of the lack of perspective of journalism and mass communication and the overweighting of China's politics analysis in China's media research in Japan.

SONG, JUNG EUN* (*SSK Glocal Culture and Empathetic Society Research Center*)

The Glocal Culture and the Korean Wave

This paper regards the Korean Wave as an exemplary glocal culture and discusses the concept of glocal culture. The Korean Wave refers to the popularity of Korean popular culture, entertainment and daily culture across Asia and other parts of the world. Glocal culture is developed through the interrelation between global and local contexts and is transnationally consumed. By considering the Korean Wave as an exemplary glocal culture, the paper discusses the globalization of Korean popular cultural contents as the result of local socio-cultural characteristics of Korea, hybridization of global and local features, and transnational consumption of contents. The glocalizing dynamics of the Korean Wave can be seen in the process of consumption and creation of new pop culture in the countries receiving the Korean Wave. People in different countries received the Korean Wave depending on political, economic, socio-cultural factors in each country. The diverse responses to the Korean Wave in each country are related to individual interactions to values and experiences in plural time periods. For example, the meaning of consuming Korean Wave products would be either advanced or low culture through interacting with a global cultural form. The local countries consuming the Korean Wave respond to globalization by creating new forms and styles of glocal cultures through local re-interpretations of the Korean Wave. In addition, the paper introduces the activities of the local K-pop fans as evidences of cultural communities. With the cases of globalization of the Korean Wave, this study intends to consider the Korean Wave as a way to build cultural relationship between Korea and the Korean Wave receivers. It is an important factor for the creation of transnational cultural communities where people among different countries share cultural universals, identities and tastes based on the Korean Wave, and further develop two-way communication, mutual understanding and cooperation.

Deconstructing the Webs: Entanglements of Nationalist Narratives and Transnational Economies

Today, in political spheres throughout our globalized world, we see a resurgence of openly nationalist, race or ethnically based, or "far-right" extremist language being used to fuel and justify a rising tide of anti-immigration and populist movements. Following the years of claims of a post-race or colorblind era, these movements appear surprising to some. This article considers two realities that reveal the current era as both a continuation of an ongoing process and an inevitable outcome of the transnational economy. This research looks closely at the experience of various groups in their local society, giving voice to the experience of life within the striated societal existence throughout the decades of the popular amnesia aiding the falsely dramatized, post-race or multicultural narrative. Further, the article explores how fascist practices and perceptions have been present in earlier iterations of the anti-other, quietly survived and thrived in eras of cosmopolitan ideologies, and emerge today assertive and unafraid. Importantly, and apart from public perceptions, the economic forces of global capital headed by transnational players create and sustain both the movements and placements of people in physical spaces and in social and political participation, and the narratives which respond to such realities. By illuminating the extent to which local players have participated in identity-based policies within striated spaces, while the causes and conditions of societal development were and are being driven by globalized political and economic factors, this research contributes to the understanding of today's populist and fascist movements and exposes the fault lines of the transnational capitalist system, without neglecting the deeply embedded language and conceptual understandings of the people who live inside its realms.

Fractals of Hegemony: Replication of Hegemonic Structures and Response Efforts in Cities across the Globe

Complex systems of hegemony impacting post-industrial urban change are found in cities across the globe. Researchers note the common problematic outcomes, such as dispossession of homes, renegotiated economy, privatization, socio-spatial polarization, and uneven development, among others. Anti-gentrification struggles along with labor strikes, women's movements, religious resurgence, and ethnic division arise as humans respond to the oppressive or directive forces in their local communities. These actions are, in turn, responded to by governing structures in a cyclical pattern that spans generations. Through comparative case study infused with analysis of existing quantitative data, this article explores the potential for unifying solidarity transforming into a global urban justice movement by illuminating the commonalities of localized struggles. This research demonstrates that, despite the intricate intermingling of varied, coordinating factors involved in local hegemonic application, there are significant similarities such that it may be shown that by considering fractal relationships among several cities, we may create an alternative theoretical framework for viewing the problems of the current global age.

Illiberalism and the Environment

Since their inception, popular environmentalism and environmental sociology have developed in close relation to – in extension of, dialogue with, and critique of – liberalism and liberal values as applied to the environmental sphere. The liberal worldview, based on classical Western ideals privileging the rights of individuals, citizenship, political pluralism, representative democracy, and accountable states and institutions, remains at the heart of environmentalism and much environmental social science. Many nation-states are predicated on the rule of law and responsive institutions, including with respect to environment and society. Global institutions are founded on liberal ideals as well, including the United Nations, the Universal Declaration of Human Rights, Rio Declaration, and the UN's Sustainable Development Goals. Yet Western-style, liberal democracies are hardly universal. Illiberalism is widespread, in forms ranging from illiberal democracies to centralized states, theocracies, monarchies; and non-state forms including various 'rights' and millenarian movements. Across the world, liberal states and institutions co-exist with, and sometimes are overshadowed by, illiberal counterparts, leaders, and movements. At the same time, strained by social and environmental crises, all states face increased calls for environmental intervention, sometimes over the rights of individuals, communities, and dependent territories. This paper asks, What are the implications of this wide spectrum of socio-political forms, ideologies, and movements for an environmental sociology of

the full range of human-environment interactions that can support attainment of a more sustainable global future? How does the interaction between political actors, including the state and civil society, play out with respect to environmental problems and responses? What are the implications in diverse contexts for the relationship between humans and nature? Liberal democracy and environmental protection pose daunting tradeoffs with critical consequences for humans and nature in diverse political contexts. Yet even in illiberal contexts, the fates of humans and the natural environment remain inextricably intertwined.

Now Is It Time to Panic? the Moral Dimensions of Russian Interference in the 2016 US Elections.

News of Russian interference in the last US Presidential election first emerged in June 2016, and the story has only grown since then. Claims and counter-claims about hacking, fake news, and document leaks have become institutionalized in the news media and in a special prosecutor's grand jury investigation. Although the evidence is still being debated, Russians have once again become folk devils in much of American news, suggesting a new Cold War. Is this scandal a witch hunt, a red scare, and an unjustified moral panic? Or is it a genuine moral crisis playing out through political channels? This study examines English-language news to identify the moral dimensions of the debate and uses field theory to locate these debates within a transnational field of online news media. Data come from Google site searches for moral concepts such as right, wrong, protection, honesty, and integrity, and this semantic field is analyzed using social network analysis and correspondence analysis. Preliminary results show that moral judgments correspond to political divisions between left and right--and center and margin--of the journalistic field. Key outlets from Russia and the US also use contrasting moral discourse: the Washington Post emphasizes positive words like privilege, reliability, and right, while RT emphasizes negative words like evil, immorality, and lying. These findings suggest that the rise of right-wing populism in the age of Trump constitutes a legitimate moral crisis, regardless of the legal conclusions sought by investigators. This study contributes to moral panic research by demonstrating a relational approach to moral claims and counter-claims and by clarifying moral conflicts by mapping them onto social and institutional contexts. Further research will update these results by linking moral concepts to particular people and events in the wider scandal and by examining change over time.

What Is the "Global" Labor Market? --Whether Japanese Companies Make Global Labor Markets--

More and more workers move across the world in increasingly integrated global economy. Especially talented people occupy the interest of worldwide competition for highly-skilled human resources, so national boundaries no longer form closed labor markets. It is safe to say global labor markets are being constructed in all over the world. While globalization has made progress in recent years, most Japanese companies are still typical ones where nationality is strongly linked to the companies by uniqueness of its language and culture. Nevertheless, as more and more foreign people who studied Japanese are trying to work in Japanese companies, Japanese companies are becoming a multinational company in the sense of labor. Although it is hard to say that Japanese is the global language, increasing foreign workers especially from Asian countries come to Japan and are a member of Japanese company. Then, can we conclude that Japanese companies make global labor market? The purpose of this presentation is to argue what is the "global" labor market we suppose in considering the case of Japanese companies.

Production of Science in Africa: Decisive Indicators

The production of science, whether it is measured in terms of scientific publications, patents or any other scientific outputs, is not shaped by a single factor. The production of scientific publications in Africa and its relationship with relevant indicators such as research and development (R&D), gross domestic expenditure on research and development (GERD), and gross domestic product (GDP) are analysed. Drawing on data from reliable multiple sources and compiling and processing them, the production of scientific publications in Africa is compared with that of other relevant regions and the world. Within Africa, sub-Saharan Africa is also in focus. There is a huge gap between the scientifically productive and the less productive countries in Africa. Half of the scientific publications in Africa for the period 1945–2015 was made by just two countries, namely, South Africa and Egypt. These two countries continue to lead Africa in scientific publications. A wide disparity between Africa and the world is obvious in the number of available researchers per million population. Within Africa too,

regional disparities (sub-Saharan Africa, for instance) are found. The analysis presents trends in the allocation of GDP for R&D. A positive correlation between the production of scientific publications and variables such as GDP and GERD in Africa and sub-Saharan Africa is evident in the data.

The Good, the Bad and the Ugly: (Im)Migrants in the Urban Renewal and State-Led Gentrification of Madrid and Barcelona

The role of the State as producer of urban inequalities through regeneration programmes has been focus of a burgeoning literature (Lees et al. 2016). However, the multiple ways in which migrants have been instrumentalized in these processes are less explored (Porter & Shaw 2009). This paper contributes to this debate by examining the complex interlink between international migrations, urban renewal, and gentrification in Madrid and Barcelona, where radical transformation started with the 1990s' "liberalisation" of the Spanish housing and credit system.

Using geo-referenced and multiple linear-regression analyses, this study contrasts and relates the location of investment/disinvestment cycles led by local governments' urban renewal programmes, and the residential patterns of large immigrant groups. Narrowing on a set of neighbourhoods paradigmatic of this entanglement, it examines (i) socio-spatial and housing changes (2001-2016) that show the regressive effects of these programmes and (ii) how migrants have been used or framed in these policies.

The paper shows ethnically diverse areas (where worse-off immigrants settled) as primary targets of renewal programmes. These were mostly run-down, but central and pericentral neighbourhoods with valuable historical/cultural heritage, and thus locking potentially high investment returns. Narratives of decay but also of celebration of local ethnic communities' symbolic attachment to these neighbourhoods were used to justify public interventions aiming at attracting private investment and well-off international migrants, and simultaneously "normalizing" the neighbourhood's social configuration. This was achieved through a mixed strategy of stigmatization and improvement of both their built and symbolic environment (Wacquant et al. 2014; Weber 2002). In both cities, despite major differences, the interplay between state-led gentrification and (im)migration operates at both material and symbolic levels, revealing the dual use of migrants to foster urban accumulation strategies. Unveiling the role of the State in these processes further contributes to the comparative urbanism's debate on rent gaps (Slater 2017).

How to Regain Legitimacy for Social Sciences Research

This communication draws from the findings of IMPACT-EV research project (2014-2017), funded by the European Commission under the 7th Framework Programme. Its main goal is to evaluate the social and political impact of Social Sciences and Humanities (SSH) research in Europe and, for that purpose, another objective is to develop indicators and standards for evaluating all types of impact of SSH. This project has been approved in a context where the usefulness of SSH research was questioned by politicians and society as well. Therefore, IMPACT-EV is a product of the growing demands from governments and society to all sciences, and particular SSH, to have relevant social impact and to show the returns they provide to the society. Social impact of research refers to when the published and disseminated research results, which have been transferred, lead to an improvement in relation to the goals agreed in our societies. Thus, this communication builds on the five cases of the identified successful European research in SSH that have achieved impact, especially social and political, to bring forward the elements that have been identified as enablers and also those elements that are inhibitors for achieving impact. We found that scientists are increasingly encouraged to reach out to their communities, sharing their research and its impact on people's everyday lives and to listen to communities and consider their research and future plans from the perspective of the people they serve.

Sartucue. Romani Feminists Organizing in the Struggle Against Gender Violence

Many women and men are struggling united worldwide for overcoming gender violence and scientific literature is shedding light on how these allies are occurring in different social contexts. However, Romani women have traditionally been portrayed as deprived from their capacity of agency to organise and foster a change. In this way, analyses offered by non-Roma women on the reason why Roma women suffer gender violence attribute the causes to the cultural aspect. As a consequence, protocols of intervention implemented in institutional organisms oriented to victims of gender violence are many times colour-blind and not done in dialogue with end-users, what makes that Romani women and women of other ethnic minority background encounter some barriers that prevent them to access to these institutional structures of help. In order to respond to these challenges, in the present paper we present preliminary findings of the research project SARTUCUE (together with you in Romany language) (funded by the Spanish Plan of Research, 2016-2019) which is aimed at studying gender violence among the Roma. SARTUCUE explores barriers to accessing services for victims and analyzes the strategies developed by the community itself to deal with situations of domestic violence and its prevention. The project is analyzing the key elements that have allowed the Roma to create a series of strategies to address and prevent domestic violence in their community. Findings are in relation to the informal strategies emerged in the very networks of Roma families. We deepen in those strategies that have a significant role in the organization and mobilization of the Roma community, focusing on the role of the Evangelical Church of Philadelphia, since it is de facto a site for meeting and social cohesion and where principles condemning any kind of violent behavior are promoted.

Professionals UNDER Judgement: How the Italian Systems Deals with Complaints Against Social Workers

Social professions heavily rely on bonds of trust between professionals and clients: on the one hand society attributes power and authority to the first ones; on the other hand, it requires them to perform accountability and confidentiality, respect for clients' rights and freedom of choice. This is also true for Social Work: many national organizations clearly state those principles in their Codes of Ethics. However, problems might occur and the professional can be accused of violating such principles. Assessing whether the social worker is to be blamed because s/he did something wrong can be a very difficult but important task. Moreover, some misconducts may pertain to the deontological sphere but they might not be relevant from a legal point of view. In order to address complaints against social workers, some countries have thus developed specific systems that guarantee the respect of rights, norms, and interests for all the subjects involved.

This paper presents the Italian approach to social workers' professional misconducts, comparing it to the English one. Both are quite new and still under development by their own professional communities, but they clearly adopt different perspectives. The analysis and juxtaposition of the two regulations and the outcomes of the proceedings so far conducted against social workers will eventually outline strengths and weaknesses of the two systems, namely in terms of accessibility, general costs of the systems, its fairness to the people involved, and usefulness for the profession. On these bases, the conclusion will provide some suggestions and remarks for the Italian system of proceeding ethical complaints against social workers. The aim of this study is to underline the importance of this tool for the profession to guard the public against power abuse, to enforce an ethical approach, and to reflect upon practical difficulties of this system.

SORJ, BILA* (*Federal University of Rio de Janeiro*)

The "Re-Enchantment" of Institutional Politics: Feminism in the Conservative Conjuncture of Brazil

The 2016 municipal elections in Brazil were a big surprise for the large number of young feminists and transexual candidates running for office. In three capitals - Belo Horizonte, Belém, and Porto Alegre - women candidates were the most voted among all the competitors. They are young social activists who fight for the causes of minorities, women, blacks and LGBTs rights.

The paper argues that the turn of feminists activists towards institutional participation is linked to the rise of the conservative and religious forces in the Brazilian Congress, which threaten the achievements of the feminist agenda and the emergence of a new leftist party, PSOL, more sensitive to identity politics rep-

ertoire. How do feminist and LGBT activists reposition themselves in relation to institutional political? How do they move between their previous logic of autonomous action and the new institutional roles they aspire to assume? How do they negotiate between political actions considered, in general, as antagonistic? What new democratic practices do they bring to institutional policy? The analysis of the renewed interest of feminist and LGBT activist movements in the institutional politics allows to complexify the predominant discourse of the Political Science on the "crisis of political representation" in Brazil.

GROSSO FERRERO, MARIANA (*Universidad Nacional de Córdoba*)

Feminicide in the Media: A Three-Dimensional View of Symbolic Violence

The use of the traditional public/private divide as justification for State inaction in relation to violence against women (VAW) has been theoretically and legally challenged in the last 3 decades. Echoing these feminist claims and in line with the international human rights framework on gender-based violence (GBV), Argentina has adopted progressive laws. These recognise the responsibility of the state for VAW in the private sphere and prohibit symbolic violence, a form of GVB that clearly transcends the public/private divide by focusing on the reproduction of harmful gender stereotypes. In addition, the murder of women because of their gender is explicitly criminalized as 'femicide', recognized as the most severe VAW. These efforts could help overcome the divide, yet media treatment of femicides suggest otherwise. While many femicides have triggered immediate social condemnation, media reports often reinforce stereotypes, and also the public/private. This article explores symbolic violence in three dimensions, theoretical, normative and empirical, and reflect on the centrality and relevance of the public/private dichotomy in the reproduction of stereotypes. The theoretical dimension examines the meaning of symbolic violence and the public/private divide in feminist literature. Then, we inquire into the legal interpretation and treatment of these notions. Finally, we examine the media treatment of the cases of femicide in Argentina through the qualitative analysis of news articles from the three largest newspapers in Argentina (Clarín, La Nación and Página 12). The covered period is June 3, 2015, date of the first massive mobilization in protest against femicide (the so-called 'ni una menos' social movement), until February 2017. The paper concludes with a discussion about the relevance of the public/private divide in relation to tackling symbolic violence and gender stereotyping, and the potential for long-standing public policies in the prevention of GBV.

Tools for Injustice: Control and Exclusion to Prevent Demands for a True Education. Mexico and Latin America

The persistence of an educational system based on the combination of rigid forms of evaluation -meant to exclude hundreds of thousands from their right to access or permanence in an educational institution- and the use of diverse mechanisms of social control to ensure that teachers, parents and students are subordinated to the system's rules even if they cannot guarantee a successful outcome that links education, social integration and employment, has increased both tension and frustration in schools and communities. The result of this tension can be the eruption of a protest movement, but mostly, it is producing massive students' desertion, isolation and self exclusion in significant cases, both in rural and urban regions, all through Latin America and many other parts of the world. Resistance against the prevailing rules and educational system can also adopt the form of adoption of different forms of involvement in so called informal/virtual/distant forms of education, or total renunciation to receive any institutional education. Some of the present alternatives are, however, linked to family or community survival strategies. These have proven to be useful and often, more satisfactory than what the prevailing institutions have to offer.

SOSTERO, GIULIA* (*Université Paul Valéry Montpellier*)

Radicalisation: Users' Guide. a Case Study on Swedish Prevention Practices

This research engages in both a theoretical and an empirical approach to prevention of radicalisation. After an analysis of the literature on radicalisation, including studies drawn from sociology, political sciences and psychology together with national policies, this study delineates the different stances that have been taken in studying this concept. It then focuses on the complex relation between radicalisation and Islamophobia, addressing the topic of "white men radicalisation" and how post-truth is fostering this phenomenon.

Based on 14 interviews with professionals working in prevention of radicalisation in Sweden - the police, the Government, youth workers, NGO workers, psychologists and experts of Islam - this research explores the diverse approaches that are taken in prevention according to the different agendas. In Sweden, prevention policies began to be drafted in 2012, and radicalisation to violent extremism has been categorised either as left-wing, right-wing or Islamic. Through the definition of the concept of radicalisation with the words of each professional, a bias against Muslim communities is detected in particular from the side of the Government and the police. The negative consequences of this stigmatisation have been explored through the confrontation with experts of Islam in the Swedish context. Moreover, the shift of responsibilities from the Ministry of Culture to the Ministry of Defence denotes the transition to a more securitarian view on prevention.

Finally, this work contains a case-study of a cultural association working in the field of prevention through the usage of music and the cultural arts.

This work fits in the recent critical tradition that examines radicalisation as a multi-faceted phenomenon that can also take place at a State level in its relations with minorities, in this case Muslim communities in the West.

SOUSSI, SID AHMED* (*Université du Québec à Montréal*)

Une Zone Grise Du Travail Dans Les Chaînes De Valeur : Le Poids De l'Action Publique Dans La Précarisation Des Travailleurs Migrants Temporaires Au Canada.

Le recours accéléré au travail migrant temporaire dans les différents secteurs d'activités s'impose comme une tendance lourde. Il contribue à la transformation concomitante des relations du travail et de la structure de l'emploi dans les secteurs concernés. Ce processus s'observe à l'échelle de deux composantes constitutives du marché de l'emploi: la chaîne de valeur et les entreprises-maillons qui en encadrent les activités. Cette communication livre les résultats d'une recherche consacrée aux impacts du travail migrant temporaire sur la reconfiguration de l'emploi et mobilise deux niveaux d'analyse. Le premier est celui des entreprises en tant qu'espaces du travail juridiquement autonomes en termes de relations d'emploi et de la chaîne de valeur en tant que procès incorporant divers modes d'organisation du travail dans ces espaces. Le deuxième niveau examine les effets conjugués 1) de la dynamique du marché de l'emploi générée par les chaînes de valeur et les contingences de leurs secteurs d'activité (agro-industrie, hôtellerie/restauration; etc.) dans un contexte subordonné à l'offre et la demande; 2) des politiques publiques du travail migrant temporaire mises en œuvre. Constats : l'accélération du processus de reconfiguration de l'emploi ne doit pas sa dynamique à la seule «logique du marché» -ni aux seules stratégies des entreprises- mais au concours déterminant de l'action publique via un rôle ambivalent de l'État. Cette étude montre comment l'action publique encadrant la logistique juridico-administrative du travail migrant temporaire joue un rôle déterminant non seulement dans ce processus affectant des espaces du travail de plus en plus nombreux, mais aussi dans la fragilisation des statuts d'emploi et des droits sociaux des travailleurs migrants temporaires dans un contexte où l'action publique et sa dimension politique se conjuguent avec les stratégies des entreprises pour exercer des rapports de domination excluant toute possibilité d'accès aux droits sociaux du travail les plus élémentaires.

SOUTHALL, ROGER* (*University of the Witwatersrand*)

(Middle) Class Analysis in Africa: Does It Work?

The dominance of the democratization/good governance paradigm ensured the decline of class analysis in Africa from the early 1990s. Yet recently, there has been a revival of interest in class - notably the 'Middle class'. While much of this

analysis is economic (and has been subject to extensive critique about what is meant by 'middle'), there are also a growing number of studies which espouse historical-political and/or ethnographic approaches. While much of this work is highly illuminating, it is curiously divorced from classic class analysis, focusing instead upon middle classness as a matter of identity. However, if class analysis is to be taken seriously, then any middle class needs to be located within an overall class structure. This certainly works in South Africa, where industrialization brought forth a class structure which was recognizable from both Marxian and Weberian perspectives. But is it equally applicable in less industrialized countries? This paper will argue that it does.

Extractive Resource Development in Canada's North: What Are People Worried about?

Following the Berger Inquiry of the 1970s, communities in the Canadian North have been able to increase their ability to control development in their regions in a number of ways including the signing of modern comprehensive land claims, self-government arrangements, and the empowering of territorial governments. As such, the situation is different from that of the 1970s when people seemed most concerned about their ability to control unsustainable industrial development. It can now be stated that, in many respects, communities now have a veto over proposed new developments. Yet concerns over extractive industry activities remain. This paper will examine what communities in Canada's North are most worried about in terms of new mining projects through a content analysis of documents associated with new mining projects in the region since 2000. Documents will include submissions to Impact Assessment processes, data gathered in research projects, and articles in the news media.

SOUTO, ANDREA* (*University of A Coruña*)

DIZ, CARLOS (*University of A Coruña*)

Immigrants' Sons: Power, Violence and Resistance in an Urban Context

In A Coruña¹, the arrival of immigrant families from very diverse places from all over the world during the last decades has completely changed the appearance of the working class neighborhoods that surround the center of the city.

Despite its own history as a migration village (indeed, A Coruña is a city built on those who left towards Latin America and Europe and also on those who came from the rural areas), complex forms of racist violence arise in the streets and in the schools, affecting deeply the lives of those children that, regarded and classified as 'outsiders', have to grow up here, facing not only the constant mistreatment they are submitted to by other scholars and neighbors but also that one their parents and love ones are forced to put up with.

In those neighborhoods where poverty and marginalization was already the norm before the arrival of immigrant people, the aggravation of the situation since the outbreak of the economic crisis in 2008, combined with the roughly traditionally xenophobic ideology of a society, do not forget, nurtured and supported by national and regional governments and media; violent acts against immigrants and their children constitute a hard but undeniable reality.

This research, carried out in the popular districts of A Coruña, tries to reveal how this everyday violence experiences impacts the consciousness of these children, shaping their development as human beings and provoking different reactions to it: from the interiorization of the hegemonic classist and racist discourses predominant in the environment, its reproduction and consequently, the emerging of self-hating feelings; to the rejection of the (un)welcoming society, but usually standing in a resistance position in the middle of both damaging options.

¹ A Coruña is a village placed in the Northwest coast of Galicia (Spain).

Trabajadoras Del Sur En El Norte. La Infrapolítica De Las Migrantas Brasileñas En Portugal y España; Experiencias De Resistencia Desde La Encrucijada De Raza, Clase y Género

Sustentado en dos pilares epistemológicos, el feminismo, y más particularmente el feminismo del tercer mundo^[1], y la teoría decolonial^[2], esta investigación pretende revelar a partir de la experiencia migratoria de las mujeres brasileñas en Portugal y Galicia (España), la manera en que las relaciones históricas de colonialidad y la condición transnacional han configurado la identidad de estas trabajadoras llegadas desde las periferias globales a metrópolis. Y cómo las propias mujeres en un ejercicio de reapropiación de dicha identidad impuesta, han ido desarrollando alrededor de la misma una infrapolítica^[3] de la cotidianidad que les es propia, específica y compleja.

Este marco de agencia construido por las migrantes brasileiras aúna, organizados formal o informalmente, un amplio despliegue de recursos subversivos y estrategias de rebeldía. Saberes, discursos y toda clase de mecanismos de resistencia que son puestos en práctica para hacer frente a un orden de poder que atenta contra el derecho a ser de estas mujeres.

En sus `cuerpos del Sur` en el Norte, las categorías múltiples de género, raza y clase que conforman la identidad de las mujeres, unidas a su condición de migrantes, convergen para crear una forma muy concreta de opresión que desborda el machismo, el racismo y el clasismo; encarnando de una vez la estructura de dominación patriarcal/colonial/capitalista que rige el mundo. Y por ello es precisamente la lucha diaria que las migrantes brasileiras mantienen a ambos lados del Atlántico por el reconocimiento y la redistribución de la riqueza, uno de los lugares contra-hegemónicos clave en que deben buscarse alternativas al poder vigente.

The Unequal Impact of the Crisis By Age: An Analysis Based on National Transfer Accounts

The recent economic downturn starting in 2008, named as the Great Recession, has had a big impact on societies. Beyond its well-known macroeconomic effects, other socio-economic changes deserve attention. In particular, our paper focuses on the impact of the Great Recession on the intergenerational distribution, an issue that has been little explored but which can provide useful information for designing social policies. In the first part of our paper we revise the arguments for intergenerational redistribution, discussing the roles of both families and the welfare state. Later, using the National Transfer Accounts (NTA) methodology, we perform an in-depth analysis referred to Spain, one of the European countries most affected by the recent crisis. NTA constructs age profiles consistent with the macroeconomic aggregates of National Accounts, hence allowing for a detailed analysis by age. Our results confirm that, as most international reports (UNICEF, Save the Children) have pointed out before, children have borne the brunt of the crisis. The rise of unemployment and the fall in wages inevitably led to the impoverishment of families, without adequate social policies acting as a counterbalance. On the contrary, the elderly seems to be by far the best protected, thanks to the well-established pensions and health care public policies. Hence, the welfare state is proven to be a powerful and effective mechanism for intergenerational distribution, preventing poverty and social exclusion.

According to EUROSTAT data, the rate of children at risk of poverty or social exclusion (AROPE) in Spain increased from 28.6% to 34.4% between 2007 and 2015, while for the elderly dropped from 27.8% to 13.7%. And this seems to be a general pattern in most European countries. The question is why high-income societies are highly averse to old-age poverty while they seem to accept child poverty almost without flinching.

Centrality of Coercion in the Governmentality of the Deportation Process: A Comparative Perspective Based on the French, Swiss and Turkish Cases

"Voluntary return" has been put forward and has been presented as a counterpart to "forced return." However, based on two qualitative comparative research projects on the deportation of foreigners (one on France, Switzerland and Turkey and another on France and Switzerland), funded by the Swiss National Science Foundation, we will show the centrality of the coercion when foreigners are deported "voluntarily" or not.

Even though "voluntary return" is highlighted in the studied countries, in practice, they make a concomitant use of incitement and coercion to pressure unwanted foreigners to leave the country. Therefore, there is a mixture of incentive and coercive measures used to different degrees depending on the case and the context. This mixture can be considered as the basis of the governmentality (Foucault, 1994) of the deportation of foreigners. Moreover, although some tools created to deport foreigners may be considered as incentives *per se*, their uses may be different. For example, when return assistance is proposed to foreigners, they are told that if they refuse, they will be deported by force.

Despite variations in our findings regarding the use of incentive and coercive tools in studied countries, our research shows that coercion is central to the deportation process. This centrality comes, overall, from the fact that deportation without coercion seems almost unthinkable for states because of the fact that coercion is inherent to the deportation process.

In our paper, firstly, we will show how coercion is used directly and indirectly by various institutions of the studied countries, mainly, on the basis of analysis of legal texts, official reports, semi-directed interviews as well as participant observation. Then, we will mobilise the concept of governmentality in order to analyse the centrality of coercion and its indirect use in the deportation processes of these countries and compare them.

Institutional Uses of Dublin Regulation III and the Eurodac Database By France and Switzerland to Identify Foreigners to be Deported

The emergence of new "migration technologies" has as a consequence that the human body is treated as "an information storage device". On the other hand, there is a process of "digitalization of the European borders" that allows the Europeanization of migration control through more or less standardised technology-assisted procedures. In this context, "identification technologies" plays a central role. At the European level, many efforts were put into the development of efficient tools for identification. Different instruments, such as the Schengen Information System, Eurodac and the Visa Information System, were envisaged for distinct purposes, at different stages of the migratory process (entry, residence, etc.) in Europe. These transformations highlight the central role of identification for deportation processes and procedures and the fact that biometrics are put forward, as they supposedly drive the technological tools for identification particularly reliable.

In this paper, after a general panorama of technological instruments created by the European Union (EU), we will focus on the use of Dublin Regulation III, which allows EU member and associated states to deport asylum seekers to another European country which is considered as responsible for their asylum applications. We will then show how Eurodac, a European database in which data of asylum seekers are stored, is utilised as an identification tool in two different ways, which we will call primary and secondary identifications.

Our paper is based on an ongoing comparative research project on institutional uses of European technological tools for identification and avoidance strategies by foreigners to be deported in France and in Switzerland. Methodologically, this qualitative study uses documentary analysis (of materials constituted by European and national legal texts, newspaper articles, case law, secondary data), as well as participant observation and semi-structured interviews with administrative officers, lawyers, social workers, representatives of migrant rights organizations, as well as migrants themselves.

Diaspora, Sporting Bodies and Aesthetic Formation: The Experiences of Dutch Somalis Examined

This paper builds on the concept of aesthetic formation to examine the sensorial practices through which diasporic imaginations become tangible, experienced as 'real', and 'felt in the bones'. The authors interpret cultural forms such as sport as a critical space for the embodied aesthetic forms through which diasporas materialise, with important implications for identification and belonging. Drawing on ethnographic fieldwork on a transnational community-based sports event, the Amsterdam Futsal Tournament (AFT), the paper discusses how Somali diasporism is mediated, becomes tangible and how it strengthens the embodiment in subjects who participate in this event. The authors conclude that these sensorial modes can simultaneously elicit multiple forms and scales of belonging that also foster a sense of integration and belonging to the nation.

Participation Versus Performance: A Critical Appraisal of (dis) Ability, Gender and Cultural Diversity in Junior-Age Sport

Junior-age sport is an important site where children and young people learn about social norms and develop attitudes toward people with diverse backgrounds and abilities. It thus presents a space where social inequalities can be reproduced, reinforced or challenged. How diversity is experienced and managed in junior sport can affect how participants are socialised to understand and respond to diversity throughout their lives. This paper discusses the findings of a three-year mixed methods research project that critically examined how diversity is understood, experienced and managed in junior sports clubs in Australia, and to what extent including people with diverse backgrounds and abilities is deemed compatible with promoting sporting excellence and competitiveness. The findings show that intersectional understandings of and approaches to diversity are virtually non-existent in junior sports clubs. Moreover, the research reveals a persistent tension between the promotion of diversity and inclusion on the one hand, and the focus on performance on the other hand, in ways that tend to reproduce social inequalities in junior sport.

Tsunami Colonies : Rehabilitating or Ghettoizing the Disaster-Affected?

Globally, China, the USA, India, the Philippines and Indonesia account for maximum number of disasters. Geographical terrain, rapid population growth, environmental degradation resulting from development projects and climate change have increased the intensity, magnitude and frequency of disasters. As a result, natural disasters have become more intense and unpredictable. Natural disasters not only adversely impact human lives, livelihood opportunities and property, but also result in voluntary and forced migrations of people on a large scale.

Against this backdrop, this paper tries to examine the post-disaster resettlement in the context of policy formulation and its implementation. This aspect, it has been noticed, has hardly been debated among the disaster mitigation experts. This paper focuses on post-tsunami experiences of tsunami affected communities from coastal districts of Tamil Nadu, a state in southern India. Visiting the resettlement colonies, popularly known as tsunami colonies, after ten years since the disaster, the article foregrounds the livelihood challenges faced by the inhabitants of the colonies and the policy lacuna in addressing these circumstances.

Always 'Discursively Negotiated' – Using Intersectionality in Biographical Research

Analyzing life stories in the context of post-colonialism and migration reinforced once again one of the basic assumptions of biographical research: that patterns of individual structuring and processing of experiences are produced within powerful social contexts, and that therefore biographical narrations always refer to social norms and discourses (cf. Dausien et al. 2005). Gender, ethnicity, and class are both social structure categories and biographical positionings that are (re)produced and performed, resisted and negotiated in biographical narrations.

In this respect, an intersectional perspective brings an advantage for biographical research as "it allows the researcher to explore how axes of difference and power are discursively negotiated by differently located individuals as they talk about their experiences, their life stories, and their identities" (cfp). At the same time, there remains a vacancy pertaining to methodological and methodical questions when using an intersectional approach: The interwovenness of biographies and discourses (cf. Spies/Tuider 2017) is not considered sufficiently in intersectional analysis.

Following Stuart Hall and his concept of articulation, as well as Judith Butler and her post-sovereign subject, our paper deals with the sex mob narratives in Germany that flared up again as a consequence of the moral panic after the alleged sexual assaults by young migrants and refugees during the New Year's Eve celebrations of 2015/2016. In this context, our point is to identify the specific subject positioning of the 'sexually dangerous Muslim refugee' as a new 'ethno-sexism' (Dietze 2016) and to develop an understanding of subjectivation that not only brings together the categories of sex/gender/religion/ethnicity but also considers the discursive context in the sense of power/knowledge/subject/agency.

This paper

- conceptualizes theoretically the axes of difference and power as well as experiences of exclusion and marginalization always as 'discursively negotiated'
- develops methodologically an understanding of subjectivation that pleads for negotiations, obstinacy, and contextualization.

From Inter-Generational Conflict to Intra-Generational Inequality: How States Are Financialising Life-Course Risks across Generations

Estimates of the fiscal impacts of population ageing have led many critics of the welfare state to raise questions about generational equity. By taking generations as the primary unit of analysis, and focusing exclusively on fiscal transfers, generational accounting and other new public accounting techniques have reinforced social policy reforms that promote individual saving and insurance – rather than collective risk pooling – to mitigate social risks across the life course. In practice, these policies typically entrench forms of financialisation, making individuals more reliant on asset and debt products. This paper examines changes in accounting techniques across three policy domains most closely associated with life course risks and inter-generational conflicts: pensions, housing and higher education. While media reporting often represents the politics of these issues as involving conflict between younger and older citizens, sociologists have highlighted how generational categories obscure other important inequalities. The paper extends this analysis by exploring how changes in public sector accounting techniques reconstruct changes in distributional patterns *within* generations as conflicts *between* generations. This construction, we argue, reflects political strategies to overcome resistance to welfare state retrenchment, and is consistent with a broader de-politicisation of welfare associated with neoliberal politics. However, we end by noting the re-emergence of political contestation within this new financialized framework, and suggest alternative tools for analyzing and understanding the intra-generational distributional impacts of policies across the life course.

From Civic Food Networks to Civic Food Platforms: Collaboration, Trust and Empowerment in the New Food Economy

The aim of this research is to investigate social and relational dynamics at the base of the emerging New Food Economy (NFE). This is defined herein as the result of the increasing collaboration among citizen-consumers and producers, in order to perform more sustainable, healthy and right ways to produce and consume food. This explorative research faces a wide range of different Italian case studies, selected among the new collaborative forms of production/consumption and exchange of food, including digital platforms in which the role of ICT is prominent. The analysis indeed considers also the "enabling" role of the ICT in the development of alternative food supply chain and food exchange networks, providing a comparative analysis about traditional and digital Civic Food Networks (CFNs). The discussion thus introduces new concepts, such as Civic Food Platforms (CFP), and examine in depth some of the basilar dynamics of the NFE itself, such as the trust building processes at the base of the collaborative capacity over time and its ability to improve individual and collective empowerment. In doing so, authors attempt to highlight in which extent, or under which conditions, grass-roots food movements are able to improve their own innovation capabilities. The results seem to suggest an increasing ability of these networks to carry their socio-economic experimentation out from the niche, also thanks to the ICT. However, this concerns a change in the trust building processes, affecting participation and voluntary collaboration within the CFNs. Meanwhile, the peer-to-peer exchange of food mediated by CFPs, seems to fail its objectives because of a lack of trust among citizen-consumers.

The Quantification of Education and the Reorganisation of Teachers' Work

This paper explores how the everyday work of teachers is organised by powerful interconnected global, national and subnational power relations that rely on the quantification of education. The research reports on the experiences of 24 teachers in two Australian public schools – one secondary school and one primary school – as they worked with various forms of educational statistics. The study used an institutional ethnographic method of inquiry to empirically trace how teachers' work was connected to power relations that operated from beyond

their local schools through the multiplicity of texts and discourses prioritising the quantification of education. The study explicates how teachers' work is connected to chains of texts that enforce the production and collection of educational data by linking numbers to funding and performance management. These texts have a significant role in organising teachers' work both in and out of the classroom across the school year. In the classroom, this included a reorientation of pedagogy, curriculum and assessment towards content tested in high-stakes tests. Outside of the classroom, teachers are undertaking a range of calculative work including the analysis and recording of statistics and participation in new forms of work such as so-called "data conversations" and meetings. This orchestration of teachers' work is also bound up with issues of equity with the re-emergence of practices known to increase inequity such as streaming students by ability, and focussing pedagogic attention on students most likely to achieve the greatest gains on accountability measures.

While public and institutional discourses often frame teachers' work in terms of individual performativity, suggesting that decisions to teach to the test are made by individuals, this research demonstrates that key aspects of teachers' work are orchestrated by external forces through series of texts that flow from governments to bureaucrats and ultimately into schools.

SPINNER, ALBIN* (*ICBC Standard Bank*)

Intellectual Harness of the Financial Markets

This article contends that Finance has a tendency to harness the market with intellectual models which do not always represent the underlying dynamics of the market. In sociological terms, a cohort of mathematically literate financiers regularly attempts to create models with a view that they will become self-fulfilling. Their intention is to influence the market so that it behaves within the parameters of the model. An example was shown by MacKenzie, D. & Millo Y (2003) as they describe how the Black-Scholes formula has had a large influence on the option market. Financial engineers are bound to have some influence on the market; for example, sophisticated pricing models ensure that there are not arbitrage opportunities. But their influence can largely overreach this remit.

This article proposes to explore how financial models evolve with the markets. We will first look at a straightforward evolution describing how the derivative valuation paradigm has changed historically in the context of interest rates modelling. Like its homologue process in numerical modelling in science, financial valuation techniques evolve when they encounter inconsistencies between the theory and practical observations. In particular, pricing techniques for interest rates have reacted strongly to the Great Recession. We will see that these pricing methodology changes managed to come together and ended up influencing the reality it was intending to model. In other words, this particular piece of the financial pricing tool ended up performing the market.

In a second part, we will explore an equity-credit model which was an attempt to link the equity option market with the credit market. Although the approach was rooted in an intellectually robust model, this particular method ended up not influencing the market. We will finish by asking the following question : what drives the acceptance by the market of a particular pricing method ?

Transforming Unions through Organising Informal Workers in Uganda

Dave Spooner and John Mark Mwanika: Transforming Unions through organising Informal Workers in Uganda

This paper analyses the power resources of informal transport workers in Uganda, and the transformation processes of the Amalgamated Transport and General Workers' Union (ATGWU) and their newly affiliated informal workers' associations in organising informal workers. We examine the process of organisation; how strategic choices were made; how the expected increases in power resources were realised; and the results. We also analyse the critical factors behind the success of the strategy, as well as lessons learned and unresolved challenges involved. ATGWU faced an almost complete collapse in membership following the impact of Structural Adjustment Programmes in the 1980s, and the subsequent informalisation of the transport industry. In recent years, ATGWU pioneered a strategy of organising through the affiliation of mass-membership associations of informal workers, notably representing minibus taxi workers and motorcycle taxi ('Boda-Boda') riders. The unionisation of informal workers has had a dramatic impact such as; a reduction in police harassment, substantial gains through collective bargaining, reduced internal conflict within the associations, and improvement of visibility and status for informal women transport workers. The rapid expansion has raised new challenges for the union, particularly in the transition to a fully integrated formal-informal organisation, the need for reform of democratic process and accountability, and the maintenance of informal-formal workers' solidarity.

The Intersection of Ethnicity, Class, Gender and Geography in Preventable Mortality Using Four Decades of National Data.

This study uses national-level census and mortality data to investigate the changing social class and ethnic patterns in premature mortality in New Zealand from 1975 to 2014. During this period there was a political struggle for recognition of indigenous rights, a social policy focus on inequality, and major macro-economic reform. A novel web-based inequality visualiser was created to enable statistically robust and user defined exploration of mortality inequalities using otherwise confidential data.

We used three different approaches to inequalities in mortality using data for the entire country. Firstly we repeated previous studies for the periods 1975-1977, 1985-87 and 1995-1997 to include 2005-2007 and 2012-2014. This involved national death registration data for each period and the five yearly national population censuses from 1976 to 2013 to examine changing patterns in social class differences in all cause, preventable, and non-preventable mortality for indigenous Maori and non-Maori men under the age of 65. Mortality data were obtained from the national mortality data collection - this included occupational information that was used to classify individual into occupationally derived social classes. Secondly we explored changing patterns of mortality inequality using annual mortality records for the period 1988 to 2014 for both males and females for all ethnicities by socio-economic position (SEP) using a small area social deprivation measure. Thirdly we created a data visualiser using R and R-Shiny to enable user-defined explorations of inequality using otherwise publicly inaccessible official data.

Social class and ethnic differences in mortality have increased since 1975. There are significant persistent inter-ethnic disparities within each social class for preventable, non-preventable and all causes of mortality. There are also increasing intra-ethnic social class differences in mortality. The persistently high inequality in preventable deaths indicates that New Zealand's government-funded health sector is still not meeting the health needs of minorities and low-SEP people.

SPRACKLEN, KARL* (*Leeds Beckett University, United Kingdom*)

Towards a New Theory of the Sociology of Music As Leisure

Many leisure theorists have explored music sub-cultures and spaces as sites of identity-making. Sociological research on many forms of popular music, from folk to heavy metal, have explored the way in which such music is constructed in work places blurred into laboured leisure spaces, disseminated through the tools of capitalism, and consumed and re-made by audiences. The dominant paradigm in the sociology of popular music is one that rejects Frankfurt School determinism for one that fetishises everyday practices and human agency. In this paper, I will show that both leisure theorists and sociologists of popular music have a similar transformative view of popular music and music as leisure, which they draw ultimately from their own shared enculturation in the bourgeois taste of academics. I will show how this has led to the dismissal of particular sub-genres and leisure spaces as uninteresting or inauthentic. I will then lay out a new theory of the sociology of music as leisure that sees all music and leisure as contested, constructed and constrained.

SPRINGER, EMILY* (*University of Minnesota*)

Transnational Evaluation Systems As Relations of Ruling: Exploring Knowledge Production through the Everyday Actions of International Development Professionals

In an era of tenacious interest in 'evidence-based decision making,' international development organizations utilize data from evaluation systems to publicize success, demonstrate project efficacy, and claim impact to donors. Transnational evaluation systems measure the 'success' of development projects through a process of downward-moving policies from funders and upward-moving data from the project site, aggregated to demonstrate a return-on-investment. This bureaucratic system is only made possible through the joint effort of diverse development workers — from data collectors in rural areas abroad to evaluation directors in donor countries. How do evaluation systems, and the bureaucratic processes of which they are a part, coordinate the behavior of people irrespective of temporal, spatial, and cultural dimensions? And what are the possibilities for individuals to resist, negotiate, and recreate these systems?

This paper is based on 57 interviews with managers, evaluation advisers, and consultants in East African field offices and headquarters in D.C. who, through labor at multiple localities, animate the evaluation system of USAID's agricultural development initiative *Feed the Future*. Utilizing an institutional ethnographic

approach sharpens analysis of the governing power exerted through evaluation systems, while being attentive to the constitutive power of everyday actions of development workers as they animate and make evaluation 'happen.' This paper argues that institutional ethnography provides rich insight into the agency/structure debate by focusing on metrics as a form of global governance within transnational bureaucracies. Evaluation systems induce diverse professionals to work together to turn the particularities of social life in varied communities into fact-like knowledge digestible to funders and policy-makers. In doing so, I suggest that evaluation systems shore up quantitative knowledge, deprioritize transformative development agendas not easily measured, and narrow the space for learning, despite official stated goals to the contrary.

RC23-426.3

SPRINGER, EMILY* (University of Minnesota)

Understanding SDG5 Targets at the Site of Development: The Contested Terrain of Knowledge Production within Organizations

International agendas for development are increasingly codified into metrics and targets to hold countries accountable to action. The demand for science-like data to demonstrate progress and substantiate 'what works' is immense and polished infographics with statistics on the problem to be solved or the progress made are omnipresent. Transnational evaluation systems have become a key component of any international development project. These systems create a chain of knowledge production through data collection at the project site and numerous points of data aggregation to report on project results. This paper interrogates the role target-setting plays in locally-embedded, complex social processes like women's empowerment and gender mainstreaming attempts by exploring what is created in the presence of quantified targets and what is left in its wake.

This paper is based on 45 interviews with gender, evaluation, and management professionals in East African countries and Washington DC around USAID's agricultural development initiative Feed the Future. I argue closer attention to the proliferating effects set in motion by a global interest in 'data driven decisions' and 'evidence based policy' is merited, especially when applied to transformative development agendas. Where the demand for data to inform science policy meets gender, women and girls may lose out. Understanding what targets 'do' around difficult-to-measure concepts such as women's empowerment provides a useful case for understanding how metrics and targets help induce accountability to international goals, while creating proliferating effects as they travel the globe and work their way into the daily agendas of development professionals and organizations tasked with implementing 'development'. I argue that if concerted and sustainable progress is to be made on SDG5 we must first understand the local site of development as a contested space of professional and organizational pressures and demands.

TG07-1000.2

SRINIVAS, LAKSHMI* (University of Massachusetts, Boston)

Cinematic Sensorium: Beyond the Visual

When the senses are considered in connection with cinema film, it is the visual that is typically privileged. Scholarship on cinema has also for the most part focused on the film itself, its images and narrative, reinforcing what film producers wish the public to attend to. Yet the success of a film at the box office is understood to rest on how well the exhibition setting minimizes distractions and the comforts it offers audiences, such as seating and air-conditioning.

This paper will examine the cinematic sensorium. Drawing on ethnographic research at single-screen cinema halls in urban India as well as historical studies of moviegoing, it addresses the question: how does sensory and embodied experience organize the lived experience of the cinema? Rather than being a simple matter of providing a standardized and predictable space for viewing films, I argue that the sensualities of the cinema are continually produced and negotiated by a range of actors including exhibitors, theater staff, audiences and others. Sensory experiences may provide distraction and surprise; they may connect the audience to place and environment in a way that detracts from the film, yet shapes the cinema experience. As the cinema is a space where people from various walks of life come together, where strangers encounter one another and where bodies are in close proximity, sensory experience becomes central to understandings of the cinema as public space and to notions of order, even of a moral order that shapes belonging and exclusion. A holistic understanding of cinema experience is impossible without attention to its sensualities.

Do Frames of Reference Change? Intergenerational Reference Group Effects on Life Satisfaction

Migrants generally move to another country to improve their own and their families' lives. The growing literature on satisfaction, happiness and well-being within migration research reflects this by measuring migration success with subjective evaluations of satisfaction with life as a whole.

Various studies show that the "satisfaction assimilation hypothesis" does not apply, thus questioning whether migration is successful in this regard. A range of factors are used to explain why migrants often lag behind in life satisfaction compared to natives, from country of origin characteristics, variations between the countries of destination, to individual traits. This literature shows that the satisfaction gap between first generation migrants and natives can be further traced back to the migration-specific challenge of managing life in a new environment. However, the frequently reported gap between second generation migrants and natives, and more specifically the stagnating life satisfaction compared to the first generation, is less often addressed. Discrimination and social barriers are cited as explanations for this finding, as well as a possible intergenerational change of the reference-group from peers in the origin to those in the host country. Direct tests of this reference-group explanation are still scarce and mainly relate to income without focusing on the second generation or migrants at all. Indeed, as Robert K. Merton already wrote in 1950, changing frames of reference appear to act as a "provisional after-the-fact interpretive concept" to "interpret otherwise anomalous or inconsistent findings".

The aim of this paper is therefore to test whether, and if so to what extent, reference-group characteristics can explain the intergenerational stagnation of life satisfaction. Based on data from the European Social Survey, different characteristics from three individual sociodemographic equivalent reference groups (native, stayer, migrant) were assigned to migrants and are used as explanations for the missing intergenerational assimilation effect.

STAHL, GARTH* (University of South Australia)

Ethnography of a 'Neoliberal School': Exploring the Institutional Practices of Charter School Management Organizations (CMOs) in the United States

In recent years, there has been a growing debate over the managerial and leadership practices of expanding charter school networks, often referred to as Charter School Management Organizations (CMOs). CMOs, by definition, are consistently high-performing school networks in urban spaces that follow a very specific formula in order to build and maintain a culture that ensures high academic outcomes for their students. To ensure their continual success in what has become a high stakes environment, CMOs often draw upon practices associated with corporate America, specifically a 'Goldman Sachs model' of zero-tolerance and firing the bottom 10% of underperforming staff each year. These CMOs have consistently attracted unparalleled levels of funding and principals often have unlimited resources to enact their vision of educational success.

The presentation presents the main findings of a recent book *Ethnography of a Neoliberal School: Building Cultures of Success* which ethnographically explores the controversial schooling practices and strategies embedded in charter school management organizations (CMOs), as well as how these practices influence teaching and learning, school leadership, teachers' professional identities, and students' understanding of success. By theorizing the common practices within the organization, I connect current research in neoliberal governance, neoliberal structuring of educational policy, aspiration and social reproduction in schooling. Honing in on the discourse on education reform, I demonstrate that a "unique blend" of neoliberalism and social justice values have permeated the CMO's institutional culture, promoting the belief that adopting corporate practices will fix America's schools and ensure equity of opportunity for all. The inclusion of institutional texts (emails, Blackberry messages, posters, and rubrics) balances the personal-subjective and inter-subjective to capture a blend of neoliberalism and social justice reframing.

(Re)Imagining Citizenship: Second-Generation Youths' Practices of Resistance

Drawing on semi-structured interviews and a participatory theatre project in the Netherlands, I explore how Black and Muslim youth are (re)imagining and enacting citizenship in a context of increasing xenophobia and nationalism. With growing scrutiny around migration in Europe, second-generation racialized and Muslim youth navigate varying barriers to belonging and citizenship: while they hold de facto (legal) citizenship, their de jure citizenship (social membership) is questioned (Arendt, 1951; Somers, 2008). My research investigates how Black and Muslim second-generation youth navigate, claim, and explore identity politics in a setting where they are made to feel "less than".

Using a critical citizenship lens, youths' practices and strategies of resistance will be highlighted. Engaging with theories of reactive transnationalism (Itzigsohn & Giorguli-Saucedo, 2002), flexible citizenship (Ong, 1999), cosmopolitanism (Appiah, 2010), and nomadic subjects (Braidotti, 1994) (among others), I will demon-

strate how second-generation Black and Muslim youth respond to this "precarious" or "contested" citizenship with creative and conforming approaches. These youths' practices of resistance may serve to expand notions and definitions of citizenship in complex and innovative ways. I will share findings from my participatory theatre project and interviews.

Theatre As Method: Engaging Publics on Racism and Resistance

In this presentation, I critically examine the participatory project "Theater School on Resistance", a fourteen-week theatre-research project conducted in Rotterdam, the Netherlands as part of my research with second-generation Black and Muslim youth on belonging, citizenship and resistance. Drawing on Augusto Boal (1979) and Paulo Freire (2002), I collaborated with a grassroots creative arts organization to develop and deliver a program facilitating critical conversations around oppression and resistance.

In the context of migration in Europe, second-generation racialized and Muslim youth navigate varying barriers to belonging and citizenship: while they hold de facto (legal) citizenship, their de jure citizenship (social membership) is questioned (Arendt, 1951; Somers, 2008). Drawing on examples from the Theatre School, I look at whether theatre is an effective method for: 1) facilitating public dialogue and 2) resisting processes of othering such as racism and Islamophobia.

Both the Theatre School training and the co-production and performance of a final play provided an opportunity for Black and Muslim youth to participate in, and facilitate, public conversations on resistance, oppression, and belonging. This presentation will examine the ways in which participatory theatre allows and disallows for expressions of subjectivities, citizenship, and resistance. It will also analyze performative ethnography's potential to reach different publics for dissemination, public engagement, and policy change. Through participatory theatre, this project interrogates normative notions of citizenship and highlights how second-generation young people practice citizenship and resistance in alternately conforming and critical ways.

Migration, Access to Health and EU's New Economic Governance Regime

The paper argues that EU governance has importantly impacted on intra-European migrants' rights to access health services. Thus, on the one side, EU's traditional horizontal integration through the building of the single market has led to the development of European citizenship based on residence rather than ethnicity. This has the potential to enhance intra-European migrants' rights to access healthcare across the EU. However, on the other side, the same single market integration has been accompanied by the diffusion of a neoliberal model of care where private actors and interests were given an increasingly important role in the delivery, management and funding of health services. This has led to privatisation becoming an important process affecting EU member states' health services. Moreover, following the 2008 crisis, the EU's New Economic Governance recommendations to make healthcare more 'cost effective' have increased the financial strain on a series of healthcare systems across the EU and have been accompanied by the acceleration rather than slow down of healthcare privatisation. In its turn, privatisation has led to both labour force segmentation among healthcare workers and inequalities of access to services among patients, processes that have also fuelled increased healthcare worker and patient mobility inside the EU. In the other direction, these mobilities have fed into the privatisation of health services, leading to a perverse cycle that deepens rather than diminishes the unevenness of the increasingly transnational European healthcare space.

The Möbius Organizational Form: Make, Buy, Cooperate ... or Co-Opt?

This paper examines the emerging contours of a new organizational form, in which firms move beyond the cooperative pacts of alliances to a radicalized, aggressive co-optation of external assets. Taking our point of departure from the literature on the "networked" firm, we point to an alternative to the make, buy, or cooperate decision: in the Möbius form, firms co-opt resources, unsecured by any alliances, formal or informal. Some companies are brazen in their co-optation, leveraging external assets so thoroughly that they might well be considered a core part of the firm. Enabled by developments in computing technologies, such co-optation challenges traditional models of organizational identity. These fluid boundaries recall the Möbius topological model, which we take as the metaphor for this nascent organizational form. We chart this new behavior by discussing a range of firm activities, including the functions of marketing, research and development, and managerial decision-making, as they are replaced with assets co-opted from other firms in the private sector, government agencies, and lastly the firm's own users.

The Effects of Parental Leave Policies on Second Birth Recuperation: A Comparison of the Czech and Slovak Populations

A transition towards childbearing at later ages represents one of the most striking features of demographic change in recent years. Postponement transition commences with an increase in the age of the mother at first birth and usually results in a decline in TFR due to the tempo effect. Less attention has been devoted to the postponement of second childbirth and hence the extension of the childbearing interval between first and second births. We hypothesise that the postponement of the second childbirth following the first delivery negatively influences the second birth recuperation rate. The aim of the paper is to compare the recent transition in childbearing patterns in the Czech Republic (CR) and Slovakia in relation to family policy. We employed the basic benchmark model in order to analyse the postponement and recuperation in cohort fertility. We focus on childcare leave schemes, i.e. the key measure influencing the ability of women and men to balance work and family. Both the length of the parental leave period and the amount of the benefit have the potential to shape the timing of a subsequent birth. The parity-cohort method was used in order to investigate changes in the spacing and quantum of second births among women who had their first child between 1992 and 2012. Despite similar developments concerning childcare leave systems during the 1990s, the CR outperformed Slovakia from 2004 due to a significant increase in both the flexibility and the amount of the parental benefit. We discovered that the increase in TFR between 2003 and 2008 coincided with an increase in the second-birth rate during the third year following first delivery together with a decrease in the second-birth rate during the fourth year and later, and thus contributed towards the higher rate of recuperation of delayed second births in the CR.

Pro-Life and Pro-Choice Attitudes of Poles: The Changes Due to the Political Climate Dynamics

After the political transformation in the 1990's, the discussion in Poland concerning a law allowing an abortion on demand started. Finally, there was a consensual agreement achieved and abortion is now legal in three cases: when life or health of a mother is at risk, when a child is going to be incurably impaired, or when pregnancy is caused by a crime (a rape or an incest). This consensual law is constantly being criticized by conservative circles and Catholic Church, and stays a subject to proposals to make it more restricted.

Two powerful social movements are active in the public sphere: pro-life represented by ultraconservative associations supported by the Catholic Church that claim abortion ban and pro-choice associations that call for liberalization of the current restrictive law. Mass street protests against abortion ban and for protection of women rights started in October, 2016 and are continuously repeated all over Poland to date. Protests gather people of both genders and various ages and attract attention all over the world.

The subject of the paper is to present social factors that determine changes in pro-life and pro-choice attitudes in a broader social and political context. The

data source will be public opinion research conducted in different socio-political situations in Poland and, also, media evidence of the public debate, including pro-life and pro-choice activities.

ZAGORSKI, KRZYSZTOF (Kozminski University)

Recognition of Culture, History, Self-Identification and Territory Versus Race, Blood, Religion and Submission to State As Criteria of Nationality – Their Determinants and Effects in Poland

The paper will present results of representative survey conducted in Poland in 2014. Statistical analysis have distinguished two separate, composite syndromes of criteria of nationality recognized by the Poles. The first, consistent with liberal philosophical and political tradition, stresses importance of common culture, history, self-identification and territory. The second, consistent with rightist tradition, stresses importance of race, religion, blood (family) and submission to the state. The liberal criteria are more widely accepted in Poland than conservative ones, but both have substantial public support. The relations between acceptancy of one or the other approach to nationality and the strength of self-identification with (a) local community, (b) nation and (c) supra-national communities (like Europe, world, human kind) will be analyzed. The adherence to liberal criteria of nationality enhances general (global) self-identifications, while the adherence to conservative tradition enhances national and local self-identification. The latter is also positively correlated with support for various forms of state interventionism and is more apparent among less educated and less affluent part of population. The relations of these two tendencies to perceptions of social relations will be also analyzed. The results will be discussed in the context of rising populism in Europe.

Conducting Survey Research on Refugee Populations. Methodological and Ethical Challenges.

From 2015 onwards Europe has witnessed a massive population movement mainly from conflict and war areas, the largest after the Second World War. From August to December 2015, Greece, only, as the main gate to Europe, had been receiving more than 100.000 persons per month, including unaccompanied children and adolescents. Conducting research in such emergency settings is highly challenging in terms of survey design, collection modes, sampling strategies and the design of culturally informed questionnaires. In addition, the vulnerability of the highly traumatized refugee population raises ethical concerns during the several stages of survey design and fieldwork operations.

The paper addresses these challenges based on the findings of the "REHEAL" survey, the first ever conducted in Greece by the National Centre for Social Research, in six refugee camps across the country during the early phase of accommodating the massive inflows of refugees in the summer of 2016 as well as the results of a pilot study (REHEAL-UAM) on unaccompanied minors during the same period.

The main goal of the survey was to examine the reasons for fleeing the homeland, evaluation of living conditions in Greece, as well as self-reported health status, health care needs, and discriminative and traumatic experiences of the refugee population residing in the selected camps. REHEAL-UaM was conducted in the shelters of greater Athens area in Greece, with the use of adolescent depression scales and a questionnaire designed specifically for the pilot by the HRT (Harvard Program in Refugee Trauma).

Measuring Health Inequalities Among Migrant and Native Population in Greece at Times of Crisis.

The paper aims at presenting the results of the MIGHEAL project funded by the EEA (European Economic Area) mechanism. The main goal of the project was to measure empirically the health disadvantage among the migrant population as compared to the native-born population in Greece, from the perspective of the rising social and income inequalities during the ongoing economic and social crisis.

Data are drawn from a survey conducted among the native-born and migrant population in Greece in 2016, in order to examine the social inequalities in physical health and their determinants as well as the health usage and health needs of the

migrant population in comparison to the natives. Based largely on the theoretical assumptions developed in the health module of the 7th round of the European Social Survey (ESS), the data provide evidence for self-reported health outcomes such as general health, depressive symptoms, non-communicable diseases, health care use and access, risk behaviours, and social determinants of health. One of the key findings is the high prevalence of self-rated depressive symptoms compared to ESS figures, especially among Greek females. This outcome will be discussed in relation to the prolonged crisis and the need for informed policies on mental health care for all, with special concerns for the native-born population.

STAUBLI, SILVIA* (University of Fribourg)

Trust in Private Security Companies and Trust in the Police in Switzerland: Similarities or Differences?

Research on trust in the police emphasizes the role of contact between the public and the police. The underlying procedural justice approach argues that a fair and neutral treatment by the police such as in a traffic control has a positive impact on peoples' trust in them. As a result, the police are viewed as a legitimate force (Tyler and Huo, 2002). In Swiss surveys, people regularly report a very high trust in the institution police which makes them ranking amongst the top trust-in-the-police-countries in Western Europe (Staubli, 2017). However, changing requirements lead to a specialization and diversification within the police (Wildi and Hagmann, 2016). In addition, the private security industry has grown, with multiple players entering the field. As a consequence, it is getting more difficult for the population to know who is responsible for what. This paper builds on this context and asks whether peoples' trust in private security companies is shaped by the same known aspects as trust in the police. Furthermore, Swiss citizens' perceptions of the roles and duties of the police are compared with those of private security companies. Empirical analyses are based on data of the *Studie Sicherheit 2017* (Szcwircsev Tresch and Wenger, 2017).

STECKDAUB-MULLER, IRMGARD* (Institut für Soziologie, Friedrich-Alexander-Universität Erlangen Nürnberg)

"I'm a Professional Beauty Specialist, Not Just a Simple Beautician." the Discourse of Professionalism and Its Function Among Body Workers.

"I'm a Professional Beauty Specialist, not just a simple beautician"

The discourse of professionalism and its function among body workers.

The body service work sector has been growing and diversifying continuously over the last four decades due to a changed perception of the body as a 'high-maintenance'-project and 'somatic capital' (Turner 1982) for the employable self. The boom not only generated a variety of beauty services but also a heterogeneous labour market with many jobs that don't require any vocational training and/or approved license, such as tattooing, naildesign, piercing. However, body work is 'high-touch' service work (Mc Dowell 2009) and consists of the product and the procedure itself, which requires a professional framing, emotion work and communicational competences. Therefore, the lack of institutionalized capital and the demands of this "front-line"- service work raise the question about the body worker's professional self-understanding and perception of their work. The analysis of narrative interviews with male and female hairdressers, tattooists, beauty therapists, piercers and nail designers of different age, national and social background on their work biography and work experiences plus ethnographic studies reveal that the discourse of 'professionalism' serves as a main category for the construction of their professional identity: Beauty service workers understand themselves as 'professionals' by referring to their expertise, high hygienic standards and the level of technical skills. They compare these challenges with (classic) professions such as doctors, psychiatrists and psychologists thus emphasizing the professionalism of their work. The lack of institutionalized capital is compensated with certificates and awards from courses, competitions and conventions, which count as qualifications thus marking expertise and distinction against 'others' in the field. Furthermore, by evaluating 'professional work' and contrasting it against 'bad / unprofessional work' body workers define criteria and norms of 'professionalism', which implies the exclusion of 'others' within their professional field.

STECKDAUB-MULLER, IRMGARD* (*Institut für Soziologie, Friedrich-Alexander-Universität Erlangen Nürnberg*)

"You've Got to Do This like a Professional, Not like One of These Scratchers." Reconstructing the Professional Self-Understanding of Tattoo Artists.

You've got to do this like a professional, not like one of these scratchers!" Reconstructing the Professional Self-Understanding of Tattoo Artists.

Since getting tattooed as beauty service work has become increasingly popular in all social milieus, the number of tattoo artists has been growing continuously. Although tattoo parlours have sprouted like mushrooms and TV shows have been portraying tattoo artists and their work, tattooing as paid labour still doesn't require a vocational training and approved licence in many countries. However, institutionalized capital and pursuing a 'conventional' occupation are crucial components of a person's social identity. Therefore, the lack of qualifications and the negative reputation of tattooing in the past raise the question about the actor's professional self-understanding within society. The analysis of narrative interviews with female and male tattoo artists of different age, national and social background on their work biography and work experiences plus ethnographic studies reveal that the construction of their professional identity is defined by a discourse of 'professionalism'. Generally, the interviewed tattoo artists consider themselves 'professionals' by referring to their expertise, their responsibility, high hygienic standards and the level of artistic quality, which their clients expect them to deliver. Like all body work tattooing is 'high-touch' service work and involves the violation of the 'territories of the self' (Goffman). The tattooing act requires a professional framing, emotion work and communicative competences, which many interviewees compare to the profession of psychiatrists, psychologists and/or medical doctors. Furthermore, along with the process of their individual professionalization they develop a set of values, norms and competences as an ideal for their commitment to tattooing. This discourse of professionalism and expertise not only frames the self-understanding as an artist, craftsman and/or beauty service worker, but also serves as a powerful strategy of distinction and exclusion against 'scratchers' within the tattoo scene.

STEELE, CORY* (*University of Ottawa*)

The Supreme Court of Canada and Religion: Examining the Supreme Court's 'secularity' By Way of Assisted-Dying

In 2015, the Supreme Court of Canada ruled in the *Carter* decision that the prohibitions against physician-assisted dying, as outlined in section 241(b) of the *Criminal Code*, were unconstitutional as they violated an individual's s.7 rights as outlined in the *Canadian Charter of Rights and Freedoms*. Though the jurisprudence of this landmark decision and subsequent amendments to Canadian law are interesting in and of themselves, what deserves particular attention is the Court's monumental shift from religious to nonreligious understandings of certain key concepts once at the heart of religious doctrine and the implications this shift has on the Court's claim of being a 'secular' institution. In its decision, the Court drastically changed its understandings of life, death, and suffering (among others) by re-framing them in ways deemed as nonreligious. In doing so, the Court indirectly upholds its claim of being a 'secular' institution. Using the *Carter* decision and how the Court interprets physician-assisted dying as a point of analysis, this paper questions the Supreme Court's supposed 'secularity' by assessing this shifting (non)religious landscape. Utilizing the data collected from a discourse analysis of the *Carter* decision and the accompanying intervenor submissions, I ask if the Court is indeed a secular institution. In short, does the presence of nonreligion imply a 'secular' institution, or does it perhaps suggest something more nuanced.

RC05-113.3

STEFANELLI, LAURA* (*Public Administration-Labour Agency*)

Italy at the Border of Humanitarian and Political Responsibility in the Crisis Migration

Since 2011, Italy faces an increasing of the refugees arrival and since the management of thousands of people reaching Italian (and European at large) coasts spread over each month, by becoming an urgent political issue to handle. This is certainly the biggest refugees crisis since World War Two (UNHCR, 2015) and a multilevel approach rose to react urgently: Italian institutions are called to regulate migration via administrative and labour techniques, while civil society and NGOs remain the main actors to handle this crisis, which is humanitarian as a matter of fact.

On one hand, the rising of neo-nationalism in numerous European countries explains limits of taking a common management system of refugees' inclusion into the labour market. Foreign policy is led by single national European country, and cases of occasionally "closing borders" between Austria-Italy, France-Italy and

Hungary-Austria has appeared in the last two years. On the other hand, crossing the Mediterranean sea keeps being the heading (but the most dangerous) way to reach Europe, while international and Italian associations are the main actors to provide assistance, at the first stage, and attempt to insert effective skilled refugees into the labour market afterwards.

To this extend, my contribution sheds light on how different approaches are engaged in including skilled refugees into the labour market, by comparing two cases applied in Central Italy, in Emilia Romagna region and in the North, within the Autonomous Province of Trento. In the former, "VESTA" project is an innovative, scaled and decentralized approach, led by a private social cooperative, which is engaged on the recognition of refugees' human and cultural capital into the labour market. While, in the latter, the Public Labour Agency takes centralized directions to insert skilled refugees through labour voucher and training into its own local market.

Returning to Places of Pain? Impact of Local War-Time Violence on the Post-War Refugee Returns in Bosnia

This paper questions the conventional wisdom which claims forced migration is irreversible following massive ethnic cleansing campaigns, by investigating durable returns to pre-conflict communities in Bosnia-Herzegovina. In our previous studies (Stefanovic and Loizides 2011; Stefanovic and Loizides 2017; Metivier, Stefanovic, and Loizides 2017) we developed and tested a set of individual-level hypotheses on the refugee returns. So far, we have determined that women and those experiencing wartime victimization are less likely to return. Older Bosnians with positive memories of pre-conflict inter-ethnic relations are more likely to return than younger persons or those with negative memories. More nationalistic internally displaced persons (IDPs) are less likely to return. While the rural displaced tend to value community returns, the urban displaced are unlikely to do so. Family dynamics seems to influence community returns, as the decision to return often seems to be made by families, not isolated individuals.

In this paper, we go a step further, by focusing on the impact of the local war-time violence (killing and property destruction) on the likelihood of the post-war return of Bosnian forced migrants. We have already established (Stefanovic and Loizides 2017) that refugees who experienced war-related loss of significant other are less likely to return. In this study we combine our 2013 Bosnian representative survey sample with two new data sources (2013 Bosnian Census and 2013 *Bosnian Book of Dead* database) to test for the effect of contextual factors on the likelihood of return. We discuss the implications of our findings for theoretical explanations of refugee return migration and for policy interventions that could help the refugees who choose to return to places of pain.

STEIGEMANN, ANNA* (*TU Berlin*)

MISSSELWITZ, PHILIPP (*Technical University Berlin (TU Berlin)*)

Architectures of Asylum – Making a Home in a State of Permanent Temporariness.

Urban and social research in Germany has started to address the socio-spatial distribution and architectures of so-called collective accommodations for asylum seekers, refugee camps, and new forms of ethnic segregation triggered by refugee movements just recently. The spatial agency of refugees themselves within these processes has not yet been a subject of substantive research.

Combining research methods from social and architectural sciences, the paper investigates the physical, material, social, and symbolic appropriation processes by Syrian refugees currently housed in humanitarian settings in Jordan and Germany. What spatial knowledge is mobilized at the place of asylum in order to turn the accommodation into a home? How does this knowledge hybridize practices of the place of origin, experiences made during the flight and the arriving and uncertain period of stay at an unfamiliar place of asylum? What is the relationship between the subjective experiences of space and home, which have been collected in different places and contexts? How do spatial appropriation processes collide with humanitarian logics and technocratic emergency management approaches at the place of asylum? For refugee accommodations in Berlin, Germany and Zaatar, Jordan, the paper focuses on the ways in which refugees perceive, adapt to, appropriate, and alter their new urban environment physically and socially and of how they thereby draw on existing and evolving stocks of urban knowledge, urban experiences, and social relationships. It argues that for developing a home-like space, arriving refugees mobilize knowledge at the place of asylum which can only be understood as a re-figuration process that is equally at work in the case of other migrants, migration and translocal processes. A study of these urban re-figurations also reveals how the interplay of refugees' agency and their knowledge and the technocratic regime and state of permanent temporariness affect the making of a "home."

STEINBACH, ANJA* (*University of Duisburg-Essen*)
SILVERSTEIN, MERRIL (*Syracuse University*)

Stepgrandparent-Stepgrandchild Relationships. Emotional Closeness and Frequency of Contact in Childhood and Adulthood

The many years of shared lives among family members in different generations have generally had a positive impact on relationships between grandparents and their grandchildren. However, high divorce and remarriage rates have led to nontraditional family forms such as step-families, challenging the durability of these relations. This paper focuses on emotional closeness and frequency of contact between step-grandparents and their step-grandchildren. Using data from the German Ageing Survey (DEAS) from 2014, we analyzed 465 relationships maintained with step-grandchildren and 7,710 relationships maintained with biological grandchildren, nested within 4,992 family units. Hierarchical linear regression results provided support for the hypothesis that, independent of other factors, step-grandparents feel less close to their step-grandchildren than biological grandparents to their biological grandchildren. In contrast, differences between step- and biological relationships in frequency of contact were explained by family members' characteristics. Results are discussed in the context of the latent-matrix of kinship relations and the proliferation of complex extended families.

STEINHARDT, ISABEL* (*University of Kassel*)

New Inequalities Caused By Digital Technologies in Higher Education?

Digital technologies are seen as the new form to generate equality in education in general, but also in higher education. For example, UNESCO explained that digital technologies "can contribute to universal access to education, equity in education, the delivery of quality learning and teaching" (<http://www.unesco.org/new/en/unesco/themes/icts/>). Some studies show how often students use digital technologies for their studies, e.g. open education resources, digital learning programs, e-lectures, facebook-groups (Yousef et al. 2015; Corrin et al. 2010). But less well known is how they use the digital technologies and is less well known if digital technologies really equity higher education. We know that there are no digital natives (Gallardo-Echenique 2015) and that the knowledge about the use of digital technologies also depends on the socio-economic background (Schulmeister 2012). On the basis of these findings, it is more likely that digital technologies will not reduce inequality in the higher education system but rather consolidate existing inequality or establish new forms of inequality.

In order to verify the assumption that digital technologies do not reduce inequality in the higher education system, biographical interviews were conducted with students from six disciplines of German higher education institutions (including universities and universities of applied sciences). The interviews focus on the practice of learning and studying with digital technologies, which make it possible to reconstruct the habitus and the milieu (Bourdieu 1982; Lange-Vester 2012). Habitus and the milieu make it possible to develop typologies of the practice of using digital technologies, which helps to understand new forms of inequality in higher education through digital technologies. These typologies will be presented at the conference.

STEINMETZ, GEORGE* (*University of Michigan*)

Critical Realism and Critical Theory: Toward a Non-Arbitrary Ethics

My paper has two parts. The first part suggests that certain principles based in Critical Theory provide a better basis for generating critical principles than either the arbitrary approach prevalent in sociology or the approach sketched in Critical Realism. But I think this approach is fully compatible with Critical Realism's ontology and epistemology of science. The second part asks how Critical Theory can help us generate the principles that can guide scientific practice. CR already tells us what to do: Combine judgmental rationalism with what Bhaskar calls epistemic relativism—basically, a sociological history of science. The question is how these practices line up with the norms that emerge from examination of actual scientific practice. CT suggests that the model of the specific, autonomous intellectual may emerge from an empirical interpretive investigation of actual scientific practice. But CT also suggests that there will be a disjuncture between rational scientific norms, and dominant norms within science. Empirical research suggests that a field like sociology in the US exists within universities and other fields that generate additional normative orders, all of which complicate the question of figuring out the normative potentials within sociology.

The Influence of Women's Commuting on the Distribution of Household Labor

Modern societies are characterized by mobility and flexibility (e.g. internal/external migration or commuting). Today, commuting seems to be a part of someone's everyday life. Whereas in past times, men were more affected by commuting than women, the number of commuting women increased. It is undeniable, that a long way to work has an influence on the life. Commuters have a minor satisfaction of life and their intimate relationships and are impaired by mental stress. Reasons are higher levels of stress and fewer leisure time.

Having a look on the domestic labor the question arises, who is in charge of managing the household. Do women still adopt the "lion's share of housework" or take over the "second shift", if they spent part of the day commuting to work and back home?

The study examines the effect of commuting on the distribution of domestic labor in heterosexual relationships. On the basis of the *Panel Analysis of Intimate Relationships and Family Dynamics* Study Germany (pairfam; <http://www.pairfam.de/>) panel analyses were conducted. Different types of domestic labor were considered: Time-consuming tasks like doing the household, groceries and childcare and irregular tasks like repairs and administrative tasks.

Panel analyses are used to empirically test for evidence of various determinants. Analyses show, that higher commuting time decreases her investment in household labor, like doing the laundry, cleaning up, or preparing meals. Interestingly a higher commuting time of *hers* does not increase his investment in household tasks. Instead, the partners do share those tasks. On the other hand a higher commuting time of *his* comes along with a higher part of household tasks of *hers*, rather than an equal distribution. Additional analyses suggest that the partner who is more likely to take care for children is also in charge for the household labor.

The Flows between Fields. the Concept of "Culture" in Sociology and Primatology

The purpose of the presentation is both to track a migration of the concept of "culture" from sociology (and cultural anthropology) to primatology, and than to compare the ways the concept of "culture" has been understood in these two fields. A process called "naturalization of the social sciences" (sociology included) is accompanied by less evident process of "sociologization/anthropologization" of the evolutionary sciences. But such "sociologization/anthropologization" is done selectively. The question is, what are the factors responsible for the reception of the certain concepts, theories, studies developed in social sciences? How evolutionists deal with problems and dilemmas (e.g. the conflict between the "behaviorists" and "psychologists") essential for classical social sciences? Do they remain unresolved, abolished, or are still hidden? Finally, this analysis allows one, both to compare ways the concept of "culture" has been understood both in social sciences and evolutionary sciences (especially in primatology) and to identify a main mechanisms responsible for translocation of the concept of "culture" between these two fields.

Measuring Collective Identities in Studying Inequality in Schools

Research in sociology of education focuses increasingly more on collective (ethnic) identities as key socio-psychological characteristics that mediate the relationship between structural and cultural school features and educational and wider outcomes with young people and their teachers in school. This presentation explores how qualitative and quantitative techniques are used to measure collective (ethnic) identities and, particularly, how a mixed methods approach can result in the development of more valid measures of collective (ethnic) identities. First, key theoretical properties of collective identities are highlighted and linked to specific measurement tools used in the literature. Afterwards, the usefulness of a specific mixed methods approach is illustrated by drawing on a study on the relationship between national collective identities and ethnic prejudice in the context of Cyprus. This study illustrates how qualitative, more inductive forms of data analysis can help to identify which features of collective identities (and ethnic out-groups) are important in a particular socio-political context. It then shows how quantitative research can build on this by developing measurement tools that consider which properties are meaningful in a specific context, as this results in the development of statistical models that are more valid in testing specific

hypotheses about the influence of collective identities on particular outcomes (ethnic prejudice).

Initiation and Discussion of Information from the Internet in GP Consultations: Managing and Negotiating the Boundary between inside and Outside the Clinic

In an increasingly connected world exchange of information about health can occur at any time. Yet patients express concerns that referring to information from the internet in consultations may be perceived as a challenge to medical authority and as such a potential source of interactional 'trouble'. We consider the ways in which patients manage the boundary between patient research about health and the presentation of medical concerns in the clinic, and how this is jointly negotiated in consultations.

Data consist of 300 video-recorded routine patient consultations with 10 GPs from the UK, a baseline survey determining information sources accessed prior to the consultation and 40 semi-structured post-consultation interviews detailing accounts of discussion of the internet in consultations. Conversation analysis is used to consider the ways patients and GPs manage and negotiate interactions in relation to prior, present and future use of the internet. Thematic analysis of interview data provides patients' and GPs' accounts of use of the internet both in and outside of the consultation.

Comparison of pre-consultation survey responses and consultation data indicates patients do not always discuss their use of the internet prior to consultations. Conversation analysis of when and how patients raise the topic of the internet indicates discussion of the internet as interactionally problematic. There is also evidence of ranking by patients relating to legitimacy of sources of information when discussing medical problems in consultations.

This work contributes to research on the management of the potentially interactionally-fraught area of the permeability of boundaries between inside and outside of the clinic relating to discussion of use of the internet. Observations are based primarily on video recorded interactions from everyday practice allowing us to comment on practices as opposed to accounts of practice, providing an additional dimension to existing research in this area.

Mismatched: A Quantitative Evaluation of Thinking Versus Doing Masculinity in Canadian Sport

Sport is widely considered a hyper-masculine environment where sexist, homophobic, and other oppressive ideologies predominate. However, increasing pressure and activism for social equality is challenging the acceptability of these ideals. Considering liberalizing trends, this study investigates the state of masculinity through a study of Canadian male athletes, commonly believed to be archetypes of normative masculinity in Western society. This research examines whether stereotypical male gender norms are softening in a hyper-masculine environment, and the degree to which progressive social trends are suppressing the reproduction of patriarchy. Correspondence analysis of original survey data is used to explore the dynamic interrelationship between social norms and traditional masculine paradigms that structure contemporary conceptualizations and expressions of masculinity. The data indicate that masculinity is conflicted amongst the athletes in the sample, signified by a mismatch between ideologies and behaviours. These findings suggest that although progressive social developments are constraining discriminatory behaviours, the ideological foundations of oppressive masculinity remain intact. Progressive change has not fundamentally altered the structuration of a gender hierarchy in which heteronormative masculinity prevails.

Cultural Capital, Social Relations and Moral Boundaries in the Shaping of Household Art and Decorations in Chile

Pierre Bourdieu argued that members of different social classes and class fractions demonstrated distinct tastes in the visual arts and other consumption fields that reflected distinct principles of aesthetic judgment. These different

tastes reflected class-based family, school, and occupational socialization. While much of his work related to cultural production and consumption, Bourdieu (1984) examined class-based tastes in home furnishings. In contrast, Halle (1993) found few substantive cross-class differences in artistic taste. Others see home furnishings as reflecting valued social connections (Csikszentmihalyi and Rochberg-Halton 1981, McCracken 2005, Money 2007), moral boundaries (Woodward 2001, 2003), or gender and class divisions (Bennett et al. 1999, Bennett et al. (2009, Madigan and Munro 1996). Based on semi-structured interviews with 77 Chilean adults from distinct fractions of the middle classes and 31 photos of their living rooms, I find important patterns of variation in taste and judgment across families. Taste in visual art is hierarchically differentiated based on variations in economic and cultural capital. Tastes in home furnishing are less clearly linked to class, but vary according to preferences for (in)formality, focus on immediate family or friends, and emphasis on kinship ties vs. display. Expressions of distaste toward decorative styles reflect both class and moral boundaries. Chilean homes reflect both class division and horizontal variations in taste and family attachments.

Processes of Legitimizing the Institutional Use of Violence in Jails and Prisons

Examinations of violence in jails and prisons usually focuses on instances in which violence by either inmates or correctional officials engage in violence deemed to be inappropriate, illegitimate, illegal or excessive. Guided by Collin's micro-process analysis of violence and Weberian concepts of legitimacy, this paper analyses an incident in which twenty-four secure custody inmates in a Canadian provincial corrections facility were subjected to violence in the form of being exposed to tear gas in response to a non-violent protest by one inmate. This exercise of institutionally sanctioned violence remained uncontroversial since the utilization of institutionally sanctioned violence was deemed legitimate by everyone involved. The incident is explored to identify conditions in which the state's use of violence remains monopolistic and legitimate.

Social Comparison and Visual Methods: Manifesting the Latent in Accounts of Social Status

Social comparisons are important tools to make sense of one's social position (White, 2012). Understanding how migrants are using social comparison in accounts of their social trajectories may help us to reveal how they understand the nexus between social and spatial mobility.

Most empirical research on social comparison has used predefined frames of comparison in semi-experimental research designs, thus restricting respondents in the process of choosing foils of comparison. Qualitative approaches, by contrast, in which people are able to decide what they compare themselves to, are more useful to understand how social comparisons are operationalized in sense-making processes in social life. In this presentation, we will be analyzing the epistemological gains and pitfalls of employing visual methods of data collection together with qualitative interview data to elicit frames for social comparisons that migrants use when evaluating their own social status and that of others.

The paper is drawing on data from a larger mixed-methods study, involving in-depth interviews with migrants from different socio-economic backgrounds and mobility experiences in Germany. A loosely structured interview schedule was used together with exercises in which our respondents were asked to describe photos and sort them in particular orders. While photos proved to be useful in eliciting foils for comparison, difficulties arose when attempting to associate the use of specific types of comparison to specific topics of conversation and to specific images. The paper gives glimpses about how we sought to overcome these difficulties in the course of analysis, particularly when attempting to associate individual accounts and comparisons to structural phenomena.

Envisioning Energy Futures in the Oil Industry: Avoidance, Persistence, and Resilience As Responses to Climate Change and the Low-Carbon Transition

The oil industry is implicated in driving climate change and has consequently been targeted by social movements worldwide. This paper asks: How does the oil industry envision social futures related to climate change and low-carbon transition within the "empowered spaces" of key oil industry events, which serve

as spaces for industry members to deliberate with each other? Taking an event ethnography approach, we analyse the 2016 and 2017 North and Labrador Offshore Oil & Gas Industries Association conference (St. John's, Canada), the 2016 Offshore North Seas conference (Stavanger, Norway), and an Oil & Gas UK event launching their Business Outlook 2017 report (Aberdeen, Scotland). The sector does not present a unified vision of social futures related to climate change and low-carbon transition. Instead, there are three heterogeneous strategies for envisioning social futures: 1) avoidance, wherein future scenarios related to climate change and low-carbon transition get limited attention; 2) persistence, wherein the focus is on adaptive strategies to remain competitive in the future social-political-technological landscapes of a carbon-constrained world; and 3) resilience, wherein the low-carbon transition is accepted and the sector needs to substantially re-envision itself to remain relevant in this emerging reality. The third of these strategies is particularly surprising, as it involves raising important questions about the identity of the oil sector as part of social futures. For a subset of participants in these empowered spaces, being part of the oil sector means having a positive stance towards a renewable energy and low-carbon transition. Furthermore, the 2015 Paris climate change agreement was a critical event that provoked some actors to envision new social futures, though this is most visible in the Norwegian case. Similarly, an ecological modernization discourse is prevalent in the Norwegian case as part of envisioning social futures. However, this is a form ecological modernization without environmental movements.

New Perspectives on Care Work through Surrogacy Arrangements

What constitutes care and care work? Only recently, sociologists have begun to include surrogacy practices into the category of "care work." Discussions of the care-aspect of surrogacy have focused on the theoretical framework and real-life examples of power and exploitations as well as on the beneficial aspects of this form of work.

Surrogacy arrangements help to elucidate problems linked to the care work and the in local, national, and global contexts in three ways: First, the previously uncompensated form of work, in the case of surrogacy pregnancy and childbirth, now has become commodified and marketized. Secondly, care work that has been traditionally performed in a family unit becomes outsourced to non-family members. Third, care work provided by surrogates oftentimes constitutes cross-border arrangements with clients having more negotiation power than the surrogate workers from lower classes.

My research focuses on the following questions: Do surrogates in the US agree with the notion that they are considered to be "care workers?" What do surrogates think about the marketization and commercialization of their bodies? How do they negotiate negative experiences?

Based on interviews with both surrogates and intended parents in the US, it has become clear that the attitudes towards surrogacy as care work differs to what other researchers have found in different global contexts. The women I interviewed are deeply devoted to being surrogates and want to help childless individuals. Even when they do talk about issues such as power difference and exploitation, they consider them to be individual issues. How then do surrogates challenge injustices that are a result of the care work they engage in? This paper discusses the ways in which US surrogates envision surrogacy arrangements that avoid potential pitfalls that are part of this care work agreement and make surrogacy a fair work relationship.

Time Space Paths in Alternative Educational Settings: A Comparative Analysis of Finland and Australia

We will use the concept of time space paths (Gordon, Holland and Lahelma, 2000) to compare how young people negotiate educational pathways and experience educational success in alternative settings in Finland and Australia. Gordon et al (2000) explore the impact of tight time space paths in mainstream school settings on young people's attitudes to and success in school life. For many young people in alternative settings these tight time space paths (eg. attending school on time) led to their disengagement from mainstream school settings as the mainstream schools did not accommodate the lives and needs of these young people.

The Finnish data consists of three group interviews with the staff as well as 23 biographical one-off interviews with 11 girls and 12 boys that were conducted during autumn 2008 in three Helsinki based special education programs targeted for 15 to 17 year olds. The Australian data consists of 50 interviews with program staff and seven biographical interviews conducted 3 times throughout 2012 (21 interviews in total) with five females and two males aged between 13 and 16 years in alternative education settings in metropolitan and regional areas in Victoria.

Gordon et al (2000) make the distinction in mainstream schools between official school (tight time space paths) and informal school (loose time space paths).

The development of positive relationships (often through loose time space paths) is a key to keeping the young people engaged but the young people need more than this to experience educational success, something they have not been able to achieve in mainstream settings. We discuss therefore how the alternative educational settings provide a mixture of tight and loose time space paths that meet the life style needs of the young people and assist with providing them a successful renegotiated educational future.

Are "Middle-Classes" in the Global South Always Classes? a Comparison of Cultural and Structural Elements of Middle-Income-Strata in Kenya and Brazil

This contribution puts the middle-class concept under scrutiny by examining its applicability in urban Kenya and Brazil. The crucial question is if there are common characteristics of the middle-income strata in both settings that make it possible to speak of a middle-class or do we find rather diverse subgroups with distinctive features and values. For studying the connection between culture and social structure, the paper discusses how structural elements such as income/ consumption and occupation consciousness, economic interests, and status relate to sociocultural elements of conducts of life. Consequently, the author suggests that it is only under certain conditions appropriate to speak of "middle-classes" and introduces as an alternative to the milieu concept.

While milieu research examines in a first step cultural characteristics, it can consider in a second step if milieus fall together with vertical positions of income and occupations. In contrast to class studies, which construct groups by structural factors such as similar occupations and income, milieu approaches identify groups according to specific sociocultural features such as common mentalities, consumption patterns, and leisure activities. Different basic orientations in life, values, and specific activities show significant characteristics of groups that do not necessarily overlap with vertical stratification.

Research on middle-income milieus in Recife/Brazil and Nairobi/Kenya shows how the milieu concept helps to understand fundamental differences in both settings. While cultural characteristics of milieus in Recife/Brazil overlap to a high degree with vertical social structures, the differentiation of milieus in Nairobi/Kenya is more complex and includes many horizontal/cross-cutting influences such as urban-rural ties or ethnicity that are less significant (or even nonexistent) in Brazil, Europe and North America.

RC07-154.2

STOLL, FLORIAN* (*Bayreuth Academy of Advanced African Studies/ Bayreuth University*)

Middle-Classes or Middle-Income Milieus? a Culture-Based Alternative Approach to Middle Strata in the Global South

For decades, social scientists and economists examined "middle-classes," mainly in Europe and North America. In the last decade began a new discussion about rising "global" and "new" "middle-classes" in Asia, South America and Africa. I suggest speaking instead of "middle-classes" of economic "middle-strata" as the groups are defined mostly by income and not by complex multi-dimensional class concepts.

This contribution suggests that it is only under certain conditions appropriate to speak of "middle-classes" and introduces as an alternative to studies in the Global South the milieu concept. Authors such as Marx and Weber established in the late 19th and early 20th-century "class" for the study of vertically stratified European societies. The concept of social classes implies that there is a group in a distinctive income stratum that shares crucial characteristics such as occupation, income situation, consciousness, economic interests, and status.

While class studies construct groups by structural factors such as similar occupations and income, milieu approaches identify groups according to specific sociocultural features such as common mentalities, consumption patterns, and leisure activities. Different basic orientations in life, values, and specific activities show significant characteristics of groups that do not necessarily overlap with vertical stratification. For instance, it is often possible to distinguish religious from hedonistic, secular milieus and social climbers from established milieus in middle-income strata. While milieu research examines in a first step cultural characteristics, it can consider in a second step if milieus fall together with vertical positions of income and occupations.

Examples from own research on middle-income milieus in Recife/Brazil and Nairobi/Kenya illustrate how the milieu concept can describe an almost paradigmatic case of vertical differentiation (Recife) and a highly complex milieu differentiation with many horizontal/cross-cutting influences (Nairobi).

Portes Meets Zelizer in Azerbaijan: Social Capital As a Byproduct of Relational Work

The unexpected presence of social capital—in the form of almsgiving to social outcasts and resource transfers at mourning ceremonies—in an exceptionally distrustful environment like Azerbaijan, suggests that contemporary social capital theories may be misspecified. In particular, we demonstrate that our two empirical cases are poorly explained by Alejandro Portes' widely-cited four sources of social capital. Drawing on our empirical work and the research program of Viviana Zelizer, we find that trust is neither necessary or sufficient to generate social capital. We propose that all social capital is a byproduct of relational work. More specifically, we find that people identify and ascribe their relationships to others by relying on available cultural conventions to mark economic transactions and other media as appropriate or inappropriate. Social capital materializes when the media exchanged is valuable.

Our argument has important implications for development sociology. Our theory and case suggests that researchers should expect to find social capital in even the most deviant, disorganized, war-torn and despondent places and social situations, where both personal and generalized trust are absent. This is because relational work is universal while trust is not. This also has implications for development practitioners. Social workers, community organizers, and other social capitalists, seeking to help individuals gain access to resources or to increase the social capital of communities, may benefit from interpreting their vocations as 'relationship work specialists,' with relationships and relational packages as their unit of practice.

Features of Green Consumption in the Eastern Partnership Countries.

The old "model of a resource-intensive economy" will lead to increased costs and lower productivity. Still ongoing crisis is an indicator of this model and forms the idea of a new model of "green economy", in which material prosperity is not provided due to the increasing environmental risks and social inequalities. The concept of "green economy" – a model that leads to better health and social justice population, as well as a significant reduction of hazardous effects on the environment. Thus, the "green" economy can be considered as a low-carbon, resource-saving and socially inclusive model of the economy.

This movement is popular in Western Europe and North America, but in the Eastern Partnership countries, green consumption neglected. The combination of entrenched old production orders, powerful coal, oil and gas lobby, lack of interest in the development of "green" economy by the authorities, unstable and complex legislation, lack of education and other factors interfere with the Eastern Partnership countries to successfully develop this area. However, some positive changes are already noted. In our work, we evaluated the awareness of student youth about green consumption and attitude towards it, established the relationship between green consumption and social inequality, as well as suggested options for popularizing this direction in the Eastern Partnership countries.

Tourist Ecovillage As an Area of Socially Responsible Tourism Development.

At present, the problem of interaction between society and the environment is especially acute. The human is constantly in stressful situations, tired both physically and psychologically, which leads to the conflict situations occurrence, both in everyday life and at work, as well as to a decrease of activity level. And to restore his innate resources, exhausted in the course of production activities and in the performance of everyday household duties, a person must rest. In order to rest, a person resorts to the use of tourism, the main function of which is social one. The social essence of tourism becomes obvious in the organization of leisure of the population; leveling and preventing conflicts in society; new relations formation between individuals and groups; acculturation of the population and cultural values promotion. However, despite the fact that tourism is a social concept, as a market-oriented economy sector, it has now become just a commercial type of activity and, seeking for profit, we begin to

lose its social essence. To reduce human influence on the environment, we, as part of the green economy concept, developed a tourism ecovillage project as an alternative to usual people's recreations. Indeed, by the development of tourist ecovillages, we can address both global environmental problems and the social problems of certain regions. In work we drew special attention to the conflict-free management and social equity system at this facility.

Living Organ Donation and the coordination of living organ donor work

Institutional ethnographers have employed the term 'health work' to describe the work people do to maintain their health/lives. I extend this area of IE studies and introduce the concept of 'donor work' to explore the work people do to be living organ donors. My project centers on the question: how do social relations coordinate the activities of living organ donation? Drawing on IE, I aim to provide a sense of how living organ donors' lives are coordinated in ways beyond their own local experience of living organ donation.

The rate of organ transplants continues to rise in Canada, and as it does, so does the demand for more organs. Living organ donation has provided a viable alternative to cadaveric donation, and has become a central way of acquiring organs for transplantation. Living organ donation transplantation surgery enables the health of the organ recipient at the expense of the living donor's own acute, and potentially long-term, health. Living organ donors undergo major surgery and yet are never considered patients throughout the donation process, as they are only ever understood as 'donors'. Through observational forms of inquiry, interviews and personal reflections, I explore the embodied and sensory practices of the everyday of living organ donors, throughout the donation process. I highlight how donation and transplantation are coordinated through donor embodiments. Specifically, I detail the 'donor work' that living organs do to be donors. Donor work is a complex form of labour that takes shape through body work, institutional work, health work, boundary work and/or emotional work. The work is done in multiple settings, as is the overall coordination of living organ donation. I posit by focusing on the interplay among these bodies and these spaces unacknowledged aspects between the coordination of living organ donation and donor work are made visible.

THOMPSON, MAXINE (*North Carolina State University*)

The Values and Virtues of Solicited Ethnographic Journals

Ethnographers often struggle with gaining access to certain populations and/or witnessing social interactions that occur outside of their own experiences. Our research team sought to circumvent this issue by soliciting ethnographic observations and reflections from the participants themselves. As part of a year-long study of microaggressions on a large predominately white public university campus in the Southeast of the United States, we solicited student ethnographic observation reports and reflections (i.e., journals) as a means of capturing the occurrence of microaggressions in everyday life, as well as students' reactions to these interactions. Student ethnographic contributors represented approximately the demographic diversity of the undergraduate student body of the campus. Their reports yielded a much more diverse array of microaggressive experiences than would likely have been captured by any single researcher, particularly one with a majority group status. While there is limited research on solicited ethnographic observations and reflections, we find that this method for data collection allows us to obtain deeper insight into microaggressions than previous research, which relies primarily on interviews and focus groups of marginalized respondents. We explore the advantages and limitations of soliciting ethnographic journals in comparison with more traditional qualitative data collection methods. We highlight the rich data such journal entries can yield, particularly with respect to student reflections provided in this study. We draw on our data to demonstrate potential for high quality data collection when soliciting ethnographic journals from students provided with some training in ethnographic methods. We advocate for the use of this method across research settings and highlight the usefulness of this method in a campus setting particularly.

Canadian-Based Research in Leisure Studies on Leisure and the Aged: From 2000 to Today

Canada is an aging society. Within the next few years, it is forecasted that one of every four Canadians will be 65 years of age and older. With this change in

the demographic composition of Canadian society comes changing needs and expectations for the service industry of leisure – specifically to better understand today's seniors and their leisure needs. Leisure studies research, has thus been called upon, more so than ever in the past to play a key role in not only conducting research on leisure and the aged, but to also disseminate research to the service industry that will provide pertinent knowledge to help better serve this cohort. The questions that this paper purports to answer are: (1) how has the leisure studies research field in Canada prepared to recognize and address the growing needs of this aging population for leisure?, (2) what Canadian-based research has been conducted and published in the top peer-reviewed leisure studies journals since 2000?, and, is recent Canadian-based leisure studies research sufficient in helping prepare for the future delivery of leisure services for Canada's growing aging population? The purpose of this paper is to provide an overview of the current state of condition of Canadian-based leisure studies research on leisure and aging. Specifically, the objective is to overview research published in Canada's two major Canadian leisure journals — *Leisure/Loisir* and *Society and Leisure/Société et Loisir* that has been published since 2000. A systematic review of articles on leisure and the aged is presented identifying the quantity of studies produced by authors affiliated with a Canadian university, the research methods utilized, and the emerging thematic categories. The conclusion presents what is needed for future research, along with an evaluation of the current state of condition of research with implications for the service sector.

STRECKER, DAVID* (*University of Frankfurt*)

Human Worth: The Social Logic of Valuation in the History of Slavery and Beyond

Economic sociology has opposed mainstream economics by highlighting the social preconditions of economic transactions. Far from being confined to analyzing how factors like personal interactions, traditions, institutions etc. influence the value formation of economic goods, this research has drawn attention to how social phenomena are commodified in the first place. The focus on understanding contemporary markets and the marketization of contemporary society, however, e.g. of death and of sex, has led to a concentration on legal markets. In order to better understand illegal markets and, moreover, to overcome the focus on markets which perpetuates the dichotomy between the social and the economic (by simply looking at their interrelations instead of questioning how such a separation became imagineable and was able to take institutional form at all), this paper presents a historical analysis of a good which has become excluded from formal market transaction: the human being.

For most of human history, conceiving of (some) humans only in terms of instrumental value (usually economic utility, often marketability) presented no conceptual problems to societies. Slavery dates back to early civilizations and only began to be challenged broadly in the late 18th century. An analysis of four different historical constellations shows that slavery rests on an underlying logic of status assignment (belonging to a specific type of ethical community); the respective processes of social valuation allow for humans to be understood only in terms of economic value. Sketching the cultural and institutional structures of status assignment in ancient Greece, at the beginning of transatlantic slavery (the Valladolid debate), during abolition and for contemporary world society, this analysis lends insight into the relation of the social and the economic as well as the functioning of illegal markets in general and specifically the persistence of slavery and the value of body capital today.

RC35-640.2

STRECKER, DAVID* (*University of Frankfurt*)

The Two Languages of Power

Although generally recognized as a central concept in the social sciences, the diverse and in part seemingly contradictory conceptualizations of power have triggered the suspicion that completely different phenomena have been subsumed under the same term. In contrast, this paper argues that the conceptual confusion can be resolved by, first, distinguishing between three levels of power (essence, action, social; see my *Logik der Macht*, Velbrück 2012).

Arguing that discussions in the social sciences are about what I have called social power, the paper then traces how the familiar distinction between power over and power to refers to two different functions of social power, namely the repression and the constitution of social relations. A sketch of how both of these functions have been analyzed in action-theoretical as well as structural and systemic theoretical frameworks leads to a four-field-matrix which substantiates the claim that the different aspects of social power may only be separated analytically. Any essentialist isolation of these aspects into different types of power necessarily loses sight of and masks how power permeates social phenomena.

Accordingly, all social relations are power relations; power cannot be escaped and evaluated from an external standpoint. However, the study of power has traditionally been motivated by critical concerns. Analyses of power aim at criticizing and altering power relations. The final part of this paper argues that a totalizing conception of power and a critique of power are compatible because they are formulated in different languages: the former in the objectifying language employed

by an observer of the social dynamic, the latter in the performative language of a participant entangled in social practices. The relation of these two languages of power is the topic of the theory of perspectival dualism.

Comparing Cases of Violence: Assessing Chidester's Analysis of Violence and Religion in Jonestown and Apartheid South Africa

After mapping philosophical and political definitions and theories of violence, from physical harm to systemic violation on one axis, and from immoral to ethically legitimate on another axis, David Chidester proceeded with a social-anthropological analysis of sacred beliefs, practices and institutions that were used by groups to justify or resist violence in apartheid South Africa. Preceding the publication of this analysis in *Shots in the Streets: Violence and Religion in South Africa* (1991), Chidester had in *Salvation and Suicide: An Interpretation of Jim Jones, the People's Temple and Jonestown* (1988) published his award-winning examination of violence in Jim Jones's religious movement within its social, economic and political context. Although Chidester noted that his emigration from the USA to South Africa occasioned his shift in focus from one case study to the other, with both cases focusing on the problem of violence, he has not offered us an account of how a comparison of these case studies might shed new light on the key term 'violence'. If JZ Smith is correct in claiming that the purpose of a comparison of historically contextualized cases is to do precisely this, this contribution will probe Smith's claim by asking in which ways a comparison of Chidester's analysis of these two case studies could help us to reconsider and see the problem of violence in a new light.

Landscape/Palestine: Conceptual Inventions in the Settler Colony

Landscapes are the dominant trope within the Palestinian imagination. From village narratives to art and music, they are at the center of the struggle against dispossession and colonization, a central theme of resistance to exile and erasure. As a place of return, landscapes are the site of memory, sensation, belonging, of being Palestinian. A multiplicity of single impression. Over the last couple years, along with a group of artists, farmers, activists, and community members, I have been working on a collaborative project around the theme of the landscape within the Palestinian imaginary, with a focus on those Palestinians returning to their lands. The project began with the aim of providing viewers an experience of being in the landscape, of feeling touching, smelling, hearing, tasting the place from which they have been exiled. For Palestinians living in exile and unable to return, this sensory attunement would permit an otherwise impossible experience. Over the course of our discussions, this phenomenological and multisensory approach has, however, given way to a more radically oriented concern with the landscape itself as material object. There was a resounding disquiet that a sensory approach left the landscape an inert and passive object when, it was asserted, landscape is actually emergent, a "thing" itself. The question I wish to pose in this paper is the two-fold: One, how can landscape become an empirical source of conceptualization (including its own conceptualization), which is to say, how do we attend to the ways in which the landscape invents what we are able to say and do around it? Two, what might a visual ethnography of such a landscape look like? To this last question I provide a filmic experiment that is attuned to scenes in which the landscape invents a set of conceptual possibilities for living in a settler colony.

Indian Economic Nationalism and Middle CLASS. Middle Class As Contested Cultural Project(s)

Recent years have seen an increased sociological interest in the middle classes of the Global South from a comparative perspective. The paper argues that in addition to sociostructural analysis, Weberian or Bourdieuan conceptualizations it might be worthwhile to look at national and transnational discourses on middle class, i.e. to study middle classes not as descriptive facts but as cultural projects.

This paper assumes middle class to consist of a specific set of subjectivities that are articulated with regard to gender, national belonging, religion, modernity, the West and others. Class is conceived as being simultaneously lived experience and a relational and interproductive phenomenon. Consequently, middle class then would be a fragmented category of aspiration and imagination with contested boundaries of membership that draw on different narratives and embodied practices.

The paper works with ethnographic material from India to show how middle class subjectivities explicitly need the opposition of other middle class subjects

and that internal fragmentation is one of its typical constituents. Comparisons with 'the other' - e.g. a supposedly global middle class or different middle class milieus within India - is part and parcel of 'being in the middle'. Moreover it discusses how in the case of India a new economic nationalism is intertwined with discourses on middleclassness and Indian modernity.

While the paper does not intend to claim that discourse analysis or ethnographic research on the relation of emic and etic conceptualizations of middle class should supersede classical sociological middle class research, it contends that for a deeper understanding of transformatory processes in the Global South, as well as for a comparative perspective, it is needed that middle classes are (also) studied as contested, often politicized cultural projects.

Gender and Power in Couple Interviews – a Case of Polish Migrants in Norway

Performativity is a well-established lens for looking at gender and power imbalances in the research context, highlighting not only what people say during the interviews, but also how they say it, and - for interviews with more than one individual- who takes the lead. Adopting this framework to an empirical context of Polish migrant couples interviewed in Norway in the realm of Transfam study, we look at how spouses interact in the research situation. As our interviews were dedicated to issues of migration, work, as well as family practices, we analyse which 'domains' remain gendered in the sense of 'who' has a responsibility and power over telling their stories and putting forward their interpretations of events belonging to the shared biography. Generally, we support earlier findings about masculine lead in the narratives on public sphere (employment) and primarily female accounts arising from questions on doing family, relationships and affect, adding to the debates the particularities of the Polish context. However, we also suggest that stories pertaining to migration may be seen as 'testing grounds' where both men and women feel the need to share their differing perspectives, contributing to the displays of power through both verbal arguments and non-verbal cues. Continuously, we put forward arguments about the concatenations of gender and nationhood (legitimacy of "Polishness") expressed in the power dynamics of couples discussing their international mobility. In our presentation we will provide a methodological reflection on conducting couple interviews with migrant families by showing how telling stories may reveal gender dynamics within a couple.

Polish HIV/AIDS Organizations through the Lens of Various Social Actors' Biographies

From an epidemiological perspective Poland has never experienced an epidemic level in terms of HIV/AIDS. The first diagnoses and the first attempts at shaping policy responses took place in the mid- and late 1980s, respectively. The history of creating HIV/AIDS policies in Poland (as throughout Central and Eastern Europe) is intertwined with political, economic and cultural transformation. The transformation of the early 1990s brought about several HIV/AIDS organizations in the biggest Polish cities, and the first state institutions addressing their activities to people living with HIV/AIDS. In the beginning of the 1990s political and economic changes taking place in the CEE created new political, discursive and cultural opportunity structures for social organizing and civil acting in the field of HIV/AIDS. On the one hand, it allowed for the strengthening of the Catholic Church and its greater involvement in humanitarian action/social assistance, also with respect to HIV, and on the other it contributed to the emergence of progressive social HIV/AIDS-related organizations acting in the field of human and minorities rights. The purpose of the proposed presentation will be to look at HIV organizations in the 1990s on the basis of biographical interviews conducted with activists and professionals throughout Poland. By introducing voices of activists and experts from different localities (both in terms of geographical differentiation and institutional and thematic diversity of organizations), the presentation will provide the mapping of personal stories of HIV engagements. Special attention will be given to the reflections of systemic changes visible in the collected narratives of the representatives of different organizations: civil society organizations, state institutions and church-related initiatives. The analysis will also present agency of the actors emerging from their personal biographies, showing the ways in which they shaped the organizations in the context of the transformation.

State-Created Images of the Past As a Way to Form Collective Identities of East Europeans

The place of a state in common beliefs of East-Europeans is special, because for long historical periods the state was first of all the instrument of external domination and as such - most often contested. Its role in constructing collective identity had been questioned as well. Nevertheless, the state constantly affected the identity and since the fall of communism its influence even increased. Nation's collective identity is supported, maintained or in some aspects created by the state, in particular by using the historical policy. The main object of our study are images of the past as an element of collective identity construction - within the state or against it. We are comparing Poland and Ukraine as the countries where historical policy becomes more and more important and where one can observe increasing interest in the past by the citizens. We hypothesize that the reasons for these phenomena are different in those countries even if the observed outcomes are similar. Since 1991 Ukrainians experience their first long-term historic opportunity to be formed as a nation with its own identity. Since 2014 they are victims of external aggression. Identity-creating activity of Ukrainian state aims at building internal cohesion, among others by using symbols of the past, useful in current situation. Poland had its long-term opportunity earlier: in interwar period. The current increasing interest in the past in Poland and the search for identity-constitutive elements seem to be the answer to quick (possibly too quick) modernization, westernization and the challenges of globalization and not the identity-creation as in Ukraine. Our research identifies and describes the mechanisms of states' influence on collective identities of Poles and Ukrainians and shows how this activity can push the identity demand in undesired direction of nationalism and xenophobia. We analyse the data collected in September-December 2017.

Managing the Planet: The Anthropocene, Good Stewardship, and the Empty Promise of a Solution to Ecological Crises

The Anthropocene has emerged as a dominant conceptualization of the current geological epoch and, more significantly, of our relation to nature. By its proponents the Anthropocene is espoused as a "solution formulation," an analytical tool which clarifies humanity's multifarious impacts on nature and nature's subsequent crises; and further as a conceptual apparatus from which to launch mitigation and adaption strategies, promising deliverance or at least engagement with ecological crises. However, the Anthropocene is not a neutral concept, merely illuminating transition within ecological conditions and connections between human activities and nature; rather, it is a particular prism from which to understand humanity's relation to nature. And, as the Anthropocene becomes ascendant both analytically and politically, it becomes vital to question its imaginary, how it constructs nature and humanity, how it influences and constrains responses to ecological crises, and what the long-term implications of operating within this imaginary are.

I argue that the Anthropocene as a political/analytical prism rests upon flawed conceptions of nature, history, and humanity, rendering it an impotent construct from which to respond to ecological crises; offering only partial and presumptive "solutions" in the form of intensified governmental regulation and the application of manifold technological "fixes" through the geoengineering of Earth's systems, in an attempt to address isolated aspects of ecological destruction. While the Anthropocene highlights human-nature relations as central to ecological crises, it does not question the economic system which drives those relations leaving the principal source of crisis unchallenged; and is thus left addressing capital's epiphenomena. The solutions offered up through the Anthropocene imaginary may extend the viability of certain lifestyles and capitalism's modus operandi within the immediate future, but will not reverse nor end ecological devastation. As such, we must move beyond the faulty imaginary of the Anthropocene to novel imaginings of our relations to nature.

Bearing Witness: Practices of Witnessing in Geopolitically Marginal Conflicts

As part of a cosmopolitan ethical project, the representation of others in need grants us the opportunity, however imperfectly, to make good on a responsibility to people that the media has allowed (or perhaps forced) us to see. The work of producing these representations, of 'bearing witness', involves journalists

negotiating an ethically ambivalent position of seeking proximity to suffering for purposes that do not include immediate (or, in the long run, possibly any) assistance for the sufferer. Furthermore, this work takes place within a social space affected by both changes in the political economy of international conflict reporting and a manichaean sociological universe particular to large scale peacekeeping and humanitarian operations that described in existing literature on 'Aidland' and 'Peaceland'.

This paper develops an understanding of the concept of 'bearing witness' - present in existing work on media witnessing - as being both a discourse used to justify the ethics of journalists' presence before suffering and a practice requiring material and discursive resources to enact. Based on research examining the case of journalists bearing witness to conflict in South Sudan, I suggest potential forms of this discourse and some of the resources that may enable or constrain its practice.

Community Based Water Management in Rural Chile

Although Institutional Ethnography has clear emancipatory goals, it has not been applied to the area of participation in natural resource management. This contribution attempts to fill this gap by looking at community based water management in Chile through IE.

In Chile, Rural Sanitary Services (RSS) work as a partnership between the State and rural communities to provide drinking water and sanitation to rural areas. 'Rural Drinking Water Associations' (APRs) are responsible for the management and operation of the RSS. More than 1600 APRs have come together under a National Federation to create a law that protects them from private sanitary companies. After 14 years of negotiations the Federation agreed a Law on RSS, and is now advocating for changes in the Water Code, the main water legislation in Chile.

This presentation will share results from my PhD where I use IE to explore the ways in which the Federation is organised. Taking the standpoint of an APR located in the semi-arid north of Chile, I start from people's personal work experiences and go beyond them, to understand the social and political processes involved in people's everyday activities. There is a disjuncture between the way people manage water locally and some aspects of the legislation that have become problematic for the APR. I will explore the ways in which the local APR wants to be involved in the modifications of the Water Code by learning about how they do water management locally and how they relate to people working in the Federation.

My research will contribute to this Thematic Group both theoretically and empirically. I will share my experience of doing an IE in Chile in the context of community water management, critically considering how a very distinctive organisation gets involved in law making.

El Sistema De Protección Infantil En Honduras

El objetivo del presente trabajo es contribuir a la comprensión del impacto que tienen los procesos institucionales e interinstitucionales del sistema hondureño de protección infantil, en la facilitación o contención de la protección de los niños y adolescentes de Honduras. En el marco de la firma de distintos acuerdos y convenciones internacionales, y de diferentes factores a lo interno del país, durante la última década, el Estado hondureño ha tratado de construir una nueva infraestructura institucional dirigida hacia la protección de la niñez y la adolescencia en Honduras.

Sin embargo, a pesar de los esfuerzos realizados, actualmente este sector poblacional continúa en situación de vulnerabilidad extrema. Solamente en el año 2014, 1.031 niños y jóvenes menores de 23 años fueron asesinados. Y en el mismo año, 9.469 niños que huían del país fueron deportados desde México y los EEUU. Estas condiciones llevan a preguntarse sobre los obstáculos que están impidiendo al sistema de protección infantil garantizar los derechos más básicos a la niñez y adolescencia en el país, por lo que se plantea la necesidad de conocer de manera minuciosa las prácticas organizacionales que dicho sistema realiza, y el modo en que éstas afectan la vida de los niños y sus familias.

Desde el Departamento de Trabajo Social de la Universidad de Ryerson, en colaboración con Honduras y otros países de la región que estudiarán esta situación en sus propios contextos, se ha propuesto investigar este fenómeno desde un enfoque cualitativo, mediante el método de la etnografía institucional propuesto por Dorothy Smith (1987; 2005), y apoyado de técnicas de recolección de datos como la entrevista, la observación, el análisis de textos y el mapeo de actores y procesos.

Pathways of Public Sociology in Nepal

The emergence of sociology as a science offering universal knowledge about society regardless of the historical and structural base and the specificity of the context became a fertile ground for scholars attached to particularism, which appealed to those who sought to challenge the hegemony of Western Sociology roughly after the 1950s. Around the same time, in between the 1950s and 1970s, the discovery of the noble concept 'Third World' in social sciences disheartened the separatist theories for the study of separate Worlds. From the 1970s, world system analysts took the initiative to minimize the dichotomy between universalism and particularism urging the dissolution of sociology into a broad social science. The dissolving of sociology into a broad social science would be suicidal for some sociologists; hence, they advocated for the development and strengthening of sociology as global sociology the backbone of which was the public sociology. Such an endeavor was supposed to offer two advantages; the bridging of gap between universalism and particularism, and the defending of discipline from the shade of economics and political science.

It was perhaps the possible threat of encroachment of sociology from social sciences disciplines in general and from economics and political science in particular was quickly realized by the Nepali sociologists and established Central Department of Sociology as an independent department within the Tribhuvan University (TU), the idea adjacent to public sociology. In this context, this paper identifies the key issues that the public sociology is expected to cover and cross-checks whether such issues are inserted within the curriculum of sociology at the TU. Also, structured interviews with the faculties, members of the Sociology Subject Committee, and curriculum developers are taken to find out the direction sociology is taking. The paper argues that the incorporation of public issues in sociology helps the subject stay alive.

Coping with Violence: Women in Sex Work and Transgender People in Karnataka, India

HIV prevention involves a sprawling structure, comprising a range of actors ranging from translocal network of governments, multinational corporations, international development agencies, non-governmental organizations (NGOs), support groups, and community organizations (COs) particularly in the global south. The prevention program has enabled the formation of a set of people and organizations in formal positions of authority which rarely acknowledge the repositories of expertise created within 'communities' of high risk groups such as women in sex work (henceforth referred to as sex workers) and transgender people. These repositories of information have facilitated the 'institutionalization' of expertise which is key to addressing intimate partner violence (IPV). Departing from the typical focus on forms of violence faced and types of perpetrators, we discern the mechanisms adopted by sex workers and transgender people to cope with violence. What forms of information do sex workers and transgender people draw upon to cope with IPV? How is this information based (or not) within COs? Coping strategies adopted, we argue, are based on tools and techniques shared through formal mechanisms and informally by CO members.

In this paper, we rely on qualitative interviews with 25 sex workers and 15 transgender people in Karnataka state (India) to examine and compare how they manage and cope with IPV. COs serve as structural interventions and spaces for sharing information which enables the institutionalization of coping mechanisms enabling members to draw upon the expertise embedded within the organization. However, access of such expertise could be uneven based on status differences CO members (by age and if holding a formal position or not within the CO). The complex intertwined relations between the sex worker and transgender people and the CO requires connecting the individual and structural to understand IPV coping strategies that can facilitate the replication and scaling up of the accumulated expertise.

Demanding Rights: Practices in Community Organizations of Women in Sex Work

Several attempts have been made to define, identify, and categorize structural factors, such as organizational and community aspects, in HIV epidemics. Community organizations as interventions can address structural factors and facilitate HIV prevention ('community' refers to community of women in sex work). Community organizing, not merely mobilizing, in the context of an HIV/

AIDS program, aims for collective action to influence safe sex behavior and address structural barriers to prevention services. This involves initiating and building localized groups of women in sex work (henceforth sex workers) and building their capacity to assume ownership of the community organization. Distinguishing between mobilizing and organizing, we argue that participating in an organized group serves as a means for both making demands and seeking rights. Such participation can facilitate a change in individual behavior, build capabilities, and develop critical consciousness for empowering sex workers while simultaneously creating an enabling environment for accessing prevention services. At the same time, the complex layers of power within the community organization (CO) may limit the processes of empowerment. In this paper, we analyze the ways in which member participants of community organizations articulate their rights and whether and how they rely on the CO. Using qualitative data from seven COs and 20 interviews which often included the President, one or two Board members, Secretary or key members, and employees (as a group), we show how 'vocabularies of structure and leadership' are used for articulating rights and simultaneously for asserting informal power. Despite developing authority structure and rules through a deliberative process, internal practices have implications for defining and maintaining solidarity.

The End of Ideologies – Why Did It Not Arrive?

The end of ideologies – Why did it not arrive?

American sociologist Daniel Bell published a book called *The End of Ideology* in 1960, in which he announced the advent of a period in which traditional ideologies would become obsolete, and ideological thought replaced by science. This paper deals with the question of why this prediction was not fulfilled, and why it is ideology and not science which still dominates our view of the world and its current problems in a number of aspects. For answers to this question, the author looks primarily to Ulrich Beck and Niklas Luhmann, and finds them in tendencies within the evolutionary development of society and science (the hyper-complexity of science), in mechanisms of functional differentiation, in the lack of resources for meta-communication and in the time pressures which ongoing events place on us.

SUBRT, JIRI* (Charles University, Faculty of Humanities, Prague)

Where Are the Leaders and the Makers of History in the Constructivist Conception of Berger and Luckmann?

Where are the leaders and the makers of history in the constructivist conception of Berger and Luckmann?

Giddens observes that social theory tends to ignore the fact that social structures are largely the result of conflicts which the societies have undergone in the past. Berger and Luckmann are no exception to this, as in their conception people construct social reality because they are able to negotiate using means of communication. Questions of physical labor, forcible compulsion and power control lie outside of this theoretical perspective. Furthermore, the common work of Berger and Luckmann introduces the idea of institutions as the result of purposeful human action. However, the formation of institutions is not always the result of conscious design. Elias's work *The Civilization Process* shows that a number of structures and institutions have formed through long-term development processes. The theory of Berger and Luckmann is rooted in interactionism and is close to the micro-sociological perspective, and perhaps for this reason we are not confronted with the fact that social positions and roles are hierarchically organized. There are actors who influence social reality only at the micro-social level, but there are also those who—through their actions— affect macro-social processes. Besides those who with their daily behavior contribute to the reproduction of existing social structures and relationships, actors can be identified who bring innovation and change to such reproductive processes, and eventually even a smaller number who come up with ideas and acts which constitute incitements to fundamental reform or revolutionary steps. The constructivist perspective is characterised by the fact that that even when it postulates human individuals as creators of social reality, they are usually regarded as anonymous and interchangeable members of humanity. The problem of great historical figures and their influence on society and time is not resolved.

SUCHODOLSKI, GABRIEL* (UCLA)

Flexible Patronage and the Contentious Politics of Dispossession

With an ethnographic case study of a riverine-peasant community menaced by a hydroelectric dam in the Brazilian Amazon, I show how patronage shapes dispossession processes. The organizational field of dispossession – including politicians, firms, and social movement organizations – provides external patronage relations that shape contention in local communities. I argue that patronage

enables both resistance to and compliance with territorial dispossession, and that patronage networks often mobilize against each other, locally and extra-locally. I conceptualize a *flexible patronage* support scenario: when clients are able to mobilize against their patron's will and still maintain patronage support for their everyday, parochial activities. Patrons may strategically tolerate clients' mobilization in order to maintain their positions of authority, providing recursive feedback between patronage networks and collective action. Additionally, I show that contention *further impacts patronage* by the rupturing or strengthening of select social ties. In this case study, in order to neutralize resistance to the dispossession project, pro-dam organizations co-opted local patronage groups in two ways. First informally, subcontracted firms used connections and distributed financial incentives to garner local support. Second, formally, privately led 'participatory techniques' made patronage groups legible to corporate and state actors and facilitated dialogue between contending groups without changing the goals of the dispossession project. Finally, state coercion quelled remaining open resistance or conflicts by clients within the flexible patronage scenario.

RC24-462.2

SUCHODOLSKI, GABRIEL* (UCLA)

Patronizing Dispossession: Patronage Networks and Contention in Amazonia

With ethnographic evidence from a riverine-peasant community menaced by a hydroelectric dam in the Brazilian Amazon, I argue that patronage groups can provide the basis for both resistance to and compliance with territorial dispossession. Anti-dispossession social movements provide resources and framing for some local groups, which selectively protest dispossession and intrusive subcontracted firms. In response, private firms employ co-optative mechanisms to ensure local support and project continuity (Selznick 1966[1949]). First, subcontracted firms co-opt local families informally through financial incentives, creating acceptance within shifting patronage groups. This partial and informal cooptation radicalizes local conflicts. Companies then deploy a second, formal co-optative mechanism by providing privately controlled information and 'new public participation' (Walker et al 2015); a "social communications" firm effectively divides the community by subsuming contending parties into a participatory and representative "community council" under private auspice, thus managing to avert threats to project continuity. I argue that patronage groups and participatory techniques are crucial intervening mechanisms to understand and explain the interactions between state or corporate powers and local communities as well as the shape of dispossession processes. Territorial dispossession provokes reaction from social movements and civil society but its contentious politics is shaped by local and extra local relations of dependency conceptualised as patronage.

SUDO, NAOKI* (Department of Political Studies, Gakushuin University)

Effects of Regional Inequality on Political Attitudes: Regional Polarization Accelerated through Aging Population and Globalization in Japan

A rapidly aging population has been hugely influential on Japanese society, especially the social welfare system. Alongside this influence, under the neo-liberal regime of the Liberal Democratic Party, certain globalization trends have accelerated various social changes, especially in the Japanese economy. It is plausible to predict that these changes will have some effects on political opinions in Japanese society. Additionally, even though changes have been rapidly permeating throughout society, the speed at which change has had effects has not occurred evenly within the different regions of the country. This presentation aims to clarify how differences occurring in relation to different aging speeds of the population and differing effects of globalization among regions cause social inequality in Japanese society, through focusing on people's political attitudes. To examine the differing effects of an aging population and globalization, the Social Stratification and Social Mobility survey (SSM 2015, N=7,817) and the 2015 national census have been used. For analysis, the rate of the over 65 years-old population in a municipality was taken as an index of the aging population, and the rate of foreign residents in a municipality as an index of globalization. Furthermore, SSM 2015 data were analyzed using a multilevel multi-nominal logit model. Analysis results showed that individual socio-economic status and demographic characteristics had mostly no effect on political attitudes. In contrast, the analysis demonstrated that differing regional rates of aging population and presence of foreign residents have statistically significant effects on political attitudes. In more globalized regions, people were more likely to support small government and minimal expenditure for social policies. In highly aging regions, people were more likely to support moderate levels of expenditure for social policies. These findings suggest that people in regions more exposed to rapid globalization changes tend to support neo-liberal policies.

RC45-765.1SUDO, NAOIKI* (*Department of Political Studies, Gakushuin University*)*Supporting Redistribution Policies and Market Principle Simultaneously: How to Shape Conflicting Political Beliefs*

Social survey data in Japan indicate that a majority of Japanese support redistribution policies. This can be said to reflect rising social inequalities in the country. However, the same data reveal that many Japanese also support market principle. In fact, their support for market principle has sustained the neo-liberal regime by the Liberal Democratic Party in Japan. At a glance, the Japanese seem to hold conflicting beliefs in social policies. This presentation aims to explain the reason behind it. In order to examine Japanese political attitudes, I used data from the Social Stratification and Social Mobility Survey (SSM 2015, N=7,817), which is one of the nation-wide surveys in Japan. First, I analyzed the data of SSM 2015 by using a finite mixture regression model. This resulted in the extraction of two latent groups: one that did not simultaneously support redistribution policies and market principle, and the other that supported them simultaneously. Next, by examining the differences between the two, I clarified the reason behind the latter group's simultaneous support of redistribution policies and market principle. Surprisingly, the members of this group belonged to a relatively disadvantaged class in society. Although economically deprived and not highly educated, this group is more likely to support market principle. Additionally, they are more likely to support authoritarian attitudes. This finding suggests that the inconsistent belief in social policies among the Japanese is shaped by unquestioning obedience to authorities, political leaders, experts, and intellectuals, even though they are often opposing each other. The inconsistent belief in social policies among the Japanese is a kind of rational judgment, as they only entrust the answers of intractable problems into the hands of the authorities.

RC31-563.4SUEN, YIU-TUNG* (*Chinese University of Hong Kong*)*Gay Brain Drain: Migration out of a Place Because of the Lack of Legal Protection for LGB People*

This paper coins the term 'gay brain drain' to connect the two research literatures on sexual migration and brain drain. It relies on Hong Kong as an empirical case, where there is a lack of protection against sexual orientation discrimination and same-sex relationship recognition. An online survey conducted with 1,026 lesbian, gay and bisexual people in August 2016, one of the largest of its kind in Hong Kong, found that 39 per cent had considered leaving Hong Kong because of the lack of legal protection against discrimination on the grounds of sexual orientation; 48 per cent had considered leaving because same-sex marriage was not legalised or recognised in Hong Kong; and 26 per cent had considered leaving because of the difficulties facing same-sex partners who wanted children. At the same time, the LGB people in the survey were relatively very well-educated, with 48 per cent having obtained an undergraduate degree, and 23 per cent holding a master's degree or above; 72 per cent of them were 29 years old or below. This paper makes several contributions to the research literature. First, it is one of the first studies to provide empirical quantitative evidence to the phenomenon of sexual migration. Second, it argues that sexual orientation discrimination is not only costly for individuals and the workplace, but also society at large. Third, it seeks to reorient social policy debates about sexual orientation based rights in Hong Kong and Asia, where discussions have been overshadowed by discussions on culture and religion, to a more evidence based approach.

RC06-JS-12.4SUEN, YIU-TUNG* (*Chinese University of Hong Kong*)*Legal Non-Recognition of Foreign Registered Same-Sex Relationships for Immigration Purposes: A Social Policy That Harms the Couple, the Workplace and the City*

Social and legal recognition of same-sex relationships has been growing rapidly. However, globally such development has been highly uneven. This paper qualitatively analyzes the experiences of six same-sex couples who have migrated from US, UK, the Netherlands and Australia where their relationship is legally recognized to Hong Kong where foreign registered same-sex relationships are not legally recognized for immigration purposes. Inductive thematic analysis of the in-depth interviews explores their experiences before and after migration and highlights the material and mental consequences of the social policy for the couple, the workplace, and the city. The findings bear both theoretical and policy implications. Theoretically, this paper intersects migration, sexuality and globalization, and expands the currently heated discussion on same-sex couples' rights into a cross-national context. In terms of policy and legal implications, this paper calls for the social policy of non-recognition for immigration purposes of same-sex relationships, which harms all stakeholders involved, to be changed.

RC12-237.3SUH, CHAN* (*Boise State University*)*More Than Words: Legal Activism and the Prevention of Torture in South Korea*

Past studies have identified the global spread of human rights norms and waves of democratization as two major forces leading to the protection of human rights. Less well-known is the process of how legal professionals exploit these macro-level opportunities to promote human rights. In this case study of torture in South Korea, I use a process-tracing method to suggest that the practice of torture disappeared only through the persistent efforts of legal professionals to establish a rule of law under the new democratic governments. Specifically, I identify three legal reforms initiated by judges and lawyers after the democratization of South Korea to enhance transparency and accountability within interrogation practices: the independence of judiciary, the guarantee of lawyers' participation in criminal proceedings, and the establishment of the Human Rights Commission. The results offer important implications for understanding how human rights activism by legal professionals can lead to the prevention of human rights violations in new democracies.

RC48-806.3SUKARIEH, RANA* (*York University*)*The Temporality of the Emergence of the Boycott, Divestment and Sanctions Movement*

How did the conjuncture of several interlocking "eventful events" contribute to the emergence of the Palestinian Boycott, Divestment and Sanctions (BDS) Movement in 2005? How do certain events introduce a change to the ordinary political structure and become transformative? This comparative paper seeks to analyze the conjuncture of events that lead to the emergence of BDS in 2005, after six decades of colonization. By analyzing the interdependence of event and political structure, I argue that the 2001 parallel summit to the United Nations conference against Racism, Racial Discrimination, Xenophobia and related Intolerance in Durban was a non-transformative event that did not alter the political structure, despite its success in expanding the transnational network of activists. Contrarily, the 2004 decision of the International Court of Justice (ICJ) constitutes a turning point event with structural and political implications, becoming a catalyst for the emergence of the BDS movement. This paper contributes to the burgeoning studies of events in social movement research.

RC50-838.3SULEMAN, RUKEYA* (*University of Bedfordshire*)*The Critical Call for Soft Science SAVVY Today: The Demand for 'transient Diversity' in Inquiry within International Tourism Studies / Related Fields*

The presenters (of this second of the paired sessions on the need for a regular short course in emergent interpretive and qualitative practices) will argue that such an embedded INTERNATIONAL SHORT COURSE IN SOFT SCIENCE should thus inspect what the fresh turn-of-the-century ventilations in research design and paradigmatic thought possibly mean for Tourism Studies (and Companion Subjects).

They will make the case that such a short course should be oriented principally to the interests of advanced researchers (particularly to in-the-van doctoral students), and that it should trace the new permissibilities (but also the new strictures!!) of Critical Theory, Constructivism / Constructionism, Advanced Qualitative Research, and Advanced Interpretive Critique. They will argue that while the short course ought not be built around instruction in singular *methods*, per se --- for decent schooling in each individual *method* amongst the teeming profusion of available methods would conceivably take the whole of a given day!!

Participants on such a short course should expect to emerge from it with an enhanced understanding of:

- new scepticisms which are nowadays held about the mid-to-late 20th century monologies of 'orthodox social science research';
- new intellectual openness of many 21st century SOFT SCIENCE (human inquiry) research designs;
- fresh possibilities newly apparent in 'intimate' / 'emic' / 'locally engaged' styles of inquiry;
- character of recent shifts towards *activist* and *politically-committed* inquiry;
- late liberalisations for enhanced forms of 'relationship-research' and 'solidarity-research';
- strong questioning of axiomatic 'expert-driven' research processes, as 'dialogic' forms of inquiry are increasingly cultivated; and,
- the equally strong questioning that has been witnessed recently against conventional styles of 'a priori driven' and 'intensely criteriological' regimes in social science research.

RC50-835.6SULEMAN, RUKEYA* (*University of Bedfordshire*)*The New Interpretive Impulse --- the OPEN Possibilities: Some Liquid Modern Imperatives for Imaginative Tourism Studies, Today*

This presentation is the second of two bedfellow papers on the condition of culture under globalisation and the interweaving of populations. It focusses upon the altered function of culture under liquid modernity and (like presentation 1 of 2) it constitutes a contextual application (to Tourism Studies) of the ideas of the social studies theorist, Bauman.

This follow-up presentation on the imaginative power of representation in Tourism Studies today will focus upon the provision of several 'open-to-the-future' propositions to help guide researchers studying the parameters of cultural interpretation ... in relation to the changing ethno-epistemic assemblages of our era. Here are four of them:

PROPOSITION 1 = VISIONS OF CULTURE NOT AS ESSENTIALISED OBJECTS BUT AS ONGOING PROCESSES

Considerable gains can be made Tourism Studies by viewing culture not as a fixed or essentialised set of objects but as an ever-dynamic realm of processes...

PROPOSITION 2 = VISIONS OF A MORE PROVISIONAL GLOBAL ORDER

Considerable advantages can accrue to Tourism Studies researchers who are open to a more contingent and less authoritative view of and about the global order of things...

PROPOSITION 3 = VISIONS OF PLURAL KNOWABILITY

Considerable benefit --- in terms of equity and creative opportunity --- can result for governing bodies in tourism management / development who are alive to (become aware of) the hegemonic understandings they uphold in their day-by-day / quotidian acts of promotion...

PROPOSITION 4 = VISIONS OVER CULTURAL POESIS AS WELL AS CULTURAL POLITICS

Considerable dividend can ensue for researchers in the social science field of Tourism Studies (who have a large mandate for matters of culture) when they turn their disciplinary / crossdisciplinary attention towards ethnoaesthetic meanings...

RC36-652.1SULLIVAN, BRIAN* (*University of Houston*)COSTANTINI, REBECCA (*Texas A&M University*)*Women's Reproductive Autonomy and Alienation: Revisiting the Original Conceptualization and Operationalization of Alienation in the 21st Century*

Contemporary empirical research has failed to conceptualize and operationalize measurements for alienation. Empirical researchers during the late 1950s and early 1960s crafted measures in an attempt to define what constitutes alienation. Seeman (1959) and Dean (1961) introduced a series of five measures through a collective evaluation of Hegel, Marx, Weber and DeGrazia: (1) powerlessness; (2) meaninglessness; (3) normlessness; (4) isolation; (5) self-estrangement. However, during the past four decades, a pivot toward understanding how trust and efficacy perpetuates alienation has overshadowed the initial intentions of explicating the concept's original measures. We posit that trust and efficacy do not operationalize alienation but are a part of the broader concept, as they lead to the causes of alienation. Trust and efficacy as a replacement for alienation is a common misconception in recent literature. An evaluation of the recent literature shows that some scholars deviate away from Seeman (1959) and Dean's (1961) conceptualization and operationalization of alienation and focus on trust and efficacy as defining factors of alienation (Southwell, 2012). Other contemporary scholars overlook the initial framework altogether and utilize trust and efficacy as the sole measurements of alienation. Therefore, we seek to restore and reassert the validity of alienation's initial framework of origin by revisiting the five measurement tenets through the examination of women's reproductive autonomy. We examine women's reproductive autonomy in the initial alienation framework to 1) demonstrate the validity of the framework in the context of a relevant sociopolitical issue and 2) address the detrimental effects alienation has on women in contemporary political society.

RC39-682.2SULLIVAN, MICHELLE* (*City of Brampton*)*Sweeter Dreams after the Nightmare before Christmas: Post-Ice Storm Capacity-Building and Resilience*

The December 2013 ice storm destroyed 42,000 trees, made travel treacherous, caused wide-scale utilities disruptions and cost the City of Brampton 51 million dollars. The storm differentially impacted the whole region; resources to address impacts were at a premium. Several of the disaster response agencies struggled to answer the needs identified. Some staff were away on holiday, regional volunteer capacities were over-extended, and the area's few certified tree-cutting crews could not answer the demand suddenly placed upon them. Brampton Emergency

Management Office personnel made it through this difficult time by depending on its Community Emergency Response Volunteers, city staff and tree-cutting crews hired out of Buffalo, New York.

After action reports revealed that the shelters were under-utilized. In the final analysis, reception centres with information updates, temporary warm-up areas and charging centres for electronic devices were needed, but appropriate facilities were too far from the citizens who needed them the most. When travel by any conveyance is dangerous, resources within walking distance are crucial. Follow-up revealed many received assistance from faith-based organizations (FBOs) in their vicinity. Baseline resilience analysis revealed why: Ninety percent of Brampton's population affiliates itself with a faith. Clearly, there's a need to have FBOs involved in disaster service provision but it raises the question: how do we involve these organizations and at what level?

Municipalities that are understaffed and facing budgetary constraints still need to build their emergency management program's capacity to be in compliance with provincial laws. This research explores how the City of Brampton developed a cost-effective program to address this need, using applications of several sociological and inter-disciplinary theoretical models to bring eight faith-based organizations willing to train, into a collaborative relationship with its emergency management office through their Lighthouse Program.

RC32-586.4SULTANA, MAKSUDA* (*The University of Sydney*)*; A Qualitative Study on Critical Gender Analysis in Bangladesh***A Qualitative Study on Critical Gender Analysis in Bangladesh****Abstract:**

Bangladesh Readymade Garments (RMG) sector is well known for offering comparatively low labor-price to the world famous retailers. Various structural limitations are causing accidents like factory fire, building collapse in RMG factories that ultimately affecting the sector labourers. 2013 Rana Plaza collapse has become one of the worst factory disasters in the world history. The RMG factories still struggling to ensure labour rights. Ongoing approach toward a gender equality based women workers' wage pattern as well as employment rules and regulations in the RMG sector are questionable. Foreign RMG buyers are emphasizing establishment of better factory compliance in Bangladesh, while government and relevant organizations are assuring to implement the standards; there are many issues remaining unsolvable. The research will show the present situation and background problems in the RMG industry in Bangladesh. The study contributes to identify women workers' working conditions and gender disparities in union awareness after the Rana Plaza incident. This will also identify lacks in implementation progress of different international regulations (labour standards) to improve women workers' post Rana Plaza working conditions in Bangladesh. The study focuses on the degree of support to labourers from stakeholders like government, producers, buyers and institutions; the barriers and opportunities for implementation of so-called adequate regulatory framework. In addition to scholarly sources of universities archives, data has been collected from related literatures of various resources like media publications and documentations, and discussion papers. The research is one of the foremost studies for identifying opportunities and barriers in overcoming real problems of the industry. Finally, the research tries to find out women labourers further problems and opportunities that have not been addressed in the existing documents.

RC15-292.1SULZER, SANDRA* (*Utah State University*)*Borderline Personality Disorder: Effects on Children, Custody, & Protective Services Encounters*

Borderline Personality Disorder (BPD) affects approximately 2% of the population at any given time. While it is among the most-studied mental health conditions, research examining intergenerational impacts has been lacking. Due to difficulties in data collection, the complexities of studying parent-child relationships, and even disagreement about what Borderline Personality Disorder is, we lack information about the long-term impacts of BPD on children, or how they interface with the legal system. While we have some evidence that parents with BPD are disproportionately represented in interventions by Child Protective Services (CPS) and within in-patient psychiatric facilities, we know little about the first-hand experiences of children in these situations. This study examines 28 online message board threads, comprised of 312 posts, by adult children who identify as having a parent with BPD. Using content analysis to examine the discourse of their exchanges, they provide new information about their experiences being raised in a home with a parent with BPD. Threads are augmented by in-person interviews with clinicians (n=32) and related providers, though this presentation will focus on the Adult Child perspective. These first-hand accounts, while retrospective, may offer insights to researchers attempting to understand when CPS gets involved, how this particular subset of children may routinely fall through the cracks, and how to develop better psychiatric interventions for parental dyads when working to resolve these issues.

RC03-73.5SULZER, SANDRA (*Utah State University*)NEID-AVILA, JAQUELINE* (*Utah State University Extension*)*Cultures of Health: A Transformative Alternative Approach to Public Health*

In 2014 Cooperative Extension in the United States, the land-grant system which provides educational opportunities to adults outside of the college environment introduced a new focus on Health & Wellness. Extension is unique in that it places masters-level faculty members in every county of every state in the nation to offer evidence-based knowledge to local communities. The courses offered have historically been primarily agriculturally based, and/or focused on home economics. In 2017, the Robert Wood Johnson Foundation partnered with Cooperative Extension and 4-H to create a "Culture of Health," using a community based model. Five states were each asked to select three different communities to begin developing such a culture. Communities had to range from being innovators in health & wellness community initiatives to beginners. We offer reflections and insights into the development of the participatory, community-focused decision making processes of three communities in Utah. This transformative alternative to addressing public health issues resituates local communities as the origin and arbiter for health decision making and influence. In particular, we use this as a case study to highlight incongruencies with funding mechanisms. Agencies are accustomed to more positivist research methods than a community based approach. In addition to these process-oriented considerations, we offer lessons learned one year into this two-year initiative.

RC49-820.2SUMSKIENE, EGLE* (*Vilnius University*)*Challenges of Mental Health Care System Surveillance in Lithuania*

According to the MH Action Plan 2013-2020, evidence and research are critical ingredients for mental health policy. The generation of new knowledge enables policies to be based on evidence, and the availability of surveillance frameworks enables implemented actions to be monitored.

The paper will present data from qualitative mental health care experts' research which took place in Lithuania in 2015-2016.

The research reveals, that the culture of reflection is not developed in mental health care system. Mental health indicators currently in use mainly focus on the *resources* and *process*, such as type and number of healthcare facilities, diagnosis of people using psychiatric facilities, numbers of professionals, and suicide rates. These indicators do not capture the broad spectrum of interrelated public mental health problems and absence of interdisciplinary approach that characterizes this field. The component of the *results* monitoring is not integrated in usual systemic practices and is implemented on *ad hoc* basis. Monitoring reports are questioned on behalf of representatives of the system, perceived as critics and direct threat.

The Lithuanian mental health care system is effective while providing treatment to persons with severe mental illness. These services compose the largest part of the *resources* and *process* indicators. Outpatient services for persons with mild diagnoses remain underdeveloped and unaccounted.

The financial component is decisive for planning and development of mental health care system. As a rule, decision makers focus on short-term financial perspective and ignore the need to reform the system of mental health care itself.

High rates of suicide is unanimously acknowledged to be the most serious public health problem in Lithuania. Nevertheless, desperate and unsuccessful attempts to change this situation do not lead to evidence based solutions. Instead, politicians and practitioners develop self-stigmatizing attitudes ("we are a suicidal nation"), feelings of reconciliation or search for irrational political solutions.

RC11-218.1SUN, HAOSAN* (*Department of Sociology, University of Toronto*)SCHAFFER, MARKUS* (*Department of Sociology, University of Toronto*)*Do Social Activities Promote Age Integration in Social Networks? A Comparison of Age Cohorts across Regions of Europe***Do social activities promote age integration in social networks? A comparison of age cohorts across regions of Europe**

Haosen Sun
Markus Schaffer
University of Toronto
Department of Sociology

Abstract

Older adults face the risk of being segregated from broader society, a process believed to be detrimental to their well-being. The age composition of one's core social network is a practical indicator of age-segregation and potential social exclusion. Little research, however, has considered the role of social activities in promoting the inclusion of non-kin, age-varied people in one's network. Using the SHARE (Survey of Health, Ageing and Retirement in Europe) Wave 6 data from 19

countries in Europe, we examine the associations between multiple social activities (paid work, voluntary activities, courses, clubs, community/political organizations, interactive games) and the odds of having an age-integrated social network. We also examine potential variation in this association across regions of Europe. Our conceptualization of age-integration is reciprocal. We incorporate (a) "upward" age-integration defined as whether those in late-middle age and young-old age (i.e., those 50-59 and 60-69 years old) maintain at least one non-kin network member from an older cohort (≥ 10 years older than the respondent); and (b) "downward" age-integration that is whether someone in young-old, middle-old, and old-old age (i.e., those 60-69, 70-79, 80-89, respectively) maintains at least one non-kin network member from a younger cohort (≥ 10 years younger than the respondent). Findings show that employment limits upward age-integration while promoting downward age-integration, particularly in Northern and Central Europe. Voluntary activities facilitate downward age integration in Central, Southern and Eastern Europe among the middle-old and old-old groups, while in Northern Europe they benefit age-integration both ways for the young-old age group. We discuss our findings in the context of cultural differences across regions of Europe and elaborate their relevance for theories of age integration and social exclusion.

RC04-85.7SUNA, SARASWATI* (*TATA INSTITUTE OF SOCIAL SCIENCES MUMBAI*)*Education As Means of Women Liberation: Myth or Reality? a Sociological Study of Dalits Women at Sambalpur University (India).***Education as means of women liberation: myth or reality?**

This paper explores the sociological aspects of educational inequality in India and based on qualitative data which I have collected from the field of the study. In India, education is perceived as a mechanism for the social and economic advancement of the deprived sections of the society through social mobility and guarantees equality to everyone. It is considered as a means of 'liberation' (Velaskar 1998) from the shackles of caste, gender, and class. However, in reality, it has become, 'an instrument for reproducing social stratification and for maintaining the hegemony of the dominant sections' (Chanana 2000). Inequalities and discrimination (based on caste, gender, class, and region) still persist in the educational system over the years with its changed forms. The Dalits, since decades, are being 'discriminated, marginalized and are educationally pushed back' by the upper castes (Krishna 2012). The paper "Education as means of women liberation: myth or reality? A sociological study of Dalits women at Sambalpur University (India)" is qualitative in nature. This paper has made an attempt to understand the experience Dalit women in Sambalpur University in India and the views of key informants, such as Dalit women and teachers. It gives various arguments on the above concept from the point of view of Dalit women. This paper tries to understand the role of caste and gender in the lives of Dalit women and their personal experiences of discrimination and humiliation. It examines the Dalit women's views about caste and gender, and how they perceive through school to University culture, which plays a role to represent the social issues, particularly through education.

Key words: Education, Dalits women, Inequality, Caste, Gender

RC28-507.6SUNA, SARASWATI* (*TATA INSTITUTE OF SOCIAL SCIENCES MUMBAI*)*Inequalities, Discriminations and Experiences of First Generation Dalit Women Students in Higher Education, India***Inequalities, Discrimination and Experiences of First Generation Dalit Women Students in Higher Education, India**

This paper explores the sociological aspects of educational inequality. In India, education is perceived as a mechanism for the social and economic advancement of the deprived sections of the society through social mobility and guarantees equality to everyone. It is considered as a means of 'liberation' (Velaskar 1998) from the shackles of caste. However, in reality, it has become, 'an instrument for reproducing social stratification and for maintaining the hegemony of the dominant sections' (Chanana 2000). Inequalities and discrimination (based on caste, gender, class, and region) still persist in the educational system over the years with its changed forms. The Dalits since decades, are being 'discriminated, marginalized and are educationally pushed back' by the upper castes (Krishna 2012). With the constitutional provisions, they are gradually entering into the mainstream of higher education. The cultural practices, behaviour pattern, sex role expectations, and association of women with the private domain of household, continue to affect their access to higher education (Chanana 2000). For Dalits women, in every sphere, they have to face it twice because of their identity, and are thus doubly Dalits' and 'doubly jeopardized' (Rani 1998).

This paper focuses on the first generation college students especially Dalit women of Sambalpur University of Arts, Science, and Commerce. The college came up with a vision of providing the opportunity to the students of the marginalized sections particularly Dalits women in higher education.

Key Words: Inequalities, Discrimination, Dalits Women, Higher Education

Using Sensitive Visual Data: Interdisciplinary Approaches for Developing New Ethically Informed Methodologies

In today's digitized society, some phenomena need to be addressed in research in order to build knowledge and understanding that can be used to maintain integrity and safety for individuals. In this paper, we address the problematic issue of smartphone bystanders in accident scenes. Photographs and videos of victims in difficult circumstances, often with no possibilities to claim their own integrity, are widely posted on social media – and the phenomenon seems to be spread in many cultures. Photographs and videos become communicative “data” in content analysis of social media platforms, but what do researchers need to be aware of in analyzing and reporting research findings in this particular area? What can researchers from different disciplines within social sciences learn from each other? The new type of digital data is challenging existing ethical guidelines and codes and we believe that interdisciplinary approaches are useful when it comes to exploring and developing new ethically informed methodologies in order to safeguard researchers working with sensitive visual data drawn from social media and the Internet in areas of social complexity.

The Mediating Effects of CSR on Market Orientation Responsiveness in Housing Companies' Business

Market orientation research assumes that the company's knowledge of customer needs has an impact on their responsiveness to customer requirements. From a Corporate Social Responsibility (CSR) perspective, it is not enough to be responsive to customers' expressed needs, as accountability should be proactively integrated in core business operations including taking responsibility for stakeholders. As CSR effects on market orientation have received limited interest in research, this study investigates the mediating role of CSR on company responsiveness to customer needs from a market intelligence perspective.

Attention is paid to Swedish public housing companies to manage the transformation from being socially-driven to becoming economically-driving based on return of investments. Traditionally, the public HCs' offered living conditions based on the principle that all people are entitled to good housing, which meant that they gained a price-setting role in the housing market. Their social role and economic importance are especially critical in declining markets. The new legislation expects of companies to act market oriented and based on economic principles. Suggested is that customer needs are handled by CSR. In this study the three elements of CSR (social, economic and environmental) are investigated to improve knowledge of their separate mediating role on market orientation. To improve comparability both public and private HCs in declining markets are investigated.

The purpose of this study is to examine how CSR elements have mediating effects on public housing companies' activities in the markets.

The quantitative method is applied. The result is based on a survey sent to 289 Swedish public housing companies.

The results show that the all dimension of CSR are more positively correlated with market orientation responsiveness in public HCs.

This study deal with public housing companies and intend only to highlight the effects of CSR as having mediating influence as crucial for company's customer commitment.

In- and out-Group Trust and Self-Rated Health: A Multi-Country Analysis

Health research has used varied social capital indicators such as trust, interpersonal networks, and civic engagement. Of those, empirical studies reported a health-promoting or protective effect of individual's generalized trust. Generalized trust refers to trust toward “most people.” Researchers have argued that people with high level of generalized trust put trust in not only their in-group members such as friends or neighbors but also out-group persons of unfamiliar or dissimilar characteristics. In turn, generalized trusters may enjoy better physical and mental health due in part to extended social networks and reduced anxiety and fear against others' behaviors. Nevertheless, comparative researchers recently showed that the meaning of “most people” can be interpreted differently across nations and regions. Therefore it is imperative to examine the associations

between in- and out-group trust and health separately rather than mixing the two types of trust under the name of generalized trust.

Using data from 56 countries in the sixth wave of the World Value Survey, I found the relative advantage of in-group trust than out-group trust in its association with self-rated health. In contrast, out-group trusters reported better health only in Western societies. These findings suggest that (a) using distinct measures of in- and out-group trust show more straightforward and detailed trust-health relationship in cross-national studies, and (b) in-group trust may generate health advantages such as receiving timely support from confidants and having sense of attachment to primary groups against distress. On the other hand, (c) out-group trust is beneficial to health exclusively in the West where relatively a high level of civic awareness and associational activities enables out-group trusters to get necessary health assistance from people beyond their in-group boundaries.

Negotiating Halal: The Role of Non-Religious Concerns in Shaping Halal Slaughter Standards in Indonesia

In recent years the global halal market has been one of the fastest growing market segments in the world. A key driving force behind such a rapid expansion has been the successful development of halal standard and certification established by various public and private institutions. While scholars have been attentive to research on halal food markets and halal certification, far too little attention has been paid to the actual processes behind the creation of halal standard. This paper seeks to fill this gap by using the standard-setting processes of the new state-led halal standards in Indonesia as a case study. Particularly, it focuses on examining competing frames and narratives underpinning the prescription of the new halal slaughter criteria in Indonesia. This study aims to answer how the provisions on slaughter and stunning methods in halal standards are determined. Using the concept of ‘backstage politics’ and based on extensive document analysis and semi-structured interviews with members of the Halal Technical Committee 03-08 of the National Standardization Agency of Indonesia, the article argues that in contemporary Islam, particularly in the Indonesian context, the criteria for halal slaughter are no longer determined exclusively based on Islamic dietary laws that explain them. Rather, increasingly non-religious concerns such as food security, animal welfare and state sovereignty are becoming integrally embedded and play a decisive role in shaping what is acceptable or unacceptable in halal standards. These findings contribute to the body of scholarly literature by critically questioning existing views of halal standards as pure religiously inspired governing schemes that seemingly disconnect from ‘secular’ food politics taking place at both the national and global context. The article concludes that, instead, as the tensions within halal politics resonate with the struggles in other domains, the meaning of halal has now extended beyond the realm of religious debates.

Biography and Access to the City: The Working-Class Women Struggle for Housing in Brazil

The housing policy in Brazil was never stable, frequently shifting from more centralized to more decentralized governmental actions. It was not before the 1940's that, as part of the national-developmental strategy - in a framework of intense urbanization and industrialization - that Brazilian's government assumed housing to be a matter of social welfare. If the segmentation in the access to adequate housing was relevant as pertaining to the class realm, one can say that a second segmentation would be the *gendered differences* in the access to durable goods: the history of urbanization in Brazil and land distribution from colonial time to the present cannot be easily separated from the processes of social - *symbolic and material* - inclusion and exclusion of women. By *biographically* interviewing women engaged in urban housing social movements, I aim the access to the historical and biographical sense of the development of housing stratification from the perspective of the embodied actions and narratives. In this sense, the main objective of this investigation is to make sense of the problem of women and housing from the perspective of the actors - women engaged in social urban housing movements - trying to understand what are the symbolic and material experiences, changes and continuities experienced by women throughout life that can help us understand the class and gender segregation in urban spaces and in the access to adequate housing.

Societal Transformations and Their Implications for Social Indicators Research: Comments on “Fifty Years after the Social Indicators Movement: Has the Promise Been Fulfilled?”

Kenneth C. Land and Alex C. Michalos presented a comprehensive review and assessment of the evolution of research on social indicators, quality of life and well-being over the past fifty years. The authors give a summary of the key developments in this research field, highlights strengths and weaknesses, and identifies several under-investigated areas. Most importantly, however, Land and Michalos point to major societal changes currently transforming contemporary societies in a fundamental way and substantially impacting on the future research agenda regarding social indicators, quality of life and well-being. In my presentation, I will focus on this crucial and particularly innovative aspect of Land and Michalos' contribution. More specifically, my presentation deals with the impacts of three major societal changes on the future research agenda of social indicators research: firstly, impacts of the changing class structure of post-industrial society, secondly, globalization impacts, including its economic, political, cultural and institutional dimensions, and thirdly, the impacts of an increasingly networked digitalization of production and consumption.

Work-Life Dynamics in a Post-Communist State -- the Case of Poland

The discussion on work-life balance is dominated by the discussion on middle-class mothers from Western societies who combine employment in the labour market with care and domestic work. In my paper I show that such a vision is far from adequate for the situations of Polish families. I resign from the term "balance", since it might be interpreted as an achievement and as such understood in a normative sense as something good and as a guarantee of life satisfaction. Thus I discuss here work-life dynamics and focus on the dynamic and relational aspects of social reality to indicate different factors that impact the way parents experience and perceive their lives and obligations.

I focus here on the situation of Polish parents. My analysis is based on 50 in-depth interviews conducted with mothers and fathers from different social classes (lower class, middle class, higher class), living in different places (villages, small, medium and big cities) and in different family situations (coupled parents, single parents, parents with disabled children, patchwork families). Different situations of the interviewees open a whole array of important factors that influence the way parents deal with everyday life, their parenthood and paid work. The most important are: (1) general working conditions, (2) individual's situation in the labour market, (3) support from other people, (4) cultural norms about care, (5) gender inequalities, (6) health/illnesses, (7) family policy system, (8) housing policy. The communist legacy of Polish society and the market-oriented family policy after 1989 are important here, since they make parents' experiences of work-life dynamics substantially different than experiences of parents from Western Europe.

In my paper I map these different factors and reconstruct the dominating perspective on work-life balance by an intersectional analysis.

Blue-Green Alliances at the Level of Local Unions: Conditions for Successful Alliances

This paper examines cases of "blue-green alliances" in the United States in the 1970s and 1980s, considering conditions which made such alliances relatively successful. It pays attention to cases in which local unions formed alliances with groups of residents concerned with (or affected by) environmental pollution and with state- or national-level anti-toxic organizations that supported residents' groups. It hypothesizes that two conditions contributed to successful blue-green alliances: (1) whether the leadership of international unions were involved in and/or gave support to those local unions that had formed blue-green alliances, and (2) whether members of local unions were able to connect their exposure to toxic substances at their workplaces with the exposure of residents to polluted air, water and lands contaminated by toxic substances emitted from the plants. The cases to be examined include the alliance between OCAW and environmental organizations during the strike by OCAW's locals at Shell Oil in 1973, the alliance between OCAW Local 4-620 (BASF), on one hand, and residents' groups and an anti-toxic organization, on the other, during the BASF lockout from 1985-1989, and the alliance between UPIU Local 14 (International Paper) and environmental groups of residents and their supporters during IP strike from 1987 to 1988.

Just War Theory Regarding New Wars

Although the international organizations have been trying to maintain international society peace and order, it seems have failed as the numbers of the international military conflicts have not declined. One of the reasons why it is difficult to eliminate the numbers of the international military conflicts of today is said that it is difficult to accuse the offenders of the current international military

conflicts of war crimes, for instance, in terms of current international law. Due to the difficulty, some politicians, such as Michael Ignatieff (2000), have found the way to determine whether or not the sovereign states would conduct the international military operations to eliminate the numbers of the international military conflicts of today in the so-called Just War Theory. This presentation, therefore, will introduce the Just War Theory regarding the current international military conflicts.

As you know, the history of the Just War Theory is prolonged; since the ancient Greece, the theory has been developed. As the basis of the current international law on wars is believed to be the Just War Theory, this presentation will introduce the influence of the moral philosophical consideration on how to carry out wars to the consideration of public international law, war treaties in particular. Then, this presentation will move to the contents; based on the categorization of the Just War Theory, *jus ad bellum*, *jus in bello*, and *jus post bellum*, this presentation will assign two key aspects from public international law; the principle of necessity and the principle of proportionality. The contents of this presentation, therefore, will be examining the six components which equal to two principles times three categories.

The conclusion of this presentation will be what the politicians should consider when the governments determine to participate in the international military operations to maintain the international peace and security.

Analysing the Process of Social Transformation for Social Inclusion through Sport: A Japanese Case

This paper examines how sport can contribute to transforming social structure so as to promote social inclusion. Drawing on the case study of a football-based homeless assistance programme in Japan, it attempts to theorise the process in which a sport-based programme enlarge not only the life chances of those who are severely excluded, but also its own organisational capacity to achieve that goal through interacting and networking with general public as well as similar organisations. This process is explained by referring to social theories such as Amartya Sen's capability approach, Anthony Giddens' structuration theory, and institutional as well as ecological approaches to organisational studies. The focal point of analysis is the organisational trajectory of Nobushi Japan, a football programme provided primarily for the vendors of the Big Issue Japan. While the programme was launched a decade ago so as to enter a team to the Homeless World Cup, it now domestically organises its own football tournament called the Diversity Cup, which connects a range of organisations trying to promote social inclusion for a variety of vulnerable people. Through this tournament, the model of social inclusion programme using football and other sporting activities has started to spread across the participating organisations. The paper is based on three years of consultancy and participant observation with Nobushi Japan, as well as semi-structured interviews with ten other organisations using sport to promote social inclusion, of which majority participate in the Diversity Cup. The paper concludes with some implications as to how a certain approach to social innovation gain legitimacy, and thus an organisational field is formed, resulting in gradual transformation of social structure.

Speech Acts and Mobilisation for Social Change - Exploring the History of Collaborative Production in the UK

Elements of sharing and collaboration in economy are involving certain mobilisations or platforms forming the basis for collective action. Historically, such mobilisations have taken place in the context of social movements and as part of the purpose for social change, making collaborative collective action different from commercial contracts in profit-oriented production and markets. The mutuality of collaboration has arguably been an element for the set up of counter-competitive action in different social movements. The paper departs from an empirical study of historical material of movement journals debating and organising for cooperative economy, economic democracy and women's collaborative economic participation in the UK. The aim of the paper is to theoretically and empirically explore how mobilisations of economic collaborations are set up by speech acts in relation to intentions for social change. The paper draws out conclusions about the relation between speech acts and moments of mobilisation, suggesting different types of conditions for mobilisation of collaboration and sharing in economy, such as contemplative and utopian mobilisations, articulations of shared material interests, or knowledge based mobilisation formed upon the pursuit for professional autonomy. The different forms of mobilisation are discussed in relation to contemporary cases of collaborative production and economy, such as open source software production, digital sharing platforms, (physical) hacker spaces and the maker movement.

RC39-697.4SVETE, UROS* (*Faculty of Social Sciences*)MALESIC, MARJAN (*Faculty of Social Sciences*)*Disaster Response in Distinct System and Cultural Surroundings***Disaster response in distinct system and cultural surroundings**

The US Incident Command System (ICS) has been developed to create temporary structures in order to better coordinate multi-organizational response to disasters and major incidents (Jensen and Thompson, 2016). ICS encompasses various functional fields such as leadership/command and control structure, operation, planning, logistics, administration and finances. Practitioners in USA mostly see the ICS as an effective tool to manage disaster related activities, whereas some scholars (Kendra and Wachtendorf, 2016) warn that ICS means imposition of external solutions to the community under stress, gives too much emphasis on centralization and hierarchical control, neglects the informal structures that are part of disaster response and underscores improvisation.

Regardless conceptual and theoretical diversity (McEntire, 2004; Etkin, 2014), authorities at different levels try to find systemic solutions, how the society should be organised to cope with disasters. The authors of the paper will explore disaster response systems in USA, Austria, Italy, Sweden, Switzerland and Slovenia. They will point out their crucial characteristics and compare them in order to identify key similarities and differences in achieving their objectives. That will be followed by the reflections on how general structural/administrative, political, cultural and economic circumstances influence the nature of 'incident command system' in the above listed countries and why multi-and interdisciplinary research on disasters is so crucial.

RC01-38.4SVETE, UROS* (*Faculty of Social Sciences*)*Security Culture As Precondition for Sustainable Development of Military Reserve Force: The Case of Slovenia*

Since its independence and own Armed forces organizing 26 years ago, Slovenian society has been facing with tremendous changes and challenges how to fulfill military units and organize recruitment and retention as well. Beginning with military conscription pulling its roots in Yugoslav total defense system which ensured wide broad base of citizens' readiness for serving in the military, the next decade brought very fast Nato integration and rush transition into all volunteer force. Consequently, the population dealt with military and national security matters has dropped down to 12.000 including police and law enforcement. But till the migration crisis in 2015 when more than 250.000 refugees crossed the country, there was no practical need for operative using of military reserve with exception of few reserve personnel served in international peace keeping (for instance in KFOR operation in Kosovo). Following economic crisis and austerity measures the military budget has been cut down for almost a half what has dramatically influenced military reserve training and recruitment and retention activities. As consequence during a period of migration crisis when Slovenian armed forces have been tried to mobilize their reserve forces for border protection, the response was lower the 40%... This caused stormy reaction among political politics and professional public. Some of them suggested the establishment of national guard, the others wished to have renewal of military conscription. But nobody opened very complex and crucial issue, the issue of security culture, which supposed to be the only way, how to sustainably organize national security system in long-term. Therefore the intention is to present empirical quantitative and qualitative research, what are the trends in this particular matter and how the very alarming situation ought to be improved since in current period of economic recovery recruitment and retention results according to the plans continue to become strained

RC35-JS-24.1SVETLOVA, EKATERINA* (*University of Leicester*)*Valuation As Science and Art in Asset Management*

In the paper, I would like to develop an understanding of valuation that is related to the idea of the investment chain which my colleagues and I started to map in our recent book (Arjaliès et al., 2017). The positioning of investment managers in the investment chain and particularly the links to other market players such

as clients and consultants determine how asset managers value assets. Even if some professional investors share Peter Lynch's view that "investing in stocks is an art, not a science", they might still exactly comply with the quantitative rules of valuation because they are exposed to the "gaze" of consultants and clients.

My analysis will be based on two sets of interviews. The first set contains thirty semi-structured, in-depth interviews with German and Swiss mutual fund managers. The second set of interviews with institutional investors and consultants is still work in progress. However, what is already emerging from my preliminary analysis of data is that the two groups have different conceptions of valuation. Mutual fund managers operate at a distance to their clients (there is usually no direct contact) and as a result often – and openly – include qualitative criteria such as a brand or the management's ability to innovate in their valuation procedures. The asset managers, who work for institutional clients regularly meet their clients, report to them and are constantly observed by consultants, suppress qualitative criteria in their valuation techniques and rather develop transparent investment processes and comply with them. Thus, differences in valuation can be observed not only across the asset classes (e.g. equities vs. bonds) but also among the investor groups depending on their position in the investment chain. By analysing these issues, the paper will highlight one important but still not widely discussed social aspect of valuation practices.

RC48-805.13SWAIN, PRANAYA* (*National Institute of Science Education and Research, Bhubaneswar*)*Movement for Strengthening Science Based Higher Education and Research: The Case of Niser and IISERs in India*

Based on the recommendations of a Task Force constituted under the XI plan of the Government of India for rejuvenation of basic scientific research in Universities several action points for strengthening science based education and research have been initiated. However, attracting students to a career in Science from the school level still remains a great challenge. Many reports claim that young students from high schools are slowly being lured away from their genuine interest in science, because of the lack of innovative ways of teaching science. Their natural curiosity about science is not appropriately encouraged and supported in the existing school and college system (Lavakare, 2016).

To set up a new paradigm in research-led undergraduate teaching of science, during 2006-2008, five Indian Institutes of Science Education and Research (IISERs) were set up, followed by two new ones in 2015 and 2016. The National Institute of Science Education and Research (NISER) was set up in 2007 at Bhubaneswar by the Department of Atomic Energy of the Government of India. In these institutes, science is taught in a holistic manner, seamlessly integrating Undergraduate teaching with research in an interdisciplinary manner (Ganesh, 2015). These Institutes were envisaged by the Government of India with a very specific purpose of embedding scientific rigour within the larger pedagogic practices in the country.

Currently the IISERs and NISER together churn out over one thousand undergraduates every year. DST-INSPIRE and KVPY fellowships have been just about the right kind of incentives that the Government of India has in place to attract the young students and to cultivate and/or orient genuine interest in Science at the high school level. Here is an attempt to deep dive into the genesis and philosophy of the movement in past couple of decades, of the research-led undergraduate teaching in Science in India.

RC48-JS-25.2SWANTON, BEN* (*Sydney University*)GOODWIN, SUSAN (*Sydney University*)*Unpacking the Promise of Prevention: A Poststructural Analysis of International Development Policy That Aims to "Prevent Violence Against Women and Girls"*

'Prevention' appears to offer progressive possibilities for eliminating men's violence against women given charges that 'responses' have been ineffective and implicated in programs of social control. Championing 'prevention' over 'response', however, contains a raft of risks as well as possibilities. This paper draws attention to likely consequences of placing 'prevention' (and 'prevention science') at the centre of efforts to address violence. Applying poststructural policy analysis (Bacchi and Goodwin, 2016) to key international development policy and program documents, the authors suggest that 'problem' representations contained within these documents serve to constitute violence as a particular type of 'preventable problem'. Notable effects of these representations include analyses of the 'causes' of violence in terms of 'risk factors' that emphasise properties of individuals, the prescription of discrete intervention approaches as 'evidence based' and the production of subject positions that affect who can speak with authority about 'what works' to prevent violence. Destabilising 'prevention' as a policy object, the authors draw distinctions between feminist, epidemiological and criminological formulations, demonstrating there is more than one way of thinking about violence prevention. The implications of these differences are related back to contemporary gender violence politics and social movements.

Transition for Whom? a Socio-Political Class Analysis of the Sustainability Transition Literature

The global environmental crisis has forced policymakers to consider alternative paths to achieve the goals of human development amidst the resource-constraints and climate instabilities imposed by human disruption of earth systems. Whereas "sustainable development" aims to make the current path sustainable, the notion of a "sustainability transition" focuses on shifting a system from a dominant regime to an entirely new regime. Sustainability transitions theory and research tends to focus on socio-technical changes resulting from top-down, managed transition strategies. To address the possibility of transitions being shaped by 'bottom-up' processes, some scholars have highlighted sustainability experiments occurring in niches or pointed to grassroots innovations as sources of bottom-up pressure. Neither approach adequately addresses how social inequality, social structure and power relations influence the beneficiaries of top-down strategies or limit the possibilities of bottom-up transformation. Our paper therefore applies a socio-political class analysis in asking the following questions: Who benefits from top-down sustainability transitions approaches? To what extent are equity concerns integrated into end goals? Can grassroots bottom-up innovations, which presumably benefit citizens living at the boom of the pyramid, actually result in the system transformation required of a sustainability transition? To examine these questions, we critically analyze existing sustainability transitions case studies from developed and developing countries (Sengers et al., 2016, Wieczorek, 2017). We find that in Northern countries, although the incumbent regimes support transitions to low-carbon economies, they often use institutional power to resist system transformations that might produce more equitable outcomes. In the case of developing countries, the strategic niche management perspective identifies the importance of networks between developed society actors and initiatives aimed at sustainability transitions in developing societies. But these beneficial network relations address neither power inequalities nor the equity dimensions of sustainability transitions.

The "Fuck White People" Phenomenon in South Africa: A Statistical and Discursive Analysis

During the recent student protests in South Africa against inequality, racism, and educational inaccessibility, the phrase "Fuck white people" appeared on T-shirts and walls. When understood only as anti-white sentiments, these words have the potential to cause panic and fear. However, key questions to be asked concern the extent to which these opinions are shared, by whom, and what should be done to people who propagated these views. To address these questions, an item was inserted in the 2016 nationally representative South African Social Attitudes Survey (n=2988). Despite the sensitivity of the subject matter, an overwhelming majority of the adult population (96%) expressed a clear preference for how this phenomenon ought to be addressed. A quarter of adults (26%), recommended that those wearing/writing this phrase should be informed that they are hampering the prospects of peaceful coexistence between different race groups (the social cohesion argument), while 39% advocated refraining ("they should stop it"). A further 16% adopted a retributive stance ("they should be punished"). Little more than a tenth (13%) opted for a non-interventionist approach ("they should be left alone"). Only a nominal proportion (2%) believed such behaviour "should be praised" for drawing attention to persisting white privilege in South African society. As might be expected there were sizeable variations in responses by socio-demographic characteristics. We found no statistically significant variation in answers by sex, generation, employment status, educational attainment, and self-reported poverty status. We did, however, find important associations by race, political affiliation, living standard level and geography both between and within groups. We discuss these findings discursively as part of "white fragility" and "rainbow nation mythology" and conclude that while the narrative of a dying rainbow nation project has its place in protests, it seems that the majority of South Africans have not yet abandoned this dream.

Crossings to Adulthood. How Diverse Young Americans Understand and Navigate Their Lives

Crossings to Adulthood: How Diverse Young Americans Understand and Navigate Their Lives assembles chapters written by members and affiliates of the Research Network on Transitions to Adulthood on pressing issues facing young, coming-of-age Americans in an increasingly diverse, globalizing world. Based on over 400 interviews with young adults from different racial, class and regional backgrounds, the chapters provide an in-depth look at how young Americans understand their lives and the challenges, risks, and opportunities they experience as they move into adulthood during changing and uncertain times. Chapters focus on how these young adults understand markers of adulthood such as leaving home, launching careers, and forming relationships, as well as issues particularly salient to them including politics, diversity, identity, and acculturation.

SWIREK, KRZYSZTOF* (*Institute of Sociology, Warsaw University*)

Administration of Things – Capitalism As Non-Government

According to the famous phrase of Engels, the future phase of social development will replace the 'government of people with administration of things'. This long lasting dream of non-intrusive forms of power was (and is) strong even after grave crisis of Marxism and its theory of 'withering of the state'. In my presentation I will argue, that, paradoxically, this idea or dream of power as *non-government* played important role in economic transformation from state socialism to capitalism in Poland. State socialism was widely perceived as overcomplicated bureaucratic system, that brings enormous amounts of human energy to waste. This opinion was a commonplace, expressed in various forms: in jokes as well as in sociological treatises. In conditions of so called 'economy of shortages', obtaining most trivial production materials and consumption goods was possible only after prolonged efforts, that involved managing expanded web of social relations. In contrast, the reality of capitalism, as it was imagined in socialist Poland, was to be free of such complications. Conscious efforts of 'organizing' things, managing the exchange of favors and bribes, were to be replaced in capitalism by simple and straight-forward mechanisms of market exchange. Capitalism was perceived as a system that strengthens subject's autonomy by freeing her/him from painstaking efforts of managing the trivialities of daily life. The bureaucratic government over most banal spheres of economic and social life was contrasted by impersonal *non-government* of market relations, in which the invisible hand of the market would replace the conscious efforts of planners. Every project of alternative to capitalism, that would be imagined today or in the future, has to address this motive of *non-government*, of freedom from complication in daily life or from unwanted social relations.

RC36-646.2

SWIREK, KRZYSZTOF* (*Institute of Sociology, Warsaw University*)

In the Face of New Masters

One of most recurrent political dreams of modernity were various projects of what could be named as 'power without domination' – power that would operate by means of rational organization and administration rather, than traditional forms of dominance and hierarchy. Such projects – from early liberal formulations to socialist and Marxist propositions – are trying to envision power, that functions without the central figure of the Master, without the One, whose charismatic power would guarantee social cohesion and order.

Traces of the same political hope can be discerned even in discourses surrounding neoliberalism, for instance in figure of subject seen as entrepreneur, actively and rationally pursuing his/her interests, even regardless of traditional cultural norms. Alienated as it is, this figure of agency can be seen also as some remote form of emancipatory hope for possibility of self-government as well as of hope for replacement of centralized, charismatic power with forms of dispersed, 'individual' management.

In our times we see, that those discourses of rational power are more and more in retreat, as we face comeback of strong leaders, new 'masters of politics', that try to advertise themselves as guards of security and national interests.

In my presentation I will argue, that in current historical situation its important to ask the question: how to reformulate the dream of 'government without domination' for new times? How to counterbalance the need for new masters of politics? How to restore the utopian potential of projects of non-dominative power, without succumbing to alienated forms of neoliberal management, that are rightfully becoming obsolete?

RC09-195.2SWISS, LIAM* (*Department of Sociology, Memorial University*)WEI, QIAN* (*Memorial University of Newfoundland*)***Filling Empty Promises? Foreign Aid and Human Rights Decoupling***

After the Cold War, the priorities of aid donor countries shifted from political and military strategy to social and economic development, with special emphasis on the improvement of governance. This rhetorical support for good governance has not always met with support in terms of aid funding and, in many cases, aid recipient countries still show very limited implementation of good governance practices such as the protection of human rights. What role does aid play in closing these human rights decoupling gaps? Does aid targeted at better governance promote a tighter coupling of human rights policy and practice in aid recipient countries? This article draws upon sociological institutionalism, proposes a framework to explore the impact of foreign aid on good governance and human rights, and examines these effects empirically. Longitudinal regression analysis on a sample of 150 aid recipient countries between 1981 and 2015 is used to examine the aid-human rights decoupling relationship and to provide a better understanding of how and where aid might be predicted to promote tighter coupling of human rights rhetoric and practice in the future.

RC17-329.2SYDOW, JOERG* (*Freie Universitaet Berlin*)BERTHOD, OLIVIER (*Jacobs University Bremen*)MUELLER-SEITZ, GORDON (*Technische Universitaet Kaiserslautern*)***From Uncertainties to Affordances: Coordinating an Interorganizational Network in Fast-Response Settings***

This paper explores the challenge of coordinating multiple organizational actors for effective, error-free interorganizational operations in fast-response settings. We present observations from a two-year fieldwork on coordinating as practiced by the orchestrator of an interorganizational network dedicated to emergency management in a large German city. We induce three sets of coordinating practices – reducing distance, staging coordination, and aligning to collective performance – that explain how the network orchestrator coordinates contributions from multiple organizational actors in the face of uncertainty. Our observations further show how artifacts and physical surroundings afford the situated enactments of these practices despite uncertainty. Specifically, these affordances prompt options for action to the network orchestrator and its partners along three main dimensions: time, space, and responsibilities. Successful instances of coordination produce an inclination to coordinate among participants, which explains the steady reproduction of the by-and-large informal structures in this network.

RC17-324.3SYDOW, JOERG* (*Freie Universitaet Berlin*)WINDELER, ARNOLD (*Technische Universität Berlin*)***Temporary Organizing – the End of Organizations As We Know Them?***

Organizations make ample use not only of temporary employment and contract work but also of projects, perhaps the most popular form of temporary organizing. This trend towards projectification and temporariness will nevertheless not herald the end of organizations as we know them. In order to be effective, most forms of temporary organizing rely on complementary permanent organizational or interorganizational structures. The full paper will discuss this role of context not only for project-based and project-supported organizations but also for interorganizational projects and project networks. The trend towards temporary organizing, that is embedded in - and at the same time contributes - towards projectification of society and radicalized modernity, will make organization theory not redundant but asks for a processual reconceptualization of the temporary and the permanent. This reconceptualization also has to reflect developments of the societal scale.

RC21-391.2SYKORA, LUDEK* (*Charles University*)FIEDLEROVA, KLARA (*Charles University in Prague*)***Who's Town Is It? Immigrant Investors, Gentrification and Politics of Belonging and Place Making in Karlovy Vary***

Neither James Bond Casino Royale, nor annual international film festival are the key reasons that attracted Russian investors, entrepreneurs, life-style immigrants and visitors to Karlovy Vary, a spa town in Western Bohemia. It was fragmented privatization of spa and hotel complexes that repelled German

capital while opening opportunities for Russian investments to utilize market potential of historic tradition of spa guests ranging from tsar Peter the Great to Soviet Astronauts. The environment of close cultural proximity offered somewhat hidden shelter for families, while keeping business operations in Russia. Contracts with Russian partners and direct flights from Russia paved the way for a massive inflow of spa guests from post-soviet spaces, thus making Russian the most heard language in the spa zone. It provided further business opportunities as well as jobs for less paid labor drawn from post-soviet republics. The superiority of foreign over domestic finance capitalized in spa zone residential sector though wholesale gentrification and displacement of locals by wealthier Russian life-style immigrants. Not surprisingly, local population began to name the town spa zone Ivan Vary (Ivan is Russian name) calling for negative and xenophobic media representations of socially polarized town landscape. On the other hand side, a local statement that "every smart Karlovarak (manager) found its Russian (investor)" refers to functioning multiethnic partnerships in everyday business life. Building on interviews with Russian speaking immigrants as well as original local population, with managers, employees, residents as well as political representatives, this paper discusses the patterns and politics of belonging and place (re)making in a town of dynamic urban transformations, ethnic tensions and transnational linkages.

RC04-88.4SYMEOU, LOIZOS* (*European University Cyprus*)***"I'm Not Sure Whether They Represent Us All or They Just Act for Their Own (Children's) Interests": The Multiple Agendas of School Parent Associations in Cyprus.***

This paper presents the findings of a research study which investigates the role of organized parents in primary education in Cyprus. Parents of pupils in primary education may participate on a voluntary basis after being elected in parents' associations at the school, local, and national level but do not participate in any educational decisions or policy-making. Parents' representatives at the national level, however, constitute a significant power-group and manage to influence the official educational policy, without this being officially guaranteed through any relevant national legislation. The findings presented in this paper are based on the analysis of interviews from Parents' Associations members as well as parents that do not participate in their schools' Parents' Associations. The paper discusses how those parents elected in their school's Parents' Association access policy and decision-making processes and highlights the different ways in which these parents act either for their own children's interest or the whole school population. The study suggests that these families have their voice heard more compared to their counterparts, and gain more opportunities to get involved in the school, in ways that they are inclined to act more for their children's interests rather than the whole student body interests. These findings appear to be culturally grounded in local and 'western' values of individualism, autonomy and independence which carry implications for the social roles (and the parenting styles) assumed by parents, pupils and schools alike, and which the latter need to consider in the context of their relationships with families. The study concludes by suggesting that despite the alleged centrality of democratic discourse in official policy, low priority is attributed to issues of equity and inclusion in the Cyprus educational system, with particular reference to families designated as socially deprived or marginalised and/or ethnic minority families.

RC24-450.12SZASZ, ANDREW* (*University of California, Santa Cruz*)***How Climate Change Is Taught – Poorly, If at All – in Introduction to Sociology Courses; An Empirical Investigation***

In the United States, each year, about 900,000 college students take an Introduction to Sociology course. That is far greater than the number of students who take a college's Environmental Sociology course. For example, at UC/Santa Cruz over 500 undergraduates take Sociology 1 every year; fewer than 50 take "Society and Nature."

Introduction to Sociology courses are, then, potentially important sites where Sociologists can teach undergraduates about our understanding of climate change, its causes, its likely societal and ecological impacts, how the public and how political systems have dealt (or have failed to deal) with the threat.

How is climate change *actually* taught in Intro courses?

I analyze the discussion of "environment" and of "climate change" in the top 10 bestselling textbooks, both the most recent edition of each textbook and, where available, earlier editions of the same textbooks, so that I could answer the question: has the discussion of climate change improved, deepened, changed in any significant way in the past decade?

I find that discussion of the "environment" is always relegated to the back (or close to the back) of the book. It does not get its own chapter but is combined with other topics (most often "population" and "urbanization"). Even then, it gets only a few pages. "Climate change" gets even less coverage, mostly a page or less, sometimes only one paragraph. Climate change is acknowledged to be real and is said to be serious, perhaps catastrophic, but the fact that it is discussed so briefly,

and so late in the semester, conveys the opposite message – that it is not *all* that important. Discussions of all aspects of climate change, causes, impacts and responses, are woefully incomplete.

I conclude that environmental sociologists should campaign to reform how climate change is taught in Intro courses.

SZELEWA, DOROTA* (*University College Dublin*)

Right-Wing Populism, Gender, and Social Policies in Hungary and Poland

After the fall of state-socialism, conservative attitudes towards gender roles dominated public debates in most of the East European countries. As aspiring to EU membership, Hungary and Poland reformed their legal systems adopting anti-discrimination law and the principles of gender mainstreaming. And yet, the legacy of this initial anti-feminist turn continued to influence social policies in the direction of re-familialization.

But a more profound backlash against gender equality took place quite recently, when right-wing populist parties formed governments in these two countries. In the context of demographic decline, women started to be predominantly perceived through their reproductive functions. In Hungary, pro-natalist policies favouring cash transfers were intensified under the slogans of 'demographic revolution of the middle class', with blaming women for falling fertility rates. In Poland, aligned with the Catholic Church, the new government has openly attacked the notion of gender, while limiting access to emergency contraception, IVF treatment, and allowing the repeated attempts to introduce a complete abortion ban.

The goal of this paper is to analyse recent reforms and discourses about gender roles as produced and activated by the right-wing populist governments in Hungary and Poland. My research strategy would be to apply the framework of discursive institutionalism, pointing to the role of crucial actors and ideational path-dependencies. My argument is that the recent developments in these policies and discourses are in line with the conservative climate for the development of social policies that already emerged during the period of transition and can be interpreted as re-building and strengthening national identities. Finally, as previous studies often focussed on Hungarian Polish comparison due to differences in their policy mixes, with Hungary being labelled 'public maternalism' and Poland – 'private maternalism', this paper demonstrates how the recent reforms contribute to transformation of Polish version of maternalism from 'private' to 'public'.

SZLENDAK, TOMASZ* (*Institute of Sociology, Nicolaus Copernicus University*)

Bilbargo: Between the Bilbao Effect and the Cargo Cult. White Elephants of Culture and Their Influence on Polish Cities.

Presentation concerns cultural superinstitutions. New contemporary art centers, philharmonics, operas, ultramodern science centers and museums, which with the use of EU funds have been emerged in Poland in the last few years and effectively change landscape along with socio-cultural urban fabric. They grew on a paradigm known in the cultural economy as Bilbao Effect. The mechanism is as follows: 1) The decision has to be made to invest in cultural infrastructure with emphasis on attractiveness, to do so starchitect is required - to add some splendor, 2) A building with appropriate significance would attract tourists, 3) Around the superinstitution – the attractor – the whole network of various services would develop and as an effect the investment would pay off in taxes, 4) Urban fabric would renew, the attractiveness of the city as a place of residence and entertainment would increase, which also would contribute to local budget, 5) Superinstitution would help to deal with the demographic challenges of the city. The only problem is that this kind of investments, which were supposed to increase the cultural participation and at the same time contribute to local budget, had been built almost like bamboo planes known in social anthropology as manifestations of the cargo cult. "Let's build a superinstitution and the Bilbao Effect will appear as in the well-known literature". The reality was different. The effects came as if magic at large. Cultural superinstitutions caused unexpected effects in Polish cities: In one city, the cultural policy pursued by such white elephants was based on the principles of Bilbao, while in the others it strengthened gentrification or the traditional socio-structural divisions. Some are examples of cultural industry development, some of decay. Presentation is based on a long-term ethnographic research project conducted in 2016 and commissioned by the Polish Ministry of Culture and National Heritage.

SZTANDAR-SZTANDERSKA, KAROLINA* (*University of Warsaw*)

ZIELENSKA, MARIANNA* (*University of Warsaw*)

The Making of Self-Reliant Citizens. Profiling Tools in Polish Unemployment Policy.

According to a growing body of literature, the traditional criteria put in place when it comes to social rights, based on collective statuses and payment of social contributions are no longer sufficient to obtain and keep some of the previously universal entitlements (Serrano Pascual, Magnusson, 2007; Dubois, 2009). Instead, access to benefits and services becomes increasingly dependent on assessment of individual behaviours and work attitudes. In order to deal with complex information, frontline workers from Public Employment Services often rely on standardised "legibility tools" that are used to translate "differentiated life-situations into 'manageable' organizational categories" (Garsten et al., 2016). Rather than reflect complex individual realities, these tools construct target population imposing "an ideal type of what a "normal" citizen should be" (Wedel et al., 2005: 37) and constitute a technology of "government at a distance" (Rose, 1990: xxii). Interestingly, these "legibility tools", disguised as merely technical devices hidden at the backstage of policy-making process, often escape public and academic attention.

This article provides specific insights into a standardised "legibility tool", which is used by frontline workers of Public Employment Offices to profile the unemployed in Poland. Profiling involves dividing all unemployed into 3 categories after a computer-based interview. Individuals are scored according to their presumed "distance to labour market" and "work readiness" to turn them into "into ranked and rated objects" (Citron, Pasquale, 2014: 3). Based on document and software analysis as well as in-depth interviews with policy-makers, frontline staff and unemployed, two specific questions will be addressed. First, we will reconstruct the implicit way of thinking and normative assumptions behind this categorisation tool, that positively values self-reliance, flexibility and low expectations concerning future employment conditions. Second, we will analyse how those, who are not up to this norm, are disciplined and excluded from most of active labour market policies.

SZTO, COURTNEY* (*Simon Fraser University*)

Racial Taunts or Just Trash Talking? South Asian Hockey Players and the Reluctance to Name Racism

In Canada, we tend to "Canadiansplain" racist incidents away. To "Canadiansplain" involves a concession that racism exists in Canada but never to the extent that it does in the United States. These dismissals of racism imply that our multicultural policies will ultimately prevail; therefore, any concerns about racism are deemed frivolous, unfounded, and/or unpatriotic. Unfortunately, our collective reluctance to acknowledge the extent of racism in Canada seems to have left racialized hockey players confused about what does and does not count as racism. Through semi-structured interviews conducted with South Asian hockey players, parents, and coaches in the Lower Mainland of British Columbia, Canada, a disturbing pattern emerged whereby hockey players referred to on-ice racial slurs as regular hockey "chirping" or trash talking. Racism, to these participants, was reserved for those in their inner circles who treated them differently, but racial taunting from opponents was considered fair play in the name of competition. Crucially, if racism is a label only placed upon those assumed to be part of one's in-group we must consider how this definition greatly alters the perceived "presence" of racism in hockey.

SZULC, ANDREA* (*National Scientific and Technical Research Council (CONICET)- Universidad de Buenos Aires*)

Beyond "Children's Agency" and "Children's Cultures": Insights from Anthropological Research in Argentina on Mapuche Childhood

Childhood has been increasingly addressed as a sociocultural construction, with an emphasis on children's active participation in social life, especially among scholars from the core countries who have spread the concept of childhood agency. In my research with Mapuche indigenous communities, this concept is valuable, though it entails a risk: that of overestimating children's capacity for social action because it is tied to Western modernity's concept of the individual—a concept that merits reconsideration (Rabello de Castro 2001). In this presentation, I will argue in favor of a concept of agency that situates children's social actions within intergenerational and interethnic power relations, and those of class and gender (Szulc, 2004).

Along these lines, I will also present a critical perspective of the concept of "children's cultures" which—replicating to a certain degree the interest in youth cultures of the 1970s—stems from the idea that children inhabit a world with distinctive social meanings (Caputo, 1995) and constitute an "ontology" by their own right (Jenks, 1996).

Though children's social agency and their capacity for cultural production are important, I have noticed a problematic use of the notion of culture in works such as these. Perhaps inadvertently, they replicate the isolationist component of the classic notion, where culture was bound to colonialism and attempted to establish discrete, internally coherent units, sealed off and isolated from one another (Wright, 1998). Under these terms, the idea of children's culture reifies and "exoticizes" children. Drawing on both anthropological tradition and on the Mapuche's

conceptualization of childhood, I instead propose analyzing children's cultural productions in conjunction with the myriad institutions and social discourses that condition the social space of childhood. From the periphery, perspectives like these can contribute to the debate on ways of theorizing childhood.

Tensions Surrounding the Rights of Indigenous Children: Contributions of Anthropological Research with Mapuche and Mbya Guaraní Children in Argentina

The lives of indigenous children in Argentina are marked by profound tensions with state institutions, corporations and other social actors with juxtaposing interests. Since indigenous rights are rarely upheld and social exclusion persists among indigenous groups in both the north and south of the country, children's undertakings—like political mobilizations and subsistence activities on the street—bring attention to this conflict in metropolitan areas. Here we will analyze the state's responses, which include police repression, the institutionalization of minors and legal attempts to revoke parenting rights, starkly contradicting a state discourse that prioritizes human rights. Actions such as these revive models for dealing with juvenile offenders—and with poverty-stricken children—dating to the turn of the 20th century and long since repealed, in spite of rhetoric among public officials on children's rights and the need to safeguard them. At a broader level, these state responses reenact the repression and tutelage the indigenous people have suffered historically in countries across the Americas. Finally, the materials analyzed in the work evidence the need for an anthropological analysis of the notion of "rights," moving away from an ontological approach to examine its concrete meanings, uses, productions and appropriations from a historical and contextual perspective (SCHUCH, 2009).

Methodologically, this work draws from a range of source material—principal-ly, press articles and media coverage—and ethnographic notes from fieldwork conducted by the authors with Mapuche children in the province of Neuquén and Mbya Guaraní children in the province of Misiones.

TABATA, MAYUMI* (*National Taipei University*)*Global Talent Mobility and Regional Development: The Role of Staffing Agencies in the Growth of East Asian High-Tech Industry*

As global talent mobility has become more common, more frequently, recruitment and staffing agencies provide transitional mobility for jobseekers, they have played an increasingly critical role in global knowledge diffusion and regional development. On the basis of depth interview in global staffing agencies and engineers in high tech firms, I argue that the role and functions of staffing agencies in East Asian countries, with particular focus to the cross national mobility of high-skilled labors in Japan, Taiwan and China. It is analyzed that the staffing agencies is increasingly playing a role of global labor market intermediaries in the East Asian high-tech industry, where it accelerates the speed and flexibility of labor market adjustment, and brings crucial impact on technological knowledge diffusion across countries. The staffing agencies build global talent networks and mitigate the risk of managing human resource and personnel training, and provide a job offering and job seeking matching system in order to reduce transaction cost between recruiting firms and jobseekers. The development of global staffing agencies in East Asian countries is closely interconnected with the long term recession, the restructuring of Japanese labor market and wage stagnation of Taiwanese labor market, and the booming economy of China has become the trigger of talent mobility across borders. The staffing agencies has started playing the role of labor market intermediaries in the competition of the recruitment for the best engineers in the rapid growing East Asian high-tech business after China's economic boom.

TABIN, JEAN-PIERRE* (*University of Applied Sciences Western Switzerland*)PERRIARD, ANNE (*University of Geneva*)*The Implementation of Work Conditionality : A Swiss Case Study*

Since the early 2000', active social policies based on the normative model of social investment have been developed in Europe (Morel, Palier, & Palme, 2012) and in Switzerland (Bonvin & Dahmen, 2017). Their aim is to « prepare to have less to repair » and « to invest early in education and health » (Palier, 2014, p. 19), which means that they rely more upon prevention than reparation (Lima & Moulin, 2006), postulating that the sooner the intervention starts, the greatest the return on investment will be (Heckman, 2005). Their normative background is that employment is better than state dependency.

The standards promulgated by the state are implemented by agents, whose power is far from insignificant. Drawing from researches on street-level bureaucracy (Lipsky, 1980; Tabin & Perriard, 2016), this communication is based on 77 semi-directive interviews conducted with 74 social workers between 2011 and 2014. Our analysis of the social workers' discourse shows that the institutionalized model (Fraser, 2005) underlying social investment policies clashes with other normative models linked for instance with age, race or sex relations. The implementation of work conditionality is thus not always the case, or can belong to a more or less distant future. And activation takes on different meanings when professionals are dealing with young people or with mothers. In some cases, the implementation of social investment policies challenges even the idea that employment is better than state dependency. Finally, the results of our study demonstrate that sociologists should always reflect on the implementation of social policies for a better understanding of what they are.

This research has been conducted with the National Center of Competence in Research LIVES (www.lives-nccr.ch).

TACELOSKY, KATHLEEN* (*Lebanon Valley College*)*Return Migration and School: Sociolinguistic Experiences of Transnational Students in Mexico and the United States*

Changing migration patterns between the United States and Mexico indicate that more Mexicans are returning to Mexico than are migrating to the United States (González-Barrera, 2015). Thus, many U.S.-educated children of Mexican origin find themselves in the Mexican public school system (Zúñiga and Hamann, 2013; Román González and Carrillo Cantú). This research examines the linguistic realities of these transnational students, who had been using English for school and Spanish for home, and are now required to use Spanish for academic purposes.

This paper draws on seven years (2010-2016) of semi-structured interviews (n=50), conducted in English, Spanish and Spanglish, with 29 students, all of whom have had one or more years of schooling in the United States and are now living

in Mexico. Particular focus is on interviews with two students, current ages 16 and 14, who have been part of the study for six and seven years. On-going analysis of students' discourse, following a Grounded Theory methodology (Glaser and Strauss, 1967), reveals confusion, frustration and a sense of strangeness regarding their experiences with English and Spanish in academic settings in both the U.S. and Mexico. By examining the categories transnational students use to talk about their linguistically-based experiences, we gain an understanding of their reality regarding socio-educational integration and adaptation. Implications for migrant education in other contexts are explored.

TACHIKAWA, MASASHI* (*Nagoya University*)*Civic Epistemology and Governance Issues on Gene Editing*

Today genome editing is widely debated as its future impact on life science and related industry. While regulatory status of the product derived from genome editing is not yet articulated by many countries, basic understanding of developers tends to regard the product as non-GM if the product does not incorporate foreign gene into their genome. Since little survey research to consumers has been done, whether the above-mentioned understanding would be taken for granted by the public remain unanswered.

Based on the result of survey research which we have conducted in Japan, the paper will shed light on the different perception between researchers and general consumers. In contrast to researchers, consumers tend to be more cautious in terms of risk and unintended impact. In general, consumers place genome editing closer to GM rather than non-GM. This is somehow opposite outcome compared with researchers' understanding of the techniques which could be closer to conventional breeding. Desirable governance of genome editing is also discussed based on the survey.

If we understand that the techniques should be regarded as just one component of emerging system of innovation across the field, such as synthetic biology, gene drive, precision breeding and so on, I argue, the nature of governance needs to be broadened and reconsidered since the impact of this complex innovation would have various implications beyond agriculture and food, such as dual use and natural resource management.

TAIBAH, HASSAN* (*King Abdulaziz University*)ARLIKATTI, SUDHA (*Rabdan Academy*)ANDREW, SIMON (*University of North Texas*)*Promoting Health Communication in Religious Gatherings: A Hajj Case Study*

There are health challenges at large pilgrimage sites where crowd members congregate in unfamiliar settings from various countries with different socio-demographic characteristics. Hajj pilgrimage is one of these major events that has more than 2 million Muslims attending annually. Pilgrims' congestion in Hajj holy shrines is a main cause of many health issues, including the spread of infectious diseases. Hajj authorities encounter these challenges by allocating a large amount of expenditure in different health promoting materials. They want to educate lay-people about unhealthy behaviors and demonstrate ways to prevent the spread of diseases. However, there is no available evidence about the benefits of different health media channels in engaging crowd members. Therefore, this study aims at filling this gap by answering the following research questions: (1) which socio-economic groups benefited from health awareness in crowded events? and (2) what can be done to enhance health communication during crowded events? The study uses the Health Belief Model (HBM) to collect empirical data from 245 pilgrims in Makkah, Saudi Arabia, between September 9th to September 19th of 2017. Two major nationalities in the three largest Muslim's areas were approached, which were (38) Indonesians and (18) Malaysians from Southeast Asia, (27) Indians and (43) Pakistanis from South Asia, and (52) Egyptians and (33) Algerians from North Africa. There were also (34) participants from Europe and the Americas. Participants provided information on threats perceived, health media channels used, challenge in access, and external and internal factors affecting health behaviors. The study concludes with recommendations for Hajj crowd managers and international governments on which channels are most effective in providing health information and what can be done by Hajj authorities and other country governments to improve proactive health protective behaviors.

Such transboundary cooperation is essential to help reduce emerging health threats in crowded religious venues.

The Strategic Impact of Cyberspace on International Relations

The emergence of information technologies and digital networks has long been regarded as a revolutionary development. At the same time, the degree and nature of their strategic impact remains the source of much debate, particularly in the field of international relations. Most controversies relate to how digital technologies are changing traditional strategic modalities, including deterrence and coercion, particularly between states. This paper proceeds in two steps. After reviewing the literature on the nature of changes brought about by digital technologies, it attempts to define the conditions under which digital technologies modify the modalities of coercion and deterrence. It concludes by analysing the possible conditions of strategic instability or stability.

RC01-35.4

TAIT, VICTORIA* (*Carleton University*)

Backtalk: How Does the National Military Speak to the International Women Peace and Security Agenda?

Although NATO forces support the United Nations Women, Peace and Security (WPS) agenda, many now stand in dereliction of their obligation to provide female soldiers to sustain its full implementation, primarily as a result of their inability to recruit and retain female combat soldiers in meaningful numbers (Karim & Beardsley 2015). The Canadian Armed Forces (CAF) provides an exemplary case study of this challenge. Despite innovative policies, female representation within the CAF has decreased from 16.7% in 2004 to 14.8% in 2014, and that number drops to 4% in the combat focused occupations of the Army, collectively referred to as the Canadian Combat Arms (CCA) (CAF 2014). The challenge of recruiting and retaining female combat personnel is not limited to the Canadian case; only 0.027% of deployed UN military personnel are female (Jacobson 2012, 6). This project probes the apparent disconnect between Canada's strong presence in framing and adopting 1325 in the UNSC and NATO with the notable absence of female personnel in the CCA. This presentation will detail findings from the primary phase of Canadian soldier and subject matter expert interviews conducted through 2017-2018. These findings suggest that WPS advocates have been unable to displace the masculinized discourse of the CCA during the norm implementation phase, and therefore positive narratives of WPS have not taken root. I conclude by offering potential best practices for future policy initiatives in gender integration.

'Native Language Education and Adaptation of Chinese Immigrants Second Generation in Italy'

The purpose of this report is to clarify the actual situation of mother-tongue education experience and adaptation of Chinese immigrants second generation

in Italy based on survey results. The survey results used in this report were conducted from July to August 2017 at six Chinese-language supplementary schools in Italy.

The survey informants were 264 of second generation Chinese immigrants. The author's analysis of the results clarifies the following points. First of all, half of the children attending the Chinese supplementary school have some experience of being educated in their home country. This shows certain effects on maintaining their mother tongue. In addition, more than 90% of families mainly speak Chinese; the households that mainly speak Italian are few. However, that is causing new problems in terms of their Italian language ability. In Italy,

limitations on Italian language ability (especially literacy) have a major influence on the education process leading to high school graduation, when the second generation Chinese immigrant advances his or her academic background. Most children will inherit their parent's business and become self-employed, rather than going on to study at a university. Therefore, while a relationship with one's 'home country' is maintained, he or she can only fully experience life within the

ethnic community. Such a tendency is also similar in the business owners who are strongly upwardly-mobile; in that case, in order to strengthen one's skills in English, which is the third language, it is creating a new demand for English schools or international schools from the stage of primary school or junior high school. Along with the actual situation of the ethnic community in Italy, the author thinks that these issues will be heavily involved in the future of ethnic Chinese communities. The author would like to clarify this problem by means of this report.

TAJROBEHKAR, BAHAR* (*University of Toronto*)

Examining the Immigration and Educational Experiences of Young Iranian Women

While multiculturalism remains Canada's official federal policy towards immigration and education, critical scholarship on the experiences of new immigrants in the Canadian education system is scarce. Given the vast number of ethnic minorities who immigrate to Canada every year and the significant educational, cultural, economic and political differences between the countries of origin and Canada, this is an area that demands scholarly attention. To date, no studies have examined the educational experiences of adolescents who immigrate from Muslim countries with a sex-segregated school policy. Iran is poignant example of such a country. In Iran, girls and boys are required to attend separate schools until post-secondary education. Transitioning from a sex-segregated to a mixed school setting can be expected to have an important impact on the educational experiences of these students. Canada receives a significant number of female immigrants annually from Iran (approximately 60,000; National Household Survey, 2011). This presentation is based on my doctoral research study which examined the immigration and educational experiences of 10 young Iranian women. Using a postcolonial feminist approach, I examine the economic, cultural, social barriers and opportunities facing these young women before and after their transition into the new (educational) system. Particular attention was paid to the intersections of gender, ethnic, and religious identities.

The Establishment of Religious Practice and Institutions in the Pre-Second World War Japanese Canadian Diaspora

Japan is often seen as a site of the postmodern, either inherently or as a result of its postcapitalist economy. Those who see Japan's culture as essentially postmodern often point to its Buddhist, and especially Zen, philosophical traditions. Satori, as Roland Barthes states in his *The Empire of Signs*, "is a more or less powerful...seism which causes knowledge, or the subject, to vacillate: it creates an emptiness of language."^[1] Nagarjuna's "emptiness/void" (*sunyata*), can be seen as reflected in what he calls the "empty center" of Tokyo, "decentered" Japanese food, and the "breach of meaning" in *haiku*. Marilyn Ivy notes that the Japanese philosopher Karatani Kōjin, "maintains that in Japan there is essentially no structure...because there is no preexisting logocentric structure."^[2] This paper will examine whether such interpretations of Japan as a country with a "decentered" religious tradition can account for the way the Japanese diaspora in Canada in the early 20th century came to adapt to Canadian religious traditions and help to understand how they practiced "religion" in their new home.

TAKAHASHI, KAORI* (*Rikkyo University*)

The Difficulties of Artists Under Tokyo's Cultural Policy for the Year 2020: The Subsidization of Socially Engaged Arts

In 2020, Tokyo will host the Olympic games. An anticipation for the games can explain the proliferation of subsidized cultural projects in the area, large-scale and grassroots alike. Over most of the last decade, it seems that there have been "grants bubbles" in Japan, especially in Tokyo. A number of actors have contributed to this situation, including those in government, the citizenry, and the art community.

Artists could benefit by corroborating with other actors, which could promote a discussion about art and its relationship to the surrounding society. Though most artists who will engage in upcoming cultural projects are formally educated in their field and are aware of the roles of the art world, many of them have had relatively little chance to learn about society. For that reason, many artists struggle with societal restrictions concerning their projects. Rules set by local communities, the concerns of neighbors, and the history of the area may cause dilemmas and difficulties for artists.

By using documentary research and interviews, this presentation analyzes the role of artists who join arts projects and collaborate with other actors because of their difficulties with societal restrictions. Most of them join "socially engaged art" projects (Helguera 2011). Collaboration with multiple actors can create new values, ideas, and benefits for the surrounding community. What, though, are the benefits for artists? Is collaboration valuable for an artist's career? How does collaboration affect artists, and why might they join either locally or socially engaged art projects?

The current cultural environment creates significant problems for the art world in Japan, and causes confusion for the career model of an artist. In addition, short-term subsidies make it difficult for artists to create strong relationships with other actors. Because of this situation, "grants bubbles" might cause problems for artists, the art world, and society.

TAKAHASHI, KOJI* (*Japan Institute for Labour Policy and Training*)

Generative Process of Wage Gap: Analyses of Nation-Wide Employer-Employee Matched Data

This poster aims to introduce a new method to analyze wage gap in the labor market. Wage is an important component that frames social stratification since most individuals are employed by firms. In principle, wage is determined within each firm although decisions at the industry-level or national-level may be in effect in some countries. However, neoclassical economists have ignored each firm's role in wage determination and created a wage function that assumes the labor market as a single existence; such an assumption is unsuitable for a country like Japan where wage determination is highly de-centralized. Analyses of the generative process of wage gap have to consider two wage determination levels: which firm they are working for, and how much the firm pays them. Based on this, we analyzed Japan's nation-wide employer-employee matched data ("General Survey on Diversified Types of Employment" in 2014) that contains: (a) independent variables such as gender, age, education, occupation, employment type, and tenure, (b) per-hour wage, and (c) number that specifies the firm. We considered that: (1) coefficients of the wage function estimated by the pooled OLS show the overall wage gap in the labor market, (2) those estimated by fixed-effect model show the wage gap within each firm, and (3) the opportunity to work for high-wage firms is calculated by subtracting (2) from (1). Results indicated that gender affects wage primarily within firms. Conversely, education affects both the opportunity to work for high-wage firms and how much employees are paid within each firm. In addition, these findings were consistent with a previous study that employed the same survey in 2010. This endorses the reliability of this method, and the contrast in the generative process of wage gap by gender and education suggests that different research approaches and policy measures are required to handle each variable.

From Refugees to Supporters: Conversions Made By Religious Organizations in Contemporary Japan

It has been more than 40 years since the Japanese government officially began accepting refugees into the country. However, since the end of the Indochina refugee crisis, Japan's refugee acceptance rate has dropped sharply. The rate is currently the lowest among advanced countries. The Japanese government has neither been exceedingly passive with regard to widespread refugee crises, nor has been sufficiently supportive of the Indochina refugees who have decided to remain in Japan. Rather, religious organizations (especially Catholic churches) have played important spiritual and social roles for Indochina refugees (most of them being Vietnamese) in many locations across Japan. In this paper, I examine several cases in which Catholic churches have undergone the formation of Vietnamese refugee communities. My examination is based on data from both documentary and field surveys. The churches I have studied have been important spaces from which Vietnamese refugees have contacted compatriots and constructed ethnic networks. Non-Catholic participants have also been a part of these networks. These churches have also been spaces in which Vietnamese refugees have been able to interact with neighbouring communities. This is because many Japanese are also members. The recent number of incoming Vietnamese migrants has rapidly increased as a result of an influx of students and technical interns, as well as family reunions. In this paper, I point out situations in which leaders of Vietnamese refugee communities have played active roles in Japanese language classes, the support of livelihood, and annual Vietnamese cultural events for second generation Vietnamese and Vietnamese newcomers. Because there is some amount of indifference in Japanese society regarding the social adjustment of refugees and migrants, as well as the maintenance of Vietnamese language and culture, the social roles of refugees who have become supporters of their adoptive religious communities are highly important.

Societal Challenges and Media Ecosystem: Reshaping Media into Societal Media

After the emergence of so-called "social media", media ecosystem has drastically changed. Not only traditional media such as television but also major social media platforms are attracting huge popular attention. And, we are also witnessing a brand-new version of media politics. However, in this era of societal challenges caused by political-economic turmoil and various kinds of disasters, we have to focus on the potential of media ecosystem which includes full-range of public communication media from local to international scale. Because we have to utilize the technology and innovation of media to advocate public issues and liaise between actors who are trying to cope with them. In this presentation, I will show the result of newly conducted survey research on media support to NPOs in Japan and discuss how the diversity of media can be helpful to people's efforts to make things better. For example, in a prefecture which was hit by destructive earthquakes and tsunami in 2011, local, community-based newspapers and radio stations have quite frequently reported activities of respondent NPOs in their communities. And a half of respondent NPOs have shown their willingness to use newly developed online platforms such as crowdfunding and volunteer recruitment websites which support pro bono projects and groups. This result suggests that it is important to recognize the societal role of those media and widen our perception of media beyond "mass" and "social" media. In this presentation, I will underline the importance of reshaping media — not only in our perception but also in our usage of media technology — into societal media which support a multitude of people who tackle societal challenges in our societies.

Exploring Worker Power across Formal and Informal Enterprises: Insights from Work Organisation in Waste Collection, Essential Oils and Clothing Sectors in South Africa.

Discourses on the nature of informal work and appropriate policy responses remain driven by a number of misguided generalisations. Informal work is defined through registration or contractual status with underlying assumptions that informal workers are homogenous in their ability to organise and influence work structures and dynamics. For example, the ILO (2011) associates total employment with formal as well as and informal activities (unregistered) and informal employment (non-contractual or non-regulated). Similarly, policy solutions focus on registering and formalising informal workers and enterprises assuming to improve work conditions and enterprise growth. These misguided categorisations, assumptions and policy priorities are challenged by new interview-based evidence from urban waste recycling, clothing and essential oils sectors around Johannesburg, South Africa. The research highlights the heterogeneity of informal activities and a range of ability and opportunity to influence the nature and structure of work organisation. Looking at the different worker influence, innovative work organisation and multiple linkages (e.g. with suppliers, customers, support institutions and other workers) suggests there is great fluidity and overlap between formal and informal activities, and that informality takes very different forms across economic activities. These imply the need to understand multiple forms of worker power, capacity for innovative activities, and different constraints and policy needs depending on the work, enterprise or sector. This is in stark contrast to the dominant conceptualisations of informality and the policy discourses of regulation and formalisation. The evidence suggests that formal work does not automatically mean better work conditions, increased worker power, or employment or output growth and that supporting informal activities and workers with tailored policies may be more relevant.

Cosmopolitan Publics and Unintended Consequences for Alternative Future: The Case of Japanese Global Sixties

Social movements can often be the agency in revealing an alternative future that has yet to be widely recognized by society. However, this new idea has often remained unknown even among the movements themselves in their initial phase of activism. Instead, movements generate new ideas unintentionally through the contingent development of activism. While the "culture moves" (T. Rochon) so do the social movements. Based on such premise this paper explores the Japanese social movements during the 1960s and 1970s that had generated new ideas for alternative futures. It particularly focuses on the transnational networks and communication between Japanese and foreign activists as primary variables for change. I will call this space of transnational communication as cosmopolitan publics, where stateless collective identity is formed and preexisting identities are

contested and transformed. I argue that cosmopolitan publics was critical space for generating new ideas for alternative futures. This will be explained through the cases of Japanese movements that became transnational in the later half of the long Sixties, including Beheiren the civic anti-Vietnam War movement and the Japanese Red Army, a partisan revolutionary movement. Beheiren, for example, developed transnational networks primarily with the Western New Lefts and the transnational communication within the anti-Vietnam War movement that urged members to shift their political issues to Asia by critically reflecting upon their hitherto Eurocentric mindset. The Japanese Red Army, on the other hand, in their interaction with Arab revolutionaries had challenged their grandeur and obstinate revolutionary ideology that led them in developing the idea that enhancing egalitarian relationships among different ethnicities (ethnic cosmopolitanism) should be the movement's new goal. These new ideas became crucial values in the Japanese civil society from the late 20th century, yet were unintendedly generated within cosmopolitan publics.

Complexities of the Experiences and Negotiations of Their Belongings of Migrant Filipino Women Married to Japanese Men

This paper will discuss how migrant Filipino women experience and negotiate the relation with Japanese husbands as well as family and their belongings.

In the line of research on migration and gender, many studies have tended to focus on how migrant women who enter the paid-work can negotiate the gender relations with their husbands and families (George 2005, Hondagneu-Sotelo 1994, Parreñas 2001).

Compared with the migrant women who began to work in the countries of destination, migrant Filipino women in Japan tend to cease work when they get married to Japanese men. They usually concentrate on the house chores and childcare, and then start again to work outside after their children grow up. This follows the dominant working pattern of women in the Japanese society, or the dominant gender division of labor.

Based on the census and interviews of approximately 40 Filipino women, the paper explores how these women experience and negotiate the conjugal and familial relations and their belongings by focusing on their social positions. It points out that many women pursue to create the equal relations with their family members. Even if there are gender and ethnic inequalities within the family relations, they have some capacity to negotiate within the family more than outside their home. On the other hand, some women feel secure outside the conjugal relations. For instance, those who have experienced domestic violence by their (ex-) husbands find their belongings in the households with their children after their divorce. Others see a paid-work as a place of their own in the "native" society. This paper argues that these various experiences and negotiations show the various routes to social inclusion of mixed married migrant women in Japan.

The Reconfiguration of the State Sovereignty in Japan's Migration Control: Symbolic and Physical Violence over Irregular Migrants

This presentation will discuss how migration control has influenced reconfiguration of the sovereignty in contemporary Japan. In this presentation, the state that holds the sovereignty is posited as "an X (to be determined) which successfully claims the monopoly of the legitimate use of physical and symbolic violence" over the population, as defined by Bourdieu (1989).

Faced with the "globalization," along with the increase of international migration in the 1990s, there were a lot of arguments on whether the state sovereignty declined or not. Some claimed the decline of sovereignty (Soysal 1994; Sassen 1994), and others criticized the thesis (Freeman 1998). Particularly after the 9.11, the operation of sovereignty over migration control has become more and more stringent (De Genova and Peutz 2010, Kanstroom 2012).

Likewise, in Japan, the migration control has been changing since around the end of the 1980s. Based on the qualitative and quantitative data, the presentation traces the changes by focusing on the symbolic dimension of the state and its impacts on its physical dimension. The presentation argues while there had been a symbolic struggle over the definition of irregular migrants in a social space, the state successfully got the monopoly of the legitimate use of symbolic violence. That is, the state categorizes irregular migrants into "illegal residents," meaning criminals, which has been naturally accepted as those who should be controlled. This monopoly of legitimacy justified the state to operate the physical violence over the migration control.

The presentation concludes that the reconfiguration of sovereignty in Japan can be seen in the shifting relationship between the symbolic and physical dimensions of the state in the context of migration control.

Succession and Reconsturction of Festivals/Folk Performing Arts in Overaged and Depopulated Communities: Focusing on the Role of Mediator between Inhabitants, out-Migrants, Incomers, and Volunteers.

This research investigates how inhabitants have continued the local festivals from generation to generation in rural area in Japan. To take over them, residents need supports from out-migrants, migrants, and volunteers. In the process of taking over the indigenous customs, participants re-construct the festivals and performances. This research analyses the transition and make clear the function of cooperation between inhabitants and migrants in overaged and depopulated communities. Moreover, it aims to show the possibility of local festivals to empower the community because they play the role of mediation among diverse collaborators.

This research focuses on conflicts and misunderstanding between residents and other stakeholders. Through the negative incidents and feelings, people can learn how to live and cooperate in the community together. The research conducts the participant observation and interview for participants in a festival at fishing village in Japan. Research cases are festival called *Kanmai* in Iwaishima Island, Kaminoseki town. In this island, most of the inhabitants have been opposed to the construction of nuclear power plants on the other side of the island since 1982.

After the Great East Japan Earthquake and the accident of Fukushima Daiichi Nuclear Power Plant in 2011, the island attracted attention of people in Japan as an island opposed to nuclear power plants, and some people emigrated to the island. They sympathize with residents of the island opposed to nuclear power and trying to continue living mainly on fishery and agriculture. In this research, through interview on the island and participation observation of preparations for the festival, I analyze how immigrants are familiar with the culture and lifestyle of the island through preparation of the festival, and on the contrary, how the inhabitants of the island accept the immigrants, and the problems on the coexistence of residents and migrants.

Possibility of Developing Volunteer Activities during the Dying Process: Evaluation of a Few Japanese and Canadian Case Studies.

In this report, I will focus on some of the activities of volunteers who work in end-of-life care. Some volunteers' activities cannot be done by paid health care providers. The dying process is always a very individual matter and it sometimes requires constant care by someone. Some advanced cases in both Japanese and Canadian hospitals show how valuable such activities are for patients. I will discuss the possibility of developing successful volunteer activities in the medical system in Asian societies. I will also focus on how to develop a volunteer association in Japan. Japanese hospital volunteers may not always be fully active for various reasons. In the Canadian case, they have had success in estimating which volunteer activities are truly helpful not only for patients but for the entire institution. Once they judge that a certain activity is, in fact helpful, local governments can actively support it with sufficient funds. Such authority might be placed in an institution's hands to endorse volunteer activities and perhaps even give permission to conduct fund-raising to support these activities. In the same way, if they judge that certain volunteer activities aren't helpful, they can withdraw their support. Local governments can take the role of estimating which volunteer activities are actually needed and worthwhile. The money that government would normally give to fund volunteers could be much less than the funds saved by downsizing hospitals. While the government remains eager to place volunteers into hospitals, hospitals are often unable to realize their full value or ready to use volunteers to the fullest extent. The gap between recognizing the true value of volunteers and their actual use, and between what governments expect and what hospitals actually experience, evidences a less than successful mobilization of this type of volunteerism in Japan.

Online Randomized Experiment on Social Influences upon Behaviors in Web Forums

The (right-wing) political extremism in online news discussion forums has been reported and attracted much attention in Japan (Kimura 2017). The observation studies, however, have difficulty in clarifying the mechanism of the political extremism. There are two possible mechanisms: selection and social influence

(cf. Lewis et al. 2012). Selection mechanism explanation is as follows: people have the determined opinion before entering the forum. Once the atmosphere of the forum is determined, those who have the similar opinion remain, and otherwise exit from the discussion, thus leading to radicalization of the existing opinion. On the other hand, social influence mechanism explains that the majority of opinion in the forum does make an influence on the participants and change their behavior in congruence with majority behaviors, thus leading to the extremism. Here, we conducted an online randomized experiment in web discussion forums for clarifying the mechanism. For the relevant studies, see Alvarez and Winter 2017; Cheng et al. 2017). We used a crowdsourced recruitment for our experiment. Participants were instructed to read the article reporting the regulation of hate speech. Then, they were randomly assigned to two different experimental conditions to see how the majority of opinion affects participants' behaviors. In the "positive comment" condition, the majority of the comments on the news was positive, supportive for the policy. In the "negative comment" condition, the majority of the comments on the news was negative, critical on the policy. Subsequently, the participants were asked to give up-votes or down-votes for each comment, write down their own comments and decide whether to display preferentially or non-display each commentator. We found the clear evidence that participants' behaviors are influenced by the major opinions in the forum. This result suggests social influence mechanism does operate in the radicalization of opinion in online news discussion forums.

Teacher Professional Learning, Boss Texts and Everyday Utopia

Increasingly a suite of 'boss' texts, including highly prescriptive curriculum documents, professional standards, and accreditation frameworks, govern the work and professional learning of teachers internationally. For a group of Australian teachers *really* knowing that they had learned something about their work began as a response to the learning needs of the students in front of them at a particular time in a particular learning environment. None of the teachers ascribed their learning experience to the key 'boss' texts at play. In each case, the learning experience that had transformed their teaching work and for which they were able to provide evidence had occurred in another 'space of possibility'. The space however, existed because of the local social relations that coordinated each teacher's 'actual doings'. Griffith and Smith (2014) assert that bringing these 'spaces' or 'gaps' into view is precisely the work of institutional ethnography at the front line of, in this case, teachers' work.

Understanding how these 'spaces' might be retained and, indeed expanded, may require however, an understanding of the 'utopic resistances' (Gardiner, 2006) that gave rise to them in the first place. How were the governing texts activated within schools in a way that prevented them becoming an obligation enforced by political and economic forces, that becomes, "routinised... everydayness" (Lefebvre & Regulier, 1999, p. 8), stifling the sort of creativity demonstrated by teachers in this study that produced spaces for transformative learning? The onto-epistemological relationship between IE and notions of everyday utopia will be explored in this presentation.

Social Inclusion, Body and Identity in Multiculturalism Contexts. the Impact of Football on the Integration of Foreign Asylum Seekers

Football can be considered an amazing space of opportunity to build a cultural identity because it allows young immigrants to get out of isolation and to socialize with the youth of the host country. Football is the most popular sport in the world and it is the dream of many young foreigners living in developing countries. It is a social integration tool that can facilitates mutual knowledge, allows the diversity and the uniqueness; to raise awareness of the rules; of companions and opponents and facilitates the building of self-consciousness, cultural identity and body. Socialization pathways and co-operation between Italian youth and immigrant people evolve inside the football team and consciously mature, despite cultural and ethnic differences, the sport improve the concept of brotherhood. Full integration is achieved through the recognition of common values and is not confined to sporting practice itself but flows into continuous relationships with social capital (Putnam 2000, Coleman 1988) of the sports environment. The purpose of the research is to analyze, through a case study (Glaser & Strauss 1967, Yin 2013) identified the Sicily, the effectiveness of educational intervention promoted by sporting practice, related to the social capital circulating around football, in order to understand the potential of this sport: what a possible path to the full integration of immigrants arrived in Sicily from developing countries through football.

Sport, Physical Activity and Rehabilitation. the Impact of Parkrun to Health and Body Wellness. an Exploratory Study in Italy

Jogging and running demonstrated the scope of these events is physical activity promotion (Lane A, Murphy N, Bauman A, et al. 2012) and working as a motivator to improve physical activity (Bauman et al. 2009). Many participants need reinforcement strategies to maintain "body activity" after the events. Parkrun could improve a potential health benefit: a free weekly timed 5-kilometers run, that takes place in parks, every Saturday morning. Parkrun promote "physical activity" and "community health and wellness spirit" with daily body workout (Stevenson C., Hickson M., 2013). This study try to explore the potential of parkrun event as a health intervention of the body workout and rehabilitation by observation of initial running status of regular frequenters. The research will be conducted in Italy, with a qualitative methodology: case study approach, direct observation and structured in-depth interviews (Yin 2013). A set of 40 interviews with the members of parkrun will be also conducted in Italy in two cities: Palermo (Uditore parkrun) and Milano (Milano nord parkrun) that could show the interests of the impact community participation event to body workout and wellness mental health of regular runners. All participants could register online, where they are issued with a barcode (no bar code no results). The intersection of the data obtained could be offer the possibility to understand the most significant knowledge about new behaviours about healthy, sport activity and wellness that emerging in the vital world of parkrun in Italy.

Civil Society and Climate Change Movement in India: A Critical Evaluation of Development-Environment Dialectic from Rio to Paris

India holds a dual position in today's global climate politics. On the one hand India is a major contributor to carbon emissions, and on the other it is a developing economy with low per capita and historic emissions. In climate debates, India positions itself as a developing nation with an urgent need to meet the basic needs of its citizens. The "right to development" narrative has been strengthened with the idea of "common but differentiated responsibility." Therefore, the concept of climate justice has had a predominantly outward focus towards global equity. Against this backdrop, our paper aims to identify critical civil society narratives on climate justice and their movements against national and international actors. To examine the dynamics of the climate movement in India, we focussed on the period from the Rio Earth summit to COP21 in Paris. Employing the conceptual framework of "climate-dialectic," we critically evaluated significant networks and mobilisations around climate change, or other related movements whose impact may be attributed to mitigating climate change. We found that most movements initiated as local resistances to protect livelihoods and human rights of communities, although anti-coal and anti-dam projects were also likely to impact the debate. In conclusion, we have highlighted that unlike Northern countries, India lacks a grand narrative on climate change movement mobilized by transnational environmental non-governmental organizations. Instead, the Indian movement can be regarded as a mosaic of dispersed mobilisations that challenge the deleterious effects of development, from which common themes for an emergent climate justice debate can be drawn.

TAM, CHERRY HAU-LIN* (*City University of Hong Kong*)

The Use of Social Entrepreneurship As an Intervention to Enhance Underprivileged Young People's Sense of Self-Worth and Career Competence in Hong Kong

Because of their young age, lack of working experience, knowledge and skills, young people are easily excluded in the economic job market. It is no need to say about those underprivileged young people who are underachievers in schools with low self-esteem and unclear direction of development. In Hong Kong, the unemployment rate of young people between 15 and 24 is usually twice or even forth than the average unemployment rate even when the economic situation is stable.

To keep in line with the global experience of adopting youth entrepreneurship as an important pillar for the creation of jobs and the reduction of unemployment among young people, the Hong Kong SAR Government had proposed to explore the feasibility of establishing a sustainable Microfinance scheme in the 2011-12 Budget Plan supporting young people at the grass-root level who wish to start their own business. The scheme is believed to be beneficial helping young people

identify their career objectives and promoting entrepreneurship as an alternative to traditional models of employment.

Integrating the concept of social entrepreneurship, which emphasizes both the economic return of a business and its social goal of addressing social issues with innovation, a NGO in Hong Kong had organized a "Social-up Youth Entrepreneurship Programme" for underprivileged young people. The programme included a 21-session of training workshop with agency visits to social enterprises and technology start-ups, 60-hour internship, and 6-month pre-incubation training to actualize their project ideas. By recognizing their unlimited talents and potentials, young people were exposed to new learning opportunities. They worked collaboratively to develop their business ideas, in return, to solve social problems. After the programme, their sense of self-efficacy and self-perceived employability were obviously enhanced.

Paradoxes of Heterogeneous Returns: The Negative Selection Syndrome in Stratification Research

This paper examines the paradoxes of heterogeneous socioeconomic returns associated with common models of attainment in stratification research. Specifically, the paradoxes stem from the pervasive presence of negative selection across diverse substantive contexts—what we call the negative selection syndrome (NSS), including Brand and Xie's (2000) finding that economic returns to college are the greatest for those who are least likely to attend. We develop a formal model of the paradoxes, specifying the common structure and crucial parameters of the phenomena, conducting simulation to demonstrate the regularities underlying the paradoxes and deriving testable predictions of the model. The model also explains why NSS is prone to be observed when propensity score matching method is used to produce counterfactual causal estimation of treatment effect on the treated and the treatment effect on the untreated. The model also connects NSS with other paradoxes in stratification research, such as the relative incompetence syndrome.

Urban Development and the Paradox of Participation

Citizen involvement and participation have been particularly promoted in urban policies by international agencies since the 1990s to realize a sustainable development such as that described as New Urban Agenda. For instance, Participatory Budgeting in Porto Alegre and the Kerala People's Campaign for Decentralized Planning were successful in mobilizing and empowering the poor, who were previously excluded. Citizen involvement and participatory governance are globally adopted in urban development policies. It is a sort of "explosion of participation." It is, however, indicated that participation is a buzzword and that it often leads to a co-optation. Citizen involvement and participation does not reduce an inequality; rather, they exclude confrontation. It is a problem of the Habermas-Mouffe debate or the works of Foucault. This paper explores the consequences of participation through experience in Japanese urban policy from the 1970s to the 1980s. The Japanese government confronted a legitimacy crisis in a rapidly advancing economy that changed the living conditions of communities and led to many residents' movements and protests. We present the process and the result of citizen involvement and participation in Japanese urban policy. From this case study, we suggest "the paradox of participation" and the importance of "the gate-keeper problem." Consequent to advanced citizen participation, the power of bureaucratic administration becomes dominant unless politicians and the legislature retain their autonomy in decision making. If the gate-keeping functions of involvement and decision making are monopolized by the administrative body, urban development is depoliticized, which leads to co-optation and exclusion. It is important to retain politics in order to deepen democracy through citizen participation in urban development.

TAMARI, TOMOKO* (*Goldsmiths, University of London*)

Ageism and Narratives: Negative Images of Aging and Stories in Later Life

Aging is a pressing social issue for contemporary societies and that is often related to personal concerns about declining mental and health conditions. The paper provides an initial exploration of images of aging through considering both ageism and gerotranscendence by examining the validity of personal life story narratives as a research method. The focus is not on whether the stories were based actual events, rather the concern is on how and why the stories are formulated by older people who seek greater self-integration by editing their own

narratives produced over time. The life-stories are formulated by a complex process which entails them being continuously re-written and re-interpreted to assimilate to dominant discourses and normative images of aging. The stories can also emerge in interaction processes which are produced by specific social and political relationships between speakers and listeners in various contexts. To articulate this process, the paper examines older people's self-internalizing (self-victimizing) processes of ageism which often implies negative images of aging. It also critically investigates the possibility of life satisfaction in later life (gerotranscendence) from both sociological and psychoanalytical perspectives.

By doing this, the paper seeks to unpack the mechanisms involved in socially constructed ageism to investigate the ways in which ageism becomes embedded in the older people's self-perception and incorporated into images of aging in social life. The life-stories can therefore be seen as reflections of aging people's lived life. The conclusion proposes 'individual autonomy' which the emphasizes significance of listening to the older people's voices, and understanding the social and political backgrounds of their life-stories, in order to adjust to contemporary aging society.

Justice, Recognition, and Solidarity in Fragile Societies: The Case of Female Civil Society Groups of Victims of Extrajudicial Executions in Colombia and Mexico

In this paper, I would like to present the experience of two female civil society groups of victims of extrajudicial executions of Colombia and Mexico from a communicative and sociopolitical perspective. Specifically, I will focus on the experience of The Mothers of Soacha (Soacha City, Colombia) and The Ayotzinapa Movement (Guerrero City, Mexico). I will explain how these two female civil society groups of victims have been addressing expressive and communicative dimensions of collective action to claim for justice, recognition, and solidarity in the public sphere. A key objective is to understand what kinds of citizen and humanitarian spaces these socio-communicative and collective actions can access within the contexts of crime, a lack of security and impunity, and how these actions have been affecting a claim for human rights and justice in these two countries. The aim of this paper is to understand how socio-communicative and collective actions developed by female victims' groups can affect dimensions of social recognition, trust in justice, and operationalization of solidarity in contexts of high levels of violence and crime. The conclusions presented in this paper are based on results of a narrative analysis of 28 interviews conducted with different members of these two civil society groups between September 2015 and July 2017.

Struggling for Democratic Future in Times of Dystopia: Case of Indian Student Activism

In the first six decades of post-independence period, most of the Indian social movements could either be classified as Socialist or as Traditionalist, fundamentalist. However, more recently, on the one hand there is blurring of boundaries between these categories. On the other hand, with co-optation and appropriation of earlier vocabularies of socialism and fundamentalism, the common ground for left leaning activists is only Constitutional goals.

"In these times of dystopia, democratic values can only provide the common ethical framework for future", said one youth leader. "Free and egalitarian society based on values enshrined in the Constitution of India." Why Constitution? "We do not believe in any notion of morality. But democratic values in the Constitution of India can be used as the new ethical framework to pave to Democratic Socialism." She continued. Currently to bring together voices of the marginalized on account of caste, class, gender, ethnicity and region, it is important to search for a common dream of future that is acceptable to the already divided sections within marginalized communities is the biggest challenge.

Last two years were marked by youth activism and movements across India. From Western Indian cities to Eastern Indian Universities there are campaigns and agitations for free speech, educational scholarships, and against suppression of free thinking, sexual harassment on campus, privatization closing opportunities for students. Though most of these agitations and student activism is against neoliberalism and aggressive globalisation, it is equally against conservatism and fundamentalism. These student activists are articulating a new democratic future with Constitutional values of social justice, equality and secularism as the ethical common framework.

TAMMELIN, MIA* (*University of Jyväskylä*)

Family Media Ecology: Parental Mediation and Family Time

The spreading of ICT as an integral part of everyday life has had a tremendous effect on social connectivity. Practices relating to staying on- or off-line are popular in general media discussion and have been focus of research as well. Mediation is widely understood as a way of capturing the parental management of the relation between children and media, and it extends the parental role beyond simple restrictions to encompass also conversational and interpretive strategies as well as parental monitoring'. Given the complexity of media environment, such as mobile technology, this role is increasingly demanding.

The aim of this paper is to explore the practices of parental mediation with family wholeness approach particularly in the context of family time. Parental mediation is analyzed first by identifying family's patterns of using mobile technology and parental mediation practices; and secondly the contextual factors that associate with mediation practices. The study discusses particularly temporality and family time: How is time and temporality of family life linked with parental mediation? The study uses an interview data of 39 employed parents. The data was collected during 2016 in different parts of Finland.

Specific practices can be identified. These are active, restrictive, and collaborative strategies. Those adopting *active parenting practice* viewed mobile technology as a way of participating to the social and community life, but required active mediation, such as discussions and explanations. *Restrictive parenting practice* included restricting the use of mobile technology such as setting 'proper' time and place. *Collaborative practice* means that parents discuss and negotiate actively with their children on the practices and rules of using technology. Typically, but not restricted to, this style was adopted by parents of older children.

TANAKA, SIGETO* (Tohoku University)

Fake Information for the "Egg Aging" Propaganda: The Role of Experts and Journalists in Its Emergence, Authorization, and Radicalization

The belief that women rapidly lose their fertility as they age has been popularized using biological findings about "aging" of eggs (or oocytes) in the ovaries. Recently, Japan has experienced national propaganda based on such a belief. In the past decade, doctors and medical organizations have broadcasted information about age-related fertility decline for women in their 20s and 30s. Their theory has spread on mass media without any scrutiny, creating a social pressure on women to bear children as early as possible. Such information has also served as evidence for the government's pronatalist policy of getting young people married.

This paper traces the history of the belief and explores how it emerged, progressed, and spread as authorized "scientific" knowledge by focusing on the graphs frequently used to support the "egg aging" discourse.

A literature survey revealed the following facts that exemplify the role of traditional experts and journalists in creating the "post-fact" phenomena. The graphs, seemingly quoted from the scientific literature, were actually fabricated, falsified, trimmed, or misinterpreted. Doctors manipulated graphs, supported it with unreachable citations, and provided insufficient or distorted explanations about the data and methods. These techniques are being used in the field of obstetrics and gynecology since the 1980s. Journalists have recently contributed to the propaganda, using sensational language to polish the message. During the development and radicalization of the discourse, no social mechanism was performing the fact-checking function. The "egg aging" propaganda, endorsed by medical authorities, aroused people's feeling about the alarming prospect of the country's low birthrate and shrinking population. It eventually achieved hegemony in public debates in 2010s Japan. (See <http://tsigeto.info/fak/> for details.)

TANAKA, SIGETO* (Tohoku University)

Hijacking the Policy-Making Process: Political Effects of the International Fertility Decision-Making Study for 2010s' Japan

Studies that compare social conditions in a certain country with those of other nations can result in national feelings of inferiority or superiority. Comparative studies thus often serve as political devices. Owing to the development of the Internet and translation technology, large-scale, cross-national surveys have become a low-cost means to manipulate public opinion.

In this paper, I introduce the case of the political use of the International Fertility Decision-Making Study (IFDMS) in Japan. IFDMS was conducted in 2009-2010 by researchers from Cardiff University and Merck Serono, a global pharmaceutical company. IFDMS prepared a questionnaire in 13 languages for 18 countries, targeted at both men and women who were trying to conceive. It featured questions regarding medical knowledge about pregnancy. According to the published results, the respondents who lived in Japan exhibited a lower level of knowledge about conception than those in other countries. Based on this result, medical authorities in Japan insisted that, because of the lack of knowledge, the Japanese people had thoughtlessly postponed childbirth, resulting in fertility decline. The government accordingly created a new outline of population policy in 2015, in

which it referred the results from IFDMS to advocate sex education for youth in order to encourage early marriage.

However, IFDMS is unreliable. It has many defects including mistranslations in the questionnaire. Nevertheless, results from IFDMS were accepted as reliable scientific findings in conferences and journals in the field of natural sciences in Europe, bypassing scrutiny by social science researchers in the targeted countries. Language differences also prevented the accurate understanding of the research results. The case of the political effect of IFDMS thus teaches us that social impacts of comparative studies may be deceptive and nullify social scientific efforts to accurately perceive the society in which we live. (See <http://tsigeto.info/hij/> for details.)

TANG, LYNN* (School of Arts and Humanities, Tung Wah College)

The Politics of Suicide Prevention: A Case Study of Student Suicide Spates in Hong Kong

While suicide has long been recognised as having a social origin, suicide prevention measures mainly focus on implementing individualised medical and psychosocial interventions at the micro level or enhancing community support at the meso level, rather than activating macro-level changes. This paper is a case study of the campaign to advocate 'upstream' social-structural changes in Hong Kong. Between 2015 and 2017, 71 students committed suicide in Hong Kong. The incidents generated widespread societal concern and the government set up a special committee to recommend interventions to support students in educational institutions and their families. However, advocacy groups have since campaigned for a more far-reaching change in the educational system. This paper utilises the concept of framing processes in social movement literature to discuss how socio-political factors shape the frames adopted by different stakeholders in the campaign, and reflects on the opportunities and challenges faced by the advocacy groups.

TANGALYCHEVA, RUMIYA* (Faculty of Sociology, St. Petersburg University)

The Social Construction of Gender Issues in the Korean Author's Cinema

The term "hallyu" was coined in the middle of 1990s by Chinese journalists in articles which described the fast-growing and spreading South Korean entertainment industry.^[1] Today Korean cultural influence has won strong positions in Asia, Oceania, North and Latin America, Europe and the Middle East. Russia and some of the post-Soviet countries have already experienced the Korean culture and Korean Wave for more than 10 years. Korean cinematograph can be considered as part of "hallyu" movement.

The paper analyzes films of Lee Chang-dong, a South Korean film director, on the basis of the theory and methodology applied in sociology of culture. The specific attention is given to the construction of gender in Korean author's movies. The theoretical interpretations are based on the ideas of the Birmingham School for Cultural Studies and the representatives of the critical theory - Jürgen Habermas and Johanna (Hannah) Arendt. Korean and Russian film images are regarded from the point of discourse: forgotten and miserable people, the contrast of social or public and individual, social as being specific and universal at the same time, cultural differences in problem perception and solving. Methodologically, the research is supported by the analysis of web-sites devoted to Korean cinematography, reviews, opinions and comments on Lee Chang-dong's films on the Russian Internet.^[2]

BRANDAO MARTINS DA NOBREGA, PRISCILA* (Núcleo de Estudos do Brasil Meridional)

Conservative Values Vs Liberal Values: Survey and Sociological Study of the Opinions of High School Students at IFC-Ibirama on Contemporary Topics That Divide Brazilian Public Opinion.

This research investigates and analyses the positions of IFC-Ibirama high school students (a school in the small town of Ibirama in Santa Catarina state in southern Brazil) regarding specific topics that have divided recent Brazilian

public opinion. These include amongst others: gay marriage, the legalisation of abortion, the reduction in the age of criminal responsibility, the death penalty and the legalisation of marijuana.

According to a study released in 2013 by Datafolha, there has been a significant shift in Brazilian public attitudes towards more conservative values. In the same year Brazil saw huge protests erupt across the country marking the beginning of a political-institutional crisis that eventually culminated with the impeachment of President Dilma Rouseff, and the establishment of a government clearly aligned with the most conservative sectors of society in 2016.

With this in mind, our research intended to verify to what extent the young people at our school conformed to this tendency and whether their views reflected a society and politics that was moving to the right. Via a questionnaire applied to a random sample of students, we tried to map their opinions on the themes mentioned above, including possible factors that contributed to their formation: religion, level of parental education, parental profession, familial income, gender, place of residence, etc.

The results obtained show an interesting variation: with the majority of subjects positioning themselves on the more conservative side of the spectrum in relation to crime, whilst at the same time leaning towards more liberal values when questioned about topics relating to gender and sexuality. These findings provide us with sufficient evidence to question the 2013 Datafolha study and the dominance of reactionary attitudes in a political environment that has swung to the right, highlighting a more complex and nuanced vision than all-encompassing general shift towards conservatism.

The Changing Pattern of Adolescents Mate Selection Preferences with Reference to Electronic MEDIA

The Study was conducted by systematically interviewing 322 adolescents (14-22 years old) in two major universities of Khyber Pakhtunkhwa to study the changing aspect of female adolescent role with reference to electronic media. The study showed that majority of respondents are unmarried, non graduated paternally educated, employed, maternally educated, unemployed adolescents residing in nuclear family with family income 25-30 thousand per month. A positive and nonsignificant ($p=3.73$) relationship was found between caste preference of mate selection and media exposure. Similarly, highly significant ($p<0.000$) and positive ($y=770$) relationship was found between social influence attribute of mate selection with media exposure. Likewise, highly significant ($p=0.000$) and positive $g=.770$ relationship was found between educated mate preference and media exposure. A significant ($p=0.000$) and positive $g=.330$ relationship was found between desire for an exceptionally good looking mate with media exposure. By the same token significant ($p=.051$) and positive $g=.663$ relationship was found between secular mate attribute in mate preference and media exposure. Correspondingly highly significant ($p=.051$) and positive $g=.999$ relationship was found between good sense of humor as obligatory requirement in a mate and media exposure. Similarly, highly significant ($p=.000$) and positive $g=.999$ relationship was found between moderation characteristic in mate selection process and media exposure. In same row highly significant ($p=.000$) and positive $g=.999$ relationship was observed between caring characteristic in mate selection process and media exposure. The study come up with conclusion that adolescent considers themselves as better than the average person on almost every imaginable dimension underestimating ground realities as indoctrinated by popular media causing Self-evaluation maintenance. The study revised Byrne and Nelson attraction model with Attrecion prediction model.

Unequal Leisure Opportunities across Genders – Powerless Women!?

Leisure is the means of reproducing our energies we lose due to objective and subjective weariness. While the 'cure' for objective fatigue is sleeping and resting, the solution for subjective tiredness is leisure and pleasure. We need both to stay healthy. Opportunities to stay healthy are however not equal in our societies: Place of Residence; Race/Ethnicity; Occupation; Gender; Religion; Education; Socio-economic status; and Social capital/Resources (all together referred to as PROGRESS) are the key determinants. In our presentation we highlight at the gender issue from among the key determinants, which status is in strong connection with almost all the above listed features. Throughout history women's political power, financial status (feminisation of poverty, wage gaps), education and labour market status (vertical and horizontal segregation) were

less favourable than men's. There are stereotypes like women cannot reconcile work and family. Women, who do all or most of the housework spare a lot of expenses for the family, without financial or moral appreciation. The Hungarian time-budget surveys performed since 1963 have proven, that the average time spent for work is more than in case of men and this extra time is taken away from sleeping and leisure.

The presentation will analyse the trends of women's time spent for leisure from 1963 till nowadays and their characteristic means of recovering their energies, using secondary statistical analysis and primary research data obtained by the research group the presenters are members of. We will also highlight at the health-mental health consequences caused by the lack of quality leisure time and powerful general resistance resources. Finally we will formulate the measures the Institute of Applied Health Sciences and Health Promotion takes to aid women in a better time management.

Temporary Jobs and Social Stratification in East Asia: Education, Occupation, and Intergenerational Mobility

The aim of this paper is to investigate the relationships between social stratification and temporary jobs in Japan, Korea, Taiwan, and China. Drawing on Goldthorpe's (2000) class theory, we predict the associations between education, occupation, and job temporality would be uniform across the four societies, but that gender difference in job temporality would be diverse. Using the EASS 2006-2012 datasets, we test these hypotheses. Although some predictions are falsified, most of them are confirmed. The gender difference in the temporary job rate is largest in Japan, second largest in Korea, and no difference is observed between in Taiwan and China. Low social class and educational level raise the temporary job rate, and the effects of class origin measured by the father's educational level is mediated by the children's educational level. These findings are uniform across in Japan Korea, Taiwan and China.

Painful Bodies, Fluid Borders: Visual Images and the Process of Making in Chronic Pain

Chronic pain is typically understood as an isolating experience; as Scarry (1985) famously observes, while one's own pain is certain, the pain of another is inherently the object of doubt. This paper will examine the role of visual images in chronic pain, moving from neuroimaging and diagnostic images to arts images that are made to express pain as a subjective experience. I will argue that while proving the truth of pain has been a central concern of many image-making processes, images are capable of doing far more interesting and productive work in relation to pain. The paper will draw on visual and object elicitation interviews on images and 'making' in relation to chronic pain, as well as my previous research using arts workshops to explore chronic pain communication. My contention is that the disruptive (as opposed to merely expressive or empathic) aspects of arts-based approaches offer new opportunities for understanding pain.

Beyond generalised assumptions that pain is somehow inextricably linked with, or at the root of, creativity, I explore what images mean for people with pain, in relation to agency, subjectivity, and selfhood. Where are the borders of the body in pain? How do images help to 'make up' or constitute people with pain in particular ways, and how might they do so differently? To what extent can visual images be used to make these borders more fluid and porous, rather than reiterating versions of pain as isolated, individualised and highly subjective?

Responsibility and Accountability of Parents and Professionals in Judicial Contexts: A Research Study with the Institutional Ethnography Approach

In the last twenty years, in Italy, as in many other Western countries, personal responsibility and accountability have been increasingly represented as features essential for people and organizations. Also the actions of parents and mental health professionals who work with family issues are assessed in terms of responsibility and accountability. This kind of assessment increases particularly in situations of crisis among the members of the 'traditional' family when they approach the justice system and have to be evaluated by third parties (e.g., judges, court experts).

Through the sociological approach of institutional ethnography (Smith 1999; 2006), this paper presents the findings of the first stage of a research study on the everyday social practices that regulate and coordinate the work of court experts and parents within the judicial context of child custody evaluation. Beginning from a visual auto-ethnography by the author, who has worked for many years as

a mental health court expert, the study utilizes participant observation, document analysis, and focus groups with professionals.

The paper examines the ways in which the everyday practices of parents and mental health professionals in a local court are textually mediated and shaped by the discourses on responsibility and accountability (and on the ways to assess their improvement) and by the need to perform these responsibility and accountability. With a focus on ruling relations, the paper explores the linkages among local settings of everyday life, organizations and translocal processes of administration and governance – that is, the linkages among parents' and professionals' everyday practices, judicial practices and procedures, professionals' guidelines, national and international policies, family law reforms. The analysis highlights how the everyday practices of performing responsibility and accountability (and assessing them) constitute themselves institutional regimes that affect the lives of professionals and families' members.

Absence of Anti-Immigrant Populism in Japan

How to deal with populism is one of the biggest issues for social science in the 21st century. Like most of the Western countries where populist parties and politicians have risen, Japan has experienced victories of them in some elections such as former Tokyo Governor Shintaro Ishihara, former Prime Minister Junichiro Koizumi of Liberal Democratic Party (LDP), Osaka Ishin no Kai and Toru Hashimoto of it. This might demonstrate that populism took root in Japan in some degree. However, a large part of Japanese populism has not taken anti-immigrant issues to win in elections. Even when hate speech movements against Korean residents developed in various parts of Japan, no political party nor major politician exploited anti-immigrant sentiment of the public to enhance their political status. Why is anti-immigrant populism absent in Japan at least at the political surface? Some factors can be supposed. First, there are fewer immigrants in Japan than in other highly-industrialised countries, which produces less social tension in Japanese society. Second, ethnonational citizenship has prevailed in Japan for a long time, thereby making unquestionable exclusion of immigrants from membership of the society. Third, related with the second, major parties like LDP reflect anti-immigrant sentiments of the public routinely and tacitly, occupying any space where anti-immigrant political parties and bodies would take up. Consequently, absence of anti-immigrant populism in Japan is not a positive, happy situation, but the result from the fact that anti-immigrant attitudes are embedded in routine political activities and institutions.

Reconsidering Migration Management from a Socio-Legal Perspective

As globalisation proceeds deeply, issues of inequality are addressed more sharply in the world. Especially, it is suspected that immigration inherently generate and expand inequality concerning immigrants. Indeed, in most cases, immigrants cannot help being engaged in so-called 3D works (Dirty, Dangerous and Demeaning works) in the host society. How can one resolve and/or alleviate inequality of immigrants in the host society? One idea has been already submitted, that is migration management. According to migration management advocates, if the state replaced migration control with migration management, immigrants could escape from the trap of inequality, because migration management can create a 'triple-win' situation among the sending country, the receiving country, and migrants. However, two research questions at least should be addressed here. First, can migration management really ensure benefits for all of these three actors, in particular for immigrants? Second, how can migration control be shifted to migration management? With mentioning some cases including care workers based on the Economic Partnership Agreement to Japan, this paper explores effectiveness of migration management in terms of tackling the inequality issue of immigrants moving across borders.

Normes Et Violences De Genre Au Bénin : Les Universités Publiques à L'épreuve Des Faits

Ces dernières décennies, l'institution universitaire, lieu d'apprentissages et de socialisation est le théâtre de violences répétées. Si l'éducation est cruciale pour autonomiser et transformer la vie des jeunes, il apparaît dès lors que la complexité et la fréquence des violences dans les universités compromettent gravement la réalisation d'une éducation de qualité, inclusive et équitable. L'objectif principal de cette réflexion est d'analyser les violences basées sur le genre en milieu universitaire à partir d'une lecture sociologique des mécanismes

sociaux et institutionnels mis en œuvre en vue de leur élimination. La démarche méthodologique adoptée est de type descriptive et analytique. Les données empiriques ont été recueillies à partir d'un échantillon aléatoire simple constitué d'enseignants, d'étudiants et de personnels administratif et de service. Les entretiens individuels approfondis et de groupe, l'observation directe, l'analyse documentaire ont été les techniques utilisées pour la collecte du corpus empirique. La triangulation des informations dans la perspective théorique de la déviance de Becker (1963) révèle que s'il est noté une certaine prise de conscience des violences de genre en milieu universitaire (VGMU) au Bénin, la lutte contre ce phénomène aux facettes multiples (violences physique, psychologique, verbale, sexuelle, etc.) ne s'est pas encore traduite par la mise en œuvre de politiques efficaces visant à réduire sa prévalence. Les mécanismes institutionnel, législatif et réglementaire de lutte contre les VGMU se heurtent à des stéréotypes et comportements socioculturels discriminatoires à l'égard des femmes. La prégnance du système patriarcal, où la domination masculine et la soumission féminine valent comme des normes sociales, de même que le glissement des inégalités entre les genres de l'espace domestique à celui académique entraînent une banalisation de la VGMU. Dès lors, l'inefficacité du cadre juridique et institutionnel de lutte contre ces violences permet souvent aux coupables d'agir dans l'impunité accroissant ainsi la vulnérabilité des étudiants.

Personal Networks and Conjugal Role Relationships of Retirement Period Couples

What kinds of conjugal role relationships and personal networks (kins, neighbors, and friends) do couples remain in their retirement period? This study will examine 19 interviews and consider two points; 1) the relationship between the conjugal role relationship (segregated or joint) and the connectedness of a husband's and wife's personal networks (low degree or high degree) are associated; 2) the causal relationship between the conjugal role relationship and the network.

The results confirmed that many of the couples had a low degree of connectedness in their networks, which means husbands' network does not connected with wife's network, even more each network (kins neighbours, friends) is not connected each other, and in the second, confirmed that four types of combination of degrees of connectedness in their networks and their conjugal role relationships.

Rather than there being a fixed combination of both the conjugal role relationships and the networks, there were both segregated and joint conjugal role relationships, depending on the thoughts of the husband and wife (their intentions) and the situation in which they found themselves (family crises).

Although couples are no longer subject to the normative pressures of social networks in the highly-mobile modern society, this has given rise to variable and unstable situations in which "it is totally up to each couple how they are as a couple".

A Criminalization of the Mind: Mental Health, Sexuality & Relationships of People Living with HIV Under the Context of HIV Criminalization in Canada

In Canada, the disclosure of HIV has been mandated by law since 1998. In 2012, the Supreme Court clarified the law. Now, PHAs are legally mandated to disclose their status to their partners when there is a 'realistic possibility of transmitting HIV'. As such, the use of condoms while having a low viral load no longer requires disclosure, from a legal perspective.

This paper examines the strategies by which straight and LGBTQ women and men understand and navigate the criminalization of non-disclosure of HIV and discusses the ramifications of this legal approach upon the mental health, sexuality and relationships of PHAs.

This qualitative study is based upon semi-structured, open ended interviews with 75 HIV positive straight and LGBTQ women and men across Ontario. The data were coded using the guiding principles of grounded theory.

Primarily, the law impacts the mental health of PHAs. It lowers their perceived sense of self-worth and fosters loneliness and isolation. It leads to a 'criminalization of the mind' where the spectre of the law keeps many PHAs out of relationships and decreases, if not truncates, their sexual activity.

PHAs often feel vulnerable in their relationships, as they fear criminalization being used as a weapon against them during the potential demise of their relationships. PHAs contend with these concerns in a variety of ways – by staying in the relationships they're in (whether they're healthy, unhealthy or abusive), documenting their disclosure in a variety of ways (so they can prove their disclosure in court), pursuing relationships only with other PHAs (so as to avoid criminalization) or by avoiding sexuality and relationships altogether by becoming celibate.

This study highlights the need for public policy to evolve to more adequately reflect and contend with the experiences of PHAs under criminalization.

RC14-263.9TATSIS, NICHOLAS* (*University of Athens*)*The Hermes Syndrome: Myth and Reality of Our Global Media(ted) Omnipresence*

As it is commonly recognized since the Enlightenment, Prometheanism has become the secular version of a new cosmology. The idealized by Aeschylus' play Greek hero symbolizes our rational discourse in modernity. However, it is paradoxically ignored that, once Prometheus won the battle with divinities like Zeus, (wo)men acquired Hermes' services as well. With the gift of new media technology, from a messenger of Gods, Hermes turned into a messenger for all Prometheans and united them into a media universe with unprecedented consequences. This paper explores the occurred communication revolution through such a media change in our own times, and explores the constitutive axes of the so labeled in here as "Hermes syndrome".

a. With the space and time compression, it offered us the divine privilege of personalized social "omnipresence". b. Enhanced world consciousness. c. Transformed localities into global enclaves. d. Connected activist groups as planetary movements. e. Created networks for associational and corporate webs. f. Made accessible knowledge depositories. g. Formed a visual and printed political citizens' "agora". h. Broadcasted instantaneously world events. i. Communalized mobility. j. Synthesized (un)realities. k. Allowed dispersed collectivities to operate as "I-Thou" individualistic relations. In sum, to use K. Marx's assessment about Prometheus, Hermes was sanctified as well, and (s)he can now be recognized as another "saint of media(ted) humanity".

RC39-689.6TATSUKI, SHIGEO* (*Doshisha University*)MATSUKAWA, ANNA (*Disaster Reduction and Human Renovation Institute*)KAWAMI, FUMINORI (*Graduate School of Sociology, Doshisha University*)*Causal Inference Techniques in Disaster Recovery Research: New Kids on the Corner*

Disaster management has been claimed as being "evidenced-based" through rigorous disaster research practices. Evidence in the most scientific sense is defined as "a causal relation between a treatment and its outcome." In real-life disaster research endeavors, however, researchers often encounter the situations where treatment and outcome variables are both affected by the confounding factors, which could lead to wrong conclusions about the causal relations. One such example is an issue of selection bias since it is almost practically and/or ethically impossible to assign subjects randomly into experimental or control groups. The other examples include the use of essentially correlational data and making inferences about the causations. This paper reviews recent use of new causal inference techniques in the disaster research field (e.g., long-term recovery) and advocates their wider utilization. Case examples are used to demonstrate such techniques as 1) adjusting selection bias using propensity score matching in the study that examined the effects of different types of temporary housing programs upon life (individual) recovery (Tatsuki, 2007) from the Great East Japan Earthquake (GEJE), 2) making causal inferences about the longitudinal impacts of critical life recovery facilitation factors over within-subject variabilities on life recovery scores using panel data analysis, and 3) identifying pre-disaster characteristics/conditions that enabled faster housing recovery among the GEJE impacted survivors using Kaplan-Meier survival curve analysis.

RC06-138.2TATSUMI, MARIKO* (*Osaka Prefecture University*)*Can Japanese Support Program for Women Researchers' Work-Family Balance Achieve Gender Equality?*

This study considers the achievement and agenda of Japanese support program for woman researchers' work-family balance to achieve gender equality. Japan ranks 111th among 144 countries on the Gender Gap Index, the advancement of women is an important agenda for Japanese government. The Ministry of Education, Culture, Sports, Science and Technology started a support program for women researchers' work-family balance in 2006. It aimed to increase the number of women researchers and improve their research skills. 90 universities have started this program from 2006 to 2016. This study examines the sufficiency of materials involved in this support program and the data about the researchers in universities. This support program helps women researchers by establishing nursery schools in universities and providing assistants for their research, allowing them to continue to work and research during pregnancy and parenting. In reality, the number of women researchers voluntarily leaving their jobs has decreased. However, the Japanese women researcher ratio was 15.3% in 2016, which is low by global standards. Gender equality needs change

the lifestyles of both women and men researchers, because the half of partners of women researchers are men researchers. In contemporary Japan, child caring fathers are recommended, and most of the younger men researchers care for their children. Men researchers comprise about 85% of the total researchers. The half of partners of the men researchers are full-time housewives, and those men do not have to take care of their children. Thus, child caring men researchers are a hidden minority within the majority. Therefore, the importance of both mothers' and fathers' child caring needs to expand, because most of the men researchers cannot perceive child-caring men. Thus, the support program for women researchers have to advance both "women and men" researchers for gender equality.

RC06-129.3TATSUMI, MARIKO* (*Osaka Prefecture University*)*Masculinities of Child-Caring Men "Ikumen": An Analysis of the Father Figures in Japanese Government Project*

This study unveils masculinities of child-caring men "Ikumen" in contemporary Japan. *Salarymen* masculinity is the hegemonic masculinity since around 1955 (the economic growth period). *Salarymen* take the breadwinner role leaving domestic duties to their wives. That is, *Salarymen* are the person who only work in their companies and do not care for their families. In contrast, fathering has become quite popular in Japan as shown by *Ikumen* phenomenon. The *Ikumen Project* started in 2010 as a Japanese government project. It was aimed to increase the rate of fathers taking child care leaves, and was expected to be able to change gender expectations. This study examines *Ikumen* figures shown in the posters used by this project from 2010 to 2015. In these posters, fathers are seen taking care of their children, however, they seem to give priority to work as *Salarymen* over child-caring, and their child-caring appears different from that of their wives. For example, the 2014 poster contains a picture of only a shirt collar and necktie which is the symbol of *Salarymen*, but no children, and a sentence stating "The working father is cool, but the father can both work and child-caring is cooler." It ends up recommending fathers' child-caring but states that their work is the first priority. In summary, *Ikumen* are the father figures who work long hours and cannot take care of their children like their wives. They seem to use child-caring for building their careers, because *Ikumen Project* appeals to companies to increase fathers taking childcare leaves. However, fathers childcare leave is meant for children but not for fathers' work. Thus, it may be difficult for *Ikumen* to change gender expectations in Japan which keeps inequalities between married men and women. We need a multiple role models for fathers other than *Ikumen*.

RC22-420.3TAVASSOLI, AFSANEH* (*Alzahra University*)*Islamic Feminism School and Its Challenges*

In contrast to the first and second waves of feminism, the third wave is more flexible than what is happening in religious societies and developing countries. This wave understands the attitudes towards women in a distinct way, possibly due to the development of social thinking in modernity. Despite such changes in the type of social thought, some theoretical schools, including Islamic feminism schools, still have to cope with many challenges. The confrontation with radical Islam, on one hand, and opposition to secular feminism, on the other hand, have brought specific challenges for this intellectual view, as we will interpret in this article.

Generally known as radicals or fundamentalists, some traditional Islamic thinkers argue that the basis of this viewpoint is a notion of an Islamic reformism and leads to a kind of religious elimination, even though they cannot escape from the most important critic of Islam: women's rights.

On the other hand, as many critics agree, the feminism school itself is a secular school with a libertarian foundation seeking for the rights of white middle-class women in a modern world, which will never match with religious roots.

The thinkers of Islamic feminism must address these two contradictory attitudes while considering the context of a society where traditional Muslim women are still trying to get acquainted with the most elementary concepts of women's rights.

RC48-813.4TAVERA FENOLLOSA, LIGIA* (*Facultad Latinoamericana de Ciencias Sociales*)*Collaborative Collective Action in Disaster Related Situations*

In response to the devastating earthquake of September 19th 2017, the residents of Mexico City undertook a variety of collaborative collective actions, just like it had occurred thirty two years before, with the earthquake of September 19th 1985. Although some similarities can be identified between the two earthquakes, circumstances were sharply different. For one thing, whereas in 2017 collaborative collective action was greatly built upon Facebook, WhatsApp and Instagram, in 1985 these information and communication technologies did

not exist. Secondly, whereas in 1985 urban popular organizations in Mexico City had been highly articulated, in 2017 the urban popular movement was almost non-existent. The purpose of this paper is to compare the impact of new information and communication technologies and the impact of the social fabric on disaster related collaborative collective action. Data will come from previous qualitative studies on the 1985 earthquake and from a qualitative study conducted between September 2017 and March 2018 in Mexico City through in-depth interviews, non-participant observation and the analysis of secondary sources.

Entre Revendication Démocratique Et Promotion De Soi : Une Nouvelle Visite Aux Causes Des Conflits Armés Internes En Afrique. Les Cas De La Sierra Leone Et De La Côte d'Ivoire

Foday Sankoh et Guillaume Soro sont deux personnalités politiques qui ont animé les rébellions en Afrique de l'Ouest post-guerre froide. Les rébellions dans leurs deux Etats, la Sierra Leone et la Côte d'Ivoire ont eu pour revendication commune la volonté de leurs animateurs d'instaurer la démocratie dans leur Etats respectifs.

Dans la perspective de résolution des différends dans ces deux Etats, des accords de paix furent signés. L'observation de ces accords permet d'affirmer que les acteurs internationaux à l'initiative des accords ont conseillé des mesures d'ordres généraux et démocratiques dont l'application était destinée à aboutir à une sortie de crise rapide.

Cependant, les conflits se sont enlisés, perpétuant la souffrance des populations civiles. Les lueurs d'espoir de sortie de crise dans ces deux Etats furent perceptibles quand des dispositions *intuitu personae* au profit des principaux animateurs des rébellions ont été concédées par les gouvernements centraux. En Sierra Leone, l'accord politique de Lomé contient une disposition centrée sur Foday Sankoh et lui confère le statut de vice-président du pays sans que celui-ci ne reçoive une légitimation populaire. En Côte d'Ivoire, la signature de l'accord politique de Ouagadougou permit la nomination Guillaume Soro au poste de premier ministre. Face aux pressions de l'opposition civile pour organiser l'élection présidentielle dont il avait désormais la charge, Guillaume Soro, qui avait largement dépassé le délai à lui imparti aux termes dudit accord a refusé d'entrer dans « le fétichisme des dates ».

Ce qui précède jette un doute sur la sincérité de la revendication démocratique des rébellions en Afrique post guerre froide. Notre communication démontrera que le si le déficit démocratique a souvent été brandi comme la cause des rébellions à la fin de la guerre froide en Afrique, la réalité résiderait dans la volonté de promotion de soi des animateurs de ces mouvements insurrectionnels.

TE KLOEZE, JAN* (*Foundation WICE-DSL*)

Inequalities and Similarities between Dutch Families: (Family) Leisure By the End of the 20th Century

In many studies on recreation and leisure as a social phenomenon, leisure is regarded as the opposite of work, or as compensation for work. Leisure is also seen as being complementary to an individual's line of work. However, a number of scholars question whether this is the most fruitful way of gaining insight into recreation and leisure. Philipsen (1963), Roberts (1981), Kelly (1983) and Te Kloeze (1985a) believe a family or household approach to be more productive, which means that the theory should be directed at the *social context* of leisure on a micro and a macro level. The social context of people refers to the primary life domains of leisure and family life – which are embedded in the wider context of society, both institutionally and socio-spatially. The question is how far the above is valid for leisure behaviour being an important part of (family) life. The family leisure market is arguably more important now than it has ever been (Southall 2010).

An empirical study on family and leisure was conducted in the mid-nineteen nineties (Te Kloeze 1996).

Part of the data of that study haven't been analysed before. Those data were focused on leisure behaviour; the activities undertaken during free time; the organisation of the leisure activities; task sharing between husband and wife. Traditional and modern-individualistic families were distinguished.

The content of the problem statement is as follows: how do (partners from) families behave in time and space with regard to activities undertaken during their free time, and are there inequalities related to their origin? (urban – rural; low versus high status; caring role; and gender)? We used data from diaries and from extensive interviews with husbands and wives.

In this paper the main findings of that analysis will be presented.

TE KLOEZE, JAN* (*Foundation WICE-DSL*)

Tourism, Sexuality, Violence, and Religion – Changes in Islamic Beliefs between the 19th and 21st Century

Since the inception of the discipline, sociologists have been concerned with power, violence and justice.

In a former paper I compared the attitude of six world religions towards tourism (Te Kloeze 2012), focussing on violence. Groups and individuals referring to Islam show being the most violent towards tourists.

On the other hand, Islamic societies and (sub-)cultures are well-known about their hospitality.

Although I found little reference towards a dramatic change in beliefs, attitudes, and utterances in the 19th century, the question remained whether this change was limited to sports, play and tourism (in the course of the 20th century).

Interestingly I found a possible similarity in sexuality (Leezenberg 2017). This author states Islamic past showed less taboos in *sexualibus* than nowadays. He pointed to the role of politics. A picture of the 1960s (about "boyhood prostitution"): "Compared with Tanger Sodom is a church picnic and Gomorra a meeting of girl scouts".

Which theoretical approach would be most fruitful? For now I believe the cultural imperialism and the colonisation theses are promising (Raponi 2014).

The following questions will lead my essayistic research:

1. Do changes in attitudes towards sports, play and tourism have the same roots as the changes in attitudes towards sexuality and the position of women in Islamic beliefs?
2. How far are the cultural imperialism thesis and the colonisation thesis helpful in order to make the reasons of these changes clear?
3. Which indications can be found regarding the more specific question whether (perceived) humiliation by (representatives of) the western world plays a role in this respect, ending in hate to all what is western, including tourism and sexuality, both being perceived as perverted products and utterances of the western world?

RC37-661.3

TEIXEIRA, ANA LUCIA* (*Federal University of Sao Paulo*)

The Conservative Resources of the Political Innovation in the Work of Fernando Pessoa

In the last decade, the world has witnessed the advance of a conservative wave that, although endowed with a transnational breadth, is fed locally by national political forces. If it has been clear for a long time that the development of history cannot be thought in a linear way; the work of some writers appears as a privileged space to think about the interbreeding between different rationalities – one of a political character and another of an aesthetic character – which point into different historical developments. This communication will focus on the apparent fracture between the conservatism of the political writings and the aesthetic vanguardism of the poetry of Fernando Pessoa, the emblematic character of Portuguese modernism. In the intersection between these two planes of the Portuguese poet's work, it will be possible to see how the author articulates a conservative political ideology for the construction of a political innovation plan for the nation, while it will be possible to show how the force of tradition continues to strengthen the language innovation project of that moment of successive vanguards. Thus, both politically and aesthetically, the relationship between conservation and innovation is so intertwined that it makes it difficult to conceive politics and aesthetics as autonomous spheres, as proposed by Max Weber.

TEIXEIRA, MARIANA* (*Cebrap (Brazilian Center for Analysis and Planning)*)

Objectification, Alienation, and Reification: Marx Meets Simmel in History and Class Consciousness

There are many affinities between Marx's analysis of the capitalist mode of production and Simmel's account of the modern monetary economy. Both authors underscore, for example, the significance of the division of labor and its nefarious consequences for the relation between subject (producer) and object (commodity) of production, or capitalism's tendency to quantify and thereby erase the particular qualities of virtually everything (and everyone). Perhaps nowhere have these affinities been more productively (albeit not explicitly) articulated than in Georg Lukács' 1923 *History and Class Consciousness*, a classic in 20th century Marxist theory. Although he there depreciatively labels Simmel "a bourgeois thinker", it is undeniable that Lukács was heavily influenced by *The Philosophy of Money*. He studied with Simmel in Berlin in 1906-07 and in 1909-10 but gradually distanced himself from the Simmelian framework, eventually turning to Marxism

and disparaging his earlier, more romantic, writings. It is worth noting, however, that Lukács was drawn to Marxism not *in spite of*, but precisely *because of* his previous engagement with Simmel's work and his account of objectification. Once one has that in mind, it is no longer so surprising that Lukács could recover the theme of reification almost a decade before the appearance of Marx's most notorious writings on alienation, the *Paris Manuscripts* of 1844 (published for the first time in 1932). In this paper, I explore the connections between these three concepts – objectification (Simmel), alienation (Marx) and reification (Lukács) – and the possibilities of actualizing them as conceptual tools to grasp problematic features of contemporary capitalism.

RC36-650.5

TEIXEIRA, MARIANA* (*Cebrap (Brazilian Center for Analysis and Planning)*)

The Dialectics of Suffering: Social Pathologies and the Tasks of Critical Theory

Obstacles to emancipation were described by critical theorists via different concepts, such as alienation, reification, and exploitation. More recently, the analogy to medical-psychological vocabulary – present in the notion of “social pathologies” – has gained importance, and the work of Axel Honneth has remarkably contributed to this tendency. However, while this terminology is ubiquitous in his work, its meaning varies over time. In Honneth's early writings, social pathologies are obstacles to individual self-realization, which are perceived as painful. Suffering, then, is taken as a symptom of social pathologies, offering, at the same time, a motivation for resistance. From the 2000s on, however, there is a systematic blockage in this motivational connection in Honneth's diagnosis, and social pathologies are identified no longer with the causes of suffering, but rather with *the erosion of the motivational aspect* of experienced suffering. A social situation is pathological, then, not because it entails suffering, but rather because social actors, although suffering, *do not feel compelled* to articulate this experience and to collectively struggle against its causes. Honneth now diagnoses, in a way that brings him in some respects closer to Adorno, widespread experiences of indeterminacy, such as loneliness, depression and emptiness over those of disrespect and misrecognition. This notion of social pathology suggests that the complete suppression of suffering should not be the aim of critical theory, whose goal would lie, rather, in contributing to more fruitful and democratic ways of dealing with social suffering.

Although this more sophisticated view of social pathologies overcomes most of the difficulties posed by Honneth's earlier formulation, it nonetheless retains a decisive problematic feature: the downplaying of structural relations of domination that produce very different kinds of suffering among different social groups. I will indicate, finally, how “peripheral” perspectives have developed insights that productively address this issue.

The Civic Engagement of Pentecostal-Charismatic Megachurches in the Philippines

There are many misconceptions over Pentecostal megachurches in the Philippines. They are often perceived as advocates of the prosperity theology and thus motivated by financial gain while their charismatic leaders are viewed by the popular media as individuals with a messiah complex because of the strong leadership demonstrate over their congregations and prominent role they play in the society. This chapter explores the growth of Pentecostal megachurches in the Philippines and their innovative indigenisation of the Christian faith as well as the influence of their Western counterparts. It begins with a review of the contemporary scholarship which has informed in the field and proceeds to identify the major Pentecostal megachurches which have been at the forefront of reinventing Christian witness in the Philippine society. It will offer two case studies of Pentecostal megachurches to examine their historical development, links to the poor and the middle class, networks, locations in the political landscape, doctrine of prosperity, and the form of their social and civic engagement. In doing so, this chapter seeks to answer the following questions: How have Pentecostal megachurches developed and what attracts the masses to attend them? What form of civic engagement do they play in indigenising gospel messages in the Philippine society?

New Forms of Collaborative Collective Action. What Does Sharing Society Mean?

In recent decades we have witnessed a progressive weakening of the moderating role that the welfare state was performing on inequalities and social

imbalances in the context of technologically advanced societies, which is assuming the gradual abandonment of mutuality, of social bonds that used to guarantee mutual support and interaction structures capable of making precarious life bearable. How important is to seek collective responses, and what effects and meanings share practices and collaborative actions have for participants and society?

The aim of the communication is to present one theoretical reflection on collective action and different examples of forms and experiences of collective actions which have a strong collaborative component and try to respond to collective challenges.

This proposal moves away from the concept of collaborative economy and seeks experiences that are developed in the field of mutual aid, solidarity, the defense of citizenship rights, not only to do-it-yourself but rather to do-it-with others, actions that reject competitiveness and are grounded in the concept of collective appropriation.

Risk Framing and Interdiscursivity of Climate Change Domestic Political Discourses: Comparative Analysis of Lithuanian and UK Cases

In this research we look at a set of discursive practices and texts – the domestic CC policy texts. The main questions addressed: 1) comparative analysis of how the risks are framed; 2) comparative analysis of the extent and character of interdiscursivity of the discourses; 3) analysis of how risk topic becomes a vehicle for enhanced interdiscursivity in the CC political discourses. We claim that risk utterances serve as carriers of diverse social meanings, become links to external discourses and thus contribute to interdiscursivity of the CC domestic political discourses. Rationale: risk statements are often supported with external reports, publications, focused policy documents, global and regional agreements. The critical discourse analysis approach allows questioning the “face” of interdiscursivity. The common risk frames impose some character to the interdiscursivity, which has to be examined. Analysis is conducted using NVivo.

The presentation employs issue framing theory (e.g. Scheufele, 1999; Spence & Pidgeon, 2010), Fairclough's model of critical discourse analysis (Fairclough 1992, 2013) and especially its notion of interdiscursivity (e.g. also applied by Carvalho, Pereira, 2008).

Lithuania and UK are taken for cross-cultural comparison. Previous analyses of CC public media discourses in Lithuania show its high reliance on external sources. CC policies are treated instrumentally in Lithuania. UK is regarded as a leader in international and domestic CC policy (EPCC report, 2016). Both Lithuania and UK follow the general EU CC policy. Yet because of differences in public attitudes and other socio-political contexts, the effectiveness of CC policies is different. Contrasting the two member states and looking for underlying discursive practices that serve as grounds for climate action, brings new insights.

The research project ‘Public Perceptions of Climate Change: Lithuanian case in a European Comparative Perspective’ is funded by a grant from the Research Council of Lithuania.

Indigenous People Migrate to the City: Visibility Versus Vulnerability

Indigenous people migrate to the city: visibility *versus* vulnerability
Maria Sarah Silva Telles

The text addresses the issue of indigenous migration to urban space, based on the biographical reconstruction of two natives who arrived and settled in the city of Rio de Janeiro, in a successful process of constructing visibility of their identity in an urban context. Today, in Brazil, there are more than 315,000 indigenous people in the country's cities, representing 49% of the indigenous population. For the majority that migrates, the condition of vulnerability is aggravated by the precarious conditions marginalized groups encounter upon arriving or living in Brazil's big cities. Most of the natives living in the cities remain invisible to society as a whole, which rejects their identity outside the village. Some of the terms used accuse the non-recognition of their indigenous identity: *desalted, acculturated, assimilated* (Albuquerque, 2015). Prejudice and discrimination complete the framework of urban vulnerability. I will use the biographical research method (Rosenthal, 2014) to provide understanding of the challenges and achievements of some indigenous people who migrate to the city and fight for the preservation of traditions and their identities. Migration of indigenous people to the cities has occurred since the 1950s, but they have usually sought to hide that identity. The city constituted a forbidden space, since the trip to the city implied in denying or hiding the indigenous identity and their cultural references. The Indigenous arrive in Rio either because they were expelled from their place of origin or because they

could not find opportunity to study, to take care of health, to meet their claims. They were doomed to oblivion and invisibility. Though reluctantly, in Rio society has been made to see the struggles of indigenous people. That is the huge challenge under discussion in this text.

Peasants and Attempts of Armed Resistance to the Military Dictatorship in Brazil

Between 1964 and 1985, Brazil experienced a period of dictatorship marked by repression of social movements and the working class. As René Dreifuss points out, one of the central themes of the public debate in the years before the coup was the agrarian question. Several peasant organizations demanded a more equitable distribution of land, and the large landowners contributed in the articulations for the deposition of the president João Goulart. With the dictatorship, in the countryside, thousands of families were violently expelled from the lands they occupied, several farms expropriated in previous years were returned to their former owners, many leaders were arrested, killed or forced to flee. In this context, fear was a very present feeling in people's lives, especially in subaltern groups. Despite this, various initiatives of resistance have taken place, from the scope of trade unionism to the armed struggle. In this work, we propose to analyze some attempts to form rural guerrilla groups based on an approach made by militants of armed organizations with peasants, with a specific focus on the way the emotional dimension has interfered in the processes of engagement, disengagement and not -engagement of peasants in these processes. As Daniel Cefai affirms, one of the most important aspects for understanding collective actions are the emotions, especially those that create the indignation necessary to be involved in the initiatives of resistance. For this work, we focused on a specific case in the municipality of Cachoeiras de Macacu, in the State of Rio de Janeiro, where the National Liberation Command (Colina) began the formation of a peasants group for guerrilla training. The methodology used in the research was the oral history based on interviews with survivors of the period, as well as queries to the archives of the political police.

New Accountability Schemes? Assessing Trends in Educational Assessment and Accountability Procedures in OECD Countries.

A main focus of recent educational reform projects which is particularly promoted by the OECD PISA study and the "New Public Management Paradigm" is the use of regular assessment and test-based accountability measures in schools and education systems. Assessments and accountability are exceptionally prone to educational reform, as they are relatively inexpensive and can be externally mandated. Thus, if PISA and similar testing projects would have the potential to influence national education policies, we should be able to observe this impact particularly in the area of accountability and assessment practices. However, systematic empirical evidence on changes in the prevalence and purposes of assessments is scarce. In this paper, we describe national evaluation and monitoring systems in education and their change in implementation over time. Particularly, we aim to assess, whether there are changes in the levels and purposes of accountability.

Our analyses include all items focusing on assessment and accountability practices (collected with the school questionnaires) from PISA 2000 onwards to the most recent PISA 2015 database. We limit our analyses to OECD countries since most of them participated in every PISA data collection. Based on the available items, we generate indicators of evaluation and monitoring systems of the respective countries by aggregating the data at the country level, and group them according to theoretical considerations. Thereby, we show how the development of evaluation systems over time can be analyzed with data from several PISA waves.

Our findings show that of 22 indicators which have been measured at least two times, 21 show a trend of decreasing heterogeneity across countries, as the (relative) standard deviations decreased. As regards to the average prevalence, all but two indicators show increasing values. Thus, there is a clear trend of increased assessment, evaluation and accountability – and less variation across OECD countries.

Power Equation between 'mothers and Daughters in Law' in Kitchen

The survey conducted across twelve cities and eight states by Help Age India, a leading nongovernmental organisation in 2015 revealed that every one in two senior citizens is facing some form of elderly abuse in India and daughters-in-law are the most common offenders. In Social Gerontology 'Feminization of Ageing' is an empirically established phenomenon which implies increase in the number of elderly women as against men. This paper is based on a conjugation of these two established facts. By extrapolation one arrives at the proposition that women who have not joined the group of elderly but would certainly be doing so at some point of time in their lives generally have a tendency to abuse their mothers in law. One wonders if the latter had ever played the role of the former with their respective older generation? This paper attempts to review the perpetuity and circularity of the conventional power dynamics between mothers and daughters in law. The domain of cooking room is the most probable area where the two of these roles particularly clash. The exclusion and marginalization that elderly mothers in law face at the hands of their daughters in law are reviewed in this paper. Due to the qualitative paradigm an interpretative approach is utilized to arrive at conclusions. A Narrative Interview Analysis technique is used on twenty respondents, all are residents of sub urban Mumbai and are living in a joint family composition for at least five years. All are above the age of sixty and are superannuated. The study focuses on the agonizing feelings, alienating experiences, fractured ego, broken norms and coping mechanisms of the elderly women. It comments on the probable solutions and the role played by the intermediate factors, kins, peers in mitigating crisis.

GEORGE, SHIRLY (*St Andrew's College*)

Trajectories of at-Home Geriatric Caregiving

In India the problem of Population Ageing is seriously understated. The sporadic and scattered mention of it in Sociological discourse is far from noting the reality of the gravity of the phenomenon. 'Care' is a subjective, abstract configuration. Even after filtering out the emotionality and utopian element of care; the ground reality of it is multidimensional with differing empirical configurations in varying circumstances. Care giving is an acquired skill and not merely an ascribed intention. However in Indian society such a consideration is remarkably absent. The institution of Family is assumed as having an inbuilt, organic capacity to care for elderly; without factoring in the rapid changes in the structure and functions of the institution of family. This kind of assumption compels women, who conventionally are placed in the position of care givers to take up the responsibility of looking after the elderly in the family.

This paper is an attempt to review the fractured potential of family as a care giving agency at the cost of the emotional, physiological and financial burn out of the middle age generation women as care givers. The paper focuses on sixty households as units of study. Thirty in Mumbai (Maharashtra) and thirty in Kottayam (Kerala). Every unit is studied as a design of three generations – maternal / paternal grand parents, married middle age parents and young growing up children. The research paradigm is qualitative; the technique of unstructured interview is utilized. The women care givers of the middle stratum of the design are interviewed to understand the perceptions, satisfaction, problems and discontent of being part of this process. Researchers hope to arrive at a comparative understanding of the at-home care giving in the two cities which represent two significant states in India.

Is Mexico Attractive for German Investment? a Diagnosis.

Globalization today is an established phenomenon. In general, globalization is considered a process that intensifies, expands, accelerates and affects social relations in the world (Steger, 2013). In this context, the aim is to analyze Mexico's strengths and weaknesses as well as Mexico's opportunities and threats for foreign investments. A SWOT analysis for the justification of the establishment of German companies in Mexico is applied. The present work emphasizes German organizations in Mexico, since Mexico and Germany maintain close economic relations which were strengthened in 2015 in the institutional framework with the establishment of a binational commission (Peña, 2016).

A non-experimental research is applied based on documentary analysis of primary and secondary sources of information, all with an exploratory scope. The results show that the ratio of strengths and weaknesses, and opportunities and threats is relatively balanced. In comparison it is possible to observe many strengths of Mexico which are usually sufficient to respond to changes in external factors. However, Donald Trump's policy involves uncertainty in several areas of the economy. There will be many changes for Mexico and its economy. It is still unclear to what extent Trump wants to modify the FTA with Mexico and Canada and thus could create new trade barriers.

RC34-629.4TENORIO, LUIS* (*University of California, Berkeley*)***Minors As Brokers: The Processing and Resettlement of Unaccompanied Minors***

Taking cue from the work of Wilfried Lignier and Julie Pagis (2012,2017), this paper seeks to center the experiences of unaccompanied minors from Central-America seeking protections and status in the U.S. and analyze and map the way in which they understand and operationalize concepts of "autonomy," "agency," and "dependence." In doing so, I bridge together the psychological perspective of children, adolescents and developments, the sociological perspective of children and childhoods, and the legal perspective of children, minors, and best interest to conceptually develop what I call "Ages & Stages," which will operate as a theoretical and conceptual tool towards a youth theory of migration. In particular, I focus on conceptualizing "Minors as Brokers," in relaying how they take on the identity of a "client" in interactions with agency and other officials. In outlining this tool, I also highlight ways in which our current theorizing of immigration and migration conflate the adult and child/adolescent experience in culturally and contextually significant ways.

Bridging the three perspectives of law, sociology, and psychology also underscores and addresses tensions in the categorization of this, and similar, populations; for instance, in discussions of whether they are to be treated as "refugees" or "migrants," "children" or "minors," "unaccompanied" versus "independent," etc. The data this paper draws from is an eighteen-month participant observation study of a legal services office which aides unaccompanied migrants, as well as 30 interviews with attorneys which have experience working on cases of unaccompanied minors in New York, Texas, California, and Arizona. The participant-observation element of this project allows me to understand the articulation and exhibition of these concepts of "agency," "autonomy," and "dependence" as embedded in children's interactions, as well as frame them with their own words.

RC53-880.5TENORIO, LUIS* (*University of California, Berkeley*)***Negotiating Agency and Home-Making: The Processing and Resettlement of Unaccompanied Minors in the U.S.***

In 2016, UNICEF reported children as the fastest-growing migrant demographic—estimating 50 million worldwide. The U.S. has experienced this demographic shift with independent children from the Northern Triangle of Central-America—over 68,000 in 2014 alone. From data gathered through an eighteen-month participant observation project, this paper centers the experience of these unaccompanied minors to analyze the way they negotiate the dynamics and contested notions of agency and dependence; how they leverage different networks in the process of home-making and belonging; and how they navigate and/or resist incorporation as a population both absent the presence of traditional parental/guardian figures and whose formative years are still unraveling. With this analysis done against the backdrop in which the U.S. state holds particular relationships of power with these children's countries of origin, it serves as a critique of U.S. assumptions and notions of children/childhood and underscores the cultural tensions that then affect both the processing and resettlement of these minors.

RC32-JS-61.3TEO, YOUYENN* (*Sociology, Nanyang Technological University*)***Work-Care-Migration Regimes and Class Inequalities***

Scholars have highlighted the multiple dimensions of care and its intersections with migratory patterns to collectively show that there are wide-ranging and sometimes unintended consequences to the global intensification of migrant care labor. My paper focuses not on migrant workers themselves nor on people who hire them. Instead, it throws into the mix a class of people who do not have access to migrant care workers, but who nonetheless live in a society where norms and standards are set by people who do. I address two main empirical questions: what is the nature of the work-care-migration regime in Singapore, and how is class articulated within it? How are the lives of the lower-income affected by this regime?

As feminist scholars and activists challenge existing state policies, societal norms, and corporate practices, we must continually insert into conversation the question of class variations and inequalities. The chapter makes the case for an expanded view in thinking about the effects of paid domestic work on public policy and the wellbeing of various groups in society and along the global care chain.

RC43-734.2TEOTIA, MANOJ KUMAR* (*Centre for Research in Rural and Industrial Development (CRRID)*)CHAUDHARY, ASHU (*Association of Professional Social Workers & Development Practitioners (APSWDP)*)KUMAR, ANIRUDH (*CRRID*)***Housing for the Poor Slum Dwellers in Himalayan Towns of North-Western India: A Case of State Induced Segregation in Summer Capitals of Srinagar in Jammu & Kashmir and Shimla in Himachal Pradesh***

The housing segregation in Himalayan towns of North-Western India including in Srinagar, the only metropolis of the turbulent state of Jammu and Kashmir and in Shimla, the only Class I town of Himachal Pradesh seems to have grown in post liberalisation period. The inequality in terms of access to housing, land, basic amenities and livelihood options has been growing with exclusion and segregation of sizeable population from mainstream urban society. The state and its local institutions have been unable to cope with growing urban challenges despite implementation of the initiatives by Central Government at local level which rather seems to have resulted increased segregation of human settlements in both the towns with multiple deprivations. Due to commodification, the urban poor find it difficult to purchase land or house. The pace of housing under central schemes/programmes seems to be very slow in providing adequate and affordable shelter to all the slum dwellers. The cities are being fragmented and new forms of inequality seem to be emerging as both the cities have provided housing to the poor far away from the city centres. The new housing settlements provided by the governments are segregated from mainstream urban settlements not only spatially but also in terms of access to basic services. Although there are some good examples of housing the urban poor in some of the towns in the region but they are also not without the issues of displacement, dispossession, deprivations and segregation etc. The denial of human rights and housing justice is visible which calls rethinking of existing housing programmes. The capacity of state and city governments to foster inclusive urban housing policies and improve social fabric has been questioned in many ways in the paper. City specific strategies have also been suggested for inclusive housing settlements for the urban poor.

RC34-628.2TERACHI, MIKITO* (*Ibaraki University*)***Local-Orientation in Japanese Youth and Xenophobia / Nationalism***

The purpose of this study is to reveal the relationship between local-orientation in Japanese youth and xenophobia/nationalism. Regarding today's Japanese youth, while their local-orientation is positively evaluated on the grounds of expectation as bearers of depopulated areas in an aging society with fewer children, it can be concerned about some negative aspects. One of the concerns is that their xenophobia can be increased by lack of opportunities to engage with various people. This study analyzes a nationwide survey carried out by the Japan Youth Study Group in 2014. Respondents aged from 16 to 29 were sampled from mail survey panel owned by a research company. Two multiple regression analyses were conducted: one explained variable is the pros and cons of fostering nationalism; the other explained variable is tolerance for foreign-born neighbors. The explanatory variables are regional affection, mobility experiences, and consistency between residence in middle and high school and current residence. The control variables are gender, age, education, level of living, DID, cultural capital, number of friends and life satisfaction. Major findings of the analyses are summarized as follows: First, cultural capital and regional affection have positive effects on the pros and cons of fostering nationalism. Second, the number of friends has a positive effect and consistency between old and current residence has a negative effect on tolerance to foreign-born neighbors. The result reveals that youth xenophobia is related to living in a native place as an actual fact rather than local-orientation as consciousness. The Japanese government promotes policies to retain Japanese youth in their native places by reducing urban universities' admission quota and to bring in scholarships on the condition of job hunting in native places. On the basis of the above results, we can consider that these approaches have a risk of contributing to heightening Japanese youth's xenophobia.

RC24-446.2TERADA, RYOICHI* (*Meiji University*)***An Environmental Sociological Analysis on Risk Perception and Typology from Perspectives of Environmental Justice, Post-Materialism, and Environmental Democracy***

According to Ulrich Beck, "risk society" is the society in which "production, distribution, and definition of risks" become the most crucial issues. However,

engineering scientists always assess the risk level using an equation: Risk = Hazard x Probability (or Exposure) without taking social process of "definition" into account, as Shrader Frechette criticizes as naïve "scientific" reductionist.

In this presentation, I propose a three-fold typology of environmental risk; a) risks with fixed probability that can be assessed with $R = H \times P$ equation, b) risks with scientific uncertainty, and c) catastrophic and irreversible (accordingly incalculable) risks. Well-known pollutants such as heavy metals and SOx belong to type a) and recently discovered ones like endocrine disruptors are type b). Nuclear accidents and GMO pollution would be categorized as catastrophic types. I hypothesized correlation between type a), well-known risks and "environmental justice" cause. While type b), uncertain risks and type c), catastrophic risks would be rather correlated with "environmental democracy" or precautionary principal concerns. Also, we can expect that those in lower social strata tend to be concerned about the former and that those in upper-middle strata with more "post-materialist" values tend to be concerned about the latter.

We conducted opinion survey twice to verify the hypotheses, once in East Japan area in 2012 and the other both in Japan and in Taiwan in 2017. We found that the respondents' perception of risks broke down roughly into the three categories and those in lower strata were more concerned about disproportionate distribution of risks (environmental justice). Those with critical view on nuclear energy or GMOs tended to support environmental democratic policy principles. Difference in political culture also affected the perception. In Taiwan, the Democratic Progressive Party supporters were more anti-nuclear in particular.

How Musical Communication Is Possible: An Analysis with Thinking of Phenomenology and Collective Memory

The purpose of this paper is to investigate how people communicate with others and build an intersubjectivity in musical communication, referring to thinking of Alfred Schutz, Edmund Husserl and Maurice Halbwachs. In this paper, musical communication is an interaction among composers, players and listeners through music.

First, this paper refers Schutz's and Husserl's works to highlight a principal of musical communication. Schutz shows a sequence of tones in a phenomenological analysis, *Fragments Toward a Phenomenology of Music*, and says people may expect next tone by way of protention. Protention is a term from Husserl's analysis of passive synthesis and means one of a perceptive ability to predict things before they occur. In spite of the suggestion, Schutz didn't mention details of mechanism of passive syntheses including protention in his analysis. This paper makes use of their analyses to explain what happens in a musical experience.

Second, this paper focuses on a sheet music. Halbwachs says a sheet music consisted of hundreds of notes is a system of signs and preserves musicians' collective memory. Halbwachs considers a sheet music as a social framework of musicians' collective memory. Halbwachs distinguishes professional musicians from amateur musicians, because former can find a system of signs in a sheet music. This paper investigates their musical experiences in view of their unique methods to understand music.

Lastly, this paper investigates how people do musical communication and build an intersubjectivity in a concert hall in spite of having different backgrounds. The key is a rhythm. Rhythm is helpful for both professional and amateur musicians to understand music and to recall memories. That makes them possible to communicate with others and to build intersubjectivity across cultures.

This paper concludes musical communication is based on passive syntheses and rhythm is essential to people to build an intersubjectivity in communication.

Multilingual and Multicultural Mexico between Homogeneity and Heterogeneity

Linguistic and cultural diversity is common in a world where migration is increasing. Although homogeneity often seems to be the ideal for many people, heterogeneity is becoming more and more reality. At the same time there is a tendency towards homogeneity too. This paper seeks to locate Mexico in a position between homogeneity and heterogeneity.

Mexico was a country with high cultural and linguistic diversity when Europeans arrived. Just as with most other countries around the world, the capital city has attracted migrants from all over the country who represented such diversity.

The country has a population of 112 million inhabitants, and a large part of this population is living in the capital and surrounding areas. Although multiculturalism is a fact across the history of Mexico, many Mexicans have largely ignored it. In general, the Mexican population has shown little interest in works addressing linguistic diversity. Usually, people refer to languages as "dialects", even though there is a considerable linguistic distance between the languages spoken in Mexico. There are, for example, languages like Mayan Yucatec spoken on the peninsula of Yucatan and Otomi, spoken mostly north of Mexico City. These two languages differ from one another as much as English and Chinese do.

Nowadays there are different regions in Mexico where multilingualism is already present. At the same time there are a lot of regions where monolingualism is dominant, in spite of returning migrants from the US. Mexico is moving between homogeneity and heterogeneity and I consider that actually the tendency seems to be homogeneity.

Looking for an emotional trigger in Brazil's 2013 Network of Outrage

In June 2013, mass protests erupted throughout Brazil, and soon protests that first attacked bus fares transformed into a multitude of demands and criticisms directed at the Brazilian State. According to Castells, Brazilian protesters were similar to the Indignados in Spain and the Occupiers in the United States in some core values, such as questioning traditional institutions. What this paper seeks to uncover is the reason that made so many people start questioning state's legitimacy in such a short period of time. If we agree with Castells that social movements are triggered by emotions shared collectively, there must have been an emotional event during the first days of protests that appealed to bystanders, transforming them into protesters in the days to come.

The hypothesis of this paper is brutal violence used by the police against pacific protesters played a major role in the delegitimation of the state. This paper argues that such abuses served as this emotional trigger, helping evidence the hypocrisy of the Brazilian State, in which even though citizens legally have the right to demonstrate, they are still repressed by state violence. Since the internet's importance in creating Outrage Networks has been highlighted by recent social movements literature, this study will analyze the online aspect of the debate. Thus, millions of tweets referencing the protests were collected throughout the month of June 2013. In order to select the most important tweets in recruiting, we will look at the most retweeted post at times in which a high number of new members entered the online debate. We will then categorize messages by themes in order to understand which subjects were most important during effective recruiting periods. Thus, we will be able to access which framings were successful in gathering new protesters, and which emotions can be found on them.

Online Framing of LGBT's Community Against the Brazilian's "Gay Cure": The Judiciary and the Question of Democratic Legitimacy

This paper's objective is to analyse the online debate of Brazilian civil society regarding law 01/1999 that prohibits psychologists to treat homosexuality as a pathology and, therefore, to offer treatment for it. However, in 2011 the Congress received a bill (popularly known as "Gay Cure") to suspend the law. During Brazilian's 2013 protests, the attacking of the bill became one of the demands, and it did not pass. Still, in 2017 a federal judge ruled in favor to suspend the law.

These two events reveal a great disparity in terms of democratic legitimacy. When trying to pass through Congress, civil society's pressures managed to stop democratically-elected representatives of revoking the bill. However, since judges do not worry about the electorate, the suspension of the law was enforced despite the mobilization against it. Hence, we argue that, although the Brazilian judiciary might have a democratic deficit in certain decisions, thanks to online power dynamics it is becoming easier for civil society to question them and pressure for a more democratic debate.

The decreasing cost of informational diffusion facilitates marginalized groups to pressure the government, propagating their voices through online activism, and even organizing protests. Thus, this paper will focus specifically on how the LGBT community frames the issue in order to pressure the government and gather supporters. Although a few framing studies have focused on the online aspect of framing, there is still a gap of empirical studies using quantitative analysis with Big Data to focus on how social movements frame issues. Therefore, using Network Analysis allied with qualitative and quantitative textual analysis of the Twitter debate of the issue both in 2013 and in 2017, we will analyze how the community might have framed the issue differently after the undemocratic judiciary decision.

A Conflictual Encounter: Turkish Conceptions of Syrians' Body, Health and Gender

Since 2011, more than 3 million Syrian refugees fled to Turkey, and many of them prefer to live in major cities, such as Istanbul, which provides a large social network and more employment opportunities, as well as a better

access to education and health care. However, the refugees often experience discrimination and endure violence during their daily lives and social interactions, which can be partly related with Turkey's own political and social polarisation, tensions and economic crisis. My talk aims at exploring the Turkish conceptions of Syrian bodies, gender and health, through a discursive analysis on media and social media, as well as how the Syrians react to these problematic conceptions and negotiate with them in their daily lives in Istanbul, through the interviews I conducted with them.

I focus on the popular discourse on Syrians, "who bring only trouble and diseases from their own country", and discuss how the political, legal, economic, social and cultural factors lead to these victim-blaming, discriminatory discourses against the Syrians in Turkey, and how these discourses are reflected and reproduced in the health sector. Syrians have disadvantageous living and working conditions in Turkey which further deteriorates their health. Often the Syrian refugees do not know how to pursue their health care rights, and experience problems in the hospitals, because of the language issues, bureaucratic problems, and discriminatory attitudes of the health care staff. Syrians' bodies are often seen as a political and social threat, and their health problems are evaluated as an extra burden for the health care providers. The talk also explores whether NGOs can provide alternative, more inclusive discourses on the Syrians and their health conditions. The theoretical framework of my talk benefits from Hannah Arendt's banality of evil, Arthur Kleinman's social suffering and Paul Farmer's take on global health inequalities.

Transnational Intimacies - a Biographical and Ethnographical Study of the Figurations between German Female Tourists and Kenyan Males in Mombasa (Kenya)

My paper is about a phenomenon which is currently referred to as female sex tourism or romantic tourism. Based on the results of biographical and ethnographic research, I will discuss the figurations between female tourists and local men, their (unequal or asymmetric) power balances, and the interrelation between discourses and biographical self-presentations.

While the behavior of sexually active men in countries of the Global South is relatively well researched, little is known about female tourists and their intimacies with local males. In my paper I will focus on the figurations between female German tourists and Kenyan men on the eastern coast of Africa. I will discuss the question of how the involved actors configure and experience their intimate relationships? How do they deal with inequalities and changing balances of power and how do discourses on these relationships influence their biographical self-presentations, in other words how are these discourses perceived, modified or rejected by the biographers?

The research results are based on a combination of participant observations and the analysis of biographical-narrative interviews which were carried out at the Kenyan coast. According to my empirical findings we need to question the simplified representations that dominate the current scientific discussion: while some researchers present the sexual activities of female tourists, in contrast to male sex tourism, as a distinctly different activity, others argue that sex tourism or romantic tourism does not depend on biological sex or gender.

My reconstruction of biographies of women and men shows that both interpretations fail to do justice to the complexity of social reality, and that a deeper understanding of the phenomenon "female romantic or sex tourism" is only possible if one goes beyond the "holiday situation".

TEUTOBURG-WEISS, HANNES* (*University of Teacher Education Zurich (PHZH)*)

The Contribution of Vocational Skills Development to Inclusive Industrial Growth

While there have been intensive debates about the concept of development – e.g. the post-development literature or the debate surrounding Amartya Sen's *capability approach* – a substantial number of practitioners and academic researchers still see (inclusive) industrial growth as an integral part of societal transformation and human development. After the global financial crisis of 2007 and the ultimate breakdown of the Washington Consensus one can identify two major trends in the development field: a) Industrial policy is no longer discredited and is therefore again seen as an integral part of the transformation of economies, b) vocational skills development (VSD) becomes a major priority for many governments and international organizations.

While there exists an extensive literature on technical and vocational education and training, a myriad of case studies concerned with economic transition in developing countries and a renewed interest in political economy, the concrete transmission mechanisms between VSD and (inclusive) industrial growth are still nebulous. This includes the relationships between VSD programmes and their economic and societal surroundings.

I – as part of a team of researchers working within the international r4d-project *The Contribution of Vocational Skills Development to Inclusive Industrial Growth and Transformation: An Analysis of Critical Factors in 6 Countries* – propose to look at the linkage between VSD and inclusive industrial growth from a genuinely sociological perspective. Irmgard Nübler suggested seeing productionist capabilities – understood as specific, collective knowledge sets – as key determinant of economic development. In this regard one could argue that VSD programmes are a form of capability building, which in turn could lead to economic transformation. I suggest adopting a critical, holistic perspective inspired by Nüblers proposal and the sociology of knowledge to deepen the understanding of the linkage between VSD and inclusive growth, while at the same time staying watchful for disruptive developments.

The Ladies Sangeet (Music) in India: A Classic Tradition of "Good Leisure"

Leisure has different classifications, and is termed as good or bad according to the benefits which are seemingly derived, in context of both for the individual and the society. The Ladies Sangeet, or in Hindi, the Mahila Sangeet is a long old custom and tradition of India, wherein women from a family, along with the relatives and friends, assemble to celebrate a marriage ceremony. It is presumed that music and dance, both add vigour and enthusiasm to the joy and promote a sense of togetherness and harmony. This function is strictly limited to the women folk, and is seen as an instrument of good leisurely activity, as women usually do not find time for such type of activities. The present study samples 25 families dwelling within the City of Kanpur, India. These families, over the past one year had undergone a marriage in their house, either son's or daughter's. The analysis takes shape in the form of a case study wherein these families were interrogated in relation to their common leisurely practices, the time factor, economical status, cultural dominance, and participation of the women folk, with a final answer on the results of such a gathering. The Cult of Domesticity was a social standard that dictated general behavior and actions in the household, on the streets, even within marriages. The premise was that ideal woman should be innocent, pure, chaste, and, a mother. Above all, she should be submissive to her husband, whose "position was ordained by biology and theology." (Campbell 1979, 2) According to the Cult of Domesticity, marriage was the ultimate goal. Motherhood was the ultimate responsibility in fulfilling a woman's social role. It was observed that Ladies Sangeet emerged as an outlet for these women to assert independence and literally embody the contemporary ideas of their generation.

Constructing the Body through Dance: Overcoming Social Malice

In a human culture, dance functions as a fundamental purpose to accomplish societal unity and harmony or togetherness, as a result of which letting them feel a deep intellect of close association with each other. As a consequence to this, people are unchained from the connections of individualism, i.e. the "ME". Cultures, the customary ethics and values of which are yet unharmed, are likely to value the interconnected or united effects of dance. The 19th World Congress of Sociology of ISA 2018 seeks what more from students and professional dancers as us, to contribute our bit towards synergizing minds and diverting those who have been distracted. By diversion, I not only intend to address those engaged in turbulent and terror strategies, but also towards those who are shining minds but have disengaged themselves from the main strata of our society.

Dance can also be construed as a structure of devotion and worship, a way of glorifying ancestors, means of propitiating the Deity, or a process to produce delight. All, in whatsoever manner, require and necessitate apt concentration, resulting into empowering our bodies only for this sole purpose. This in turn distracts the being from other tumultuous orders. As a proponent of "Kathak", an ancient and worldwide popular dance form of India, I study the structural changes occurring over a passage of time, through this journey. I discuss the issues arising in consonance within the society, which is attended to simultaneously. Dance assists to conserve the people's culture in the most effective manner, and in the process addresses the factor of "negativity", thereby overcoming social maladies. A case study methodology has been applied in this analysis, hypothesis being that proper construction of the body via dance is satisfying, both to the mind, and the eternal world.

FIFA U-17 India: The Future of Football - Expansions Endorsed

The FIFA U-17 World Cup India 2017 may see some of the most excellent and gifted juvenile players from around the globe collectively in a preview of the potential and future of the men's sport, but the organizers in India want to

ensure that girls and women too take a part both mentally and physically in the tournament's legacy. The name given to this dream project is "Mission XI Million", which envisages making sure that all youngsters, both girls and boys, invariably play a role in developing the future of football in India, a nation which has been obsessed with the fever of cricket for decades. The FIFA U-17 in India happens to be an endorsement and approval for football, which till now has found itself limited to small playgrounds, lacking for apt facilities and amenities, and with almost no commercial support. The Government of India is firm in its resolve, to support the cause of football, and garner our youth to grow themselves into proper players, and individuals, and in this process, decent citizens. This project revolves around the noble idea of contacting Schools aiming to get 11 million children enjoy the game of football, with the sole intention and revelation of making football an alternating sport preference in India.

In my role as a State Coordinator of the IAAF Kid's Athletics Program, which too draws children from Schools, I envision this Mission as one analogous initiative to make sport practices in India more vibrant. Having studied and practiced the Kid's Athletics, I draw a report on the positives of the Mission XI Million, and in my role as a Sociologist, to outline the primary obstructions for sociological growth through the sport of football in particular, as a movement, to achieve further recognition as a valuable instrument for development.

The Whitening of Ethnic Women in U.S. Popular Media

Representations of women of color in Western visual media have long been subjected to "white" beauty ideals – specifically, the preference for (and perceived attractiveness of) seemingly white features, such as fair skin, straight hair, small noses and lips, and slim figures (e.g. Collins 2000). These beauty ideals influence the intentional decisions made by (mostly male) media producers when casting female roles (e.g. Mulvey 1975). Even with some increases of diverse representations in the 21st century (e.g. Thakore 2016), women who adhere to these beauty ideals are more likely to be cast in dramatic and romantic roles. Those women of color who challenge these norms are limited to comedic representations. This is particularly the case for non-black U.S. women of color (ethnic women), who seemingly occupy a middle-ground status of being acceptable enough to be written about and cast in media representations, but still subjected to non-white minority status. In this chapter, I will discuss: a) the historical context of the perceived attractiveness of "white" features, b) a brief overview of the history of women of color in visual media, c) examples of ethnic women in 21st century representations, and d) a matrix of understanding which women, which ethnicities, and which roles are most and least subjected to these dynamics.

THAKUR, MANISH* (*Indian Institute of Management Calcutta*)

Economics and Sociology in Post-Independence India: Contestations and Appropriations

Academic disciplines are to be seen as 'unstable compounds' that go through a series of contingent transformations depending upon a range of institutional and political factors. The characteristics of the national field of intellectual production, the geopolitics of global knowledge creation, and the relative scientific rigour and scholarly robustness (real or perceived) of the neighbouring disciplines – all play a role in shaping the historical evolution and contemporary configuration of a given academic discipline. Sociology in India has not been impervious to these general influences. In fact, it has largely grown under the shadow of the much more influential and policy-relevant discipline of economics. The latter had a kind of inherent standing as it was bestowed upon the role of providing a newly-independent nation with the master key to unlock its pressing problems of poverty, unemployment, under-development and the like. And, sociology has had to inch its way to the academy by agreeing to play second fiddle to the national prominence of economics. By trying to smuggle in culture in the interstices of the planned economic change, sociology stayed its course by demonstrating its relevance, albeit of a lower order than economics, to the policy priorities of Indian state. As a consequence, a certain intellectual division of labour was normalised wherein sociologists generally kept off from the study of 'economy' and tried fashioning themselves as students of 'traditional' institutions and cultural obstacles to development and change. Against this backdrop, the paper maps out the contested field of interactions between these two disciplines in post-Independence India. It also explores if the emergence of new economic sociology had the promise to re-write the terms and protocols of intellectual exchange between economics and sociology in our times.

Indigeneity and the Question of Collective Identity

Evolutionary anthropologists consider the hunting-gathering mode of subsistence as the preliminary stage of human evolution. There are a few communities even today partly depend on the hunting-gathering mode of subsistence. Their interaction with "the other" and the interventions of the State and non-state agencies are major sources for their shift into other economic activities and territories. Such shift plays a catalytic role in the transition of identity which is often symbolically expressed in cultural and economic activities. But, indigenous peoples often assert on a common identity in the event of an external force which adversely affects their habitat or curtails their rights over the habitat. In such cases, the identity acts as a source of collective mobilization. The indigenous peoples of India often assert on collective identity in the times of need despite the scattered habitat arrangement in huge territories. At the same time, identity is not necessarily the homogeneity in all aspects of the culture. Its manifestations may vary according to the variety of social situations in which it is expressed. Multiple identities may emerge based on the categories within an ethnic group. This may result in the structural differences within an ethnic group over a period of time. In this context, this paper examines the sources of identity, circumstances of its expression and assertion and its transformation among the hunter-gatherer communities in contemporary India.

Aesthetic Torment and Samizdat Whispers: Questions for the Study of Czech Countercultural Social Movements before and after 1989 in a Global Perspective

My current research examines the working-class counterculture of post-1968 Czechoslovakia – the groupings and networks of hippies, rock musicians and samizdat authors often termed the 'underground' – as a social movement, yet one significantly diverging from the standard frameworks of scholarly analysis applied in both the Global North and South. The experience of European 20th-century state socialism, it would seem, remains unintegrated into scholarly attention from outside the geographic region where this method of governance existed; in turn, post-communist analytical methods predominantly adhere to a deliberate methodological restriction in their application of a paradigm of the uniqueness of 'totalitarianism' against any trans-national comparisons. Moreover, the Czech underground itself presents several questions for confrontation with standard social movement theories. It did not propose concrete demands to political power, but instead a far more diffuse and generalised sentiment of rejection, an emotive-artistic resistance to state cultural control. It did not challenge specific policies or actions of the Communist regime, working instead to evade the symbolic violence ('aesthetic torment') of the consistent ideological cultivation and administration of every aspect of life from architecture through music to fashion. As an essentially 'post-materialist' social movement, the Czech underground managed to highlight the specific forms of symbolic violence used by state socialism; perhaps even more importantly, its study in confrontation with current methodologies of social-movement theory might well illuminate the persistence of symbolic violence even in the post-totalitarian world and its contribution to growing exclusionary populism there.

Care Migration in Long-Term Care in Germany: Care Arrangements, the Commodification of Care Work and the Interaction of Policy Fields

With the introduction of Long-term Term Care Insurance (LTCI) in 1995/96, Germany made universal long-term care support available and simultaneously restructured professional care provision based on New-Public Management (NPM) orientated ideas. Embedded in social and demographic changes within this framework distinct patterns of formal and informal care arrangements developed, which built the starting-point for the expansion of both, the professional care infrastructure and paid care work up to 24-hours care services within the household context. The commodification of care work – both within the professional care infrastructure and within private households – was followed by an increasing employment of migrant care workers embedded in an interaction of long-term care-, employment- professionalization- and migration policies.

In the focus of the paper is the comparative analysis of the patterns of increasing employment of migrant care workers within and between both types of paid care work embedded in an interaction of policies – long-term care-, migration-, employment- and professionalization policies – on the national and EU-level. Conceptually, the paper combines neo-institutionalist approaches created within international comparative care research and multi-scalar intersectional approach-

es. Empirically, it draws on an analysis of the institutional design of the policy schemes, findings of an own representative inquiry with care workers, representative statistics and a literature review.

Elderly Care in Changing Societies: Concurrences in Divergent Care Regimes. a Comparison of Germany, Sweden and Italy

The European countries are facing social changes that are challenging their long-term care (LTC) systems in different ways. Ageing populations and a decrease in the care potential in families have led to different paths of modification of traditional care regime organization. The paper compares the LTC policies of Sweden, Germany and Italy, three countries that have traditionally been regarded as representatives of distinct care regime types. The interrelation between policy reforms, changing public support, patterns of care arrangements and the commodification of care work are compared among the three countries. The analysis aims to reveal the basic dimensions of (changing) LTC policies and their effects in these countries, trends of convergence and divergence among the three regimes, and the main characteristics of the changed care regimes. The own conceptual framework combines different approaches developed within the area of international comparative research on long-term care respectively on welfare state and the area of professionalisation. Empirically, it is based on national representative statistics, an analysis of the institutional design of policy schemes and a literature review. Despite a trend of convergence characterized by redefined involvement and a complex mixture of state, market and family resulting in an increased employment of migrant care workers and precarisation of care labour the countries analysed still represent different care models. In particular, public efforts, the emphasis on family care versus professional services, and the role of different state levels in the governing system and reform paths are the key elements that distinguish national LTC organization.

Students on (why) Family Matters: Family Involvement in Higher Education through the Case of Cyprus

Family involvement is increasingly spreading into higher levels of education as many parents/guardians strive to contribute to and become involved in their children's university experience (Lynk Wartman & Savage, 2008). Nonetheless, the exploration of the phenomenon of family involvement within higher education has only recently begun to receive attention, even though it affects not only the student but also other domains of higher education experience, such as institutional philosophies and policies, programs and services and administrative structure (Carney-Hal, 2008). This paper presents part of the data collected for a mixed-methods study (including surveys, individual and focus group interviews, and online logs) aiming to investigate family involvement in higher education through the case study of two universities in Cyprus, a state and a private.

The broader project is situated within sociological examinations of family involvement, looking at how values, ideas, ideologies and power dynamics play out in the different manifestations of family involvement from the perspective of the main actors involved: students, parents, faculty, and university staff. The data discussed in this paper are drawn from in-depth one-on-one interviews with 40 students as well as a survey completed by undergraduate students (N=1250) attending the two universities between September 2013-June 2014.

The analysis of the student data indicates that many families in both universities get involved in the university life of their children who, even though, they may express discontent about what they perceive as their parents' intrusion into their lives, they nevertheless also accept, or even desire, their involvement as a natural part of parenthood and upon certain conditions. Implications of the normalization of family involvement in higher education for the role of higher education in the context of its increasing marketization and commodification are discussed.

THEODOROU, ELENI* (*European University Cyprus*)

The Politics of Representation: Refugee Children in Digital Media

Over the past few years, Europe has seen a significant rise in immigration as a result of protracted and violent conflicts in various places around the world. One of the conflicts that has featured prominently in European media is the Syrian conflict. Images of men, women, and children refugees from Syria reaching European shores in small, overcrowded and fragile boats drifting in tumultuous Mediterranean waters have been traveling around the world through, inter alia,

digital media. The power of the media to produce, reproduce and represent ideas and ideologies about refugees and asylum seekers, often construing dehumanizing and stigmatizing representations of (mostly adult) refugees, has been documented in the literature (for example see Banks, 2012; Eses, Medianu, & Lawson, 2013; Bleiker, Campbell, Hutchison & Nicholson, 2013). This paper draws on a broader project of representations of the refugee child in 350 news articles on refugees which appeared in ten different Greek-Cypriot digital news media (digital newspapers and news sites) in the period May 2015-May 2016. Qualitative visual, content, and thematic analysis of both images and texts revealed the workings of three main technologies of representation (namely, otherization, collectivization and obscuration) which invisibilized and depersonified the refugee child. Building on this work to shift the focus on the politics of (digital) representation, this paper seeks to unravel how particular notions of race, class and gender operate in the digital and visual text to give way to how refugee children are rendered as classed, gendered and raced child-subjects.

RC57-JS-88.2

THERBORN, GÖRAN* (*University of Cambridge*)

Cities As Representations and As Manifestations of Power

City centres are representations as well as manifestations of power. Representations are visualizations of power. Representations – of the might, wealth, glory, and directive intentions of power – are expressed in the spatial layout, in the topology clustering and architectural form of representative buildings, the pattern of monumentality, and the toponymy of streets, places, and buildings. These representations often have to be understood in their layered temporality, their selective expression of past relations of power.

Manifestations of power refer to the actual functioning of the cityscape in terms of power, which includes also manifestations of fear, of powerlessness or neglect, and of counter-power. Manifestations of power further include processes of invisibilization, of hiding phenomena amenable to questioning / critique, and methods of surveillance. The main powers which set their mark on contemporary cities are, the political rulers – national and local –, and private capital, national and foreign. Counter-power comes bottom-up, from popular classes, grassroots movements, and popular urban reform coalitions, asserting themselves in squatting and spatial enclaves, in some change of urban development or policy, or in a transformative popular city government.

The proposed paper involves presenting a systematic analytical framework for studying cities as sites of power, and a small worldwide set, north, south, east and west, of illustrative cases, drawing upon the global empirical research for my recent book *Cities of Power*.

THIANN-BO MOREL, MARIE* (*UNIVERSITE DE LA REUNION*)

Environmental Justice and Postcolonialism in Reunion Island : The Case of the Shark Attacks

This communication proposes to study, with the theoretical framing of the environmental justice in a postcolonial context, how a culturally majority population struggle with what they considered as environmental degradation.

To fight against the repeated prohibitions on accessing "their" environmental amenity, some surfers build their sport as a risk and stuck out, despite themselves, their privileged access to one of the most valued seaside resort of this short island. As a result, the prevention of shark attack is seen as a community struggle to maintain their privileges. But these surfers oppose a desire for environmental justice that would not discriminate its beneficiaries according to their social origin. This instrumentalizations of environmental justice asks two questions.

First is the question of distributive justice: in the name of what principles to help or not a population to maintain access to environmental amenity, access that does not would, in theory, deprive another population of its rights? Distributive justice would mean less helping this "favored" population because they would have the resources to solve the problem on their own. This would require a public acknowledgment of the majority status of the surfers who are not constituted as an ethnic group, despite the exogenous designations. French Republican values prevent from saying that a privileged ethnic group seizes a territory. The postcolonial context thus imprints its first stigmata: the impossibility of saying a form of social inequality on a territory which is experiencing deep inequalities.

Then is the question of the ethics : must the environmental justice necessarily be pro-environmentalist? One of the solution applied shows the desire to exert "preventive" fishing pressure on sharks. This anthropocentric positioning is challenged by eco-centered arguments: "killing sharks" for the development of "leisure" seemed to be unfair. We will also study the polemics around the solutions of prevention.

RC15-287.5THIBAUT LÉVESQUE, JULIEN* (*University of Ottawa*)*Narratives of Opioids Users in Addiction Recovery Resources : A Preliminary Analysis.*

The objective of this communication is to explore how the navigation of addiction services, through their own specific logics, practices and interactions, contributes to modulate the biographies of the services users and, ultimately, shapes their recovery trajectories. Based on interactionist theories, we postulate that contrasting conceptions of addiction traversing the many approaches in the substance abuse field carry differing views on identity. In this sense, in order to answer our research question, we conducted participant observation and semi-directive interviews (in process) with opioids users. Observations of the interactions between workers and users (roles, tasks, biographical demands) were made in three different addiction services, each with its specific intervention approach, etiology of addiction and definition of relapse. Interviewees were also recruited from the same community organizations. Data was then submitted to a paradigmatic analysis of narratives. A twofold comparison was made between the accounts of newer and older services users, and between users of different resources in order to explore the changes in the language used by the services users and to better understand the biographical demands of the various approaches. This strategy also allowed us to explore the biographical strategies used by recovering opioids users and the challenges of navigating different approaches to addiction management. The analysis showed how knowledge and practices modulate subjectivities and how resource users must juggle between subjugation and resistance to the multiple demands for biographical reconstruction. Through the integration of a new vocabulary, users of the different services learned to re-evaluate their conducts and to reframe their life story via a lens specific to the approach. In this sense, biographies were shaped during treatment episodes and could be seen as central to the actions taken in recovery. Therefore, it becomes important to explore the narratives of the services users and their effects on recovery.

RC15-282.2THIERBACH, CORNELIA* (*Technische Universität Berlin*)DINI, LORENA (*Charité - Universitätsmedizin Berlin*)*Regional Healthcare Service Provision By Gynecologists and General Practitioners for Women 49 Years of Age and Older in Germany*

In Germany, the mandatory statutory health insurance supports universal health care coverage. However, due to demographic changes and regional differences we are facing inequalities in access and provision of healthcare services. Therefore, the current needs-related planning of physicians for ambulatory care requires revision.

In 2016 with the goal of contributing to the improvement of healthcare service provision, The Joint Federal Committee established the Innovationsfonds. Our project, funded by the Innovationsfonds, analyses ambulatory gynecological healthcare service provision for middle-aged and older women.

Initial evidence shows reduced access to gynecologists (Gyn) for women over 49 years living in rural areas and with lower socioeconomical status. Up to now, health policy disregards aging population for adjusting the needs-related planning of Gyn.

The aim of this project is to explore current ambulatory healthcare services for women over 49 years by Gyn and general practitioners (GPs) and to identify innovative interdisciplinary solutions to face the imminent undersupply i.e. task-shifting. For this purpose, we apply a mixed method approach including a randomized survey of GPs and Gyn from three northeast states (about 1.000 GPs and 500 Gyn), semi-structured telephone based interviews with women over 49 years of age from the same regions, a systematic literature review, and secondary data analysis. Based on our results we will develop a new concept to improve the ambulatory gynecological health care provision. To do so, we choose a participatory approach using focus groups including major stakeholders.

To conclude, sociological theory and methods are important in this healthcare research since we are dealing with societal challenges such as social inequality. In this case, our assignment is to inform health policy regarding possible improvements in healthcare services and practices. Our ultimate goal is to contribute to the improvement of women's quality of life contemplating physicians and patients' needs.

RC46-767.3THILLE, PATRICIA* (*Holland Bloorview Kids Rehabilitation Hospital*)GIBSON, BARBARA E. (*University of Toronto*)ABRAMS, THOMAS (*Dalhousie University*)MCADAM, LAURA (*Holland Bloorview Kids Rehabilitation Hospital*)MISTRY, BHAVNITA (*Holland Bloorview Kids Rehabilitation Hospital*)SETCHELL, JENNY (*University of Toronto*)*Enhancing the Human Dimensions of Children's Neuromuscular Care: Piloting a Methodology for Fostering Team Reflexivity*

For people with chronic, progressive conditions, high quality clinical care attends to the human dimensions of illness - emotional, social, and moral dimensions - which co-exist with biophysical manifestations of disease. We piloted a dialogical methodology with a children's rehabilitation team to foster reflexivity, aiming to strengthen attention to human dimensions of clinical practice. Reflexivity brings historical, institutional, and socio-cultural influences on clinical activities to the fore, enabling consideration of new care practices. The participating clinical team works with young people with muscular dystrophy, and their families. The methodology involved three facilitated, interactive, two-hour dialogues with the clinicians. We aimed to make routine practice strange, and thus open to reflexive examination. Each dialogue involved clinicians learning to apply a social theory (Mol's *The Logic of Care*) to ethnographic fieldnotes of clinical interactions, with discussion and refinement of recommendations for improving clinical care. Dialogues were audiorecorded and transcribed. We used discourse analysis methods that preserve group dynamics to evaluate the extent to which the methodology spurred reflexive dialogue within the team. Overall, imagining impacts of clinical care on people's lives - emphasized in the social theory and aided by the fieldnotes - showed promise, shifting how clinicians interpreted routine practices and spurring many plans for change. However, this reflexive orientation was not sustained throughout, particularly when examining entrenched assumptions regarding 'best practices'. Clinicians defended institutional, choice-logic practices by co-constructing the metaphor of *balancing logics* that inform care delivery. When invoked, the balance metaphor deflected attention from emotional, social, and moral impacts of clinical care on the lives of patients and their families. These emergent findings highlight the value of analysing reflexivity-oriented dialogues using discourse analysis methods. Our findings now inform a follow-up study, which will examine emerging impacts on clinical practice using realist evaluation methods.

RC46-776.2THILLE, PATRICIA* (*Holland Bloorview Kids Rehabilitation Hospital*)*Stigmatization, Marginalization, Health Care, Knowledge, and Knowledge Brokering*

I am a clinician-turned sociologist who studies how health care policies and practices contribute to inequities. To date, my work focuses on interpersonal and systemic influences on stigmatization. I use varied social theories and qualitative methodologies to foreground the relations (social and material) that push and pull lives in particular directions (inspired by Annemarie Mol's and colleagues' work). My career is grounded in both social scientific and health care communities, which helps me do theoretically-driven research and use that research to spur changes in health care practice. Often, my contributions intervene by making visible contrasts and variation in clinical practice and brokered knowledge.

Two publications I led that exemplify my interests and skills:

Thille P, Friedman M, Setchell J (2017). Weight-related stigma and health policy. *Canadian Medical Association Journal*, 189(6), E223-4.

Thille P, Ward N, Russell GR (2014). Self-management support in primary care: Enactments, disruptions, and conversational consequences. *Social Science & Medicine*, 108(May), 97-105.

My submitted or in-development publications address knowledge brokering and continuing education.

My career opportunities are strongest in health professions faculties and related research institutions. For example, my post-doctoral work has been in health professions education and rehabilitation research institutes. I have presented at family medicine, obesity, and other clinical conferences, alongside sociological conferences such as 4S, SSSP, and the CSA. Emerging issues I am navigating include communicating the distinct value of sociological work and skills (including ethnographic study of practice), differences in capital within collaborations, and epistemological debates. I am interested to learn how senior clinical sociologists navigate these challenges.

Time-Saving Accounts in France and Germany a Quantitative Analysis of Company Agreements

The capitalisation of working time aims at saving, valuing and sometimes exchanging of accumulated time related to professional activity. This process, which concerns a large number of employees in France and Germany, raises a number of questions. According to which rules the savings are constituted and spent by the employees. Does corporate collective bargaining guide these practices? What are the consequences on work, on employment, on health and on the articulation of social times? Can temporal autonomy of employees be reinforced by the capitalisation of working time?

To answer these questions, we will present the results of a Franco-German research project on collective bargaining of time-saving accounts. Our research is linked to the theory of social regulation (Reynaud) and displays four objectives: characterise the production of a decentralised time rule, describe and analyse inequalities of the rule, question the tension between collective and individual logic of time savings, analyse the time / money transformation (monetisation). We have created a comparable codified database for France and Germany (600 company agreements on each side) in order to carry out statistical processing. The results first show that the time-saving account is a central device for managing the economic and social life of enterprises. They then indicate that the time-saving account takes different forms in different societal configurations (France, Germany), by sectors of activity and by categories of employees. The purpose of the communication is to show these differences and explain the reasons for them.

THOMA, NADJA* (*University of Vienna*)

*"I Dream to be a Teacher in a Completely Normal School".
Language and Othering of Minoritised University Students from a
Biographical Perspective.*

Within discourses on migration, much importance is given to language, especially to the respective national language(s), both for educational success of migrants and for their transition into certain fields of the labour market. At the same time, inequalities between individuals and groups perceived as 'native speakers' and others labeled as 'non-natives' are persistent regardless of the effective linguistic command of individual speakers (Davies 2003; Bonfiglio 2010).

The drafted discourses are of special interest for educational institutions in general, as well as for teacher education. Thus, the planned paper will focus on the experiences of young minoritised adults who are enrolled in German Studies programmes in Austria. It is based on biographical narrative interviews conducted in a research project on language biographies. Theoretically, it links biographical (Schütze 1983; Dausien 2000) with sociolinguistic (Blackledge/Creese 2014; Piller 2016) and educational (Flores/Rosa 2015; Mecheril 2015) theories.

The following questions will be addressed:

- How do linguistically minoritised subjects on their way to be language teachers reconstruct the meaning of language(s) in their biographies?
- What power relations do they experience in institutions of education, especially in the German Studies programme?
- Which desires are connected with their decision to become German teachers, how are these desires endangered by 'native speaker' ideologies and how do the students position themselves vis-à-vis the researcher in the interview setting?

THOMAS, JACOB* (*UCLA*)

*How Economic and Political Factors Interact in Stratifying
International Visa-Free Travel and Migratory Opportunities*

This paper shows how different levels of economic welfare and political freedom in nation-states are associated with how many countries its nationals can visit without a visa (visa free mobility) (2). Previous research suggests that as a country increases its income per capita and political freedom, one observes a monotonic rise in visa free mobility. However, I show that the size and direction changes in visa free mobility of nationals both depend on its level of economic wealth and political freedom. (1). I use multivariate regression to analyze data on visa free mobility from Henley and Partner's 2014 Visa Restriction Index, World Bank data on logged Gross national Income (GNI) (Purchasing Power Parity (PPP) adjusted), population, inequality, and membership in regional economic organization and Freedom House's (2013) score of political freedom for 156 nation-states (4). When one includes a political freedom and GNI interaction term, the relationship between the level of political freedom in a country and visa free mobility is negative for countries with low levels of economic wealth and positive for those with a middle and high level of economic wealth, increasing geometrically as

income further increases and revealing that among wealthy countries nationals suffer a penalty severely restricted international mobility if their governments restrain political freedom (3). A state membership in a transnational economic organization (e.g. European Union) somewhat mediates this relationship, but not entirely. This article refines the understanding of scholars about the social stratification of travel and migratory opportunity of nationals from countries with varying levels of political freedom and economic well-being (5). This interaction suggests that governments and diplomats when designing policy may want to carefully to consider economic status of a country when considering the impact of policies promoting political freedom and liberalization.

THOMPSON, SCOTT* (*University of Saskatchewan*)

*Thunder Bay Dirty (Now on Facebook, Twitter and YouTube):
Surveillance, Social Media, Forced Identity Performance, and the
(Re)Production of "Indian" Stereotypes in Canada*

In April of 2015, a young woman received several texts from friends warning her of her appearance on a social media page. After a few clicks, she was appalled to find her image coupled with a message reporting that she was yet another "Drunken Indian" degrading everyday life in the city of Thunder Bay. Though this claim of excessive alcohol use was unfounded, this depiction of her had not only repeatedly performed the stereotypical actions of "Indian Drunkenness" to everyone who had visited the site, but had also made this performance sharable, likable, open for comments, and capable of being reformatted to other social media platforms. This paper demonstrates this link between surveillance, identity, performance, and social media. It charts how the use of social media to identify, classify, and sort individuals and populations within communities, is being used to (re)produce stereotypical understandings of First Nations and Métis peoples in Canada. Specifically, it takes up the case of "Thunder Bay Dirty" (Facebook, Twitter, YouTube), in order to identify key traits associated with "Indianness" thought these technologies, while also looking to understand the role of these technologies in labeling, reproducing, and multiplying these forced identity performances. Staring from an understanding of identity as being constructed through performance and repetition, this paper argues: first, that the posting of labeled images and videos represents a forced identity performance; and second, that these externally imposed, and much more public, social media performances, represent an important culturally productive capacity of surveillance technologies, making them capable of (re)producing imposed identity categories within society, and (re) producing externally constructed stereotypes within understandings of self.

THOMSON, KELLY* (*York University*)

*Professional Insecurities: Examining the Relationship between
Identity Safety, Moral Agency and Patient Safety*

There is a growing consensus that "the last mile" in improving coordination of care and patient safety is understanding why it is that professionals say they "know" how to work collaboratively in teams and have the competences to provide "safe" care but continue to report that they find it difficult to actually implement these skills in day-to-day practice. Evidence suggests that in order to make further progress we need a greater appreciation of how interprofessional practice actually occurs in clinical settings and how sociocultural factors facilitate or impede high quality communication and coordination amongst professionals. Theoretical perspectives from organizational scholars have shown that effective interprofessional practice is predicated on professionals' sense of "psychological safety"; however, they also argue that "a well-entrenched status hierarchy exists in medicine making it difficult to speak across professional boundaries" (Nembhard and Edmondson, 2006). "Status" and a sense of psychological safety derive not only from one's professional identity and position in the medical hierarchy, but also one's personal identity and circumstances. As Nembhard and Edmondson argue: "status refers to the level of prominence, respect and influence associated with an individual as a result of some characteristic such as age, education, ethnicity, gender, organizational position, profession, wealth etc. (2006:944). We include the expansion of precarious work as another critical factor for appreciating a worker's status. Studies by Edmondson and her colleagues have highlighted how status differences may undermine a worker's sense of psychological safety, making those in lower status positions less willing to engage in quality improvement activities in health care settings as they feared that their suggestions could expose them to reprimand or ridicule and were likely to be ignored. Drawing on Nelson's work on "damaged identities", we theorize how identity safety may infiltrate the consciousness of some workers, impeding their agency in intra and interprofessional interactions.

RC17-324.1THOMSON, KELLY* (*York University*)*Slow Motion Revolution or Assimilation? Theorizing Entryism As a Mechanism for Destabilizing Regimes of Inequality*

Post-essentialist and post-structuralist conceptualizations of identities and social structures offer the theoretical potential for social change to emerge from actions and interactions among socially located actors. This "micro-emancipation" approach suggests that changes negotiated in relations among actors can be "scaled up" or expanded beyond individual interactions to effect change in societal structures that sustain inequality. This micro approach contrasts sharply with binary, essentialist and structuralist approaches that implicitly suggest that hegemonic structures will undermine any incipient changes in social relations that emerge in interactions (Ahonen et al., 2014). What has been called "entryism", i.e. the entry of marginalized actors into organizations has, as Swan and Fox note "always possessed an ambivalent reputation with many critical theorists wondering whether "oppositional forces [can] enter... without becoming coopted? (Cooper, 1995:100)" (2010: 574). Does the entry of some actors from marginalized groups into organizations advance the opportunities for others or, as some have argued, do actors who succeed become coopted or even participants in the legitimization and reproduction of systems of exclusion? Consistent with this call for papers, we theorize the role organizations play as mechanisms contributing to the reproduction or disruption and transformation of regimes of inequality. Scholarship regarding the potential for micro-emancipatory actions to generate more substantial social change is at a crossroads. While research findings illustrate the binary of outsider/insider is transgressed and there is a sense that larger scale change is occurring as a result, existing theories have not enabled us to account for how this change is occurring-if it is. In this paper we illustrate how postcolonial theories offer distinctive conceptual tools that enable us to advance our understanding of how the entry of marginalized actors into organizations may contribute to destabilization and transformation of regimes of inequality.

RC52-869.4THOMSON, TAMMY* (*Continuing Education, Lester B. Pearson School Board*)*Shining the Light on Dental Assistants*

Shining the Light on Dental Assistants seeks to identify factors creating and sustaining a stalled professional situation of dental assistants (DAs) in Québec where DAs are routinely delegated regulated tasks such as radiographic exposure while simultaneously being denied professional status under the Professional Code. Regulation of dental assisting has been repeatedly recommended yet never actualized; Québec's Minister of Education found the majority of dentists "would like to see radiographic exposure by DAs become an officially delegated act as a way of legalizing what is common practice" (Étude, 1992).

DA's professional work is "not part of the official and textual organization" of oral health care delivery in Québec, thus their work is "not officially noticed and (may even) be illegitimate" (Campbell and Gregor, 2008). Dentists continue to delegate restricted tasks to DAs and DAs continue to perform them so that DAs have been subjected to fines for illegal practice as a result of law suits by Québec's Order of Hygienists. Why would DAs perform restricted tasks in such a climate and how has the situation so degenerated that DAs are daily placed in a situation of ethical quandary?

State-provided DA curriculum in Québec incorporates training in restricted tasks alongside professional ethics and inculcates in DAs a tolerance to contradictory imperatives; they are trained to ignore their own ethical guidelines in deference to their employers'. Jackson (1995) states curricular guidelines may "constitute the actual and stand in for workplace reality" and Smith refers to curriculum decisions which just happen as an experience of textually mediated social organization and suggests "the sequence of textually coordinated moves is foundational" (Smith, 2006). An Institutional Ethnography (IE) of the revision process of the current DA training program in Québec permits us to see how restricted tasks came to be simultaneously required of and disallowed by DAs.

RC34-619.2THREADGOLD, STEVEN* (*University of Newcastle*)*Humorous Youth Taste Communities, Class and Homologies of Snark*

This paper will discuss research about young people involved in online taste communities. What do individuals get out of participation in collective online expressions of taste, especially when they are based upon disgust towards an imaginary other? The online communities analysed here have formed around homologous forms of denigration. Found news stories, photos and other digital ephemera are turned into satirical fictional profiles, memes and polemics that create taste hierarchies, while positioning oneself in said hierarchy (even if not meaning to). These blogs and posts are then shared and commented upon. Stereotypes are engaged, where class aspects are often blurred and complex,

that is, it is more than straightforward downward symbolic violence. In terms of the theorisation of taste and collectivity, 'distinction' is an important way to think about how people relate to each other and position themselves through hierarchical relations based on the symbols and affects of consumer taste and popular culture, and how those very relations produce and transform class. The original conception of distinction still has considerable relevance for how people use taste to judge, categorise and relate, especially when considering how people consume, rather than just what. But, since the lines between so-called high and popular culture have blurred, and much social interaction is online and ironic, this paper develops the concept of distinction by incorporating aspects of affect, irony and theories about social media. Taste communities work as affective economies that create moral boundaries, and produce reflexive class relations. Habitus lubricates online aggregation of taste through forms of social gravity, affective homologies and immaterial labour, and therefore helps formulate capitalist value extraction.

RC04-81.25THROM, MEGAN* (*Wayne State University*)*Performativity & Reproduction of Gendered Identities in Academia*

Through intensive interviews of professors at teaching intensive institutions this project investigates the relationship between the undervalued nature of teaching in academia by analyzing individual experience, agency, and power relations present at the institutional level in order to develop a theory capable of linking structures in academia to privileging of research over teaching, tracing this privilege to the devaluation of feminized labor. Utilizing interviews of faculty members whose primary responsibility is teaching, I explore the pathways, choices, influences and obstacles they have encountered throughout their educational careers. This chapter of my dissertation project focuses on the gendered performativity of professors at teaching-intensive institutions in the United States, and how these performances reify & reproduce the privileging of research over teaching in academia. Such performances are examined as gendered through the lens of hegemonic masculinity via the feminized nature of teaching and service, responsibilities which are devalued in connection to their classification as emotional labor and labor of care. Also prevalent are themes of institutional barriers in regards to initial job application procedures as well as in tenure and promotion, especially as related to more privileged research focused institutions. Additionally, these academics lament the lack of preparation for their teaching intensive positions while in graduate school, which underscores the institutional nature of this devaluation of teaching and service.

RC55-899.3TIAN, FELICIA* (*Fudan University*)LI, XUE (*Fudan University*)*When Guanxi Meets Global: Global Connections and Network-Based Job Searching in Urban China*

Institutional contexts matter for network-based job searching. However, most studies focus exclusively on institutional arrangements within nations; few have explored how economic globalization as an institutional force affects network use in the labor market. This paper explores this issue by using reform-era urban China as a case study. On the one hand, China has deeply integrated into the global market. It is ranked as the largest host of foreign direct investment and

the largest country of foreign trade. On the other hand, China suffers from imbalanced regional development between externally-oriented, marketized coastal areas (Yangzi Delta and Pearl River Delta) and other inland areas in which power remains predominant in the distribution of resources and opportunities. Based on analysis of data from 2004 Social Capital Survey – China and 2008 Chinese General Social Survey, we find that network use in finding jobs varies sharply with global connection. In particular, network use is significantly lower in delta areas where job seekers use less networks for information and influence, while in the huge inland areas network use persists. These findings suggest that the effect of economic globalization on network use is mediated by local power, and both global and local institutional arrangements play a role in shaping network use in China.

"Political Indifference" or "Political Concealment"? —the Analysis of Youth Political Participation in Internet Context

In the 2016 US presidential election, Trump was elected president and raised an argument and analysis about youth participation in political behavior. Those youth groups who promoted Trump's election victory were labeled with Political Apathy for a long time before the election. But it turned out to be the case that these "silent majority" become key groups that determined the situation. Based on the analysis of political participation and political apathy through the traditional concept, this paper puts forward that the embeddedness of political participation should be taken into account in the Internet context, and political participation should be regarded as an integration of online and offline behavior. And then it derives the concept of "political concealment" based on the differences between online and offline behaviors, and this conceptual framework is used to analyze the current situation of political participation among Chinese college students and youth groups. Key words: Political Apathy, youth group, Political Concealment, Political Embeddedness.

TIBAJEV, ANDREY* (Linköping University)

Immigrant Selection and the Propensity for Self-Employment

Immigrants' propensity for self-employment has primarily been studied using ethnic capital and economic-structural constraints as explanatory variables. The former explanation proposes a causal link between the self-employment rate of the country of origin and the propensity for self-employment in the destination country. The logic is that immigrants from countries with high rates of self-employment are more likely to have been self-employed or socialised into an entrepreneurial spirit. However, this reasoning ignores that immigrants are not randomly selected from their countries of origin, and thus neither selected from random economic positions nor uniformly affected by culture.

The purpose of this study is to measure the extent of immigrant's specific entrepreneurial human capital, i.e. experience of self-employment, that they bring with them from their countries of origin; and to analyse to what extent this human capital transforms into the propensity for self-employment in the destination country. Data comes from the Level-of-Living Survey for Foreign Born and their Children (LNU-UFB), a Swedish survey conducted in 2011. LNU-UFB contains a unique employment biography with information on the respondents' labour market activities from both before and after immigration, making it possible to create a year-by-year employment history.

Descriptive analysis of the data (N=2100) reveals that a considerably smaller proportion of immigrants in Sweden were self-employed before immigration than suggested by the average rates for their countries of origin. This accentuates that migrants to Sweden are not randomly selected, making national averages a poor approximation for their actual experiences. Furthermore, pre-immigration experience of self-employment, studied with discrete-time event history analysis, was correlated with propensity for self-employment in Sweden. Immigrants with this experience had both a higher overall rate of self-employment, and a shorter duration to first self-employment spell. The analysis highlights the importance of the entrepreneurial human capital that some, not all, immigrants bring.

TIETJE, OLAF* (University of Kassel)

Community Unionism in the South of Spain. Migrant Organised Trade Unions and the Labor Struggles within the Greenhouses of Almería

The south of Spain is – because of its highly intensified agriculture – often called the 'garden of Europe'. Related to the big amount of all-season produced fruits and vegetables, mostly for the markets of northern Europe, there is also a high demand of workforce. Within the greenhouses of the Andalusian province

Almería most of day labourers are migrants from Morocco, Mali and Senegal (Jiménez Díaz 2008; Tietje 2015).

The hard and usual informal organised labour is done by the often illegalised working immigrants under precarious circumstances. Related to their status the immigrants are hardly organised in trade unions or participating in labour struggles, but confronted with the permanent threat of deportation. Nevertheless, in the beginning of the 21st century some immigrated farm labourers founded a local group of the Andalusian day labourer trade union SOC/SAT. Over the years these immigrants could establish an important structure of support for farm labour struggles in the agriculture of Almería and for the everyday life of the immigrants as well – by using tools and strategies of community organising (Caruso 2017; Tietje 2016).

In my lecture, I will concentrate on the possibilities of community unionism in the context of the migrant organised SOC Almería. From this perspective, I will describe their strategies of organising and supporting the (migrant) workers and conclude to the innovative and revitalising potentials of their local built concepts. My conclusions are based on the research for my PhD thesis at the University of Kassel (Germany) and will be underlined by some selected empirical examples of my qualitative research.

Immigration, Asylum and Right-Wing Populism in Germany: Critical Perspectives on 'Civil Society' and 'Democracy'

In summer 2015, the German state and the German society were surprised about the rising numbers not only of immigrants but also of refugees from different countries. Those people leaving behind their war-framed living conditions crossed the German national border and reached the communities, villages and cities in order to construct new existences (Hess et al. 2016; Schünemann/Voigt 2016).

The high number of immigrants and asylum seekers temporary overstrained the state structures and its common integration strategies. This structural deficit and related racist violence embedded in the new regulations that aim to control the European and German borders created so-called "welcoming culture" movement as a counter-reaction (Rother 2016). This culturally as well as politically motivated reaction was shaped by the civil society who questioned the gap emerged between the 'universal' understanding of democracy and its goods for the people (Eilert et al 2017; Hamann et al. 2016).

In our presentation, we focus on the discursive circumstances created this specific 'welcoming'-situation by focusing on the process of its rhetorical development in Germany. We are going to outline the (historical) circumstances of the temporary overstraining of the German state, its integration policy and the practices of organising civil aid as a political solidarity with the refugees. On the other hand, we are going to focus the isochronal rising of right-wing populism in political interpretations of migration (as the 'muslim other') in Germany. Our presentation will be illustrated by the first outcomes of our qualitative research project entitled 'Welcoming Culture and Democracy in Germany'.

Youth & Digital Capital in Late Modernity

This presentation considers Andy Furlong's legacy as it relates to new scholarship about youth and the digital age. The points of departure are Andy's presentation (*Digital capital and inequality in later modernity*) and his co-investigation on my Social Sciences and Humanities Research Council of Canada (SSHRC) funded project *Digital Media and Young Lives over Time*. This project developed digital portraits from video interviews and digital data (facebook, Snpachat, Instagram, twitter, etc.) with 185 young people and their digital shadows (those with whom they interact on line) in Canada, UK and Australia. Unlike the work of other commentators who insist on complacency and/or hysteria about the digital age,

this talk focuses on sociological analyses for considering youth digital capital that both interrupts and interrogates the digital present; one deeply owned by purveyors of digital technology. The legacy of Andy Furlong is recognized in both theoretical and methodological contributions to examining digital capital for youth in late modernity. Young people interrogate gains and losses from embedded and multiple digital positions. With the generous assistance of these young cyborgs, a youth-attuned and visual rendering digital capital is presented.

Weaving Solidarity, Stitching Power: Factors Facilitating Informal Textile and Apparel Worker Mobilization in Brazil, China, India, and South Africa

As informal work—outside the reach of labor laws and standards—has grown in most of the world, scholars and advocates have debated how to shore up labor standards for this workforce, and the potential role of organizations of informal workers. In this paper, we take a macro look at the factors facilitating mobilization of informal textile and apparel workers by comparison across four countries: Brazil, China, India, and South Africa—all of which have experienced neoliberalization in recent decades. Our methodology is conducting country-sector case studies, with particular attention to selected sub-regions within each country. We examine economic, political, and ideological factors, with special attention to the state and traditional trade unions as actors. Brazil and India are the two success stories, whereas in China and South Africa informal worker organizations in this sector have accomplished much less. Though all four countries differ markedly in many ways, we find some important commonalities that distinguish the two successful countries from the other two, notably more responsive democracy (robust federalism, competitive elections) and innovative unions committed to reaching out to informal workers. We trace the like causal mechanisms at work and discuss the generalizability of these facilitating factors

The Potential for Mass Social Movement Mobilization over Climate Change and Oil and Gas Pipelines in Canada.

Recently, Doug McAdam (2017) has provided an analysis of the prospects for mass mobilization in the United States over climate change. His analysis, based primarily on a review of the social movement literature, but also on the empirical conditions of American politics and public opinion, is quite pessimistic.

We use this assessment to motivate an analysis of the Canadian situation. The Canadian context is similar to the US in some regards, but different in others. We examine nation-wide survey data on environmental organizations members on their opinions about climate change and oil and gas pipelines, their identification with the movement, and their participation in various types of activism in order to assess the mobilization potential in Canada for a mass social movement focused on climate change.

Shopping Tourism and Conflict in Contested Urban Space

The proliferation of shopping tourism has been observed among consumption-based, urban-dwelling consumers in emerging and transforming economies like China. With the increase of disposable income and newly-acquired taste in overseas shopping, these travelers have quickly become a major group of inbound visitors in host societies worldwide. While their economic interests and business niches are acknowledged, less attention has been paid to the undesirable changes taking place in host communities and their resistance against unwelcome tourists. This study explores the interrelationship between shopping tourism and conflicts in the process of restructuring and transformation of urban spaces. With the case of Hong Kong, the destination hosting the most mainland Chinese tourists, we

discuss how anti-tourism protests and local resistance have shaped and been shaped in the context of changing landscapes caused by the tourists' shopping spree.

In this study, we propose a theoretical approach to the manifestation of "unwelcome tourism" through the local conflicts by highlighting the importance of understanding urban spatiality and its contested nature. Urban spaces consist of physical, social, and political dimensions that may both enable and hamper the development of tourism and the required local support. They are spheres of opportunities and conflicts to be explored and made by different social actors with diverse, often ambivalent concerns and interests. Using participant observation and documentary research, we explore how the protest movements have emerged in the process of engaging with and re-constructing urban spatiality, and explicate how movement participants interpret and strategically frame particular tourism practices to differentiate the in-group (local) from out-group (incoming) actors in limited urban spaces. Such resistance against shopping tourism embodies the negotiation of spatiality and the development of corresponding discourse, through which local citizenship and urban landscapes are contested, reproduced, and claimed.

Understanding the Performativity of Networked Activism: A Post-Structuralist Turn

Whereas social movement organizations remain as important mobilizing agents, individual citizens have increasingly constituted themselves as movement actors in experimenting with new information and communication technologies (ICT). However, while the digitally-enabled individuals have been considered at the forefront of the contemporary social movements, extant research has tended to emphasize the technical capacity of Internet as the unifying power of movement recruitment and diffusion, limiting our understanding of the dynamic process by which citizens today engage digital media in coming to protest movements.

This study proposes a post-structuralist approach to understand how networked activism emerges and develops among individual citizens in the digital age. Illustrated with the case of Umbrella Movement in Hong Kong, I conceptualize how people's pathways to networked activism unfold as performative engagements, constantly (re-)constructed in their digitally-enabled practices within real-world situations. In this view, rather than unidirectional outcomes of cheaper and faster computer networks, individuals' engagement with digital media is simultaneously a way of being, knowing, and acting. This research suggests to shift away from the instrumental view which focuses on analyzing ICT as independent tool for supporting and facilitating contentious politics, to examining how activist identity and action emerge and transform *in* as well as *for* digitally-enabled networked activism.

TIRYAKIAN, EDWARD A.* (*Duke University*)

Burying the Evil of Genocide

Since its first description by Dr. Raphael Lemkin in 1944 and the subsequent trials of Nazi criminals at Nuremberg, genocide has been seen as a heinous crime: the attempted mass killing of a population. The topic has spawned a voluminous literature on the relatively few documented cases of genocide that have taken place. To make an analogy with the medical sciences, genocide, like Creutzfeldt-Jakob disease, is a very rare but for the most part fatal disorder.

This paper deals with an understudied aspect of genocide: how does it relate to a very old aspect of the human condition: the question of evil. The question of evil has had only limited recognition in the behavioral sciences, including sociology. It is, of course, a long-standing topic of theology and philosophy, yet a secular aspect of modernity has branded "evil" as mostly a taboo subject. The wall of silence was broken by political scientist and theorist Hannah Arendt in her epochal and controversial 1963 *Report on the Banality of Evil*. Although the subsequent literature is not bountiful, some social scientists have wrestled with the topic -- including such sociologists as Jeffrey Alexander, the late W.S.F. Pickering, and Christian Smith.

This paper engages two questions. First, I examine how "evil" and "genocide" pair together in these various social-scientific works (including whether writers have in mind "ontic" or "ontological" evil in reference to empirical situations labelled a "genocide"). Second, I examine the question of "burying the evil": what have been major attempts to do so in salient cases of genocide such as the Holocaust, the Armenian genocide, Rwanda, Bosnia, Darfur, and what have been the results for the affected populations?

Uncovering Community: How to Deal with a Misleading Concept?

Since the 1990s, the notion of community has enjoyed an upswing in development planning and disaster risk reduction (DRR). Participatory bottom-up approaches at the local level have come increasingly into vogue both in academic and practical circles. Today, governmental as well as non-governmental organizations, donor agencies and researchers are working with local communities and households to mitigate disaster impacts, promote climate change adaptation and improve livelihoods.

'Community-based' has become a cover term for several approaches that stem from different scientific and practical traditions. However, the intense debates about notions of 'community' in sociology, anthropology, human geography, and development studies are barely acknowledged in DRR and CCA practice. The meaning of 'community' has been blurred to the point where the term has been rendered quite useless – there is often no reflection on its meaning and implications, and it has therefore taken on a life of its own. Referring to 'the local', 'place based' or 'with the people', many organizations and agencies display a rather one-dimensional, static and simplistic understanding of community which ignores social dynamics, hidden inequalities, power relations and the multiple, sometimes conflicting, layers of meaning that are embedded in 'community' as a complex set of (often contested) narratives and everyday practices. Continuing to do 'community'-related research and action without acknowledging tensions and inequalities may even contribute to a perpetuation of such injustices, and actually worsen the livelihood (and environmental) situation rather than improving it.

This paper addresses the challenges of the 'community' concept, and raises questions about the extent to which the predominant idea of 'community' is still viable or adequate as a basis of DRR intervention and CCA action. The paper assesses the way the concept is put to practice, and argues for a more meaningful form of 'community'-related analysis and action.

Narratives of Chinese Rural-to-Urban Migrant Mothers' Experiences in Mother-Child Interactions and Self-Evaluation: A Symbolic Interactionist Perspective

While previous research has highlighted the crucial role of parent-child communication in alleviating the developmental problems faced by left-behind children, little research has investigated how migrant parents maintain ties with their children and construct their parental identity while they are physically away. Based on the symbolic interactionist perspective of identity construction, this qualitative research collected the first-hand accounts of 30 Chinese rural-to-urban migrant mothers about their experiences in maintaining ties with their children and examined how such experiences relate to their self-evaluation in motherhood. This study identifies four types of maternal self-evaluation. The first type of mothers had little interactions with their children who were very young, and their maternal self was constructed mainly out of the cultural and social understanding of motherhood. The second type of mothers evaluated their self-identity positively based on the perception of being able to maintain relational connectedness and securing exclusive influences on their children. The third type of mothers narrated accounts of unfavorable parent-child interactions and constructed a resigned and gloomy view of their maternal self. The last type also evaluated their self-identity negatively. Yet, they maintained hopes of redeeming the maternal self through changing parental practices. As their children grew older; however, these mothers seemed to have more negative self-evaluation and struggled harder to maintain close mother-child relationships. The findings echo the idea of symbolic interactionism that experience is interpersonally constructed and constituted by the social structures and ideologies. While the perception of maintaining deep parent-child bonding and having positive influences on children is crucial for the construction of maternal identity, these mothers also use the social expectations of the larger society with regard to motherhood to evaluate themselves. The interplay between the sociocultural context and actual experience which evolves between the mother and the child should thus be understood.

Parenting As a Risky Venture: A Narrative Analysis of the Parental Experience in Non-Engaged Youth's Life and Career Development

The precariousness of life in late modernity has induced a reconstruction of the meanings of parenthood and an upsurge in parental anxiety. Whereas studies on the needs of non-engaged youth (NEY) in school-to-work transitions have supported an increased policy focus on risk management through parental involvement, how parents of NEY perceive their parenthood and negotiate their risk responses remains unexplored. This study thus examined the parental experience in NEY's life and career development. Narrative analysis was adopted for the research design. Fifteen Chinese parents were selected as research participants. They had at least one child aged between 15 and 21, who was not in education, employment, or training (NEET), or who was at risk of becoming a NEET. They were recruited through five social service centers providing career counseling for NEY in different districts of Hong Kong. Each participant was interviewed twice for narration of their life stories. The findings indicate that these parents drew on contemporary cultural understandings of risks and parenting to make sense of their children's circumstances and experienced various negative emotions. While some parents interpreted their parental experiences along this storyline and narrated stories of self-blame and blame for their children, other parents made use of their biographical narratives and social resources to renegotiate parental choices and dilemmas in their children's school-to-work transitions and reconstruct the meanings of parenthood. The findings suggest that on the one hand, parents' self-perception is shaped by the risk discourses and neo-liberal policy focus; on the other hand, parents who are able to reconstitute their reflexive selves can create a space, no matter how tenuous, within which they can have a more positive view of themselves and their children. Policy makers and practitioners should hence be cognizant of the ideological and social contexts in which parental distress and parents' resistance coexist.

Responsible Higher Education - Practicing Transformative Learning and Teaching

Our research aims at exploring the transformational potential of three pilot projects organised by the recently established science shop – an interface of CSOs and academics - of a leading business school in Hungary. Students' and community partners work together for 3 months with the support of dedicated educators. One of the learning objectives is to enhance the sense of responsibility and critical thinking related to societal challenges.

Our theoretical frame is transformational learning (Mezirow, 2000), working with the embedded nature of the learning process: including changes in learner and educator, and also in their relationship, as well as their interactions with the structure. Transformational learning does not demand social change; instead, it increases freedom through more information and openness to alternate points of views; the ability for critical thinking and reflectiveness on assumptions; including the individual's; thus, enabling social change. Transformational learning links reflection and action through an open and iterative process, while developing the learners' critical reflection and responsiveness.

Transformational learning is a process with key turning points (Mezirow, 2000): (1) *disorienting dilemma* - increased awareness on the conflicted nature of assumptions and need for change; (2) *dilemma* and the associated feelings, discontent and need for change *shared with others* - need for supportive group of peers; (3) development of *sustaining practice* for the (re)integration of change.

The research explores all these turning points to answer the research questions: To what extent is transformational teaching and learning practiced in the studied projects? How is structure (re)interpreted in the transformational teaching and learning process?

The cross-case analysis is provided (1) from a process perspective along the key turning points identified for the transformational learning process, and (2) from a content/value perspective, interpreting the practice through the process requirements and policy agendas of Responsible Research and Innovation (RRI).

Educational Continuity Following the 2013 Colorado Floods: A Case Study of Lyons Elementary and Middle/Senior High Schools

Schools are consistently identified as one of the strongest protective institutions for children's well-being following a major disaster event. Yet, little research is available to offer guidance on how schools should plan for student displacement, what pre-existing social conditions make continuous education possible following a disaster, and how school continuity influences community recovery. In non-disaster times, schools support child development, education, peer-to-peer and child-to-adult relationship building, and nutrition, health, and well-being. They act as a community hubs, bringing families together and building networks that strengthen the social fabric of a region. On average, K-12 students in the United States are required by law to spend approximately 180 days each year in the classroom. Therefore, it is imperative that school districts are proactive in mitigating and planning for disasters and their long-term consequences.

This dissertation is a case study that documents the displacement and educational continuity process for Lyons Elementary and Middle/Senior High Schools following the devastating 2013 Colorado Floods. This event forced the evacuation and displacement of nearly 2,000 residents in Lyons, Colorado and rendered the schools unusable for students for 11 weeks and 2 days. It is imperative that we learn from the actions taken by the St. Vrain Valley School district to keep students together and on regular class schedules during displacement so that we can continue to strengthen disaster plans for schools in the future. Findings from this research demonstrate the power and importance of leadership at the district and school levels, the value of table top exercises and thoughtful disaster planning, and the importance of school continuity for students, families, and communities throughout the recovery process.

Decolonial Solidarity in Palestine-Israel: The Case of Anarchists Against the Wall

The past decade has seen a resurgence of critical scholarship which has utilised settler colonialism as the most appropriate theoretical framework to describe the geopolitical structures of Palestine-Israel. Building on this line of thought this paper examines the discourses and embodied decolonial activism of Anarchists Against the Wall (AATW), a collective of Israelis active in the Palestinian-led struggle against the Separation Wall in the West Bank. The paper examines the challenges facing AATW in their endeavour to translate decolonial solidarity into the socio-political decolonisation of Palestine-Israel. AATW's praxis demonstrates a remarkable level of reflexivity on key issues pertaining to privilege, solidarity, and decoloniality; something that is often absent from other critical Israeli accounts. The paper concludes that the decolonial praxis of AATW testifies to the possibility to articulate new alliances between the Palestinian struggle for decolonisation and decolonial Israeli activists; expanding the field of decolonial struggle in Palestine-Israel.

Stars, Hearts, Smiles, Buttons or Grids: How to Design Rating Scales

Rating scales are one of the most frequently used type of questions in surveys. There are many ways to present the items of the scale. Many times, traditional radio buttons are used in grid or matrix formats. With more and more people accessing surveys via mobile phones, online surveys are being adapted to fit small screen sizes. In addition, rating formats from outside survey research, such as the use of hearts, stars, and smiles can be used.

In an experiment, we randomly distributed respondents over a five-point Likert scale, varying the response format. We use traditional radio buttons, fully clickable tiles, grids, and visual response options such as smiles, stars, and hearts.

We discuss responses quality indications such as response rates, frequency distributions, satisficing, primacy effects, and respondents' evaluation of the survey. In addition, we compare surveys across devices: regular desktop PC, tablet, and mobile phone. We focus on special populations in our discussion on which formats works best for which population.

Data come from the panel of Internetspiegel. This panel consists of civil servants in the Netherlands. Preliminary results show that smiles work best.

Going Beyond Competition between Migrant and Native Workers in the Cleaning Services Industry

The cleaning services industry is a sector particularly interesting in order to analyse the impact of the globalisation of labour markets on terms and conditions of work, since it is characterized by bad working conditions, the penetration of multinational companies in the domestic market and a multilingual and multi-

ethnic female labour force. At the same time, the analysis can reveal unforeseen capacities of workers to resist negative transformation.

The paper explores the transformations of the Italian cleaning services industry that have occurred throughout the last 20 years, considering in particular the progressive worsening of employment conditions and the new scenarios of alliances between different kind of workers that are taking place in this sector.

An original qualitative research on migrant and native workers experiences in Veneto (North-East Italy) examines the effects of several measures including externalization of services, labour market flexibilization, subcontracting, rise of temp agencies on employment standards and competition among migrant and native workers. Moreover, in this context of flexibilization and precarization of employment, the paper analyses the relationship between native and migrant people and how they are responding to reductions in pay and deteriorations in working conditions.

The study was co-financed by the EU programme "Europe for citizens" with the project "Towards shared interests between migrant and local workers".

Decentering Civil Sphere Theory through Intervention: An Encounter with Latin America

Recent extensions of civil sphere theory have shed light over the competitive dynamics between civil and non-civil discourses of solidarity throughout Latin America. In institutional settings where fear, intimidation or (self-)censorship apply, though, it may be more difficult to witness the fine mechanics of such competition at work. To make it more observable, civil sphere theorists can resort to one specific practice of intervention. Here, I will start by briefly characterizing it in contrast with other interventive practices within Touraine's sociology of the actor, Fals Borda's participatory action research, Burawoy's public sociology, and Garfinkel's ethnomethodology. Based on that, I will then unpack why adding civil intervention to the methodological toolkit of civil sphere theory may tie the latter to some important threads of that complex intellectual fabric that defines the very idea of Latin America.

Mixed Unions and Women's Religious Conversion: An Inquiry into the Role of Media Language

According to some sociological researches, mixed couples enact unique ways of experiencing and practising spirituality, unveiling original encounters between worldviews. Furthermore, sociocultural background beliefs shape gender differences among partners. In Italy, Christian-Muslim weddings are one of the most "contested" type of mixed-union. Increasingly media hype stereotypes these unions, depicting them as a potential danger, constructing a discourse which represents wives' religious conversion as a possible danger. According to that peculiar construction, women would be forced to embrace partners' system of beliefs, often against their will. Through few common stereotypes, these languages describe the role of women as an uncomfortable and disadvantaged position. Media interpret these conversions as the loss of original religious systems in favour of the new threatening semantic "world" of the Muslim partner.

The purpose of this contribution is to scrutinize how media contemporary language builds up wives' positioning within Christian-Muslim couples.

Genealogy of the Concept of Justice during the Transition Period of Iranian Society in the Constitutional Era

For the genealogy of the concept of justice in Iranian society can be returned to the distant past. But if justice is to be considered in its modern sense - with the emphasis on the human subjects- the most important moment of this transition is the Nasser's era and the Constitutional Revolution (1906), as a primitive stance. It takes the main controversy of constitutionalists and Sharia proponents over the meaning of equality and basic rights, especially gender equality and religious equality. The important point is the reference of the laws that attribute some to God and others to the people's vote. This paper attempts to illustrate the views of 40 elites and influencers of the Constitutional era (clerics and Western educators familiar with modern concepts), to delineate The plurality of meaning in the concept of justice, the substitution of some of the traditional concepts to Modern, and the position of human in their thoughts. As a result, the main point of the

article is that it is necessary to re-read the main issues of the transition society to understand conceptual changes in the face of western perspectives.

In Iran, that era has occurred, changing the understanding of justice from "putting everything in its place" into "accepting the equality of basic human rights." The main strategy of justice in that era is "reduce inequality", instead of "expanding justice"; "fairness" and paying attention to justice as a "moral virtue." The less importance is "equality in the opportunities and resources of scarce" and even "distribution of wealth" in Iran in the transition to modernity. In the constitutional era, cruelty has been the main issue with the distance raised to the issue of poverty. Therefore, even at that time, left Marxist groups in Iran, are seeking to solve the problem of oppression.

Knowledge Production in the Periphery: An Overview of Brazilian Human Genetics

This paper seeks to discuss the integration of Brazilian research on human and medical genetics in the global context, analyzing processes of international division of scientific labor among Brazilian laboratories, accounting for it through the analytical framework of center/periphery dynamics. In parallel, I intend to analyze the influence of the international circulation of ideas and researchers – and the growing internationalization of higher education – in the careers of Brazilian human geneticists, upon their return to the country after a period abroad. To look at the division of scientific labor as well as at knowledge circulation in terms of center and periphery is to take into account the assumption that scientific production is unevenly divided between different regions around the world. For this analysis, centers and peripheries are conceived as relational concepts, thus considering that both "central" and "peripheral" forms of science are heterogeneous entities, which include a variety of practices and methodologies. Empirically, the work is based on quantitative data on the career and trajectory patterns of 416 Brazilian researchers in the field of human and medical genetics, as well as bibliometric analysis of their work in international co-authorship. In addition, 50 in-depth interviews were conducted in three Brazilian regions (North, South and Southeast) in order to investigate in more detail the different dilemmas, difficulties and strategies of knowledge production in the periphery.

Who Become "Double Carer" in Japan?: Quantitative Analysis Using the National Survey on Social Security and People's Life

Recently, with rapid proceeds of a declining birth rate and aging population, "double carer" is becoming problem in Japan. In this presentation, double carer means that people who care their children and parents simultaneously.

However, in Japanese sociology, study about double carer is still undeveloped. It is expected that a declining birth rate and aging population in Japan will continue for a few decades. So, it is important to get the picture of double care in Japan and to take measures to meet the situation.

In this presentation, using the data of The National Survey on Social Security and People's Life by National Institute of Population and Social Security Research, I'll analysis two point about double carer in Japan. First, based on my previous research, I'll reveal that K6 point of double carer is worse significantly than those of who care only children, only parents, or no people. Second, with multivariate analysis, I'll analyze what is the determinants of becoming double carer.

In conclusion, relating with familialism in Japan, I'll point that promoting three generations living together by Japanese government has a risk that caused double care in future.

The National Survey on Social Security and People's Life has been conducted every five years since 2007. In this presentation, I mainly use the data of 2012. But if I can, I'll introduce the data of 2017 briefly.

PERALES, FRANCISCO (*University of Queensland*)

Beyond Graduation: Stratification of Long-Term Socio-Economic Returns to Higher Education in Australia

A wealth of international research shows that participation in Higher Education (HE), particularly at the advanced graduate level, has positive impacts on people's socio-economic outcomes. The attainment of advanced tertiary-level educational qualifications is amongst the strongest predictors of subsequent success in the labour market, including the attainment of secure and continuous employment (OECD, 2006), high productivity and wage growth (Daly et al. 2015), and occupational standing (Hauser et al. 2000). There are also documented spill-

over effects on other domains in life, such as psychical and mental health and wellbeing (Ross & Wu, 1995; Anstey & Christensen, 2000; Hill et al., 1998).

However, in the Australian context, concerns have recently been expressed about heterogeneous returns to HE, whereby graduates from more advantaged backgrounds reap more benefits from participation in HE than graduates from less advantaged backgrounds (Tomaszewski et al. 2017; Perales & Chesters, 2017). Despite these concerns, there is a dearth of research in Australia that specifically considers differences in long-term trajectories of graduates' outcomes (recognising that the benefits of HE take time to accrue), and of studies that move beyond an exclusive focus on income (recognising that the benefits of HE are broader than its economic returns and, for example, include enhanced social and cultural capital, and improved wellbeing).

This paper seeks to address this gap in knowledge by investigating post-graduate outcome trajectories of students from advantaged and disadvantaged backgrounds. The research employs statistical analysis of high-quality, large-scale data from the Australian Government Census of Population and Housing (the Census) and the Household, Income and Labour Dynamics in Australia (HILDA) Survey to investigate the stratification of post-graduate outcomes of advantaged and disadvantaged students over the short, medium, and long run, and across a number of domains (labour market, social capital, wellbeing), discussing concrete implications for research and policy.

Comparability of International Survey Projects and Ex-Post Harmonization: Data Documentation and Quality Controls

This paper proposes methodology to assess and account for variation in survey quality as reflected in the general documentation of extant international survey projects. Poorly documented data reduce user confidence, while inconsistencies between codebook and technical reports on one hand, and the data records in the computer files, on the other, make the data difficult to use. Researchers harmonizing cross-national surveys ex-post encounter these problems early on, since existing projects vary substantially in how transparent and accurate the descriptions of survey design and implementation, and of data coding, are. To facilitate greater inter-survey comparability in these dimensions, we develop a schema of data quality indicators that takes into account accumulated knowledge from the Total Survey Error, Total Survey Quality, and Total Quality Management frameworks. We apply the schema to 1,721 national surveys in 22 international projects and construct metadata composed of three sets of control variables: variables describing the quality of data documentation; variables capturing inconsistencies between survey documentation and data records; and variables revealing errors in data records. We analyze the extent to which these control variables correlate with substantive variables such as trust in institutions, interest in politics, or attending demonstrations. We propose that researchers can use the metadata in statistical analyses to partial out the effect of variation in source data quality on variables of substantive interest.

Trends in Youth Political Participation Worldwide, 1990 – 2013: A Test of the Deconsolidation of Democracy Hypothesis

In a provocative article published in the *Journal of Democracy*, Foa and Mounk (2016) found that the youth of rich and established democracies are less likely than earlier birth cohorts to support the political system and its institutions. "Citizens of democracies," they write, "are less and less content with their institutions." While scholars assume that full-fledged democracies will endure, Foa and Mounk argue that, for the first time in many generations, deconsolidation is a real threat. Noting their critics, we engage Foa and Mounk's call for more research on potential deconsolidation. We compare political participation of the young with that of older groups across countries and time. To do so, we analyze a massive dataset of over a dozen ex-post harmonized international survey projects, including the World Values Survey, International Social Survey Programme, European Social Survey, Arab Barometer and other regional Barometers, among others, that cover ca. one million respondents interviewed from 1990 to 2013 in most of the world's regions (e.g. North America, South America, Europe,

Asia, and Oceania). These data contain harmonized individual-level variables of political participation, trust in institutions, and socio-demographic characteristics (dataharmonization.org/data). Macro-level measures of democracy, economic development, and economic inequality for all country-years complement the individual-level measures. Specifically, we examine trends in youth protest and voter turnout in light of within-country over-time changes in GDP, income inequality and level of democracy.

Public Defenders of the State of Sao Paulo: Activism and Career Profile

This paper aims to present the main results of a postdoctoral research carried out on the Public Defense Office of the State of São Paulo. This study, which is part of a more extensive project on conflicts in the construction of urban spaces, focuses on how the Public Defense Office acts in this area, mainly working on activism issues among public defenders. We seek to understand the activism of these professionals from their own perspective: we try to perceive how they mobilize this category in a context in which they feel strongly encouraged to reinforce the relevance of their professional activity and their social role (the creation of the Public Defense Office is recent and professional conflicts are diverse). Therefore, activism is pertinent among these professionals since they understand that their activity is built in opposition to other legal careers and their performance would also be much more "humane" (because of the constitutional guarantee of defense of the accused); We also seek to contribute to this contemporary debate studying a topic that has been subject of little research in Brazilian social sciences so far, as it is the case of public defenders in São Paulo. Quantitative and qualitative data will be presented (in their contrasts and complementarities) in order to create a profile of the Public Defense Office of the State of São Paulo and this is relevant, from a sociological point of view, for it allows us to glimpse the results of training and recruitment processes of this particular state agency. The results, so far, point to two types of activism in this field: one related to more professional issues, or, to be more accurate, to the consolidation of that career and another involving a more committed performance of the public defenders, bringing them closer to social movements.

Household Demographic Heterogeneity and Migration Consequences to Household Economic Outcome in Rural China

Using 1997-2011 China Health and Nutrition Survey (CHNS) house level data and fixed effect models, we examined how migration has affected the household economic status from both absolute net income and relative rank within community. We first examine whether migration has positive or negative effect on the household economy and how this has been changed over time. We then examined whether the influences could be mediated by who left-behind and whether it is conditional on household human capital stock and land. We found that migration has negative consequences on household net income and relative economic status and it became particularly true in more recent years. The influence of men migrant is larger than women. In contrast, more stay-at-home labor ages people, especially men, can compensate the loss by migration. However, the influence is differed by household human capital stock and land holding. The harmful effect of migration on household economy is more salient when household average human capital is higher.

Is Local Language a Necessary Pathway to Immigrant's Labor Market Integration? the Case of Hong Kong

Upon immigration to a society, gaining the proficiency of native language in the host society has often been seen as a necessary pathway to the labor market integration. Immigrants who lack of language proficiency have often been suffering from labor market disadvantage. However, this conventional wisdom may be challenged when the economic sectors are largely linked with outside economy. Hong Kong is such a case. In Hong Kong, the local language is Cantonese, thus we should expect immigrants who gain the proficiency of Cantonese should perform better in labor market. However, due to its open economy system as a global city and mainland China oriented economic system, people who speak fluent English or Madeiran may be even in a more advantaged situation. Using Hong Kong population census data from 2001 to 2016, we will examine the impact of spoken language on people's labor market outcome. Since 2016 data is not available yet, the analysis based on previous census from 2001

to 2011 has showed such a pattern. After obtaining the more recent data in 2016, we will examine the temporal change of language ability on immigrants' labor market outcome to shed light on the influences of changing economic context in the host society. We will merge the economic sectors data with the individual level census data together to examine the impact of changing economic context on importance of language proficiency on immigrants' labor market outcomes.

The Culture of Surveillance in Turkey

Surveillance in Turkey has in recent years moved from being authoritarian to totalitarian: rather than targeting selected dissident groups, it now aims at mass disciplining and pre-emption of dissident behavior. This paper aims to analyze the causes of this shift in surveillance, paying particular attention to the role of culture. While the current surveillance regime represents a new stage in the curtailment of rights and freedoms, cultures of surveillance are not created overnight. Erdogan's AKP inherited the culture of authoritarian state surveillance in Turkey and brought it to new levels. The establishment of totalitarian surveillance should not be understood from a negative teleological perspective either, as the unfolding of an inevitable totalitarian tendency found in the Turkish "culture". In order to understand the current culture of surveillance in Turkey, we need to take into account the national, regional and global conjunctural events, the complex interactions among multiple internal and external actors, as well as Erdogan's strategic maneuvers to protect and expand his sphere of influence. In *Electronic Eye* (1994: 11-12), David Lyon notes that the increasing surveillance capacities of states does not necessarily mean sliding into totalitarianism, even though there is always a risk. The case of Turkey demonstrates that the actualization of such risk could be located in the articulation of a "culture of surveillance" within a complex conjuncture.

(im)Mobilities in the Time of Terror: Experiences of Canadian Dual Citizens Post 9/11

We live in an era in which security politics are generated and sustained by the 'war on terror' (Dunne & Wheeler, 2004; Mueller, 2006). This war often targets mobile people. Therefore, security and international travel have become more intertwined with geopolitics and racial discrimination has continued to be a widely-debated feature of the politics of control (Anderson, 2013; Bianchi, 2006). Borders are the points at which individuals are subjected to power through their bodies and are being limited to an object of knowledge (Epstein, 2007). A *corporeal lens* makes visible to us the ways the body comes to testify, along with our documents, about our intentions, character, utility, moral quality, and social and economic origins. Therefore, it is important to engage in an analysis of the ways in which bodies are constructed not only in relationship to a single sovereign, but also as bodies that negotiate mobile subjectivities with respect to more than one sovereign, a process that conditions the ways in which we understand ourselves as international bodies (Salter, 2006).

In my PhD research, I explore the border crossing experiences of Canadian dual citizens who have travelled internationally post 9/11. My focus in this qualitative research is on the ontological experiences of international travel. I seek to understand what dominant discourses materialize at border crossings and how these discourses become embodied in travellers' experiences. In my research, I engage with the scholarship now often known as the *corporeal turn* in which the body, the social, economic-political conditions of embodied subjectivity, and the relationship between the body and the body politic are taken as important sites of political struggles. Through this presentation, I discuss how fragments of identity, such as race, gender, class, ethnicity, religion, nationality, and citizenship shape the border crossing experiences of individuals.

Mapping Gender and Social Inequalities: Young Women and Men in European Countries

The paper discusses results from an ongoing research project on *Gender (in) equalities over the life course*, analyzing data about young women and men (15 to 29 years) in different European countries and welfare regimes. The present analysis aims to map gender and social inequalities, across European countries and within countries, examining several indicators. A longitudinal study of young Portuguese women and men, using quantitative but also qualitative methods, will also be presented.

The analysis highlights the obstacles that young women and men across Europe face in their transition to adulthood and autonomous life, and which accentuated after the economic crisis: unemployment, precarious jobs, low salaries, gender inequalities in the labor market.

Intersecting class, age and gender in our analysis, we further discuss educational and social mobility identifying different class and gender trajectories. Values and how they change over generations, in different European countries, is also a topic that will be addressed.

Through a cluster analysis we were able to identify three groups of countries and of young women and men. These comparisons led us to interesting conclusions. For instance, why do Portuguese young women look closer to eastern women in a considerable number of indicators, while Portuguese men, are closer to the other southern countries?

Why are young women, more than young men, leaving sooner their parents' home and leaving on their own, in all European countries?

And how to combine class and gender when trying to explain the persistent educational gap between young men and women?

To answer these questions we mobilize a theoretical background that combines gender, welfare state and workcare regimes, material conditions of existence, but also cultural and historical trends of change in different countries, social classes, different type of masculinities and femininities.

CLOTET, CINTHIA (Colegio Militar de la Nación Facultad del Ejército Argentino UNDEF)

La Evolución De La Formación Universitaria En El Ejército Argentino

Desde el punto de vista educativo, la formación de oficiales del Ejército Argentino ha tenido reformas importantes. Una de las más relevantes se observa a partir del año 1990, donde se establece incorporar al Instituto de Enseñanza Superior del Ejército al régimen de la Ley 17.778 – Universidades Provinciales -, esto implica otorgar validez nacional a los títulos. En 1995, a partir de la promulgación de la Ley de Educación Superior, la Institución adapta su orgánica para dar lugar al nivel universitario. La transformación de la titulación de nivel terciario a nivel de grado tiene su anclaje en la Ley de Reestructuración de las Fuerzas Armadas, Nro. 24.948 que impone alta capacitación a sus integrantes. En el marco del proceso de modernización de la formación de Oficiales del año 2010, se diseña un Plan de Estudios para la formación tendiente a la integración plena de la formación académica y la instrucción militar, aseguramiento del nivel universitario de la formación, preparación de los cadetes para que actúen en forma autónoma y responsable y elevación de la calidad y tiempo destinados al estudio y la instrucción. En el año 2016, se realiza una reforma curricular basada en los aciertos y desaciertos observados en el Plan de Estudios 2010.

El presente trabajo pretende demostrar que la falta de continuidad en los Proyectos Curriculares no permite realizar un adecuado análisis de formación de Oficiales. Los resultados del estudio pretenden hacer énfasis en la necesidad de otorgar cierta estabilidad en la formación universitaria que permita planificar y mejorar la calidad de la carrera, sin estar sometida a cambios constantes. Para ello es fundamental identificar los principales motivos por los que se produce la reforma permanente, así como proponer algunas líneas de mejora que permitan sostener una mayor estabilidad.

Right to the City and Water Crisis in São Paulo (Brazil): Challenges and Opportunities for Urban Environmental Governance Strategies

São Paulo is a metropolis with approximately 12 million inhabitants according to the latest official estimates. The environmental crisis faced by several megacities in the world, both in the Global-South and in the Global North, has hit São Paulo with force at the beginning of this century. The general objective of this work is to analyze the challenges and opportunities in terms of environmental governance, from the water crisis that hit São Paulo State between 2014 and 2016. Although the mentioned water crisis has reached a considerable part of the State of São Paulo, the frame for the present work is in the metropolitan region - home for approximately 21.2 million inhabitants. The specific objective here is, on the one hand, to analyze the proposals and projects adopted by the authorities at the time, comparing with the projects and demands presented by civil society,

in a perspective of environmental justice. On the other hand, this presentation also seeks, in an articulation between academic knowledge and public policies, to reflect on possible strategies and tools to be used for a better management of water resources. In this sense, the possibilities of using the concept of ecological corridors and urban linear parks as tools of environmental governance will be analyzed in order to face the water crisis of the São Paulo metropole. These projects, however, need to be evaluated from the point of view of the local people, and their demands. In a debate on the commodification of water, environmental crisis and the right to the city.

Migration and Elderly Care: An Ethics of Care-Informed Study of Media Representations

International migration and population aging have brought renewed attention to the scholarly debate on the ethics of care. The ways in which care impacts our societies, what it means to democratic states and how care responsibilities can be divided so that all citizens are able to both, provide the care they need to provide, and receive the care they are in need of, are all topics being discussed by sociologists, political scientists and caring scholars. Even though research has long established that media representations can influence people's perceptions of phenomenon they lack first-hand experience on, little is known about the ways in which public debates around these issues are shaped. It is against this backdrop that we embarked on quantitative and qualitative content analyses of what the Swedish daily press reporting on these issues has written ever since the public debate on the intersection between migration, aging and care started in this country in 1995. The presentation will present some of the findings from the analyses we are in the midst of performing (300+ newspaper articles are being analyzed at this very moment); findings which show not only how undervalued caring activities actually are but also how many conflicting views about migrants' role within the elderly care sector the media is reproducing. By showing that representations and debates about care are a theoretically profuse source of information about how societal values are shaped, this presentation aims to contribute to the recently re-ignited debate on the ethics of care that Tronto's recently launched notion of 'caring democracy' has started.

Researching Far Right Movements: Which Implications for Social Research?

Since several decades, the issue of extreme right movements is a consolidated object of study for social sciences, witnessed by the vast literature on this subject. This literature is largely based on studies and analysis ascribable to a political sociology approach, mainly focused to specific aspects of these movements, i.e. the organizational dimension, the analysis of their ideological and political orientations and their interpretations, the electoral weight, the mechanisms of mobilization.

Therefore, are still few the studies focused on a cluster of key questions that remain under-explored within the existing literature. These questions are mainly related to the subjective dimension of who are mobilized by and take part in extreme right movements, as far as the ethical implications tied to researcher's reflexivity on this specific fieldwork. The study of these movements, in fact, presents some difficulties connected to the access to the research field since qualitative inquiry techniques need a direct connection with actors that are the object of the study.

The paper aims at exploring some theoretical and methodological issues related to the study of far-right movements that are still under-explored within the existing literature. In particular, I will face some questions related to the subjective dimension of who are mobilized by and take part in extreme right movements, as far as the ethical implications tied to researcher's reflexivity on this specific fieldwork. The study of these movements, in fact, presents some difficulties connected to the access to the research field since qualitative inquiry techniques need a direct connection with actors that are the object of the study.

The Role of Businesses in Empowering Farming Communities through Non-Monetary Transactions. the Case of Organic Wayanad, India

The paper engages with the role that small private enterprises can play in the development of marginalised communities in the Global South, through the less visible non-monetary relations that underpin market transactions. The role of businesses in development has been studied primarily in relation to broader

global development initiatives to include the world's poorer communities into global markets, as well as in the context of Corporate Social Responsibility (CSR) activities. Such projects tend to focus heavily on the development of innovative products and on income generation, while often their impact is assessed 'in terms of the instrumental value to business rather than to the poor and marginalised' (Blowfield and Dolan 2014: 35). Moreover, the non-monetary input of businesses remains obscured; yet, it is this non-monetary role that presents a valuable opportunity to explore the different ways in which businesses can contribute to development. First, and drawing on the work of feminist scholars Katherine Gibson and Julie Graham, I propose that understanding the development efficacy of businesses can benefit from recognition of the social relations that underpin market transactions and create possibilities for non-capitalist development. Second, I explore these relations through the case study of a community of Fairtrade, organic farmers in South India – the Organic Wayanad – and their foreign buyers, a group of small private enterprises. This is an ongoing study and the data presented in this paper has been collected through two rounds of focus groups and individual interviews with farmers and officials from Organic Wayanad in 2014 and 2016. These were combined with in-depth interviews with six buyers in Europe and North America. The findings demonstrate some of the less visible communicative practices that connect farmers with the buyers and can empower farming communities in subtle yet significant ways.

Learning to Love Where We Live Again: Children's Wildfire Education for Community Recovery and Resilience

On February 7th 2009, a major bushfire devastated the small town of Strathewen in south-eastern Australia. The fire destroyed the primary school, the community hall, and most of the houses in the area. Twenty-seven of the town's 200 residents lost their lives. Eight years on, the primary school has been rebuilt and the senior students are participating in a place-based, experiential, student-led bushfire education program. Throughout this program, the students develop knowledge and skills for assessing local bushfire risks, investigate actions for reducing those risks and lead creative arts-based projects that centre on the development of locally relevant bushfire education materials for their community. Then, as the bushfire season approaches, they share their knowledge, skills and arts-based projects with their families, friends and the wider community at a public presentation evening at the new community hall.

This paper will present the findings of an in-depth qualitative case study that was conducted as the first cohort of students approached the end of their time in the program. Drawing on interviews with students, parents, teachers, fire brigade volunteers and other community members, the paper will explore the various ways the program has supported recovery, reduced risk and increased resilience amongst children and their families. It will then identify the key mechanisms and processes that have contributed to these positive outcomes and reflect on some of the key challenges associated with providing quality bushfire education in a post-disaster context. The paper will conclude with a discussion of the need for continued theory development and further research in the township of Strathewen and in other communities that are recovering from disaster.

Physical and Psychological Distance in Warrior Society: Warfare, Courtesy and Verbal Dueling in Medieval English and Japanese Narrative

Norbert Elias, in *The Civilizing Process*, thinks of the medieval period as the age of both courtesy and aggressiveness. In his view, knights gradually began to behave in a constrained manner at court, but never restrained their savage joy in war throughout the Middle Ages. Mainly from the evidence of the thirteenth-century French data, he infers the standard practice in knightly class of considering or assailing others. Nevertheless, fourteenth-century England, at least, shows a quite different picture. We modify his model of physical and psychological distance in warrior society by investigating the transformation of the manner of making war and its possible relationship to the rapid development of courtesy in the case of England at the time. The analysis of literary representations of warfare and chivalry in medieval English narrative from sociological and sociolinguistic perspectives indicates that the innovative method of combat at a distance influenced a new mode of proprieties characterized by linguistic politeness, and vice versa. However, a quite different emotional response was likely to be evoked along with new types of warfare. This can be attested in Japanese war fiction of the Middle Ages. Our results strongly suggest that courtesy among Japanese military nobility was rather enhanced in spite of the introduction of close combat. Fencing and wrestling on the battlefield, judging from such depictions, became much more important than mounted archery in Japan. In contrast, the English longbow can be considered to have made obsolete single combat accompanied by verbal dueling with ritual insults and boasts. According to the findings, similar ceremonies in earlier times may have been replaced by rational exchange of

courteous self-praise on the fourteenth-century Japanese battlefield. We argue that a different style of new tactics might have established a different mode of courtesy in warrior society.

National Myth Busters: The Most Important British and Australians, Living or Dead

National identity in Western nations has been claimed to be founded on the myths of a 'golden age', personified through heroes, saints or sages. If this is the case, contemporary citizens may be expected to identify historical and mythical characters as important national figures. Using national survey data from the United Kingdom and Australia, we asked who are the most important British or Australians, living or dead. By far the most frequently selected important British people were Queen Elizabeth II, and the former Prime Minister and WWII leader, Sir Winston Churchill. Like the British, Australians also selected former prime ministers, but also surgeons, a saint, and a cricketer in their top 10, although Australian responses were far more evenly distributed among several important individuals. The most important people identified in both countries tended not to be mythical heroes from an earlier 'golden age', nor contemporary sportspeople, but for the most part, those who have had a direct influence upon the lives of the citizens of each nation. Our findings suggest that the 'myths' associated with a 'golden age' of nationhood are to a large extent 'busted'.

TRATSCHIN, LUCA* (University of Lucerne)

All Hazard Disaster Approaches and the Expansion of Expertise

Modern society sees itself confronted with a wide range of risks. As is well known, contemporary risk society relies heavily on scientific expertise: Scientifically trained experts offer risk-assessments to political administrations or the general public and explain how one should deal with risks.

Sociology has a long tradition of investigating the way in which experts frame risk problems and thereby uncovering the social situatedness of their assessments. It regularly points out that lay assessments of risk-problems may in fact be more sensible than technocratic views on risks. While these sociological critiques of experts are mainly external to risk-discourses, one can currently observe interesting developments in political strategies dealing with catastrophic risks, which take these sociological arguments substantially into account (while not necessarily being aware of them).

While political administrations used to create specific plans for specific risk-scenarios, they are re-organizing their catastrophic preparedness strategies more and more towards a so called *all hazard* approach. Since this approach is supposed to cover all catastrophic events, a correspondingly wide range of technocratic expertise is involved in catastrophic planning. Furthermore, one can observe that lay perspectives and knowledge are becoming more important in *all hazard* strategies. These two developments create interesting tensions in regard to the status of expertise: A wide range of experts and lay-persons is anticipated to be involved in identifying catastrophic threats and dealing with them. The question arises: Who is an expert for what?

In my presentation, I will study the status of experts and "hybrid" forms of lay-experts in all hazard approaches to pandemic influenza. The main idea of my contribution is that we should gain sociological insight into participant concepts of expertise if we study cases where expertise is not clear-cut and where there are possible overlaps in "jurisdictions" of different kinds of experts.

TRATSCHIN, LUCA* (University of Lucerne)

New Directions in the Study of Social Movements: From Causal Explanations to Attribution Processes

In my talk, I would like to address a type of research question that has been neglected by sociological research on social movements. While social scientific research on social movements typically focuses on explaining the emergence of contentious performances of social movements through different causal models (e.g. structural strain, resource mobilization, political process, collective identity, collective action frames) it hasn't paid much attention to the processes through which performances like demonstrations, sit-ins or strike are being attributed to specific social movements. I will suggest that the study of attribution processes offers new insights into dynamics of social movements which can complement causal accounts.

After showing why the attribution of protest is a salient question, I will introduce a conceptualization of attribution processes which distinguishes between protest offers and protest reception. Protest offers are performances such as demonstrations, sit-ins, rallies which claim to be considered as protests of a

specific social movement. Such claims can be evaluated by two types of protest reception: Validating attribution and attribution based on the observation of differences between protests. The former takes the attribution of demonstrations to a specific social movement as granted, while the latter gives an account that explains, why a certain protest can be understood as a contentious performance of a specific social movement. I will illustrate my theoretical account with examples from the occupy movement.

TRAUE, BORIS* (*Technical University Berlin*)

The New Relational Turn in European Sociology – Theoretical and Methodological Perspectives

In the past years, the debate on relational sociology has intensified considerably. After North American network research and pragmatist sociology embraced relational thought, an alternative relational research programme has emerged in European sociology and social theory. It is grounded in philosophical anthropology, the sociology of knowledge, Science and Technology studies as well as qualitative empirical methods.

This approach is fostered by scholars such as Pierpaolo Donati, Margaret Archer, Hubert Knoblauch, Gesa Lindemann and others, with major works having been published in the last five years. Taking leads from Simmel, Schütz, Mead and Plessner as well as media theory, such approaches emphasize the 'triadic' character of social relations and thus deliver a strong critique of substantialist concepts. They seek to integrate micro- and macro-perspectives through the implementation of qualitative methodologies, which allow us to create thick descriptions of the processuality of social action as well as long-term societal transformations. Such 'triadic relational thought' is articulated through a dialogue between qualitative inquiry (ethnography, discourse analysis, hermeneutics) and a recasting of classical theories – and thus substantially enriches and expands the range of relational theory in sociology and social thought in general. In the contribution, commonalities and differences of this research programme with other forms of relational sociology are pointed out by discussing themes such as communication, technology, power, violence, and democracy. In the conclusion, perspectives for relational sociology which emerge from this new research programme will be proposed.

150 Years after Das Kapital: Are Classical Marxian Visions Relevant for Studying Capitalism/s in the XXI Century?

The paper aims to discuss the Marxian vision of bourgeois society with regard to current sociological debates about contemporary capitalism/s. In existing sociology, both mainstream and critical, capitalism is understood primarily in line with the Weberian tradition (historical macrosociology or new economic sociology), sometimes mixed with Ricardian Marxism (world-system analysis). In this paper, we want to ask, what kind of conceptual benefits a stronger fidelity to Marx himself would bring to our understanding of capitalism, especially of its categorical core that remains beyond the institutional and technological varieties.

To do so we will sketch out how to operationalize Karl Marx's visions for doing sociological inquiry into current versions of capitalism/s. We will try to accomplish this by (1) summarizing the ways in which Karl Marx himself conceived and formulated ideas of studying bourgeois society, (2) going over the number of criticisms lodged against different versions of Marxist accounts, and (3) evaluating the various ways in which Marx's ideas have been operationalized in existing sociological research. In so doing, we will center our attention on *Das Kapital* and *Grundrisse* as well as various commentaries to these classical texts.

Vulnerabilización espacio-cultural: mercado El Tepetate

Productividad y competitividad son palabras frecuentes en la gestión de la ciudad. Las políticas urbanas invierten en infraestructura asegurando mejorar la calidad de vida del habitador, aunque pobreza e incertidumbre, estén presentes. Desarrollo económico, prosperidad, sostenibilidad ambiental y tecnología son prioridad en la carrera por obtener recursos internacionales. Para la ciudad de Santiago de Querétaro, México, integrar conceptos antropológicos, históricos, arquitectónicos, sociales, urbanos y políticos resulta una opción difícil de atender, la cultura híbrida de este territorio, tiene improntas profundas que denotan desigualdades estructurales. La rehabilitación de un mercado, como elemento regulador, es una alternativa que puede contribuir a minimizar la vulnerabilidad de la ciudad. La segunda fundación de la ciudad generó nueva fisonomía urbana, con carácter pluriétnico y población organizada en barrios, los "Barrios de la Otra Banda" ¿Son el espacio y la tradición factores de enlace y exclusión?

La historia del territorio simultáneamente conforma la realidad social, tiene y hace memoria. Cuidar bien de las personas y de la valiosa vida que tiene lugar entre los edificios es uno de los principios humanistas de Gehl. Pallasmaa, refiere de la tradición y la novedad que la forma arquitectónica ha perdido sus bases ontológicas. Para Ricoeur, ser fiel al pasado es lo mejor que se tiene para significar que "algo" ha ocurrido, la memoria implica no olvidar.

Se considera un método holístico con estudios físicos, históricos y etnográficos: se estudia la forma urbana, historia y cultura del lugar, posteriormente un acercamiento a la vida social en el uso de los espacios y, finalmente la búsqueda de la conexión de resultados de los puntos anteriores. Se presentan configuraciones de mapas, relacionados a los cambios físicos acontecidos históricamente en la traza urbana y una propuesta de mejoramiento micro-urbano de inclusión físico-social con la ciudad patrimonio UNESCO.

Intensification of Work in Female Professions : The Hidden Dimension

As mentioned in the call for papers, a certain number of authors have studied the intensification of work over the last decades. However much of the work related to intensification has tended to be done in sectors such as multimedia, IT, finance, and other sectors related to the Knowledge Economy and, often, in male sectors. However, many women work under a strong pressure and intensification of work has also touched female jobs, such as the hospitality, restaurant and airline (stewards), amongst others. Our paper will look at how the professional and domestic spheres are very closely intertwined, and how more challenges emerge as intensification of work increases in these sectors. In the restaurant and hospitality sector, it is the reduction of personnel and increase in what is required of workers. In the airline industry, it is the passage from one steward for 40 passengers, to one for 50, that has contributed strongly to intensify work. Intensification has an impact on working hours, atypical work schedules and, in turn, on family activities, as well as on stress and sometimes even burnout. Our paper will present the results from some research done in these two sectors and show how intensification of work is particularly challenging for women, as it impacts also on their work-family articulation and personal time. Our paper will shed light on these situations and present a contrasted view of work-family articulation, characterized simultaneously by obstacles and work advantages in these sectors.

Experiences, Motives and Subjective Meanings of Childlessness in Lithuania: A Comparison of Women in Two Generations

The phenomenon of childlessness in Lithuania has so far received little attention from researchers, even though it has become increasingly relevant in recent years. According to Human Fertility Database, cohort childlessness has increased by a factor of 2 since the 1950s in Lithuania: among women born in 1953 5,6 percent were childless, whereas 12,4 percent remained childless among those born in 1970. The data from the Generations and Gender Survey (conducted in the country in 2006 and 2009) also indicates the increase in voluntary childlessness among women of reproductive ages.

In this paper we aim to analyse *experiences, motives and subjective meanings attributed to childlessness* in two generations of women in Lithuania. Our study employs qualitative research methods and is based on 45 semi-structured interviews with childless women, gathered during the research project *Childlessness in Lithuania: socio-cultural changes and individual experiences in modern society* (financed by the Lithuanian Research Council, contract No. S-MOD-17-3). The first generation of women who are currently aged 50-69 represent a generation who's most active reproductive years passed in the late soviet period and the first decade of Lithuanian independence in the 1990s. Women aged 27-49 represent a younger generation that is still in the process of remaining childless. Cultural norms in Lithuania praise maternity and since the mean age at first birth in Lithuania is 27 years, childless women of this age and slightly older experience high normative pressure to have children.

Following recent literature on childlessness we do not focus on one type of childlessness but rather view it as a complex, multifaceted phenomenon, recognizing that the boundaries between voluntary and involuntary childlessness are not always clear. In our analysis we highlight the importance of the socio-historical context and aim to reveal individual, familial and socio-cultural determinants of childlessness in Lithuania.

WG05-946.1TREUKE, STEPHAN* (*Federal University of Bahia*)*Explorando Las Dimensiones Espaciales De La Pobreza Urbana En Latinoamérica y Sus Implicaciones Para Las Políticas Públicas*

En este trabajo, nos proponemos, en primer lugar, examinar las diferentes trayectorias de abordaje de la pobreza urbana y de sus manifestaciones en la organización socioespacial en los contextos urbanos estadounidense y latinoamericano. En segundo lugar, indagamos cómo los procesos de segregación residencial se convierten en un mecanismo reproductor de la pobreza a base del concepto de *neighborhood effects*. En Latinoamérica, estas consideraciones de origen estadounidense influenciaron la discusión en torno del desajuste entre los activos potencialmente movilizables por la familia en situaciones de vulnerabilidad y las estructuras de oportunidades generadas por el mercado, el Estado y la sociedad. Aunque menos explorada que en el caso estadounidense, la dimensión del vecindario recientemente ganó una mayor relevancia en los estudios urbanos latinoamericanos debido al impacto de la criminalidad y violencia en la organización social de las comunidades y en consideración de las transformaciones ocasionadas en las estructuras de soporte precapitalistas, como la familia y el vecindario. Finalmente, discutimos la relevancia de la dimensión espacial de la pobreza para las políticas públicas a partir de tres ejes principales: *People-based policies* proporcionan una asistencia temporal a determinados grupos residuales viviendo en barrios desfavorables a través de los programas de des-segregación y de movilidad residencial asistida. Los *place-based policies* focalizan el barrio como unidad de intervención, invirtiendo en infraestructura y equipamiento urbano o promoviendo un mayor grado de heterogeneidad social y étnico-racial dentro de la composición populacional del barrio. Finalmente, el *indirect approach* se propone a remediar las propias causas de la polarización socioespacial a través de una mayor intervención regulatoria del Estado en el mercado laboral y habitacional para responder a las transformaciones producidas dentro del sistema socioproductivo post-fordista y mediante la implementación de programas sociales que promueven un acceso más equitativo a las instituciones de educación y a los servicios urbanos.

WG05-950.1TREUKE, STEPHAN* (*Federal University of Bahia*)*To Dwell Among the Affluent: Spatial Proximity Versus Social Distance in Three Shanty-Towns of Salvador Da Bahia (Brazil)*

This research seeks to verify whether enhanced structures of opportunities can be corroborated within the constellations of spatial contiguity between the shanty-towns Vale das Pedrinhas, Calabar and Bate Facho and its' surrounding upper-class condominiums. Salvador has traditionally hosted patterns of central-periphery segregation. However, recent processes of upper class auto-segregation have induced a geographic approximation between socially distant classes. On the basis of 120 semi-structured interviews – 90 conducted in the three shanty-towns and 30 in the surrounding upper-class condominiums – we examine the impact of neighborhood effects in the inhabitants' well-being at the material, social and symbolic dimension. Concerning the material dimension, the study corroborates that the contiguity to the upper-class condominiums benefits the inhabitants' economic integration in the personal service sector. However, structures of social segmentation hierarchize the access to urban services, particularly evident in the unequal access to schools and hospitals. Regarding the social dimension, the analysis of personal networks, the influence of peer groups and role models on school achievement and the community's capacity of informal social control confirm the confinement of social relationships to the local level whereas the existence of potentially bridging cross-class interactions could not be attested. At the symbolic dimension, strong evidence could be found for the neighborhoods' territorial stigmatization, hampering the access to the formal labour and housing market. Concluding, this research emphasizes the relevance of the neighborhood effect hypothesis for the analysis of the mechanisms of reproduction of social inequities in Brazilian metropolises. By identifying the causal interrelatedness between the three dimensions, it reveals the deleterious impact of spatially concentrated and mutually reinforcing constraints on the inhabitants' well-being. The dialectic relation between economic integration and social avoidance underlines the fact that spatial proximity does not automatically promote enriching opportunities or translate into a socially ascending dynamic per se of the shanty-towns.

RC51-849.5TREVÍÑO, LETICIA* (*Universidad Nacional Autónoma de México*)*"Growing Old Today in Mexico" Public Policies Regarding Social Security in the Growing Old Process and in Old Age.*

The social security concept is a social construct, accepted as a human right in the Universal Declaration of Human Rights, emitted by the United Nations Organization. This concept exemplifies the transformation that occurs with the knowledge construction.

Social security is a complex system, with subsystems that aim toward protecting the related risks or contingencies: health, old age, unemployment, labor risks, death, etc. The subsystems define each other and impact each other. Social security is influenced by the environment and influences the environment, and this occurs in a cyclical dynamic, allowing a constant adaptation regarding the social macro-system. An example of this is the correlation that exists between the health and old age subsystems. Life expectancy has increased thanks to the new knowledge that we have in the health subsystem, and has impacted the old age subsystem, generating new challenges that can become problems, this are not necessarily recognized by individuals due to their particular levels of reflexivity.

In this work we summarize the cognitive trajectories of Mexicans between 35 and 60 years of age, concerning social security and old age welfare. The theoretical framework was established as a sociocybernetics system based in Beck's global risk theory, in Bourdieu's capital theory, and in Piaget's genetic epistemology theory. The observables were cybernetically processed in the Amozurrutia's SIAS system. The results show that Mexicans have a scarce perception for anticipated old age risk planning such as health and income, risks that will eventually reach them.

Today the prevention is an axis in Mexico's health and retirement public policies, non the less, in Mexican educational system, children are not educated in regards to social security and in regards to planning their long term health and income. We consider that Piaget's genetic epistemology might aid in creating new educational public policies, with a sociocybernetics approach.

RC38-670.1TRIANA, BRUNA* (*Universidade de São Paulo*)*The Portuguese Colonialism through the Lens of Ricardo Rangel: Analytical Contributions on Photography and Memory*

During the colonial period in Mozambique, mainly when the conflicts for the independence intensified, a set of counternarratives were built and became important for the memory of the country, particularly because they contradicted the hegemonic and official narratives of the Portuguese empire. One name that occupies a privileged position in that context was Ricardo Rangel (1924-2009), a Mozambican photographer who wanted to bring attention to the violence, conflicts and paradoxes generated by the Portuguese colonization. Rangel's photographs could be deemed a precursor of the Mozambican photography. The idea of this paper is to examine the work of Rangel in the context of intensification of anti-colonial struggle and independence in Mozambique, between 1950 and 1975. The empirical object of my research is his visual collection, from which I would like to examine, on the one hand, the narrative mechanisms used by him to compose a photographic experience – a particular point of view and a way to understand the daily life and the violence of colonial period, outlining an ambivalent socio-political context. On the other hand, I seek to investigate the importance and specificity of Rangel's work within the panorama of Mozambican photography, in order to analyse which memories are possible to access from the images, which leads to looking at what senses and experiences the photographs generate. To do so, the photographs will be contrasted with a variety of materials, such as, but not limited to, interviews with people who lived in the colonial period, documents and newspapers of the colonial time, and Mozambican literature. Therefore, the axes of my analysis are the Rangel's anticolonial activism (both in his trajectory and in his photographs), the inventiveness in the practice of photojournalism, and the memoir aspects present in his work.

RC39-692.3TRIPATHI, DURGESH* (*G.G.S.Indraprastha University*)VIKRAM, NAMIT (*Vivekanand Institute of Professional Studies, Pitam Pura, New Delhi*)*United for One: Role and Impact of Youth on Community Oriented Disaster Management Programmes in India*

India as a society has witnessed a major transformation over time. With the growth in the forces of modernization in the 21st century Indian society, there have emerged many diverse set of processes which are indicative of growth and development of the population. However, simultaneously, the forces of modernization due to its nature of over-utilization of resources have created a series of complexities both naturally and man-made which have ultimately emerged within India in the form of disasters.

From 1993 to 2017 - the Latur earthquake, the Odisha cyclone, the Uttarakhand floods or the Bihar floods - every event has had catastrophic effects. In light of such events, the state introduced various state and non-state sponsored initiatives aimed at recovery and rehabilitation of such disaster affected or disaster prone areas. However, the policies and programs have not turned out to be fruitful in the long term process.

Since, India is considered a demographic dividend, the government agencies have started to understand the importance of the youth's participation in such disaster management programs and how they can help in complementing the overall development process by collaborating with the state both internally and externally for disaster management, recovery and rehabilitation.

The principle aim of this paper is to highlight how the state policies and programs are motivating the youth to engage in community based disaster management aimed

at providing recovery and rehabilitation to the disaster affected areas. The paper will also highlight how the youth within India are incorporating different tools and techniques of media to engage with the issues of disaster management at a community level. The paper will also aim to highlight the future prospects as well as the challenges that such youth related policies and programs are offering and facing within India.

TRIPATHI, RAM NARAYAN* (BANARAS HINDU UNIVERSITY VARANASI)

An Assessment of Objectivity in Sociological Research

Analysis of sociological facts in their original form by neutral perspective is known as the objectivity. This real form of incident or can be bitter, immoral, and contrary to all expectations ideals and values of the researcher. This is a matter of fact to reveal the reality of events itself. This acquisition will only reveal the truth or reality of events and this will be objective. Since, researcher's views, thoughts, perceptions, values, have influenced the objectivity and any researcher may not completely deny from all that influences that's why a researcher cannot see the reality of the facts. Scientific Research without objectivity is not only purposeless but waste. The significance of scientific research lies in the fact that we become familiar with the realities of facts and events and this introduction is not possible unless the objectivity is attained. There are protests that create a major obstacle in the path to discovering reality and we go away from the objectivity. This article argues about methods of finding more absolute objectivity in sociological research.

Sociusartography: A Study of Sketching Society through Art

Art, the term relates mainly to beautification, is also one of the technique of understanding society for converting the abstract notion to the concrete one. Art picturizes society and society defines art. A point where both art and science merge. How art sketches society and how sociology becomes the voice of art? Both sociology and visual arts are behaviour-centric disciplines. One studies the human behaviour in the conscious world from positive, verstehen and phenomenological or ethnomethodological method, the other attempts to picturize even the subconscious mind and the behaviour of man.

It sounds pretty cool in representing this unique paper which combines the very essence of both the subjects under one roof. Art is what we say the graphical picturization of society, whereas society is the lingual description of art – In order to understand the co-relationship between the two subject an inter-disciplinary approach, has been applied.

The most authentic and accepted multi faced explanation of culture given by E. B. Tylor. Art is a part of our materialistic culture, which in other word is a subject matter of sociology. In one sense art is related to realism it picturizes the mere facts of society be it beautiful or even if it sounds ugly. The power of art to influence the population cannot be ignored. Earliest cave paintings of Altamira, Lascaux, Ajanta, Ellora, Bhimbetka or alike which depicts the then present social condition of the society through arts. On the basis of these findings we can say that art has nothing to do with a socially decided parameters of development. Art helps in better and complete understanding of human society on the same hand it is also true that these artefacts are of no use unless and until they are described analysed and comparatively studied through a subject like sociology.

Evacuating Pets and People: Time, Decisions, and Resources

In the aftermath of Hurricane Katrina, the PETS Act was put into place to help provide more planning and options for pet evacuations in the United States. However, since then pet evacuations have remained a complex problem for many people affected by disasters. Some residents may refuse to evacuate without their pets, leaving both pets and people stranded in rising water and dangerous storm conditions. Residents who do evacuate face a range of issues related to bringing pets with them, such as finding appropriate cages for use at shelters or arranging for alternate care at veterinarians' offices or kennels. While such problems pose an obstacle to evacuation, they also cause time delays in the evacuation process. Whether taking time to address these obstacles or causing residents to waiver on evacuation decisions while considering if they can evacuate with their pets, these delays can cause serious complications to the evacuation process. Residents can thus become trapped in dangerous situations, sending residents to shelters instead of being able to reach the homes of family members or friends, or resulting in pets having to be left behind in immediate moments of crisis to save human lives. Examining these delays to understand the decision-making timelines and other related problems contributes to our knowledge of how and why people evacuate or shelter in place with pets, as well as to our more general

understanding of how large-scale evacuation efforts may run into complications such as lower rates of timely evacuation or the need for additional rescues.

Riffraff. Polish Social Media about Ukrainian Minority

Poland and Ukraine share a border and 1000 years of common history. Over that period, many stereotypes have arisen in both societies. For economic and political reasons (the Russia-Ukraine conflict) more than 1 million Ukrainians have emigrated to Poland. This is the largest and most visible minority in Poland.

The aim of the text is to describe the attitudes the Poles take towards Ukrainians by analysing statements about the latter in social media. We present the results of a 12-month study on Internet discourse. During the study, commercial tools were used to gather more than 1,000,000 statements about Ukrainians. The purpose was to analyze social media discourse, including the description of hate speech: quantitatively - as a percentage of all speech and qualitative - what topics appear in the discourse. The random sample of texts was encoded by a trained encoder team. Then we used Machine Learning and other tools from Natural Language Processing to expand the marked categories to the whole corpora.

The results of this study show how social media reproduces / constructs negative stereotypes of minorities. In the analyzed dataset, 57% of the responses were considered negative, 35% were neutral and only 8% were positive. Throughout the corpora, 24% of sentences have been labeled as hate speech. The subject of the analyzed statements was dominated by references to history - especially the Second World War, when in 1943 UPA (Ukrainian Insurgent Army) murdered more than 100,000 Poles in Volhynia. Indeed, topics related to economic migration, although related to the phenomenon *hic et nun*, always appear in the context of historical harm and stereotypes. Notably, negative statements tended to present a point of view coinciding with the version of Polish-Ukrainian relations and history as presented by the media of the Russian Federation.

TROSZYNSKI, MAREK* (Collegium Civitas)

Understanding Social Media. Use of Machine Learning (ML) in Qualitative Data Analysis.

Since the beginning of the 21st century we have seen rapid development of computer-mediated communication, especially the so-called social media. A collection of texts written by traditionally understood "users" (User Generated Content - UGC) appeared in public space. Researchers faced a major problem - how to analyze texts created by non-professionals who are characterized by the diversity of language, styles of expression, conventions, sociolinguistics, dialect or colloquialisms.

The purpose of this article is to present the process of automating coding of texts from social media. The implementation of this process allows for quantitative treatment of qualitative methods: analysis on the corpora of hundreds thousands of texts based on their meaning. The process is possible through algorithms of machine learning (ML).

The example of the hate speech designation project in texts from Polish online forums is presented. The first step is to gather the largest database of texts using key words. This part was carried out using commercial tools to collect the texts.

The key issue is the precise of conceptualization and operationalization of individual research categories. This allows for preparing specific instructions and conducting the training code unit. As a result we get higher rates of inter-coder agreement. Marked texts will be used as training data for automated categorization methods based on ML algorithms.

Then we describe the course of machine coding. This article also seeks to establish problems associated with automatic coding of hate speech and propose solutions. In summary, we point the factors that are crucial to the research process that uses machine learning.

TROTSUK, IRINA* (Russian Presidential Academy of National Economy and Public Administration)

National Security As Food Self-Sufficiency: Russian Official Discourse and Public Sentiments

The Russian political leadership defines food security primarily by the share of food imports and monetary expenditures on it. The government considers the terms 'food security' and 'self-sufficiency' to be synonymous, and, thus, food import policies combine government assistance for domestic production with restricting market access for selected imported foods. The situation with food security (and protectionism) became more complicated after August 2014, when Russia's food embargo was announced as a reaction to the western sanctions, and the government adopted about 900 discriminatory trade measures. According to both the international conventional definition of food security and the Russian

political leadership discourse, the vast majority of the Russian population is not food insecure in terms of adequate access to sufficient food. Nevertheless, the government declares the country as food insecure based on food imports, i.e. uses fears about food insecurity to bolster national security and further state interests. The national phone surveys in 2016 and 2017 prove that the 'grass-root' interpretations of food security in Russia combine elements of its traditional and politicized definitions and support the ideology of food nationalism. On the one hand, the population feels insecure when considers food prices and one's abilities to buy food products of good quality and in sufficient amount, i.e. there are evidences of domestic food insecurity due to the household poverty. On the other hand, the population supports the food anti-sanctions: the majority prefer Russian products to the foreign, and believe that Russia should not import foreign food. Such a support is determined by the fact that the western sanctions and Russia's retaliatory food embargo support the official discourse of self-sufficiency and put additional emphasis on national security as relying on import substitution, i.e. the Kremlin's narrative on food security with patriotic and autarchic overtones corresponds to popular sentiments.

Social Indicators Movement and Human Agency: Some Updates from Local and Global Approaches

This paper offers a critical comment on Land and Michalos (2016) and suggests a relay perspective to see the past achievements and future directions in the social indicators movement. In accordance with Land and Michalos, it suggests bringing the issue of human agency to the foreground, and offers an example using an index of the mother's wellbeing for global comparison. The maternal health and the social protection and autonomy of mothers are two distinct dimensions to represent the agency and capability of the mother. On the basis of this conceptualization, I calculated the scores for each country and present the ranking of 150 countries for 2010. The ranking of the mothers' well-being shows substantial differences across countries. This index is also a strong predictor of children's health in a cross-national perspective. Recent research trends also are updated.

On the Fall of the Patrimonial Bureaucracy in the Imperial China: A Weberian Imaginary Experiment of Confucianism

Max Weber's theoretical concept of traditional Chinese society, "patrimonial bureaucracy", is a mixed model of irrational and rational types of domination, since it contains elements of both patrimonialism and bureaucracy. Although many scholars debating on the applicability of Weberian concept, there have been relatively few research focusing on the collapse of patrimonial bureaucracy during the transformation from the imperial to modern China. Weber left no words on the China revolution in 1911 as he did on the Russian revolutions in 1905. However, it does not prevent us from establishing a Weberian imaginary experiment in which the question how and why the patrimonial bureaucracy and its cultural root, Confucianism, vanished could be scrutinized. This paper attempts to investigate the complicated ways by which the Confucian literati and local gentry mediated the legal disputes among the religious pluralism—Catholicism, Protestantism, Confucianism, Chinese Buddhism, Daoism—from the late Qing dynasty to the early Republican period. During the conflict events between different religious groups, the Confucian group went through a self-transformation in terms of both legal and cultural ways: a shift from Confucianism as a religion in order to manage all the religious affairs to Confucianism as a culture withdrawing from the religious discursive field. This crucial shift not only constituted an influential impact on the patrimonial bureaucracy, but also jeopardized the social reproduction of the Confucian literati. To sum up, this paper revisits Weber's theoretical concept of patrimonial bureaucracy with its historical case of Confucianism reform, and establishes a Weberian analysis from religious, legal, and cultural dimensions.

The Differentiation of the Literati-Gentry and the Reception of Citizenship Idea: A Cultural Sociology with Cultural Pragmatics and Social Performance

This paper adopts Jeffrey Alexander's cultural sociological approach—the concept of cultural pragmatics and social performance—to investigate how the differentiation of the literati-gentry influence the reception of citizenship idea in modern China. During the 1890s to the 1920s, it was the first time that citizenship, a Western idea, was imported into Chinese society in which the literati-gentry

played as the main carrier strata of this reception process. Nevertheless, during those decades, Chinese society went through a crucial change named "the rise and fall of gentry-power"—a shift in public opinion from "revive gentry's power in order to establish citizen rights" to "fight against corrupted gentry's power in order to protect citizen rights". It is not merely a historical event but also a sociological puzzle: how and why did "the rise and fall of gentry-power" and the reception of citizenship idea co-occur. The literati-gentry was divided into different sub-types—rural gentry, merchant gentry, and militant gentry—who played their respective roles superseding the literati-gentry's place in the reception of citizenship idea. Meanwhile, the literati-gentry gradually faded out from the stage of modern Chinese history since the internal differentiation happened, but crucially initiated the reception by playing a "pre-citizen" role, a forerunner of modern citizen in Chinese society. Synthesizing the analytic framework from citizenship scholar E. F. Isin and cultural sociologist J. C. Alexander, this paper views the reception of citizenship as a kind of "social performance", employs the cultural pragmatics approach to re-describe both the conceptual and institutional scholarships in the field of modern Chinese history, and analyses how the differentiation of the literati-gentry, including the three main sub-types and the various interactions between them and the popular, influences the reception of citizenship idea in Chinese society during the late Qing dynasty and the early Republican period.

Encountering Bureaucracy: Emotion and Affect in Interactions with the State

Historically the bureaucratic ideal has been described as one where emotion is absent, where bureaucracies function *'sine ira et studio'* without hatred or passion, and hence without affection or enthusiasm (Weber and Roth [1925] 20, 225, vol 1.). This paper will illustrate how our current bureaucratic regimes suggest quite the opposite: that emotion and affect are central to bureaucratic encounters on both the part of the bureaucrat and the client.

Bureaucrats, far from being indifferent, function within an environment which is emotionally charged; they expect particular emotional responses, face situations that may be emotionally manipulative and use their own emotional reactions in the form of 'gut instinct' (Friedman 2010, 179), to arrive at bureaucratic decisions. Even what could be considered as relatively mundane forms of bureaucratic documentation, such as the passport or the identity card, can have the effect of regulating emotional expression.

From the perspective of the client, this paper will consider the affective and emotional intensity of waiting in bureaucratic encounters, by drawing on empirical evidence from in depth interviews carried out in Australia and Greece with multiple citizenship status holders. In doing so it will highlight the role that power and privilege may have in insulating individuals from these encounters, how the emotional intensities of these encounters through repetition build up over time, as well as highlighting the importance of non-determinist analyses in this context, illustrating how emotion and affect are central to encounters with bureaucracy, not absent from them as has been previously theorised.

TSALAPATANIS, ANNA* (*Australian National University*)

Where Are You Really from?: Normative Schemes of Intelligibility and Encounters of Address

'I just remember- that's my clearest memory of any question that I had all through my teenage years, it was more or less all reflecting on my identity and my place. Because one of the first questions, if you met someone new when I was in high school, was, 'What's your natio?', was the first question. 'Where are you from?' 'Oh, down the road [laughter]. 'I live - see that street over there [laughter]. Where are you from? What's your natio?' It was perfectly acceptable, for whatever reason, it was an important question to everybody that I hung around, and everybody who I happened to meet.'

Drawing on Judith Butler's concept of 'normative schemes of intelligibility' this paper explores the constraints both imposed and implicit within encounters of address: when one is addressed or is called on to respond to that address, they must do so in a way which fits within existing normative schemes, including those of nationalism, and neoliberalism. These social and socialized limitations in terms of address, and the repetitive calls to 'give an account of oneself' may lead to significant consequences including those of double alienation and rupture, which will also be examined.

Drawing on empirical evidence obtained through of series of in-depth interviews with multiple citizenship status holders, in Australia and Greece – from which the opening quotation is sourced – this paper explores the limitations encountered when one is called on to give an account of oneself, and in the at-times violent address they receive from others.

RC57-931.4TSANGARIS, MICHAEL* (*University of Piraeus*)*Re-Adapting Radical Forms of Expression in the Digital Era - Investigating New Aspects of Recuperation*

Undoubtedly all past media forms held possibilities for alternative communications but most of the times commodification degenerated such options and tuned everything into 'spectacle'. Even some of the most experimental forms of painting, photography, music or moving images after all, removed far away from the original frames in which they were initially created and got absorbed by the mainstream cultural industry. In fact, some forms of alternative media such as underground music, street graffiti or tattoos were used actually to express distinctive youth cultural scenes or counter-movements that were challenging the dominant culture. Nevertheless, nowadays all those radical expressions are getting into mainstream circulation for commercial purposes and they are exploited by the very culture which they intended to challenge. In this sense the transformative power of mainstream media visual encounters 'cultivates' mimicry and converts ideologies and myths into commercial fashion. The investigation of the cases mentioned above will also take under consideration that perhaps we are marching through the final stage of a complicated recuperation process: the social media era. Is this the dawn of an open and horizontal communication era that abolishes hierarchal authorities, promoting progressive ideas at the service of social communities; or is it the 'Empire', that strikes back supported by the ensemble of all media forms aspiring to take control over existence? This work has been partly supported by the University of Piraeus Research Center

RC46-780.1TSHIFHUMULO, RENDANI* (*University of Venda*)DAITAI, ELLIA (*student*)*The Effects of School Feeding Programmes in Addressing Food Insecurity in the Mutale Municipality of Vhembe District, Limpopo Province in South Africa*

This study focused on the effects of the school feeding programmes in addressing food insecurity in Mutale Municipality of Vhembe District, Limpopo Province. School feeding programmes provided by the government to try and alleviate the scourge of food insecurity in Mutale Municipality were investigated. The study openly delineated various factors contributed to the ruthless chronic food insecurity which ravaged many families in rural areas. On the theoretical framework, the research enfolded Capability theory and Entitlement approach as the foundational basis of the study. The qualitative approach was used to ensure an in-depth understanding of the phenomena under study, in particular to understand the contribution of school feeding programmes as a right based in-kind social safety net implemented by the government in addressing the discourse of food insecurity on a rural setting. d Quota sampling in the selection of respondents. The researcher gathered data through the use of interviews, non-participant observation and document analysis. The findings of this study were analysed by organizing the data and presented it in a descriptive manner. The study analysed food security results amassed by the community members from the provision of food at schools. However, the findings of this study revealed that the feeding scheme, though it possess pronounced potential to eradicate food insecurity, slightly changed the susceptibility of the community members. The feeding scheme marginally created employment, reduced poverty, reduced hunger and increased health and nutrition education among the community members. The program achieved minimal results as it confronted implementation constraints which ruined its capacity to exterminate rural food insecurity. The current food procurement model excluded the needs of the community in terms of the provision of a stable means of acquiring adequate nutritional food, therefore operational state hindered the impact of the program as a way of addressing food insecurity.

RC32-586.1TSHOAEDI, MALEHOKO* (*University of Pretoria*)*Cosatu Women's Voices on Trade Union Politics: Reflecting on Women's Political Attitudes in the Cosatu Survey*

This paper aims to reflect on Congress of South African Trade Union (COSATU) women's political attitudes based on the three (2004, 2008 and 2014) sets of data from the *Taking Democracy Seriously: COSATU Workers' Surveys*. It highlights women's opinions on issues such as the tripartite alliance (which includes COSATU, the African National Congress (ANC) and the South African Communist Party (SACP)) and COSATU's unconditional support for the ANC. Analyses of these political issues are often conducted in gender neutral terms, with the focus always being on the perspectives of COSATU leadership which is mainly men. It has generally been noted that there have long been disagreements within COSATU on the issue of the alliance and that support for the tripartite alliance has been declining among COSATU workers since 1998 (Buhlungu and Tshoedi, 2012; Maree, 2012). A gen-

dered analysis of the survey shows that in 2008 and 2004 about 50% and 66% of women workers supported the alliance. In 2014 this was however estimated 42.1%. Similarly, the survey shows a declining trend in women workers' support for the ANC in the national elections of 2004 (68%), 2008 (44%) and 2014 (43%).

It is argued that male domination in leadership positions of COSATU fails to adequately reflect women's political voices. COSATU's decision to fully support the presidency of Jacob Zuma in 2008 was fully endorsed by a male dominated leadership structure, which was mandated by the COSATU congress. This paper argues that union democracy as practiced by COSATU unions, privileges the interests of men. Emphasis on the politics of the majority prioritises male dominance and power. Trade union democracy as currently practiced in the unions, which includes the politics of the majority, those who dominate public discourse, further marginalise women and excludes their voices from the political discourse.

RC38-676.1TSIOLIS, GEORGIOS* (*University of Crete*)*Body Modification As Biographical Work: Different Types of Identity Construction through Tattooing*

The presentation refers to the findings of a research project aimed at detecting the meanings assigned to tattooing by those who practice such body modifications. From the analysis of eight narrative interviews with tattooed men and women, a latent function of tattooing emerged: in societies of late modernity, in which individuals are charged with the task of building a coherent identity of themselves within varied and changing social circumstances, tattoos function as "identity pegs" (Goffman), as sources for securing consistency and coherence of the self. Interpretative reconstruction of our material (biographical narratives) has highlighted two different versions (types) that this process can take, which correspond to two different discourses of identity:

In the first version, tattooing as one type of identity work functions as an enhancer of a process of introspection. In order to take the risk of making an indelible and permanent inscription on his/her body, the individual searches (through an inner dialog) for elements of a (supposed) inner authentic self. Once these elements have been discovered, their public manifestation seeks to express and consolidate a consistent identity, within the changing context of late modern societies. In this version, the narrators seem to adopt elements of an essentialist discourse of identity.

In the second version, identity construction does not take place through the search for "an authentic internal essence" but through inscriptions that refer to important biographical stations or experiences: In this case, the body functions as a canvas, as an inscribed personal calendar, which includes significant life events in a sequential order. The inscriptions provide "reference points" for constructing a coherent biographical identity. Thus, identity of self acquires consistency without appearing static but rather as an open project of personal development. In this version, identity appears as a fluid narrative construction.

RC26-484.1TSOBANOGLIOU, GEORGIOS* (*University of the Aegean, Sociology Department*)*Politics of Innovation for Empowerment and Sustainability in Rural Communities*

The paper addresses the issue of local (rural) development in Greek areas, a source of diachronic labor migration (exodus) both rural and international and locates this issue within the present attention given to Greece under the "economic" crisis in Europe. The Debt Crisis in the Eurozone brought into the surface parameters of "governance" capacities of the Greek State to manage the unemployed, minorities, youth, excluded populations in poverty in rural communities. In some successful cases, diffused industrialization was combined with other forms of economic activity, e.g. agriculture and tourism to produce zones of work opportunities.

Our Project aims to detect and register the hindering factors for rural development within the politico-administrative frameworks on a sub-EU level (Greece) and seek to establish the role and actions of social entrepreneurs within that sector. The importance of rural communities in defining local gastronomy, culture and employment innovation, as they engage in local community cooperative action, will be compared in areas with direct top-down political promotions and areas whereby endogenous local cooperative assemblies manage, as bottom-up social enterprises, steering the community into social development. The Ruraction H2020 -MSCA-ITN-2016 Project of the European Union addresses, in a comprehensive manner, the future of rural spaces in Europe. Our approach here will be an examination of EU policies and their interaction with the Greek socio-political structures.

GIANNOPOULOU, IOANNA (*Psychiatry Department (Second), Attika Hospital, University of Athens, Greece*)

Unaccompanied Minors in Greece

Greece is one of the major gateways for migrants entering the EU. Even though data on unaccompanied minors (UASC) living in Greece is rather conflicting, there is consensus among all concerned parties, that numbers are high, with several minors remaining undetected, non registered for asylum, and no legally entitled to remain in Greece. The closure of the Balkan route in March 2016 had implications for unaccompanied refugee children, given that a significant number of minors who perceived Greece as a transit country were forced to remain in Greece for an indeterminate period of time.

This presentation will briefly outline the current situation of UAMC in Greece, focusing on the legal framework, living conditions, services and practices these minors encounter. It is argued that legal protection of UAMC does not in reality translate into actual protection due to poor implementation of legislation and guidelines, as well as, due to fragmentation of the services and poor communication/cooperation between the different Authorities that have the obligation to care for and protect UAMC.

Next, it will proceed to discuss whether the existing research findings, so far focusing mainly on emotional and mental health problems relating to UASC's trauma experiences, have had any implications for setting out a coherent plan to meet these youngsters' complex needs. Throughout the migration crisis, Greek and international NGOs have stepped in to provide a series of services ranging from accommodation to legal aid and healthcare, some of questionable quality. The Greek State, by shifting its responsibilities to the charity sector, remained the "coordinator" rather than the main actor of refugee and migrant children's welfare provision services.

Lastly, it discusses the need of exploring UASC's coping strategies, their perspectives and experiences in the host country, all of which will better inform the development of policies and services for unaccompanied minors.

Tuna Fishing As Subsistence and Migrant Work: Cases of Two Japanese Fishing Communities during the 1960s

Japanese deep-sea tuna fishing remained a prosperous industry from mid 1950s to the early 70s, until the 1973 oil crisis shot up the fuel price, and the 200 nautical miles agreement gave a finishing blow to the industry in the late 70s. It is little known, however, who were those fishermen who literally sailed seven seas of the world on tuna boats.

My paper will focus on two contrasting communities on the Pacific coast of the Shikoku Island of Japan: Muroto and Ainan, and discuss how they survived in the global tuna industry by using locally nurtured knowledge and skills.

Muroto, located on the Southeastern part of the island, developed as a Whaling port until the 19th century, subsequently switching to tuna business. The town accommodated not only tuna fishermen but also shipbuilders, ship-owners and all kinds of businesses related to tuna. Tuna-fishing was indeed subsistence activities for the whole community. Muroto seafarers were known for their bravery to explore new fishing grounds, and to sail long distances by their simple wooden boats.

By contrast, Ainan, located on the Southwestern part of the island, consisted of small fishing communities mostly living on coastal fisheries. Many young fishermen there responded to the call for crew members for tuna-fishing expeditions during the 50s and 60s. Some of them got on board Muroto-based boats, while others on larger tuna-ships owned by big seafood companies. They were migrant workers, so to speak, living away from their home for one, two, or more years. Some community leaders established an education system to get seaman's licenses so that the fishermen get higher salaries.

Both Muroto and Ainan fishermen were exploited in the gradually globalizing tuna industry, but at the same time, they also exploited the opportunities to bring cash income to their communities.

The Changing Objects of Government: Malaria Eradication, Political Power and the Jewish National Home

Studies of states usually emphasize a shift in the interest of governments from controlling territories to controlling the populations under them. While some have criticized this linear narrative, or remained agnostic regarding the primacy of one object of government over the other, literature still lacks a more complex picture of the wielding of political power by government. We know less on when and how

populations or objects become governmentalized, which actors value different objects over others and what are the implications on political institutions' legibility of populations, territories and so on.

Drawing on the case of malaria eradication in British ruled mandatory Palestine, I show how the attention of doctors shifted from population to prioritizing governing nature and territory following a change in the scientific method used to eradicate the disease. However, this general shift did not mean uniformity across agencies or actors involved in malaria eradication: some bodies focused on different objects and differences can be seen also between individuals. Thus, I argue, the use of political power is more complex than usually thought as multiple objects can simultaneously be prime concerns of government. This situation means that some of the populations suffering from malaria had "vanished" as they became illegible to political institutions.

Empirically, I will focus on the work of the Malaria Research Unit (MRU), a Zionist research unit working from within the health department of the British colonial state formed in Palestine, as well as on the antimalarial work of the Department of Health itself. I will also examine the work of one of the unit's antimalarial inspectors following the unit's disbandment in 1931.

Intergroup Contact and the Racial Attitudes of Black and White Youths, 1976-2015: Does Contact Really Matter?

This paper draws on a unique four decades-long series of nationally representative surveys of high school seniors in an examination of interracial contact among black and white adolescents from the mid-1970s through 2015. We track trends in opportunities for, frequency of, and closeness of contact and examine whether contact shapes youths' racial outlooks. We find that for the first two decades of the time series young African Americans reported more opportunities for and greater frequency and closeness of interracial contact than young whites, and that frequent and close contact, in turn, increased support for interracial ties and lead to more positive evaluations of diversity. Opportunities for contact, by contrast, do not by themselves foster more positive racial outlooks. Moreover, since the 1990s, black youths' racial outlooks have become less sanguine and now closely resemble those of white youths. In explaining these findings we focus on the role of social capital as a mediating factor through which contact shapes feelings of racial inclusion and exclusion.

Representing Futures in Tourism

Hollinshead's (2009) notion of worldmaking in tourism is useful in its drawing attention to the ways in which 'particular dominant / favoured representations of people/place/pasts' are privileged and projected in tourism. In this paper I seek to extend Hollinshead's (2009) ideas on worldmaking in order to consider how tourism also represents futures. The futures which tourism represents may include utopian futures or alternatively apocalyptic futures, and thereby produce particular orientations towards the future. The ways in which certain futures are selectively privileged in tourism, therefore, are a particularly potent aspect of the power of representation in tourism. This paper will discuss the potential implications of different future-representations in tourism, and hence why this aspect of tourism's worldmaking power is important to consider.

TUEY, CATHERINE* (*Trent University*)

Memorial Objects and the Cultural Repertoires of Loss

There are the photographs that people put on display, pieces of clothing that some may keep and do not wear, or a car that a person may keep investing in even though it may be time to get a new one. These are just a few examples of objects that participants in a study on experiences of loss described as important in their lives because they were related to someone they lost. The materiality of loss demonstrates the meaning that people give to objects that might seem common in everyday life but it also represents the "hidden" emotions related to the process of memorializing. How do people come to give such artifacts meaning in their lives? Drawing on qualitative interviews with 32 participants in Ontario, Canada, my presentation investigates memorial objects as an important cultural repertoire. This paper explores the complexity of emotions and memorial objects that facilitate a type of interaction with a world that opens space for otherwise "hidden" emotions.

RC44-750.1TUFTS, STEVEN* (*York University*)THOMAS, MARK (*York University*)MACDONALD, IAN (*Université de Montréal*)*The Labor-Populism-Urban Nexus*

This paper examines the ways in which austerity, populism (including its authoritarian variants), and labor are brought together within and through the urban scale. While theorists of populism do not completely ignore the urban, too often the city is seen as a container of interactions for populist sentiments that have been constructed at larger scales (e.g., the nation state). Rather than simply emerging 'in the city', however, we approach the study of populism with the recognition that populism is itself produced by emerging urban forms, inter-urban and intra-urban competition for investment, sub/urban segregation, growing economic polarization, and divisions among the working-class and metropolitan elites. We seek to elaborate on how the changing urban fabric itself produces new spaces within which capital and labor are involved in often contradictory populist contests to advance their interests. Further, we attempt to understand labor's role in both the production of and resistance to emerging forms of urban populism. We focus on how urban populism is implicated in processes challenging the 'elitism' inherent in: urban planning initiatives such as transit, specific forms of cosmopolitanism, and select campaigns by local labor. We illuminate our framework with the cases drawn from labor's response to the short-lived regime of Toronto Mayor Rob Ford and his populist legacy as well as more recent campaigns. The research is drawn from a larger comparative project examining labor and urban populism in four North American cities.

RC31-559.4TUMMINELLI, SANTA GIUSEPPINA* (*University of Palermo*)*Unaccompanied Foreign Minors in Italy: Problems, Contradictions and Social Inequalities*

In recent years, in Italy, the interest in Unaccompanied Foreign Minors has increased, also because the number of migrant arrivals has increased. The theme has activated several debates and policies to manage emergencies and to reply to the needs of children. In 2016, the minors who arrived on Italian coasts were 24,929. Sicily is the main region that hosts migrants and where 40,9% of the Unaccompanied Foreign Minors are present.

The analysis proposes a reflection on the difficulties encountered by minors in the new country and on the contradictions that come from the different meaning that age, as a conceptual category and as the organizational principle of society, has for the social actors involved.

I'm going to present the first results of an exploratory research aimed at the perception of age and relationship with the roles associated with it. Ages have different significance in different phases of life and assume different connotations when compared with cultures.

Furthermore, I'll analyze other aspects because in the stories there are many sense elements and number of barriers:

- separation from the family of origin;
- need/desire to elaborate detachment;
- to remember the sense of the migration as a need not as a choice;
- to learn new language;
- integration in reception center for immigrants;
- academic inclusion.

RC32-JS-74.2TUNCER, SELDA* (*Yuzuncu Yil University*)*Gendered Geographies of Displacement: Asylum-Seeker Women's Living Experiences in Van, Turkey*

The massive mobility of Syrian people that continues to exist heavily due to the internal conflicts in Syria has placed the issue of asylum-seekers and refugees in the focus of politics and academia again. Turkey is historically a transitional zone between various geographies; according to the 2016 statistics, two thousand asylum-seekers per day are trying to enter Europe illegally from Turkey. Owing largely to gendered processes of war and displacement and also to consequences of immigration legislation, refugees and asylum-seekers in Turkey had to face many different kinds of violence, discrimination, and exclusion in their journeys to a new destination. The experiences of the women who had to escape from their home countries are particularly troubling, because, as commonly argued; refugee/asylum-seeker experience is heavily gendered in its impact. Asylum-seeker women from various ethnic and religious backgrounds came to stay temporarily in Turkey; however, it should be noted that their transitory locations never be a place where asylum-seeker women are simply newcomers who stay temporarily, but one in which their identities and livelihoods (re)make the places in which they come to live for an unknown given period. Therefore, it is important to examine how and in what ways women have located within these spaces in

the Turkish context; in which spaces and why they are excluded and/or included; and, what kinds of means and forms of struggles and strategies are developed by asylum seeker women. Accordingly, this research aims to explore the gendering of displacement experiences based on the research conducted in the city of Van, a border city of Iran, which is heavily populated by Kurdish people and became a crossroad for Afghan, Iranian, and Syrian asylum-seekers.

RC28-506.6TUPPAT, JULIA* (*Freie Universität Berlin*)DE MOLL, FREDERICK* (*Goethe University Frankfurt am Main*)*Long Term Effects of Children's Non-Cognitive Dispositions at School Entry on Academic Outcomes*

The paper investigates the role of kindergarten children's non-cognitive dispositions on educational outcomes in grade 3 from a longitudinal perspective. Most research on early educational inequality sets focus on school readiness in terms of children's cognitive skill development. Building on Bourdieu's theory of habitus, we argue that non-cognitive dispositions and attitudes toward learning and school might play an equally important role in generating unequal educational chances between children of different social strata.

We study these questions using a quantitative approach. We use data of the kindergarten cohort of the German National Educational Panel Study (NEPS), a longitudinal study that has been conducted since 2008. The kindergarten cohort follows children from kindergarten into primary and then secondary school (N=3,000). Data from waves 1, 2 and 5 are used, following target persons from age 4 (before school entry) to grade 3 in elementary school. Variables stem from parent interviews, as well as kindergarten teacher and school teacher interviews. Standardized competency tests before school entry enable us to estimate the effects of non-cognitive dispositions net of children's cognitive skill development before school entry.

We show that there is evidence of (1) social inequality in children's non-cognitive dispositions before school entry, (2) effects of children's non-cognitive dispositions before school entry on educational outcomes later in the educational career in grade 3 and also analyze whether (3) school-related non-cognitive dispositions (partially) mediate the effect of social class on educational outcomes.

We show that non-cognitive dispositions before school entry predict academic success later on in the educational career. Dispositions and attitudes towards learning affect academic achievement beyond cognitive skills.

RC11-222.3TUREK, KONRAD* (*Netherlands Interdisciplinary Demographic Institute*)*Effect of Training for Old-Age Employment and Retirement Transitions – Comparative Longitudinal Evidence from SHARE Data*

European and national ageing policies give high priority to increasing retirement age and employability of older people, but still no effective solution exists. Lifelong learning (LLL) is an important tool to address these challenges. It aims to increase employability, alleviate risks and consequences of destandardised working lives, improve empowerment and adjustment to the changing reality. In result LLL should support increase employment in older cohorts and increase the average retirement age. However evidence shows that lifelong learning policies does not necessarily contribute to expected improvements and the net effect of interventions is often low. Unequal access to education, selective approach to training in companies and the effects of accumulation of advantages and disadvantages may also contribute to growth of inequalities throughout the lifecycle.

The primary goal of this presentation is to provide empirical insights into the patterns and consequences of human capital investments in older ages. It is based on comparative (European) and longitudinal data. It also refers to the policies aimed at lifelong learning that are implemented within European ageing and cohesion programmes. The presentation outlines the findings of the Horizon2020 Maria Skłodowska-Curie Individual Fellowship granted project LEEP about longitudinal evidence on human capital investments in older age.

DATA. The analysis are based on data from waves no. 4, 5 and 6 (2010/11, 2013, 2015) of international panel Survey of Health, Ageing and Retirement in Europe (SHARE) for population 50+ and include more than 10 European countries.

METHODS. Panel and multilevel regression models that focus on individual lifecourse trajectories.

RESULTS. The presentation provides evidence on the role of training for employment situation of people aged 50+, their wage trajectories, chances of re-employment and retirement transitions patterns. The results are discussed with reference to public policies.

Discussion

The book traces the experiences of religion and secularity in eleven countries not primarily shaped by Western Christianity (Japan, China, Indonesia, India, Pakistan, Iran, Russia, Turkey, Israel, Egypt, and Morocco), and examines how the status of religion and the emergence of secularity have evolved in the course of the 20th century in these societies. All chapters do so in conversation with Charles Taylor's grand narrative of the North Atlantic world in his *A Secular Age* (2007). The case studies indicate that in all eleven cases, the state – building on colonial and imperial legacies – highly determined religious experience, by variably regulating religious belief, practice, property, education, and/or law. The book identifies the major critical junctures and path dependencies that have led to the various levels of religious regulation and discusses the consequences of these for the possible emergence of something approaching Taylor's core condition of secularity – namely, the social acceptance of open religious unbelief (Secularity III). The discussants will engage with the book's main theses from the perspective of their own work on the topic.

TUSIKOV, NATASHA* (*York University*)

Policing through Digital Dragnets: Internet Intermediaries' Regulation of Illegal Pharmacies

Internet intermediaries, particularly large, U.S.-based companies like Google, PayPal and Facebook have become the new global regulators. These companies are increasingly responsible for policing online wrongdoings on behalf of nation-states and, in a recent development, other powerful corporate actors. These campaigns are not based on legislation or court orders, but secretive, non-legally binding "voluntary" enforcement agreements. Consequently, there is little oversight or adherence to due-process measures. Internet firms' capacity for and interests in regulating information and behaviour, whether on behalf of states or other companies, are critical areas of inquiry. In their current incarnation, these practices have the potential to create surveillance dragnets that track millions of law-abiding Internet users. Further, as these firms work as regulators – for states and powerful companies – they are shaping ideas of online deviance, as well as normalizing corporate and state surveillance in ways that are undermining fundamental civil rights.

This paper argues that governments, especially that of the United States, play a key role in directing specific regulatory outcomes, often strategically employing the narrative of 'voluntary intermediary-led' regulation. The paper contends that government-directed, intermediary-facilitated enforcement enables intermediaries to shape standards that privilege western legal, economic, and political preferences. As a result, these mostly U.S.-based intermediaries are concentrating power in ways that serve their commercial interests and the U.S. government's economic and national security interests. To make this argument, the paper explores the creation of a private regulatory program, backed by the U.S. government, called the Centre for Safe Internet Pharmacies (CSIP). CSIP is an industry-run association that brings together the pharmaceutical industry with Internet intermediaries to target and dismantle illegal online pharmacies. Through CSIP, the U.S. government can extend its reach to govern actors outside its legal jurisdiction and compel intermediaries to act as regulators to govern wrongdoing by third parties.

TUSINI, STEFANIA* (*University for Foreigners of Perugia*)

Temporal Apartheid As Italian Response to Global Migration

The migratory phenomenon reveals the contradictions of globalization and belies the rhetoric of open borders. Despite the economically strongest countries spend huge sums to limit immigration, more and more migrants reach the destination countries.

In many Western societies (like Italy) the local response to this global phenomenon is discriminatory, and places migrants in a peculiar spatio-temporal collocation that I call "temporal apartheid".

Wearing the lens of the politics of time (migration policy is one of them), and mixing theoretical sources and empirical data, my intervention aims to illustrate how migrants in Italy are experiencing a condition of non-coevalness than natives, since the two social groups share the same space but not the same social time. Analysing some demographic, social and economic dimensions, in fact, it emerges how migrants live in a kind of temporal apartheid (as I called it) according to pa-

rameters characterizing a very different period than that contemporary one. So, they result to be confined in a separate social world.

Allochronic temporal policies produce significant social consequences. To analysing them, Merton's means-goals pattern and Hirschman's tunnel effect are employed. In brief, the gap between socially desirable goals and available means has very real effects on migrants: poverty, marginalization, but also frustration (especially on II generation migrants) because while goals are formulated in the present (and eventually achievable in the future), means are placed in the past ("where" migrants are living) and generally are inadequate or insufficient to achieve the purposes.

The prolonged discrepancy between means and goals (aspirations, using Appadurai's terminology) could produce potentially deviant and protest attitudes (called by Merton "rebellion", by Hirschman "exit"). Using this "tools" the French banlieues riots and the foreign fighters phenomenon are analysed.

Informed Consent in the Age of Cybersecurity: Testing Messages and Questions and Exploring Perceptions of Privacy, Confidentiality, and Security

The U.S. Census Bureau's mission is to serve as the leading source of quality data about our country's people and economy. The success of our programs depends on the public's perception of the Census Bureau as a credible and reliable protector of individuals' personal information. Our survey and census programs follow informed consent procedures as required by federal laws and regulations and our own policies. An important part of our mission is to communicate clearly to respondents how their data will be used and protected.

Researchers from the Census Bureau have conducted numerous studies to test messages that communicate security procedures without alarming respondents unnecessarily, and survey questions intended to quantify respondents' perceptions of sensitivity and risk with regard to data requested by government surveys and censuses. This presentation will highlight findings from studies in which various types of messages and questions were tested to provide insights into respondents' perceptions of privacy and security in the context of government statistical collections.

Return Migration of Iraqis: Two Case Studies.

Throughout the past three decades, there have been a growing number of Iraqi refugees settling in both Middle Eastern countries and in European Member States due to the 2003-2011 war in Iraq and the on-going Syrian conflict since 2011. Both dreadful events have been a watershed for the Iraqi State and its citizens, leading to a profound process of state-society transformation (Yahya, 2015).

In the past ten years, a substantial number of those displaced Iraqis have returned to their homeland, sometimes with the intention to resettle permanently there, although they have usually defined their return as a visit or a temporary sojourn (Kivisto & La Vecchia-Mikkola, 2013). A major pull factor is the wish to reconnect with left-behind families and friends and with the land of origin. Nevertheless in refugees' decision to return, push factors, such as the host government policies and civil society attitudes towards them as well as anti-immigration sentiments and integration failure, can play an important role in stimulating the will to go back to the country of origin.

This study is the result of a joint multi-situated research and fieldwork in Lebanon and Finland and it aims at examining push and pulls factors of Iraqi refugees' decision to return home. It also investigates the ambivalence towards this decision in order to offer an insight into the process of redefining refugees' relationship with their country of origin – which in their imagination is not a country of violence and suffering anymore, but becomes an idealized, mythic place at odds with reality on the ground (Kivisto & La Vecchia-Mikkola, 2013).

TUZI, IRENE* (*Sapienza University of Rome*)

Syrian Families throughout Forced Migration and Transformation of Gender Relations

This research aims at exploring how Syrian families, facing the challenges of forced migration, deal with social repercussions of displacement. In particular, it will focus on how forced migration affects gender roles and gender relations among Syrian families displaced in Lebanon and Germany.

Bourdieu's theorisation of *habitus*, *capital* and *field* will be at the base of this research. The concept of cultural capital refers to symbolic elements acquired through being part of a particular community or social class. Forced migration

obliges people to share those forms of cultural capital with others but also pushes them to create a common sense of identity and a collective position within the society of resettlement. Cultural capital is physically embodied by Bourdieu's concept of *habitus*, which deeply ingrains habits, skills, and dispositions that people collect due to life experiences. Forced migration brings about the transfer of people's habitus into different fields – or distinct arenas of practice. In this sense, it is important to understand which habitus and which capital refugees bring to the receiving society, as well as the way they experience a hysteresis when their habitus is not in line with the field in which they exists (Bourdieu 1986).

This study is part of a wider on-going PhD research designed on a qualitatively driven approach and empirical data. My hypothesis is that forced migration has an important role in empowering people, transforming household dynamics, as well as in shaping the idea of home and family (Salih 2013). In this sense, Lebanon and Germany, as countries of destination, have an important role in challenging existing forms of gender relations and family dynamics. Focusing on the country of destination is important to differentiate the nature of agency that refugees are able to assume.

An Examination of a New Parental Leave Policy in the UK: Findings from a Survey with Expectant Parents

The UK is an example of an Anglophone country, which historically have been characterized by low levels of statutory leave provision for mothers and even less for fathers. However, in April 2015 the UK introduced Shared Parental Leave (SPL), allowing mothers to transfer their maternity leave to their partners from two weeks after the birth or adoption of a child. Despite policy and media interest in SPL, there has been very limited research conducted to date and knowledge on take-up is poor. This paper will present findings from an in-depth survey conducted with expectant parents in two NHS trusts in England on their knowledge, views and plans around leave after the birth of their child. The study offers the opportunity to examine the relatively new introduction of fathers' access to parental leave in the liberal welfare regime context of the UK. 856 expectant parents took part in the survey. We found that knowledge of and access to SPL is strongly correlated with education, ethnicity and home ownership. Finances and negative career consequences were cited as primary barriers to take up of SPL. Hypothetical vignettes around potential policy changes indicated that knowing others who take SPL would be most likely to encourage individuals' reported intention to take SPL. We discuss the findings in relation to theories around social stratification, policy-feedback, and gender as a social structure.

TWAMLEY, KATHERINE* (*University College London*)

What Impact Do Campaigns to Introduce Fathers' Leave Have on Gender and Generational Equality? a Case Study from the UK.

Over the last twenty years, there has been a steady increase in the number of countries and organisations that endorse and provide fathers' access to extended leave after the birth of a child. Feminist and gender scholars and activists have argue that such leave will denaturalise the mother/woman as primary carer; will lead to less discrimination in the workplace since both men and women would be potential carers/leave takers; and, if leading to increased care from men, could bring about a more equitable and less repressive society. Childhood scholars have had less to say about fathers' leave, though some campaign enthusiastically against extended daycare with individual parent care favoured. Reactions to the introduction of men's access to extended leave in the UK have, however, been mixed, with feminists and conservative groups alike, concerned with displacing women's mothering roles. In examining these issues, I draw on a longitudinal mixed methods qualitative research project with first-time heterosexual parents in the UK who choose to have the mother take all the leave available to parents, and those who choose to share leave between parents. I argue that the focus on men's access to parental leave may be to the detriment of the relations between women and children, with little capacity to enable more equal gender and generational relations.

From Vulnerability to Agency in Disasters: The Experiences of Women Victim-Survivors of Typhoon Haiyan

This paper presents the experiences of women victim-survivors of Typhoon Haiyan, considered "the most powerful storm to make landfall in recorded history" (Republic of the Philippines Gazette 2013). Police data of violence committed against women shows an increase of reported rape-related and physical abuse

cases in 2014 and 2015, the aftermath of Typhoon Haiyan, compared to 2010-2013 in the Province of Leyte. Based on the data from the Department of Social Welfare and Development, economic abuse and emotional crisis are among the top cases experienced by 'women in especially difficult circumstances' in 2014-2015 in Eastern Visayas.

Drawing from vulnerability theory in disaster studies, this research examines women's experiences of disaster as they intersect with their multidimensional characteristics of economic, physical and social vulnerabilities (Yumarni 2014). In addition, Bourdieu's concept of capital is used to analyze women's practices as agents to overcome the limitations of their predicament. Using interviews with women victim-survivors in Tacloban City and a nearby town, areas that were badly hit by the typhoon, the study captures the narratives of women's experiences of disaster, examines articulations of their practices of survival, negotiations with others, and rebuilding their lives in the disaster aftermath. Women's traditional social roles and their strong sense of commitment to their family are among the themes in their narratives as victim-survivors of disaster. On the other hand, their agency is also explored as they become advocates, organizers and responders.

The Hieroglyphics of the Border: Racial Stigma in Neoliberal Europe

In the summer of 2015, 1.5 million refugees arrived at Europe's borders. This article examines how and why this humanitarian crisis was transformed into a 'racist crisis'. It begins by recounting a highly publicised event in the Czech Republic which saw police forcibly removing hundreds of people from trains at midnight in the border town of Břeclav, before inking numbers on their arms and transporting them to detention centres. Thinking with this scene, the article develops the conceptual framework of 'racial stigma' to capture some of the multiple practices that characterize border regimes in Contemporary Europe. Racism, it argues, is the stigma machine of sovereign power in neoliberal Europe. The article concludes with some reflections on how Europe's current 'racist crisis' reanimates both historical spectres of race and spectral geographies of racism.

Foreign Language Knowledge: A Resource or a Barrier for Economic Integration?

The economics of language has stressed that foreign language competences are a form of human capital that promotes wage benefits among immigrants. In the same way, sociology has emphasized their potential as a cultural asset that enables economic integration in host societies. However, foreign language skills are not always rewarded in the labor market. The academic literature has shown different outcomes depending on several conditions, being occupational and contextual level variables among the most important ones. Thus, demand and supply aspects, country-specific policies and social context (e.g. anti-immigrant attitudes), are relevant moderators of the language-earnings relationship. However, the effects of these variables have not systematically evaluated and the conditions by which languages are recognized by labor markets are not clear. In this presentation we take into consideration the effects of these variables to explain the language-earnings relationship. We base our work on a combination of three European databases (AES, PIAAC and SES) that enables a comprehensive and cross-national exploration of the mentioned effects. This research can enhance sociological knowledge regarding economic integration of immigrants through language.

Youth Unemployment, Labour Precariousness & Gender: A Statistical Analysis of the Deterioration of the Spanish Youth Labour Market Since 1985.

The Spanish labour market is notorious for its high general and exceptionally high youth unemployment rates and labour precariousness, temporality and under-employment have by now become its general characteristics. Though diverse studies describe the current situation, few have centred on the development of the Spanish youth labour market over the decades and considered gender differences. In this paper, we present two mathematical models, developed with data from the *Muestra Continua de Vidas Laborales* (official Spanish Statistics). We have analysed the data of the contracts of a large sample of the Spanish workforce over the 1985-2015 period, using several statistical models. In concrete, we consider the median annual income of the sample by year, daily working time compared to a full-time contract by year and median length of the contracts. Moreover, we differentiate between regional locations and sexes, adding, hence, further dimensions of difference to our analysis over time. Our results show, amongst others, clear gender differences beyond the gender pay gap, an abrupt change in trend for the year 1999 and onwards regarding the daily working time and a linear downward evolution of the contract length since 1996. Our analysis of this data gives, in summary, statistical evidence of a significant deterioration in the quality of the employment of the young adult population in Spain.

Framing Sexist Hateful Words and Actions in Nigeria : The Paradox of Women Exclusion in Development

Feminist and critical scholarship situates sexist discourse in hate speech as creating, perpetrating and justifying dominance and violence against women. This paper is insightful to the increased public awareness and support to address the alarming rate of virulence of speech and actions on social, political, virtual and ethno-religious spaces in Nigeria that deflects attention from sexist hateful words and actions. Sexist hate speech has remained invisible and unaddressed because it is embedded in the complex social matrix and historical continuities that relegate women to the background. Actions and words are equal, pervasive in nature but sexually suggestive hateful words and actions are denigrating and lead to vulnerabilities of women and girls. This discourse challenges sexist hate speech as false perceptions that have institutionalized social hierarchies animated by sexual prejudice, stereotypes and the basis for women exclusion in development in both private and public spaces. The article analyzes the multiple dimensions of intersectional realities of sexuality, gender and other social categories that

are shaped by social practices like spoken or written words, actions and power relations undermining equity and women inclusion. The paper examines the invisibility of legal and constitutional frameworks that particularly address sexist epithets as validating the permissibility of sexist speech in Nigeria.

UEDA, KYOKO* (*Sophia University*)

Bridging the Islands: A Miracle Tool or Burdensome Legacy?

A purpose of this paper is to discuss the functions of a massive concrete-made bridge for an isolated island. As soon as an island is bridged, does the island become no longer geographically isolated, nor remote? Or does a bridge make an island even more periphery to lose its sovereignty in exchange for its traffic efficiency? This paper poses a question that if there's any correlation between the topographic isolation and the local autonomy by analyzing cases of two bridged islands in Okinawa, Southern part of Japan.

How does the bridge change the society? What are the functions of bridge other than to improve the traffic efficiency for an island? As a case study, this paper will refer to small islands called Yagaji and Kouri, placed in Okinawa prefecture of Japan. These islands, including another between them, were bridged from 1953 one by one until 2010.

After opening of the bridge in 2005 in Kouri island, the elementary school, a clinic, and the public port to get on the ferry, the busiest places in the island, have disappeared. They were, institutionally, no longer needed inside of the island after the bridging because they are replaced by the better and larger ones beyond the bridge.

This paper will discuss the socio-cultural effect of the concrete-made bridge especially for a small island. Their geographical features and four bridges would show us clearly enough to understand the difficulties imposed on the islanders in exchange for the traffic convenience brought by the bridge.

UENO, AYA* (*Osaka University*)

Influence of Cultural Context on Healing Process :Analysis of a Japanese Undiagnosed Rare Disease Patient

Diagnosis is necessary to start the healing process. However, data from Rare Disease UK, UDP (Undiagnosed Disease Program in America) and FORGE (Finding of Rare Disease Genes in Canada) unanimously show that patients with undiagnosed rare disease (URD) are on the increase. Living with URD makes it difficult for patients to understand and accept their condition, thus the healing process cannot start. This paper examines a Japanese URD patient's experience, and explores their struggle to accept and narrate a condition without medical diagnosis.

Crystallization is the realization of what body failure means for one's biography (Strauss et al. 1987). My research examines this concept by analyzing a case study of a Japanese URD patient and her life without diagnosis. I conducted participant observation during my multiple stays with the patient, accompanied her medical checkups, as well as interviewed the patient, her family, doctors and members of her local community. Close observation of the patient and her family helped me understand their situation, interactions and medical resources. I found that although *crystallization* is said to occur when patients experience performance failures, this case indicates that it is rather the patients' cultural background that plays a significant role in the process. Therefore, my findings add to the current theory by highlighting how some URD patients unconsciously adapt their biographies according to available cultural context, such as concepts of spirits, body or life. As URD patients' conditions fail to be classified, illness trajectories and legitimate access to health care system remain limited. Conventional illness narratives focus on major chronic illnesses with names, but a growing body of research, including mine, suggests researchers should pay more attention to undiagnosed conditions, and especially to the influence of the patients' cultural backgrounds.

RC30-552.4

UGARTE, SOFÍA* (*University of Cambridge*)

'I Need to Work to be Legal, I Need to be Legal to Work': Clandestine Markets and Labor Precarity Among Haitian Women in Santiago (Chile).

Immigration and legal status are dimensions of recent forms of labor market stratification and precarious employment in countries with high migrant flows. This paper explores the relationship between precarity and legal status within the framework of Haitian migration in Chile, where new forms of racial discrimination and gender segregation have emerged in the past few years.

Chile's migrant population has recently transformed based on the changing political and economic circumstances in Latin America, and the tightening of migration policies in the 'global north.' Since 2015, Haitian migrants have become more present in the Chilean social landscape, which is reflected in the dramatic

increase of their temporary visa and permanent residence applications. As a new group, their presence entails racial and linguistic differences, as well as new kinds of gender segregation that challenge current forms of integration that operate at different levels of society.

Drawing upon participant observation with Haitian women in Santiago (Chile), statistical analysis of migratory records in the country and interviews with the key informants, I intend to unravel the different strategies Haitian women use to gain labor stability, such as clandestine economic practices to regularize their migrant status. I seek to describe the nascent black market of fake contracts, in which most Haitian women fall into with both successful and failed outcomes. Also, I describe the multiple experiences of employment and unemployment that Haitian women who buy these fake contracts have. In doing so, I attempt to critically analyze how the relationship between migrant status and labor precarization in Chile is explained considering these findings; and how racial and gender differences can deepen our understanding of this relation in Latin America and other contexts.

Politics of Transnational Humanitarianism: Humanitarian Aid Organizations Assisting Syrian Refugees in Southeastern Turkey

Turkey, as the top host country for Syrian refugees, also hosts dozens of INGOs, local Turkish and Syrian NGOs assisting them, mostly in southeastern Turkey. However, Syrian refugees are not the only population who have been suffering in the region. The region, where Kurdish people constitute the predominant ethnic group, has recently witnessed state violence, curfews, civilian deaths, human rights violations, and hundreds of thousands internally displaced persons (IDPs) since the June 2015 general election. The co-existence of historically 'less-than-citizens' Kurdish people and relatively recently 'less-than-human' Syrian refugees in the same region constitutes the ideal setting to explore the complex dynamics of transnational humanitarianism with politics, law, and morality, more specifically with nation states, supranational decision making bodies (e.g. the EU), international law, and humanitarian ethics. In the presence of these complicated dynamics and two "possible" beneficiaries of the humanitarian aid in the region, namely Syrian refugees and Kurdish citizens, this paper analyzes the humanitarian claim of impartiality in determining who can be the "subject" of its assistance. The in-depth semi-structured and open-ended interviews with 20 humanitarian workers from 15 different organizations reveal that this morally and legally driven international assistance intersects with national and international politics in various ways. The research shows that humanitarian assistance cannot be given to the conflict induced IDPs in an authoritarian nation-state, like Turkey, if there is a prevalent fear among NGOs about being dismissed from the country where they operate. The paper argues that the realization of the humanitarian principle of impartiality in such conditions is strictly restricted by the national politics.

The Fulani Moslem Pastoralist Versus Agrarian Armed Conflicts in Nigeria: Causes and Implications for Achieving Sustainable Development Goals Target 2.1

The Fulani Muslim Pastoralist versus Agrarian Armed Conflicts in Nigeria: Causes and Implications for Achieving Sustainable Development Goals Target 2.1

The history of most Sub-Saharan African countries is awash with myriads of widespread incidences of conflicts that usually aggravate human misery, deaths, poverty and hunger. In recent times, the enraging Fulani pastoralist armed conflict with the largely Christian sedentary agrarian farmers in Nigeria accounts as one of the highest of such sporadic conflicts. Most existing explanations of these conflicts has to date, been a panoramic brush overview, comments and opinion piece. Academic work emphasizing on primary research has been largely scarce. The aim of this paper which adopts descriptive survey design methodology explores both conflict victims and other citizen's perception on the dynamics of the phenomenon. Data collected using questionnaire and qualitative interviews from the north-central and south-east states indicate that there are emerging meta-causes and consequences attendant to this conflict which the federal government has been unable to checkmate. These consequences which have not been analyzed sufficiently in most previous studies on the subject matter includes among others, both agrarian and pastoralist low or no participation in their chosen agricultural activities due to fears of attacks on attending to their land and water resources that are in contention. This phenomenon has occasioned no or scarce food or livestock production for household and small scale farming activities which triggers off sustainable and substantial food insecurity. The paper argues that this has ushered in severe hunger and malnutrition, low or no household incomes, rise in poverty and accelerated increase in non-communicable diseases in these conflict regions. The paper concludes by advancing possible panacea to ending these conflicts, that have made Nigeria food dependent and not

contributing to her achievement of the United Nation's Sustainable Development Goals target 2.1 by year 2030.

The "No Papers, Pay and Pass Syndrome" in Nigerian Police-Check Points: Consequences and Implications for Citizens' Trust in Public Institutions.

The Nigerian police force which started during the pre-Nigerian colonial state in 1861 with the initial 100-man contingent and formerly promulgated in 1930 in Lagos, has today burgeoned to the more than 370,000 bulky and largest police personnel in Africa. However, since its inception till date, this key security and political institution has the highest record of official corruption in the conduct of her duties. On the basis of this, several commissions, panels, police reforms, comments, opinion piece and academic research, aimed at the explanation of this phenomenon has been attempted. The aim of this paper is to explore one of the most notorious aspects of this institutional corruption that is rarely academically researched on, which is operationalized at the frequently observed police check-points on Nigerian roads. The police behaviour at these check-points is that all most all mobile transport passersby, cough out some money to the police, as gratification before being allowed to pass. A special focus of this paper will border not only on the dynamics of this institutionalized attitude, but also on the study of the officialdom and efficacy of these check-points, as a crime prevention measure in Nigeria. Particularly of interest to this paper, will be the analysis of the consequences and implications of this endemic security praxis, to the Nigerian citizens' trust, in the nature of operations of their public institutions and governance systems.

Social Protection and Climate Resilience: Evidence from Ethiopia, Kenya and Uganda

Within the context of recurring humanitarian emergencies in sub-Saharan Africa social assistance programmes are increasingly mentioned as effective interventions to build people's resilience to climate-related shocks and stresses. Innovative 'shock-responsive' and 'adaptive' social protection frameworks highlight how synergies between climate change adaptation, disaster risk reduction and social protection can more holistically address the vulnerability of extremely poor people to a range of livelihood risks. Based on qualitative research conducted in Ethiopia, Kenya and Uganda this paper critically analyses in how far social assistance programmes can play a role in reducing the vulnerability of the poor to climate change, and where other programmes need to step in to complement these efforts. The analysis is informed by an understanding that resilience to climate extremes and disasters cannot be built by one programme or sector alone, but requires a range of programmes that together increase the capacity of people and governments to reduce the diverse set of risks that underpin poverty and vulnerability and increase the risk of disasters. While the potential of synergies across sectors is promising, merging climate and humanitarian policies with social protection can run the risk of losing focus of social protection's core objectives.

Transformation of the Professionalism of Vocational Teachers: Social Context and Agency of Teachers

The paper focus on (re-)conceptualizing the professionalism of vocational teachers. Freidson (2001) regarded professionalism as the "third logic" in contrast of that of the market or organization. Social changes and global trends (such as neo-liberalization, increasing migration etc.) have involved changes in operation of professional groups and professionalization of non-traditional occupations. Estonian case enables to analyze how the multilevel context factors, such as radical societal changes and reforms, have involved changes in work and professionalization of vocational teachers as occupational group.

In Estonia, only as recently as in 1995 the role of vocational teachers was introduced and qualification requirements were set for vocational teachers. During the recent years, the work of vocational teachers has become more and standardized and demanding, asking for new competences in order to fulfill diversifying work roles. In this paper we focus on how vocational teachers themselves construct narratives of their professional careers and changes in their work. The analysis of work-life-history narratives enable to understand how the occupation

of vocational teachers has changed and what is the role of contextual factors and the agency of vocational teachers here.

Although, often the becoming a vocational teacher has rather been a chance than pre-planned career path, the teachers narratives reflect high commitment and caring for students as well as the vocational field taught. The multiple patterns of discontinuous "boundaryless" career paths including shifts between the industry and the school or sharing time between them reflects the identity profiles of vocational teachers often involving identification with vocational field taught and with the teachers' identity at the same time. On the other hand, the shifts and disruptions in teachers' careers has been related to societal changes and reorganization of the vocational education system or circumstances of private life.

Abstract

The apartheid South African government used a skewed land use policy, the *Betterment Planning*, to dispossess black South Africans of their land and create labour reserves to power the economy of a racially non-inclusive country. The social and economic consequences created by this policy and similar projects in the former black homelands led to mass impoverishment of communities, demographic displacements and confinement to unproductive lands. With the emergence of a democratic dispensation in 1994 came the need to redress historical injustices of the apartheid era. In order to promote social and economic empowerment and as well as mass poverty in different African communities, the post-apartheid state instituted several corrective measures. One of these measures is the Land Reform Programme (LRP) of the ANC government. This paper peers into the ongoing land reform programme of the post-apartheid state used as a tool for 'corrective justice'. It explores how institutional dynamics and social factors influence sustainable development for the beneficiaries of the land reform program. The study focuses on three communities – *Cata*, *Cwengcwe* and *Tyuty*– in the former Ciskei homeland. It uses primary and secondary data collected from the study communities.

New Horizons for Second Order Cybernetics

Cybernetics today consists of two branches: 1) technical cybernetics that many people are familiar with – personal computers, GPS devices, the internet and on-line banking and 2) theoretical cybernetics. The latter is similar in breadth and depth to physics, though much less developed. Whereas physics provides a general theory of matter and energy that underlies the engineering disciplines, cybernetics offers a general theory of control and communication that underlies biology, social science and artistic fields. As a general theory of regulation, cybernetics includes theories that explain processes in the human body, among groups of people, organizations, nations and the world as a whole.

The most innovative development in theoretical cybernetics has been the work on "second-order cybernetics", a term introduced by Heinz von Foerster in the mid 1970s. According to von Foerster first order cybernetics is concerned with observed systems; second order cybernetics concerns observing systems. Despite the progress that has been made, this work is not widely known. To illustrate the advancements, a recent book, *New Horizons in Second Order Cybernetics*, has been written and edited by Alexander Riegler, Karl H. Mueller and Stuart A. Umpleby. Part I consists of six target articles, each followed by several commentaries and a response by the author of the target article. These contributions address philoso-

phy of science, mathematics, psychology, consciousness, design and drama. Part II considers why the work in second-order cybernetics is not more well-known after four decades. The principal reason is that second-order cybernetics uses an epistemology of constructivism, whereas the scientific community is committed to an epistemology of realism. However, cybernetics has influenced and been influenced by many fields – philosophy, mathematics, social science, biology, and engineering. The current concern with increasing communication among disciplines will likely lead to more interest in the common language that cybernetics offers.

Performing alternative networks of trust and solidarity in the aftermath of Gezi protests

Square movements have mobilized in response to two major crises of neoliberalism and representative democracy. While rejecting insecurities, exclusions, and inequalities imposed by the governmentality model of neoliberalism, activists have criticized incapacities and unresponsiveness of conventional political actors and institutions in terms of representing interests and concerns. They merge new social movements' demands for liberty, autonomy, self-expression and authenticity with economic and political justice concerns, particularly those expressed by the Global Justice Movement. In doing that, protestors have formed inclusive, participatory, decentralized and leaderless protest camps where a plurality of individuals express their indignation and prefigure alternative networks of trust and solidarity through performative practices while preserving diversity. In that regard, square movements signify the formation of a new subjectivity and an alternative politicization based on which activists engage in envisioning and prefiguring a future that they aspire. Even though these protests have disappeared as quickly as they have emerged, alternative networks of trust and solidarity persist in different forms. This paper analyzes formation of alternative networks of trust and solidarity during and after the Gezi Protest. Based on 65 in-depth interviews and 30 months of participant observation, I argue that alternative networks of trust and solidarity building on cognitive, emotional, and relational transformations at the Gezi encampment continue to exist in the aftermath of the protests. I show that even though the Gezi Protest itself phased out, the new subjectivities and alternative relations of trust and solidarity have not vanished. Rather, they have become embodied in the post-Gezi protests and everyday life practices such as food collectives, city gardens, citizen initiatives and issue specific movement networks, and these carry out the task of imaging and shaping an alternative future.

« Informer En Contexte d'Exception : Une Étude Sur La Production Journalistique Sous Le Gouvernement Akp En Turquie, Le Cas De Doğan Medya »

Ce travail se propose d'étudier la production journalistique dans le champ médiatique turc que nous considérons comme une institution politique et économique au sein de la réorganisation du champ journalistique et des transformations du champ politique. Nous avons réalisé 37 entretiens semi-directifs avec les journalistes et les cadres du groupe *Doğan Medya*, un des plus grands groupes de médias de masse en Turquie ainsi que des observations participantes dans la salle de rédaction de la chaîne d'information en continu *CNN Türk* et dans le journal *Hürriyet* détenus par *Doğan Medya*. En Turquie, l'économie du champ politique est marquée par une concentration extrême : « tous les journaux et toutes les chaînes de télévision majeures sont détenus par un grand conglomérat opérant dans divers secteurs, tels que la construction, l'énergie, l'exploitation minière, la banque, les télécommunications ». Ainsi, notre cas d'étude, le groupe *Doğan Medya* est un choix approprié pour deux raisons principales : premièrement c'est un des groupes de médias de masse ayant un pouvoir de manipulation et deuxièmement le groupe *Doğan* opère également dans divers secteurs comme l'énergie, la vente, l'immobilier. Il faut se rappeler que ces conglomérats, afin d'avoir plus de pouvoir dans les adjudications sur leurs autres investissements, créent leur propre pouvoir médiatique. Nous cherchons à répondre à la question suivante : À quoi correspond exactement le régime de domination au sein des médias de masse en Turquie ? Ainsi, pour citer Alain Accardo, « Pourquoi le discours médiatique semble-t-il converger spontanément vers la légitimation de l'ordre établi ? ». Nous analyserons les rapports du pouvoir au sein des organisations médiatiques de masse et les enjeux et stratégies concrets mobilisés par des journalistes et des dirigeants face aux contraintes du pouvoir politique et économique.

RC44-741.2UPADHYAY, SMRITI* (*Johns Hopkins University*)*Keeping the Peace? Evaluating Hindu Nationalist efforts to defuse class conflict and reproduce a stable class compromise in Gujarat*

Scholars have long theorized the close articulation of projects of economic development and nationalism. In the 20th century, postcolonial leaders sought to cement cross-class bases of cooperation to bolster capital accumulation. In India, labor unions, most notably those affiliated to the ruling Indian National Congress Party, played a central role in consolidating this class compromise and in producing hegemonic capitalist accumulation for at least a small section of the working class. This paper investigates whether Hindu nationalism is playing an analogous role in India today. In particular, it examines the Bharatiya Mazdoor Sangh (BMS), the Hindu nationalist labor union federation and asks: is Hindu nationalism able to obtain the consent of workers in India's contemporary political economy? To answer this question, I draw on ethnographic and historical insights based on fieldwork conducted in a high-profit manufacturing corridor in the Indian state of Gujarat, a site where the twin projects of nationalism (both of secular and religious variants) and capitalist development have historically been most closely articulated. I argue that since the 1980s, the BMS has played an important role in reproducing a stable class compromise between permanent workers and capitalists, but that today, this task is becoming increasingly difficult for union leaders. In particular, it is the pervasiveness of informality, even in jobs that were once relatively high-wage and well-protected by the state, that complicates the BMS' efforts to maintain stable class relations through their ideological claims of a Hindu community unified across (intra and inter) class divisions and their rejection of class struggle. Gujarat's manufacturing sector, which has become the poster child for the current Indian state's ambitious plans to boost manufacturing, is increasingly becoming a site of worker discontent, and consequently, perhaps the initial unraveling of the hegemonic articulation of capitalist development and Hindu nationalism.

RC27-499.5UPENIEKS, LAURA* (*Department of Sociology, University of Toronto*)SENDROIU, IOANA (*University of Toronto*)*"We Made You Pay Attention": Media Representations of Sex Segregation and Male Practice Players in Women's College Basketball*

To take a step forward and move beyond the bounds of sex segregation and its stringent grip on sport, we need to both imagine and implement spaces for competition between women and men. This paper gives close consideration to the interaction between male practice players and elite NCAA Division 1 female basketball players in the United States, through a content analysis of media articles on the subject. We analyze 122 news articles using Linguistic Inquiry and Word Count (LIWC), a software program comprised of a set of database dictionaries that reflect psychologically meaningful linguistic categories. Our findings suggest that in contrast to NCAA committees that have raised concerns that this practice subordinates female athletes, the media has portrayed the practice in a largely positive light. We find that the media largely ignore the ways in which the use of male practice players reinforces gender essentialism, instead highlighting the friendships that develop as part of these cross-gender interactions. Moreover, the use of male practice players is advocated in terms of its diffuse rewards or benefits rather than success or failure. While the use of male practice players may be a way to challenge sex segregation in sport, much more work is needed to understand the "promises and pitfalls" of gender integration in sport.

RC10-204.2UROS, SUVAKOVIC* (*University of Pristina with temporary Head Office in Kosovska Mitrovica, Faculty of Philosophy, Department of Sociology*)*From Socialist Self-Management to Neoliberal Democracy on Example of Serbia or Must Democracy Have ONLY One Dimension?*

Social changes are considered in the article on the example of Serbia, accomplished by the transition from the self-managerial socialism to the neoliberal capitalism. Most of the social-economic rights of workers were reduced, even canceled, the rights that characterized the self-managerial socialism of the ex-Yugoslavia in which Serbia was one of the republics having the same rights. Yugoslav self-managerial socialism had significant differences concerning the Soviet model of real-socialism, so that it was often called "soft socialism", since it provided also the influence of the people that were not members of the Communist Party to political life of the country. In Serbia in the last quarter of the 20th century, and especially after the 2000, black economy is flourishing, a great number of workers is non-registered, wages are among the lowest in the world regarding the education of the labor, unemployment rate is high, there is no possibility to get a flat except in case of debtor's slavery with foreign banks, there is a high contingency regarding the keeping of the own job since labor contracts

that guaranteed employment for indefinite period are being cancelled, precarity is being developed, and these are just a few of the phenomena that appeared as the consequence of the transition. While workers in Serbia used to have the right to choose the director of their company and decide at workers' gatherings on the distribution of profit and who was going to get a flat from the company, today they have only the right to vote, periodically, at elections, as citizens. Self-management rights are lost forever, while gained political freedoms have become much less important for their everyday life. Is it possible that democracy is simultaneously social-economic and political category, which is the issue to which the answer is searched?

RC05-114.3URVASHI, SHREYA* (*Tata Institute of Social Sciences, Mumbai*)*Understanding Ethnic Identities in Urban Spaces in India*

The ethnic identity of an individual is a chief characteristic in determining her or his belongingness to parts of urban space in a society. Various studies show how Indians have internalised this identity for themselves as well as for others, and have experienced some sort of discrimination and/or advantage based on their ethnic group and identity; in explicit forms like document verification and obtaining a visa, or in much more implicit forms like rented accommodation or in entrance in gated communities. Moreover, this identity for some people further pushes them into what is known as a ghetto condition, coming out of which is an immense task not only due to economic reasons, but due to the culmination of social and cultural reasons piled up on the economic factor.

Although theorization on such lines have been done primarily in America and Europe, the same is very relevant in the Indian context as well. The concept of ghettos, particularly, is widely prevalent in India. What however makes it different from the western discourse is the presence of class as well as caste dynamics in the formation and sustenance of ghettos in urban areas in India. A comparison of racism and casteism has always been of interest to scholars and thus, not surprisingly, a feature directly related to this phenomenon finds its existence in India with the prevalence of Dalit ghettos. What makes the current discourse even more interesting is that living in ghettos in India is not restricted to the lower castes only. Such urban spaces which are basically formed as a result of unequal attitude of the larger society also cater to religious and regional minorities as well. Another entrant into the concept of such ghettos includes the ones formed due to coming of various refugees.

RC48-811.1USHIYAMA, RIN* (*University of Cambridge*)*The Polyphony of Victim Activism: Social Performance(s) of Victimhood after the Aum Affair*

The Aum Affair, a series of crimes and terrorist attacks committed by the new religious movement Aum Shinrikyō between 1988 and 1995, constituted a tumultuous moment in recent Japanese history. Not only did the event reveal tension in civil society, it also left in its wake a raft of social problems, some of which victims sought to address through public campaigns. This paper applies and develops the theory of social performance through a study of three of Aum's victims who became leading figures for victims' pursuit of justice in the aftermath of the Aum Affair. Though each figure engaged in activism in the pursuit of 'justice' as the ultimate moral end, their social performances have varied much in style and substance. First, Nagaoka Hiroyuki – father of a former Aum believer and a victim of a murder attempt – has appealed for clemency on behalf of Aum's ex-believers, on the basis that they had been 'brainwashed'. Second, Takahashi Shizue, widow of the 1995 Tokyo sarin attack, became the leader of a victims' movement campaigning for a state-funded compensation system. Takahashi has also occasionally reaffirmed the death penalty as a necessary mechanism for retributive justice. Third, Kōno Yoshiyuki, a survivor of the 1994 Matsumoto sarin attack who was initially falsely accused as the perpetrator, became a prolific advocate for due process and civil rights. In contrast to Nagaoka and Takahashi's antagonism towards Aum, Kōno has explored possibilities for reconciliation with Aum members, in a model of restorative justice different to Takahashi's. This paper proposes the utility of 'polyphony' as a concept which captures different and clashing interpretations of victimhood in civil society.

RC46-JS-50.3UYS, TINA* (*University of Johannesburg*)*Facilitating Anonymous Whistleblowing*

This paper considers the role of facilitators of anonymous whistleblowing, which provide an important opportunity for whistleblowers to place their concerns in the public domain where the power holders can be held accountable, without necessarily revealing their own identity. Are these facilitators successful in their attempts to assist whistleblowers to get attention focused on their message? Companies and government departments often employ anonymous hotlines as a means of encouraging employees to disclose suspicions of perceived wrongdoing

internally. This practice tends to blur the distinction between whistleblowing and informing in the eyes of employees: is the aim to establish whether employees are defrauding the organization, or to enable employees to expose that the organization's perceived unethical behaviour? Other facilitators to be considered are ombudspersons, the media and WikiLeaks.

The Accreditation of International Programs By Capacs: Important Considerations

Dr. Tina Uys, and Dr. Jan Fritz, CAPACS Board members, and ISA Officers (RC 46), will discuss the accreditation of non-US programs in applied, clinical, and engaged public sociology and sociological practice in higher education by CAPACS. Particular attention will focus on variations in academic cycles and calendar years, the structure of higher education degree and certificate programs in non-U.S. institutions, and working with the Commission in aligning government mandated course and program outcomes with CAPACS Standards. Additional discussion will address the Commission's commitment to adjust the costs of international program accreditations consistent with the World Bank's Classification of Economies (COE) and International Sociological Association tiered pricing schedules.

The Nordic Model of Higher Education Contested

The Nordic model of higher education contested

Abstract

The Nordic higher education system can be described in terms of a particular model – the Nordic welfare state higher education system. The defining features are high levels of public funding, low levels of contributions or fees from students, and systems largely publicly-owned and relatively closely regulated by the state.

In contrast to liberal (USA, Canada, Australia) or corporative (France, Germany) welfare state models, the social democratic welfare state model of the Nordic countries to a larger extent builds upon the universal welfare rights of the citizen independent of economic status and labour. The egalitarian aspect of the higher education system could be illustrated by relatively similar financial and legal conditions provided to the institutions by the state.

The Nordic approach with regard to accessibility is ambiguous. Stricter criteria for selection have been introduced as a strategy for enhancing quality and status. Elite tracks are under development, such as the organisation and selection of pupils and students for elite schools or for research tracks in secondary school. We argue that the Nordic higher education system has moved towards being more pluralistic and fragmented, with inherent dynamics and mechanisms promoting homogenisation/divergence, cooperation/competition and inclusion/exclusion. Furthermore, the systems now include a remarkable number of institutions of different size, profile and traditions, competing for excellence, visibility and not least resources.

Our analysis is based on a synthesis of existing research, research literature of general relevance, reports, public and other documents, web sites, statistics and budgets.

This paper is part of a more comprehensive study of the Nordic model of higher education funded by NordForsk.

The Making of the Senior Entrepreneur: Heterogeneity and/or Homogeneity?

The Making of the Senior Entrepreneur: Heterogeneity and/or Homogeneity?

This paper presents results from a systematic research overview of studies on senior entrepreneurship. The paper will explore how previous studies construct the meaning of age, the category of the senior entrepreneur, and what the possible implications of these constructions are.

Entrepreneurship, in terms of business start-ups, is promoted by governments around the world as a way of creating jobs in increasingly insecure labour markets. In a similar vein, older people are encouraged to start their own business as a mean to extend their working lives. In research, there is also a growing interest in the phenomena of entrepreneurship in later life. This is a research field that has expanded considerably in later years and since research has the potential to influence policy, it is important to consider what kind of knowledge that is produced.

The results show that the research field as a whole is limited by an underdeveloped theoretical notion of age. The concept of age is mainly understood from a biological and chronological point of view and depicted as an objective fact. This restricts the chances to explore how other meanings of age, e.g. subjective age, influence motives and conditions relating to entrepreneurship. Further, a generic picture of the senior entrepreneur emerges; however, to a large extent, this generic picture excludes the experiences of entrepreneurs outside the western world since most studies have been conducted in the USA or a few European countries.

Departing from critical age studies, the paper argue that the research on senior entrepreneurship needs a more elaborated theoretical understanding of age if the field is to flourish. The paper also develop this argumentation with the help of life course theory.

RC17-335.2VÄHÄ-SAVO, VALTTERI* (*University of Tampere*)SYVÄTERÄ, JUKKA (*University of Tampere*)TERVONEN-GONCALVES, LEENA (*University of Tampere*)*Accumulating Authority in International Meta-Organizations*

The world has seen a dramatic increase in the number of international organizations during the last hundred years. Among them there is a constantly growing group of so-called meta-organizations, whose members are themselves organizations. Especially in the case of national policy-related organizations, it has largely remained a mystery, why they are so eager to join international meta-organizations, even when their activities are mostly tied to national policy objectives. Drawing on the theoretical framework of epistemic governance, our paper suggests that from the member's viewpoint meta-organizations appear as accumulations of epistemic capital, which they can tap into when pursuing their interests on the national field.

To understand why potential members decide to join meta-organizations, it is necessary to analyze how meta-organizations build themselves and present themselves as accumulations of authority, which can be utilized by the members. This paper focuses on a case study concerning the International Association of National Public Health Institutes (IANPHI), which was established in 2006 and quickly gained a membership of 100 National Public Health Institutes (NPHIs) from 88 countries. Our case study examines the activities of the meta-organization and the rationales it offers for prospective members to join the IANPHI. We identify five distinct mechanisms, through which the IANPHI accumulates epistemic capital, making itself an attractive body for NPHIs throughout the world. The paper also looks at the more general implications these mechanisms have for the construction and spread of global models and for the dynamics between local and international organizations.

RC15-282.22VAHID SHAHIDI, FARAZ* (*University of Toronto*)SIDDIQI, ARJUMAND (*University of Toronto*)MUNTANER, CARLES (*University of Toronto*)SHANKARDASS, KETAN (*University of Toronto*)QUIÑONEZ, CARLOS (*University of Toronto*)*Unemployment and Health in the Neoliberal Era: Towards a Political Economy of Widening Health Inequalities*

There is an extensive literature on the topic of health inequalities. A key insight to emerge from this body of research is the finding that, despite more than a decade of professed effort on the part of governments, health inequalities are widening in most, if not all, advanced capitalist countries. Though scholars have posited several competing explanations for this problematic trend, these have not been subject to rigorous empirical testing. As a result, we know little about why health inequalities are widening over time.

In response to this gap in the literature, we investigate the case of changing unemployment-related health inequalities in Canada. Using data from the Canadian Community Health Survey, we complete three sets of analyses. First, we describe recent trends in the health status of employed and unemployed Canadians and show that the gap between these populations has grown over time. Next, we examine whether these adverse trends can be explained by commensurate changes in the demographic, socioeconomic, and behavioural characteristics of the unemployed. Finally, we use a quasi-experimental study design to test the hypothesis that neoliberal welfare state reforms have contributed to growing unemployment-related health inequalities.

The results of our analyses suggest that compositional factors provide little in the way of an explanation for widening health inequalities between employed and unemployed Canadians. Instead, our findings suggest that this gap has widened due to the neoliberal restructuring of Canada's social and economic landscape, including its welfare state policies. Advancing recent calls for a political economy of health inequalities, we conclude that scholars interested in explaining why advanced capitalist countries are failing at health equity should turn their theoretical and empirical attention to the neoliberal transformation that is underway in these societies.

RC47-792.1VAIDYA, ANAND, ANAND* (*University of Bergen*)NIELSEN, KENNETH BO* (*University of Bergen*)NILSEN, ALF* (*University of Agder*)*Neoliberalization and the Politics of Dispossession in India: Investigating Three Moments in a Contentious Trajectory*

India's experiment with neoliberalism is now over a quarter century old, and during that period a range of economic trends and political fault lines have

become visible. This paper tracks the struggles between, on the one hand, social movements from below – that is, the various forms of collective action by subaltern groups – and, on the other hand, movements from above – that is, the collective action of capital and far-right upper-caste movements – in animating the trajectory of neoliberalization in India from the early 1990s to the present. We examine these struggles through the lens of movements against dispossession across three moments. First, from 1991 until 2004, a heightened wave of dispossession occurred in the early aftermath of neoliberal reforms. Second, a partly successful push took place in the period from 2004 to 2014 by subaltern movements to mitigate the worst effects of this dispossession through rights-based legislation. Finally, an ongoing, contradictory period, in which factions of the far right allied with capital are seeking to unravel the rights established through legislation in the earlier period while other factions attempt to gain further consent for right-wing rule among the dispossessed by defending these same rights.

RC01-43.1VAISANEN, MINTTU* (*University of Helsinki*)*The Role of Faith-Based Organizations (FBOs) in Finland's Foreign and Security Policy*

In the 2000s, the Finnish Government emphasized the need to enhance cooperation between military and civilian crisis management and development cooperation and humanitarian aid. In this paper, I will analyze the role of Faith-based organizations (FBOs) in crisis management policy. I examine the differences between the so-called mission-based and humanitarian-based FBOs that are involved in development cooperation projects. I will outline my research of advocacy work, which aims to address a gap in knowledge of how FBOs that work in fragile states make use of their expertise in Finland. This paper analyzes the dialogue between FBOs/NGOs and the Finnish political system. The data was gathered by qualitative methods. The study is based on the theme interviews and public documents of FBOs. Moreover, I use documents of the Finnish Government and Parliament. The study is theory-bounded where the logic of abductive reasoning is used.

RC38-673.3VAJDA, JULIA* (*ELTE University Budapest*)*„It Wasn't like I Pull Off a Dead Man's Shoes, I Pull Them Off As I Give Him the Piece of Bread” – the Analyser's Struggle Against His/ Her Own Positive Prejudices*

Can hermeneutical analysis protect us from our own prejudices? Do not we develop blind spots when we want to avoid seeing our interviewees morally reproachable? In dealing with Shoah and other traumatic historical events, it is easy to slip into the fault to see the world in the dichotomy of victims and perpetrators, i.e. goods and evils, just like in fairy tales; hence we inevitably categorize the individuals as belonging to one or the other side.

It can be similarly hard to analyse the interviews unbiased: it does not feel right to think of the persecuted, the Shoah survivor, as „bad”, who sinned against his/ her fellow sufferers. It may easily happen that we repress any hypothesis concerning the narration that would make the interviewee look blameworthy.

In the interviews, survivors of camps tell many times that the piece of bread they had hidden under their head for the night disappeared by the morning; their shoes, which were their most precious asset of which they took the best care under those circumstances were stolen; their carefully guarded blanket was nicked. These objects serve and symbolize their chance of survival: nourishment and protection from environmental conditions.

It is impossible that we only come upon respectable survivors who were victims of these atrocities. It is similarly improbable that, out of remorse, all perpetrators of petty crimes would refuse to be interviewed.

However hard it is to accept at a theoretical level and recognize in specific interviews, in many cases the thieves reported in the narratives are the interviewees themselves.

My paper aims to illustrate our struggles when working with such interviews against our also existent, however positive, prejudices.

TG03-962.2VAKSHA, ANUJ* (*Guru Gobind Singh Indraprastha University*)*A Bottom-up-Community Approach to Theorization of Global Justice: An Outline*

Making a theory on global justice is more than an exercise of academic adventurism or a journey of intellectual fantasy. It is still more than an industrious exercise propelled by ideological fiat. It is more than the moralistic formulation of a panacea to end all the ills and the evils of the mankind on this earth. It is a process to enunciate a framework for defining global justice as it exists and thereof explain its genesis, its manifestation, the scope of its content, its interface with similar systems and processes operating at sub-global level. The said

theoretical framework of Global Justice should minimally explain the following questions,

1. What is the genesis i.e. causation of global justice?
2. How does global justice manifest and evolve?
3. What is the nature of interface of global justice with similar systems and processes operating at sub-global level?
4. How is the content of global justice determined?
5. Global justice for whom, by whom and for what purposes?
6. What is the normative value, if any, on which the whole edifice of global justice rests?

The present paper entitled, "A Bottom-up-community Approach to theorization of Global Justice: An Outline" seeks to formulate a theoretical framework of global justice that is based on the bottom-up-community approach. This approach does not rely on the mores of established morality or idiosyncrasies of dominant politico-economic ideologies. It examines the critical questions of global justice from the perspective of evolution of the form of justice as it is found at the simplest level of human community. It is argued that the theory of global justice based on bottom-up-community approach strengthens the systems, processes and institutions of justice at the sub-global level and together they complement each other to significantly address the contentious contemporary problems of the mankind.

VALDIVIEZO-ISSA, RENE (*Benemerita Universidad Autonoma de Puebla*)

Independent Candidacies in Mexico: Discontent, Citizen Representation or Democratic Deficiency.

After the climax of the *democratic transition* process (1997 and 2000), Mexico fell into a democratic recession (elections 2006 and 2012), in which "electoral fraud" and the use of illegal resources were strongly present.

The decay of the political forces and of the electoral institution increased; simultaneously, citizen participation (1985) flourished once again.

Vicente Fox's presidential term (2000-2006) had a strong civic presence, away from the formal partisan structure, and close to civil (business) organizations.

The elections of 2006 and 2012 revealed weakness and doubts about the electoral authority. In light of the irregularities of the process, the electoral authorities, parties, governments and political actors were strongly criticized by social sectors, which lead to the nth crisis of both the electoral system and the political parties.

In addition, in the local elections (2010), ideologically inconsistent alliances were formed between right and left parties. These alliances won three times.

In this context, and fueled by citizen demands, the immediate re-election of deputies (local and federal), mayors and governors, was approved, as well as the figure of independent candidates.

For the elections of 2015, 125 independent candidates were in the running for various positions (22 federal and 103 local). Only six won. In the local elections of 2016, 308 independent candidates participated, and only 10 of them won. The average percent of votes obtained was just over 3.0%.

Are independent candidacies an expression of the citizen's discontent with the political system and its actors? Are they an expression of citizen representation? Or do they only show enormous deficiency of electoral (partisan) democracy in our country?

This paper examines the general picture of the participation of the independent candidates, in the context of ever deeper democratic deficiency. The paper also approaches responses about what these candidacies express, both at local and national levels.

The Importance of Relative Differences in Workplace Characteristics between Partners for Their Parental Leave-Taking Behaviour

Parental leave is one of the key policies that facilitate reconciliation of family and work life. There is extensive literature dealing with individual determinants of parental leave uptake among mothers and fathers, including individual workplace characteristics of mothers and fathers separately. However, only little has been done on the relationship between relative partners' characteristics and parental leave up-take. In the present paper, we bridge this gap in the current research by analyzing how parental leave up-take associates with relative differences in partner's hourly wages, number of hours worked and workplace characteristics (such as public-private sector, firm size, blue-white-collar work). This approach allows for better understanding of the link between intra-couple setting and higher leave take-up among parents. We use the administrative social security data from 1999 – 2007 from Luxembourg to cover the entire population of the

country. Our analysis reveals that father's leave up-take increases significantly if mother has high hourly wage, mother works in private sector while man works in public one, woman works more hours per month than her partner, and if man works in a large firm while mother works in a small one. Mother's leave up-take appears to be less affected by relative differences in couples' characteristics than we observe among fathers. The only relative difference that slightly increases the mother's up-take is when mother has a notably lower hourly wage than her partner does and when she works less hours per month.

Enter Your Mood. Mood Disorders in the Era of Mobile Digital Technologies

Mobile digital technologies allow people to track their mood, contributing to the construction of quantified selves. While digital mood tracking has become a matter of personal choice in recent years, it has been incorporated in mental healthcare practices since the beginning of the 2000s, following a century old tradition of paper-based technologies. This presentation analyzes this trend, focusing on the experience of a mental health team working at a private university hospital in Chile, that has experimented with mood tracking devices for over a decade. Based on interviews, participant observation and document analysis, we explore the sociotechnical deployment of a series of devices that this team has experimented with; three of them pertaining to the category of mobile digital technologies. The proposed analysis deals with two interrelated dimensions. First, it analyzes how mood tracking devices give form to mood as an epistemic object, incorporating decisions regarding what mood is and how it might be measured and portrayed. Visualization technologies are key in this regard, as they allow mood to be represented as an entity that evolves throughout the lifetime of patients, reacting to clinical interventions. At the same time, images prepare mood to be transported to different settings; from the patients' computers or mobile devices to the physicians' screens and beyond: to management monitoring systems and research databases. Second, it analyzes the kinds of work that these technologies prescribe to different users, and whose interests prevail in defining the organization of such work. Even though not all actors might be in an equal position to negotiate, they all become incorporated in networks of global scope that prefigure how they will continue to participate in the trajectory of illness. Based on this case analysis, this paper aims to contribute towards a sociological critique of digital health.

Change in Social Fluidity over Birth Cohorts in France: Educational Expansion and Democratization of Education As Key Explanatory Mechanisms

Sociological research on intergenerational mobility and the status attainment process has recognized for long that education has a twofold role in the development of individual socioeconomic trajectories. First, as level of education attained is the major variable mediating the association between class origin and class position in adult life, education is the main vehicle of social reproduction across generations. Second, as level of education attained is not strictly determined by class of origin and other ascriptive criteria, education *also* is a key factor that promotes intergenerational social mobility. Taking France as a case study, we address the role of education at the societal level by examining to what extent historical change in social fluidity across cohorts is linked to, and produced by, two mechanisms that describe change across cohorts in the distribution and allocation of education: educational expansion on the one hand, reduction in inequality of educational opportunity on the other hand.

Using the 1970, 1977, 1985, 1993, 2003 and 2014-15 *Formation - Qualification Professionnelle* surveys conducted by the French Statistical Office (INSEE), the paper analyzes how intergenerational social mobility and social fluidity have evolved in France for men and women born between 1906 and 1985. It demonstrates that the association between class of origin and class of destination has become weaker in recent cohorts than in older ones, and shows that the same association also diminishes with age, i.e., along the occupational career. Finally, a simulation and counterfactual exercise reveals that change in education has played a key role in the process of increasing social fluidity. In the immediate post-war cohort, the reduction in inequality of educational opportunity is the main factor and the educational expansion is the secondary factor for explaining increasing social fluidity, but the relative importance of these two factors is reversed in more recent cohorts.

RC34-JS-87.5VAN DE VELDE, CÉCILE* (*Université de Montréal*)*"What Have You Done with Our World?". the Generational Issue in 5 Post-2011 Social Movements*

This presentation aims to identify the place of the generational issue within the post-2011 movements. It is based on a generational and comparative analysis of 5 social movements initiated by the younger generations from 2011 to 2016 : Indignant in Madrid, Student Movement in Santiago de Chile, Printemps Éreable in Montreal, Umbrella Movement in Hong-Kong, and Nuit Debout in Paris. The comparison is founded on a large database of writings and slogans (n = 1400) collected by direct observation within the 5 movements. These slogans were subjected to a statistical and textual analysis, with the aim of identifying the "generational grammars" of these movements. The analysis confirms : 1 - the existence of a "we" that is primarily generational within the collective identities claimed, identifiable at the statistical level ; 2. the existence of shared generational demands structured around three interrelated issues: education, justice, and democracy ; this generational matrix thus relies on the defense of the value of education - studies, at what cost? - on justice between generations - who must pay the debt? - and the future of democracy - which right to speak? ; 3. the existence of three large variants of this generational matrix, structured mainly according to the type of social movement and the model of the welfare state.

RC02-60.6VAN DE VELDE, CÉCILE* (*Université de Montréal*)*A New "Generational Gap"? Global Trends in the Relations between Generations*

Are we witnessing the emergence of a new generational gap at the global level? This paper proposes a return to the question of « generation » as defined by Mannheim (Mannheim, 1928), but here necessarily extended to a transnational scale. It is based on an international and comparative survey of younger generations in the face of the world economic crisis, and aims to bring to light emerging trends in intergenerational relations analyzed at the family, social and political levels. This survey was conducted in five cities with the common feature of having epicentres of youth protests in recent years : Madrid, Montreal, Santiago de Chile, Hong Kong, and Paris. It is based on a mix of methods (more than 130 interviews with young adults from different social backgrounds in the 5 cities, OECD statistical data, and comparative analysis of social movements in each of these cities). The comparison makes it possible to identify common trends in the evolution of relations between generations: 1. within the family - analyzing the consequences of the increase in economic dependence with parents ; 2. in society - analyzing the emergence of a generational "we" ; 3. at the political level - analyzing how the social movements raise common generational questions. Analysis will link these three dimensions of intergenerational relations to show the existence of tensions not in priority between generations but rather between the younger generations and their societies.

RC33-599.3VAN DER VAART, WANDER* (*University of Humanistic Studies*)GLASNER, TINA (*University of Humanistic Studies*)*Response Styles in Answering Scale Items By Older Respondents: The Role of Biographical, Contextual and Cultural Aspects*

To enhance data quality in survey research it's a common rule to combine positively and negatively worded items in one scale. Alternation of both types of items urges respondents to read more carefully and seeks to reduce response styles like acquiescence and satisficing. However, since negative items are harder to process than positive items and alternation is more burdensome, such balanced scales might also stimulate response styles. This may be true especially for respondents with reduced cognitive or motivational capacities. Accordingly our study examines the occurrence of response styles in an older population. Background and contextual features are explored to gain insight in the underlying mechanisms of response styles.

A split-ballot experiment was performed on 397 inhabitants from Dutch senior residences. For two different scales - 'meaning in life scale' and 'self-reliance' - respondents randomly obtained one out of two versions: a scale with positive and negative items combined, or a scale with positively phrased items only. Ten senior residences were selected as to cover different regions in the Netherlands and to obtain a variety in residence size (36 to 335 inhabitants). All 1259 inhabitants were sent a questionnaire; resulting in N=397 (31% response); age ranged from 46 to 99 years.

Analysis focused on data quality indicators like straight lining, item non-response, number of valid cases, and further aspects of scale reliability and validity. Differences in response style between age groups were established and explored. First, it is examined whether differences in social biographical characteristics of the age groups are related to response style and whether they can be interpreted

as subcultural differences. Second, it is studied whether senior residences with relatively younger versus older populations, show contextual and cultural features that may further explain difference in response style.

RC06-147.1VAN HOOFF, JENNY* (*Manchester Metropolitan University*)LAHAD, KINNERET (*NCJW Women and Gender Studies Program, Tel-Aviv University*)*Discourses of 'Toxic' Friendship: Rethinking the Everyday Realities of Friendship*

Recently there has been a great deal of media attention given over to the phenomena of 'toxic' friendship. This paper aims to critically explore this discourse as a significant lens through which to view the everyday tensions and affects of close friendships. By problematizing the assumed practices and unmet expectations of friendship we argue that there is a missing formal institutionalized script for addressing friendship issues or difficulties. To a certain extent, the media's growing interest in toxic friendships reflects this problematic. Our analysis also shows that the new category of 'toxic' friendship builds upon the ideal of neoliberal entrepreneurial self, which takes control of its fate and benefits from practices of self-knowledge (Rose 1990; 1998). We thus claim that the recurring advice to end toxic relationships reflects a 'hierarchy of intimacy' (Budgeon 2006) in which one's partner and family of origin take precedence and are worth "investing" in.

As such, these discourses offer reductive, disposable approach to friendship ties that attempts to design out the complexities and ambivalences of what can be a challenging relationship. By looking at the silences, the miscommunications, the stuckness and bewilderment, which characterize these relationships our analysis emphasizes the need to look beyond these popular representations of friendships. In this way, the paper contributes to existing critical friendship literature (Smart et al 2012; Mallory and Carlson 2014; Finn 2015) to provide a significant contribution to the conceptualization of friendships and personal life

RC22-405.21VAN HOUWELINGEN, PEPIJN* (*The Netherlands Institute for Social Research*)DE HART, JOEP (*The Netherlands Institute for Social Research*)*Religion, National Identity and the Dutch State*

How important is religion for Dutch national identity? Has religion become a more or less important 'identity construct' in The Netherlands during the past few decades? Is religion only a relevant aspect of Dutch national identity for religious people? Or has (christian) religion emerged as an important element of national identity for the non-religious (so-called 'culture christens') as well? And if indeed so, why?

These are some of the research questions we would like to answer based on data collected for two different research projects: religion and national identity in The Netherlands. We will use these data sources -survey data, interviews and case-studies - to shed light on the importance of religion in constructing a national identity in contemporary Dutch society. We will also compare our findings, using data from the ISPP religion module, with those of a few other (European) countries.

By focusing on the situation in The Netherlands we are also able to take into account institutional and policy contexts especially the modern-day role of religion for the Dutch state, for example in its educational system and during national holidays. Special attention will be given to the role of religion - or religion-like substitutes - in national events in The Netherlands such as the commemoration of the MH17 crash.

RC17-327.2VAN KRIEKEN, ROBERT* (*University of Sydney*)*Organizing the Theatre, Organizing the Court: Elias's Figurational Analysis As Prototypical Assemblage Theory*

In this paper I discuss the ways in which Elias's *The Court Society* anticipated more recent conceptual developments in social theory, in particular Deleuze's concept of 'assemblage' and Latour's 'actor-network theory'. My starting point is the recent book by the theatre historian David Worrall on British Georgian Theatre, *Celebrity, Performance, Reception*. I outline the ways in which Worrall's analysis, drawing on Deleuze and Latour, parallels Elias's in *The Court Society*, with the concept of 'figuration' doing much of the same work as the concept 'assemblage', and his account of the French court displaying many of the features of actor-network theory. The paper concludes by identifying the ways in which the performativity of court society analysed by Elias parallels theatrical performance and also the performance of celebrity, pointing to the historical continuities between the court aristocracy and the emergence of a 'celebrity class'.

A Case Study on a Generalist Service Delivery Model for Street Children in Durban, South Africa: Insights from the Capability Approach

This paper adopts a qualitative case study on the generalist service delivery model of I-Care, a Durban-based NGO, that works with male street children. Fifteen face-to-face interviews were conducted with ten I-Care employees and five former street children. A focus group was set up with I-Care employees. While existing literature is forthright about a generalist approach for children at risk, it remains unclear how to implement this approach in practice. This article identifies a continuity of six fundamental social work practices for working with street children. These include outreach work; child-family and community mediation; transitory care centres and programmes; assistance to access food, grants, education and jobs; follow-ups; and empowering through mentorship. The study evaluates how these practices contribute to capability and agency expansion on behalf of street children and the challenges which service providers and former street children experience.

Utilising a modified Capability Approach framework to review a sustainable retail skills training programme for survivors of violence in South Africa

The study reviews a specific sustainable retail skills training programme for survivors of violence in South Africa. A detailed analysis of this programme seeks to understand if and how adding sustainability and a competition and showcase component to a retail skills programme contributes to reducing violence against women. The programme is fulfilled by Edcon, South Africa's leading non-food retailer. Edcon has partnered with the United Nations entity for Gender Equality and Empowerment of Women, the Government of South Africa's Department of Social Development, government shelters in three South African regions, and non-governmental organisations. Despite the fact scholars have identified the benefits of public-private partnerships for the success and sustainability of socio-economic empowerment programmes for survivors of violence, there has been limited empirical evidence that demonstrates how to implement partnership programmes and how to design them in ways it includes non-economic dimensions, such as gender inequality. In order to measure the programme's impact, the study applies the Capability Approach, a normative framework that measures quality of life. By modifying the Capability Approach's key concepts such as 'capabilities, agency, aspirations, and dignity', new conceptual insights emerge about how interventions affect these aspects, how these aspects affect each other, and how they manifest in women's adaptive preferences. Ultimately, the way in which the programme outcomes are interrelated with these key aspects is identified. Based on the findings of this study, holistic programmes that bridge intertwined socio-economic problems are recommended. Remarkably, through consciousness raising, shared skills learning, mentorship, and self-esteem enhancing elements, the programme effectively generated 'hope' and significant 'retail, business, and life skills'. This shows how traditional sewing programmes can be adjusted to enhance the gender dimensions of empowerment.

Upper-Class Parents' Strategies for Helping Youngsters Access to and Succeed in Prestigious Higher Education Tracks

With the implicit assumption that at the end of secondary education youngsters are able to make autonomous choices and, even more, that they become independent from their parents during their higher education studies, the existing sociological literature tends to focus on parental educational strategies mostly concerning children and adolescents. However, especially in countries such as France where parents and children are extremely anxious about getting the best higher education credentials to enter an extremely selective and competitive

market of high-level jobs and where the most prestigious higher education tracks, especially the *classes préparatoires aux grandes écoles* (CPGE), are very academically demanding, upper-class parents develop a variety of strategies to help their children access to these tracks and succeed in their studies. Using data from interviews with 40 upper-class parents in the Parisian region whose sons and daughters were either in the last year of secondary school or in the first year of CPGE, this paper will analyze some specific features of these strategies including the indirect influence of higher education choices, the creation of material and social arrangements to facilitate students' total concentration on academic matters and various forms of moral support. The paper will also compare and contrast the strategies of two upper-class fractions, 'managers' and 'intellectuals'. The conclusion will emphasize the importance of parental sponsorship alongside institutional sponsorship in the successful higher education careers of upper-class youngsters.

VANDENBELD GILES, MELINDA* (*University of Toronto*)

Motels, Mothering and Mobility: Finding the Meaning of "Home" in a Neoliberal Era

The "home" is imagined, according to western industrialized history, as the place of "refuge," the site of the "domestic," the private sphere of "home-making" and child-rearing. The "home" is thus conceptualized as a private, feminine, static, normative space. In sharp contrast, according to modernist imaginaries, the "motel" is conceptualized as a public space, a counter-site, a place of transience, where the normative social obligations of the modernist era could be superseded within the bland banality of the motel rooms' four white walls. A "motel" is a liminal space. No longer a public space of happy family frolicking, as it was positioned from the 1920s to early 1950s in conjunction with auto-oriented Sunday afternoon drives, nor a mobile space of affluent social networking as symbolized by the "hotel", the "motel" has become a symbol of suburban modernist decay, marginality and gross inequality.

Given the pervasive home/motel dichotomous imagery, how did it become, in the late 1980s, "sensible" in North America for the state to house families in these very spaces of marginality? And how do families create "home" spaces in the places of these motels? Based on eight months of fieldwork spending time with mothers living with their children in a Toronto motel, I will discuss how these women understand "home" living long-term (some families up to two years) within such a transitory space.

Theories, Paradigms and Turns in Contemporary Social Theory

Theories, paradigms and turns in contemporary social theory

Abstract

We don't really have a history of contemporary social theory. Textbooks, handbooks and syllabi typically list a series of schools (from critical theory to actor network theory, from pragmatism to critical realism, from cultural sociology to rational choice) and authors (Archer, Boltanski, Collins, Honneth, etc.). Without discerning the underlying logic that moves the field, the whole looks a bit "like a certain Chinese encyclopedia". To bring some order into contemporary theories, I will distinguish three constellations: post-Bourdieuian social theory; paradigmatic sociologies and turns. The first constellation is formed by the epigones of the "new theoretical movement" (Bourdieu, Giddens, Habermas and Luhmann) that tried to solve the agency-structure conundrum. Bourdieu now takes the position of Parsons, with the result that the best part of contemporary social theory (pragmatism, critical realism, critical theory) can be reconstructed as an engagement with Bourdieu. The second constellation does not deal with grand theory, but with theories of the middle range. Analytic sociology, cultural sociology, moral sociology, relational sociology are the best-known examples of attempts to consolidate various approaches into a paradigm (in Merton's sense). The third constellation is more heterogeneous and is in constant flux. It is formed by a sequence of continuous "turns" (the linguistic, cultural, praxeological, ontological turns, twists and returns) that operate at the boundary of sociology and aim to subvert existing theories by heralding a new revolution.

VANDERSTRAETEN, RAF* (*Ghent University*)

'Disciplinarization' of Sociology in the Mid-Twentieth Century

The expanding post-World War II academic system was characterized by increasing disciplinarization, by a focus on disciplinary independence. In the academic system, disciplinary differentiation became the dominant type of 'division of labour'. Shortly after the war, for example, UNESCO initiated several international disciplinary associations, including the International Economic Association (IEA) and the International Sociological Association (ISA). It also stimulated the foundation of national disciplinary societies (such as the

Österreichische Gesellschaft für Soziologie, the Sociedad Mexicana de Sociología, the Société Belge de Sociologie, and the British Sociological Association), all of which were expected to join the international disciplinary associations.

At the same time, however, some prominent sociological theorists also explored the viability of interdisciplinary projects. At Harvard University, Talcott Parsons co-founded in 1946 the Department of Social Relations for Interdisciplinary Social Science Studies, a collaboration among three social science departments at Harvard University (anthropology, psychology, and sociology). Harvard's "yellow book", *Toward a General Theory of Action*, had to lay the groundwork for this project. In Chicago, Edward Shils later spoke of the "indissoluble tie" between sociology and the humanities. A number of his projects, including the interdisciplinary journals *Comparative Studies in Society and History* and *Minerva*, were instrumental in distributing and testing this view.

On the basis of detailed archival research, primarily in the Talcott Parsons Archives at Harvard University and the Edward Shils Archives in Chicago, this paper will look at shifting disciplinary and transdisciplinary projects in sociology. The focus will be on mid-twentieth-century diagnoses of the "present state of sociology," the forms of institutional support then available for disciplinary and interdisciplinary projects, and the lasting effects of the choices made at that time.

Symbolic Boundary Making Among Syrian Refugees in Belgium: Moral Deservingness, Education and Cultural Merits

Shortly after arriving, immigrants begin to redefine their social identities by positioning themselves in a different environment. We analyse how Syrian refugees in Belgium draw and enact symbolic boundaries among themselves, other immigrants and native Belgians. By using 'comparative strategies of self' refugees situate themselves as equal on a range of symbolic hierarchies, including those of morality, education and cultural capital.

Drawing on 26 in-depth interviews with 39 Syrian male and female refugees, as well as on-going participant observation, we discuss three boundary-making strategies refugees rely upon to construct their social identities, and to position themselves vis-à-vis other social groups.

First, these Syrian men and women often emphasise their "deservingness", both by distinguishing themselves as refugees from economic immigrants, and portraying themselves as hard-working, in contrast to immigrants depending on social welfare.

Second, they emphasise being an "educated person", by which they refer to different moral manners in social interactions and in public spaces (e.g. politeness, hygiene). They often use this strategy to build bridges with native Belgians, thus drawing on popular frustrations with other immigrant groups and/or refugees they claim to share.

Third, they emphasise the civilisational merits of (Middle) Eastern cultures. By drawing attention to, among others, the refinement of their culinary traditions, and cultural norms of hospitality, they distinguish themselves from native Belgians.

In sum, these three boundary-making strategies serve to legitimise their presence and strengthen their own (moral) position vis-à-vis other social groups, including their compatriots, other immigrant groups and native Belgians. Our results highlight the myriad ways in which refugees respond to their subordinate position by using comparative strategies of self and present themselves as equal or even superior on a range of symbolic hierarchies.

VANNIER, PATRICIA* (Université Toulouse Jean Jaurès / LISST-CERS (UMR 5193))

L'aislf Et La Sociologie Francophone

L'AISLF (l'association internationale des sociologues de langue française) a été créée en 1958 par G. Gurvitch et H. Janne dans le projet de constituer un espace d'échanges pour les sociologues utilisant la langue française. Il s'agissait pour les fondateurs de répondre à la domination de la langue anglaise dans les congrès et rencontres internationales et plus particulièrement de s'opposer à l'hégémonie de la sociologie américaine et de son modèle. Dans ce contexte sociologique particulier des années cinquante, l'usage de la langue de travail ne constituait pas seulement un enjeu national mais aussi et surtout un enjeu sociologique.

Une des principales activités de l'AISLF a longtemps été l'organisation de congrès dont la fréquence a permis de dépasser le nombre des congrès de l'AIS (Association Internationale de Sociologie) pourtant née 10 ans plus tôt. Nous verrons qu'ils ont fortement participé à développer l'association et à renforcer son influence (augmentation des adhésions, rayonnement international, positionnement politique) en particulier par rapport à l'AIS.

Les congrès sont des moments et des lieux qui favorisent les échanges scientifiques, confrontent différentes méthodes, différents courants théoriques, et participent ainsi à une internationalisation des savoirs sociologiques. Leurs thèmes reflètent l'état de la discipline à un moment donné marquée par l'hégémonie ou

le déclin de tel courant, ou par l'émergence de nouvelles approches. Les congrès de l'AISLF ont également joué un rôle important dans la promotion d'une sociologie de langue française qui s'exerce au-delà de l'espace francophone. Pourtant, nous verrons que par la nationalité des adhérents, des membres du bureau ou des lieux des congrès, l'AISLF est restée très largement et durablement (jusqu'aux années 1980) dominée politiquement et sociologiquement d'abord par la France, puis par un noyau dur francophone (français, belge, suisse et canadien).

VANNUCHI, LUANDA* (University of Sao Paulo)

São Paulo City Center between Neoliberal Urbanization and the Common

This paper seeks to unveil the recent changes in the effective and symbolic landscapes of São Paulo city center, considering neoliberal urbanization and the common as both opposing and complementary analytical keys.

Following the Occupy movements in the USA, 15M in Spain and the struggles for Taksim Park in Turkey, Brazil has seen its own new cycle of urban struggles emerge over the past years. Committees organized against the processes of accumulation by dispossession undertaken in the making of Brazilian cities for sports mega-events and enormous countryside protests in the so-called June Journeys in 2013 are all expressions of a new wave of activism for the right to the city. In São Paulo, one noticeable aftermath of this wave is the proliferation and the spread of social movements, mobilizations and radical action occupying vacant/public spaces, opposing privatizing and predatory urban projects, prototyping alternative urbanities and reclaiming the city as a common. Contesting neoliberal urbanization and the imperative of rentability, these movements challenge an urban structure dominated by shopping malls and high-rise gated communities, shaped over the past three decades as a highly segregated city of walls.

But the exercise of a collectivity in reshaping urbanization process is soon appropriated by the real-estate capital in a power struggle over the production and consumption of central urban spaces. Ideals behind urban activism are incorporated to discourses and to the promotional material of new housing development, mildly translated as a desire for a "more creative" city "on the human scale". The paper examines new housing development in the city center of Sao Paulo, studios as tiny as 10 square meters targeting educated, creative young adults. I argue that for this new and extremely rentable typology of housing products, the city advertised as a lively stage for expression and contestation is a valuable product.

At the End of a Cycle of Environmental Protest in Latin America? Toward a Research Agenda on Outcomes and Consequences

Since the end of the 1990s, and partially as a consequence of the structural reforms, the commodification of natural resources and the transnationalization of different sectors of the economy, Latin America is going through a cycle of environmental protest. There have been protests against the introduction of genetically modified crops (and the coincidental process of agriculturalization and increasing use of agrochemicals), against different kinds of mining, against different facilities (electric and gas lines, hazardous and non-hazardous waste deposits, cell phone antennas), against risky industries (pulp and paper, petrochemical), against gas and oil extraction (especially, but not limited to, against fracking techniques). Social scientists have analyzed these protests from different perspectives and with different methodologies. In this presentation, we intend to go one step further and explore different approaches to answer some key questions. Is this cycle of environmental protest at an end? What would be the indicators we should look at to make such diagnosis? What could be the reasons behind the demobilization? What are the aspects we should focus on in terms of understanding the outcomes and consequences? From our own empirical research and from a review of the literature, some preliminary observations could be: i) the institutional response has been heterogeneous, thus the demobilization could be a consequence of exhaustion, institutionalization, cooptation, or repression in different territories in the region; ii) specialization of different territories: countries (and jurisdictions within countries) with more/less mining, more/less agriculture, more/less industrial facilities after this period; iii) learning by different social actors; iv) legal and normative changes: higher regulation in certain areas/activities, new public consultation norms and practices, new repressive norms and practices; v) new views on science and technology, and on the role of scientists on technical controversies; vi) process of stigmatization of certain economic activities, and of protest and protesters.

Community Engaged Learning As a Strategy for Increasing Student Knowledge, Skills & Positive Community Impact

Our research on teaching and learning demonstrates that community engaged learning (CEL) is both an active learning pedagogy and an example of a high impact educational practice (HIEP) that can advance course learning outcomes (LOS) and positively impact community organizations with whom students and faculty engage. Using a mixed method approach (i.e. online surveys, telephone interviews, student reflections and community engaged learning products), we heard from community partners and students from sociology courses (4th year and graduate at the University of Guelph) about their CEL experiences. Students reported increased knowledge and skills related to civic engagement and collaboration. Community partners reported positive impacts from their engagement with the students and for receiving quality knowledge mobilization products that they immediately used in their work toward positive social change. We will provide specific examples of how CEL was embedded into the undergraduate and graduate courses via the constructive alignment of course LOs across knowledge, skills and values; teaching and learning tools and strategies that occurred in and outside of the classroom and assessment strategies that included formative and summative opportunities related to both course content and practical skills. We are currently conducting additional research with new community partners and students from multiple disciplines and years of study. Preliminary results from this fall and winter study will be included in our presentation.

Civil Military Relations in Turkey before and after the July 15 Failed Coup Attempt

After 9/11 the armed forces are important actors in many countries and involving in many different roles in addition to security as Turkish military have experienced. This paradigm shift on the rising role of armed forces had an important role in designing "civil-military relations" (CMR). The military Turkey had been the most powerful institution in the country for years. In addition to global impacts, Turkey has been experiencing a paradigm shift in its CMR in recent years and especially after July 15 attempted military coup. Turkey has experienced, for the first time in the Republic's history, a coup attempt by a religious community, known as the Fetullahist Terrorist Organization (FETÖ), who secretly flourished in the cadres of the Turkish Armed Forces (TAF). From Huntington's objective control to Janowitz' subjective control of the military, Turkey's revolutionary civilianization process has implemented reforms one after the other at a breakneck pace in recent months. The paradigm shift has gained speed toward "complete civilianization", but the relationship between civilization and democratization of the military has not been balanced yet. Turkey has overarching dilemma in the post-July 15 setting regarding CMR, whether to *monopolize* or *democratize* CMR for more effective civilian control. That is, on the one hand, the monopolization of CMR, implying transfer of power from the military elites to the elected executive Presidency enables strict civilian control of the military by the elected civilian president; on the other hand, democratization of CMR enables diffusion of power among the elected president, elected government, and parliamentary and civil society actors such as academia, think tanks, and media so as to create a more effective oversight and monitoring system over the military. The damage from this failed coup will continue to put pressure on all Turkish institutions, including the military as well in the near future.

Global, Cool and Omnivore? Transnational Expertise in the Musical Field, the Case of Vice/Noissey

Cultural intermediaries have been a longstanding concern for cultural sociologists. However, transnational connections and influences have been rarely addressed in research on these actors, so that we know little about how processes of globalization and transnationalization influence their work. This paper addresses this gap focusing on the rise of 'transnational expertise' in the popular music field and, more specifically, on the case of *Noissey*; the global brand of music criticism launched by *Vice Magazine* in 2011 (currently available in 14 countries). Focusing on the Italian version of *Noissey*, and drawing on a discourse analysis of reviews and features, the article explores how 'global' music criticism shapes (and is shaped by) the following socio-cultural processes: – the rise of new symbolic and social boundaries in the popular music field, i.e. the ageing of the post-war 'pop-rock' distinction (and its audience), and the growing prominence of both new genres – e.g. indie and rap/hip hop – and new generational and classed distinctions. – the reproduction (or change) of enduring hierarchies between centres – the US, UK and North Europe – and peripheries of music production, and the meaning of these geo-spatial boundaries for critics and their audience. – the reproduction of distinctions between highbrow and lowbrow modes of engagement, and the extent to which *Noissey* promotes new dispositions and repertoires (potentially in line with the allegedly more democratic and participatory character of digital media). – the extent to which gender and race/ethnicity continue to affect processes of cultural evaluation and consecration

in the musical field. Focusing on the Italian context, the paper pays particular attention at how these processes work in a semi-periphery of the popular music field, but also at how local and national concerns feed back into the global brand of *Vice/Noissey*.

VASCONCELOS, ISAMARA* (*Universidade de Brasília*)

The Business Community in the Sector of Public Transport in the City of Brasília, Federal District, Brazil: A Case Study on Public Policies, Urban Mobility and Development.

This paper analyzes the performance of family business groups in the urban public transport sector, through the granting of service by the State, and the impacts on the development of the urban transport system based on the concept of mobility in the city of Brasília, Distrito Federal, Brazil. The first part of this research, based on a case study in progress on two of the three main business groups families of urban public transportation, it is observed that, over a period of 40 years, the public policy of transport in the Capital favored the consolidation of family business power of these groups, given the high degree of interference of the business family interests on the *decision-making* process, whereas it entailed low regulation and low bureaucratic autonomy in the controlling, monitoring and evaluation of politics. Such aspects contributed to the non-consolidation of public transport model as a facilitator of local development, governed by standards of quality, efficiency and low-rates, as well as the lack of effective integration of service and modals and the concept of urban mobility over the history of public transport in the Capital, signaling, thereby, the urban transport service in the city of Brasília among one of the most inefficient, expensive and of poor quality in the Country.

Alternatives to the Academic Violence: The Body of the Researcher in the Neoeextractivist WORLD

The movement of re-allocation of the human body, which characterises our current age of migration, is directly linked with the huge scale of the extractivist activities that, in turn, is connected with the non-renewable conception. The extractivism started to be structured at the Age of Discovery (Acosta, 2016), better known by critical theorists as Age of Concealment (Dilger et al., 2016), and it is worked, here, as any activity that remove large quantities of natural resources beyond the minerals or oil, passing by farming, by fishing, going to the own human body (direct and indirect workforce in slavery condition) as part of natural resource. The perpetuity of the extraction is a rule of capitalist system; of which we are part and in which the mode of production/distribution/consume are associated with the imaginaries of accumulation. The alternatives to the development, and not alternatives development, start by the movement of rethinking its own dominant notion and breaking the old hierarchy between development and underdevelopment. These alternatives search recognize and recover knowledges and worldviews that exist in the different forms of life – rural, urban, tribal, etc., rethinking the dominant notions of poverty and richness, as well as of wisdom – they are transcultural and transdisciplinary movements (D'Ambrosio, 2002). The body of researcher, the role of our production, reproduction, and contradictions, must be renewable through our situationality (Freire, 1970.), facing the disavowal mechanism (Žižek, 2006) developed behind our researches – which inhibiting us from confronting the truth about why are we engaged in research; for whom are we doing it.

The Paradoxical Outcomes of Gender Self-Determination Laws Under Neoliberalism

The State and legal apparatuses are certainly one of the main locations for the construction and legitimization of (asymmetric) gender binaries, as the registry of 'legal sex', inscribed in one's legal identity and with all kinds of differential impacts on citizenship, is paramount. The diverse reality (and increased visibility and recognition) of non-binary and trans lives and claims has already had an impact on legal gender regimes. This is quite evident in the profound changes that have open up possibilities for legitimized legal gender transitions, or even indeterminate legal gender, and for the legal institutionalization of the 'non-concordance' or even disconnection between 'sex' (the apparent truth of genital semblance) and 'gender' (as public identity). Drawing on a comparative analysis (ERC funded project Transrights), we will try to address some of the overall and paradoxical outcomes of legal changes in 'Gender Identity Laws', in the direction of individual gender self-determination, that have been or are occurring worldwide (Argentina, Denmark, Ireland, Malta, Colombia, Norway, Bolivia, Ecuador, Belgium

and Portugal). We will contend that, notwithstanding the beneficial outcomes of such legal changes for transpeople, in most cases the new laws not only tend to be quite disconnected from the material concretization of rights (other than administrative entitlements), but also that we are witnessing a process of categorical construction that tends to institutionalize a third position (for trans or gender non-conformity) within persisting gender binaries. Furthermore, we will also argue that such changes in legal recognition are often accompanied by the dismantling or privatization of support institutions and provisions for transpeople. As such we believe that the principles of individual gender self-determination are being used by neoliberal capitalist states to not only dismantle the welfare state but also to potentially conceal collective and structural forms of (gender) inequality through the screen of a hiper-individualization.

RC32-575.3

VASCONCELOS, PEDRO* (*ISCTE-IUL University Institute of Lisbon*)

'What's in a Name?' on the Category Travesti

Travesti is a category used in the Portuguese language (as in French and Spanish) to designate female trans sex-workers. Drawing on ethnographic work carried out in Lisbon (Portugal) with trans street prostitutes (Portuguese and Brazilian), we aim to deconstruct views that tend to homogenize *travestis* as a group of female trans individuals who cherish their 'masculinity' (the penis) while pursuing typical standards of sexualized feminine beauty and bodily attractiveness achieved through cosmetic surgery and silicone injections. Contrary to most academic writings, viewing *travestis* as a category and identity can be problematic. Rather, though united by sex work and the practices entailed, lives and subjectivities are plural, ranging from MtF transsexuals and transgender women to cross-dressed gay men, among other forms of self-identification. Against reification and exoticization, the category *travesti* (as others) can be a misnomer, hiding the complex entanglements between the diversity found at the intersection of a vast number of factors and the common gendered position in the sex labour market. *Travesti* can be often taken as just a subjectivist identity when in reality it is more a descriptor of an objective position, which encompasses an enormous diversity. It is not just an identity, not even for the sex workers who tend, in various conjugations, to resort to different terminologies when describing themselves and their 'job'. As we will show, through the materials collected within the ERC funded project Transrights, the discourse of travestility is far from straightforward identitarian coherence. Rather, a material approach is needed.

Youth and New Technologies: Problems of Developing Innovations in Modern Russia

The result of the technologizing of various spheres of social life is the formation of a new environment, transformation of knowledge in financial, economic, managerial and political innovations, as well as reformation of economic values and economic culture of the population. New information technologies affect all aspects of society in an integrated manner, especially the behavior of youth. Analysis of foreign and Russian experience of the study of innovation activity has shown that the value has been attached to the process of introduction of changes.

A sociological study conducted in the framework of the project suggests that it is necessary to take into account the matrix of values of the Russian society in order to stimulate the studied processes. Due to a number of causes the economic socialization of youth goes with varying degrees of success, as in 1990-2000s it was mostly spontaneous and only from 2010-ies begin to appear institutions whose objectives is the development of innovative and economic activity of young people. Economic socialization of youth, on the one hand, is successful, as the majority of young people get experience in the period of study in educational institutions and is focused on the acquisition of new knowledge, on the other hand, it is not successful, as there is being formed a large layer of young people, ready for labor migration and emigration to economically highly developed countries. During the study of the space of reproduction of labour migration as a form of socio-economic activity, has been studied the economic value of labor migrants; strategies of adapting to a new socio-cultural space have been showed. Thus, labour migration, on the one hand, ensures the formation of a communicative space and is characterized by "hypermobility"; on the other hand, it contributes to the growth of social tension.

"#Russiansdidit": Drama of Social Problem in Internet Memes

The global Internet communication system generates new media that can transfer the information, overcoming territorial restrictions. This report is devoted

to one of them - Internet memes. They are both global and specific: the same meme can be used in different countries, but have their own semantic features.

The authors consider Internet memes as a way of visualizing significant social information and demonstrating the focus of interest of the Internet community, as a way of constructing new links and actual values. Internet memes draw attention to a new perspective of perception, to the presence of a certain "second bottom" of reality, which propagandized by mass media. By the example of Internet memes "#RussiansDidit" and "russian hackers" the authors shows how the danger of Russian hackers is being transformed. These Internet memes are interpreted in the context of the concept of public arenas (Hilgartner S., Bosk Ch. L.), which considers the social problem as a result of the struggle for a resource of public attention. The gain in the competitive struggle of meanings is caused by such factors as the need for drama and novelty, the danger of saturation, cultural accents and political predilections. In this context, it is shown how, through structural transformations of the Internet meme (variations of correlations of the core, periphery and background), the drama of the analyzed social problem unfolds and the initial socio-cultural assessments are reversed. The recognizable sociocultural code of an Internet meme influences the context in which the entire image is understood. The authors pay special attention to the similarities and differences in the interpretations of the memes "#RussiansDidit" and "russian hackers" in the Internet spaces of the US and Russia.

Understanding Vulnerability from a Social-Ecological System Perspective to Enhance Resilience for Ecosystem-Based Adaptation and Disaster Risk Reduction: Finding a Path of Acceptance

Historically communities across the world have had to deal with environmental and climatic changes. Over centuries, people have adjusted to changing conditions and learned to do so by modifying infrastructure, landscapes or their behaviour. Recent population growth, sedentary lifestyles, and changes in socioeconomic activities have reduced the flexibility of communities to changing conditions. This is especially true considering the rapid changes due to anthropogenic pressures on ecosystems. Extreme weather events have exacerbated the challenges of adapting to new conditions and have increased the level of vulnerabilities of communities. Community vulnerability is difficult to understand due to the complexity that arises from the interplay between political, economic, social, and cultural factors, as well as the biophysical environment. These interactions affect governance, equity, power and poverty all of which may increase community vulnerability. Assessing vulnerability is a fundamental step to defining solutions that enhance community resilience and capacity to adapt to environmental change. A social-ecological system assessment is an approach to enhancing community resilience that integrates ecosystem-based adaptation (EbA) and ecosystem risk reduction (Eco-DRR) to offer a valuable yet under-utilized approach for climate change adaptation that complements traditional actions such as infrastructure development. EbA uses biodiversity and ecosystem services as part of an overall adaptation strategy to help communities adapt to climate change at local, national, regional or global levels. EbA with Eco-DRR represent a promising approach to integrate issues such as vulnerability, human wellbeing, ecosystem health and resilience using a social-ecological system assessment frame to provide a more holistic view. Appropriately designed these initiatives can also contribute to climate change mitigation by reducing emissions from ecosystem loss and degradation, and enhancing carbon sequestration. In this talk, we use two case studies to examine how use of this integrated framework, enables communities to move effectively towards a more sustainable future.

Moving: The Transformation of the Organization of Residential Relocation during the 20th Century

Our presentation explores women's experiences of residential relocation (moving) and the transformation of the social organization of "moving work" within the United States. We use the oral histories of older women and historical archival materials to describe the coordinative work women do with others to move and to explicate the changing relations within the transportation/housing enterprises. Guided by Smith's mode of inquiry, institutional ethnography, we demonstrate the ways in which relocation activities are organized and have been restructured through the coordinating efforts of families, employers, agents within the household goods moving and storage industry, and the work of other transportation and public officials over the 20th century.

RC14-265.9VAZQUEZ, EDGAR* (*Universidad de Guanajuato*)GUTIÉRREZ, CLAUDIA (*Universidad de Guanajuato*)*La Gestión Universitaria En La Implementación De Un Programa Integral De Seguridad Institucional En Una Institución De Educación Superior.*

El problema de la violencia en México se ha intensificado en los recientes años, dicha problemática, ha puesto el interés en que gobiernos, empresas, universidades y sociedad en general, desarrollen e implementen estrategias a fin de hacerle frente a este gran y desafortunado problema, que altera la convivencia y la paz social. El presente artículo tiene como propósito analizar la implementación de un programa integral de seguridad en una institución de educación superior mexicana, dicho programa forma parte de la estrategia de la alta dirección a fin de garantizar la integridad física, psicológica o material de los integrantes de la institución educativa, dentro de los recintos universitarios.

En un primer apartado, se presenta el contexto de la problemática de la seguridad en México con datos poco alentadores. Posteriormente se aborda el tema de la gestión universitaria y la responsabilidad que se tiene para abordar el problema de seguridad no solo como tema objeto de estudio, sino a partir de la realización de acciones en las que participan la comunidad universitaria. En seguida se describe la conformación del programa, los ejes que lo integran entre los cuales se destacan: Prevención, Vinculación y Participación de la Comunidad Universitaria, Desarrollo Estratégico Institucional, Funcionamiento de la Seguridad Interna y Coordinación Operativa, Atención de Contingencias y Protocolos de atención. Así mismo, se destacan algunas de las acciones que se han emprendido a partir de la implementación del programa, entre las cuales se destacan el establecimiento de un acuerdo de Seguridad y Prevención en el Entorno Universitario. El método utilizado para la realización del estudio es cualitativo, utilizando como instrumentos metodológico el análisis documental y las entrevistas principalmente. Se desea que el presente estudio sea un referente para otras instituciones y organizaciones, que sea utilizado como instrumento para enfrentar el problema de la seguridad.

RC34-622.4VAZQUEZ, LUZ MARIA* (*York University*)NAZILLA KHANLOU, NAZILLA (*York University*)*Promoting Inclusive Anti-Oppressive Research Practices: Community-Based Research with Young Adults with Developmental Disabilities*

Background: Young Adults with Developmental Disabilities (YADD) face systemic exclusion and discrimination across multiple domains of society, including meaningful participation in research studies. **Objective:** Drawing from three community-based studies, we present a Model of Inclusion in Community-based Studies with Persons with Developmental Disabilities. Our model applies anti-oppressive and inclusive approaches and discusses strategies that researchers may apply to promote meaningful inclusion of YADD and their families in research. **Methods:** The studies were conducted between 2012 and 2017 (Project 1: 57 participants, Project 2: 28 participants, and Project 3: 85 participants); qualitative interviews were conducted with YADD, their caregivers and service providers. **Approach:** We applied flexible research strategies to accommodate and include YADD and their families, such as inviting YADD and parents of children with developmental disabilities/ YADD to participate on the projects' Advisory Committees; adapting recruitment and fieldwork instruments for YADD (e.g. flexible options for interview location and formats according to their needs, adapting interview guides), accommodating caregivers to be present during the interviews with YADD when required; inviting YADD and families with children/ YADD with DDs to provide feedback on knowledge transfer and dissemination activities, and participate in them (e.g. as co-authors and co-presenters in knowledge transfer activities). **Discussion:** Research has historically overlooked, diminished, and excluded the voices of people with disabilities. As researchers we need to be critical of the research strategies we apply in research with marginalized populations and engage in reflexivity. We need to ask ourselves whether our studies are empowering the populations we are studying or reproducing the social exclusion of persons with disabilities as part of the research process itself.

WG01-937.1VDOVICHENKO, LARISSA* (*Russian State University for Humanities*)*Monitoring of Foreign-Control*

My current presentation is on the use of sociological monitoring as one of the means to ensure control of the "global borderlands". Monitoring of these Zones is a way of introducing sociology into practice. The issue of protecting objects located on the border of states affects not only the interests of these states but also foreigners temporarily staying in their territory. It is an important component

of international interactions at the global and local levels. Each country uses its methods of control over the border zones. So for example, I was in the US in a special center near Washington, which controls the entry of various types of transport: aircraft, ships, cars, etc. This requires a good electronic database of information about all those intending to enter the US territory, as well as certain principles (methods) for separating those who enter from the streams and may pose a threat to US citizens, institutions, and foreigners temporarily staying in this territory. The current US President, Trump, has embarked on the path of simpler restrictions on entry into the United States, from certain, primarily Islamic, states. Are these restrictions a necessary and sufficient filter to cut off dangerous personalities, or are other restrictions necessary? I believe that sociologists can contribute to the improvement of the principles of filtering those entering the territory, as well as protecting border zones of many foreign-local interactions. The report is devoted to the study of this important topic based on existing experience in different countries, as well as sociological recommendations for solving this problem, especially in the context of combating terrorism. It appeals to the analytic work before the Foreign-Control and then on the study of its implementation. This new approach to advisory work in the field of the Foreign-Control becomes a tool of assessing new laws.

RC36-647.1VDOVICHENKO, LARISSA* (*Russian State University for Humanities*)*Roots of Overcoming Sociology's Alienation from the Pressing Problems of Politics*

My current presentation is on the use of sociological consulting in political sphere as one of the ways to overcome the alienation of sociology from empirical practice. Sociological monitoring of legislation is a mean of is a way of introducing political consulting into practice. It forms an integral part of law drafting, and allows to make transparent its elaboration, adoption and implementation. Its goal is to synchronize legislative activities at the national and local levels of the country. Sociologists, who play the role of political consultants, based on the results of such monitoring prepare their recommendations whether to adopt a law or to amend it, taking into account the current political situation and its changes in case of adoption of this law. This approach to lawmaking becomes vital for improving the wording and implementation of laws. It helps to consolidate efforts by state bodies and public institutions in the adoption of legislative acts most relevant to the needs of society. Political consulting based on sociological monitoring gives a good example of using new interdisciplinary technology of overcoming sociology's alienation from the legislative process as the most important part of politics. The practice of using monitoring legislation is characteristic not only for some Scandinavian countries (for example, Sweden), but also became applicable in the Russian Federation Council, where annual reports on the results of such monitoring were issued in the zero years of the 21st century. Monitoring legislation encourages the development of special practice of political consulting different from ordinary work of state bureaucracy. It appeals to the analytic work before the law creation and then on the study of its elaboration and implementation. This new approach to advisory work in the field of legislation becomes a tool of assessing new laws, comparing them with social environment and general policy framework.

RC55-897.5VEENHOVEN, RUUT* (*Erasmus University Rotterdam*)*Co-Development of Research on Happiness and Other Social Indicators*

Social Indicators Research covers many topics, which each have their own history. Happiness research is one of these included topics. Longstanding interest in happiness revived since the 1960s together with the emergence of the social indicator movement. Happiness became a prominent issue in the movement and the movement has fostered the development of happiness research in several ways. Synergies among with other topics are discussed.

RC55-898.3VEENHOVEN, RUUT* (*Erasmus University Rotterdam*)BURGER, MARTIJN (*Erasmus University Rotterdam*)*Findings Archive: New Technique for Facilitating Research Synthesis*

Social scientists are producing an ever growing stream of research findings, which is ever more difficult to oversee. As a result, capitalization on earlier investment declines and accumulation of knowledge stagnates. This situation calls for more research synthesis and interest in synthetic techniques is on the rise. To date attention has been focused on techniques for meta-analysis, with little attention paid to the preliminary step of bringing the available research findings together. What we need is: 1) techniques for describing research findings in a comparable way 2) a system for storing such descriptions in an easily accessible

archive, 3) to which research findings can be added on a continuous basis. The World Database of Happiness is an example of such a tool. The archive is tailored to meet the requirements of assembling research findings on happiness; both distributional findings (how happy people are) and correlational findings (what things go together with happiness). With its focus on 'findings' the system differs from data-archives that store 'investigations' and from bibliographies that store 'publications'. As yet there is no established term to describe this tool for research synthesis. I call it a 'focused findings archive'. This technique has gradually developed since its first version in the 1980s. In this session I present the latest version, which involves a renewed website that allows better searches in this ever growing collection of research findings.

OLIVEIRA, RENAN THEODORO DE (*Universidade de São Paulo (USP)*)

The Impact of Victimization over Citizen-Police Relationships: The Case of São Paulo

In recent years, the study of youth victimization and deviation became more frequent. In Brazil, studies have shown that young people are the main group affected by serious violence (WASELFSZ, 2014; 2015), the main victims of police violence (SINHORETTO, 2014), and are exposed to multiple forms of victimization (CARDIA, 2010). The exposure to violence has been proved to affect youth development (OSOFSKY, 1999), causing psychological traumas. National researches in Brazil (CARDIA, 2003; 2010) show that people exposed to violence during youth have more chances to become victims in the future, and are more likely to support the use of violence to solve conflicts.

This paper aims to explore another kind of impact that exposure to violence may have over youth: their relationship with legal authorities, such as police. Many scholars have highlighted the role that contact with police has over the attitudes of citizens towards authorities and laws and how these attitudes may influence youth's future legal behavior (TYLER et al., 2014). We argue that victimization also has an important role in shaping these attitudes and legal behaviors.

From a sample of 800 early-adolescents born in 2005, studying and living in the City of São Paulo, Brazil, we have found that those who have seen people selling drugs on the street, seen armed people walking in the neighborhood, and heard gunshots are less likely to trust in the police. In addition, those who declare have experienced more of these situations also reported more rule-violating behaviors.

Results suggest that victimization may undermine youth's relationship with police and negatively shape their legal behavior.

RC09-195.1

VELASCO, KRISTOPHER* (*The University of Texas at Austin*)

A Growing Queer Divide: The Divergence between Transnational Advocacy Networks and Foreign Aid in Diffusing LGBT Policies

In recent years, there have been remarkable advancements across the globe when it comes to policies concerning lesbian, gay, bisexual, and transgender (LGBT) communities. States are increasingly adopting same-sex marriage laws, decriminalizing homosexuality, and instituting anti-discrimination measures. International organizations like the United Nations, European Union, Organization of American States, and the World Bank have also outlined their support for LGBT rights. Consequently, development agencies have begun factoring in the treatment of these communities into aid conditionality decisions. Meanwhile, the world has seen hardened polarization on this topic. World society scholars would argue that the diffusion of policies may be attributable to growing norms and transnational advocacy networks, while realists would contend that material incentives, such as foreign aid, could compel states to move in a more progressive direction. To assess both the diffusion of such policies and the mounting divide amongst states, I perform a series of cross-sectional time-series models using data from 1991-2016. For the dependent measure, I develop a 13-point LGBT policy index scale. I predict this index value by creating a novel measure of global LGBT pressure. Through interacting this term with state embeddedness within the world society, via prestige scores from a social network analysis, and four different measures of foreign aid, results demonstrate that both factors moderate the effect global norms are having. States more embedded within transnational advocacy networks respond positively to global pressure and enact more policy reforms. States connected to the broader global system through foreign aid dollars, meanwhile, negatively respond to the growing expectations on how to treat sexual minorities, hardening their opposition. Since states centralized within the network are generally not those receiving aid, how these two groups are responding to global norms can help explain both the diffusion, but also the growing divide on how LGBT communities are governed.

Making Sense of the 2016 San Andres Water Crisis, a Colombian Caribbean Island

In October 2015, the Colombian Institute of Hydrology, Meteorology and Environmental Studies -IDEAM declared that the El Niño Phenomenon had reached severe conditions, and later, on July 13, 2016, reported conditions of neutrality. One of the affected areas was San Andres, a drought prone Colombian Caribbean island. On April 2, 2016, there were 11 road protests spread throughout the south-center of the island where the Raizales, an ethnic-minority group, and people from poor neighborhoods burned tires, blocked streets, and held up signs saying "We need water." That was the official beginning of the water crisis, which had by then affected 14,000 people. On April 15, the local Government, for the first time in its history, declared a State of Public Calamity, attributing the causes of the lack of water to the Niño phenomenon. Although the government established the Niño phenomenon as the only trigger, the ways in which the community framed and understood the water crisis were omitted. Acknowledging the importance of the community voice, this research analyzes the way the San Andres community and institutions made sense of the causes of the water crisis and the factors that made this crisis unique from others. 34 semi-structured interviews were conducted in August 2016 with a variety of stakeholders. The results show officials were more inclined to point out three main causes: 1) The Niño phenomenon, 2) overpopulation, and 3) lack of technology and water storage capacity. On the community side, people mainly pointed out four causes: 1) overpopulation and mass tourism, 2) inadequacy and inequity in the production and distribution of the water resource, 3) degradation of wetlands, and 4) drought. This study helps to expose and understand the complexity of the San Andres water crisis and ultimately contributes to the prevention of repeated or more severe crises.

VELASTEGUI BAHAMONDE, NAPOLEON* (*Colegio de Sociólogos del Guayas*)

Marx in Latin America: Economy, Politics and Citizen Participation in Ecuador

Marx in Latin America: Economy, Politics and Citizen Participation in Ecuador

Author: Napoleón Velástegui Bahamonde.

E-mail: nvelasteguib@gmail.com

Keywords: Economy, Society, Property Relations, Citizen Participation, State.

General objective

To analyze, from the economy and the politics, the property structure in Ecuador, its corresponding social relations of production and the achievements of the citizen participation.

Specific objectives

- Examine the contradictions in the socioeconomic and property structure.
- Systematize the approaches and results of the "socialism of the twenty-first century" developed.
- Analyze the level of Citizen Participation in relation to the application of theoretical models along with the social praxis of the Citizen Revolution.

Theoretical framework

Capital, a relationship. The Market, a visibly unequal hand.

"Capital" is a relation of antagonistic classes at a particular point in history.

"Both juridical relations and forms of State cannot be understood by themselves or by the intended general evolution of the human spirit, but rather have their roots in the material conditions of life (civil society)"

"The anatomy of civil society must be sought in political economy."

He pointed out that: "The Commune has demonstrated, above all, that 'the working class cannot simply be limited to taking possession of the state machine as it is and using it for its own purposes'"

Results

- Systematization of variables and indicators of the contradictions of the Ecuadorian socio-economic structure and its ownership structure.
- Theory and practice of XXI Century Socialism in Ecuador 2007-2017.
- Conceptualization of the processes of "citizen participation" under the approaches and achievements of "Socialism of S. XXI" in Ecuador and the role of the State.

VELASTEGUI BAHAMONDE, NAPOLEON* (*Colegio de Sociólogos del Guayas*)

Technology and Society: Cultural Interaction for the Use of Social Networks, and Its Impacts in the Development of a Democratic Culture in Ecuador.

TECHNOLOGY AND SOCIETY: CULTURAL INTERACTION FOR THE USE OF SOCIAL NETWORKS, AND ITS IMPACTS IN THE DEVELOPMENT OF A DEMOCRATIC CULTURE IN ECUADOR.

Author: Napoleón Velástegui Bahamonde.

E-mail: nvelasteguib@gmail.com

Keywords: Social Networks, Technology, Society, Democracy.

General objective

Analyze the interrelation between technological changes, resulting from political changes in the Ecuadorian state and the development of a new national culture whose quality level is expressed, among other channels, through social networks, particularly in electoral processes.

Specific objectives

- Examine the intersection of Technology and Society in a process of social change at the local level, with contemporary methodologies.
- Systematize the results of technological impacts on social processes in a period of change, specifically in electoral processes, and their feedback.
- Analyze comparatively, technological impacts of social networks in social processes of intense social change, at a global level.

Theoretical framework

Marx pointed out that "Society is not merely an aggregate of individuals; but, "it is the sum of the relations that individuals hold together." Karl Marx, *Die Grundrisse* (1857).

On the other hand, the contemporary methodology of the "Analysis of Social Networks", ARS, has very advanced applications.

Why sociologists should study Social Networks? Ofelia Cervantes responds: "Because it is the semantics of the relationship alluded to, reciprocal to the" doing "of people and their" saying."

Results

Ecuador is going through a period of consolidation as a democratic nation. This is not just a semantic problem. It is a semantics of life, regarding the content of the communication and culture that we establish.

Sociology must take in its hands the Analysis of Social Networks, ARS, to contribute to the development of civilized forms of life with transformations that eradicate inequality, through mechanisms of lower social cost.

Commitment to Moral and Religious Principles Among British Muslim Women

The autonomy and freedom of women – in the sense of what they want to do or to value– is related to "the capability approach", introduced by Amartya Sen in 1980s, as a conceptual framework to measure well-being in all aspects of life. Taking this approach, Muslim women's involvement in grassroots organisations should be given a greater value.

Muslim women in the UK are considered to have a less autonomous status than their counterparts in terms of 'standard outcome assessment' based on visibility in the labour market, as well as their 'material means to well-being'. This is often viewed as the indication of gender inequality in Muslim communities.

However, there is a growing commitment among Muslim women to involve in social and cultural activities and help community as a social obligation and a Positive commitment to their faith. My interviews with Muslim women, particularly young well educated, reflect their syncretic identities and inclination to integrate into the British society. They are more capable of claiming various simultaneous identities and more open to engage in inter-cultural discussions. They often self-identify themselves as British Muslims, embrace cultural diversity and balance their faith with the demands of modern life and British values.

They often use the language of rights, especially rights to observe and express their religious values. They enter into a dialogue and communication with wider society, which pave the way for a understanding about Islam and Muslims and their acceptance and integration in British society.

Women in my research were mostly involved in community value-oriented activities, either as their main activity, or in combination with their formal employment. Therefore, at personal level they get self-satisfaction and fulfilment, and at social level, they contribute to the multicultural aspects of British society, social cohesion and cohesive communities through cross-cultural understanding and collaboration.

VELAZQUEZ, ROBERTO* (*Columbia University*)

The Art of Civilization: Modernization, Modernism, and Taste Migration in Latin America (1961-1973).

Esta ponencia analiza la dimensión política de los esfuerzos culturales desarrollados por Estado Unidos en América Latina durante la temprana Guerra Fría, específicamente en lo referido a la exportación de un modelo social (modernización) en el plano de las artes visuales (modernismo) entre 1961 y 1973. Desde un punto de vista empírico, la propuesta rastrea los canales de colaboración transnacionales creados por instituciones diplomáticas para la

circulación de objetos, modelos museográficos, e imaginarios sociales en el periodo a explorar.

A través de una revisión sociológica de las redes gubernamentales, conexiones interpersonales, y medios de comunicación asociados a una serie de 12 exhibiciones viajeras coordinadas por la OEA, el Metropolitan Museum of Art in New York y el Center for Inte-American Cultural Relations, la ponencia aborda la emergencia de un *ethos* cultural vinculado con la Alianza por el Progreso, el cual tuvo fuertes implicancias estratégicas en la configuración de la esfera social en el arte visual de Guerra Fría. Principalmente, el análisis de fuentes primarias provenientes de ocho fondos documentales de cuatro países (US, Chile, Argentina y Brasil) revela la existencia de un programa modernizador y desarrollista asociado a la exportación del modernismo europeo curado por Estados Unidos, en un momento crítico dentro de los planes de contención del comunismo desarrollados por Lyndon B. Johnson (1963-1969) tras el triunfo de Fidel Castro (1961) y el auge de la teoría de la dependencia en las ciencias sociales (1962).

Así, este trabajo busca contribuir a la aún escasa historiografía sociológica de la dimensión política de la cultura en disputa durante el periodo, la cual ha sido opacada por las narrativas teleológicas que ven en los 1970s, con la caída de Salvador Allende y el quiebre de la democracia en Chile, el momento fundacional de la relación entre arte, política, e internacionalismo.

Language Shift in Small Communities. an Analysis of Bilingual Language Usage in Family

Languages of minority groups are decreasing all over the world. Successful language maintenance has to be long-term language planning in the community where minority languages are spoken.

For the most adequate actions in language planning we have to know how to evaluate the sociolinguistic situation in the relevant bilingual community. In a former presentation we presented a way based on the framework of "ecology of pressures" (Terborg, 2006) to analyze and explain language shift in small communities of minority groups in a given area considering language knowledge in actual speakers. We support our examples on several researches of language shift of indigenous languages in Mexico. The framework includes the concept "utmost common routine" that may be partly calculated by a quantitative corpus obtained by a questionnaire applied to a representative population. The data of the indigenous language have been compared with the data of Spanish, the official language spoken in Mexico, to determinate which language is the strongest one among a given age group of the population. Now we want to extend our analysis on bilingual language usage in bilingual families.

Terborg, R. (2006) La 'ecología de presiones' en el desplazamiento de las lenguas indígenas por el español. Presentación de un modelo en *Forum: Qualitative Social Research [On-line journal]*, 7 (4), Art. 39. Disponible en: <http://www.qualitative-research.net/fqs-texte/4-06/06-4-39-s.htm>

Civil Identity in Crimea: Between Consensus and Conflict.

The problem of constructing and developing of civil identity is very actual for transforming political systems and for societies with confused identity. Crimea nowadays has to change and correct not only legislature and administrative system, but also to solve some socio-cultural problems which should provide integration with Russian society. In this context we pay attention to historical consciousness and historical memory, which is considered as one of the grounds of civil state identity.

Our paper is based on the data of sociological research of 2017 years which supposed different methods. We analyze different canals and different social agents which transmit main cultural values and historical memories which determine national and civil identity. Crimea identity is determined mainly by memory of soviet period which is estimate by people as "lost paradise". During period of belonging to Ukraine Republic all of Soviet symbols (not Russian ones) were used in the latent fight against ukrainization. We offer to discuss rating of actual symbols of civil identity which are used intensively in Crimea and to analyze which of them connect with Russian, Soviet and post-Soviet (Ukrainian) and modern periods.

We focus on content of historical consciousness which can unite regional community and some conflict factors which divide it. During all post-Soviet period in Crimea pro-russian orientations were dominating and all these sentiments were partly protest one which created deep conflict with Ukrainian political and public institutes. Family remains the main factor of broadcasting ideas of "Russian World" and we didn't notice significant intergenerational differences.

As for constructing of identity we can conclude that power choose the different victories of Russia as the base for actual civil identity which gives as opportunity to speak about militarization of consciousness particularly in Crimea and in Russia in general.

Quality of Life in the Context of Socio-Cultural Developments of Small and Medium Towns in Russia.

Small and medium towns are the ground of structure of urban settlement in Russia. There are more than 27 mln. of inhabitants in 709 small towns and 163 medium towns. We suppose to find out main tendencies in cooperation between local authorities, local communities and local NGO which promote increasing of Quality of life. Our paper is based on complex sociological research with different methods and we analyzed as well organizational models of LG, socio-economic indicators and subjective characteristics. Geography of the research included 10 small and 16 medium towns from all federal districts of Russia.

Modern development of Russian small towns reflect common irregular unequal development of different territories in the country. Polulation of small towns has been reducing, efforts of local authorities are not effective.

In order to estimate level and quality of life in the small and medium towns we analysed the following indicators: life time and birth rate; level of unemployment and average salary and pension; quantity of people with income lower than living wage; social satisfaction ext.

We also pointed out main social problems common for all of towns as decrease of population and aging, lack of system policy of supporting of local enterprise and business, bad quality of roads, a lot of ramshackle buildings and old engineering infrastructure, bad health care and lack of infant schools.

VELITCHKOVA, ANA* (*University of Mississippi*)

The Global Citizenship Regime As a Caste System

This work extends Weber's discussion of social status, and of caste in particular, to the global level. I identify the existence of a global caste system organized around citizenship and maintained by nation-states through a regime of laws and cultural practices. Comparably to smaller-scale caste systems, this global caste system is characterized by a high degree of social closure assigning social positions—citizenships—principally by birth. Citizenship-based castes display high levels of inequality in terms of the rights to life, liberty, and pursuit of happiness at the least. Underprivileged citizenship castes experience legally enforced territorial segregation with limited access to the territories of privileged citizenship castes, which exposes them to high risks of suffering and of dying prematurely. Groups of persons not fitting in its legal framework (e.g. "stateless" and "undocumented"/"illegal" persons) experience some of the highest levels of exclusion from the global citizenship caste system. The paper showcases the continuing importance of nation-states in a globalizing world. The nation-state is a primary institution affecting persons' life chances by holding a monopoly on bestowing privileged or underprivileged social statuses under the banner of citizenship. Furthermore, nation-states coordinate the legal and cultural mechanisms through which citizenship and its differentiated status outcomes are enforced. Citizenship associated with some countries—the most developed ones—is a form of privilege. It is the equivalent of a new form of aristocracy, a global aristocracy, that confers better chances to enjoy life, liberty, and the pursuit of happiness. Citizenship associated with other countries is a form of disadvantage. This kind of citizenship decreases people's chances to be free—e.g. to move across borders—and to live long, healthy, and happy lives. If persons migrate to counter their disadvantage, they face years of limbo that most likely will not result in acquiring a privileged citizenship status.

Securing Canada Against Dangerous Foreign Criminals? Analyzing the Relationship between Severity of Sentence and Deportation on Grounds of Criminality

In June 2013, the Canadian government enacted the *Faster Removal of Foreign Criminals Act*, which amended the *Immigration and Refugee Protection Act* by including "a number of provisions for strengthening the safety and security of Canadians". Among other things, this Act limited the review mechanisms for foreigners who are inadmissible on grounds of serious criminality and by doing this it aims to accelerate the execution of deportation orders. This paper discusses the crime-immigration nexus and the increasing importance of administrative forms of social control in the penal field. More particularly I will focus on the use of removal orders (deportations) on grounds of criminality in Canada, by

analyzing procedural differences between criminal and immigration regimes and the relationship between severity of sentence and deportation. Based on an analysis of minutes and decisions of deportation hearings between 2014 and 2015, I will argue that the way in which criminality is framed in immigration law differs drastically from criminal law and that deportation is the outcome regardless of the severity of sentences imposed to foreigners. I will conclude that the Canadian immigration regime does not need to rely on criminal law in order to deport someone on grounds of criminality. It does so while ignoring the procedural safeguards and sentencing principles related to criminal law

The Evaluation of Public Services As an Instrument of Accountability. the Case of Ibge.

New ways of information diffusion are creating new ways of social participation. Societies require today transparent and efficient accountability processes from the public administration. The internal governance procedures of each government body must be increasingly efficient and transparent.

Official Statistics Institutes are central institutions in this new scenario. The information they produce reveals the social and economic reality of each nation and therefore becomes increasingly relevant to a grounded analysis of public administration performance. IBGE (Brazilian Institute of Geography and Statistics) is Brazil's official statistics institute and has the difficult task of maintaining its credibility in a scenario of social outbreak caused by constant corruption scandals that undermine the population's confidence in public institutions. IBGE has so far managed to maintain its good technical reputation and is able to position itself as one of the most respected official statistics institutions in the world. However, in terms of governance and management transparency, the Institute is still taking its first steps and needs new administrative standards and evaluation processes in order to respond the new demands of society in this area.

This paper describes an initiative of the Institute to create new evaluation procedures in order to improve its accountability capacity. A pilot study in IBGE seeks to develop an internal evaluation model that combines quantitative and qualitative techniques to verify the Institute's performance in terms of relevance, effectiveness and efficiency. The project combines the quantitative techniques of the DEA (Data Envelopment Analysis) with the qualitative ones of the EVAM Model (Evaluation, Learning and Improvement) to develop an internal evaluation model that helps the institute to properly address the social demands of better internal governance and greater managerial transparency.

Urban Revitalization in Central Areas and Gentrification: The Cases of Brazilian Large Cities and of the Sapucaí Street, in Belo Horizonte, Minas Gerais

This paper aims to understand the relationship between gentrification and urban policies in central areas of large cities. The cases of Bairro Antigo in Recife, the harbor area of Rio de Janeiro, Pelourinho in Salvador, the Luz region in São Paulo and Belo Horizonte's downtown are starting points for discussing urban revitalization as one of the main causes for gentrification through the creation of cultural equipment, business and events centers and establishments for leisure, tourism and consumption. A case study about Sapucaí Street - located in Floresta, a peripheral, middle class neighborhood that borders Belo Horizonte's downtown (Minas Gerais, Brazil) - is used in the article. Since 2012, gastronomic and leisure establishments have been created in this urban road and in its surroundings and have attracted young publics. The changes in this region are analyzed from the point of view of urban renewal and the possibilities of consumption gentrification. To this end, observations and interviews were made with traders, employees and consumers in order to understand their motivations to invest and/or consume in that part of the city, and also to capture the collective representations about these spaces. This case, like several others in Brazil, shows the preponderance of consumption gentrification on residential gentrification and how it happens in micro spaces, not in the neighborhood as a whole. It also shows how the phenomenon in this street is linked to the public policies of revitalization of the city's downtown, border with the neighborhood.

Of Victimization, Criminality, and Punishment: The Narratives of Women Formerly on Death Row in the Philippines

This paper illuminates women inmates' experiences, social environment, and persisting issues and concerns, focusing on the narratives of women who spent time on death row before the abolition of capital punishment in the Philippines.

Drawing upon participant observation and in-depth interviews with women formerly on death row, their family members, and prison staff, the researcher examines the women's pathways to prison and death row and the link thereof to their prior experiences of victimization and social and economic marginalization. The researcher also considers how deception and betrayal in close relationships, compounded by institutional corruption in the criminal justice system, constituted a pathway to death row for the majority of the informants. This study looks into the women's concerns and coping mechanisms when they were still on death row and the impact of their incarceration on their family members, particularly their children, and other significant networks. This paper elaborates on their social worlds under confinement, their struggles for dignity and survival, their relationships with fellow inmates and prison staff, and their negotiation of the social order in the penitentiary. This research also delves into the near-execution of one woman, the confirmation of the death sentences of five women, and the impact thereof on other women on death row. The researcher discusses the women's views on the suspension of capital punishment, their understanding of their current sentence of life imprisonment without parole, any changes in their situation, and their fears regarding the revival of the death penalty under the administration of President Duterte. This paper concludes with a discussion of their issues and service needs in prison, their relationships with their significant networks, and their survival strategies as they continue to serve long-term sentences, while avoiding the prospect of returning to death row if capital punishment were to be reinstated in 2017.

European Parents' Risk Perception of Online Hazards: A Data Science Approach.

In this study, we explore the determinants of risk perceptions of European parents about online hazards concerning their children. The study is based on a multi country survey with a stratified sample of EU parents from eight countries ($n=6400$). We analyse the main domains of risks that emerge from data identifying three clusters of risks: persuasion risks, personal safety and financial ones. After, we model their determinants in terms of parents' past experience online, several different type of their digital skills and their parenting style regarding access of online resources. Last, we explore countries differences using a novel statistical method from data science, model-based recursive partitioning, which represents a synthesis of a theory-based approach and a data-driven set of constraints to the model validation and further development. The latter method allows us to obtain a more nuanced picture of the differences across countries and of their sub populations in terms of risk perception and their determinants.

Goddesses to the Rescue! A Critical Analysis of Priya's Shakti, an Anti-Rape Comic Book

This presentation examines a comic book called *Priya's Shakti* (2013), which tells the story of a victim of gangrape who becomes an unlikely "superhero" in a crusade to end sexual violence. The comic was a response to the horrific, widely mediated gangrape and murder of a young woman in New Delhi in 2012 (the Nirbhaya case). Following this case, several media and public education campaigns were created to address gender-based violence in India (Dutta and Sircar 2013; Kotiswaran 2013). *Priya's Shakti* was created by an Indian-American filmmaker, Ram Devineni, and went viral in Indian and American news media. The comic integrates "augmented reality" technology and embeds the stories of real-life survivors, and was touted as a unique and powerful means of drawing attention to the problem of sexual violence. By positioning a rape victim from rural India as a protagonist with power, it was widely applauded as a means of changing the discourse surrounding victim-survivors of sexual violence (Mullin 2015; Pandey 2014).

However, as we argue, the comic does not actually center the protagonist Priya's experience. Instead, drawing upon paternalist themes and imagery in Hindu mythology and in the action-driven comic book genre (Chandra 2008; Scott 2010) the narrative undermines Priya's agency by representing her 'superpowers' as mediated by the gods. This raises questions about what model of social change the comic's creators envision, and about the underlying message of the comic as a whole to its readers. Reading *Priya's Shakti* through an analysis of the transnational discourses about religion, popular culture, and sexual violence that surround it, we discuss the ways in which this comic actually reiterates rather than opposes tropes about the passivity of Indian women and the dangers of brown men, and plays into nationalist claims about Hinduism's dominance in India.

Violent 'Others': The Interconnections between Hate Speech Against Women and Immigrant Men in Online Discussions about Gendered Violence

Social media has become an increasingly central site for the dissemination of misogynist, racist and xenophobic hate speech in recent years. Specifically in the context of online discussions about gendered violence, hate speech towards women, feminists and immigrants abounds. In this paper we examine the similarities in hate speech targeted at women, on the one hand, and immigrant men, on the other, in online discourse about gendered violence in Finland. We adopt an intersectional approach and propose that focusing on the interconnections of gender and ethnicity allows for a more nuanced analysis of these very common forms of contemporary hate speech than a perspective that examines them separately. Our data consist of discussion threads in online discussion fora and blogs focusing on 1) the topic of violence perpetrated by women (in 2007-2017) and 2) violence perpetrated by immigrant men (in 2015-2017). The analysis focuses on the ways in which categories of "violent women" and "violent immigrant men" are constructed in these discussions, and what is rhetorically accomplished with these constructs. We illustrate, in particular, how these constructs 1) evoke an image of Finland as gender equal and thus function as a means for constituting national identity based on the exclusion of those whose conformity with the value of equality is put under suspicion, and 2) allow for justifying anti-feminist and anti-immigration positions for Finnish men, who, in turn, are constructed as an unprivileged group betrayed by women and proponents of anti-racism. Both of these constructs thus allow to defend against perceived threats to the powerful position of Finnish men by veiling their privilege and the existence of gendered and racialized inequalities in Finland.

Social Capital in Online Learning: Insights for Designing Collaborative Online Learning Experiences

One of the ways in which Open Distance Learning (ODL) institutions attempt to accommodate the increase in enrolment numbers while decreasing the distance and disconnectedness between distance education students is by using online learning technology and pedagogy of collaborative online learning. Collaborative online learning has the potential to provide a social space for students to build a learning community where they can develop trust, share resources and learn together, even when they are from different locations and backgrounds.

A qualitative study explored how groups and networks are formed in an online learning environment and investigated whether online learning enables the development of social capital and if so, what the potential risks and effects of social capital in online learning are. A case study is used to gather in-depth information from focus group interviews and semi-structured interviews conducted with online students at the University of South Africa (Unisa). In this way information was gathered about the subjective experiences and perceptions of a diverse group of online students.

From the research it is clear that students develop personal learning environments which comprise both mandatory interactions on the official, formal learning environment and voluntary interactions on informal learning networks. Social capital theory is used to explain how close ties between students provide bonding social capital and weak ties facilitate bridging social capital. Both types of social capital contribute to the facilitation of online learning albeit in different ways. The findings indicate negative effects or risks to collaboration in online learning which is explained by using theory on the down side of social capital. The paper reports on how the theoretical insights can be employed in designing and developing collaborative online learning experiences which support social capital development and meaningful and sustainable interactions between online students.

Materiality, Community and Syrian Refugee Settlement in Canada

On a cold December night, members of a refugee settlement committee with the acronym SAFE – for Syria-Antagonish Families Embrace – waited at the airport to greet the first of their "privately sponsored (Syrian) refugees" (PSRs). He entered the arrivals area carrying an infant whose frail mother, also a Syrian refugee, was being assisted by her husband while he carried their toddler. The fatigue and deprivation of the young family was not lost on the SAFE members. Established by five community members, SAFE became a spark for community members who wanted to respond to the Syrian refugee crisis. Strangers came together to create a committee structure that would allow them to collaborate to "settle" Syrian refugees. In fact, in a matter of months, SAFE and two other

faith groups in a small, primarily rural area of Nova Scotia raised enough money to sponsor six refugee families, as well as settling two government sponsored Syrian refugee families. This paper focuses on how their processes of establishing the material necessities for several Syrian refugee families created community. I argue that their campaigns to raise funds and acquire material necessities such as furniture, bedding, food, clothing, and other tools for living – vehicles, shovels, toboggans – reflects their awareness of the importance of materiality for the social and economic integration of the new residents. Drawing upon insights from participant observation, interviews, and media stories, I argue that assisting refugees to build the lives has created community among people who would otherwise never have met.

VERGARA, GABRIELA* (CONICET-UNVM)

Alimentar, Cuidar y Proteger: Un Análisis De Formas De Reproducción Social y Sus Sensibilidades En El Siglo XXI

Las políticas de los cuerpos nos permiten identificar distancias, marcas y formas de expropiación de energías, de las que son objeto los agentes sociales en países como Argentina, atravesados por un capitalismo extractivista, neocolonial y dependiente.

Existen al menos dos procesos de estructuración social que se vuelven relevantes para el análisis propuesto. Por un lado, el hecho de que es cada vez más generalizada la configuración de una sensibilidad basada en el individualismo y la pérdida de confianza en personas cercanas, en el disfrute inmediato en el consumo y en interacciones fugaces y desechables.

Por otro, la feminización de las ocupaciones remuneradas se ha dado en el marco de una precarización generalizada del mundo del trabajo, siendo a la vez las mujeres quienes principalmente son las encargadas del trabajo reproductivo.

En este marco, nos preguntamos por las formas que adquiere la reproducción social, en el siglo XXI. Es decir, el interés está puesto en identificar formas de cuidado y reproducción de la vida que otrora se ubicaron claramente en el ámbito doméstico, como parte del trabajo reproductivo femenino. Así, la sostenibilidad de la vida parece adquirir otras lógicas en el marco de una economía de cuidado ampliado.

Para ello, nos proponemos describir e interpretar tres tipos de experiencias en las que mujeres participan del cuidado de la vida: a) protegiendo frente a posibles femicidios; b) garantizando alimentación a niños y, c) cuidando a adolescentes embarazadas de escasos recursos económicos.

Dichas experiencias registradas en ciudades intermedias del interior de Argentina (particularmente en las provincias de Córdoba y Santa Fe) son abordadas desde una Sociología de los cuerpos y las emociones. A partir de entrevistas y registros de diarios, identificamos prácticas, percepciones y emociones que dan cuenta de nuevas formas de sensibilidades.

VERHOEVEN, IMRAT* (University of Amsterdam)

Governmental Activism Against Dutch Offshore Windmill Parks

After the Paris Agreement, national governments push renewable energy more than ever before. In the Netherlands, the national government committed itself to a growth from 4 percent in 2013 to 16 percent in 2023. Building large offshore windmill parks is seen as a quick win to achieve these goals.

The plans for these parks have met with great resistance along the Dutch coastal line since they are planned within the 12-mile zone, which makes them visible from the shore. Surprisingly, the resistance is driven by local governments in close collaboration with local action groups. These local governments engage in demonstrations, petitions and rallies. They subsidize local action groups and form action strategies together with them. At the same time, they engage in intense lobby processes with the national ministry and the Dutch parliament.

In a recent article, I called this phenomenon 'governmental activism', which refers to both the unconventional political behavior of these municipalities and to their use of apparently conventional political behavior deployed within an activist strategy (Verhoeven & Duyvendak 2017). Although governmental activism is a phenomenon that stretches far beyond climate change measures, I want to focus on how it operates in a political environment that pushes hard for renewable energy. Hence my main question for this paper will be: how does governmental activism work when resisting renewable energy policies? Answers will come from recent fieldwork on governmental activism against a large offshore windmill park in the Netherlands.

KIRSCH, KATHARINA (Caritas Wien)

Housing for Generations - a Participatory and Needs-Based Approach to Housing for the Elderly.

Like many other European capitals Vienna is both a growing and an ageing city. The demand for housing is high, especially for housing that is both affordable and age-adequate for the elderly. In this context the older social housing stock in Vienna poses a particular challenge: while in these housing estates the demographic change is highly visible with large numbers of older residents, this old housing stock provides the least age adequate housing situations. The housing estates are in need for renovation and modernization when it comes to energy efficiency, thermal rehabilitation and accessibility for people with limited mobility. Furthermore they are also lacking important social features that affect older residents' health and well-being like common rooms, accessible open spaces or high quality entrances and hallways. Resulting are neighborhoods with little communication and interaction amongst residents and low qualities of life especially regarding the needs of the elderly.

In this context the proposed contribution is based on a research and implementation project called "Smart Housing for Generations" conducted in Vienna by an interdisciplinary committee including researchers, social workers and non-profit housing constructors. The project aims at developing modernization plans for two Viennese housing complexes that were both built with public subsidies in the 1960-70s. The modernization plans encompass social as well as spatial and constructional aspects with a special emphasis on integrating the needs of the mainly older residents in a participatory way.

The contribution will explore potentials and challenges of a participatory and needs-based approach to creating housing for older people. We will discuss methods used for participation of residents, reflect on formats for communication between different stakeholder groups (housing constructors, residents, caregivers etc.) and present aspects of the resulting plans for modernizations in the housing estates.

Experiences of Escape and Displacement As Cognitive Resource – Children's Worlds in Refugee Shelters

The perspective on refugee experiences – or refugee minors in particular – is often perceived deficient in social respects. Considerably because of their (frequently generalized as 'traumatic') experiences of escape as well as the encounters prior to and after their escape, they are being diagnosed with psychological difficulties. Terms such as 'resilience' and 'coping strategies' among children and adolescents are mostly absent.

Purpose and first results of a postdoctoral project will be presented.

This project deconstructs the concept of the 'traumatized refugee minor'. Narrative interviews and questionnaires conducted with and replied by the subjects themselves are supposed to lead to a perception of gathering cognitive resources and potentials rather than conditions of psychological strain. The sample consists of twenty refugee children between six and ten years old, who were accommodated in emergency shelters in Cologne, Germany. At the time of the interview, the children and their dependents had no residence permit.

The interviews show, that the refugee children consider themselves as strong and with a high adaptability, regardless of age and gender. They are mostly optimistic – even if they live in a refugee shelter without any prospect right of residence. The often proclaimed psychological instability is questioned by the collected data.

Considering the right balance between qualitative and quantitative methods, the questionnaires allow additional 'standardization' of the collected 'structures of meaning'.

So far refugee minors have well been discussed *about* instead of talked *with*. Mentioned narratives give them a chance to be part of the discourse and pave the way to higher presence and reinterpretation.

Women As Agency during Disasters

Women have always been seen through the lens of vulnerability since gender-centred research slowly made its way into the field of disaster management. However, a little progress has been made in the direction of understanding the role that women can play during disaster situations. This paper while acknowledging the fact that women indeed are at risk during disasters, tries to put focus on their role as first respondents to a disaster situation. The qualitative research was undertaken in the villages in Uttarakhand, India that were affected

by the flash floods in 2013. Defying the social construct that never allowed their strength to be taken into account while discussing disasters, a group of 80 women gathered together and saved a school from the wrath of flood waters and demonstrated their capacity as an agency. Besides, they showcased tremendous capacity to come together as an agency and bounce back to a normal life post-disaster. The paper concludes that how there may be several examples where women as agency would have taken control of the situation during disasters but their efforts were ignored equally by the society and the media in order to sustain the pitiful, sympathetic image of women as the 'most vulnerable'.

Development Disparity, Special Economic Zones (SEZs) and Farmers: Interrogating Involuntary Displacement in India

Due to incessant scientific advancement, a new degree of developmental height is attained wherein the governance is vying for 'capacity building', 'inclusive growth' and 'sustainable development' to ensure social justice and a just social order. But behind such admired development achievements lays the grave for the underdevelopment of millions of marginal whose land is utilized for the sake of attaining national goal – creating paradoxical situation of 'crisis of success'. By virtue of claim of sustainable and inclusive growth of the marginal farmers and labourers, the development endeavours carried out in recent past, contrarily, proved to be bane as it aggravated the problem of involuntary displacement, loss of land and livelihood, unemployment, food insecurity, human rights violation and hence negate the chances of an egalitarian society. By introduction of SEZs in 2005, on pretext of rural development, industrialization and employment generation, government opened flood gates to MNCs and big industries, further aggravating the problem of development induced displacement and making situation worse for the farmers. In this background, the paper critically comprehends the predicament of development induced displacement vis-à-vis state of farmers in India especially after the inception of SEZs act 2005. The paper brings under sharper purview the politics of governance which lacks social accountability by remaining apathetic to the plights of the farmers. The fluid condition of land acquisition and resettlement and rehabilitation acts in India, despite many revisions and amendments, act as catalyst to strengthen hegemonic minority against the feeble majority representing proletariat. The situation has set-up battle ground, wherein fierce struggle, protests and violence is seen on streets of India between the government, MNCs, industrialists and planners on the one side and; farmers, labourers, marginal communities supported by exponents of civil society, human rights activists, NGOs and environmentalists on the other destroying the tranquil environment.

Life in a Fringe Zone: An Empirical Analysis of Peri-Urban Lucknow City of India

Peri-Urban areas evolve as a consequence of urbanization and inordinate growth of city boundaries towards the hinterland: a phenomenon most commonly associated with a developing country like India which is home to world's second largest population. The peri-urban zones lies at the point of interface between urban and rural areas, remains in constant transition and characterize by the co-existence of urban and rural activities, institutions, culture and society. Urbanization results in transformation of land use, environment and culture of communities living in the fringe zones and thereby, changes in the ecological balance of the city-region. Even though, the rapid expansion of peri-urban areas present both opportunities and challenges for urban and rural sustainability, however, unlike the western realities, the process often leads to the formation of 'urban villages' with hybrid culture, poor quality of infrastructure, lack of basic amenities, ecological imbalance and environmental tribulations that eventually hampers serenity of mind and impede quality life for the inhabitants. In order to examine the above viewpoints empirically, the paper analyses social, ecological and environmental matrix of peri-urban Lucknow city situated in the state of Uttar Pradesh, India by randomly selecting 500 sample families from four blocks (two villages from each block) located at four opposite corners. The findings of the study underlines that in order to accommodate rising population due to rapid industrialization and urbanization process; unplanned and haphazard development of fringe zones of the Lucknow city is on a rapidly accelerated path resulting into environmental destruction, ecological imbalance, poor quality of availability of infrastructure, crumbling of social structure and cultural decay. The perennial situation has drastically shattered the traditional structure of the society, disrupted employment and livelihood patterns, created health, hygiene and sanitation problems, apart from exhibiting trends of fading age old cultural beliefs and practices in the interface zone.

Incentive Models between Financial Network and Critical Theory

The paradigms of the new economy (Stiglitz, Lordon) displace the classical dialectic of the system and the actor (motivation, discipline) formulated by Weber and Giddens. They proceed by extensive implication of the network and the subject constituting the efficient market. So result some deep reformulations of subjectivities at work (suffering, contempt, autonomy and negotiation of trajectory, discipline and bio power). The libidinal economy are reactivated by the theory of affects.

The notion of incentive is a central category sustaining the financialization, in the construction of market (Stiglitz, 2008), in the construction of consumption and labor (Lordon, 2008), in the construction of financial policies (Tirole, 2006), in the construction of fiscal politics (Piketty, 2001, 2014). The motivations for work have been modified by the praxeology of incentives (subprime, added value) in the last 20 years (Fligstein, 2009, Aglietta, 1995) so to reinforce the upper middle classes as super richs (Piketty 2013).

Our analysis intends to specify the social structure of incentives, mobilized by different economic frameworks (financial networks, governance system). The classic discussion leads on the role of market as differentiation (Simmel), as communication and medium (Habermas) positioning the subject on the limits of market (Sandel), on the cultural recognition (Honneth). The new conjecture of transnational financial economy specified by the incentive structures and incentive models, moves the discussion on the alignment of the ethical formulations inside the extended capitalism between moral communication and communication networks. This disembedding underlines the ethical and political disjunctions inside the new capitalism between ethic of work, civil ethic, religious ethic (Kallberg, 2014).

RC52-859.5

VERPRAET, GILLES* (University Paris OUEST Nanterre)

Social Power and Discipline inside Professional Legitimacy

The distinctive forms of social legitimacy are framed between the work discipline (Beruf) and the networks of influence. This analysis of the social power of professions (Harendt) was developed by Courpasson on the examination of the banking professions and their capacity for domination (influence, disciplinary consent). This differentiation of forms of legitimacy can also be applied to the professions of the digital economy and to the managerial professions by their capacity to collect and to capitalize on the extended chains of added value services. For Courpasson, domination comes from a combination between influence power and discipline. Case studies can be developed on bank, insurance, management.

Sociological analysis should not forget the professions whose influence and domination fall under other sociological schemes. The status of bureaucratic professions was formed between domination of public standards and office disciplines. We take account on the contemporary uncertainties of professional qualification reinforced by these new forms of social influence and domination, considering the extension of the middle classes superichs (Piketty). New forms of division of labor can be envisioned between professions with influence and professions with discipline, in computer work (networking v data center) and their consequences on the wages valorization. The discipline of work process can also be externalized towards the client (co working). We may question the role of the managers on their capacities to organize network of influence, management standards and work discipline.

Contributions of Organisations to Stability and Insecurity during Election Times: A Case Study of a Kenyan Informal Settlement

The ill placed optimism surrounding globalisation's inclusivity and egalitarian potential has been increasingly replaced by the stark reality of fragmentation according to locational, group and individual positioning within processes of functional democratisation. Huge swathes of populations remain on the margins with weak levels of power and economic participation. This proposal focuses on one such location in Kibera, Nairobi, Kenya which is the largest informal settlement in East Africa. The settlement is associated nationally with high levels of crime and violence alongside low incomes and poor health and education. State organisational commitments to the area tend to be restricted to security force presence during times of tensions. Thus far 2017 has largely been a period of tension with Presidential elections contributing to ethnic rivalries.

Against this stereotypical backdrop of life within informal settlements, there is considerable resilience and community driven opportunities for collective action designed to protect and improve local lives. A range of organisations are intertwined within the figurations including family, schools, business, NGOs and political parties. The bulk of the paper examines the roles of these organisations both in helping to shape forms of cohesion and integration and fragmentation and

divisive We/I identifications. Recent fieldwork in Kibera, and extended to include outcomes from the October rerun of the Presidential elections, is drawn upon to help explain the interconnections between these organisations, levels of electoral tension and changing patterns of political violence.

The Organisation of Hunger Strikes and Established-Outsider Relations

Hunger strikes have a long history within struggles to address power imbalances and perceived injustices. Over the last 100 years or so, people have become involved from a variety of socio-economic backgrounds ranging from British suffragettes, Gandhi's fasts in South Africa and India, younger generations imprisoned in West Germany and to Palestinians recently protesting political conditions in Israeli jails.

Such organised self-starvation is adopted as a political tactic to try offset the group's asymmetrical relationship with governments and state related agencies. Hunger strikes are intended to raise awareness about issues such as oppression, injustice and prison conditions to try shift power dynamics resulting in increased support for the strikers and growing pressure on governments to concede. That today hunger strikers tend to be associated with prisons is symptomatic of the exaggerated power imbalance that incarceration causes through the removal of individual liberties and the severe restrictions placed upon participating in wider figurations.

In this paper we argue that the likelihood of people becoming involved in hunger strikes and the level of support they arouse will depend in part upon the habitus that group members share and the intensity of we/I identifications and how far they can resonate beyond the prison walls. Through comparing a range of hunger strikes with very different outcomes such as those involving Irish republicans and loyalists associated with the conflict on the island of Ireland, the Red Army Faction in 1970s and 1980s West Germany and contemporary Palestinians, attention is drawn to the discursive influences, levels of collective identification and insecurities that shape established-outsider relations, and attitudes to life and death. Broader social processes are instrumental in the adoption of self-starvation as a tactic, willingness to volunteer and persevere and the likelihood that the strikes will mobilise wider support that help reduce the established-outsider power ratio.

VERZELLONI, LUCA* (*Centro de Estudos Sociais*)

The Italian Lawyers' Role Ambiguity: Users and Protagonists of the Civil Justice

What is the impact of lawyers on the functioning of civil justice? How does their behaviour affect the courts' activities and the process of dispute resolution? What is the role of lawyers? And why do we still need to deal with one of the most studied professions in our society?

The paper is focused on the Italian civil justice. The article aims to introduce a new interpretative perspective to examine the complex and partially unexplored relations between lawyers and judicial offices. The basic hypothesis of this research is that the Italian lawyers have a sort of "role ambiguity", since they are at the same time "users" and "protagonists" of the judicial service. Firstly, lawyers are "users", given that they constitute the main beneficiaries of the services provided by the courts. Far from expressing a negative connotation, the term "user" defines the condition in which you find any lawyer who frequents the courthouse and its courtrooms. Secondly, lawyers are "protagonists" of the judicial service. They represent a fundamental "filter" between society and courts and they can contribute to the realisation of justice, i.e. dispute resolution, evolution of law and completion of judicial proceedings within a reasonable time. The article intends to develop a comparison between these two concepts, in order to discuss the role of lawyers in the civil justice field.

This paper is based on the results of an empirical study on the Italian legal profession. The analysis involved 16 lawyers of 3 law firms (Sigma, Kappa and Omega), specialized in labour and employment law. The case studies were selected on the basis of size and type of organisation. This research has used qualitative techniques, including document analysis, semi-structured interviews, participant observation, and shadowing.

RC57-931.1

VIAL KAYSER, CHRISTINE* (*Langarts*)

Buddhism and Glocal Art

Since John Cage Buddhism has for some time now been a marker of spiritualism in Western art. This trend was followed by Allan Kaprow, and also shared somewhat

by Yves Klein. In the 1990s Wolfgang Laib and Marina Abramovic infused their practices with a sense of meditative silence and a search of holism which they related to Buddhism and Yoga. In the 1990s in China the reference to Zen also appears, albeit as an ambivalent sign, a search for a spiritual tradition, after the demise of Maoism, as well as an attempt to halt the dependence on Western art –especially on Duchamp and Warhol– and philosophy –especially Foucault and Marx. It was suggested that Duchamp was in fact influenced by Zen. The philosopher Li Zehou also tries to tie up Marxism and Taoism and Confucianism.

In this paper I would like to propose a reflection on the bridges established by artists between Buddhism and Western philosophies. Using visual and textual evidence I want to suggest that it is the actual proximity of transcendentalist Protestantism with Zen meditation concerning nature and the historical proximity of Greek philosophy, especially Skepticism (Pyrrhonism) with India, that explain a shared sense of detachment in Duchamp and Buddhism. It will be emphasized that such proximities weaken a sense of Eastern exceptionalism that is commonly associated with Buddhism, and in fact serve a political purpose, as a counterpower against Western exceptionalism.

Innovative Organizational Models in Courts: "Office for the Trial" and the Restructuring of Services in the Courts of Turin and Florence

The Italian justice system is notoriously affected by several problems, including excessive length of proceedings, high litigation rate, lack of human, financial and material resources, and public distrust in justice.

In response to growing complaints about delays in justice and to reduction of public resources, a new wave of change took place in the Italian courts, involving technological, organizational and cultural innovations starting from below.

The lack of human resources, combined with the development of the online civil trial, has led to a shift in the internal organization, especially for non-judicial staff and support services, gradually moving from a "divisional" structure to a "functional organization". Advantages of a functional organization are a more efficient allocation of staff personnel and a better specialization that may lead to more productivity and quality of support services.

On the other hand, this organization model has broken the close relationship between judges and their staff: one of the gravest difficulties of the Italian system is the profound solitude of the civil judges, which work alone, often without any form of assistance.

In order to solve these problems, some courts started to experiment new organizational models, especially the "Office for the Trial", consisting of magistrates assisted by young interns. The Court of Turin, in particular, is experimenting an innovative organizational model where the judicial teams are composed not only by interns, but also by honorary judges, clerks and other staff. These teams are working in a flexible way, applying some of the basic principles of the "agile organization" model: simple rules, shared purpose, engagement and adaptability, self-organization.

This paper aims to discuss the impact of the organizational models on efficiency and quality of courts, exploring new perspectives for the development of innovative forms of organization, such as "agile organization", in the courts of justice.

Changes and Challenges in Italian Medical Profession: Rethinking Concepts and Reflecting on Future Configuration

Almost a decade ago, it was argued that doctors were very close to losing their professional dominance, as they underwent different pressures (demographics, epidemiological, technological and socio-cultural). Currently, after a deep economic crisis that has hit Italy, some data indicate that the individual and collective discomfort of physicians has increased significantly, as well as the awareness of overtaking the professional model that was forged during the twentieth century. From a sociological point of view, this raises the question about how the new social relationships characterize and comprise the medical practice. In fact, if one accepts Elias's teaching, professional changes should be read as the result of the remodeling of interdependence bonds that hold all those who need and offer care.

To forge an analytical tool able to address the hypothesis of a decline in physicians' dominance in Italy, the various suggestions coming from both the scientific and the professional debate can be used. In particular, by using the directions of the Royal College it is possible to identify three major relational areas within the overall configuration of the medical profession. These areas can be understood as sub-configurations that relate to: relationships with patients and their caregivers (family and non-family members); relationships with medical colleagues and other health and social workers; relationships with administrative staff and corpo-

rate management, public and political institutions, the goods and services market in its various components.

On this basis, the paper offers a first attempt at interpreting the relationships among professionals and the above-mentioned subjects, as the latter developed in the Italian context, with the awareness, however, that the data are scarce and the themes too big to be able to deduce a result in terms of "dethronement" of doctors.

Doctors in the Crisis and the Crisis of Doctors: The Case of the Italian NHS

The economic crisis and the related austerity policies are promoting a trajectory of change in the Italian NHS, slowly transforming its universalistic and public nature into a more privatized healthcare system. This institutional change has been brought about by the weakening of the main veto players (doctors' associations and unions, trade unions, Regional governments), which had previously acted as "NHS defenders".

Given this picture, described at the beginning of the paper, our focus is on the weakening of doctors' associations and unions, which may be attributed to two broad sets of reasons. First, the economic and financial crisis severely constrained the traditional capacity of doctors to negotiate and affect public spending policies, because national governments were often pushed to assume tough and quick decisions to confront the turbulence of financial markets and EU pressure. Moreover, the loss of influence on policy making reflects a more general decline of the "medical dominance" (Freidson, 1970) exerted within the healthcare system.

In the second part of the paper we will investigate the causes and the extent of the decline of professional dominance of doctors in Italy, with some reference to other national cases, concentrating on three components: the effects of managerialization, the assertion of other health professional groups and the impact of technology (especially ICT) on medical practice and the medical labor market, depicting new scenarios for single practitioners and the professional group. Final remarks will end the contribution.

Social Innovation and the City: A Theoretical Map

ABSTRACT

Social Innovation and the City: a Theoretical Map

Serena Vicari Haddock, Università di Milano-Bicocca, Milano (Italy) serena.vicari@unimib.it

Enzo Mingione, Università di Milano-Bicocca, Milano (Italy)

enzo.mingione@unimib.it

This article discusses the concept of social innovation based on Polany's and Marshall's analyses and on more recent contributions from within that theoretical framework. In the last decade, the concept has become widely used to discuss and interpret a wide array of practices and networks of solidarity built as responses to social needs left unsatisfied by the state and/or by the market. The authors propose an interpretation of social innovation on the basis of the crisis of welfare capitalism and the instability of the institutional foundations of social cohesion and integration. The relevance but also the ambiguities and limits of the processes and practices of social innovation are discussed and evaluated in terms of the potential to respond to the present urban crisis.

Producing Immigrants and Workers: Borders, Migration and Class in an Age of Crisis

This paper examines how categories of 'workers', 'migrants', and associated subcategories have been structured and mobilised in recent years within representations of 'migrant crisis' and 'welfare crisis', to facilitate capitalist exploitation. The paper situates mobility in relation to class formation and exploitation through the concept of labour process, which highlights the importance of capitalist control over movement, at a micro and macro scale, in order to extract surplus value from living human subjects. This analysis is tested and further developed by drawing on a programme of empirical and theoretical research between 2012 and 2017, concerning patterns of migration and settlement, labour markets, state policy and implementation, the media, and activism.

The paper focuses on Britain in particular. This goes against the grain of the general turn toward a transnational frame in many studies of migration and

bordering practices, but has value given the persistent national organisation of capital, and the continuing significance of national divisions and connected racial boundaries in governing migration and migrants' rights. This has added importance in the context of the UK referendum vote in 2016 to leave the European Union, which represents a turn back toward the nation, in political, cultural and economic terms and is part of a wider international turn toward protectionism and unilateralism supported by populist movements. Yet the British economy remains heavily reliant on international investments and export of services, and key sectors are structurally dependant on migrant labour. Through a detailed analysis focusing on this particular case, theoretical insights are developed that have international relevance. The paper concludes by proposing alternative, counter-hegemonic understandings of the relationship between borders, migration and class that are informed by grassroots movements and foreground solidarity.

LORETTO, WENDY (*University of Edinburgh Business School*)

Gender, Risk and Retirement

The public policy push to extend working lives is typically gender blind, focusing on increasing individual 'choice' without recognition of the extent to which the ability to exercise choice is mediated by gender, class and other structural inequalities. The differing gendered impacts of policy changes such as raising of state pension ages and abolition of default retirement ages are neglected. In the UK women have been particularly impacted by a rapidly rising state pension age. In conditions of austerity and the prevalence of gendered ageism in organisations the effect is new risks for many women and some men and retirement seems both more distant and more problematic.

These gendered effects are explored through four in-depth organisational case studies in transport, engineering and manufacture, hospitality and local government. HR managers, pension specialists, line managers, trade unionists and a range of employees were interviewed alongside examination of organisational policies and data. The research captures different organisational responses to extending working lives issues and a range of risks and opportunities that women and men face in a span of occupations. The study shows that in the context of policy change and organisational response there are winners and losers amongst older women workers but that overall women are now facing greater risks with respect to health and poverty in older age. The paper explores how women talk about retirement in this emerging context.

Theoretically the paper demonstrates how the prevailing policy narrative reduces the phenomenon to a matter of individual choices, is based on a homogenous view of older workers and frames the issue as an economic necessity isolated from current social changes in society and working life. The paper engages with the global conditions which shape precarity and risk, the individualisation of employment trajectories and the need for a feminist understanding of work.

VICKERY, ALEXANDRA* (*Cardiff University*)

Men and Distress: Help-Seeking, Coping and Daily Management

In the context of mental health, talks about 'gender equality' should recognize that men also have gendered issues that may impact on their mental health too. Men are three times more likely to commit suicide than women (ONS, 2013), are more reluctant to seek help for distress and thus less likely to utilize health-care services (Addis and Mahalik, 2002; Courtenay, 2000). Studies suggest that men do not open up or seek help on account of a perceived threat to performing 'hegemonic' masculinity that limits emotional expression and vulnerability. They also put forward that men use fewer, and more ineffective coping strategies than women to manage their own mental health. In this context, there is a need to explore men's positive experiences of help-seeking and coping with emotional difficulties in everyday life. This paper presents PhD research that explores men's experiences of mental distress in regards to their help-seeking, coping and daily management but with a more positive emphasis on what they find effective. Semi-structured interviews were conducted with a diverse sample of men to explore their experiences and how they cope with adversity. Analysis demonstrates distinct gendered characteristics of men's help-seeking and coping behaviour. Masculine discourse is evident in men's help-seeking and coping behaviour, as they attempt to take charge of distressful situations, adopt their own personal management strategies and utilize support in their own way. Men are still trying to live up to traditional masculine norms, particularly those of certain ages and social backgrounds, however findings suggest that men use these norms in a flexible and proactive way. The research aims to move away from a deficit approach that focuses on gendered barriers to a more positive focus, highlighting the presence of multiple, flexible masculinities as an advantage for men when managing their mental health.

RC49-822.3VICKERY, ALEXANDRA* (*Cardiff University*)***Men and Distress: The Influence of Social Relationships on Coping and Management***

In the context of health, particularly mental health, there is a dominant narrative that men are more reluctant to seek help for distress than women (Addis and Mahlaik, 2002). Studies suggest that men do not open up or seek help on account of perceived threat to performing 'hegemonic' masculinity that limits emotional expression and vulnerability. In addition, men's inability to express emotions and reluctance to seek help may also be due to men's lack of social networks or their tendency to deal with things alone. Studies put forward that men use fewer, and more ineffective coping strategies than women to manage their mental health. This paper presents PhD research that explores men's experiences of distress in regards to their help-seeking, coping and daily management. Semi-structured interviews were conducted with two sample groups of men: men from the general population and men who had accessed support groups. Findings indicate that strong social relationships and support networks are an influential factor in men's help-seeking behaviour as well as being essential for managing and maintaining good emotional wellbeing. Men are active in managing their mental health and are able to proceed in managing moods effectively with the support from significant people around them. The use of two different sample groups enabled the exploration of various positive coping strategies that men deem effective. The research demonstrates the usefulness of support groups for men, particularly older men in addressing social isolation, as well as the importance of having someone safe to talk to in the face of everyday adversity. Masculinity is still very much present in the men's accounts of their experiences, yet masculine norms are adapted in a more flexible way, enabling them to open up and engage with others around them as a means of successfully coping with distress.

RC11-232.1VICTOR, CHRISTINA* (*Brunel University London*)WILLIAMS, VERONIKA (*University of Oxford*)CAIRNS, DEBORAH (*University of Glasgow*)RYAN, SARA (*University of Oxford*)***Ageing with a Learning Disability: A Critical Literature Review***

In the debates around population ageing the emphasis is upon the changing demographic profile in terms of the number and proportion of older people within given societies. Where the debate extends to the nature of future populations of older people this is focused predominantly on the emergence of specific groups defined by age such as (super) centenarians. Much less interest is expressed in the emergence of 'new' ageing populations such as those ageing with learning disabilities. In the United Kingdom, there are an estimated 1.14 million people with a learning disability and life expectancy for this population is approximately 60 years. Little is known about the experiences of this group of people as they age and how they conceptualise 'successful ageing'. We undertook a systematic literature review to evaluate our current evidence base in terms of the experience of ageing for adults with a learning disability.

We identified 65 papers for inclusion in the review, which were published between 2001 and 2016 and which focused predominantly on those with mild to moderate impairments. We classified papers in 6 domains which linked to the ability of older people to live healthy, safe, meaningful and socially inclusive lives. Our themes were health; activities of daily living and function; experiences of ageing; quality of life and well-being; autonomy and transition. Most papers, 43, focused upon health/activities of daily living often limited to very narrowly defined groups or used large data sets to assess overall health status of older learned disabled people. Our 11 studies examining ideas about ageing, autonomy and transition highlighted the socially exclusion experienced by this population. We still lack a clear understanding as to what a good later life for older learning disabled people consists of and how, if at all, it differs from the rest of the population.

RC01-42.2VICTOR TILLBERG, LOTTA* (*Royal Institute of Technology, Swedish Centre for Studies of Armed Forces and Society, Stockholm*)***The Dynamics of Skills – an Epistemological Study of Military Professionalism in Situations When Rules Clash***

Military personnel have to be prepared to act in situations over which they do not have full control. They must be able to make decisions in uncertain and contradictory circumstances. The ability to adequately interpret phenomena in a given situation includes a variety of inarticulate knowledge. These often experience-based forms of knowledge are an important but rarely noticed aspect of military professionalism.

The article epistemologically investigates the role of experience-based knowledge in military practice based on narratives from Swedish soldiers' experiences

from situations when rules clash. The empirical material on which the study is based shows that transgressing rules is occasionally a prerequisite for military operations. The article discusses the risk of deprofessionalization as a result of a unilateral use of evaluation methods (e.g. new public management) that focus mainly on measurable forms of knowledge.

RC18-343.2VIDAL, CAMILA* (*Universidade Federal do Rio Grande*)***Party Polarization and Social Policies in the United States (1936-2016)***

This paper dedicates itself to the study of party polarization regarding social policies in the United States between 1936-2016. Through the use of national platforms, this study aims to empirically verify the supposedly polarization between the two main political parties in this country and the Republican Party conservative ascendance. As a methodological tool chosen, it aims, also and as a consequence of it, to contribute to new research methods in the study of political parties and conservative rise. In this research, the Republican and Democratic national platforms were used as an indicative of party ideological portrait. As such, through the creation of categories such as abortion, homosexuality, civil rights movement, and others; and scales of gradation built through informational programs such as SPSS and NVivo, the political positioning of these two parties were measured and compared seeking to verify ideological approximations and distances as well as conservative ascendance and/or decline. The results show us that, indeed, there is a party polarization in recent period when referring to social policies caused, mainly, by a sharp conservative rise by the Republican party that began in the 1970s. Result of an exhaustive work of reading, interpreting and coding 42 documents that embrace almost a century of history, this paper contributes to a greater comprehension of a recent political and social phenomena of great importance for Sociology and Political Science that provides empirical evidence of what now seems to be a fact throughout the globe: the rise of new right wing parties and the ascendance of conservative thought in old ones.

RC18-JS-35.1VIDAL DE LA ROSA, GODOFREDO* (*Universidad Autónoma Metropolitana- Xochimilco*)***Institutional Failures of Mexican Democracy: The Electoral Regulatory System***

Since 1994, driven by dramatic events, the creation of the regulatory institution of the electoral process was erected at the center of the democratization of Mexican Political system. This innovation represented the end of the hegemonic party and the beginning of the electoral competitive regime: 1) A distinctive feature was that the transition did not include visible mechanisms to neutralize the "authoritarian legacies" of political clientelism, and the chains of clandestine finances of political campaigns. 2) The Citizen's Council, composed of "notables", was captured by the political parties. The IFE (INE) presided over three federal electoral processes and provide the rules of fairness of the electoral process (with adjacent auditing institutions as TRIFE and Fepade), and manages extensive financial resources required to campaigning, and to register of the the electoral census. Although this institution has undergone numerous "reforms" over a quarter of a century, it has three fatal flaws since its inception, which have been slowly de-legitimized and discredited the institution: First, the absence of a mandatory (compulsory) voting system; Secondly, the electoral system introduces perverse incentives, especially the regime of prerogatives and public financing of the parties, which have degenerated into electoral processes excessively expensive, long, and nearly impossible to audit. Third, as a partial result of the second flaw, the electoral mechanism has been "captured" by the same parties that it must regulate. Because the centrality of electoral institutions in the State democratic functioning, the quality of political representation, and the overall effectiveness of the Mexican State's auditing and accountability mechanisms, is convenient a critical evaluation. This paper examines: a) the formation of electoral institutions and their transformations over a quarter of a century, b) the behavior of electoral participation, c) the establishment of a "mixed" political regime (electoral competition and authoritarian clientelism).

RC04-95.2VIEIRA, ANDRE* (*Federal University of Rio de Janeiro*)***Stratification in Higher Education and Labor Market Returns***

The expansion of higher education and its impact on the configuration of educational opportunities and the overall levels of inequality have long interested social stratification scholars. The extensive literature on the subject have shown that both the level of education attained and the type of education received matter for understanding outcomes throughout adult life, particularly the labor market returns. However, there is quite limited evidence on how the return to college attendance has changed for different cohorts of individuals or how the

return varies over time for individuals in a given cohort in Brazil. Using nationally representative, restricted-access datasets from National Exam of Students' Performance (Enade, in Portuguese acronym) and Annual Report on Social Information (RAIS), this study examines the effects of college and major types on economic well-being (social class, occupational status and individual earnings) of college graduates from 2004 to 2014. Preliminary results indicate substantive differences in all three dimensions of economic well-being according to the type of higher education institution, academic degree, and field of study attended. The analysis provide original insights on the relationship between educational and labor market sorting and allocating processes, as well as advance the more specific research agenda on horizontal stratification in higher education and school-to-work transitions.

Brazilians in Japan and Overseas Compatriots: Local and Transnational Alliances

The present paper proposes to discuss how Brazilians in Japan have interacted with other Brazilian communities abroad in order to strengthen their bonds and stimulate the birth of ethnic organizations. The activism of Brazilians abroad dates to the beginning of the 1990s and it is related to the social, political and economic environment that surrounded these immigrants. It began in Europe, where restrictive policies resulting from the Schengen Agreement led to the deportation, death and even murder of undocumented immigrants. This was a defining factor in stimulating Brazilians to demand the recognition of rights both in Brazil as well as in the host society. In the case of Japan, two main issues have been pointed out as the triggers for mobilization: the matter of health security for foreign residents, which became a concern during the late 1990s, and extremely high unemployment rates that followed the 2008 financial crisis. After understanding the context in which these changes happened, we move on to the analysis of how the Brazilian community abroad has interacted and shared their experiences. We focus on ethnic organizations in Japan and study how their interaction with other Brazilians abroad affected the organizing and institutionalization of the community. In order to do so our analysis will be based on field work in Japan during the period of 2011 to 2017. That includes interviews and surveys conducted in areas where the Brazilian community is concentrated, as well as the participation in meetings of the Brazilians Citizen's Council of Tokyo. We intend to highlight how mechanisms from the community, such as the Seminar on Brazilian Immigration and the Meeting of the Brazilian Community Abroad, as well as endeavors sponsored by the Brazilian government, such as the Brazilians in the World Conference, have contributed to shape the community in Japan.

Work-Family Benefits As an Incentive to Better Well-Being Conditions of Employees. Empirical Evidence from an Industrial Sector in Italy.

The topic of "Work-Family benefits" has received attention in different streams of literature such as psychological and behavioral studies, Human Resource Management studies, pension studies, social research, focused on the change in work practices and the related effect on work-life balance.

Among the different type of corporate benefits provided to employees as a form of additional welfare, the "Work-Family benefits" are those who interest most in our research, as a consequence of a primary attention given to work-family balance in an era where flexibility of work arrangements and attention to well-being is crucial.

Previous findings evidenced how the organizational provision of employees' benefits is a sign of companies' competitiveness, attraction and retention of employees, a means to improve organizational performance or to manage conflicts between work and family.

In this wide literature however, the investigation of the well-being construct seems to represent a frontier of research in understanding the inner relation between employee engagement, organizational performance and individual well-being. Specifically the aspect of Subjective Well Being (SWB) associated to the personal and family life of employees and organizational provision of benefits remains completely uncovered.

Our paper contributes with an empirical analysis to evidence the link between the use of employees' benefits and SWB. We based our analysis on a sample of 5074 employees of an Italian industrial sector, who answered a specific questionnaire designed to investigate three main issues: the diversity and accessibility of corporate welfare, the satisfaction of employees and the possible relations with subjective well-being. In order to answer to the questions mentioned above, we applied two statistical methods: a Multiple Correspondence Analysis (MCA) and a set of logistic models. With respect to the logistic models, we estimated the

impact of the effective access to the different corporate welfare benefits on the subjective well-being.

Gender Justice and Violence: The Politics of Reforming Personal Laws in India

One of the most enduring clichés about Indian women is that it is the country of contradictions. Like all clichés, this too has a grain of truth in it. At the heart of the contradiction stand Indian women -- both Hindu and Muslim. It is true that women in India are the most oppressed in the world. It is equally true that they (only some of them) are among the most liberated, the most articulate and perhaps most free. Can these two realities be simultaneously true? Despite the codification of Muslim law in 1930s and the Hindu Personal laws in 1950s, the enactment of many other laws to deal with crimes against women, such as dowry deaths, rape, sati, sexual harassment at workplace, denial of education and inheritance rights, the status of women in India has not improved. This paper attempts to explore answers to the following questions: Is there a relationship between gender violence or discrimination and the religion-based family laws? Does Hinduism and Islam provide for gender justice and equality in their religious texts and scriptures? To what extent this equality of sexes is found in practice among Hindus and Muslims? Are there any deviations from the scriptural precepts of gender equality? What reformative measures have been undertaken by Indian Government to improve the status of women by enacting various laws? Are there any social movements or women's movements for gender equality in contemporary India? What has been the role of the Supreme Court of India to enforce the constitutional precepts of gender equality and address the issue of gender violence? Has the ratification of CEDAW by India has made any difference to address these issues?

VILA, ESTEBAN* (*Instituto de Investigaciones Gino Germani*)

Durkheim in the Pampas: His Reception in Argentina and Uruguay (1894-1947)

The present work aims to study the reception of Emile Durkheim and his disciples' ideas (Paul Fauconnet, Marcel Mauss, Celestin Bouglé, etc.) in the Sociology chairs of the Schools of Law and Social Sciences, Philosophy and Arts, and Humanities and Education at the following universities: Buenos Aires, Córdoba, Santa Fe and La Plata (Argentina) and Republic (Uruguay). This study identifies three periods of that reception: the first covers the initial appearance of Durkheim's ideas in the Río de la Plata from 1894 to 1915, when, while sociology in Uruguay was based on Spencerian outlook, the reception of French sociology in Argentina was mainly limited to *The Rules of Sociological Method* and, subsidiarily, *The Division of Labour in Society*. The second period comprises the years 1915-1933. This was a time when a first sociology chair was created in Uruguay. The readings were extended to others works (*Sociology and Pedagogy* and *The Elementary Forms of Religious Life*) at the same time that the local sociologists began to study others French sociologists, such as Maurice Halbwachs. Finally, the third period (1933-1947) involves a reinterpretation of Durkheim's doctoral thesis in Argentina creating a pre-functionalist thought in the country. This did not happen in Uruguay where even in the 1950's the sociology lectures would follow a trend linked with complementarian cultural background for future lawyers.

Articuler Les Modèles Classiques De Stress Professionnel Aux Grilles D'analyse Des Perceptions De Justice Au Travail

De nombreuses recherches s'intéressent aux conditions de travail et à la santé mentale à travers deux modèles prédominants : le modèle demande-latitude-support de Karasek et Theorell (1990) et le modèle déséquilibre-effort-récompense de Siegrist (1996). Le modèle de Karasek et Theorell permet de comprendre comment de fortes demandes (tant psychologiques que physiques) issues de l'organisation du travail, le manque de latitude décisionnelle et le manque de soutien social peuvent avoir un impact sur la santé mentale des travailleurs entraînant des troubles tels que la détresse psychologique. Le modèle de Siegrist permet d'analyser l'organisation du travail dans des systèmes d'échanges dans lesquels un déséquilibre entre des efforts et des récompenses perçues peuvent entraîner certains troubles psychosociaux chez le travailleur. Malgré leur pertinence, ces modèles présentent deux limites. Premièrement, ils ne permettent ni de décrire les spécificités propres à chaque profession, ni les relations de pouvoir présentes sur les lieux de travail (Kristensen, 1995). Deuxièmement, ces modèles s'intéressent peu à l'impact des injustices liées à l'organisation du travail. L'objectif de cette communication sera de proposer un modèle d'analyse articulant les modèles classiques avec le concept de la justice

organisationnelle de Greenberg (1993) et les principes de justice au travail de Dubet (2006).

Food Banks As Grassroots Initiatives: Defying Food Injustice in Spain One Step at the Time

This paper presents an ongoing research project concerning the main theoretical models and empirical findings on voluntary giving and grassroots organizing focused on hunger relief efforts in Spain. Two models are examined here: registered food banks, which embody a top-down philanthropic rationale, and grassroots food banks and pantries, which represent bottom-up initiatives based on self-organizing and localized political action. Registered food banks, although upholding the interests of agri-business in giving their surplus food to the needy, have been successful in supporting an extensive system of charity based on improving food security in Spain. Born as a response to the financial crisis in Spain beginning in the late aughts, grassroots food initiatives are supported by community organizing, mutual aid, and transformative social change.

Conceived as a form of micro-resistance, solidarity food pantries have emerged in contexts of interpersonal proximity under the principles of decentralized solidarity at the local level. This novel form of reciprocal solidarity (also called as neo-communitarianism) plays a dual role as a means to include oneself in alternative forms of (re) production on the one hand, and achieve social acknowledgement (and dignity) on the other. While this paper addresses the ideological underpinnings that distinguish the two models, it also critically analyzes their similarities. Chief among these is the fact that both depend on voluntary giving (i.e., food donations from large food corporations). Furthermore, they rely on a voluntary labor force, focus much of their activities on gathering and distributing (leftover and discarded) food, and launch food drives as a main organizational tool. Given the reign of neoliberalism and progressive state retrenchment, this study hopes to raise awareness about the challenges that Spanish grassroots initiatives face in providing long-term food relief to individuals across all levels of poverty and scarcity in the developed world.

VILLA, PAULA IRENE* (*LMU Munich*)

Knowing the Right Measure - How Class Matters in Bodily Practices (the German experience)

In sociological debates regarding embodiment, it has become common sensical to state that bodily practices (such as quantification, self-presentation, fitness, sports, cosmetic surgery, etc.) follow the governmental imperative of explicit (self-)optimization. While this is surely true in an empirical sense, I argue that this is not the whole empirical picture. Based on own research regarding a) cosmetic surgery and b) quantified self-monitoring in relation to food and fitness (in the German context), I will argue that class/status and according capital (in the Bourdieu'an sense) do matter. In our research (group discussion on cosmetic surgery along milieus, and ANT oriented participant observation with self-tracker and life loggers; both in Germany), we have found that the ethic of aesthetics - e.g. what is considered as 'good' bodily practice or how people judge others through an evaluation bodily practices etc. - follow distinctive milieus and structural positioning. We further found that a core concept of such aesthetic/ethical arguments is the seemingly common-sensical reference to "the right measure". In our material, the "right measure" constantly reappears as signifier (Derrida) for a specific truth. Further, we found that people articulate diffuse uneasiness and even critique of current political and social conditions - such we might label as neoliberal governmentality - through narratives of micro political embodiment practices (such as laziness, sloppiness, leaky bodies, etc.) Beyond the presentation of the empirical studies and according results in detail, in my presentation I hope to open a debate over class and (intersectional) inequality on practices of embodiment.

Sustainability of Fishery Resources in Conflict: Government Modernization Practices and Field Strategies Used By Artisanal Fishers

Introduction: According to FAO (2016), 31.5% of global fish stocks are over-exploited. In Chile, the Under-Secretariat for Fisheries and Aquaculture, SUBPESCA (2017), declared that out of 25 fisheries, 6 fall under over-exploitation regimes, and 8 are depleted or collapsed. This situation led to the review of the Law of 1991, and the elaboration of modifications and regulations that promote a "modernization" of fishing activities to structure conflicts between fishery agents.

Theoretical Framework: The social field theory allows to identify the fishing phenomenon as an economic field, comprised by diverse actors struggling to defend their interests. Under this context, there is always a dominant position, traditionally occupied by the Government. Likewise, other strategies arise, the purpose of which is to achieve a more dominant position in the field.

Objective: Develop an analytical model related to the strategies used by artisanal fishers in the fishing economic field on the basis of their accumulated resources and in response to Government strategies.

Methodology: Qualitative research, adopting an ethnographic approach, carried out in two artisanal fishing coves located in the Region of Valparaíso, Chile: Caleta Portales and Caleta Maitencillo. On the basis of semi-structured interviews, participant observation and document review, a content analysis is applied.

Results and Discussion: Resistance practices are identified in Caleta Portales, such as counter-demonstrations against the authorities and scarce productive re-conversion. On the other hand, it is demonstrated that the strategies used in Caleta Maitencillo are appropriations of the practices promoted by the Government, and are described as *mimesis* practices.

Conclusions: Fishers develop two types of strategic practices: resistance and *mimesis*. The first consist in re-appropriation of resources controlled by the authority in the field; the second reflects the assimilation of the practices and interests of the Government. Both strategies are found both at the discourse and practical levels.

Constrained Collaboration in Patient Consumerism

One of the marked changes in the social organization of healthcare in the United States over the past 50 years has been the increase of patient involvement in the medical encounter. Increased patient involvement has been described in various ways, including as patient empowerment, changes in patienthood, and patient consumerism. While many analyses focus on tracing the development of patient involvement, this paper examines patient consumerism from the perspective of the medical profession. I find that patient consumerism is anticipated and managed by physicians, and moreover, that medical trainees are overtly taught to manage patient consumerism. As described in earlier work, a process of constrained collaboration (Vinson 2016) can help us understand the ways in which this management occurs. Moving this earlier work forward, in this paper I discuss physician attitudes toward patient consumerism and how these are transmitted to medical trainees during their education. Thus, in order to understand how and why patient consumerism is managed by health care providers, the analysis draws on medical education, where teaching is done by practicing clinicians. This analytical window into the thought processes of practicing clinicians allows insights into what physicians think consumerist patients are like and how they think physicians should properly manage them. Understanding this process has implications for theories of professions that imply that physicians are being steadily deprofessionalized, as well as for theories of professionals and patients that imply that patient consumerism is entrenched and unstoppable—these trends may not be as operative in the local doctor-patient encounter as broader medical sociology analyses imply.

Indigenous Peoples at the Frontlines of Globalization

The overall aim of this paper is to make a literature overview and analyze conflicts concerning environmental destruction that involve Indigenous peoples and their claims to land. In particular we will through an comparison of conflicts on four continents examine what social relations, political strategies and claims of local governance and/or local autonomy are developed in the process. Indigenous peoples (IPs) cannot be separated from land as IPs think of human beings in terms of their knowledge, experiences, stories, and memories where relations to the land is essential. Land rights and responsibilities are of particular importance to study considering the centrality of land in the colonization to which IPs have been subjected, in their articulation of cultural revival and local autonomy, and the particular inflection it gives to Indigenous environmentalism in comparison with other forms of environmentalism. We are particularly interested in how ethnic boundaries may be transcended in the process of local, national and transnational political mobilization, which creates links between different social movements and socio-geographic and political contexts. Using examples of Indigenous struggles in East Asia, North America, Scandinavia, South America our paper transcends the conventional distinction between the (rich) Global North and (the poor) Global South often used in globalization research. These are our overarching questions:

1) How do IPs articulate conflicts concerning environmental destruction, in which land rights are involved, – and what strategies and social relations are shaped in the process?

2) How are collective identities shaped in the conflicts that IPs are involved in and what claims to, and actual forms of, local governance are shaped in the process?

Femicides and the State: An Analysis of Gender Based Violence within Mexican Justice Institutions

After 2007, and under the framework of the war on drugs, there has been a growing number of female deaths, particularly presumed murders, in Mexico. In 2015, out of 2,383 women who were allegedly murdered, only 323 cases had a preliminary femicide investigation, and 79 of these (3.31%) ended with a conviction. This illustrates a structural issue within the justice institutions in the country: *institutional violence*. In the case of feminicides, institutional violence contributes, on the one hand, to deepen *gender gaps* regarding the prosecution and administration of justice, and on the other, develops negative incentives that perpetuate the crime, thus contributing to an increase in *impunity*. Therefore, the objective of this article is to determine how gender based violence is reproduced within the institutions in charge of prosecuting and administering justice in Mexico, especially after the New Criminal Justice System was implemented. To do this I performed a statistic analysis of the Survey on the Pursuit of Justice at the State-Level, the Survey on the Administration of Justice at the State-Level, as well as deaths through alleged murder. These were all obtained from INEGI and through this I built a panorama of feminicides in Mexico. Additionally, I performed a comparative analysis of national femicide research protocols with international protocols and recommendations. I also held semistructured interviews with public officials across different hierarchical levels and justice offices. Finally, I followed up on a case of alleged femicide where a conviction has still not been officially made. Results show that mechanisms that reproduce violence within the justice system include: a lack of coordination between institutions; ignored or unknown protocols; and the omission of international recommendations. In conclusion, public policy recommendations are presented to reduce inequality gaps and gender based violence.

VIRCHOW, FABIAN* (*University of Applied Sciences Duesseldorf*)

Radical Right Movements and Radical Right Parties: Cooperation and/or Competition

Radical Right Movements and Radical Right Parties: Cooperation and/or Competition

While the focus of research on the radical right in many countries has been on parties much more than on movements the latter's investigation should also consider the former. There are several reasons for this: a) both often address the same/similar political issues, b) both draw their activists from the same group of people, c) the one's success might lead to the decline of the other, although this should not be generalized.

The paper takes the German PEGIDA movement and the party Alternative for Germany (AfD) as an example to elaborate on the dynamic of the PEGIDA movement in general but with a particular focus on the rise of the AfD and the controversies and contradictions this created for both actors. While for a long time leading PEGIDA activists had been self-confident to be the major radical right political player (especially in Saxony) even up to the point to create a political party alongside the AfD, finally the movement spiralled down to a weekly event of some 2,000 people performing highly ritualized. With the growing electoral success of the AfD cooperation grew closer.

The paper will bring to light the interlinked, yet different dynamics of the two projects and will discuss the empirical findings in light of existing research on party-movement-relations.

Racism, Crisis, Brexit

This talk will offer a conjunctural analysis of the financial and political crisis within which Brexit occurred with a specific attentiveness to race and racism. Brexit and its aftermath have been overdetermined by racism, including racist violence. We suggest that the Leave campaign secured its victory by bringing together two contradictory but inter-locking visions. The first comprises an imperial longing to restore Britain's place in the world as *primus inter pares* that occludes any coming to terms with the corrosive legacies of colonial conquest and racist subjugation. The second takes the form of an insular, Powellite narrative of island retreat from a "globalizing" world, one that is no longer recognizably "British". Further, we will argue that an invisible driver of the Brexit vote and its racist aftermath has been a politicization of Englishness. We conclude by outlining some resources of hope that could potentially help to negotiate the current emergency.

L'entrée Des Jeunes Dans La Profession D'animateur Socioculturel : Impact Des Nouvelles Pratiques De Management Sur Les Parcours Professionnels.

En France, l'animation socioculturelle est à la croisée de l'intervention sociale et de l'éducation non formelle. Les animateurs font partie d'un groupe professionnel hétérogène et en tension (Lebon, 2009). Depuis les années 1980, les collectivités locales sont devenues les principaux acteurs du champ de l'animation socioculturelle. Les associations qui y évoluent également inscrivent majoritairement leurs actions dans des politiques publiques leur assurant des subventions. Dans un contexte d'adaptation à la demande sociale et aux appels d'offres, l'amenuisement des frontières entre secteur associatif et secteur privé marchand impacte les orientations des structures (Hély, 2009) et les parcours professionnels (Virgos, 2017). Les animateurs professionnels doivent s'adapter à ces évolutions ; qu'elles soient structurelles, pédagogiques ou politiques (Douard, 2003). Si certains parviennent à y (re)construire leur place (Bordes, 2016), d'autres le vivent comme un « désenchantement » (Eme, 2005), les amenant parfois jusqu'au *turning point* (Abbott, 2001 ; Bidart & Longo, 2007) de la réorientation professionnelle. Cette problématique est d'autant plus prégnante chez les plus jeunes, qui entrent dans la profession. A nos yeux, la professionnalisation implique trois conditions, qui ici sont loin d'être des allants-de-soi : Trouver du travail, conserver ce travail, s'y projeter afin d'y envisager une carrière (Virgos, 2017). Nous verrons dans cette communication comment les jeunes animateurs profitent et subissent à la fois la précarité des postes et l'instrumentalisation du bénévolat et du volontariat (Dansac, Vachée & Gontier, 2011) dans leurs premières expériences « professionnelles ». Nous questionnerons l'impact de ces pratiques sur les processus de socialisation professionnelle (Dubar, 2000 ; Darmon, 2006 ; Serre, 2010) et sur l'implication (Mias, 1999 ; Monceau, 2008) des jeunes dans l'animation. Nous nous appuierons sur des études de cas issues d'une thèse actuellement en cours, articulant observations participantes et entretiens non directifs, centrés sur le parcours dans l'animation des individus.

VISPUTE, SHRUTI* (*University of Coventry*)

Beyond Belonging: Emotions in the Social Movements Resisting Against the Hydropower Dams in Contemporary India

This paper explores repression in the context of hydropower 'development' projects especially where space for dissent is very less for the 'affected' marginalised communities. The paper investigates a local Affected Citizens of Teesta (ACT) movement against hydropower dams on Teesta river, in Dzongu region of Sikkim state in India. The paper considers that emotions are produced in relations between and among people and environments and across a range of spatial scales and contexts. The paper discusses range of questions to understand the affects and effects of emotions, such as,

How spatial processes across variety of scales as well as at specific places and the relationships between the dominating power and marginalised groups, influence the emergence and expressions of various emotions.

How activist in ACT have responded [emotionally] to the hegemonic policies of the state in the case of hydropower projects?

How these emotions are related to the specific space, strategies and tactics of social movements? How these strategies enable the members of social move-

ments to deploy various emotions such as anger, outrage, fear, insecurity, love and affection for their specific place?

The paper argues that the place-based social movement members have emotions in which the sense of agency is 'beyond belonging'. And in the current scholarly understanding of emotions in social movements, there is a need of a strong emphasis on understanding of spatiality of emotions – emotions associated with the sacred land, affiliated to the river, for the culture that is shaped up because of a river, which is threatened by the neoliberal accumulation today.

VISPUTE, SHRUTI* (*University of Coventry*)

Neoliberalisation, Hydropower and Hegemony: The Contentious Politics Around Water Resources in Contemporary India

Water is a very distinct natural resource. Water use needs prioritization and choice, and this itself means possible differences and potential conflicts. This paper focuses on the proliferation of social movement struggles around water, particularly following the increase in the number of hydropower projects in India especially in the North Eastern part of the country, to facilitate conditions for industrialisation and urbanization. These processes of accumulation of capital by exploiting water resources altered the ways in which different social groups use and access water resources. It increased the conflicts over water resources and exploitation of the marginalised for the greater good of the nation. These hegemonic processes of neoliberalisation in the water sector have produced spatial inequalities and displacements in India. This paper discusses how the extractivism; inequalities and exploitation accompanying it, have been challenged and collectively resisted by the people with varied identity markers (caste, class, gender and ethnic identities). While investigating the nexus between the neoliberalisation, hydropower and hegemonic policies of the government, this paper emphasizes that it is important to understand how the social movement struggles around water internalise the general problematics of accumulation by dispossession (Harvey, 2006). The paper considers inter-relationships between the processes of domination and resistance within Indian civil society, with the example of Affected Citizens of Teesta (ACT) movement against hydropower dams on Teesta river, in Dzongu region of Sikkim state in India. The paper argues for the need to address questions such as what is being dispossessed and by whom and what can be done about it and by whom.

Children's Rights Leaders Speak Truth to Power about the Uncrc

Globally, the world of childhood has changed, which influences the transformation of traditional adult-child relationships. In this presentation, scholars who were invited to speak at the 25th anniversary convention of the UNCRC in the Netherlands will join back together to speak about the successes and challenges faced with the implementation of the treaty. These may include:

Ton Leiffard, Netherlands – youth rights and higher education

Laura Lundy, Northern Ireland – youth rights and the law

Kay Tisdall, Scotland – youth participation in the civic arena

Yvonne Vissing, USA – young people's physical and mental health

Jane Williams, Wales – youth in the legislative arena

Data from non-European/North America child rights initiatives will also be provided, including information gained from child rights in Africa (Cameroon and Nigeria), Asia (India and China), and South/Central America (i.e. - Bolivia, Mexico and Costa Rica).

It is proposed that the UNCRC has made significant contributions to the well-being of young people when policies and infrastructures supporting child rights exist. On the other hand, while rhetoric about the importance of children and their wellbeing seems universal, predictable obstacles confront implementation of child rights policies and programs. Whether in the fields of education, health-care, social services, government, or law, tension between adult and child rights contribute to challenges implementing programs that would enhance young people's wellbeing. Issues of structure, power, control, agenda-staking, social class and culture will be addressed from a multicultural and intergenerational perspective. An examination of theories including intersectionality, conflict, labeling, and functionalism will help frame the current discourse about child rights.

VISSING, YVONNE* (*Salem State University*)

You Can't Do What You Don't Know: The Importance of Human Rights Education of Young People

The Convention on the Rights of the Child and the Universal Declaration of Human Rights both require that people be educated about the contents of these treaties. In some parts of the world this happens. However, in many other parts of the world children do not even know they have rights. Data indicates that when young people know they have rights, they are better able to self-advocate for

themselves and reduce exploitation. Data collected from US college students will be presented that indicates that they did not know they had rights as children, and they don't understand what rights they and others have. Studies indicate that teachers may not teach students about human rights because they were never taught about them. Teachers cannot teach what they do not know. We allege that training young people about their rights means teaching teachers and adults about rights as well. However, there are significant challenges that exist in adding human and child rights information into existing school programs. In order to counter this obstacle, we will share hundreds of free HRE materials, including handouts, film and video links, readings, websites, and a series of down-loaded, ready-to-use materials. We have scoured HRE sites looking for materials and found that there are extensive materials ready and available - but most are hard to find. By joining together training materials from organizations such as UNICEF, Amnesty International, and dozens of others, the website we will present provides a "one stop" for hundreds of materials on any given topic. Structures and adult gatekeepers are still needed, but HRE should increase the likelihood they will emerge. Use of HRE for global at-risk populations like child soldiers and trafficked children will be explored.

Violence Performance on the Mexican Global South

The objective of this lecture is to interpret violence as a social performance that has shaped a civil sphere in which a binary speech shows the existence of a conflict linked to the following assumption: violence in Mexico is the result of a weakened State or it is derived from its collaboration with criminal violence originators. This assumption has legitimized armed social activities from groups that have emerged as vigilantes of public safety at both local and regional levels. The latter has justified armed government actions in order to address illegality within a country in which this same illegality has been a mechanism used by the poor in order to attain social well-being objectives. Thus, illegality in Mexico cannot only be studied as a regulatory issue derived from a weakened lawful order but also as a constituent part of social interactions within a neoliberal capitalism context at the Global South that, in some instances, it may produce violence.

VIVIANI, LORENZO* (*University of Pisa*)

Populism and the Broken Promises of Democracy: Towards a Partyless Democracy?

The paper discusses the relationship between the crisis of representative democracy and the perspective of populist democracy in Europe. Starting from the two sides of democracy, a procedural and an ideal type, it analyzes the emergence of populism as a politicization of a feeling of mistrust that emerges in reference to the broken promises of democracy. Populism as a thin-centered ideology is characterized by the appeal to the people and opposition to the ruling élite, nevertheless the paper underscores that the people of populists is an imagined community, a social construction manipulated by new anti-establishment political leaders and parties. The restructuring of political spaces should be observed as the restructuring of the forms and actors of political representation, neither as the end of political parties in democracy or as the end of representative democracy itself. In conclusion we consider populism as a phenomenon compatible with democracy, while stressing that it is a challenge to the mainstream actors of liberal-democracy but not an anti-system opposition to democratic institutions.

Enjeux Et Défis d'Un Programme Collaboratif De Recherche Mené Dans Une Perspective Clinique Et Critique Auprès d'Un Groupe Professionnel

Cette communication a pour objectif de mettre en discussion les enjeux d'un programme collaboratif de recherche auprès d'un groupe professionnel – celui des conseillers d'orientation du Québec – dans une perspective clinique et critique. Les difficultés de ce groupe professionnel à faire reconnaître sa pertinence sociale et son expertise, tant sur la place publique que dans les milieux de travail (OCCOQ, 2016), peuvent se traduire, selon nos recherches, par une souffrance identitaire de métier (Viviers, 2014) susceptible de contribuer à la dégradation de la santé mentale (Viviers & Boulet, à paraître). À la suite d'une demande de deux groupes de personnes conseillères d'orientation, une recherche en clinique du travail a été menée de 2009 à 2013. Dans les suites de cette recherche, de nombreuses activités de recherche, de formation et d'accompagnement ont été tenues pour à la fois mieux circonscrire le problème vécu et explorer des voies d'action possibles. Certaines de ces initiatives ont été menées en collaboration avec l'ordre professionnel des conseillers et conseillères d'orientation ou avec leur fédération syndicale, et d'autres l'ont été indépendamment de ces partenaires. Dans le cadre

de cette communication, nous présenterons d'abord succinctement l'ensemble des démarches réalisées pour ensuite discuter des enjeux épistémologiques, politiques et pratiques (Rhéaume, 2007) inhérents à ce type de programme collaboratif de recherche, fondée sur une perspective clinique et critique. Les défis de la reconnaissance d'un «nouveau» paradigme de recherche participative seront mis en perspective au regard de la managérialisation des universités (p.ex., De Gaulejac, 2012) et du courant des «données probantes» qui marque les pratiques professionnelles dans les métiers de la relation (p.ex., Couturier, Gagnon & Carrier, 2009).

Violence and 'Porous Identity': Autochthony in the Central African

Over the last twenty years, autochthony has emerged as a new identity claim during political crises such as Côte d'Ivoire and western DRC. Autochthony as identity proceeds from constant reification because it is almost impossible to prove the original belonging of any individual or group as the first inhabitant of a territory. However, different contexts of sociopolitical crisis have propelled the calls of autochthony to the front of the stage without it being ever clearly specified what it is.

Autochthony is an identity that can serve as a support for any kind of political demand. In Côte d'Ivoire, for example, autochthony served as a receptacle for xenophobic nationalism through the slogan of 'ivoirité'. Pushed to the extreme, autochthony seems to carry also a violent character which is difficult to explain.

This paper draws on five months of fieldwork in the CAR and research in newspapers archives and seeks to understand the autochthony claims in the conflict. The anti-balle-AK groups during the last political crisis claimed that they were the "true central-africans" and violently attacked Seleka rebels and the Muslim community. The CAR since its independence from France experienced various violent episodes more precisely in 1996-7 and 2001. However, unlike previous coups in the country, the armed groups involved had not used this type of identity claim. This paper shows how an empty identity claim can in fact conceal several layers of meaning for the populations that use it.

Of Loops and Circles: Imaginations and Indicators of 'Circularity' in EU Policy Making on the Circular Economy

In recent years we have witnessed a growing interest in the concept of a Circular Economy in EU policy-making, which promotes a future in which linear 'make-use-dispose' cultures are replaced by more circular models. Visions of a Circular Economy eave together ideas of waste management, recycling, reuse and resource efficiency with visions of sharing economies, maintenance and repair cultures and discussions about product quality and longevity. Although the origins of this concept lie in waste management, current ambitions go beyond a focus on biophysical flows and draw on a broad variety of culturally situated meanings.

In this contribution we ask for the multiple meanings of 'circularity' in EU policy-making and explore the ongoing assembling and stabilizing of a particular imagination of circularity in a range of different sites. To do so we will draw on the concept of sociotechnical imaginaries (Jasanoff & Kim, 2009, 2015). Imaginaries are understood as collectively shared visions of desirable societal futures (social and technical order) and as a way to analyse contingencies in policy-making through highlighting especially the futuristic orientation of policy narratives.

The aim of this contribution is to explore how the vision of a circular future is being established and which social, political and epistemic orderings are related to these futures. We will proceed in three steps: first, we will discuss from a historical perspective how a particular imaginary of circularity has been assembled, rehearsed, contested and stabilized in the development of the different legislative proposals of Circular Economy. Building on that, we will look at indicators and that are currently in development for monitoring and 'measuring' circularity and show how indicators need to be understood as a specific site in which imagination are stabilized. In a third step we will ask for the performative dimensions of these indicators and for potential alternatives.

The Role of Quantifying Material Flows in the Governance of the Water-Energy-Food Nexus

In recent years we have witnessed a growing interest in the water-energy-food (WEF) nexus in both academia and policy highlighting the need to address the institutional, political and cultural dimensions of nexus policy-making (Cairns & Krzywoszynska, 2016; Stirling, 2015). The concept directs attention to three aspects: (1) the interrelated pressures created by agricultural production, water use, and energy production and consumption practices, (2) the epistemic challenges of understanding these complex and non-linear interactions and (3) to the policy problem of governing a transition to more sustainable modes of production and consumption.

This presentation aims at contributing to an understanding of the institutional, political and cultural aspects of nexus governance. It will be based on material from the Horizon 2020 project 'Moving towards adaptive governance in complexity' [1], which aims at exploring the quantitative assumptions within policy narratives on the nexus, using an approach called Quantitative Story Telling (QST). QST is a cyclical participatory modelling approach, starting with problem definition, establishing and quantifying the narrative using a social metabolism approach called MuSIASEM (Multi-Scale Integrated Analysis of Societal and Ecosystem Metabolism), then discussing the model results in terms of feasibility, viability and (crucially) desirability. Scoping interviews and thematic analysis of policy documents suggest there are different narratives around what is measured and how these metrics can be used to generate niches for nexus thinking within the European Commission policy units. In particular, we are interested in seeing whether alternative metrics and discussions catalysed by these results, can help make space for alternative modes of governance. (Asdal, 2008; Hajer, 2006; Porter, 1995)

As such, this talk will contribute to the overall aim of the session to provide a critical analysis of the role of metrics in environmental governance by directing attention to their discursive, institutional, political and material aspects.

Women Must and Men Can: Paid Work during Retirement in Germany

Poverty in old age has increased in Germany in the last 10 years and is expected to grow even more the next decades due to both, cutbacks in the generosity of the public pension system and changes in employment biographies that become more discontinuous and precarious. At the same time employment participation during retirement has been increasing from 5,1 percent in 1996 to 11,6 percent in 2014 as findings from the German Ageing Survey (Deutscher Alterssurvey DEAS) show. These both trends have motivated the debate whether retirees work because they choose to do so or whether the participation is provoked by financial reasons in a context of increasing poverty.

Further, the question raises whether the determinants of employment participation at older ages differ between genders. Employment biographies of retired women in Germany differ substantially from those of men, characterized by higher and longer employment breaks and lower earnings. As a result, their financial situation after retirement is more precarious, especially if they live alone. Since decades, the poverty rates for older women (65+) are higher than for older men (e.g. 18,3 percent versus 14,5 percent in the year 2015, rates provided by the Federal Statistical Office).

Using data from the German Ageing Survey (DEAS), we investigate which are the factors determining employment participation during retirement and employment income in old age, with the focus on income poverty and gender differences. We expect the financial situation after retirement to play a more important role for women than for men. However, employment income in paid work during retirement does not seem to be helpful to alleviate poverty.

Who Gets to Play? Role of Gender in Taking up Professional Sports in Pakistan.

Youth constitute more than a third of the population of Pakistan which is a country of more than 200 million. Apart of looking at youth's schooling and work, it is also important to study what they do for leisure including sports and games. These activities are not just important for their physical and psychological health but also bolsters their social skills, improves learning capacity and protects them from various risky activities. Despite knowledge of these important outcomes through sports, access and participation of youth remains limited due to various reasons, ranging lack of resources, opportunities, facilities, societal views on sports and security concerns.

In Pakistan, participation of females in sports, especially in formal and structured ones are extremely limited as facilities and opportunities are limited. Hence, only those young girls who in an educational setup report involved in sports. However, since girls' participation in education is increasing, their chances of being part of sports is also rising. Moreover, with increasing modernization and westernization culture and aspiration is also changing. Now, at least in larger cities of Pakistan, females are taking up sports professionally. Pakistan has professional sportswomen and teams for major games such as football, cricket, hockey, squash, boxing etc. However many of them have to strive to make it on their own to reach international arena as there is little support from community and government.

There are plethora of factors which impacts women's participation in games and professional sports. The aim of this research is to explore these issues from different angles.

Data for this paper will be drawn from interviews of female university students who are part of formal sports teams and also coaches and sports officials. The interviews will explore the social, cultural, financial, and other factors that create barriers or facilitate women's participation in sports.

Youth Engagement in Politics in Digital Age in Pakistan

Pakistan, a nation of more than 200 million has a youthful population structure. A third of the population falls in the category of youth. The country is rapidly urbanizing which has made access to various technologies such as internet, easier than before. There are more than 45 million users of 3G technology which has brought literally internet at the fingers of these users. A large majority of Pakistani internet users are very active on online social networking sites (SNS) such as Facebook, Twitter, Instagram etc. Facebook, itself reports around 30 million active users from Pakistan. These users of Facebook are mostly under the age of 34, residents of large cities, and fairly educated. Low cost, ease of use, interactive nature and the ability to reach out the audience instantly has made these SNS sites darling of various entities including government, political parties, businesses, non-profits, mass media etc.

Research on political and civic engagement of youth in Pakistan has shown a dismal picture as there has been a apathy among youth towards this aspect of public life. However, since the spread of social media, this has changed as youth who are already engaged online can be motivated for politics and civic activities. Now, all major political parties in Pakistan have a significant social media presence and they use these sites to engage with current members and recruit more.

The current study plans to interview 100 undergraduate students of a university in Islamabad, about their current civic engagement activities through SNS and the potential of SNS for such activities. The study would explore their views on generating social good and political engagement through social media. Findings will be bolstered with data from experts on social media in Pakistan.

VOGT, JAN VALENTIN* (*KU Eichstaett-Ingolstadt*)

Avoiding Old-Age Poverty in Times of Demographic Change: An Unconditional Basic Income Scheme for Pensioners within the German Statutory Pension Insurance

Due to pension reforms in the last decade, the problem of old-age poverty is back on the agenda of German social policy. To address this problem, tax-financed subsidies to stabilize the replacement ratio in the statutory pension system are being proposed by the German government. Due to the equivalence principle in the German pension system, pensioners benefit from this subsidy according to their individual life-time contributions. This raises the question whether these subsidies should rather be used to combat old-age poverty. In this paper, we propose an unconditional basic income for pensioners (UBP) additional to the contribution based system.

We simulate the current pension system and both reform proposals for Germany until the year 2060. Demographic development is projected using a Leslie matrix approach. The economic environment is projected via a Solow-Swan growth model. The labour market is modelled using the approach of Burniaux et al. (2004). Finally, the German Statutory Pension Insurance is modelled via a detailed computation of each cohort's average earnings points in each year, and a projection of contribution rate and replacement ratio via the balanced budget requirement. For the distributive analysis, the cohorts' earnings points accumu-

lation is also modelled separately for different income brackets. This model is run in three different scenarios: the status quo, the government proposal, and our model of an old-age unconditional basic income. The UBP is designed to be fiscally equivalent to the government proposal.

Our results show that an unconditional basic income scheme for pensioners significantly reduces old-age poverty, whereas the government proposal mitigates the burden of demographic change mainly for medium and upper pension incomes. As a positive side effect, the UBP increases the internal rate of return of the pension system for low-income earners. However, compared to the status quo, both proposals require substantial additional tax-based subsidies.

VOHLÍDALOVÁ, MARTA* (*Institute of Sociology, Academy of Sciences of the Czech Rep.*)

Academic Careers and Parenthood: A Generational and Gender Comparison

Since 2008 the Czech system of research and innovation (R&I) has increasingly promoted a managerial model oriented toward measuring research performance and enhancing the competitiveness. This went hand in hand with decreasing long-term institutional funding and increasing work insecurity. This has had a major impact on research organizations and individual careers alike. Since the current transformation of R&I has developed around the ideal of a masculine career model which is free from any care obligations in the private sphere it influences parents' (and particularly women's) careers and their possibility to combine parenthood with career progress. The qualitative analysis comparing the careers in R&I of women whose career developed before 1989 and young women academics today, underscore many differences in coping strategies and perceptions of and values associated with work-life conflict and its everyday management in the workplace (Vohlídalová 2017). The paper further discusses the impact of parenthood on the course of academic careers in the context of neoliberal transformation of R&I and investigates generational and gender differences, as well as differences between various research domains. The analysis is based on a unique representative on-line survey including 2,089 Czech academics collected in 2017. The study enriches the contemporary state of the art with findings from the cultural environment of a post-communist country characterized by a combination of a relatively strong gender conservatism, where the issue of gender equality in science is not addressed in R&I policies as a relevant issue and where there is a strong pressure on Western standards of science and scientific excellence.

Required Competencies for Robotics in a Digital Era

The transition to a digital economy radically changes the labor market: digital competencies become critical in all areas. One of the main mega-trends that occur together with digitization is a robotization. Robotics is one of the fastest growing industries in the world. However, a significant barrier to the development of robotics around the world is the lack of qualified employees and the lack of the required competencies (so called «skill gap»). The survey of organizations in the field of robotics (universities, research institutes, manufacturers) and interviews with their leaders was conducted at the end of 2016 in Russia. The data collected in the survey was enriched by job advertisements analysis: job postings aggregator indeed.com to identify top required skills in robotics on the international market (vacancies from USA, Great Britain and Canada were included) and Russian job postings aggregator hh.ru. This assures comparison of countries at different development stages, which influence companies' innovation activities. In general, professions in robotics are "international": the most important competencies of specialists in Russia and abroad coincide. The results showed that currently in most Russian organizations (61%) there exists a shortage of qualified staff. Employers indicate that the already unfilled demand for highly skilled personnel will only grow in the future. According to more than 70% representatives of surveyed organizations, in the next 5 years will increase the importance of specialized knowledge in the field of robotics, understanding of the latest trends in the field of robotics and possession of special methods and techniques. All this should be combined with deep theoretical knowledge, which are stable important for this the field, and the ability to adequately apply them in practice.

RC09-198.2VOLOSEVYCH, INNA* (*GfK Ukraine*)*Factors of Tolerance Towards Corruption*

Factors of tolerance towards corruption

Both according to experts and according to public opinion polls corruption is the main problem of Ukraine along with occupation of the territories Donbas and Crimea. Intolerance to corruption in society is one of the main factors of its combatting. On the one hand, perception of importance of corruption problem among Ukrainian population is increasing. According to public opinion surveys of residents of Ukraine conducted for IRI by GfK Ukraine and funded by USAID in 2017 Ukrainians for the first time since 2014 assigned the same importance to the problem of corruption as to Donbas war problem: in June 2017 51% of Ukrainians named corruption and 50% named Donbas war among three top problems of Ukraine while in previous surveys in 2014, 2015 and 2016 corruption problem was perceived as significantly less important than Donbas war. On the other hand, according to recent survey conducted for the USAID New Justice Program 46% of respondents believe that corruption is an integral part of the political life of Ukraine and it's useless to fight it (vs 40% of those who do not agree with this). Moreover, 20% of Ukrainians are even not ashamed to say that they will consider giving a bribe to the judge in case of receiving correspondent offer - considering the sensitivity of this question and 27% of "hard to say" answers the real share of such citizens is significantly higher.

By analyzing the results of recent population surveys in Ukraine the paper will address the questions: 1) what is the relation between individual social position, corruption experience in local public institutions and tolerance to corruption? 2) what are the main factors which motivate people not to give bribes and report about corruption offers?

RC31-557.9VOLOSEVYCH, INNA* (*GfK Ukraine*)*Human Trafficking in Belarus, Moldova and Ukraine*

Human trafficking in Belarus, Moldova and Ukraine in 2017

GfK Ukraine conducted 5 waves of nationally representative surveys in Belarus, Moldova and Ukraine in 2006, 2008, 2011, 2015 and 2017 on labour migration and human trafficking for IOM. In 2006-2015 the studies showed the following trends:

- the positive trend in Moldova where in 2006-2011 the trend of increasing of illegal labour migration and trafficking rates was observed while in 2015 it changed into a positive trend of decreasing of the number of illegal labour migrants after the introduction of visa-free regime with EU in 2014.
- the negative trend in Ukraine where the trend of increasing of illegal labour migration and trafficking rates is observed in 2015 as a result of military conflict in Donbas and crisis in the economy.

The paper will explore the results of the survey conducted in 2017 to understand the extent, dimensions, causes and consequences of human trafficking in three countries, to explore migration-trafficking-risks awareness nexus and to develop gender sensitive recommendations for increasing of awareness of the risk of human trafficking in particular situations.

RC34-630.5VOLTURO, STELLA* (*University of Bologna*)MARTELLI, ALESSANDRO* (*University of Bologna*)ZURLA, PAOLO* (*University of Bologna*)*Patterns of Self-Employment Among Young People. the Case of the Emilia-Romagna Region in Italy*

The paper aims to present the main findings of an empirical research concerning life and work conditions of a sample of young self-employed in Emilia-Romagna region, in Northern Italy.

By starting from the goal to understand life and work conditions of young self-employed, three main questions have been addressed:

- Under which social, economic and family conditions young people decide to follow the pattern of a self-employed career?
- Which are the subjective meanings, motivations and goals which oriented young people towards this working pattern?
- Which are the main social needs emerging from young self-employed?

In order to answer these questions, after providing a brief statistical review of the phenomenon, we opted for a qualitative approach, which better fits the goal to reach the subjective dimension of interviewers. More in detail, 50 biographical interviews involving young self-employed have been carried out. They come from different sectors and working conditions, such as those belonging to the emerging forms of work (web strategists, digital communicators, start uppers) and the more traditional ones (translators, artisans).

The results of the research show that the so called 'self-employment world' is far from being a homogeneous scenario. Although among the interviewers it is certainly possible to find common aspects, in terms of positive and challenging

factors linked to their working life, it is also remarkable the presence of differentiated conditions which could be understood in the light of wider social and economic changes occurred in our contemporary societies, such as the process of individualization and the fragmentation of working conditions.

Finally, thanks to the analysis of the empirical data, we can distinguish new social needs emerging from life and working conditions of young self-employed. These needs are challenging the current welfare system which seems to act by pursuing a fragmented approach which produces social insecurities and new vulnerabilities.

RC19-351.2VON GLEICHEN, ROSA* (*University of Oxford*)PAROLIN, ZACHARY (*Herman Deleeck Centre for Social Policy, University of Antwerp*)*Varieties of Liberalism? A Comparative Analysis of Family Policy & Poverty Outcomes across the 50 United States*

The comparative family policy literature tends to assume uniformity in the United States' liberal family policy. This dominant perspective, however, overlooks the decentralization of and immense subnational heterogeneity in family policies across the 50 states. Thus, this paper systematically investigates the extent to which a family's ability to achieve financial recourse from the welfare state or market varies across the United States. The analysis then demonstrates that such variation helps to explain differences in family employment and poverty outcomes across the U.S.

To arrive at these findings, we first compare policies related to social assistance, access to health insurance, potential gains from minimum wage employment, publicly-supported childcare and pre-Kindergarten programs, and paid family leaves across the 50 states and the District of Columbia. Differences are aggregated into an 'index of defamilization' based on relative generosity and accessibility of the policies offered. We apply the resulting index into an analysis of poverty and employment outcomes among households with children across the 50 states. A cross-sectional, multi-level model using the CPS ASEC demonstrates that families living in states with more generous sets of family policies are less likely to live in poverty and less likely to engage in low-wage employment (after controlling for other household and macroeconomic characteristics).

Contrary to the dominant perspective of a uniform 'liberal' welfare state within the U.S., the results corroborate our hypothesis that 'Varieties of Liberalism' exist, and that this variation matters in examining social outcomes. Though comparative family policy often assumes that the U.S. does not encourage families to turn to the state for support, many states do appear to offer relatively generous state provision. Future research into American family policy should take into account state-level variation in order to more appropriately represent U.S. family policy in the context of 'Varieties of Liberalism.'

RC47-792.3VON HOLDT, KARL* (*University of the Witwatersrand*)*Between Neoliberalism, 'corruption' and Social Crisis in South Africa*

This paper explores the politics of democratisation and transformation in post-apartheid South Africa. I argue that South Africa, 20-odd years after the negotiated transition, is characterised by the disjunction between two intertwined and contradictory political systems: a formal political system based on institutions of constitutional democracy, and an informal political system structured around the politics of patronage, factionalism and violence centred on the struggle to capture rents, resources and state institutions. This latter is usually – and I believe misleadingly – described as "corruption", thus eliding the possibility of understanding its systemic qualities and the particular socio-political and economic roles it plays.

Underpinning the contradictory entanglement of these two political systems is a struggle over the nature of South African capitalism – that is, between a predominantly neoliberal corporate capitalism centred on Western models, and a more localised form of accumulation centred on a murky nexus of state institutions, patronage and capture of rents through which a rapacious new black elite is attempting to muscle into a field dominated by previously white corporations and Western multinationals. This latter form is not only local, but has powerful alliances with corporations from the Brics countries, and specifically those with similar relations between national corporations and the state, namely Russia, China and India.

The paper will also refer briefly to similar practices and themes in the other Brics countries.

RC16-303.5VON HOLDT, KARL* (*SWOP, University of the Witwatersrand*)*Bourdieu in the Grey Zone of Violent Politics (South Africa)*

Pierre Bourdieu is the quintessential theorist of domination and social order. South Africa presents an exemplar from the global South – fractured, contested, disputative, disorderly, violent. In this paper I rethink Bourdieu from a Southern perspective. In particular, I reconstruct the concept of political field to provide for multiple overlapping, mutually unintelligible and subversive fields of practice occupying the same social space, thus accounting for double-meaning, ambiguity, violence and subaltern agency in the making and unmaking of social order.

Drawing on empirical research on local politics in South Africa, I identify three political fields which intersect, overlap and destabilise each other: the formal democratic field, and informal field of patronage, factionalism and violence, and a field of insurgent citizenship. It is this complex political arena of overlapping, meshing and mutually disrupting fields that characterises violent democracy and its grey zones (Auyero 2007) of legality and illegality, symbolic ambiguity and dissonance. While some agents may attempt to restrict their practice to one or other of these fields, others engage in practices across two or more fields simultaneously, and in any case each field is irretrievably influenced by or 'corrupted' by the symbolic practices of the others, meaning that most agents – or at least those who survive – are implicated in moral and symbolic ambiguity and the workings of the grey zone.

This is an attempt to rewrite Bourdieu for the postcolonial world, where each of these different political fields bears a different history in relation to conquest, colonialism, modernity and democracy. Such rewriting is fundamental, constituting a fundamental departure from Bourdieu rather than an elaboration.

RC38-675.1VON UNGER, HELLA* (*LMU University of Munich*)*Narratives of Young Refugees in Germany: Chances and Challenges for Ethical Conduct*

Given the increase of migration to Germany in recent years, more research is needed on the situation of refugees. Research with refugees encompasses many ethical challenges given the vulnerability of the group including the possibility of re-/traumatization when narrating experiences and life histories. Yet refugees may wish to tell their story in order to bear witness, have a "voice" and change both the situation as well as the perception of their group in the host society. This paper describes a qualitative interview study conducted with 31 young refugees (age 17-24) in collaboration with the city of Munich in 2016-2017. Ethical challenges included procedures of written informed consent, questions of voluntary participation, dealing with emotions and precarious life circumstances (such as participants' fear of detention), careful handling of sensitive information, strategies of anonymizing the data and issues of interpretation. Furthermore, a more general aim was to meet the "dual imperative" of refugee research, an ethical standard which implies that research with refugees should meet both highest scientific standards and produce useful results to benefit the group itself and/or policies directed at the situation. The paper discusses how the ethical challenges were met in the current study and draws conclusions for research with refugees, in particular qualitative, biographical research with young refugees.

RC06-132.1VOORPOSTEL, MARIEKE* (*FORS (Swiss Centre of Expertise in the Social Sciences)*)*Diversity in Life Course Trajectories: Pathways of Choice or Vulnerability?*

This study aims to assess whether increasingly diverse family life courses are indeed pathways of choice, or whether they reflect pathways of cumulative disadvantage and vulnerability. Using data from Switzerland, this study will answer three questions:

1. Is the increase in family transitions across the life course universal or is it concentrated in specific social groups?
2. To what extent are diverse life course trajectories in the family domain related to outcomes such as health and wellbeing?
3. Is this relationship the same for all socio-economic groups and for men and women?

The main hypothesis is that advantaged groups benefit from the myriad of options that have become available, whereas disadvantaged groups are more likely to experience the risks involved. As a result, individuals from a lower socio-economic background are expected to report more instability in the family life course, with more negative health and wellbeing outcomes compared to individuals from higher socio-economic backgrounds, reflecting increasing vulnerability. For higher socio-economic classes we expect to find a higher share of more standard life course trajectories and a weaker association between nonstandard family life course trajectories and wellbeing and health.

To test this hypothesis we use biographical data from the third sample of the Swiss Household Panel (collected in 2013, N=6090) complemented by panel data from 2013 to 2016). Using the biographical data, we assess the number, timing and sequencing of transitions in the family domain, such as transitions into and out of partner relationships, and transitions to parenthood. We then describe these life course characteristics in relation to socio-economic status to assess the extent to which they are equally distributed over social groups. Next, we relate these life course characteristics to measures of health and wellbeing and examine whether this relationship differs by socio-economic background and by gender.

RC31-566.6VORHEYER, CLAUDIA* (*University of Zurich*)*Expatriation As Mobility or Migration? – Theoretical Considerations and Empirical Insights*

The aim of this session, to highlight the place of the expatriation in the field of migration studies, relates directly to my current research project on people who have lived in more than two different countries, including their country of origin respectively birth, which often takes place in the context of career path of the persons concerned, or indirectly, by their spouses or parents. These social type of the (post)modern stranger, who is coming today and leaving tomorrow, is mostly discussed in other scholarly fields than in migration studies. However, in my own research they are contextualised in the rarely examined phenomenon of onward migration and thus within migration literature. Significantly, in this slowly evolving research field particular and increased attention – at least in the European context – is paid to refugees, who are crossing another nation-state border some time after the legal-administrative recognition of their refugee status, which allows them free intra-European movement respectively migration, depending on how one chooses to put it. Nevertheless, up to the present concerning the object of my own study I also make use of the term «transnational mobiles» and ask amongst others about potential cosmopolitanisation processes, which indicates the connection not only to the literature focusing on expatriation but also on cosmopolitanism, both empirically, theoretically and semantically to a great extent separated from the field of migration research. Despite this seemingly inconsistent and conflicting framing, the idea to contextualise expatriation in the field of migration studies remains and is combined with the expectation of its mutual benefits. For the presentation in this session the approach of the study and its results will be outlined and discussed.

RC18-342.6VORHEYER, CLAUDIA* (*University of Zurich*)*Good Citizens and the Common Good: Expectations, Everyday Efforts and Scopes of Responsibility*

The presentation is based on a survey focusing on the common good, which took place in Switzerland in 2015 and 2017 and consists of a representative sample. As a central part of the study, the respondents evaluate - from their own perspective and experience - national and international operating companies, governmental as well as civil society organisations regarding their public value, meaning their contributions to the greater good. Amongst others, the population is also asked about their own possibility of contributing to the society as a whole. As a matter of fact, 95 of 100 respondents believe that the citizens can make significant contributions to the good for all through their behavior. The qualitative part of the data - in form of a substantial amount of often even extended and detailed comments made in response to an open question - reveals that people are not only convinced they are able to, but also, more in-depth, how they put effort into it in everyday life. Moreover, in the light of the statements it becomes apparent which role the citizens ascribe to themselves as well as to other social actors and sectors in society, such as the economy and the state, and who they account responsible for what. Their comments express, explicitly as well as implicitly, the ways in which people interviewed understand themselves as citizens in the 21st century, what does it mean to them to be a «good» citizen, and last but not least, what is the sense of their social and political membership and feeling of belonging in a globalised world.

RC44-JS-15.2VOSKO, LEAH* (*York University*)GRUNDY, JOHN (*York University, Department of Political Science*)CASEY, REBECCA (*Department of Political Science, York University*)NOACK, ANDREA (*Ryerson University*)*Exemptions in Ontario's Employment Standards Act: Deepening Labour Market Insecurity*

The Ontario *Employment Standards Act* (ESA) is a key source of workplace protection for employees in Ontario. Since its inception in 1968, however, the ESA and regulations made pursuant to it have specified exemptions and rules

that provide 'special treatment' for certain industries, occupations, or sectors. As a result, the ESA and its regulations include a complex web of more than eighty-five exemptions, partial exemptions, and qualifying conditions, which limit the application of its protections. The central argument of this paper is that exemptions and special rules can exacerbate precarious employment among the employees to whom they apply, often with the consequence of deepening insecurity among those belonging to disadvantaged social groups in the labour force, such as young people, recent immigrants, and women. Legislators must therefore direct attention towards eliminating unprincipled exemptions with a view to, at once, confronting precarious employment and social disadvantage.

How and Why Do Doctors and Nurses Leave the Profession? - Transition and Retirement Patterns for Health Professionals in the Nordic Region

Regulating health professionals in a globalized context with rapidly developing technology is a challenge. While the traditional picture is of a fairly stable health professional workforce it appears that the current situation is characterized by more diversified career patterns. Many health care professionals transition to other types of jobs, retire early or move across national boundaries. - Recent surveys in Denmark and Norway show that a high number of doctors are considering to leave their jobs before retirement age. Even stronger transition trends can be found among nurses in the two countries.

This indicates a change in the perception of professional roles, and also a perception of growing dissatisfaction with the working conditions in contemporary health care settings combined with relatively good job opportunities elsewhere. This problematic for users of health care and for planners of future health professional work force needs as it leads to shortages in some areas and perhaps also a skewness in the skillset of remaining health professionals. A particularly important issue is how the large cohorts of aging health care professionals choose to transition or retire from their jobs. This paper will use registry and work force data to analyse trends in regards to transitions and retirement of doctors and nurses in the Nordic region. We will combine the registry analysis with survey and qualitative data to seek explanations for the observed trends. - Finally we will discuss potential consequences at the societal and professional level.

Participatory Action Research of the Actuality of "Manifesto of the Communist Party"s 10 Points Revolutionary Action Program for Conquering Self-Managing Democracy

170 years after the first edition of the Manifesto of the Communist Party, this paper proposes to interested colleagues the organization of the Participatory Action Research (PAR) of the actuality of the Manifesto of the Communist party's 10 points revolutionary action program for uplifting proletariat into a ruling class and conquering simultaneously political, economic and cultural democracy or self-management, on the track of lessons drawn from the 1871 Paris commune experience for accomplishing classless society in the second decade of the 21st century. PAR namely enables overcoming of the class division of labor between active small-bourgeois subjects, passively responding working class objects and minority of large bourgeois research financiers.

Proposed PAR should explore what is the current state of realization of the 10 points revolutionary action program in the field of capitalist property and labor legislation, industrial and agricultural, credit and fiscal policy of state administration as well as in the domain of communication, transportation and education means, proposed by the MCP authors as necessary for carrying out of the structural transformation of the entire capitalist mode of production. Paper recalls that the authors of the MCP proclaimed this program themselves in later editions of the MCP to be outdated and variable depending on concrete conditions of class struggle in particular countries.

The paper identifies as the main challenge to organization of the PAR on conquering simultaneously political, economic and cultural democracy or self-management, the scaling up of the participatory action research as a form of referendum of the great majority of wage laborers on the desirable organization of egalitarian, peaceful and just social production relationships through the implementation of contemporary production forces of IT technology put under the control of freely associated producers and consumers so that the freedom of each individual is the condition for the freedom of all.

Changing Patterns of Inequality in Higher Education: The Role of Private Universities in Cyprus

Since 2007, there was a remarkable growth of a private university sector in Cyprus. This development met no resistance on ideological or political grounds but was rather actively promoted by left and right wing governments alike. This expansion of higher education was primarily driven (a) by the existence of a growing demand by lower middle class families to offer high value cultural capital to their offspring, and (b) by a rhetoric that saw higher education expansion as a field of economic growth. As a result, today 8 out of 10 secondary school graduates pursue higher education within Cyprus (roughly 50% in private or public universities) or abroad (primarily Greece and the UK).

This paper will examine whether mass participation in higher education is sustainable in a small country with limited places for prestigious white-collar jobs. In an environment of credential inflation, higher education qualifications are no longer enough to secure upward social mobility. Thus, contemporary inequalities in terms of social class effects may lie not just in accessing university education but in the unequal pattern of choices (a) for fields of study and (b) for selective (or non-selective) higher education institutions which offer distinctive symbolic advantages to graduates in the labour market. As Collins (1999) remarks, instead of having systems characterized by class-based inclusion and exclusion, we now have a more differentiated fields of higher education. While more lower class students enter university, inequalities arise from the unequal opportunities for choice-making. This paper explores the intersection between stratified social backgrounds and the stratifying structures of higher education destinations, which include public/private distinctions, local universities and universities abroad, different fields of study and the perceived hierarchies of institutions and qualifications gained. As always, larger social inequalities set limits on what education can achieve in terms of producing social equity of outcomes.

Solving the North Korea Nuclear Crisis Is the Responsibility of the United Nations and Not of the Great Powers or the United Nations Security Council

North Korea has conducted a series of missile and nuclear tests, some of which flew over South Korea and Japan, and continue to threaten other tests in the future. This escalated international tensions in the region and beyond. Failure to reduce tensions and solve the North Korea nuclear crisis this time may lead to the third world war. This paper proves that the imposition of various sanctions by the United Nations; the call for a joint freeze and dialogue by China and Russia; the suggestion of solutions through the United Nations Security Council and cooperation between the United States and China by Germany; and the "fire and fury" threat by the United States, all of which are not good for the world.

Meta-Organizational Perspective on Interest Intermediation in Multi-Level Governance Contexts: Theoretical Propositions and Empirical Illustrations from the European Knowledge Policy Domain

Interest groups are political organizations considered to be an increasingly important channel for articulation of public interest in modern democracies (Richardson, 1995). While the burgeoning interest groups literature provides significant insights into interest groups populations, their status, lobbying strategies and success, their internal organizational dynamics constitute somewhat of a lacuna (Halpin, 2014) and we know far less about "how interest groups come to pursue specific goals" (Binderkrantz, 2015, p. 310). Moreover, insufficient consideration has been given to the fact that many interest groups operating within federal states or complex polities such as the EU are actually associations of national or local interest groups, i.e. they are meta-organizations (Ahrne & Brunsson, 2008).

This study will combine insights from comparative politics and organizational sociology (including the meta-organizational perspective) into a theoretical approach suitable for analysing the relationship between (1) organizational identity, status, policy positions and lobbying strategies of the meta-organizations, i.e. associations of interest groups and (2) the same organizational attributes of their members (national or local interest groups). The robustness and relevance of this theoretical approach will be illustrated with a case study of a European association operating in the knowledge policy domain.

The study will contribute to understanding how political meta-organizations and their members relate, in particular with regards to (a) effects of membership

on meta-organizations, (b) power within meta-organizations, and (c) struggle for autonomy between meta-organizations and their members.

Career Aspirations and Outward Migration of Students Pursuing Higher Education (A Study of East Champaran, Bihar)

Introduction:

The East Champaran District is in North Bihar headquartered in Motihari. It is a relatively backward region of Bihar. Gandhi's historic visit to Champaran in order to support those who had revolted against the conditions of indigo cultivation in 1914 and 1916, and his extensive tour of Bihar before launching the non-co-operation movement, had set this small district at the centre stage in the history of struggle for independence of India. The opening up two central universities in the state makes it imperative upon the researchers to study the pattern of higher education and the outward migration of students in search of good educational institutions. The purpose of this study will be to assess the university and college programs on career aspirations of students of Bihar and the major factors responsible for the outward migration of these students to other states. The paper shall also discuss the perception of the students about higher education in the State. The proposed paper shall focus on studying the link between the career aspirations and outward migration of the young students of this District.

ICT As a Vehicle for Rural Development (A Socio-Economic Appraisal in Selective District of Rajasthan, India)

ICT as a Vehicle for Rural Development

A Socio-Economic Appraisal in Selective District of Rajasthan (India)

Dr.Hamendra Nath Vyas*

Information and Communication Technology (ICT) plays a catalytic role in the domain of socio- economic delivery systems in the modern world. It helps in strengthening the rural livelihoods. India has wintered a quantum leap in the welfare activities after initiation of ICT in governmental spheres. People are the greatest resources in the society and are the focus of all delivery mechanisms of the social organization and enterprises. The range of rural resources of society in India is wide and varied. If the rural situation is analyzed closely, resources would be found to be unexpectedly numerous, but still there exists an inequitable distribution of economic gains.

The debate of the impact of ICT on rural livelihood is two-fold. On one hand, literature vindicates the fact that ICT conduces to the complex task of poverty reduction by leveraging the effects on earning opportunities, on educational and health services, on good governance and promoting democracy. This argument is corporated by C.Kencny et al 2001, World Bank, Millar and Mansell 1999, Potashnik and Capper 2001. On the other hand, the second line is bringing in socio economic development to rural areas in the developing countries. On the contrary, there are also arguments that the technology serves as solution. All these literatures emphasize that ICT with marginalized groups, such as the poor, is not only about overcoming that digital divide, but rather enforcing and furthering the process of social inclusion, which is warranted for transformation of the environment and social system that reproduces poverty. Present work I have selected districts Bhilwara and Chittaurgarh of Rajasthan, India.

Key words: Catalytic, Organization, Resources, poverty, Development

Rural Enhancement through Panchayati Raj(A Socio-Economic Study of Rural Upliftment in Rajasthan)

Main objective of Indian government is overall development of country since independence. Seventy percent population is rural based and its economy is based on agriculture. In this context government of India thinks that how to develop agriculture and rural economy.

Keeping this thought in mind the Panchayati Raj Institutions were introduced under the 73rd Amendment Act of Constitution of India. Rural development includes to strengthen the democratic structure of society through Panchayati Raj Institutions (PRIs). It also includes steps to improve the rural infrastructure, income of rural households and the delivery system leading to education, health and safety mechanisms.

Rajasthan has the distinction of being a pioneer in accepting the scheme of democratic decentralization envisaging a three-tier system of representative bodies at the village, block, and district levels. The system later came to be known as Panchayati Raj, which was inaugurated by the Prime Minister Pandit Jawaharlal Nehru on 2nd October 1959. Panchayati Raj system is important agency for rural areas in Rajasthan which are related to the enhancement of rural socio-economic situations. So that PRIs can make availability to the dream of rural administration and rural enhancement with complete co-ordination and transparency. For this purpose the PRIs has provided a citizen charter, provision of gram Sabha at the bottom level of society, right to information and panchayat members who are elected by the rural people and the election process includes class wise reservation which is strictly followed. These factors are responsible for the enhancement of rural areas. By keeping these above mentioned factors. I have done research work of Southern Rajasthan, India.

Key words : Rural, economy, panchayati raj, enhancement, reservation

WAECHTER, NATALIA* (Ludwig-Maximilian University Munich)

Teenage Social Media Culture(s): About Adolescents' Challenges and Strategies between Peer Pressure and Individuality

Young people use social media, above all, for forming networks and for interconnecting with their peers. The research presented draws on transition theory and understands social media as a place where early adolescents learn how to become a teenager and how to cope with teenage life. Becoming a teenager involves developing one's individual identity through interaction with others and thereby negotiating collective identities and peer culture(s).

The research presented (from the project "The Profiler" 2014-2016) focuses on challenges young people face when dealing with peer culture on social media and on the strategies they employ to overcome those challenges. Due to the fast-changing research field we have used the participatory concept, involving adolescents as experts already at an early stage of the project. Conducting qualitative individual and group interviews with 13 and 15 year old school students, we investigated challenges and strategies regarding privacy, hate culture and peer pressure, which have shown to be the teenagers' main concerns.

Regarding the issue of privacy the results reveal that teenagers have to negotiate the dilemma between acquiring as many followers as possible and maintaining privacy. Regarding hate culture, they have developed different strategies such as understating and ignoring the postings, or not interfering when others get bullied. Regarding peer pressure, teenagers have to learn to overcome high expectations of achievement and perfectionism. I conclude that adolescents employ individualized strategies much based on personal experiences and on the notion of self-responsibility. On the one hand they learn how to fit into the teenage culture of social media and on the other hand, they develop individual ways to distance themselves from common practices and from collective peer culture(s).

WAGNER, CHRISTIANE* (UNICAMP)

Critique Des Médias Vers Une Réalité Incisive : Le Pouvoir Et La Perception De La Violence

La réalisation culturelle par les médias et les réseaux sociaux serait due au fait d'une « image » de la réalité en constante reconfiguration. Toutefois, est-ce que cette image inscrite dans la contemporanéité serait dans une interdépendance entre les structures et les relations du pouvoir mondialisées résultant de l'image de la violence et de l'injustice ? Ainsi, les paradoxes de la réalité véhiculés par les médias, vérifiés par cette critique, sont, d'une part, que l'individu peut choisir et sélectionner des informations diffusées consciemment et, d'autre part, que les médias peuvent même construire la réalité dominante. Les médias comme les réseaux sociaux convergent vers un événement récent et important, qui consiste en une grande réalité incisive composée de nouvelles illusoires ; autrement dit, cette réalité n'a aucun sens historique par rapport à l'esprit du temps (Zeitgeist). Dans ce sens, des références à l'œuvre de Niklas Luhmann, Die Realität der Massenmedien (La réalité des médias de masse, 2009), permettent d'analyser le système des moyens de communication de masse. D'après ce théoricien, la construction de la réalité suit les lois internes de l'établissement médiatique en tant que pouvoir : la manipulation est orientée par des moyens vers un renforcement de la mémoire sociale. C'est ce qui détermine la façon dont les moyens de communication se développent. Le caractère constructif de Luhmann implique nécessairement une orientation raisonnable et méthodologique dans le cadre de la théorie critique des médias et de la culture. Une critique sera donc formulée à l'égard de l'image des transformations au moyen de la technologie numérique, de l'Internet et de la convergence des médias, mettant ainsi en lumière la perception de la violence et de l'injustice par rapport aux différentes formes de représentation et de reproduction du pouvoir.

RC14-263.1

WAGNER, CHRISTIANE* (UNICAMP)

Power As Control: The Use of Technologies of Communication

In this digital era, we are going through a convergence of human beings and machines that defines our image of the world as a virtual reality that is constructed and continuously transformed. Furthermore, power as control is part of the essence of the human being, together with belonging to the society through communication. As well we know, human beings need to adapt to society; they shape themselves around an outside world and become "real" when informed by creative skills. Technology offers us the communicative possibility of joining a social environment and being renewed by it. Controllable or not, transformations are promoted by such technological development, giving rise to new possibilities of communication in the sociocultural context.

According to Norbert Wiener (1948), the founder of cybernetics, information is a term that designates the content of what we exchange with the outside world in order to adjust to it. The process of receiving and utilizing information is the process of our adjustment to the contingencies of the environment. This is according to Marshall McLuhan's, whose ideas explored the impact of communication technologies at the human level, and to Norbert Wiener, whose work made the main socio-philosophical implications of the social consequences of automation available. Jürgen Habermas's reflections on rationality, according to Max Weber, address the choice of strategies in the use of technologies and the appropriate organization of systems according to the objectives of institutions whose aim is world organization. Therefore, we can add to the discussion the intellectual and scientific role of builders of "inventions" who generate "artifices" and seek innovation, especially in the understanding of evolution that relates to the concept of freedom from violence through justice.

Methodological Challenges of an Online Survey about Water Sensitive Urban Design in an Upmarket South African Residential Estate

With water shortages increasing in South Africa, the Departments of Urban Planning and Psychology at the University of Pretoria collaborated on a project about community perceptions of Water Sensitive Urban Design (WSUD). A survey was planned in an upmarket South African residential estate that showed potential for various WSUD measures. We initially planned a door-to-door survey of a random sample of property owners using students as fieldworkers. However, the management of the estate would not allow students to do fieldwork inside the estate and instead suggested that we disseminate the survey online. The survey questionnaire was then programmed on Qualtrix and disseminated to residents online via the estate management offices using their database of residents. Our paper discusses challenges and shortcomings of this online approach and makes recommendations for future surveys about community perceptions of WSUD.

Commemoration, Power, and Contested Heritage: Towards "Commemorative Justice"

As recent confrontations over commemorations of Confederates from the American Civil War illustrate, public cultural heritage sites are contested spaces where social issues and historically entrenched power relations play out. Sites that commemorate cultural heritage, such as monuments and interpretive plaques, are often ideologically driven spaces, representing the subjective narratives and histories of dominant cultural groups and the "winners" (victors) of war and territorial struggles. Cultural stakeholders who possess less social influence and symbolic capital, including women and racial minorities, are often marginalized in such commemorative representations. Commemorative social space is further complicated by the presence of tourism, which exacerbates the overlap of public and private sector interests, residents, and tourists with those of competing cultural stakeholders. Yet, little research has been undertaken to critically understand these relationships in the "production" and "consumption" of cultural heritage through commemorative practices in touristic places. Theory building is lacking, and so are ethical principles to guide and evaluate public cultural heritage sites of commemoration. What is being represented at commemorative sites, by whom, to what end? What role does tourism play in this?

The purpose of this paper is to examine the commemoration of heritage with respect to contested meanings and symbolic violence, identifying issues of social justice that may lead toward a preliminary discussion of "commemorative justice". Research methods include the exploration of relevant academic literature, and a case study on commemoration at a historic battlefield. Our study suggests that commemorative justice seeks to provide equitable representations of heritage for different stakeholders, residents and tourists in the context of sites of commemoration where tourism is a significant factor. Four commemorative management principles are forwarded based on the ethical and justice issues identified in the preliminary research that offer equitable representation to traditionally marginalized stakeholders and meaningfully enhances tourists' understandings of the past.

RC39-697.3WAHL, STEFANIE* (*Freie Universität Berlin*)KOX, THOMAS (*Freie Universität Berlin*)GERHOLD, LARS (*Freie Universität Berlin*)**#Irma – Issues of Trust When Communicating During Disasters.
The Case of Hurricane Irma 2017**

As a crucial part of disaster response and recovery, emergency management agencies (EMAs) need to inform the public about the ongoing situation (Beneito-Montagut et al., 2013). Especially, social media technologies such as Twitter serve can be used to quickly share information on the actual situation with the public, but also to receive relevant information, e.g. from people in the affected area (Alexander, 2014; Starbird et al., 2010). This requires both emergency managers and the public to trust (cf. Meyer et al., 1995) in each other as reliable information sources (Hughes & Chauhan, 2015). Nevertheless, situation information can include different kinds of uncertainties, e.g. referring to non-knowledge or stochastic variability. This holds true for weather-related disaster situations such as information regarding hurricane pathways or flooded areas. At the same time, rumors or false information can be easily distributed via Twitter (Mendoza et al., 2010).

We thus ask how EMAs deal with uncertain, unverified or false information during a disaster situation. For further illustration of their communication strategies, we investigated crisis communication efforts during "Irma", a category 5 hurricane, which affected the Caribbean and Southern USA in 2017 as one of the most powerful hurricanes during the last years (NOAA, 2017). Therefore, we conducted a mixed-method study by combining qualitative expert interviews on crisis communication strategies of EMAs in the USA with a content analysis of twitter data.

Results show that EMAs seek to establish themselves as a trustworthy source of information, e.g. by constantly providing updates and clarifications of the ongoing situation. For information outside their domain, they refer to other credible sources. They counter rumors or false information by using rumor control web-pages or specific hashtags (#RumorControl).

Based on our findings, we discuss and derive recommendations to further improve trust building among EMAs and the public during disaster management.

RC28-508.2WAKELING, PAUL* (*University of York*)**Graduate Education and Social Mobility: A Comparative Overview**

In this paper, I set out to do three things. First, I introduce Posselt and Grodsky's (2017) summary of the state-of-the-art on theory and research about graduate education and social stratification in the USA. I extend their summary by comparing it to what is known in this field about other countries, with a principal focus on findings from Europe. Specifically, I identify some key areas where there appears to be international consistency in patterns of access to and outcomes from graduate education. I also draw out pertinent differences, including the structure of graduate studies and student funding arrangements. Second, I present a more detailed comparison of a single national case, by examining patterns of access to graduate education by social class background in the UK and their connection to subsequent outcomes (Wakeling and Laurison, 2017). This shows that social class inequalities in attainment of graduate degrees have strengthened across successive age cohorts. This tightening inequality has occurred alongside considerable expansion of access to undergraduate - and graduate - study. However subsequent occupational outcomes continue to be socially stratified, even among holders of graduate degrees. Finally, I make the case for the potential of a comparative case-study approach, inspired by the work of Shavit, Blossfeld and colleagues (1993, 2007), in the field of graduate education. Such an approach should extend our understanding of the institutional and cultural influences on national variations in educational inequality and social mobility patterns through the novel case of graduate education. Conversely, it will bring to bear further insights into graduate education and its connection to social stratification and mobility by drawing on theories from the 'persistent inequalities' tradition.

RC02-51.1WALBY, SYLVIA* (*University of Lancaster*)**Democracy, Feminism and Capitalism****RC16-302.1**WALDENBURGER, LISA* (*Friedrich-Schiller-University Jena*)TEUTOBURG-WEISS, HANNES* (*University of Teacher Education
Zurich (PHZH)*)**Critical Realism Meets Resonance**

The role of critique in social science is still in a state of suspense. While Critical Theorists created a *circulus vitiosus*, in which the conditions of critique are the sole focus of attention, thinkers of the postmodernist tradition still confuse demystification with the substantial critique of the state of affairs. A critical CR inspired reading of social reality might bypass this conundrum. In a time, where capitalist globalization expands and deepens and corporate power increases along with global, national and local inequalities, the need for a consistent critical approach is urgent. However, another problem persists. While the ability to look critical at social reality – with an emancipatory gaze – can be considered a main pillar of CR, it is debatable if this potential has been realised – in theoretical and practical terms – yet. Staying close to the idea of CR as midwife and underlabourer for broader thinking within the social sciences, one might argue that the critical aspects of CR remain largely underdeveloped – even if there are some notable exceptions (cf. Andrew Sayer; Frédéric Vandenberghe).

What we propose – to strengthen substantial criticism originating from within the social sciences – is to bring together two research traditions, which have both a strong emancipative impetus: CR and newer Critical Theory. Hartmut Rosas recent contribution to Critical Theory introduces resonance as a key concept of critical social theory and breaks free from the above mentioned *circulus vitiosus*. Resonance, the opposite of alienation, describes a certain relation between ourselves and the world / other entities that is characterized by simultaneous co-influence and co-development. While Rosas theoretical account remains in some parts sketchy and cursory, we are convinced that both research traditions could benefit greatly from conversing with each other.

TG04-980.1WALL, GLENDA* (*Wilfrid Laurier University*)**Being a Good Digital Parent: Managing Children's Online Risks and Experiences**

Social concern about online safety for children and youth has increased dramatically over the last two decades. While initial concern centred on pornography and internet predators, this has broadened with the expansion of social media to include public anxiety about cyber-bullying, sexting, and the impact of social media on young people's mental health. Sociologists of youth have connected the regulation of young people online to media panics in general, social concerns about the moral pollution of children's purity, the increasing surveillance and supervision of children, and the shrinking spaces of freedom available to them. Relatively little attention, however, has been paid to the implications of the changing social expectations facing parents, who find themselves having to negotiate cultural ideals of intensive parenthood of children for longer and longer periods of time while avoiding what has become pejoratively known as 'helicopter parenting.'

Drawing on a sample of educational material and media reports that address the role of parents in managing and regulating their children's digital experiences, this study examines cultural understandings of good parenthood with respect to children's internet safety. The ways in which the parents, children, and the internet are framed are examined within the cultural context of risk aversion, child-centred intensive parenting, growing concerns about over-parenting and neo-liberal understandings of self-management and responsibility. Initial findings suggest that parents must navigate a number of contradictory expectations based on representations of them as both agents of surveillance and children's confidantes, and as both lacking in knowledge but having a great deal of control over, and responsibility for, children's choices. The implications for parents' and children's experiences as well as parent-child relationships are discussed.

RC24-449.1WALSH, DEATRA* (*UiT The Arctic University of Norway*)**Righting the Whale: Fast Science As Science Fiction for Eubalaena Glacialis in the Anthropocene**

The summer of 2017 has been a particularly troubling one for Eubalaena glacialis, also known as the North Atlantic Right Whale. By the end of August, 13 of the approximate 500 remaining endangered whales died. The deaths prompted scientists and government officials in both Canada and the United States to further investigate and respond. In this paper, I critically examine the unfolding of this "unusual mortality event", posing two main questions, namely: what is happening to the whales and what action should be taken? Drawing upon international print news coverage available online from April to August and a theoretical framework informed by posthumanism, actor network theory and an ethics of cohabitation, I analyze academic, bureaucratic and popular discourses that emerged as increasingly more whales died. I find evidence of scientific uncertainty and, not surprisingly, anthropomorphism. The discourses reveal a spectrum of human/non-human actors called upon to participate in "righting the whale", thus suggesting an underlying ethics in addressing the issue. The analysis has theoretical and practical implications for (re)imagining the Anthropocene. I introduce the concepts fast science and fast bureaucracy to account for the sheer speed at which a human understanding and response will be required in this

new age, and yet acknowledge that even the fastest science cannot anticipate a science fiction troubled by the impossible decentering of a human lens.

'everyday Bordering' in the UK: An Examination of Social Work Decision Making Processes When Working with Migrant Family Members.

The data on which this paper is based, was gathered as part of a broader international study, funded by NORFACE. The paper specially focuses on data from focus groups conducted with social workers in the UK, in four service areas (child welfare, addictions, mental health and migration), and compares how practitioners in each service area approach working with migrant family members. UK policy and media narratives increasingly focus on the need to control immigration, and populist politicians point to the possible illegality of migrants, resulting in *all* migrants being treated with suspicion (Anderson, 2014). In this paper, we argue that social workers conceptualise migrant family members in terms of their immigration status and their subsequent entitlements. As 'street level bureaucrats' (Lipsky, 1980), they reify government policy in their decision making processes. This can be described as 'everyday bordering'; processes by which state bordering practices extend into everyday life (Yucal-Davis et al., 2017). Whilst the extent to which migrant status impacts on decision making processes differs in specific service areas, families experiencing migration *are* viewed through a legal lens and the subject of 'everyday bordering'. As such, this impacts on their access to important services and can be perceived as a socially mediated harm. We conclude by considering how understanding the processes of 'everyday bordering', and their consequences, is critical for exploring the ways in which social workers might develop alternative, more productive professional responses when working with migrant families.

Migrant Family Display: A Strategy for Achieving Recognition and Validation in the Host Country

This paper draws on the narratives of ten migrant families living in a predominantly white British northern UK city, Hull, and brings together the typically distinct fields of the sociology of family, transnational family studies and migration studies. By uniquely applying the lens of family display to migrant family accounts, this article offers a timely new way to understand the strategies migrant families employ when negotiating recognition and validation in an increasingly globalised world. Existing applications of family display focus on what might be referred to as unconventional families: same-sex couples; dual-heritage families; single-parent households; families living in commercial homes. Further previous migration studies consider the strategies employed by migrant *individuals*, sometimes within a family, but do not do so through the lens of family display. The concept has not, then, been applied to migrant families and their everyday lives, and with a specific focus on understanding the influence of audience in family display. This paper, therefore, contributes to migration and transnational family studies by providing a new way of understanding migrant family lives, and also advancing the concept of family display in three clear ways: by showing that migrant families *do* display family to audiences beyond the family – including the State – so as to present as a 'legitimate' family; by expanding understanding of how family display is enacted; and by arguing that broader narratives, (anti-migrant/islamophobic) influence those related to 'family' and impact on how and why migrant families engage in family displays.

Life Events, Resilience and Educational Outcomes for Aboriginal and Torres Strait Islander Children

The life circumstances of Aboriginal and Torres Strait Islander children are replete with hazards, many of which can impact on students' educational achievement chances. Aboriginal and Torres Strait Islander families are more likely than non-Indigenous families to experience long term poverty, labour market difficulties and exclusions, family deaths and illnesses, low security in housing and imprisonment of a family member than non-Indigenous children and families. Despite adverse circumstances many Aboriginal and Torres Strait Islander chil-

dren achieve educationally, within the mainstream schooling system and within their community and culture. This presentation uses Indigenous social and cultural resilience whereby social, cultural and identity practices can support positive adaptation among children despite the presence of developmental process hazards as its key concept. Resilience related data are modelled against an index of major life events data (modified for Aboriginal and Torres Strait Islander life circumstances) from Waves 4-8 of the Longitudinal Study of Indigenous Children. The analyses assess the relationship between the cumulative and individual experience of major life events and children's educational outcomes. Results indicate that families and children with stronger cultural identities, higher levels of cultural engagement, broader extended family support and connection to country demonstrate a greater ability to achieve good educational outcomes in the face of adverse life circumstances.

Communal Solidarity in Malaysia: The Practice and Challenges of Community Mediation

This paper highlights the practice of community mediation in Malaysia. Community mediation is a powerful mechanism that enables community leaders to manage conflict, especially in a collectivistic society such as Malaysia. Various efforts have been done by clinical sociologists in Malaysia over the years to equip community leaders with mediation skills throughout the country. The 20-steps guide and module developed have been useful to promote and maintain social stability. Among the aspects covered in this paper include, periodic training of selected community leaders as well as the monthly case conferences for mediators in different states. Though the role of community mediators have been recognized by the mediators, community leaders, policy makers, and members of the society, challenges faced by community mediators at micro, meso and macro levels cannot be ignored. Among the reported challenges include technical or process error, commitment issues, lip-service support and power struggle especially between mediators and other authorities. Since each community contains varied members in terms of its economic standing, educational background, racial and ethnic membership and political affiliation, this paper focuses on the practice of community mediation in one neighborhood in Kuala Lumpur, Malaysia. It is hoped that this case study would not only shed light on what clinical sociologists *can* and *should* do, but able to provide recommendations well as suggestions to further overcome the challenges of community mediators.

Caught in the Net: The Risk Discourse of Problematic Internet Use Among Adolescents

The World Health Organization regards the problematic internet use as a non-substance addiction that might have a negative impact on mental wellbeing. In Taiwan society, the prevalence of the problematic Internet use among youth is nearly 20%. The high rate makes educator and medical expert growing consciousness about this issue. Especially the junior and senior high school students caught the experts' attention. The education and medical discipline gave a different explanation and set the action agenda for youth mental wellbeing promotion. The aim of the research is to investigate how does those experts problematize the internet using behavior as unusual and get the legitimization of intervention. The research analyzed different viewpoints of the risk discourse about the youth excessive use of the internet, both from the educator and psychiatry experts. The research adopts a qualitative content analysis of the publication and survey conducted by those experts. The contents implies how experts delineate the difference between the normal and abnormal way of using the internet. The research found that the two disciplines adopts different stand toward youth internet using issue. On one hand, the educators concern about the deviant behavior that derive from internet use. Like violent behavior, scam, sexual exploitation. On the other hand, the psychiatry expert focus the possibility that Internet addiction triggers the depression or other mental illness. Despite of the different focus, the two discipline co-construct the normalizing power of youth internet using behavior. In conclusion, the excessive use of the internet is deemed a lure and causing users get escapism. On this assumption, the teenagers are not having the capacity to resist the lure. However, those assumptions are, usually focus the negative impact of the internet use, lack of concern about the digital world is part of multi-reality and the peer culture among teenagers.

The Comparative Time Series Analysis of Males' and Females' Indigenous Populations Under the Education Affirmative Action Reform in Taiwan: The Influence of Surname-Based Status Inheritance Rule on Two Generations

In Taiwan, 550,000 Indigenous Peoples accounts for 2.3% of the population, whose rights were affirmed in 1997 *Constitution Amendment*. In 2007, the Indigenous education preferential treatments were reformed as "affirmative actions" for future self-governance. According to the *Indigenous Peoples' Status Act* of 2001, similar to 1985 *Bill C-31 Amendment of Indian Act* in Canada, intermarried Indigenous women not only can restore status, but also pass it down to descendants following maternal surname. Since then, males' population has increased by 56,000 (27%), and females' has increased by 82,000 (42%). The sex ratio has decreased from 105 to 95. This study aims to analyze the impacts of those policies on Indigenous males' and females' populations. Time series analysis was adopted, using monthly statistics released by the Ministry of Interior.

The findings are as follows: First, the auto-correlation functions of females' series are higher than males' due to more increasing numbers, but seasonal auto-correlation functions are equivalent, reflecting the resembling periodical increase during the beginning of semesters for obtaining educational grants or additional scores for entrance examinations; Second, the extra increase of females' series promoted by educational affirmative action reform were much more than males'; Finally, both series can be accurately forecasted with ARIMA(1,2,1)(2,1,0)₁₂ model.

The differences above reflected the far more females' population increase, and the sex ratio for natural increase is 65 (mainly due to males' much shorter life expectancy), while 68 is for the numbers of Indigenous status registrants. For the age group of 20–64, there were about 16,000 and 34,000 registrants of males and females respectively; while 26,000 and 28,000 were for the age group of 1–19. It implies that the Chinese patriarchic "surname-based status inheritance rule" restricted male adults born to a Chinese father from registering Indigenous status much more than females, but not so for younger generation.

IE As a Political Activist Approach in Chinese Culture

I was a social worker involving in social activism at a time of rapid political transition in Taiwan. As a non-English speaking Ph.D. student in U. of Toronto, I found my experience was silent in my study which was overwhelmed by social theories. Learning institutional ethnography with Dorothy Smith, my voice was validated as the starting point of research. IE gave me the academic tool to integrate my roles as a critical social worker and an academic. "Writing your disjuncture experience as a social worker" becomes a regular exercise in my class to give voices to front-line workers. I use IE to develop critical consciousness among social work students. I re-designed the course on social policy analysis based on IE as I believe social workers need to analyze policies from the standpoint of social workers, rather than to familiarize themselves into social policies from the ruling relations.

I explored how family ideology in long term care regulates the practices of home care in my Ph.D. study. After my return to Taiwan, I continued to be involved in social activism in the field of long term care for family care givers and indigenous people. Over the past twenty years, I began to realize that I am witnessing the transformation of state power from an authoritarian state to neo-liberal state. The privatization in social welfare is incorporating social work profession and NGOs into the ruling relations of neo-liberalism.

As more and more Taiwanese scholars are adopting IE in their research, a study group of fifteen academics has been organized to share their work on IE. We reflect on the issues of translation, Chinese culture on relations (Kuanxi), development of civil society, and theorization of resistance in IE, which I will summarize in my presentation.

How to Reconcile the Traumatic Past?: A Case Study of Historical Dialogue in East Asia

East Asia in the postwar era has been characterized by divided memories and contesting interpretations of its traumatic past, generally known as the "history problem." The legacies of colonialism, war and oppression, most of which are associated with the pre-1945 Empire of Japan, are still haunting the region.

Through education and commemoration, each nation tends to use its past sufferings to enhance national identity of its citizens. For instance, Japanese tend to regard themselves as "the only nation victimized by atomic bombing," while downplaying Japan's wrongdoings during the wartime period. In China, nationalist narratives portray Chinese as victims of imperialism, exemplified by Japanese invasion of China before 1945. South Korea, too, regard themselves as victims of Japanese colonialism. While national identity in these countries has been built upon "victim consciousness" to a great extent, the reconciliation among people between these nations becomes more and more difficult, if not impossible. Against this backdrop, however, a group of scholars, high school teachers and NGO activists from Japan, South Korea and China have been collaborating to write a joint history textbook for high school students for the reconciliatory purpose. This joint project has been continued for over a decade with fruitful outcomes: they have produced two joint history texts, simultaneously published in the three countries in respective languages, as supplementary teaching materials. The publication of the texts has received considerable publicity and evoked discussions in all the three countries. How can we explain such an undertaking from a sociological perspective, and what are their theoretical implications for sociology? This paper draws on Jeffrey Alexander's civil sphere theory to analyze the process and the effects of this joint history project. Through the analysis, the relations between national identity, traumatic memory, historical dialogue and reconciliation will be further elaborated in light of cultural sociology.

WANG, HORNG-LUEN* (*Institute of Sociology, Academia Sinica*)

Theorizing War and Civil Society: A Two-Way Model

This paper proposes to theorize the relations between war and civil society through a two-way model. First, to theorize the impacts of war on civil society, I draw on theories of William Sewell Jr., Michel Foucault and Jeffrey Alexander, among others, to conceptualize war as a structure-transforming event that has long-lasting effects on civil society. What has been transformed includes not only objective structures, but also subjective schemes (or cognitive frames). As a result, war should no longer be seen as the continuation of politics by others means, as famously put by Clausewitz; on the contrary, politics is the continuation of war by other means. Subsequently, the binary codes in civil society has been shaped and reshaped to maintain its boundary. Secondly, to theorize the impacts of civil society on war, I shall expand Alexander's civil sphere theory (CST) in innovative ways. In Alexander's original formulation, civil sphere is conceptualized as simultaneously inclusive and exclusive, civil and anti-civil, which, in turn, account for how democratic nations could have civil spheres functioning domestically but simultaneously engage in anti-civil violence outside the nations. However, I argue that CST could be expanded to think about transcending anti-civil violence (such as wars) between nations. The "transnational civil sphere" is the key to understand how this can happen. Since civil society is territorially and spatially fixed, civil sphere is often conceptualized as existing within a given bounded community, mostly molded by the nation-state. This paper argues that a "transnational civil sphere" above the national level may exist to resolve conflicts (including wars) between nation-states. To expound this two-way model, I shall use East Asia as an illustrative case to demonstrate how this two-way process takes place in actual contexts during the postwar era.

Networked Individualism Among Older Adults: Digital Media Use and Personal Network Structures

Older adults are typically defined as individuals 65 years or older. To what extent are older adults networked individuals, in terms of the structure, composition and functioning of their networks? How does older adults' involvement in digital media affect their social networks, or vice versa? Although there have been some studies on older adults' adoption and use of digital media, we believe we are the first to inquire into how older adults are networked individuals --or not-- and their use of digital media. Based on semi-structured in-depth interviews conducted in 2013 and 2014 with 41 older adults living in the East York borough of Toronto, we examined these two research questions through (1) quantitative analysis of device ownership, communication channels, digital media use as well as their personal network characteristics such as social ties, size, and diversity; (2) qualitative content coding of major themes emerged from participants' comments; and (3) user profiling to generate case studies on networked seniors. Our findings suggest that older adults are becoming more accepting of digital technologies, especially for maintaining important social relationships and overcoming challenges with geographic distance and limited mobility. Networked individualism should not be limited to younger individuals. Many older adults are actively engaging in mediated communication, after formal retirement and living alone. Although the stereotypes around older adults and the digital divide may be

reflected among participants over 80 years old, we believe many in their 60s and 70s are qualified as networked individuals in their own way.

Can the State be As a Vehicle of Technological Change?

The global integration of capital and technology generates a pressing debate on how technologically backward countries can benefit from FDI and catch up technologically. To better understand the mechanisms in the triangle of globalization-state-firm accounting for firm innovativeness, I test three types of the state's roles – the state's infrastructure-building, the state-firm partnership, and the state's direct intervention in firm governance, combined with FDI spillovers and local firms' absorptive capacity, in shaping local firms' innovativeness in a national dataset of Chinese firms. I find that during Chinese firms' initial technological take-off, the state helped enhance local firms' indigenous innovativeness through its infrastructure-building and various partnerships with the firms. All three types of the state's roles are found to positively modulate the firms' absorptive capacities in affecting their innovativeness. Moreover, the state's infrastructure-building and the firm's state ownership weakened the negative role of some FDI-related effects in influencing firm innovativeness.

RC23-425.7

WANG, JUNMIN* (*University of Memphis*)

The Soft Foundation for National Innovation

In the current literature of national innovation, economic studies offer rich knowledge of a nation's "hardware" for shaping its technological innovation. However, most economic studies leave many institutional and social elements that do not appear to have immediate, direct effects on economic outcomes out of their analyses. The central theoretical goal in this paper is to develop a "high-context" research approach and a "thicker" theoretical account to examine a developing nation's software for pursuing technological innovation. Specifically, I incorporate a sociological perspective into the political economy studies of development, using a more comprehensive lens through which we can disclose contextual features in political, social, and cultural domains that shape, enable, or disable a nation's technological change. I argue that the structure-level factors (e.g., political regime, institutional characteristics, and social factors) that help foster social consensus and incentivize a society to pursue long-term, comprehensive goals promote a nation's innovation. The micro-level cultural factors (e.g., the individuals' perceptions, beliefs, and values for trust, creativity, entrepreneurship, risk and long-term goals) also affect national innovation. Moreover, the structural factors mediate the role of the cultural factors in shaping national innovation. It is argued that the hardware factors (e.g., financial investments, economic policies, and infrastructures) may be effective in helping a nation's economic take-off during its initial development stages, especially if the nation can gain access to "the low-hanging fruits" and imitate the successful technological and management knowledge from the advanced nations. However, the software factors that are deeply rooted in a nation's political, social and cultural soils will play a more deterministic role in a nation's indigenous and breakthrough innovation.

Changing Characteristics of Taiwan's Anti-Nuclear Movements from Politically-Oriented to Grassroots Movements

Anti-nuclear power plant movements in Taiwan emerged in the mid-1980s and the thriving movements made considerable achievement. In 2014, the construction of what would be Taiwan's fourth nuclear power plant in New Taipei City was successfully suspended due to the rise of citizens' anti-nuclear actions. In 2016, Taiwanese government decided to abolish nuclear power plants by 2025, which met the public demand for a nuclear-free society. As scholars have shown, social movement is a tool for democracy. Environmental movements, anti-nuclear movements, in particular, have been strategically mobilized by the Democratic Progressive Party (DPP) in taking political power from the Nationalist Party (KMT) in 2000 (Ho, 2004). However, the research fails to explain why anti-nuclear organizations are still working towards the goal even after the DPP came into the cabinet and made a compromise with its anti-nuclear stance. Owing to the 3.11 great East Japan earthquake and the Fukushima nuclear power plant accident, the social concern for the environment, especially for nuclear accident risks, drastically changed even in Taiwan. Some organizations began to distance themselves from political parties and became independent in to attract support from wider range of the public. This paper analyzes the organization's characteristics, strategies, and movement based on interviews with four non-profit organizations in Taiwan. The movement stressed educating community residents, creating the citizen's network, designing the symbols used in daily life, and constructing social programs to demonstrate shifting into using renewable energy; which would pressure society into concern for the environment. The depoliticization

by grassroots movements in Taiwan has similarities with Japan's environmental movement from the 1960s. This depoliticization can be interpreted as a strategic reconstruction of the problem from party politics to livelihood issues in order to broaden public support from the perspective of environmental sociology.

The Moral Economy of Sexual Exchange in an Anti-Monetary Market

In advancing Hirschman's (1982) theses on the moral implications of market society, Fourcade & Healy (2007) charge a new paradigm that prompts us to steer away from asking how morals affect market, and vice versa. They propose that we examine markets as "explicitly moral projects, saturated with normativity." That is to say, markets are themselves culture—not only do they emerge as products of human behaviors and meaning-making, they contain beliefs and practices that constitute their very own logics. Heeding their call, this study draws on interview data with 40 Couchsurfers to interrogate the moral economy of an *anti-monetary* market. Couchsurfing.com, my empirical case and an exemplar of such a market, is a nonpayable hospitality-exchange network that offers an analytical window into a market system designed to oppose commercial ideals. Because monetary transactions are altogether shunned in Couchsurfing, members engage in social or cultural exchanges to keep the market afloat. Using sex, a form of exchange that exudes moral ambiguity, I argue that Couchsurfers' actions are deeply structured by, and at times contradictory to, the platform's moral and cultural logics. I conceptualize a typology of sex—sex as bona fide exchange, transaction, leverage and assault—to illustrate that while processes of sexual meaning-making can differ between individuals, actors are fundamentally guided by a moral imperative to engage in reciprocal exchange as a means to alleviate emotional and material 'debt.'

Gendered Retirement Transitions and the Unequal Distribution of Transitional Risks

With the ageing of the 'Baby Boomer' cohort, more and more adults are transiting into retirement, and in parallel, institutional retirement pathways have evolved (e.g. bridge employment) or have been abolished (e.g. statutory retirement age). From this emerge new transitional risks that affect social groups in different ways. Research has shown that the retirement experiences differs between men and women (Martin-Matthews & Brown, 1988) due to gendered retirement trajectories (Fasang, 2010), and that these influence health and life-expectancy (Bloemen, 2013). Gendered transitions are the outcome of gendered life-courses and, accordingly, working conditions (Carr et al., 2016), organizational negotiations (Phillipson et al., 2016), and conditions for effective retirement planning (Moffatt & Heaven, 2017).

This paper asks how institutionalized pathways affect retirement experiences and transitional practices of older men and women, linking quantitative data from the German Survey of Transitions and Old Age Potentials to a qualitative longitudinal study that follows 15 older Germans throughout their retirement process. Other than most research it considers non-normative types of transitions, as retiring from unemployment or domestic work. Results show that differences in retirement experiences are less due to gender but gendered pathways into retirement. For example, the transition experience is more strainful for women transiting from gainful employment than men, but less for women transiting from domestic work. We also find gendered retirement roles that are shaped by gendered lifecourses: Men tend to increase involvement with grandchildren after retirement, as many feel they have not spent enough time with their children, whereas women aim to make up for limited chances to engage in education or leisure activities.

In the future, more emphasis should be placed on the retirement transitions of Baby Boomer women, who are increasingly part of the labour force, and the potential risks they entail for quality of life in older age.

RC13-258.4

WANKA, ANNA* (*Goethe University Frankfurt on the Main*)

Retirement As a Critical Life Event for the Organization of Leisure in Later Life

With the ageing of the 'Baby Boomer' cohort, more and more adults are transiting into retirement. This transition can have a crucial effect on the organization of everyday lives and leisure activities of older adults. Many older workers identify work as the biggest barrier to them engaging in more fulfilling leisure activities and feel optimistic that their leisure life will increase once they are retired (Age Wave/Merrill Lynch, 2017). However, the distinction between leisure and non-leisure activities becomes increasingly blurry once leisure's natural counterpart

– work – has vanished. Drawing upon social practice theory (Schatzki, 2006; Hui et al., 2017), this paper asks: Which everyday life leisure practices change when people retire and which stay the same? What do people expect to change and what does really change? Can we distinguish different phases of the retirement transition that are characterized by distinct leisure activities? And as longitudinal research suggests that people tend to continue their leisure activities regardless of changes in work and age leisure (Scherger et al., 2011), how is the maintenance of leisure activities facilitated in the retirement process?

Empirically, the paper presents results from Germany a) analysing the quantitative Survey of Transitions and Old Age Potentials and b) drawing upon a longitudinal qualitative study following 15 older adults throughout their process of retiring from before to three years after retirement, combining episodic interviews, daily diaries and photo-diaries (Pilcher et al., 2016). Results show that leisure changes significantly for the majority of respondents with retirement, but these changes are manifold – e.g. changes in the relationship to the partner or increased travel – differ by socio-economic status, gender, marital status, former occupation and retirement pathway. Qualitative data helps us to describe the processes behind these changes.

Adjusting Taste: Bodily Management and the Acceptance of Unfamiliar Foods in Three English Cities, 1995-2015

Social acceptance and reputation require the manipulation of bodily techniques of many kinds, food consumption being one. The extent to which bodily management is a function of class position and possession of cultural capital is disputed. The balance of sociological opinion in recent decades is that their effects are diminishing but the evidence is far from overwhelming. In this paper we examine processes associated with the modification of culinary taste over two decades by analysing the changing acceptability of different manifestations of 'ethnic' cuisine. We draw on results from a re-study of eating out in three English cities. After a twenty year interval, in 2015, we administered a survey in London, Preston and Bristol, covering similar topics and asking mostly identically worded questions, and we also conducted follow-up in-depth interviews with some of the respondents. One clear trend is towards greater popularity of and familiarity with ethnic cuisine. In this paper we focus on how orientations towards novelty, possession of cultural capital and class trajectory jointly impact upon tastes for previously unfamiliar foods. Survey data chart the parameters of the social differentiation of taste for different cuisines and interviews capture the experience of the novel and the familiar, the pleasurable and the disgusting. The taste for ethnic cuisine is greatest among people with higher education and higher class position, with class differences becoming magnified in the period. We reflect on methodological and theoretical issues associated with carrying out a re-study, with the measurement of class, and with isolating the mechanisms behind changing tastes. We draw conclusions about the role of class differentiation in the socially and symbolically significant activity of exposing the body to new and unfamiliar experiences.

WARING, JUSTIN* (University of Nottingham)

Understanding Risk Work As Pastoral Power: The Governance of 'Risky' Subjectivities in the English Healthcare System

The concept of risk work attends to the situated practices of interconnected actors in the identification, assessment and management of risk. As many risk scholars remind us, the social meaning and governance of risk is inherently political. In this paper, we draw upon Michel Foucault's concept of 'pastoral power' to offer a new perspective on risk work. Foucault's ideas have been used effectively to explore the social control of risk. However, analysis often focuses on the broader discourses or technologies of risk, and not necessarily the relational practices of risk work. A focus on the practices of risk work can illuminate how discipline and governmentality is achieved. This paper draws upon his concept of pastoral power to examine how 'risk workers' define moral imperatives of risky conduct, shape group identities, and promote desirable conduct. These ideas are explored in the context of strategies to manage clinical risk in the English health system. The paper highlights a range of risk work practices across different occupational and organisational communities. Although shaped by similar risk management discourses, these practices vary according to the target subjects, the moral imperatives, and the influence of other discourses. The paper suggests risk work centres on the dynamics of morality, self and identification. But it also shows how the risk work of one pastor is often at odds with that of another, where risk management resembles a 'multi-faith' congregation. This creates the possibility for subjects to move between moral codes and maintain an ambiguous notion of risk. The paper extends the Foucauldian analysis of risk management through re-visiting his concept of pastoral power.

WARMING, HANNE* (Roskilde University)

Society and Sociological Theory through a 'Childhood Prism'

As stated by Roets & Thomas (2017) "understanding childhood properly is to understand society differently". This statement can be traced back to the basic recognition that childhood is part of the social structure, and to the subsequent de-naturalizing of the othering of children and problematization of their position in the social order (Qvortrup 1994). However, childhood sociology is a heterogeneous field, which is reflected, among other things, in the diverse positions on fundamental sociological tensions – such as agency/structure, materialism/discourse, local/global, and particularism/universalism – that are represented within it. This was already pointed out by James, Jenks and Prout back in 1998, but it may be even truer today. Childhood research therefore reflects society in various and sometimes ambiguous ways; and it both contributes to and challenges broader social theories. I propose using the concept of 'childhood prism' to address the multi-faceted contribution that the field of childhood studies makes to sociology, and I invite a discussion of the achievements, potential and challenges of exploring society and contributing to sociological theory through a childhood prism. Thus, in the presentation, I will offer (a probably non-comprehensive) outline of what we have already achieved as well as of future routes, perspectives, potential and challenges. I suggest that the field of childhood studies offers not only a route to understanding society differently, but also a sociological microscope for studying social changes in the acceleration society (Rosa 2003).

Perceptions of Professional Regulation's Effects on UK Practitioners' Professional Identities

What is the relationship between professional regulation and professional identity, and why does it matter? The Professional Standards Authority for Health and Social Care is developing an evidence base in this area, to help us understand how policy decisions about who and how to regulate may ultimately affect the quality of patient care through their impact on professional identity.

This paper draws on our own literature review and a piece of qualitative research we commissioned on the views of UK healthcare practitioners. The literature review aimed to identify the many factors affecting professional identity, situating regulation's role amongst those factors (such as media portrayals of practitioners), analysing sources from academic research to organisational policy documents. The qualitative research, carried out by independent researcher Dr Simon Christmas, explored the perceptions of professional identity of practitioners from four differing fields and regulatory status (pharmacists, physiotherapists, psychotherapists and acupuncturists).

Our research suggests that professional identity is a contributing factor to good patient care, and is shaped by factors such as societal perceptions and the blurring of boundaries between roles on multi-disciplinary teams. Relatedly, we discovered some inter-professional tensions relating to identity and regulation as some non-statutorily regulated practitioners suggested their techniques were being 'co-opted'. Professional regulation appears to have some influence on practitioners' identities, but this is mostly indirect. We also found that the regulator's register can play a role in practitioners' identity by providing a tool for like-minded practitioners to validate their place in a community of practice. In this session, we will discuss how practitioners may perceive that their professional identity is affected by issues of societal status and legitimacy. We will look at how regulation's role is primarily a public protection tool, not a badge-of-status, and ask what should be expected of regulation.

An Examination of Newspaper Coverage of Hate Crimes in the United States

Abstract

This study examines 10 years of major newspaper hate crime coverage in the United States. Historically, scholars have gained valuable insights into American perceptions about crime by critically examining newspaper coverage of crime (for example, Kimmel, Warren, Dombrowski, Greer-Williams, & Orbe, 2001). The central argument is that the amount of press coverage of hate crimes has an impact on public perceptions, values, attitudes, and behaviors in the short run and on actual hate crimes in the long run (Dome, 1996). Previous studies reveal the existence of a unidirectional relation between both news content and public opinion regarding social issues. This project examines newspaper reports from 2006-2016 from each region in the United States with the top five newspapers (determined by readership) will be chosen from each region. A mixed method approach of both quantitative and qualitative is used to examine the prevalence

of articles that focus on hate crimes and the types of hate crimes that are covered in regional newspaper.

Local Health Promoted Groups and Health in Old Age: A Case of Genki Stations in Yokohama

Backgrounds and aims: The purpose of this study was to examine local health promotion group and the effect on health in old age. Yokohama city in Japan established the new approach for preventing nursing care "Genki Station (vitality station)" from 2012. Genki Station provides a local channel for community-dwelling elderly to connect with others and to sustain physically and mentally healthy. The elderlies are formed into local self-organized groups of about 20 persons to do exercises, walking, and other activities to prevent the onset of physical problems and dementia with the support of public health nurses. As of August 2017, 217 Genki Stations were built.

Materials and methods: A mixed methods approach includes a collection of quantitative data using the questionnaire survey and semi-structured interviews. Two waves of data collection have been completed in 2013 and 2015: 237 Genki Stations' participants as exposure groups and 1,537 seniors(65+) as control group were mail-surveyed. In addition, semi-structured face-to-face interviews with about 30 participants of 12 Genki Stations were conducted and data was analyzed qualitatively. Comparing a result of statistical analysis to a semi-structured interview data, we show the elderly minds for their activities and their health.

Results and implications: Results of hybrid model of time-series logistic regression show that participants of Genki Station are healthier compared control group. Genki Stations contribute to care prevention. Results of interviews indicate that participants try to organize and facilitate their groups voluntarily. Through the management by rotating schedule, they enjoy their new roles in clubs. Some participants who take a leadership position tend to facilitate better communication and connect local resources. Local authority and local public health nurse give behind support for Genki Station. Under shrinking the government's role in society, Genki station is an important solution that meets the needs of the elderly.

Genetic Citizenship in Rare Diseases Policy: Patient's Participation for Genomic Science Research

Genetic information and disease's data were negative information that once caused prejudice and discrimination for patients. However, the practice of patients who positively utilize them as means to engage with society has been emerging from the end of the 20th century. The aim of this research is to analyze the actual phase of patient participation policy based on Genetic Citizenship. Genetic Citizenship is a sociological concept concerning a form in which individuals participate in civil society through promoting scientific research of the disease. In the United States, Europe, and Japan since the 1980's, patients and families of rare diseases themselves have organized clinical and genetic information database and played the leading role of scientific research. Since the 1990s, new scientific achievements to identify factor genes by constructing registries and biobanks have been drawing attention in rare disease's research. In this research, I report the findings from the in-depth interview and semi-structured surveys of Japanese patient organizations and medical scientists. The target group is divided into three groups: (1) patient organizations that have already engaged in research, (2) patient organizations that have not yet been implemented, and (3) researchers who are researching the rare disease. Promotion of research participation brings the complex impacts and the innovation of senses to medical treatment. We analyze the social resources provided by patients and researchers, factors of barriers to participation, impact on people's awareness for medical treatment. Patient participation has brought about a new phase of the health rights campaign, and at the same time, it demands patients to provide advocacy based on professionalism.

From Space to Boundary: An "Atopic" Pathway of Social Theory from Simmel to Luhmann

Niklas Luhmann would not apparently be counted among the increasing number of sociologists interested in spatial reconfiguration. Rather, space appears to be lacking or sidelined within his construction of systems theory.

This paper neither critiques Luhmann's inattention to space; nor does it attempt to incorporate the concept of space into his theoretical design. Instead, it explores *the meaning of his spatial indifference*, seeking to answer the following

question: *What epistemological insights can be derived from a serious consideration of Luhmann's dismissal of the space concept as a premise of theorization?*

The application of Luhmann's social theory to the empirical field of migration studies, as distinguished from the prevailing tradition of methodological nationalism, has undeniable appeal. Luhmann declared that contemporary society should no longer be conceptualized as an entity divided by territorial boundaries, but rather as one comprising functionally differentiated forms of communication.

To investigate the theoretical potential of this line of inquiry, this paper also draws on the work of another sociologist, Georg Simmel. Both of these sociologists held that increasingly abstract forms of socialization (law and money) lead to the emancipation of space. However, this phenomenon does not challenge the actual existence of functionally differentiated communication under certain spatial conditions. The application of Simmel's concept of "fixation" opens up a theoretical perspective that envisages various forms of fixation of functionally differentiated systems, rather than presupposing that a certain space exists and attempting to describe its internal differentiation.

The paper concludes by questioning the adequacy of the space concept itself as a tool for understanding hypercomplexity of contemporary urban settings and the very diverse experiences of transnational daily life. Thus, it contributes to re-invigorating sociological imagination and enhancing reflective engagement with contemporary society.

Academics from Working Class and Impoverished Backgrounds: "You Always Remain Slightly an Outsider, and That's Not a Bad Thing."

Education has long been understood as the primary way for individuals to experience upward class mobility, escaping the disadvantages of lower social class status. However, elite environments can be exclusionary for those who may lack the cultural capital, social capital, and *habitus* required to successfully integrate in these social fields.

This paper draws on interviews with ten Canadian academics who self-identified as having working-class or impoverished family origins. Semi-structured interviews asked about experiences of belonging and marginality, inclusion and exclusion. The results suggest that even those who pursue high levels of education and are 'successfully' socially mobile may continue to experience daily class-related struggles. All participants reported tensions around social mobility and their shift from working-class roots to being upper-middle-class academics, reminded of their class backgrounds and 'difference' daily as they engaged in the social and cultural realms of academia. As participants increasingly moved into the upper echelons of academia, they felt further from their roots, culture, and families, making social mobility an emotionally fraught experience. Many participants referred to academia as a "game" they had learned to play, and felt both isolated in and disenchanted with their work lives. Some felt unable to achieve the social change they aspired to in pursuing academic careers.

Examining lived experiences of social mobility demonstrates that it is much more than an increase in economic capital. In the exclusionary environment of higher education, the process of upward social mobility itself can be a struggle; even those who successfully "play the game" of academia struggle daily with the cultural capital and *habitus* required in elite environments like the university. Upward social mobility often means a distance from one's roots, which may leave individuals feeling that they do not belong in either the environments they have come from or those they now find themselves occupying.

Using Design to Promote and to Understand Intergenerational Housing: A Research-Project Experience in the South of France

Intergenerational housing opens new possibilities for the elderly when facing isolation. It provides a solution for an old person to organize new ways of co-living with a younger dweller in need of a cheaper rent or conviviality. This system has to be understood within a larger framework of housing for the elderly. Housing typologies (co-living, participatory housing) are also developed beyond the domestic sphere through a new habitat created by public relations between generations. The intergenerational housing "model" quite popular in many European countries has been greatly mediatized in France since the growth of the aging population and a recent housing boom in central cities.

For the past ten years many organizations, mostly nonprofits, participate in creating this new type of service to build this mutual match between old and young dwellers. If some networks are starting to be gradually structured nationwide these initiatives are usually somehow fragmented while being punctually considered by the housing private sector and stimulated by local government.

This phenomenon in housing services illustrates the limitations both of public policies and the housing market by designing the public realm and interests through the lens of user centered practices or even citizen centered design. Our contribution will show an experience of a "research-project" initiative using design methods and practices to promote such intergenerational housing across cultures of work and habits while understanding at the same time its scope (health, mobility, communication) and larger context of development (central cities, rural areas). This "research-project" is located in the south of France and developed by a research team of social innovation by design (Projekt Research Lab) at the University of Nîmes.

Transnational Movement Power: Examining Racialized and Class Based Movements within and between the United States and Brazil

Social movements correspond to particular social realities of inequality and sociopolitical identity. While one type of inequity may motivate mass mobilization in one context, it may not in another; and the socio-political categories leveraged to build collective power in one context may be completely different somewhere else. The United States of America and Brazil have similar and interrelated racial and economic histories where racial and class struggles are present in both, however the politics around race and class differ such that, race is more salient than class in the United States and class is more salient than race in Brazil. And frequently, these localized movements influence each other transnationally. For example, in the last decade, we have been seeing an increase of the "racialized language" when addressing the issue of police brutality in the "favelas" in Brazil as inspired by the US based #Black Lives Matter movement; while class based mobilizations in the US have drawn significant inspiration from class based movement such as the Landless Movement (MST) in Brazil. In this paper we will use United States based and Brazilian based movement case studies to compare and contrast racialized and class based mobilizations in the two countries. We will discuss primary similarities and differences within the racialized and class contexts of the countries, examine how those contexts affect specific movement cases in the country as evidenced by the particular cases, and how the movements influence each other transnationally. While much of the prominent social movement literature and frameworks focuses largely on US cases, this analysis will reveal local, national and transnational interactions that affect political mobilization and consciousness, in order to develop a broader framework for transnational social movement analysis.

The Gender Puzzle Revisited: Contemporary Spirituality and the Rise of the Feminine

Debates surrounding the increasing popularity of the "spiritual but not religious" (SBNR) moniker in the West have tended to be couched in terms of the rise of individualism, the loss of traditional forms of (religious) community, the postmodern turn, and the spread of consumer culture. As a result, little attention has been given to what Linda Woodhead and Paul Heelas (2005) deem the "gender puzzle" that pervades the spiritual milieu, referring to why far more women are interested in contemporary spirituality than men. In this paper, I turn my attention to this much-ignored, yet pertinent, subject. Drawing from ongoing ethnographic fieldwork, conducted with Canadian millennials who self-identify as SBNR, I seek to show that contemporary spirituality prizes what are traditionally understood as feminine characteristics—emotional, nurturing, flexible and peaceable—in both men and women. Thus contemporary spirituality has historically attracted more women because it gives value to the virtues of their culturally prescribed gender role. I then trace the intermingling relationship between feminist and alternative religious movements in the West, outlining how and why the two have tended to attract one another. I conclude that the rising popularity of contemporary spirituality among both female and male millennials supports the view that second wave feminist discourses and aims (especially those concerned with religion) have, in certain ways, become mainstream among younger generations.

Criminalizing the Political: The Liberal State, Dissent and the Problem of Legitimacy

Acknowledging a pattern of global dissent since 2001 involving pro-democracy, anti-war, environmental and anti-Austerity campaigns, this paper highlights the way so many liberal states have criminalized political dissent and asks why this

has happened. This tendency is not well understood or acknowledged. The paper proposes a novel interpretative framework drawing on empirical and historical research, and legal, political and ethical theory to establish why liberal states (like America, Britain, Canada and Australia) do this and why repressing dissent and criminalizing the political is bad for democracy. The paper assesses the respective merits of several possible explanations. One explanation identifies the increasing willingness of liberal states to criminalize political dissent as part of a broader criminalization process, referred to as the 'punitive turn' taken by any number of neo-liberal states. A more satisfactory explanation begins with an examination of the long-running crisis of legitimacy illuminated sharply in the 'debate' between Habermas and Schmitt about the relationship of sovereign power to legitimacy revealed in Schmitt's aphorism that 'sovereign is he who has the power to declare an exception'. The paper argues that in all liberal democracies we see the normal provision for what Dyzenhaus (2006) calls legal 'black holes' and 'grey holes' legalizing exceptions to the rule of law. Notwithstanding the liberal self-portrait emphasizing commitment to constitutionality, rights and the rule of law, most liberal states illustrate a long-standing historical disposition to privilege security over freedom. This suggests a more fruitful line of inquiry and points to a disposition to criminalize political dissent that is far older than the neo-liberal project but one that has become especially virulent in the neo-liberal era.

GENOVA, CARLO* (*University of Turin Department of Culture, Politics and Society*)

Wearing Our Principles: Putting Performance Back into Politics

Until the 1960s protestors dressed in their everyday clothes or used working clothes to highlight occupational or class identity. This changed as clothing became an increasingly significant aspect of 1960s' protest activism as youth cultures joined with anti-war and civil rights protest movements. The repertoire of protest activity and the use of clothing changed in the 1970s with the adoption of masks including handkerchiefs, gas masks, and balaclavas. Anti-globalisation movements since the late 1990s and anti-Austerity campaigns post-2008 saw new forms of creative color-coded masks and clothing by anarchists (including black, blue, pink, silver and yellow blocs (Dupuis-Deri)). The Guy Fawkes mask of Anonymous and the colourful balaclavas of the Pussy Riot Girls or Code Pink achieved global recognition (Rowe 2013). The paper explores and critically assesses the ways the social sciences have acknowledged and understood the use of clothing and masks in political activism. Granting eg. that wearing a mask or a costume may be variously a way to conceal personal identity under conditions of heightened surveillance, to protect against the effects of tear gas, or a masquerade as part of a performative politics (Madison and Hamara 2006), the paper shows how performance studies have not figured in the research programs of sociology, politics or international relations as much as they might have done. The paper argues for the need to consider the varieties of expressive production as well as its reception by various audiences. Taking a cue from Park's (1950) sociological argument for the centrality of masks in social interactions, the paper explores the possibility that wearing a mask or a costume can amplify voice or foreground belief more firmly, with a view less to deceive the audience and more to reinforce and gain agency through selective self-representation.

WATTS, VANESSA* (*McMaster University*)

Reconciling to the State: Social Justice in an Era of Reconciliation

The era of reconciliation has presented an opportunity for Indigenous-related issues to be recognized in the sociopolitical realm via visibility in the media, education, and policy uptake at regional and federal levels. Yet, statist objectives to eliminating the "Indian Problem" remain present. This paper will examine how reconciliation discourse ultimately reinscribes state-centered efforts towards assimilating Indigenous peoples and communities in the Canadian body politic. The national inquiry into Missing and Murdered Indigenous Women has been a fraught process, replete with Indigenous communities, activists and scholars as well as families of MMIW calling for a reset of this Inquiry. Child welfare advocates continue to fight the inequities and discrimination that are embedded in the child welfare system against First Nations children despite the Canadian Human Rights Tribunal ruling in favour of Indigenous advocacy organizations. Further, "economic reconciliation" with Indigenous communities has emerged as a priority from the federal government and continues to be met with opposition from Indigenous peoples. While the idea of reconciliation lends to the notion of authentic engagement between Indigenous communities and the state, it has in many respects, accelerated the need for social justice in Indigenous communities.

WAWRZYŃIAK, JOANNA* (*University of Warsaw*)

Durkheimians Transformed: The Case of Poland

The paper discusses the engagement of Polish sociology with works by two generations of Durkheimians. First, based on a quantitative scrutiny, it summarizes translations, discussions and absences of their key works in the interwar, communist and post-1989 periods. Second, qualitatively, it explains, how interwar meshing of Durkheimianism with Marxism by Stefan Czarnowski, a student of Henri Hubert and Marcel Mauss, and counted among the fathers of Polish sociology, became an important part of Polish post-war sociological mainstream and a tool in the hands of local sociologists against a crude version of Marxist propaganda of the Party State. More generally, fusion of Durkheimianism with Marxism in the specific case of East-Central Europe calls for some attention in the studies of the Durkheimian school as a movement in international social sciences. Although reception of Durkheimianism in various geographical and linguistic areas has been studied, it seems that a deeper, contextual historicization is needed to understand both how this school made a global career and how it changed in various localities.

A Framework of Recreational Program Delivery: Instilling Positive Development in Youth and the Capacity to Facilitate Community Development

Recreational activities can provide an effective setting for positive youth development (PYD). However, youth's participation does not automatically lead to positive developmental outcomes and a framework for promoting and evaluating PYD through recreation does not yet exist. Also, often ignored within PYD research and programs is the need to instill in youth the willingness and capacity required to contribute to their civil societies and become active members within community development. As a result of this research project a model, following a logic model format, was created that can help guide recreational program design to bring about positive developmental outcomes and a sense of community stewardship in youth participants. This model was constructed using empirical data collected from three successful PYD aimed recreation organizations which also contain community outreach components. A qualitative multiple case study approach was utilized. Youth participants (n = 26) and staff delivering programs (n = 22) in these three organizations were approached for one-on-one interviews and one focus group. Inductive and deductive analyses resulted in key themes categorized into the five-steps of a typical logic model. Contained are a series of process factors including inputs (i.e., contextual factors and external assets) and activities (i.e., direct and indirect strategies) and intended PYD outcomes including outputs (i.e., objective measurable indicators), short-term outcomes (i.e., life skills), and long-term impacts (i.e., the four Cs and community contribution). A framework for designing recreational programs towards the goal of promoting positive developmental outcomes in youth, following a logic model format, is presented. Also, by designing recreational programs, aimed at PYD, after the inputs and activities outlined in this model and looking for the results highlighted in the outputs, outcomes, and impacts, recreational programs can help youth become active and important contributors to their community's development.

La Prise En Compte Des Enjeux Et Risques Cyber Au Sein De L'armée De Terre Française : Le Poids Des Cultures Militaires Et Professionnelles.

Si l'expertise et les compétences techniques tiennent indiscutablement une place centrale dans les capacités de toute organisation à faire face à une attaque cyber et potentiellement à y répliquer, la littérature existante souligne tout autant et systématiquement l'importance de l'acteur humain. Considéré comme le maillon faible - celui par qui le « mal » peut entrer (par négligence, par duperie, par intimidation, par volonté de nuire, etc.) - la communication s'attachera au personnel militaire œuvrant par définition au sein d'une institution des plus sensibles ; et plus précisément au cas de l'armée de terre française. Bon nombre de constats opérés semblent en effet traduire une marge de progression certaine en vue d'optimiser encore la sécurité numérique et minimiser les risques encourus. Avant même l'évocation de certaines pistes d'amélioration, le propos cherchera à poser quelques constats éloquentes et de tenter de montrer les liens directs entre les cultures et sous-cultures militaires et professionnelles et certains comportements inappropriés et/ou à risque dans le domaine cyber. Comment des considérations relatives au commandement, à la notion de communauté solidaire et aux valeurs associées, à la place du combat et aux représentations associées mais également les notions de transgression, d'impunité ou de sentiments forts de maîtrise ou de capacité à faire face, etc. peuvent expliquer les mentalités et comportements des personnels de l'armée de terre vis-à-vis de l'enjeu cyber.

Legal Protection of Privacy and the Social Reality of Disability

This paper will discuss legal protections for privacy in relation to the social reality of disability. Legal rights to privacy are of key importance to people with disabilities both as a safeguard of human dignity and autonomy, and as a means to avoid the discrimination that may occur when a person's disability is known to potential employers or others. At the same time, people with disabilities frequently must waive privacy protections to obtain needed accommodations. They may also choose to "come out" as persons with disabilities in order assert their identity and to be part of the community of disabled individuals. This paper will consider the paradox of privacy rights for people with disabilities, critically examining national legal regimes in North America and the privacy article of the United Nations Convention on the Rights of Persons with Disabilities (CRPD) (Article 22).

WEBER, MAXIMILIAN* (Goethe University Frankfurt)

Analysing Differences in the Cultural Field Using Facebook Data

The rise of Web 2.0 platforms has enabled easier participation through one's own content on the Internet. Previous research has shown that Internet usage and online skills are stratified by socio-economic characteristics. For example, it is demonstrated that people from resource-rich households tend to use the Internet more often for obtaining information, whereas those with less resources tend to be more interested in the entertainment functions of new technologies. Can such a pattern be found in online content from young people, too? Does self-produced content posted on social networking sites differ according to social background characteristics?

Research in the field of cultural practices has revealed that differences based on social positions can be found in almost every sphere of life. Referring to Bourdieu's mention of capital, a relationship between social origin and different forms of participation in online social networking can be built.

Data gathered from a social media platform is used in order to answer the research questions. For this purpose, information on social background is collected through an online survey. After the poll, respondents are asked to log in with their Facebook account, and if they agree, their posts and likes are stored in a database. This data can then be analysed for patterns according to social background characteristics. Not only can the frequency of participation be analysed, but also the posted content, using text-mining algorithms (e.g. structural topic model). Analysing Facebook posts in connection with social background characteristics is an understudied field of research.

Preliminary results from the ongoing data collection phase show that there might be a relationship between cultural capital background and the usage of the Facebook "Like" button. A similar pattern can be expected for posted content.

How Do Graduates and Non-Graduates Imagine Their Lives after Turning 60? a Computer-Assisted Analysis of Open-Ended Survey Responses

Previous research has shown that different leisure activities are carried out by individuals' social status. Numerous methods can be applied to analyse differences in the cultural field. In contrast to previous research, a semi-automated text analyses method – structural topic model (STM) – is used. In the 1990s the debate about the benefits of closed and open-ended survey questions revealed that the latter are more difficult to analyse because human coding is needed, probably therefore open-ended questions are very rare in today's sociologically motivated large-scale surveys. In this study topic models are used to analyse answers from an open-ended question in the British National Child Development Study (NCDS) mostly automatically. The respondents of the panel study were asked how they imagine their life when they are 60. The answers of the 50-year-old responders are analysed using a structural topic model (STM).

From Bourdieu we know that cultural choices are related to individuals' social positions. Different sports and leisure activities are carried out according to cultural capital level (e.g. education). To test whether answers in the open-ended survey responses from the NCDS show a similar pattern, differences in topical prevalence are analysed by educational level of the respondents (N=7222).

Results show differences in topic prevalence according to academic qualification and gender. Regarding their imagined life one decade later, adult men are more likely to write about playing golf or tennis and watching sport than women. For university education, the findings support earlier research on the frequency of cultural activities carried out. Respondents with an academic degree are more likely to mention terms from the art topic in their answers. In other words, they imagine doing art related activities more often at the age of 60 than respondents without a degree.

Six Ways to Measure Status and Expectations

Six Ways to Measure Status and Expectations

Murray Webster, Joseph Dippong

August 28, 2017

We review six alternate research designs for status and expectation states questions, identifying what is known about each, what remains to be determined, and how each design might be developed for greater usefulness in research conducted in this theoretical perspective.

(1) Joseph Berger's design using disagreement resolution. Two computerized versions are available.

Properties: (1) Precise measurement. (2) Known properties (3) Adaptable.

Limitations: (1) Only dyads. (2) Requires laboratory. (3) Somewhat stressful. (4) Requires deception. (5) Requires training.

(2) Questionnaires. A 7-item scale; factor analysis has shown that it is unidimensional.

Properties: (1) Good correlation with behavior. (2) Large group administration. (3) No deception.

Limitations: (1) Respondents' access. (2) Respondents' scaling. (3) Simple situations.

(3) Vocal accommodation. This measure is suitable for recorded speaking, and uses measures of a sub-audible frequency of speech that differs across individuals, but that they tend to adjust towards each other during interaction.

Properties: (1) Non-reactive. (2) Usable in natural settings.

Limitations: (1) Theoretical justification is undeveloped. (2) Requires expensive equipment. (3) Unknown correlations.

(4) Brain wave and MRI.

Potential: (1) Precise measures, long scales. (2) Usable in complex settings. (3) Non-reactive. (4) Perhaps usable with non-human primates.

Limitations: (1) Expensive equipment. (2) Trained technicians. (3) Cumbersome. (5) Behavioral cues.

Properties: (1) No deception. (2) Unobtrusive. (3) Computer coded.

Limitations: (1) Requires laboratory. (2) Unknown measurement properties.

(6) Factorial Surveys. Properties and limitations similar to other questionnaires, but with greater ranges of independent variables measurable.

General points on these measures:

1. All are available.

2. Need varying amounts of development.

3. Researchers may choose the most appropriate measures, based on theoretical and practical considerations.

WEIDENHAUS, GUNTER* (TU Berlin)

Mapping the Reconfiguration of Space

Within the social theory and present diagnosis of social change, nearly all authors describe fundamental changes of the spatial order of the world. There is a consensus that spatial reconfiguration takes place. Most recent theories and concepts, like world system theory (Wallerstein), the idea of McDonaldization (Ritzer), the rise of the network society (Castells) or planetary urbanization (Brenner) for example, claim that the spatial order of the world changes. However, there are fundamental differences between these descriptions. The authors use different connotations of space and many different scales to analyse the spatial order of the world. That leads to different claims about territorialized, deterritorialized and reterritorialized spaces, network spaces and so on.

On a more abstract level, these analyses of the social that lead to a description of the spatial order of the world have something in common: All authors use on the one hand reconstructions of the spatial constitutions of actors in everyday life and on the other hand more or less reflected assumptions about relevant spaces on methodological level. If we understand, how the authors conceptualize the interconnectedness of empirical constitutions of space, methodological assumptions and the spatial order of world, it is possible to categorize and analytically differentiate the ways of thinking about space by social scientists. By reconstructing existing perspectives on space in recent social theory, I offer a general schema to map the ways of thinking about spatial reconfiguration.

The Periphery in the Core: Cider Production, Migration and Agrarian Citizenship in the Pacific Northwest

While historical cider production in North America has long been tied to the popular imaginary of the frontier and settler-colonialism, contemporary craft cider has breathed new life into small-scale local agrarian economies grappling

with the pressures of global capitalism. Liquor laws in the Pacific Northwest have supported the establishment of apple orchards and land-based cideries in rural communities, thereby enabling livelihoods for young orchardists, who are often women. Geographical indication of locality and place has served as a vital element in the viability of this industry, and various appeals to 'heritage' likewise bolster the legitimacy of a fledgling cider culture. Craft cider producers often mobilize the idea that the unique taste of a given region owes to the apples that grow in that region, including heirloom cider apples. But the narrative of cider's geographical rootedness obscures the racialized, non-local migrant farm workers whose labour brings into being the local agrarian landscape. Their labour is not valorized as part of the 'craft' of craft cider production, and their living and working conditions often contrast with the romantic agrarianism underlying local cider's geographical indication. Furthermore, deploying a narrow and romantic agrarian heritage belies the ongoing history of cider's fraught relationship with local Indigenous peoples and lands. In this paper, I draw on data from interviews with cider producers, farm workers and industry experts in British Columbia and Washington state. I investigate how each set of actors relates to the agrarian landscape through the process of growing local apples, and how their racial, class, and immigration status shapes their relationship with the natural world. I use the Marxist concept of metabolic rift to consider how human-nature relationships in specific agrarian geographies can inform efforts to reverse the capitalist exploitation of both people and lands.

WEILER, VERA* (Universidad Nacional de Colombia (Bogotá))

Elias' s Idea of a Processual Type of Explanation

At the end of his life Norbert Elias clearly wanted his work not to be labeled as figurational sociology because he felt that thinking in terms of human beings bound together in figurations had been assimilated by thinking in terms of systems instead of processes. At that time the label *figurational* had been always firmly established, perhaps too firmly to get replaced by that of *processual*. But what if the point made by Elias wasn't fully understood? Sometimes both words have been used as if they were synonyms. Anyway the distinction figurational-processual did not get much attention. Surprisingly enough in the meanwhile the term "processual sociology" has been taken over by others, and we will feel compelled to compare. So, we should no longer avoid the task to come to terms with Elias' idea of processual thinking underlying that of a processual sociology. The paper is aimed to face this task. Based on a collection of references from archive records and published work of Elias it is argued that processual thinking has been conceived of by Elias as the overcoming of a specific type of explanation related to a specific structure of causation. Elias avoided explicit statements on the origins of that structure though clear in that it should form under empirical conditions, and that for precisely that knowledge of our natural constitution were needed. All this, then, invites to look at the first figuration which is effectively experienced by human beings in their lives in search of the empirical conditions under which the structure of causation-explanation is primarily formed. The latter has been fundamental to the processual theory of Günter Dux, much in the sense in which Elias could accept it.

Processual Individuals and Their Experiences

Perhaps it may be taken for granted nowadays that individuals are not fixed entities, but rather become the people they are at a given moment, thinking and acting in one or another way, due to their experiences. This makes understanding of experiences crucial for understanding of virtually all the forms of organization of human life, and by this way experiences turned out problematic too. The absence of a shared frame of reference for understanding of and dealing with human's experiences as well as the variety of efforts to take in account experiences in empirical research, they both should be taken as signals of difficulties.

The paper is aimed to recognize them as such, as difficulties. It will be examined to what extent they are related to those one has to face when trying to overcome a static view of individuals, with lasting consequences rather than merely displacing an absolutistic substance. This is pursued a great deal by means of a comparison of two approaches to the processual nature on individuals (via their experiences), the one stemming from the sociologist Andrew Abbott (Processual sociology), and the other from Günter Dux (On the processual logic of cultural change), also a sociologist. Key concepts to be discussed in this context are Abbott's "historicality of individuals" and "encoded experience", and Dux' "subject logic" and "processual logic".

RC14-269.10WEINER, NATHANIEL* (*University of Hertfordshire*)*"I Just Don't Feel It's As Heart-Felt As the Japanese Brands":
Anglosphere Men's Transnational Consumption of Japanese
Denim, Workwear and Military Reproduction Clothing*

Following sociologist Agnès Rocamora's (2002) theorisation of fashion as a Bourdieusian field, this paper looks at transnational consumption within the sub-field of online menswear communities. These are online communities that men visit to discuss and read about men's clothing. Reporting the results of an online ethnography of these communities and in-depth interviews with fifty community members located in the Britain, Canada and the United States, this paper explains why so many Anglosphere men are so passionate about Japanese clothing. In the process of doing so, it demonstrates how the transnational consumption of high-end Japanese 'heritage' brands troubles the traditional class meanings attached to denim, work clothing and military surplus.

Beginning with a genealogy of Japanese menswear, this paper explains how menswear is itself a transnational field, with American style having greatly influenced Japanese clothing consumers and producers during the 1960s, 1970s and 1980s. The focus here is on how the class meanings of these clothes changed in the process, with working-class American jeans and military surplus clothing becoming sought-after luxury commodities in the Japanese market. This paper then turns its attention to contemporary transnational consumption practices, detailing how expensive Japanese imports bestow 'subcultural capital' (Thornton, 1996) within fashion's sub-field of online menswear communities. To the uninformed outsider, Japanese jeans, flight jackets and work boots are indistinguishable from the cheaper, contemporary versions worn by huge numbers of men around the world. But within online menswear communities, the craftsmanship, high price point, and rarity of these Japanese clothes make them very similar to the types of luxury garments more commonly associated with high levels of economic and cultural capital. This challenges nationally-bounded analyses of men's fashion, revealing the need for transnational analysis of consumption within the field of men's fashion.

RC16-300.2WEINSTEIN, DEENA* (*DePaul University*)*Simmel's Assessment of Cybersociety*

A century after his death, Simmel has returned to haunt the brave new world of the internet, smart phones and social media. He has gained newfound celebrity as the go-to theorist to make sense of and shine light on our myriad interactions in cyberspace. The focus of this paper is to critically assess how Simmel's work is used in the scores of recent analyses of our digital environment. The author then considers whether or not the society which Simmel examined at the turn of the twentieth century is especially different than our current digitally-mediated world.

RC21-401.3WEINSTEIN, LIZA* (*Northeastern University*)BALIGA, ANITRA* (*London School of Economics and Political Science*)*The Mumbai Model in Delhi: Shifting Relations of Developers,
Residents and the Local State in Housing and Land Politics*

Contributing to an understanding of the political economy of developers, this paper analyzes how large and small development firms work with local governments and urban residents to shape the field of informal settlement upgrading and low-income housing construction in urban India. Based on a case study of Mumbai's Slum Rehabilitation Scheme (SRS), it argues that configurations of local state power, including the relative strength and coherence of administrative and political institutions, shape the relative influence that private developers can garner in this field. The paper traces the shifts and mobility of SRS over the past 25 years, revealing the ways it has changed in response to both the changing field of property development in India and emerging housing and urban land rights movements across the country. It traces the program through three periods: first from 1991 to 2004, the program's early years, during which Mumbai's politicians worked to craft a cross-subsidized housing program that was both sufficiently populist and entailed hefty enough incentives to elicit participation from private developers. During the second period, from 2004 to 2012, the program's aims and incentives were altered as both property development firms grew larger and more international, and housing advocates and activists grew savvier and more effectively networked. During the third and current period, beginning around 2008, the "Mumbai Model" of privately financed in-situ slum upgrading has become a mobile policy model and has been adopted by the Delhi government as a way to "make Delhi slum free." Drawing on both historical and comparative analysis, this paper demonstrates that local configurations of state power and urban democracy affect how private developers operate within the field of urban development. These findings contribute to an emerging political economy of

developers by revealing the importance of the institutional and political context in which they operate.

RC31-JS-84.1WEISS, ANJA* (*University of Duisburg-Essen*)*Sociology of Global Inequalities*

Conceptualizing society as a stratified class society has lost much of its appeal since the 1960ies. Today, theorists of social inequalities prefer an intersectional approach (Yuval-Davis) or they focus on microsocial and organizational mechanisms (Tilly).

Class is a difficult topic for international migration scholars, too. Traditionally, migrants were seen as exploited and as segmenting national labor markets. Today, scholars of transnational migration describe a contradictory class mobility (Parreñas): migrants may be poor in the country of arrival while supporting middle class lifestyles in the country of origin.

In an attempt to "decentre" migration (Dahinden) and to theorize migrants' 'class' position in a multidimensional theory of social inequalities, the paper offers a sociological theory of global inequalities. Instead of placing persons in one national welfare-state thereby turning migrants into an exception, the proposed theory argues that all humans are situated in a plurality of functionally differentiated, politically contested, and territorially segmented contexts. For some people the nation-state succeeds in conflating these contexts, but for migrants, elites, and those living in dysfunctional states contexts are plural, in part deterritorialized, and/or extending beyond national borders. Resource rich groups can strategically place themselves in context relations. Therefore, socio-spatial autonomy is an important dimension of global inequalities.

Put differently: Social structure is not contained by the nation-state, but it emerges from a web of context relations. Since the value of resources depends on the contexts in which they are put to use, stratification by citizenship and symbolic exclusion is a constitutive element of social structure.

RC39-687.4WELLS, KATHRYN* (*York University*)*Activism in a Post-Disaster Context: Environmental Views Following
Displacement from Disaster*

Environmental conservation is an important part of understanding the conditions in which social inequalities can be exacerbated during and in the aftermath of a disaster. Often people are displaced for varying amounts of time following a disaster and this displacement is not only a cause for concern for the most vulnerable of populations but may prompt a stronger sense of environmentalism in the people affected by disasters. Since disasters are increasing in frequency and severity, the social impact of disasters is an ever-growing subject of research that has real implications for both the environment and the livelihood of people within our society. This paper examines the link between environmental displacement and the underlying environmental views of those who are the most vulnerable during times of disaster. Utilizing an intersectional ecological feminist lens, I explore those who are the most vulnerable to displacement and whether this displacement contributes to feelings of distrust of our political, social and economic systems. If so, are these people contributors to environmental movements and do they spearhead a link between vulnerable populations and activism? More specifically, are those who have been displaced by disaster the most likely to start or contribute to the environmental movements common today?

RC39-682.4WELLS, KATHRYN* (*York University*)*Redefining Basic Needs for Families: A Qualitative Analysis of
Services Provided after the Flood*

The literature on families in disaster currently leaves many questions unanswered with regard to their basic needs during and after a disaster. This study fills that gap using focus group data conducted with service providers one year after the 2013 Southern Alberta Flood in High River, AB. My analysis looks at the basic needs of families during and after the disaster event. It also asks how families and service providers define basic needs. Findings suggest that there are many ways in which service providers were able to support the community but there are also discrepancies between family needs and what service providers made available and offered. My analysis contributes to a new perspective on family basic needs during and after a disaster like the 2013 Southern Alberta flood. This paper provides important research findings that points to how families were supported by service providers and a major discrepancy between family needs and the resources offered to them by community service providers. These findings have important implications for attempts to best assist families both during and after disasters, and makes important contributions to the existing literature in this area.

RC46-771.2WEMMERS, JO-ANNE* (*School of Criminology, Université de Montréal*)*Victim Support As Crime Prevention***Victim support as crime prevention**

Abstract: Since the 1980s victim support services have approached victimization as a random act and have largely ignored research on multiple victimization. Victims already often blamed themselves and, therefore, victim support services tended to avoid any suggestion that the victim was an actor in the crime. However, the research on multiple victimization, and more recently poly-victimization, shows that individuals who have been victimized in the past are at risk of being re-victimized in the future. This article, examines why previous victimization puts individuals at risk of re-victimization and considers the importance of timely support as a means to empower victims and reduce their risk of future victimization.

RC28-524.5WEN, FANGQI* (*New York University*)CHENG, SIWEI (*New York University*)*Perceptions of Economic Well-Being and Attitudes Toward Inequality and Redistribution: Evidence from Survey Experiments*

Previous studies have shown that in the U.S., income is correlated with attitudes toward income redistribution, which reflects how material self-interest affects opinions. However, ordinary people generally have a vague sense about the national income distribution. In other words, their perceived income rank might be different from their actual economic standing. Does the misperceived economic well-being affect individual attitudes toward inequality and redistribution? Will we be able to change people's opinions by correcting their misperceptions? In this study, we try to answer these questions by survey experiments. Specifically, we hypothesize that after being informed about their true income ranks, respondents who originally underestimate (overestimate) economic standing will show higher (lower) tolerance toward inequality and become more (less) averse to redistribution.

Six experiments with a total sample of 3,912 research subjects have been launched in the online platform Amazon Mechanical Turks. Results support the hypothesis proposed above. They are summarized as follows: 1) most respondents (around 90%) underestimate their personal income rank; 2) most respondents (73%) overestimate the average income of the poorest 10% American population, but they (60%) underestimate the average income of the top 1%; 3) after being informed of their true personal income ranks, respondents who initially underestimate themselves believe more in meritocracy, become less concerned about inequality, display less support for redistribution and agree less with the statement "inequality continues to exist because it benefits the rich and powerful", and opposite effects could be found among respondents who do not underestimate; 4) similarly, if we correct people's misperceptions of income for the very poor and the very rich, we detect attitudinal shifts as predicted; 5) finally, after being primed with a pessimistic message about intergenerational mobility, respondents show less tolerance toward inequality and more support to redistribution, especially among those who have high expectations of upward mobility.

RC23-425.20WENTEN, KLARA-AYLIN* (*Technical University Munich*)*"Now, with the Tools Available at a Makerspace, Anyone Can Change the World..." How Makerspaces Can(not) Contribute to a Democratization of Work and Production.*

This paper focusses on the interdependence between democratized production – as supported by the "Maker Movement" – and prevailing work practices in industrial companies. While Makerspaces are often portrayed as open workshops, where democratized production is claimed to be possible, the paper especially discusses its limits and constraints when being integrated into business models. It demonstrates how the fusion of such work practices is organized by putting both Makerspace and industrial company into the focus.

The belief in democratized production at Makerspaces is often associated with communal access to technological tools and knowledge, as well as with a greater participation in manufacturing processes. Over the past few years, industrial companies from product development or the automobile industry have also started to integrate Makerspaces into their business models. By letting their employees create prototypes outside the company, Makerspaces seem to become a workplace, where actors can experiment with the idea of democratized work and production.

In this context, both industries and Makerspaces are confronted with work practices that are extremely decentralised, flexible and self-regulated by the respective actor using the Makerspace for commercial purposes. But these practices can also be challenged by the prospect of higher autonomy and democratization.

It is against this background that the paper aims at examining more closely the relationship between the two organizations. Supported by an interview study and ethnographic fieldwork, it will investigate how these new forms of work are actu-

ally organized. To what extent do they reorient business or innovation models? And how do they in the end respond to the potential of a greater democratization of work?

RC30-542.2WENTEN, KLARA-AYLIN* (*Technical University Munich*)*On the Relationship between Industrial Work and Democratized Production*

This talk seeks to engage with the relationship between traditional work practices in industrial companies and new production practices related to the "Maker Movement". It will give insights into the impact of the proclaimed fourth industrial revolution on these different practices and understandings of work in the context of digital fabrication.

Over the past few years, actors from the "Maker Movement" have characterized the fourth industrial revolution with an increase of collective, decentralized and democratized production. They have claimed to disrupt prevailing practices in innovation and production owing to new technology like 3 D printing and communal access to it by open workshops, so-called Makerspaces or FabLabs. These workshops are spaces, where employees from larger industrial companies, private users or self-employed workers can come together to prototype and experiment with digital production tools.

Makerspaces are located right in the center of conventional industrial work practices and novel forms of digital work. Since greater industries show growing interest in Makerspaces, innovation and entrepreneurship become relocated beyond the conventional industrial realm. This paper seeks to investigate such development in order to understand its effects on work practices in both Makerspaces and companies that start to cooperate with them. How can this relationship between conventional and novel work practices be described? The paper concludes with a better understanding of whether and how actors can also challenge conventional forms of work through digital technology and how this might affect and transform innovation industries. The research purpose will be supported by interviews and ethnographic fieldwork in two Makerspaces that are financed and used by industrial companies.

RC28-506.5WENZIG, CLAUDIA* (*Institute for Employment Research*)TOPHOVEN, SILKE (*Institute for Employment Research*)REITER, SABRINA (*Institute for Employment Research*)*Poverty Patterns during Childhood – Characteristics, Determinants and Impacts on Socio-Emotional Development*

In Germany – like in most European countries – children and adolescents are still a social group at higher risk of poverty and welfare benefit receipt. However, most official statistics as well as a number of research findings depend on cross-sectional data. Using longitudinal data instead enhances the perspective on poverty trajectories during childhood. As a result, questions of how poverty patterns are characterised and determined arise. Against this background, we examine poverty patterns of children in Germany in a longitudinal perspective as well as their determinants and impacts on children's socio-emotional development.

We employ the nine waves of the German panel study "Labour Market and Social Security" (PASS), which is an annual household panel survey. In order to gain a more precise picture of low-income households, we distinguish between five different household income situations: "secured income position", "intermediate income position", "at risk of poverty", "receipt of basic social security" and "at risk of poverty and receipt of basic social security". In order to identify typical poverty patterns, we use sequence analysis in combination with cluster analysis. The results show five differing clusters in terms of changing income situations and the length of poverty. The biggest group of children lives in permanently secured households during their childhood (69 %) whereas a smaller group of children grows up in permanent poverty (12 %). Three other groups experience multiple changes between secured and precarious income situations for short or longer periods (19 % in total). As determinants of poverty cluster affiliation, we identify household and parental characteristics. The results of impacts on child development show that growing up in a low-income family, especially in permanent poverty, restricts children's opportunities to participate in social activities and interact with peers.

RC43-735.1WERNER, GRETA* (*The University of Sydney*)*Comparison of Social Housing in Three Areas of Practice*

This paper reports on a study of social housing in three areas of practice. The research compares housing in Sydney, Australia, where around 5% of households live in social housing, with Vienna, Austria, where around 60% of households live in social housing and with Singapore, where more than 80% of households live

in social housing, to identify practices which support government provision of housing.

A theoretical framework is constructed to analyze social housing using Fligstein and McAdam's (2012) theory of fields, which draws on Bourdieu's concepts of field, habitus and capital to develop a spacial analysis of housing infrastructure. The term 'spacial' is used in Lefebvre's sense of social space, which includes both physical and relational aspects.

Fligstein and McAdam view strategic action fields as constructed social orders on which economic, civil society and government organisations are built (Fligstein and McAdam 2012: 2). Within these fields, actors work strategically for advantage, both material and 'existential' (Fligstein and McAdam 2012: 3). Existential advantage refers to meaning-making projects which ultimately seek to avoid the emptiness of Nagel's (1986) 'outer perspective'. To combat meaninglessness, skilled social actors create meaning and order for themselves and others towards evolving collective ends. However, the meaning projects of groups thus formed can compete with those of other groups, in which case agenda setting and agreement on definitions of the situation are key to maintaining advantage in negotiations (Fligstein and McAdam 2012: 51).

This framework highlights the processes which lead to the material and spacial organization of the city and housing in particular, by focusing on both the meanings and physical effects of practices. The framework is used to understand how government agencies, firms and non-government organisations involved in housing provision seek to transform space according to their values.

GÜNTHER, SANDRA (Leibniz Universität Hannover)

"What Qualifies a Woman to Compete As a Woman?" - Intersexuality in Sport

The examination and standardization of testosterone levels for female athletes have been suspended in 2015 after the female sprinter Dutee Chand has pressed charges against the IAAF's Hyperandrogenism Regulation at the Court for Arbitration for Sport (CAS). The suspension of the „IAAF Regulation Governing Eligibility of Females with Hyperandrogenism to Compete in Women's Competition“ for female athletes for two years has ignited a debate about the justification of gender affiliation and negotiation of gender binary in sports. This regulation might be declared void, depending on the scientific evidence that the IAAF needs to file until the end of September 2017. The IAAF has to verify a coherence between higher testosterone levels and advantages in performance or otherwise this policy will be abrogated. We would like to discuss the gender norms, power relations, and the logic of argumentation that have been applied during this ongoing debate on regulating the female body in sports by analyzing the discourse on this issue.

Same Context – Different Choices? Explaining Group-Specific Variations in the Impact of Socio-Spatial Context Conditions on the Choice to Study and the Field of Study

The paper investigates group-specific differences in the relevance of socio-spatial contexts on the *choice to study* and the *choice of field of study*.

It is well-known that residential settings influence individual decisions. However, less is known about the relative importance of residential contexts for different groups of individuals. This paper systematically assesses to what extent patterns of study choices of different groups – focusing on *social origin*, *ethnic origin* and *gender* – are unequally affected by regional conditions.

Theoretically, I argue that variations in the evaluation of (financial, social, emotional) costs, benefits and success probability between social groups can result in a *differing* relevance of the *same* residential context – e.g., depending on families' socio-economic situations, moving out of the parental home for study purposes might not be considered an option. Hence, the local supply with study opportunities becomes increasingly important. Moreover, educationally-relevant information provided by social networks in the residential area is particularly important if the familial context is less likely to provide information on educational alternatives.

Data from the German National Educational Panel Study (NEPS-SC6) is utilized and enriched with macro information on respondents' residential contexts on the municipality level and flexibly aggregated within travel-time radii. The macro data contain information on supply with study opportunities, fields of studies and vocational training. The combined data set contains information from 1996-2016 for East and West Germany.

In line with theoretical expectations, preliminary findings indicate that youngsters from lower social and immigrant origin depend in their study choices strongly on offerings in the residential context as they are – regardless of how unfavorable their residential area is – less likely to relocate. In that respect it can be demonstrated that a favorable supply with study opportunities can compensate

for social class differentials. Poor training-market conditions are particularly disadvantageous for males.

Beyond Militarisation: Why Sociology Should Better Appreciate War and the Military

In this paper I argue that advances in sociological thought can be made through a better appreciation of the ongoing influence of war and the military in the shaping of contemporary society. After outlining the reasons for a general reluctance by sociologists to study war and the military, certainly in contrast to historians and political scientists, I will focus on the limitations of the dominant 'militarisation thesis' that has emerged post '9/11' in sociology and cognate fields. I will then argue that a new cultural sociology of war and the military can be achieved by reconceptualising the perceived relationship between armed conflict and civil society, allowing for sociological analysis to move beyond a primary concern with representation to integrate the direct and indirect influence of war on belief and social action.

WETZEL, DIETMAR* (University of Basel)

Alternative Forms of Life in Switzerland – Transformative Communities As Social Innovations (Cohousing)?

The normative underlying of a "transformative community" is, that it has to offer a political-ethical space for social transformation through innovation to preferably all of its members. Based on the project "Transformative communities as a form of social innovation? Cohousing and contract farming projects in the German-speaking part of Switzerland", a project funded by the Swiss National Science Foundation, I will present empirical and conceptual results in the context of alternative forms of life in Switzerland (Co-Housing). First, the talk will tackle the question of alternative forms of life in a more sustainable society. The term "form of life" by Rahel Jaeggi (2015), which is defined as an "instance of problem-solving" (Jaeggi 2015), will be critically evaluated (1). In a second step, my talk will consider the possibility of a conceptualization of social innovations. In order to precisely connect alternative and new communities with their social, political and cultural practices I refer to two concepts: "Communities of Practice" (Haluza-DeLay 2008) and "Intentional Communities" (Shenker 1986) (2). Ultimately, the introduced topics of (1) and (2) will be empirically illustrated using the example of cohousing in the German-speaking part of Switzerland. I try to mobilize arguments for the following: Community based housing projects (Cohousing etc.) can be labelled as transformative communities, as they are challenging "normal" forms of dwelling through social innovations.

Innovative Communities in a Sharing Society? Collaborative Collective Practices and Discourses in Community-Based Housing Projects (Switzerland)

In the course of a re-politicization throughout Europe and North America, more and more community-based housing projects (co-housing etc.) have emerged since the 1990s that seek to formulate a response to the "multiple crises" (e.g. Brand 2016) in our western-postindustrial societies. In Switzerland, these projects have been conceived and known as 'alternative' cooperatives ("Genossenschaften"), who are experimenting with a collaborative orientation and shared practices in the organizational structure, in the planning and the creation of the projects, and finally in everyday life. My empirical data comes from the project "Transformative communities as innovative life forms? A study using the example of German-speaking Swiss cohousing and cooperative farming projects", funded by the Swiss National Fond. In my contribution, I will examine the extent to which the recent discussions on "social innovations" (Moulaert et al. 2015) are suitable for analyzing and interpreting the spread of new cooperatives in a sharing society. In particular, I am concerned with innovation theories who relate to the French sociologist Gabriel Tarde and his "laws of imitation" (1921). At the same time, I believe that the consideration of social innovations must be expanded by a praxeological approach to innovation, which results from an explicit interlocking

of theory and empiricism. With regard to collaborative practices and discourses, co-housing projects could be analyzed as "innovative communities".

SHAHROKH, THEA (Coventry University)

The Role of Creativity and Storytelling to Address Power Inequalities and Structural Violence

Past research shows how creative participatory processes have the potential to support people living with violence, poverty and marginality to reflect on their lives in ways that strengthen their self-confidence and sense of solidarity, and deepen their socio-political understanding of the structural causes of violence. Drawing on past and current research, this paper critically examines the sequencing of creative visual methods in the context of participatory research and policy engagement on gender-based violence and responses to everyday insecurity with community-based activists in Cape Town. It traces a process of methodological layering that starts with telling a personal story through creative group process, and moves through a collective power analysis of these stories to articulate a group narrative. This methodological layering draws on multiple forms of creative expression including drawing, visualisation, photography, film-making, drama, dance, and writing.

The paper analyses how the process of layering multiple forms of creative expression in order to tell personal and collective stories exposes new perspectives at the interface between personal and structural lenses on understanding violence. The paper argues that through layering reflective creative storytelling processes (both personal and collective), differential experiences and responses to violence become more accessible for discussion. This uncovering in turn provokes new questions about the sources of problems, in order to challenge gendered and intersecting power inequalities, such as race and sexuality, that block pathways of transformative change for marginalised men and women. Furthermore, where research enables an inclusive group-building process, it can reveal new capacities for action to respond to the concerns raised.

The insights generated from a critical assessment of this layered methodological approach point to the need to build relational understandings of violence and injustice, grounded in everyday contexts, and on the role for creative story-based methodologies within this.

Abstract Systems, Ontological Security, and Campus Mental Health: Mitigating the Risk of Student Anxiety

In recent years, the mental health of university students has become a topic of grave concern. According to a 2013 Toronto Star report, in a survey of 30,000 Canadian university students, "89 per cent of students said they were overwhelmed by all they had to do; nearly 54 per cent reported being hopeless...56 per cent felt overwhelming anxiety and nearly 10 per cent had seriously considered suicide." (https://www.thestar.com/news/gta/2013/06/17/national_survey_of_postsecondary_students_in_canada_shows_stress_and_anxiety_are_major_factors_in_mental_health.html) Universities are responding by increasing services to accommodate, treat, and prevent student anxiety. This paper uses Ian Wilkinson's (2001) work on anxiety and risk and Anthony Giddens' (1990) concepts of abstract systems and ontological security to examine the ways in which management of the risk of anxiety is represented in Canadian university policies and materials for students. We pay particular attention to representations of social sources of stress and approaches to responding to them, arguing that contemporary approaches to student mental health contribute to the individualization and medicalization of social problems.

Raconter Montréal Autrement : Des Récits Fondateurs Au Pluriel

Les récits fondateurs de nos pays, régions et villes puisent dans le passé, mais ils cherchent aussi à agir sur le présent. Ils ont donc un impact important sur le sentiment d'appartenance et de reconnaissance de tous les citoyens au

lieu où ils habitent, indépendamment de leurs origines. Pour imaginer l'avenir de la ville autrement, nous aurons besoin d'abord de réfléchir ensemble sur nos compréhensions respectives du passé. Le récit de la fondation de Montréal présente, comme fondateurs de notre ville, les Européens qui ont fondé Ville-Marie, une ville missionnaire. Il s'agit pourtant du moment initial de la colonisation d'un territoire habité depuis des millénaires. En effet, les recherches historiques et archéologiques ont permis de mieux comprendre le contexte de cet événement de 1642, la vision et le rôle de ses divers acteurs, incluant les autochtones, déjà présents sur le territoire. De ce point de vue, une mise à jour s'impose. Comment faire pour raconter la « fondation » de la ville à plusieurs voix? Est-il possible de les faire coexister dans un récit commun et partagé? Serait-il possible de voir l'histoire du peuplement du territoire comme une série de rencontres, dont certaines ont été marquées par la violence, d'autres par la fascination ou la mécompréhension, d'autres par des alliances éphémères? Dans le cadre d'un projet de recherche collaboratif, plusieurs stratégies de médiation culturelle ont été mobilisées pour mettre en images et en mots les divers savoirs et matériaux qui construisent ces « récits fondateurs » : documents historiques, artefacts archéologiques, mythes, légendes, contes, archives, mémoires, objets, traces physiques, et autres. Si nous voulons que les Montréalais et Montréalaises de toute origine aient un sentiment d'appartenance, il faut commencer par la création d'un nouveau récit fondateur qui permet de repenser le rapport au territoire et surtout au passé.

Are German Employee Representatives Learning to Speak on Behalf of Migrant Labour? Addressing the Problems of Status and Organizational Dilemmas

Drawing on the findings of a European Union funded project into industrial relations and multilingualism, *IR-Multiling*, the following paper discusses the issue of employee representation and the problem of foreign language barriers in the context of a German labour market increasingly dependent on migrant labour. Focusing on three case studies, a foundry, Fair Mobility (a DGB project for migrant workers) and a hospital employing Spanish nurses, we exemplify how employee representatives in Germany continue to struggle to talk on behalf of migrant labour. Although the problem of communication, conversing with migrants who possess a limited or no understanding of German, is undoubtedly a huge challenge, the paper contends two deep rooted historical problems might explain the inactivity of employee representatives' in Germany. The first concerns the question of migrants' status, specifically the political establishment's stance that the *Gastarbeiter* would return "home". While it would be an exaggeration to claim unions and works councils openly supported such a government line, they seem to have struggled to challenge such a mantra. Consequently, employee representative structures have labored to 1) free-up resources to address foreign language barriers and 2) only partly construct democratic platforms to provide migrants a voice. Undoubtedly, unions and works councils have welcomed migrant members into existing structures, but the proliferation of such involvement remains limited. The second issue concerns the construction of class identity, perceived organizational dilemmas on the part of works councils and trade unions. At this juncture in the paper we suggest employee representatives have been reluctant to acknowledge the diverse character of the workforce, i.e. the problems specific to migrant employees, out of a fear that such an acknowledgement could lead to the emergence of special interest groups, a development considered a direct threat to the hallowed notion of working class solidarity.

Decision-Making Bodies? Contesting Notions of Choice and Control in Sex and Reproduction Research

This paper brings together the work of two doctoral projects, the first on young people's constructions and experiences of sexual consent, and the second on women's experiences of abortion. Both studies have explored notions of choice, control and empowerment in relation to the material body. Empowerment has been defined in this ISA stream as 'a psychological state, a feeling of competence, control, and entitlement'; however, we have found this definition of empowerment does not map easily onto our participants' experiences. In contrast to this individualised conception of empowerment we consider empowerment as gaining knowledge of and negotiating complex power relations.

In particular, we consider how abortion and sexual consent are framed as successful products of feminist struggle, which participants experienced as both liberating and restrictive. For example, their narratives were interspersed with feelings of responsibility and anxiety about how to manage and regulate their bodily

autonomy in 'legitimate' ways. Gender, class, race and other intersecting axes of oppressions were significant in this process. To do this we mobilise Butler's work on vulnerability and resistance to explore how moments of choosing make the 'chooser' vulnerable to stigma, a significant aspect of our participants' discussions of sex and abortion.

Like many researchers, we have experienced a lack of adequate language to talk sociologically about embodied experiences. We consider how available discourses about the body are often either euphemistic or highly medicalised, leaving little room for the awkwardness and ambiguity our participants indicated were a significant aspect of their experiences but struggled to vocalise. We argue that considering empowerment as embodied, relational and ambiguous rather than an individual psychological state is a step towards enabling these discussions. Amplifying these experiences of ambiguity, uncertainty and embodiment in relation to empowerment facilitates a recognition of its contested nature, and better reflects our participants' lived experiences.

West African Youth Against Democratic Backsliding – a Comparative Process-Tracing Analysis of the Uprisings in Senegal in 2012 and in Burkina Faso in 2014

Over the last years, presidents in African states tried to extend their constitutional term limit. The announcement of the presidents led to broad mobilizations. *Y'en a marre* in Senegal and *Balai citoyen* in Burkina Faso are impressive examples of youth-led movements that successfully mobilized the urban youth. They illustrate which challenges those new movements faced in keeping the mobilization alive and effecting the presidential decision. In both cases, other actors such as representatives of the opposition parties and civil society organizations rose up against the constitutional coup. But they mainly refused to ally with those new movements that they perceived as media-centered and, in the case of Burkina Faso, less politicized. Their understanding of politics and strategies differed to those of former protest movements.

Despite the mobilization successes in rather similar institutional settings and of comparable social movements, the uprisings proceeded differently leading to a diverting outcome: Whereas in Burkina the president resigned, the Senegalese president ran again for office. This leads to the question of how those varying uprisings have been influenced by actors' perceptions, behavior and institutional preconditions.

By tracing back the processes and placing those uprisings in the historical context, I will show how political culture, former protest experience, democratization pathways and splits within the ruling elite and the military led to diverting perceptions, collective identities, and hence behavior.

The article mainly based on semi-structured interviews conducted in Berlin, Dakar and in Ouagadougou as well as on protest event duration statistics based on the Social Conflict Analysis Database (SCAD). Furthermore national media coverages by archive research, international newspapers, and collected grey literature published by protest actors themselves helped to gain more insights in the actors' perceptions on strategies and opportunities.

Violent Metaphors and Beyond: On Impact and Futures within a Global Sociology of Youth

The concept of impact is now ubiquitous in the world of research. On the one hand, it is the frame for measuring effectiveness in the social, economic and ecological interventions funded by donors, governments and multilaterals; and on the other, impact has been deeply (and differently) written into the way that funding bodies, universities and sociologists think about research. There is a vexed and changing relationship between these frames.

Impact is a war metaphor. This is ironic, when one considers how effective social and cultural changes are made. Yet, impact is also about physics and the laws of nature, precision, touch-points, how far something travels, as well as catalytic energy. The latter interpretation may offer something more useful.

A global sociology of youth involves advocacy for some form of liveable futures. Arguably, never has an understanding of the social and cultural forces behind changes been more needed, and never has an understanding of complex causality been so vital. Yet at the same time, in the context of rising levels of white noise

and fear, it may also be the most challenging time for the insights of public-facing sociology to be heard.

Recognising rapid ecological, economic and social changes, and also recognising the convergence of the challenges surrounding climate change, economic precarity and mass movement of people, we are now looking at futures that raise these stakes sharply for researchers. Engagement demands the interplay of insightful local inputs and strong global networks.

In relation to the concept of impact, this session offers and examination of the growth of, touch-points for, and trajectories for a global sociology of youth. Drawing on analysis of RC34 records, and current inputs from our members, it offers a future-focussed reflection on impact, global forces, imperatives and opportunities.

Exiting Violence : Levels and Temporalities

Exiting violence is becoming a domain in academic research, and not only a practical issue. But is it possible to integrate in a one single field perspectives that could become contradictory when one consider different levels, from the more individual dimensions, to the more general and global ones, and when one takes into consideration different temporalities, from short term or contemporary perspectives to long term ones ?

'Lecherous' Refugee 'Sex Mobs' 'Threatening German Women'? the Stereotypical Portrayal of Migrant Men/Refugees in German Print Media - a Quantitative Content Analysis

The main aim of this paper is to present and discuss core research findings of the first phase of our British Academy/Leverhulme Trust funded Research Project 'The end of tolerance'. 'Race', Sex and Violence in Germany's Media discourse on migration (2017/2018).

The project methodologically triangulates a quantitative content analysis with a critical discourse analysis of three major German newspapers [FAZ, Sueddeutsche, BILD] and the political Weekly FOCUS, chosen on the basis of their popularity and market-leading role and circulation compared with other newspapers.

The data sample of articles (n=408) covers a period of 21 months between May 2015 and January 2017 and has been collected in a digital data screening of these media based on a keyword search matrix.

The paper focuses on core findings of the first stage of the research, involving a quantitative content analysis of the data corpus, using a formal coding instrument to identify the prominence of different themes and actors in the sample. Based on the search of truncations (such as *sex *mob *refugee *migrant *muslim *islam *arab, *syr *northafrican etc.) as well as the analysis of the interpretation of crime statistics discussed in the articles the paper discusses the use of specific words and the wider context of the development of stereotypes in the three newspapers and the weekly magazine. Beside the univariate and bivariate statistical analysis the Multidimensional Scaling (MDS) enables the visualisation of the distances of the truncations in order to show the different images of migrant men related to sex-related issues created in the three newspaper and the weekly magazine. First results show that those created images to a certain extent follow the assumed political agenda of the newspapers and the weekly magazine.

The End of Tolerance? 'Race', Sex, Violence and Islamophobia in Germany's Media Discourse on Migration - a Critical Discourse Analysis

This research paper's main aim is to reflect on most recent developments in Germany's media migration discourses and to critically examine the role of media in promoting racist representations of predominantly Muslim migrant men, and the discursive intertwining of racist and sexist patterns of discrimination within media discourses.

Germany's media have been accused of spreading racist and sexist stereotypes especially of Muslim migrant men, after representing them as major challenge to society. In the wake of the European refugee crisis and Cologne New Year attacks, social controversies surrounding immigration have intensified nationally and internationally, with German media imagery of 'lecherous refugees threatening German women' exacerbating public debate. Against this background, my project investigates the intersection of narratives of race, sex, violence and Islamophobia in representations of migrant men in a critical discourse analysis of three German newspapers/a Weekly in 2015-2016, uncovering their racialised, gendered and

sexual dimensions and exploring historical connections between Islamophobia, anti-Immigrant sentiment and anti-Black racism.

My main research questions are: 1. How exactly do German print-media write about migrant Muslim men and what role do narratives of race, sex, violence and religion play in their representation? 2. To what extent are the concepts of race and sex linked in perceptions of male Muslim migrants in German media? 3. What does the structure of this discourse tell us about underlying stereotypes and ideologies associated with migrant Muslim men? 4. What is the historical, social, cultural and political context of this discourse and how does it reproduce existing power relations?

This British Academy/Leverhulme funded project is theoretically innovative and advances research. While several studies have focused on representations of migrants in the media, only few have studied intersectionalities of discrimination in them, and even fewer have attempted to look at these in historical context.

Characteristics and Implications of Online & Mobile Health Information Use Among American Indians in Arizona

Our presentation combines findings of two case studies, conducted in 2014 and 2016, on the use of online and mobile health information among residents of the Hopi Reservation in Arizona. Both case studies involved focus groups and a survey which was administered with focus group participants, which, although not representative of the community at large, does provide context for the focus group discussions. The Hopi – known for their cultural vitality – reside on a remote 1.6 million acre reservation, located in Northeastern Arizona, entirely surrounded by the Navajo Nation, the largest U.S. Indian Reservation, and more 60 miles from the nearest town. Like many Native American tribes, the Hopi experience some of the most severe health disparities in the U.S. We focus on barriers to health information access due to digital divides and cultural factors, as well as implications for health equity. Focus group and survey questions address health-related use of technologies such as search engines, e-mail, smartphone apps, texting, instant messaging, and social media, as well as devices used to access the Internet, types of health information searched for, confidence to find the information needed, etc. Key findings include very limited availability of fixed broadband and thus heavy reliance on smartphones to access the Internet, individuals with access functioning as information brokers for others in the community, and need-based rather than exploratory online searches for health information. Many participants also report difficulty selecting trustworthy online sources of health information, and are generally concerned about technology use which may violate Hopi cultural norms.

If Not Work, Does It Mean Care?- Work and Family (im)Balance Women Aged 45+ in Poland

In this paper, we explore the work-family life balance among women aged 45+ in Poland. Poland is known to be a familialistic country in which family plays an important role in providing care for children, people with disabilities and older people. Women are consistently defined by their family roles, and the social system offers little if any support for combining work and family duties. Yet, studies examining work-family life balance often focus on women in the prime age. This paper however emphasizes the need to explore work-family life balance in later life. To that end, we examine the labour market position of women aged 45+ and their various intergenerational care duties, including care of older parents, disabled family members and grandchildren. The data set for this study comes from the Generations and Gender Survey (GGS) for Poland and includes 7042 women 45+. We use multinomial logistic regression models to explore the potential link between care situations and the probability of being unemployed, dealing with home/care duties and being retired among women aged 45+ in Poland. Our results indicate that the informal care work affects the labour position and quality of life of women aged 45+, but it does so in different ways. While caring for older parents and living with adult children barely affects women aged 45+, living with a disabled person and having grandchildren reduces the chances for women's employment significantly and negatively impacts their quality of life. In discussing these findings, we propose that the recognition of structures of gender and age is essential to meet goals of inclusive work-family reconciliation policies.

Music and Democracy – Organizational Structures of Contemporary Classical Music Ensembles

This dissertation focuses on music ensembles that specialize in contemporary classical music. The research is interested in the genesis and transformation of the organizational forms of these ensembles. I argue that contemporary classical ensemble-culture is at the same time a countermovement against and a support for the institutionalized world of professional classical music.

In Germany, the number of foundations of contemporary classical ensembles has increased since the beginning of the 80s and has reached a peak in the 90s. The growth of the contemporary classical music scene is observable until today. The accompanying discourse of this development stresses among other things the contrast between modern democratical and traditional hierarchical forms of organization.

At first glance, the rise of contemporary classical ensemble-culture can be seen as an attempt to overcome hierarchical structures in order to make new aesthetic languages possible. At second glance, it can be seen as the attempt to satisfy just another expectation that has its roots in the 19th century: the aspiration of creativity, innovation and aesthetic autonomy that very often goes along with financial and life planning risks for the artists or musicians. A third glance reveals that this expectation again has led to a postmodern tiredness of repeating the nomenclature of innovation. Moreover, professional instrumentalists are educated within the trajectories of a highly traditional and institutionalized world of classical music, so that it becomes obvious that typical tensions occur.

Based on the results of a reconstructive analysis of documents (self-descriptions of ensembles, newsletters, CD-booklets), ethnographic observations and interviews held with (former) members of contemporary classical music ensembles, the research investigates how the perspectives of reflection are treated and related to one another by the actors. This provides insight into the social character of making contemporary ensemble-music regarding its involvement in the institutionalized world of classical music.

At the Rainbow's End: Challenging the Economic Discourses of Refugees in Canada

Since 2005, Canada has resettled over 215,000 refugees, most of whom expect to and consequently do work and have relatively successful economic integration. There is no doubt that economic integration for refugees takes time, often longer than those migrating under different circumstances. Using primary research from two major Canadian surveys (conducted by the author), this presentation examines the short- and the long-term labour market experiences of refugees in Canada. While the short-term economic outcomes of refugees are understandably weak, there is considerable evidence that most refugees experience success in the long-term. This can be explained by several reasons. First, over 60% of all refugees arrive to Canada prior to their 30th birthday, meaning that most will have some exposure to secondary- and post-secondary education which means that employers are less likely to discriminate based on country of origin. Second, evidence from this and other studies reveals that age at arrival has significant influence on labour market outcomes, even among refugees. Those arriving to Canada prior to their 14th birthday tend to do better in the labour market than older teens. These findings challenge the discourse of the 'struggling' refugee which dominates the scholarly research, theoretical paradigms, political discourse, and policy platforms. Matching theory has been recently suggested as one way of organizing the equitable distribution of refugees to resettlement countries (Jones and Teytelboym 2017) which may reduce some of the problems of labour market integration in the short-term. The results of this research indicate there may be some merit to this approach, but it will not be as easy to implement as matching theories imply.

Data Mining in the Cloud? Revisiting the Sociology of Digital Health Platforms

Recent work in digital sociology has shown interest in health platforms as site for intensification of government and value creation. Work by Srnicek (2016) on 'platform capitalism' proposes a new typology of online platforms, and argues that they exist to gather data as the new raw material of global capitalism. In empirical studies of the largest health platforms, especially those focussed on

research which have captured most sociological attention, researchers have described the promissory discourses that encourage ordinary people to store and share personal health data, including that produced by self-tracking (e.g. Sharon 2016, Van Dijck and Poell 2016). This paper draws on analysis of a more extended set of platforms using interviews with commercial and policy actors, ethnographic observations of digital health events and 'walkthroughs' (Light 2016) of devices, to examine the multiple logics shaping their development - beyond the search for data. Health monitoring helps companies embed their products and services in everyday life producing engagement from 'activated' consumers. At the same time, platforms appeal to governments/health care providers hoping that digital solutions will reduce future spending. Seeking greater specificity around the different platforms and the markets in which they arise, and drawing on recent work in Science and Technology Studies, we suggest that health platforms participate in the negotiation of 'care' and care needs at domestic, local and national levels, despite their apparent global reach. The paper argues for an appreciation of the heterogeneous logics and forms contained within commercial attempts to establish and expand digital health platforms as emerging information infrastructures.

Community Partners in Evaluation and Change: Reflections on a Two-Decade Old Intervention Project Addressing Racial Disparities in Health Outcomes

Over the past two decades, The Magnolia Project has served a section of "the Northwest Corridor" of Jacksonville, FL, providing reproductive and well-woman care and intensive case management to reduce infant mortality in the African American community. During this time, the primary focus for Magnolia has been to provide clinic based well woman care, prenatal care, support groups and case management through a store-front site in the heart of the target area. As new opportunities for funding became available, Magnolia moved from its "traditional" focus of women who come to, or are referred to, the clinic site to a broad-based Community-wide focus in order to address the underlying symptoms affecting the community's health and the disparities this community faces. The Director and Staff of The Center for Community Initiatives at the University of North Florida have been involved in the discussion, design, and implementation of Magnolia throughout the past 20 years, literally "sitting around the table" working on the original program proposal. In this paper we reflect on our role as evaluation partner for the Magnolia Project, and discuss how Program Representatives and staff, Evaluation Partners, and Community Partners joined forces over the past 20 years to implement the Magnolia project, and how they made a difference in their community. The lessons learned from this process are informative to other programs seeking to expand their community impact through partnering with .

Coupling Social Networks and Agent-Based Models: State of the Art and Prospects

Agent-based modelling is a valuable tool for capturing the interactions of individuals or groups connected in a network. Therefore, it has been applied to different disciplines of contemporary research to model, for example, social-ecological systems concerning land use or resource management, epidemiology, or social dynamics. The arising topics like group formation, cooperation, or diffusion of information are similar throughout the different disciplines and the methods resemble one another. Although those methods are widely applied, reviews of the existing literature always focus either on one specific discipline or on certain interactions happening within the network; an overview across disciplines and methods is missing so far. To fill this gap, we systematically reviewed articles combining social networks and agent-based modelling. We divided the evaluation into categories concerning the underlying network structure and its properties, the characteristics of the agents, the links and interaction between them, and the incorporation of empirical evidence to the models. Based on this overview, we discuss to which extent an exchange across disciplines is necessary and useful, and where the commonly used practices are sufficient. While we identified a broad range of underlying network topologies describing the interacting populations across the different disciplines, ranging from data-based network structures to classical network structures like small-world or scale-free networks, we found that the interaction mechanisms show large varieties with respect to the context. For instance, models for information diffusion in the social sciences are much

more detailed than those in epidemiology, where constant transmission rates for the diffusion of diseases are often assumed. Besides the aim to foster synergies between the disciplines, we focus on open challenges when dealing with social networks in agent-based models.

Effects of Microinsurance on Informal Safety Nets – a Model-Based Analysis

The fight against hunger is an urgent global challenge. Microinsurance is promoted as a tool for improving food security and resilience for poor smallholders. But assessment studies of such policies show that apart from direct positive effects they may have unintended side effects. One potential side effect is that the introduction of microinsurance products may lead to a crowding out of informal safety nets. Informal safety nets are traditional arrangements of households to share risk, where income shocks are buffered by an exchange of money, labor, or in-kind goods. A loss of informal safety nets may lead to rising social inequality if poor households get excluded but cannot afford microinsurance.

With the help of a stylized agent-based model combined with instruments of social network analysis, we investigate under which conditions microinsurance will crowd out informal safety nets and under which conditions both can act as complements. The informal safety net, in our model, comprises a network where the nodes are households; links between two households represent their level of trust in each other. Households who suffer a shock may receive transfers from households with whom they share a link. The households decide about transfer payments based on their experience, current strategic and economic situation, and their individual preferences. This is incorporated in decision rules based on altruism, trust, reciprocity, expected utility, or learning.

Model construction and analysis are inspired by two case studies with different risk contexts. A first case study in northern Kenya and southern Ethiopia considers the consequences of weather insurance against drought in a pastoral social-ecological system. The second case study in Cambodia investigates whether voluntary health insurance can have unintended consequences. We test to which extent formal decision rules can map the observed behavior and assess the dynamics in informal safety nets given access to microinsurance.

Access to Justice and Refugee Rights As a Survival Strategy of Central American Women

For women fleeing violence in Central American countries refugee protection in Mexico has become an alternative to migration to the United States of America. Due to migration enforcement policies, traditional migration routes of escape have become too dangerous for women, especially when travelling with children. As a result, refugee applications in Mexico have been rising significantly; between 2013 and 2016 applications have been increasing over 600% (COMAR 2017). Yet, the Mexican refugee system and the particular local contexts in refugee receiving communities contribute to situations of re-victimization of migrant women and their children, unless the efforts made by UNHCR and regional NGO's.

This paper is based on a longer field study in Tapachula, Mexico, starting in 2013 until 2017, looking at the circumstances of Central American Migration through Mexico and to the USA. The paper looks to analyse the particular situation in the aftermath of the humanitarian crisis of 2015 and the effects of following migration enforcement that led women with children choose to settle in Mexico in order to avoid deportation and look for refugee protection as a strategy for survival. This paper aims to analyse the difficulties and particular circumstances women face during this process, such as the effects of structural and gender based violence and segmented labour markets that endanger women's and children's livelihood in receiving communities.

WILLERS, SUSANNE* (*Universidad Nacional Autónoma de México*)

Changing Mobility Regimes and Gender: Practices of Care Circulation in Processes of Migration Settlement in the Southern Mexican Immigrant Receiving Communities

After the humanitarian crisis of 2015 the mobility regime of people fleeing violence in Central America has been changing. Particularly women migrants and their children have to settle in Mexico due to violence on migration routes and the lack of financial resources in order to migrate up north. One strategy of survival is looking for access to formal rights through refugee protection status in Mexico. Yet this legalizing processes requires time, knowledge and care provision from other members of the family. This paper looks at the particular experiences of refugee claimants in the southern Mexican town Tapachula. Based on fieldwork in the southern Mexican town Tapachula in 2017 and drawing on earlier research in 2013 and 2014, this paper looks at the particular experiences of women during this process, their strategies put into practice in order to manage this situation and the role of the extended family network. It looks to analyse how processes of re-victimization due to segmented labour markets and other aspects of structural and gender based violence impact women's agency during this process.

Inequalities in Choice: Australian Accounts of Healthcare Preferences and Perceptions

Australia has a dual healthcare system with taxation based universal health insurance providing free public hospital care and a thriving private health insurance industry enabling healthcare provision in a private setting. The health policy context privileges healthcare as a consumer choice and there are policy incentives for individuals to choose private healthcare. We interviewed 78 individuals, and 41 healthcare gatekeepers (eg health professionals, administrators) to examine how preferences and perceptions about public and private care shapes the choices that they make for themselves or for others. Drawing on Bourdieu's relational view of inequality, and using the conceptual triad of habitus, capital and field, we found the capacity to make healthcare choices is unequally distributed; and that this is exacerbated in a system where preferences for private care are privileged in public and popular discourses about healthcare. We find that because private healthcare is privileged in healthcare policy and the media, both individuals and their healthcare providers are more likely to view private healthcare as a necessity, rather than an option. Even in a healthcare system where there is a world class public health system, we observe emerging inequalities between those who feel confident in choosing health care (and usually state their preference is for private care) and those who perceive that their choices are limited (usually referring to the need to seek public care). Quality healthcare is increasingly viewed as requiring the use of capital resources (eg economic, social, cultural), as dispositions and preferences (habitus) are shaped through the dominant positioning of private over public in the healthcare field.

State and Non-State Cyber Deterrence: Theoretical Expectations and Practical Constraints

For decades deterrence theory has proven adaptable and responsive to systemic and technological change. Traditional approaches to deterrence have evolved in response to the proliferation of nuclear weapons and missile technology, to shifts in global polarity, to the rise of authoritarian states and international terrorist organizations, and to other security concerns, like piracy, human trafficking, and transnational organized crime. Today, technological developments in algorithmic and computational power, digital networks, and cyberspace more broadly challenge deterrence anew, often in novel and peculiar ways. In cyberspace, coercive paradoxes abound. Under the right conditions, for instance, digital weakness can prove itself a strength, and digital strength, a weakness. Moreover, online, the distinction between criminality, espionage, and warfare is necessarily blurry, complicating military, civilian, and non-state responses. And questions

abound regarding identification, attribution, and retaliation in cyberspace. The proposed paper is derived from a SSHRC-funded project on state and non-state cyber deterrence. It does two things. First, the paper explores several tactical concerns states and militaries will encounter in applying deterrence theory and practice to cyberspace. These challenges include: disaggregated state responses; technological limitations to "probabilistic attribution"; synthesizing offense, defense, and denial; balancing hardware and software necessities; contemplating undetected deterrence and defensive failures; tackling the power of weakness and weakness of power; and addressing the nexus between Artificial Intelligence, security, and cyber deterrence. Second, the paper explores cyber deterrence below the state. Cyberspace is inherently non-state in nature, made up of the billions of digital interactions between non-state actors. Accordingly, the paper suggests ways in which individuals, firms, NGOs and other non-state actors can apply the logic of coercion to protect their own digital assets.

LOVATT, MELANIE (*University of Stirling*)

Universities Project: Understand the Multiple Layers of the University. the University As Archipelago (Glissant).

Corporate projections of marketised universities present future-focused, glossy, uniform and safe spaces to the outside world. Such totalising visions exclude the lived (and sometimes difficult) experience of diverse students and staff. Starting from a perception of the university as constructed through multiple and evolving layers, relations and dialogues, many of which remain under-voiced or recognised, the aim of the collaborative project discussed is to better understand and to represent the different student (and eventually staff) experiences that contribute to/ produce the 'university'. We asked undergraduate and post-graduate students (self-selected but purposively sampled to reflect different genders, sexualities, ethnicities, nationalities, disabilities, social circumstances, family experience of university etc) at a medium-sized campus university about their experience, however ambivalent, of coming to feel a sense of belonging to, or sense of recognition within the institution (or not). Participants were also asked about their conceptions of the 'university' as they see it and how they consider it should be. A variety of text-based, visual and aural methods including individual and collective mapping to produce meta-maps of different relationships to university space, supplemented by photographs, written narratives, sound recordings and audio-diaries and walking interviews were employed. Multi-modal presentation of the resulting textual, aural and visual data is seen as a key way to display dynamic, multiple and potentially conflicting perspectives of the same space-without the pressure to provide or to conform to a dominant synthesis that might sweep away under-represented views and experiences. The aim is also to provide a sustainable means for the 'data'/ accounts given to serve as a 'starting point' for further collective discussion and re-imagination of the university (into the future), but also reflection on whether the dialogue so provoked values such diversity and relationality/ complexity or not.

WILSON, TIMOTHY* (*University of Turku*)

KRIZSÁN, ATTILA (*University of Turku*)

Politics in Science: A Struggle for Legitimacy in the Production of Knowledge By a Pseudoscientific Theory

Intelligent design (ID) is a pseudoscientific concept conceived in an attempt to bring religion-based teaching into the classroom. As such, it is involved in a constant struggle for legitimacy with the dominant scientific discourse of the theory of evolution and this results in ID politicizing science. In our paper, we use a corpus linguistic approach to study how intelligent design discourse uses dialogistic positioning to forward its creationistic propositions and at the same time limit the propositions of the theory of evolution. The results suggest that intelligent design discourse employs heteroglossic constructions that appear in uses of engagement structures (a sub-system of Martin & White's Appraisal theory) far more frequently than evolutionary biology discourse does so. These structures are used mainly to counter opposing propositions and to entertain propositions of ID discourse in their stead. The underdog position of ID obligates it to highly modulated heteroglossic engagement in order to forward its position, which is ultimately aimed at changing the political decision-making related to the teaching of science. This is because for many decades the control of dialogic space in both science and scientific education has largely belonged to members of the mainstream scientific community who have based their use of language on well-developed scientific arguments. The aim of the proponents of intelligent design to change this makes their intentions political in the sense of Palonen and their (discursive and material) actions could be considered as clear examples of politicking in the scientific and educational domains via discursive means of legitimization.

RC06-145.2WILTSHIRE, ANNE* (*Stellenbosch University*)***Reproductive Insecurity: Failing Social Services and Labour Security Burdening Reproductive Networks.***

Economic growth in South Africa has been accompanied by low employment growth, labour flexibilisation and a disproportionate increase in women's labour force participation. This adversely affects the 'double shift' of lower income women. However, reproductive work is not an individual task, static nor gender or household bound. Rather, it occurs within metamorphosing networks.

Participants are farm workers, agents stratified by residential (on- and off-farms) and employment status (permanent, temporary and seasonal). The study is a longitudinal design of qualitative interviews spanning 1 year with 12 farm-working women, each being a single case of a reproductive network stratified by residency and employment.

Findings illustrate household fluidity and how reproductive work occurs across (geographically split) households within reproductive networks. Networks are bi-directional between adults-children and children-children and children are nodes of networks. Networks metamorphose spreading the burden of reproductive work, especially when primary carers enter paid work and in lieu of social services. However, to earn a living in the absence of family, friends, neighbours and other supervisory services, some children are left in inadequate care. Child neglect is attributed to the misalignment between the operating hours of workplaces and schools, as well as a lack of state investment in childcare services.

This study highlights how, firstly, households are interdependent on each other and institutions for reproductive work. Secondly how, in lieu of state investment, social services and training provided by employers can mitigate reproductive insecurity. This occurs within a state committed to economic redistribution via social grants rather than transformative redistribution with the expansion of social services which means that lower income households are not privy to privatised services, leaving the onus on horizontal networks to carry the burden of unpaid reproductive work.

RC12-244.2WINCZOREK, JAN* (*University of Warsaw*)MUSZYNSKI, KAROL (*University of Warsaw*)***Paths to Justice of Small and Medium Enterprises in Poland***

Paper presents the initial results of an extensive empirical study of small and medium enterprises' (SMEs) access to justice, conducted in Poland in 2017. Quantitative and qualitative methods have been used to obtain information on prevalence of justiciable problems in SMEs, actions they take on their paths to justice, owners' and managers' understanding of the process and a number of explanatory factors. Statistical model of incidence of types of problems and reactions to them is presented, along with in-depth analysis of the decision-making processes in SMEs. In the theoretical dimension, paper attempts to combine conceptual tools used in paths to justice studies with more abstract notions from systems theory. In this vein, decisions to use law (or to abstain from using it) in SMEs are conceptualised as risk management under conditions of legal and economic uncertainty.

RC17-326.2WINCZOREK, JAN* (*University of Warsaw*)MUSZYNSKI, KAROL (*University of Warsaw*)***Risk, Uncertainty, and Legal Problems. How Do SMEs Use Law?***

Paper presents the theoretical framework aiming to explain patterns of decisions to use law in small and medium enterprises (SMEs). It informed an extensive empirical, quantitative and qualitative study of aspects of decision-making in SMEs, conducted in 2017. Two traditions of theorizing in social sciences inspired this project. Luhmann's systems theory delivered most conceptual tools, allowing to theorize organizations, forms of decision-making, structures of legal communication, types of communication within economic system and other relevant function systems. Paths to justice paradigm, originating in empirical legal studies on "access to justice", enabled operationalisation of legal phenomena for the purposes of empirical research and provided insights about the multiplicity of forms of legal communication in professional and non-professional contexts.

In this vein, using law - ie. consulting lawyers, drafting legal documents, going to court, using other forms of dispute resolution, or resorting to many other types of legal communication, formal and informal - was conceptualized as an outcome of processes of risk and uncertainty management in organizations observing their multiple environments. This led to an observation that decisions in SMEs to use law presuppose a transformation of the observed uncertainties into internally calculable risks. These are further mediated and re-allocated within organization itself or transferred to other entities. Such processes differ depending on type of organization, its available resources and the source of contingency.

The framework suggests that decisions to use law are different in businesses of different size and structure, family-run businesses and corporations, depend on the branch of economy and relative position of a business in the market. The paper also stresses, that contrary to a belief expressed by some theorists, the law is itself a source of contingency for SMEs. This makes it possible to observe different forms of contingency-to-risk transformation, including transformations using law, as competing decision-making opportunities.

RC17-327.4WINDELER, ARNOLD* (*Technische Universität Berlin*)JUNGMANN, ROBERT* (*TU Berlin*)***Collective Innovation, Organizations, and Fields: Towards the Organized Transformation of Today's Innovation Societies***

Sets of organizations currently transform societies into innovation societies (Rammert et al. 2018; Windeler 2018). They make 'creative destruction' (Schumpeter 1934) an almost ubiquitous imperative. Organizations in these contexts not only reflexively and collectively produce the new and destroy the old; they also face radically new demands.

Likewise, innovation studies do not only describe the society-wide expansion of innovation. They also highlight that heterogeneous actors produce innovation collectively in networks and fields today (e.g., Saxenian 1994; Ferrari/Granovetter 2009; Sydow et al. 2012). In so doing, such studies point to forces of homogeneity (DiMaggio/Powell 1983) and heterogeneity as well as to struggles within these fields (Hoffman 1999). Although many aspects of collective innovation have been well studied, central theoretical questions remain. What qualifies as a field of innovation? What does the collective production of innovation in and between organizations mean? How do organizations shape fields, and how are they shaped by them within practical processes of producing innovation?

We outline a practice-theoretical perspective informed by Giddens to understand the active, recursive, reflexive, and collective transformation of societies and organizations in and through processes of innovation. We highlight the entwinement of organization, field, and society and of domination, legitimation, and signification in constituting collective agency in contexts of radicalized modernity. We develop and illustrate our framework by studying two completely different fields of innovation: the globally oriented semiconductor industry (Sydow et al. 2012) and a regional cluster in catalysis research (Schmidt 2013). We examine organizations as reflexive social systems, the role of organizations in processes of collective innovation, and the challenges they face. In this way, we contribute to a repositioning of organizations in today's radicalized modern innovation societies.

RC11-230.4WINDELER, MALOU* (*Freie Universität Berlin*)***Active and Successful Ageing. Toward a Performativity of a Regulatory Regime***

"Population aging is one of humanity's greatest triumphs. It is also one of our greatest challenges." - World Health Organization (2002)

The active and successful ageing paradigm as well as the anti-ageing movement reflect the sociocultural triumphs and challenges of ageing we face today (cf. Katz, 2001/2002). However, the World Health Organization's Active Ageing Policy (2002), the national health policies of Canada as well as the British Columbia provincial and the Vancouver metropolitan area government with their Age-friendly action plans not just reflect these developments; they also construct a 'futurity' for ageing and ageing populations. Therefore, it is important to understand how they construct ageing in these programs. What kind of an ageing person do they imagine? What role does the state play? To approach these questions, I use Butler and Foucault as a theoretical framework. I ask how the active ageing policies through power/knowledge of institutions and discourses construct ageing and ageing populations. I scrutinize the performativity of the policy programs. More precisely, I, first, analyze if and how the discourses around the policies mentioned shape an exclusionary and individualistic understanding of ageing. Second, I examine if the programs confirm Nicolas Rose's (2001) thesis that the state tries to free itself of some of the responsibilities that it acquired across the 20th century for securing individuals lives or not. Third, I determine further important aspects around the construction of a futurity of ageing populations in these policies and action plans. In addition to a text analysis of the policies, I utilise interview data. I conclude with some general reflections on the constitutions of the futurity of ageing populations in modern Western countries today and challenges how to research them.

RC04-81.14WINDLE, JOEL* (*Fluminense Federal University*)***Racializing Media Discourses and Parental Perceptions of Stigmatised Student Populations: Implications for Marketized Schooling***

This paper analyses some ways in which racializing discourses interact with the spatial and social dynamics of marketized schooling. It identifies conflicting discourses that contribute to the polarisation of school social composition and resourcing in the Australian state of Victoria. Media narratives around "ethnic" gangs contribute to wider discourses surrounding working-class neighborhoods and schools as dangerous and violent "hotspots". At the same time, some elite private schools discursively produce themselves as providing a ladder of opportunity for talented and deserving minority youth. The paper draws on critical discourse analysis, based on media reporting on refugees, and interviews with parents selecting a secondary school for their children. Although some parental concerns mirror media reporting, many create alternative narratives and rely on personal and local histories to make sense of racialized student populations. The findings have implications for the management of school choice as a policy framework, suggesting that its exclusionary effects are heightened in the context of intense media and political attention to refugees as racialized subjects.

Artificial Intelligence and Machine Learning: Algorithmic Biopolitics in Policing

The recent introduction of machine-learning technologies has produced (among other things) 'recommender systems' with applications ranging from Netflix ratings to policing, law enforcement and criminal justice. In the latter it is used to predict 'likely offenders' and 'likely reoffenders' (thus recommending police activity), and by judges in assigning sentences. Widespread and uncritical assumption that computer-based recommender systems are objective and immune to bias has influenced their rapid uptake. However, analysis of these 'algorithmic policing' and 'algorithmic justice' systems show unsupportable 'preference' toward ethnic and racial minorities. The result is a biopolitics embedded in technoscience that—on the surface—ratifies long-standing bias associating biological factors and criminal behavior.

There is no current means to audit workings of machine-learning algorithms creating these results. This has produced substantive concern in computer-science that these systems do not reflect defensible science, and has spawned research and conferences under the name of Fairness, Accountability and Transparency in Machine Learning (FATML) seeking to produce means to detect and remove bias in the operation of such systems.

At present there are believed to be two principal sources of bias. First, data used to 'train' algorithms and machine-learning software systems comes from archives that are known to be problematic—'uncleaned' data from police databases and national security databases. Second, algorithms are constructed by (primarily white male) programmers using not just statistics and logic, but also—probably unintentionally—biased 'commonsense' held by the programmers in relationships between factors including race, ethnicity, and sex that are not necessarily correlated with criminal behavior.

This session will report cases of algorithmic bias and their biopolitical implications—especially as they may extend to the War on Terror—and current efforts among FATML researchers to address the identified issues in the production of fair, accountable and transparent systems.

Sustainable Seafood Labeling Programs As a Tool for Sustaining the Oceans: Probing the Level of Consumer Awareness

This paper reports on the results of an online survey conducted as part of a larger research project focused on sustainable seafood certification and labeling programs and the Canadian retail food industry. Eco-labels have emerged as a key tool to arrest the depletion of marine species we take for food but some have questioned their effectiveness in actually promoting the sustainable harvesting of marine resources. The issue of consumer awareness of labeling programs has been identified by scholars and food retailers themselves as an important factor impinging on the success of these programs. A sample of respondents were randomly selected to reflect income and ethnic diversity in both a major metropolitan area and a smaller city located in central Canada. Demographic information on age, education and ethnicity were collected. Respondents were queried about their knowledge of environmental threats to marine life more generally as well as awareness of sustainable certification labels for seafood and their receptivity to purchasing sustainably certified seafood products and actual purchasing behavior. They were also asked to reflect on what they saw as the main barriers to purchasing sustainably certified seafood in both retail and restaurant food environments.

Preparing a Program in Sociological Practice for an Accreditation Review and Site Visit By Capacs

Dr. Norma Winston, CAPACS Vice Chair, will discuss the CAPACS Site Visit Process, particularly organizing and hosting meetings with university administrators, internship site supervisors, and program faculty and students. She will address how applicant programs can prepare for CAPACS accreditation, and provide examples of how students' benefit from their tangible practice experiences, from her perspectives as a Review Committee Chair, Department Chair, and Program Director. Particular attention will focus on how successful CAPACS-accredited programs, and their host institutions, assume responsibility for the students they admit, educate, and train, as part of a growing trend in incorporating "experiential education" in higher education. Programs sow strong, supportive alumni by building relationships with business, community, and government leaders, and leveraging institutional resources, such as internship and career services, in placing program students into meaningful internships, supervised field work, and practice, where many alumni find employment after graduation.

The Who & the How - Insights on Inclusion in Tourism in Brazil's Northern Littoral Pleasure Periphery (LPP)

Tourism in Brazil was originally concentrated on a few urban areas in the South; however, it has been expanding to regions that were traditionally not on the list of travellers (Lohman and Dredge, 2012). To promote social and equitable development in Brazil's widely-deprived North, tourism development was encouraged by the Brazilian government which led to huge investments into Brazil's northern Littoral Pleasure Periphery (LPP) (Pegas *et al.*, 2015). Consequently, sun, sea and sand tourism in the northern LPP has been growing rapidly attracting Brazil's new middle-class of domestic travellers and an increasing number of international tourists (Fennel, 2008; Ministério do Turismo, 2016). Tourism has become the most important sector in the northern regions; however, little is known about the structure and sustainability of Brazil's northern LPP (Pegas *et al.*, 2015).

The aim of this paper is to provide empirical insights on *the who* and *the how* of inclusion in Brazil's northern LPP using a mixed-methodological approach. Quantitative value chain analysis (VCA) was adopted to identify *who* is and *how* they are included in the tourism value chain. This was followed by a qualitative photo-elicitation project which explored people's perspectives on tourism in terms value of tourism-related income, individual opportunities and challenges, and wider societal benefits and costs. Tourism development is highly valued by local people, because it brought an improved standard of living - in particular, through income generation and provision of infrastructure, health care and education. However, tourism in Brazil's northern LPP strongly mirrors classical disparities between the White and Black, the North and South, the Rich and Poor. Local people with a mainly Black Afro-Brazilian background have low-income jobs in hotels or *pousadas* without professional development opportunities, whereas owners and managers are dominantly White Brazilians from the South or expatriates from Europe.

Parenting in Military Families: Stability and Change in a UK Context

This paper reports on a study of military families conducted across the UK in 2014-16. It comprised of focus groups with serving UK Ministry of Defence (MOD) personnel, and a diary study amongst a selection of military spouses. Families of interest were those who had chosen to live 'off-base' (i.e. not on housing schemes on or near military bases, provided by MOD). It sought to understand reasons for living off-base, and the implications for welfare support and familial wellbeing. The study revealed families negotiating the needs of the military, and their personal fulfilment, and offers insight into the lives of a significant proportion of UK families, who are vastly underrepresented in both academic and policy circles.

The study revealed the impact of cultural change with respect to gender roles and expectations. For example, male serving personnel sought and felt, a greater emotional proximity to their families whilst away from home. This is because social media and ICT are able to traverse the temporal and geographical divide that military service regularly demands. However opportunities for greater paternal involvement could be curtailed by institutional needs or culture, and this could heighten the awareness of absence for serving parents. Expectations for spouses' rights to a career was evident and proximity to maternal families for support could be a reason to live off-base. However, narratives of independence

and support were complex and contradictory. Careers and/or independence was hard won and the loss of informal support and shared understanding from other military wives was sometimes keenly felt.

The paper will foreground the changing demands and forms of the military and of the family in a contemporary UK context. It will consider what this means for individual and familial wellbeing and resilience, and the implications for those living within and also outside of a military base.

Understanding Diversity Issues through the Lived Experience of UK Defence Personnel

The UK's demographics are changing and competition for talent is getting fiercer. The Ministry of Defence (MOD) needs to adapt to maintain its employment levels and maximise the benefits of drawing on a wider talent pool. The organisation has long recognised and taken steps to address the challenge in recruiting and retaining people from backgrounds not traditionally associated with Defence, specifically females and Black Asian Minority Ethnic (BAME) personnel. However, numbers relatively remain low.

A large-scale qualitative study is being undertaken to explore the 'Lived Experience' of working in MOD of females and BAME personnel. This refers to a person's first-hand experience in everyday events in their working lives. A timeline interview approach is being used with over 600 personnel across the three Armed Services and Civil Service in the UK. The aim of the study is to better understand the experiences of these individuals (in comparison with the white, male majority) to inform further actions to improve the representation of these minority groups across Defence. The study asks:

- To what extent does gender and ethnicity influence the Lived Experience of working in MOD?
- What are the positive aspects of this and how can these be exploited?
- What are the negative aspects of this and how can these be addressed?
- How can these findings be interpreted in light of theories/literature on minority representation in organisations?

This is a considerable qualitative study, in terms of its scale and ambition. Before embarking on the main study the method was piloted with 30 participants to assess whether the approach worked effectively across all cohorts and mediums, and mitigating steps have since been taken in the next phase. To date, a number of methodological lessons have been learnt, which we suggest are valuable to garnering sociological insight of use to large scale military organisations.

WINTON, SUE* (*York University*)

Fundraising for Toronto, Ontario's Public Schools

Fundraising by parents to augment school budgets is commonplace in Toronto's public schools. Why are families asked to fundraise for public schools? Why do some parents who oppose school fundraising nevertheless participate? To answer these questions, I turned to institutional ethnography (IE) because IE offers a way to examine the everyday world and determine how things happen as they do. My investigation began from the standpoint of parents engaged in fundraising activities (i.e., their fundraising work). To understand how this work is socially organized I conducted interviews with parents, school council members, teachers, and educational leaders. I also analyzed texts produced by schools and school councils in the Toronto District School Board (TDSB), the TDSB, Ontario's Ministry of Education, and the media; and I drew on my knowledge as a parent, teacher, and researcher.

My findings highlight four Ontario policies introduced in the past two decades that play key roles in organizing parents' experience of fundraising today: school councils, parent involvement, fundraising, and school funding policies. These policies reflect, contain, and mobilize neoliberal discourses that advocate greater individual responsibility, a new role for government (i.e., to facilitate market conditions, attitudes, and behaviour), and increased involvement of private actors in public program delivery. A new funding policy introduced in 1997 resulted in major funding cuts to the TDSB. School councils, also introduced in 1997 and mandated in every Ontario public school, are parent-majority organizations that are permitted to fundraise; most spend the majority of their time doing so. Participating in fundraising provides a means for parents to support their children's schools and academic success (as they are called to do in government, TDSB, school, and media texts), to create 'better' schools that may help give their children competitive advantages in the global marketplace, and thus enact "good parenting" under neoliberal rationality.

Philippine Scholars between Manila and Chicago: A History of the Social Sciences, Decolonization, and the Cold War

This paper explores the creation and circulation of social scientific knowledge about Philippine society, history, and culture between Chicago and Manila. This analysis unfolds in a postcolonial time frame and at the nexus of the Cold War, decolonization, and development efforts in the so-called Third World. At the heart of this paper lie Philippine social scientists, mainly anthropologists, who rotated within transpacific academic networks between the University of Chicago, the University of the Philippines at Manila, and the Ateneo de Manila. The late 1950s and early 1960s are particularly important because it was during this time that the first generation of highly trained Philippine academics returned to the archipelago from the U.S. and taught the following Philippine generations of social scientists. ^[1] The University of Chicago was the place where this first generation earned its Masters' degrees and Doctorates.

This paper traces the intellectual and migratory Philippine biographies of the Chicago alumni F. Landa Jocano, Arsenio Manuel, David Barradas, and Alfredo E. Evangelista who were central individuals within the transpacific social scientific community. The main questions are: What kind of social scientific—mainly anthropological—knowledge about the Philippines did these scholars create? How did this knowledge circulate between the U.S. and the Philippines? In addition, how did these academics contribute to "Cold War social science" ^[2] and to decolonization efforts?

The sources analyzed for this paper will be letters, (un)published publications, notes, reports, government documents, and photographs.

WIRTH, HEIKE* (*GESIS*)

Gender-Specific Differences in Time Use of Girls and Boys Regarding Domestic Work

Depending on their area of life, adults show gender-specific differences in their use of time. Although the time spent by women on domestic work has declined over recent decades and the amount of time spent by men on domestic work has increased slightly, there appears to have been little change in the gender-specific division of labor. The continuing gender-specific division of work is seen as the result of negotiation and specialization processes between the partners, particularly in the context of family formation. Differences in the economic and non-economic resources of men and women are assumed as underlying mechanisms which come along with better or less favorable negotiating positions. Other mechanisms are the influence of social norms on gender roles and gender identities.

The focus of this study is on gender differences in children (10 to 17 years) regarding time spent with domestic work. In contrast to adults, economic and non-economic resources, as well as negotiation processes (e.g. between parents and children), should have no impact on gender-specific differences in time use of children and adolescents. However one could assume that the division of labor between father and mother or the time parents spend with domestic work, and also negotiation processes between siblings might influence the time spent by boys and girls with domestic work.

Based on the German time use study 2012/13 our findings up to now are: (1) Girls spend more time with housework than boys. This gender-specific difference increases in the transition from childhood to youth. (2) It is not so much the time constraints of the parents as a result of gainful employment, which influence the children's working hours. Rather, parents' involvement in the household seems to be closely related to the children's contribution. (4) The household context seems to have different effects for boys and girls.

Leisure in 21st Century Later Life

New ageing populations are emerging in the UK, people are surviving into later life in greater numbers than ever before and many of those people are healthy (ONS 2014), which is a new phenomenon. This research considers theory and research from subjects that often consider later life to be problematic, but reads them from a more optimistic perspective. Leisure research and theory,

gerontology, sociology, public health, epidemiology, and UK office for National Statistics reports all contribute to creating a new perspective on later life.

The narratives about leisure in late life presented in this research were constructed through immersion in the contributions of individual Mass Observation Archive correspondents writing about everyday life from 2000-2016. Current and remembered stories about everyday life are woven together using direct quotes to create stories that illustrate everyday leisure in 21st century late life in the UK. Creative non-fiction is an important narrative form (Gutkind 2012) which is used in leisure studies research (Humberstone 2011, Smith 2013), and aims to present qualitative findings in an engaging and emotive way (Caulley 2008).

The rich and insightful reports from the correspondents of the mass observation archive record in great detail the lives that people are living, and how they feel about them. There is not currently a grand narrative to lead us in this uncharted extended later life. So looking to the side, at peers to find out about later lives in the 21st century is one way of imagining this new phase. With varied stories of later life for inspiration we can begin to imagine our own later life stories, not based on historical generalisations, but on the carefully reported everyday lives of people that know.

Decentering Cold War Social Science: Alva Myrdal's Social Scientific Internationalism, 1950-1955

Early post-World War II international social science was marked by paradoxical tendencies. On the one hand, it experienced a rapid expansion underblown by a new optimistic internationalism in the wake of WWII (Iriye 2002; Sluga 2013). On the other hand, many of the initiatives taken were increasingly framed and affected by the emerging Cold War tensions and processes of decolonization (Heilbron et al 2008; Solovey & Hamilton 2012). Embedded in these cross-currents of internationalism and geopolitics, UNESCO's Department of Social Sciences (SSD) became a transnational key player (Selcer 2011, Rangil 2013).

The aim of this paper is to contribute to our understanding of UNESCO's SSD and its role for Cold War International Social Science, by analyzing Alva Myrdal's social scientific internationalism during her term as Director of the SSD, 1950-1955. Empirically, the historical and sociological analysis is centred round 15 key texts in which Myrdal explicitly articulated her ideas and visions regarding international social science in general and UNESCO's SSD in particular.

The argument of the paper is developed in three steps. First it is shown that a relatively distinct "core" in Myrdal's social scientific internationalism can be discerned and that these core ideas in important respects overlapped with the dominating view according to which U.S. social science constituted the unquestioned center and model of international social science. In comparison with her predecessors, however, Myrdal promoted a more interdisciplinary, applied and, not least, polycentric approach to international social science – a difference that became increasingly emphasized over the years. Third and finally, it is argued that Myrdal's polycentric internationalism was based on a power-sensitive analysis of the geography of knowledge, according to which the Indian case emerged as a theoretically important alternative node in the decentered international social science envisioned by Myrdal.

Researching Harmful Cultural Practices: Intersectionality As a Tool for Rethinking Power and Privilege in Research

The concept of 'harmful cultural practices' has become a common, yet contested term in academic scholarship (Longman & Bradley, 2015; Mohanty, 1988). Developed mainly within Western institutions to particularly call out non-Western practices as sexist and violent, it has been criticised for its inherent biases and the ways it might be abused to justify neo-colonial interventions and oppression in non-Western settings. When uncritically reproduced in research, scholars may thus partake in the reproduction of problematic representations of non-Western men and women as respectively inherently violent or as passive victims of 'culture'. These issues are complicated by the differing views of morality involved and the difficulties that arise when exposing practices considered as 'normal' and inherently 'good' by some, but described as 'harmful', oppressive and 'bad' by others. Researchers working from positions of privilege, may therefore become caught up in a complex of challenging moral and epistemological questions. Because: Who exactly is exposing these practices as 'harmful'? Whose voices are heard in research and which perspectives become silenced? How does a concept like HCP – with its emphasis on 'culture' – obscure the impact of racial, economic and neo-colonial exploitation in the persistence of these practices?

In this contribution, I focus on scholarship on honour-based violence and female genital mutilation, to describe how concerns with power and privilege have been addressed in research. This may involve for example adopting comparative perspectives or incorporating adjusted notions of autonomy and agency. Further, I explore how intersectionality theory may be useful for researchers studying harmful cultural practices. By centralising a commitment towards social justice

and a dynamic view on the nature of oppression, intersectionality may provide useful tools for rethinking research strategies and concepts, and for critically assessing one's position when studying contentious issues like 'harmful cultural practices'.

WITTE, NICOLE* (University of Goettingen - Center of Methods in Social Sciences)

(Social) Parents in the Healthcare System: Helped or Trapped?

When children are born, this leads to big changes in the life of the adults who are responsible for them. This goes far beyond intrafamilial changes, for it inevitably involves contact with various organizations within the healthcare and education systems. This applies to an even greater degree to (social) parents of children with a so-called developmental delay, whether physical, mental or psycho-social.

In a research project on children with motor development delay, my colleagues and myself are studying the course and the meaning, or interpretation, of interactions between the (social) parents and the professional actors in such organizations in Germany. In addition to considering the 'effects' of these interactions on and for the children, we are mainly interested in reconstructing the interactions against the background of the biographical experiences of the individuals involved. At least for the professional actors, experiences with and in the organization are an immanent part of their biographical experiences and are constituted daily.

If, for instance, we analyse a consultation between a mother and a nursery school teacher, we are not only interested in whether the mother accepts the teacher's advice and puts it into practice in her handling of the child, and what effect this has on the child's development. Rather, our main focus is on reconstructing the course of the interaction, in order to reveal how the specific organization is (re)produced and structured by, or structures, the social actions that take place within it.

In a contrastive comparison of biographical case studies and video analyses of interactions between (social) parents and the professional actors, we will be able to show not only how the organization (the nursery school) structures the interaction in different ways, but also how the organization is structured by the actions of the individuals involved.

WITTRICK, BJORN* (S)

The Axial Age and Cultural Crystallizations in Global History By Björn Wittrock

The Axial Age involved a series of profound shifts in trade, rulership and cultic practices in the middle centuries of the first millennium BCE in several high cultures across the Old World. Jointly theses shifts, or perhaps rather breakthroughs, gave rise to new world religions and a new imperial politics. These changes were often premised on assumptions about a chasm between a mundane and a transcendental sphere and concomitant assumptions about the conditional nature of legitimate rule as expressed in ideas about a mandate of heaven or rule bestowed by divine grace.

These changes also gave rise to antinomies that have characterized human societies ever since such as that between the availability to rulers of religious beliefs and practices of world religions to draw upon for the purpose of legitimating an existing socio-political order and the inevitably contingent nature of that rule.

In the course of the two millennia CE the profound consequences of the Axial Age have become apparent on a global scale. In most cases it is a question of ensuing shifts that can be broadly encompassed as a sequence of so-called secondary breakthroughs.

Secondly, even if we were to tentatively accept a description of the pivotal role of the Axial Age, this would not preclude an analysis of later periods of momentous transformation and crystallization, analogous to and influenced by but not reducible to the Axial Age and its consequences. In a series of texts, I have argued that both the period of transregional reorientation in the 10th to 13th centuries and the formation of modernity in its different varieties constitute such periods.

I shall explore empirical examples from these two periods after the Axial Age proper of profound cultural crystallization in global history.

Body on the Plate. on the Relation between the Carnality and Food (on the example of meat in advertising)

The aim of the paper is to answer the question on the nature of particular relations between the cultural and social construction of the body and food consumption represented by **selected media advertisements**. I will attempt to

explain how food stabilizes, catalyses, separates and mediates social relations, as well as social and individual bodies.

The body representations (in the analysed advertisements of meat) primarily perpetuate **social divisions and inequalities**. They are oppressive to a large extent: race stereotypes, the apparent emancipated female sexuality, the simplified vision of the national community based on patriarchal patterns.

The way of presenting the actors' physicality nearly imposes the meaty interpretation – naked bodies are associated with the advertised product – the juicy beef or firm and well flavoured chicken. **The individual is thus more of an object, a commodity, a physical form of capital than the embodied subject (fine line between the advertised product and the body that advertises it). At the same time, we influence the social construction of meat and the body, the way it is packaged and what it looks like, or what values it codes.**

Analyses show that making class choices we choose light, interesting, healthy food. This transforms bodies, assigns them class qualities which must be maintained by proper food. This way the described relation deepens – **the cultural and physical construction of food is more and more strongly coupled with the cultural and physical construction of the body.**

The media transmit the message, shaping the nature of the relation and form the matrix of memory and a set of commands to determine the manner of transforming the body. **Contemporary consumers torn between the oppressive culture, economy and society and the rather naive attempts at emancipation** – buying at discount stores and hypermarkets, we are undergoing physical and cultural unification.

A Preliminary Examination of Elder Care Among Canadian Armed Forces Personnel

The impact of elder care upon military personnel is an important but seldom researched area of concern for the Canadian Armed Forces (CAF). As the "baby boom" generation enters into their senior years, and as the average lifespan of Canadians increases, there are an increasing number of individuals who require age-related care and assistance. CAF members engaged in elder care may experience challenges balancing those responsibilities (e.g., appointments, providing help with medicine, providing financial assistance) with the demands of home life that may include dependent children along with managing a military career that commonly includes extended training and deployments. Elder care is also a highly gendered activity as women assume primary caregiver responsibilities in elder care more often than men (Yee & Schulz, 2000), and women are four times as likely as men to leave employment as a result of elder care (Keating et al, 2013). This pattern is potentially problematic for the CAF, who have worked toward increasing the proportion of women in uniform. In the fall of 2017 the Canadian Armed Forces, in collaboration with academia, launched its first survey dedicated to work-life balance and elder care. This presentation provides a preliminary overview of the level of elder care provided as well as the impact of elder care upon the well-being, career intentions, and mental health of CAF members. Gender differences in the impacts of elder care are also examined.

WOLF, CHRISTOF* (GESIS Leibniz-Institute for the Social Sciences)

The International Social Survey Programme – a Resource for Comparative Analyses

The International Social Survey Programme (ISSP) was founded in 1984. Initially it was conducted in four countries while today the ISSP has around 50 member countries from six continents. Since 1985 the ISSP has run a comparative survey every year and has collected data from more than one million respondents.

The ISSP can be a resource for comparative analyses at least from two different points of view. First, ISSP surveys cover pertinent social topics stimulating research around like Citizenship (fielded in 2004/ 2014), Environment (1993/ 2000/ 2010), Family and Changing Gender Roles (1988/ 1994/ 2002/ 2012), Health and Health Care (2011), Leisure Time and Sports (2007), National Identity (1995/ 2003/ 2013), Religion (1991/ 1998/ 2008/ 2018), Role of Government (1985/ 1990/ 1996/ 2006/ 2016), Social Inequality (1987/ 1992/ 1999/ 2009/ 2019), Social Networks (1986/ 2001/ 2017) and Work Orientations (1989/ 1997/ 2005/ 2015). As can be seen from this list, ISSP is not only comparative across countries but also follows a longitudinal design thus the data can be used for cross-national as well as for analyses of social change. These data are easy to find, they are well documented and available free of charge.

However, the ISSP can also be resource for comparative research in another form: The ISSP has developed a set of rules and procedures that allow it to achieve a high level of cross-national relevance and comparability. Rules for questionnaire development, for translation, for documentation have been developed to ensure high quality of the process and results while at the same time formally involving every member country to the same degree (one country, one vote). These rules will be described in more detail and it will be demonstrated that they may serve as best practice for other comparative projects.

Performing Quantification: Productivism, Multifunctionality, and Ecological Sustainability in Agrienvironmental Policy

Payments made to farmers under agrienvironmental policy schemes in USA serve multiple functions. The material sustainability of farming (e.g., soil erosion control) and mitigation of off-farm ecosystem degradation (e.g., Gulf of Mexico hypoxia) are elements of this diverse set of social functions. Through critical examination of efforts to rationalize payments on ecological grounds – a shift to so-called, data-driven, outcome-based programs structured by new ranking algorithms and new logics of accountability – we are able to observe aspects of the political economy of environment and political economy of agrifood. The study highlights how technoscience serves to re-legitimate existing relations and values in policy networks, and at the same time technoscience is mobilized as a disruptive force. The results indicate that technology is a central and thoroughly ambiguous resource in processes of development.

Reflexive Environmental Governance and New Performances of Accountability: A Critical Analysis of Adaptive Management

In the context of contemporary environmental governance, promulgation of technified metrics – and performance of audits to signal accountability in relation to standards – is, perhaps, no longer sufficient. New forms of assessment and new modes of engagement with sustainability emphasize reflexivity and learning. An emerging requirement for public performances of reflexivity and learning is visible in the growing relevance of adaptive management, experimentalist postures, and programs of projectification. These emphases on learning reflect interest in i) spurring innovation (i.e., organizations and practices must be dynamic), ii) integrating socioecological change into assessment routines (i.e., metrics and standards must be dynamic), and iii) addressing criticisms attached to reliance on indicators that fail to capture relevant outcomes. While efforts to mitigate environmental degradation and expand public good production necessarily rest on doing new things and doing things differently, there are theoretical and historical reasons to maintain a critical stance in relation to contemporary commitments to reflexivity and representations of learning. In this paper, I develop these arguments through a review of pertinent literature and empirical analysis of efforts to institutionalize adaptive management in sagebrush steppe habitat exchanges; conservation platforms designed to offset risks to populations of greater sage grouse, and at-risk species in the Western states of the USA.

Multigenerational Attainment and the Mortality of Silent Generation Women

This study builds on previous scholarship on women's socioeconomic attainment and mortality by studying racial differences among "Silent Generation" women, a cohort of women born between the early 1920s and 1940s. Prior research suggests that the attainment of multiple familial generations provides health-related resources related to mortality, but the historical contexts of these women, their parents, and their adult children suggest that the nature of the relationship between multigenerational attainment and mortality varies by race. Using data from the National Longitudinal Survey of Mature Women, this study examines the relationship between white and black women's mortality and the socioeconomic attainment of their parents and adult children. By taking into account the historical contexts of these women and their families, the analysis reveals that multigenerational attainment is indeed related to women's mortality, but the economic, educational, and occupational components of SES most relevant to longevity vary by both generation and race.

RC15-JS-29.2WOLFE, JOSEPH (*University of Alabama at Birmingham*)BAULDRY, SHAWN* (*Purdue University*)HARDY, MELISSA (*Pennsylvania State University*)PAVALKO, ELIZA (*Indiana University*)*Multigenerational Attainments and Mortality Among Older Men: An Adjacent Generations Approach*

Recent work in stratification emphasizes the importance of multiple familial generations in status attainment and other transmission processes. In support of this line of thought, studies find evidence that grandparent and parent socioeconomic attainments are associated with both children's life chances and health in early life and adulthood. Health disparities research in this area generally assumes that the rewards of attainment are paid forward across successive generations, meaning grandparent and parent achievements give children an advantage, but an emerging literature suggests that mortality risk in old age may be more closely linked to the attainments of parents and adult children, i.e., adjacent generations. No single study, however, considers the unique multigenerational structure of health disparities suggested by this literature. To address this gap, we use nearly complete and recently updated information on mortality from the National Longitudinal Survey of Older Men (NLS-OM), a nationally representative sample of U.S. men aged 45 to 59 beginning in 1966. These men were followed for over two decades, providing extensive biographical information about themselves, their parents, and their adult children. Our results support a three-generation model in which men with high-attaining adult children have an especially low risk of mortality in later life when compared to fathers with low-attaining children and men who remain childless. More broadly, our findings highlight the importance of accounting for the attainments of adjacent generations and suggest that increasing educational and occupational opportunities for children and young adults may help generate broader improvements in population health among older adults.

RC54-887.5WOLFF, VIRGINIE* (*Université de Strasbourg*)*Sensitive Bodies: From Lack of Recognition to Social Distinction*

While the sensitive body, or highly sensitive body, was misunderstood and marginalized, non-seen as a suffering body because of its invisible symptoms, a major change is coming to its status through the action and the empowerment attempt of some social agent who describes themselves as sensitives.

Gluten sensitivity, an example of a contested illness, helps to demonstrate that by the visibilization's mechanism of the sensible body and the progressive legitimization of the body experience, social inequalities have been hidden and became invisible.

Using data from in-depth, semi-structured interviews with gluten-free and gluten-restricted persons in France (Paris, Strasbourg) and in Germany (Berlin), this study aims to show how the category "sensitive body" tends to transform the social mechanisms into natural mechanisms, naturalizing the relations between the ones who "feel" and the others who do not "feel".

The ability to sense is presented as a difference based on innate properties, as a sixth sense, whereas to describe oneself as "sensitive" implies the acquisition of knowledge and skills. A learning is necessary to understand, decrypt and talk about the symptoms, which are perceived by the gluten sensitives as evidences supposed to guide their everyday food practices. Since, the way to be sensitive depends on the process of socialization and therefore, sensitivity can be considered as part of the habitus.

This categorization, separating the ones more able to sense from the others, less able, can be seen as an attempt to create a new power configuration, which could arise new form of symbolic violence.

Moreover, within the group of sensitive people, different kind of practices take place and let us see that it is an heterogeneous group, in which some leaders take advantages and manage to distinguish themselves in diverse social spheres.

RC35-632.4WOLTERS, LAURA* (*Hamburger Institut für Sozialforschung*)*Observing Sexual Violence: Strategies of De-Legitimizing the Cologne Sexual Assaults*

The New Year's Eve sexual assaults during mass-gatherings in the center of Cologne in 2015/16 marked a turning point in German public discourse about sexual violence. Before the events, many of the acts of groping and harassment that occurred in Cologne would not have been perceived as violent, but would have been understood to fall into the gray area between consensual sexual interaction and blatant sexual violence, i.e. rape. After the news coverage caught up with the events, a broad consensus emerged that what happened was indeed and undoubtedly violence. It was, in other words, the act of observing that transformed certain practices into violence. However, the particular discursive

and interpretative processes in this case can only be understood in light of the so called European "refugee crisis" and the alleged perpetrators' North-African origin, which provided a crucial resource for drawing attention to the assaults and, at the same time, transformed political interpretations and notions of legitimacy.

The paper will look into these dynamics with particular focus on the various observers' strategies to draw attention to specific aspects of the events and de-legitimize them as violent. Drawing on media coverage as well as on NGO and official statements, this paper analyzes how the sexual violence discourse has changed after the events and whose narratives became dominant. It will show that the whole discourse was formed by the competition between two interpretations of the incidents – one focused on the origins of the perpetrators, the other on the gaps in culpability – which now determines new perceptions of sexual violence.

RC09-JS-39.2WON, JAEYOUN* (*Yonsei University*)DAI, FEN (*Yonsei University*)*Compliance Management As Neo-Liberal Strategy in China*

This paper discusses local-global dynamics of neo-liberal compliance management strategy in China by investigating a case of "A" transnational enterprise in China. The notorious GlaxoSmithKline plc bribery scandal in 2013 pushed the issues of corruption in China to the highest point and disclosed a series of misconducts in violation of compliance management. China has a long history of practicing "guanxi" on business relationship, which is based upon reciprocity, emotional feelings, and personalized networks. However, recently, a series of compliance regulations and rule of law have been established in post-socialist China. In particular, the Foreign Corrupt Practices Act (FCPA) is gradually into public's vision with several bribery cases. Based upon qualitative data from transnational enterprise "A", this paper attempts to examine the local adaptation of global compliance management tactics.

RC24-442.1WONG, CATHERINE MEI LING* (*University of Luxembourg*)LOCKIE, STEWART (*James Cook University*)*Policy and Industry Elite Perceptions of Risk and Uncertainty in Climate Policy: A Cross-National Study*

Uncertainties associated with the pace, timing and non-linearity of anthropogenic climate change constitute a significant challenge for climate policy and the management of subsequent risks. This paper is thus concerned with how those involved in the design and implementation of climate policy: 1) think about the temporal dimensions of climate risks; 2) understand uncertainty; and 3) rationalize specific policy preferences and recommendations. Based on semi-structured interviews with policy and industry elites in Australia, China and the UK, this paper found that participants had significant difficulty conceptualizing long-term as opposed to short-term climate risks. On the latter, both public and private sector participants across all three countries were far more concerned over the management of political risk than with uncertainty over the magnitude or timing of environmental change. For a majority of participants, market-based policy options and technological fixes were the overwhelming preferred policy option with little critical reflection on: (a) their ability to deliver results within the IPCC's SRES scenario timeframes; and (b) the kinds of risks they may generate and how best to prioritize or mitigate them. Adaptation was also a conspicuously minor theme indicating that it may not be a policy priority despite a number of participants expressing the belief that the world has run out of time to avert a tipping point in climate change. These empirical observations reflect the enduring difficulties in bridging science and policy, particularly in dealing with disconnected and uncertain temporalities of climate risks; as well as the continued lack of appreciation for more deliberative forms of decision-making. The paper concludes by reflecting on what this means for risk governance as a normative frame and its translation into a mode of (policy) practice. Finally, some tools and institutional arrangements are suggested as instruments for facilitating such developments.

RC04-81.7WONG, YI-LEE* (*Chinese University of Hong Kong*)*Is Transition to University an Emotionally Straining Pursuit?: A Case Study of Community-College Students Seeking a Second Chance in Hong Kong*

In view of global development, educational expansion has been taken as a human resources development policy that seeks to equip students with knowledge and skills appropriate to an ever changing economy in a post-industrial era. Consequently, the youth as the prospective workforce are urged to obtain at least a higher qualification, which is necessary, although not sufficient, for seeking social mobility or at least for avoiding being marginalized in an increasingly competitive labour market. Given this individualized discourse on explaining the outcome of educational equity, individual youngsters are expected

to bear all the cost involved in social advancement through education; it is then argued that the transition to university against a post-industrialized capitalist context becomes emotionally straining. Taking up this issue, this paper refers to a case study of community-college students in contemporary Hong Kong in order to examine the emotional aspect of their pursuit of a bachelor's degree through a new option brought by the community college policy – the transfer function of associate degree – launched in year 2000. Throughout the course of this pursuit, respondents, despite their sense of hope initially, had to cope with negative emotions associated with the socially perceived inferiority of this option, its competitiveness, and its gloomy prospects for transferal. Without challenging the structural design of the education system – the quota policy on the number of places at university for the relevant age – but essentially tackling educational inequity by encouraging individual students to pursue a bachelor's degree through an expensive and risky option of transferal, this community-college policy keeps the status quo intact and also somehow gives many students a false hope hurting their feelings. While the effectiveness of the policy could be challenged on the grounds of social wastage of human resources, this should also be questioned on emotional grounds.

East Asian Religions in Diaspora: The Chinese Experience in Canada

"The Chinese Case" includes Folk Religiosities, Confucianism, Daoism and Buddhism and argues that the traditional Chinese religious ethos, taken as a whole and in the singular, offers an early example of the complementarity of secularization and market theories in capturing multiple pluralistic and dynamic religious landscapes. (Beyer, 1997)

It seeks to offer an alternative, indigenous understanding/theory of religion building on works by Robert Company (1992), Thierry Meynard (2005), Anthony Cua (2005), and Michael Puett (2013) by drawing on foundational masters like Laozi, Zhuangzi and Kongzi, and the Avatamsaka scholar-monk Fazang and popular *shanshu* (morality books). "The Chinese Case" focuses on teachings of change, skepticism, self-cultivation and individual responsibility that generated the adage that "all Religions teach people to be good"; a pluralistic understanding of "Religion" or religious impulses; the historic syncretism or "buffet-style" religiosities; and the inclusive, non-doctrinaire ethos that allowed for a seemingly ready integration into the Canadian religious landscape, which in turn allowed for the shaping of "model minorities".

Everyday Politics in Diverse Communities: Spatial Imaginaries of Citizenship within Global Ethnoscapes

Many urban young people today experience the everyday realities of global migration and demographic change first-hand as part of their experiences of growing up in culturally 'hyperdiverse' neighbourhoods. In cities such as Auckland, New Zealand, overseas-born communities now make up more than 40% of the population. This extent of diversity has a significant impact on young people's emerging identities, feelings of belonging and their desire to participate as citizens. In this paper I examine how school-aged young people navigate 'difference' daily in some of New Zealand most culturally diverse communities. Drawing on focus group and visual data, I explore how they saw themselves as socially and spatially 'connected' (or disconnected) to peers and communities and how this shaped their everyday politics and practices. Of significance within hyperdiverse neighbourhoods was the intersectionality of classed, gendered and raced experiences which enabled some young citizens to emerge with 'distinction' (Bourdieu, 1984), creating a symbolic hierarchy of belonging and citizenship. Exploring the spatiality of young people's citizenship imaginaries provided a way to understand this stratification of belonging and drew attention to the heightened significance of space in globalised times. How young people comply, resist and challenge this stratification through everyday acts of citizenship provides insights into spatial and scalar understandings of youth citizenship in transnational times and has implications for how we theorise youth sociologies today.

Networks, History, Race and the Nation-State – Movement Experiments in the Trump Era

Networks, History, Race and the Nation-State – Movement Experiments in the Trump Era

Post-Trump, the contradictions and tensions about race and national identity and about the relationship between nation-states and movements are central and need to be examined. Examining a catalogue of hundreds of protest events in

the US in 2016 and 2017, one finds shifts in the form of movement activity and an increasing centrality of identity claims. When combined with an analysis of movement statements and organizational maps – one can track the way movements are experimenting with and pushing beyond the classic movement-state dynamic. This paper explains these shifts by emphasizing the convergence of global movement networks, a crisis of, and confrontation with existing political and economic logics and institutions and historic racial and colonial inequities.

Managing the Risks of the Rise of Non-Standard Work Patterns: Tracking the Impact of Individualized Work Schedules on the Lives of Young People through Their 20s

Non-standard employment patterns are increasingly common across the world, particularly for young people. However, this type of employment is often considered to be transitional, and not to lead to insecurity due to the reduced responsibilities of youth. This presentation is based on ten years of mixed-methods longitudinal data (2007-2017) from an Australian study of youth transitions (560 participants). Drawing on data from repeated survey questionnaires and qualitative interviews, I investigate the impact of non-standard employment on other aspects of life for young people in their 20s. While there are clear patterns of transition towards full-time employment and ongoing contracts, there is no transition towards 'standard hours' of employment. Even by age 28-29, less than half of participants were working standard Monday-to-Friday daytime hours. The timetables and rhythms of the participant's lives are individualized, primarily due to their work patterns, and do not become substantially more stable as the participants age. When the participants were in their early 20s they highlighted the impact of non-standard work on their social life, but in their late 20s their narratives shifted to the impact of individualized temporal schedules on their intimate relationships. The survey data shows that those working non-standard hours in their late 20s are much less likely to be married or in de-facto relationships and the interview data suggests this is linked to the challenge of building and maintaining intimate relationships. A paradox emerges from the analysis. Contemporary life is characterized by a temporal individualization that demands new efforts to routinize and synchronize lives with others. This work is gendered (more likely to be done by women) and classed, the resources to do so are unequally distributed.

WOODMAN, DAN* (*University of Melbourne*)

What Comes after 'Post-Subcultures'? Generation, Biography and Finding the 'Collective' Time for Culture and Leisure

The subcultures approach of the 'Birmingham School' profoundly shaped the emergence of contemporary youth studies. This approach saw the most significant youth cultural forms as concrete subcultural groupings of larger class cultures. The past two decades have been characterized by a sustained 'post-subcultural' critique highlighting the fluidity of cultural engagement and the autonomy of culture; and by a robust defense of subcultures, based on the demonstrable impact of social stratification on youth culture. This debate has reached a stalemate and there is a search for alternative, productive, framings. In this paper I suggest that a generational and biographical lens provides such an alternative, framing young people's collective cultural practice in the context of the multiple, highly structured but also individualizing, engagements that shape everyday lives and transitions for the contemporary generation of young adults.

The paper draws on ten years of qualitative data (2007-2017) from an Australian mixed-methods study of transitions. Drawing on longitudinal data from 50 participants, I argue that the individualizing social structures shaping the lives of this generation mean that investments and demands in one sphere, such as employment, often do not articulate easily with those in other spheres, such as leisure. The timetables and rhythms of the participant's lives have not clearly become more stable as they have transitioned from university into full-time employment, 'non-standard' hours of employment are common even at age 28. Contemporary life demands new activity (often drawing on digital technology) to synchronize schedules to engage in leisure and collectively create and consume culture. A paradox of contemporary life for these participants is that periods of collective creativity and 'tribal' abandon require active synchronization, and even routinization. This work is gendered (more likely to be done by women) and classed, the resources to do so are unequally distributed.

WORBS, SUSANNE* (*Federal Office for Migration and Refugees*)

ROTHER, NINA* (*Federal Office for Migration and Refugees, Research Centre*)

Refugee Surveys in Germany: Challenges of a "Special Population"

Since 2015, Germany has been confronted with an unprecedented number of asylum seekers since the early 1990s. Nearly 1.3 million people submitted their first application for asylum by July 2017. Syrian civil war refugees are by far the most important group of origin, followed by people from Iraq, Afghanistan, Iran and Eritrea. In response to this development, a broad and diverse "refugee research" has meanwhile been established in Germany to investigate this specific population.

The proposed contribution deals with the two largest quantitative studies on refugees in Germany so far and draws on the experience gained in this field. This involves a written survey of people entitled to asylum and recognised refugees (BAMF Refugee Study 2014) and a CAPI panel study on refugees who came to Germany between 2013 and January 2016, encompassing people with different legal statuses (IAB-BAMF-SOEP survey of refugees).

Two special characteristics of the group of refugees that are relevant for empirical surveys will be discussed in more detail:

1. Sampling:

Access via standard procedures is often not possible for migrant target groups due to small numbers of cases and high screening costs. For the two studies mentioned above, the German Foreigners' Central Register (*Ausländerzentralregister*) was used, which enables the drawing of representative samples among refugees and is exclusively accessible to the Research Centre of the Federal Office for Migration and Refugees (BAMF).

2. Design of the survey instruments and conducting the interviews:

The problems to be overcome here are the lack of knowledge of German, the lack of literacy (or non-latin script literacy) and the adaptation of questions to the cultural context of migrants. In particular, experiences with questionnaire translations and audio files will be presented. The question of how motivation and trust can be created and maintained for refugees as respondents is also reflected.

RC38-JS-14.1

WORM, ARNE* (*University of Goettingen*)

The Presence of Collective Violence, or: How Do Syrian Refugees Re-Construct Their Biographies within the Figurations of Illegalized Migration from a (civil) War?

In this paper I will present empirical findings from my PhD project on changing constructions of belonging and processes of (re-)grouping within the biographies of Syrian refugees, which forms part of the bigger DFG-funded research project "The Social Construction of Border Zones". In the field of sociology of violence/violent conflicts, and in migration research, changes in the social order and in relations between groupings, as well as transformations of images of the self, group belonging and perspectives on other groupings on different levels (e.g. gender, religion, ethnicity, class) have long been important topics. Yet, these two perspectives have rarely been combined.

Based on biographical case reconstructions from our fieldwork in the Spanish exclaves of Ceuta and Melilla in North Africa, and drawing on considerations of the sociology of violence and figural sociology, I will present different courses of illegalized migration against the background of an ongoing (civil) war. I will highlight that specific experiences of (collective and individual) violence in the past and the present play a crucial role in the processes of biographical re-orientation of my interviewees and thereby the dynamics of (forced) migration. To understand these courses, I will argue that we have to pay attention to the complex *interrelation between life courses and the collective and family histories* of refugees, as well as *their figurations with other groupings* before, during and after their migration projects from a (civil) war.

Education for Reconciliation: Confronting the Challenge of Residential Schooling and Its Intergenerational Impact in Canada

Canada's national Truth and Reconciliation Commission, which highlighted the impact of residential schooling on Indigenous survivors of those schools, has also drawn attention to the intergenerational consequences of residential schooling and what it signifies for relationships between Indigenous people and other Canadians. In seeking to acknowledge and move beyond the "cultural genocide" represented in the policy, the commission's final report included a series of calls for action to mobilize movement towards reconciliation, many of which involve educational mandates; as emphasized by the declaration by the commission's chair, Murray Sinclair, "Education is what got us into this mess...but education is the key to reconciliation" (Watters, 2015).

This paper explores the dynamics and prospects for effective change associated with reforms in elementary and secondary education systems in Canada since the release of the calls for action. School boards and educational organizations across the nation have engaged in a flurry of activity in the two years since the report's release in an overwhelming show of support for the reconciliation process but important questions remain concerning the nature and consequences of these activities. The analysis highlights these reforms, including a critical assess-

ment of their potential for effective change and the limitations associated with their implementation, based on analysis of policy guidelines, action plans and public discourses on relations between Indigenous people and other Canadians. The paper addresses key questions: to what extent are all of these initiatives a matter of performativity and good faith rather than a movement towards foundational change? To what extent is effective reconciliation possible and how can it be accomplished in the context of institutional structures and discourses framed within the context of a white settler colonial society?

WOZNIAK, WOJCIECH* (*University of Lodz, Faculty of Economics and Sociology*)

KOSSAKOWSKI, RADOSLAW (*University of Gdansk*)

NOSAL, PRZEMYSŁAW (*Adam Mickiewicz University in Poznan*)

The Team with No Left Wingers. on the Roots of Right Wing Political Orientation Among Polish Fandom.

The data collected by Kossakowski (2016) in the largest survey of Polish football fans confirms that their political attitudes are skewed towards the far right. One quarter of 888 respondents declared no political preferences while more than half supports three radical anti-establishment parties. Law and Justice, ruling right-wing party is supported by 5,56 percent while four left-wing parties gained three percent. Anti-establishment attitudes are accompanied with the growth of nationalist ideology at the terraces, what is very much in line with memory politics as developed by current right-wing government of Poland.

The paper is an attempt to discuss several non mutually-exclusive explanations of the phenomenon:

1. Contrary to the resurgence of right-wing attitudes at the football stands in other European countries, situation in Poland remains stable as the right-wing orientation of the fandom lasts for a long time.
2. It is a good predictor predictor of tendencies in the national politics: demise of left-wing parties and conservative turn among young generation confirmed by voting behaviours.
3. Aforementioned single-mindedness stems from the shape of political scene and the discourse prevalent throughout transition period. The long shadow of communism over the public discourse impacted political debate and other social fields (e.g. economic/academic ones).
4. The radicalization of right-wing parties, particularly anti-migrant rhetoric gave a new momentum to chauvinism and xenophobia refuelling nationalism and right-wing extremism in Poland. This can be partially explained by the ethnic/religious composition of the most homogenous society in Europe. Nevertheless, relatively well organized Polish fandom remains independent from the interferences of institutionalized politics. To the contrary, they sometimes form surprising political alliances to get influence on local decision-making processes.

The empirical basis of the paper is quantitative and qualitative data on football fandom in Poland gathered within several ongoing research projects which are conducted by the authors.

Looking within the Bay-Area Skate Scene: A Unique Example of Place-Making and the Repurposing of Space

Skateboarding's rise in popularity is in part due to the growing adult presence that hoists new interests and consequences upon an activity that was once considered an activity with elements of non-conformity, freedom, and creativity. Our research has focused on the fascinating and complex San Francisco Bay Area skate scene; once distinguished by its "skate and destroy" reputation, we now see how neoliberalism has played a significant role in redefining this skateboarding culture, with significant investments on the part of families, governments, and social enterprise groups.

There is much diversity within the Bay Area skate scene, with this paper focusing on how one city came together to repurpose space and develop place that fostered social, cultural and emotional attachment for their community members around the sport of skateboarding within the Bay Area in California, USA (Johnson, Glover, William & Stewart, 2014).

The city of San Jose, dubbed as the *Capital of Silicon Valley*, simultaneously uses ideologies around public health and at-risk youth culture to construct numerous skate parks. A unique set of socio-cultural and economic circumstances sharply implicated how skate parks were being conceptualized and managed by the city government. We completed over 30 hours of observations at two skate parks, and conducted interviews with 20 individuals who were parents, youth, and adults as-

sociated with skateboard programming. Different strategies for placemaking for different neighborhoods. We examined why these strategies were used in these different neighborhoods' skate parks. In one case, the skate park was used to brand the city as innovative. And, in turn, *place-making* was used in ethnic minority neighborhoods as "redemptive" strategies. We discuss the implications of these strategies.

The Perception and Framing of Political Opportunity and Threat Among Social Movements in Online Space

How does collective action operate differently for social movements in online space than in other, more traditional sites of inquiry? Specifically, how might the perception and framing of political opportunities and threats differ in the digital environment than in other contexts that have been studied by movement scholars? Opportunities are often conceptualized as openings which can reduce the cost of collective action, while threat is a force which increases the cost of inaction. But if the affordances of Internet technology can provide new ways of reducing the cost of collective action, might opportunity become less salient for mobilization since cost is already low, while threat becomes more so, particularly for movements which are most adept at leveraging these affordances in pursuit of their goals? To study the perception and interpretation of political opportunities and threats in online space, this study utilizes automated text mining and network analysis to examine archival text corpuses from two online social movements, the Digital Rights movement and the Anonymous hacktivist movement. Analyses confirm that indeed frames of threat appear with much greater frequency than opportunity in the documents, particularly for the Anonymous movement in which frames of opportunity are virtually nonexistent. While earlier scholars have shown that the processes of contention are necessarily spacial, no one has specifically examined how digital space might shape the dynamics of political opportunity and threat. This study shows the importance of such spacial considerations of the digital realm by arguing that when technological affordances are most highly leveraged in online social movements, the cost of collective action becomes so low that political opportunities lose salience as a motivating factor.

Diversity and Employment Equity in the Defence Team: Results from the Defence Civilian Employment Systems Review

Diversity management continues to evolve for the uniformed and civilian members of Canadian Defence Team. One of the core aspects of diversity management continues to be the organization's obligations legislated under the Employment Equity (EE) Act. The Employment Systems Review (ESR) is a key EE activity the Canadian Armed Forces and the Department of National Defence must conduct on a regular basis. The ESR is an in-depth analysis of human resources systems (e.g., hiring, promotions, training, termination and management) that determines whether employment barriers exist that impact the EE Act's designated EE groups (women, Indigenous people, visible minorities and persons with disabilities). This presentation discusses the initial findings from the most recent ESR for the DND civilian workforce. Data was collected through focus groups conducted with civilian designated group members employed in occupations which were determined to be underrepresented relative to the Canadian labour market. A series of interviews were also conducted with key stakeholders, including human resource officers, managers, supervisors, union representatives and EE champions. The results of this ESR will be used to develop the next 5-year EE Plan for the DND civilian workforce, including strategies to eliminate employment barriers and improve the representation and inclusion of designated group members.

Scenes Making: The Development of Three Urban Communities in Beijing from Cultural Dynamics

The past researches of urban development rarely involve specific local cultural characteristics, for example, amenities, activities, organizations, norms, values, etc... The researchers mainly focus on land, capital and labor when they explain the dynamics of urban development, while they often overlook the roles of

culture and arts. With the advent of the post-industrial society, the tradition of this kind of research has changed gradually. The paper selected three different communities in Beijing to explain the driving forces of urban regeneration from cultural scenes, including Zhongguancun community characterized by the culture of innovation and entrepreneurship, the 798 Art District and Nanluoguxiang community characterized by traditional culture. The cultural scene or local cultural characteristics include the following dimensions: facilities consumer oriented, diversity population, characteristic activities, these factors combined to form the scene, and the values and the way of life in the scene. It's believed that the local cultural features are very important during the process of the gathering of senior human capital, especially for the IT talents and arts crowd. These will bring regional prosperity, including jobs increasing, new industries and social development.

School-to-Work Transition and Identity Capital of Second Generation of Chinese Migrant Workers

Since China's post-1978 economic reforms, there have been large amount of young people migrating from mainland to coastal regions, from rural to urban areas, and from towns to big cities. Born after China's economic reform and growing up in an era with rapid development of globalization, informatization, industrialization and urbanization, the second-generation of migrant workers have gained higher level of education and skills than their predecessors, which would bring them more choices for city life. Meanwhile, since the old rural-urban institutional barrier still exists, and their access to necessary welfare services is limited, they have to deal with plenty of risks and uncertainties in late-modern society.

Identity capital theory reconciles the structure-agency debate by applying them in a cross-tabulation, it provides a perspective to study how people strategically manage the various elements of their subjective, interactional, and social lives, which involving a portfolio of identity-based resources. This research focused on the questions about how do the second generation of migrant workers perceive their school-to-work transition, and how do they deploy their identity capital in their school-to-work transition, the current work environment and life adjustment in the host society. Identity capital is deployed in social situations with their parents, classmates, friends, colleagues, supervisors, neighbors in this process of school-to-work transition through interactions. It would be reflected as the strategy portfolio when young migrant workers dealing with potential opportunities and obstacles, and be embodied in every choice they made from education to work.

Through elaborating stories of a new target group, the second-generation of Chinese migrant workers, who are non-local citizens from disadvantaged background facing with multi-aspect structural barriers while possessing diverse agentic skills, this research will substantialize identity capital theory. Besides, relevant research findings can yield welfare ideas formulating more age-oriented policies in response to true needs of this group.

One World, Several Ethics - Governance Paradoxes in Higher Engineering Education

Education is one of the sustainable-development-goals(SDG) in the United Nations guidelines. However, as public funding for education decrease, a conflict occurred, whom and which institution should be funded [1].

The research question is: How does the literature on social aspects of higher education of engineering reflect this issue of neoliberalism? The method is literature survey. 345 papers appear in Scopus with the keywords "Higher education", "engineering" and "ethics". The results show that this issue became significant from 1999, mainly due to the effort of IEEE and American Society for Engineering Education. There are several reasons: The falling wall and uprising countries flooded researchers on the job market. After the 2008 crisis research investment became restricted, utilitarianism occurred. In such a atmosphere of confrontation, competitors try to get any selfish advantage even with deploying dark pattern [2], such as isolation, mobbing[3], gossips[4] etc. Several psychological paradoxes can be noticed: Students, who demand best instruction, learn less than the active ones. A professor who demands much from his students, will get less due to the nature of curiosity-driven creativity[5]. Longest staying faculty staff has gained most trust, but suffers highest temptation to deploy harassment, as knowing the loopholes best. Politicians are attempted to follow the newest technology trends in financing education, but then they weaken the base of long-term-stable education on basic STEM subjects[1].

Conclusions for best scientific practice [6,7] are:(1) enforce better legal, structural, or organizational countermeasures, preferential through cooperation [8], (2) educate young researchers to better awareness and adaption, or (3) encourage the mobility and transfer to other jobs in higher education.

Legitimization of Wage Penalties for Mothers and Wage Premia for Fathers – Results of a Vignette Study.

Gender wage gaps and wage penalties for mothers are well-established phenomena. Their persistence may be partially explained by the fact that the unequal distribution of rewards between genders is often perceived as just and legitimate. The goal of our study was to establish how different conditions affect perceptions of just inequalities. Using status characteristics and double standards theories, we predicted that status consistency/inconsistency between genders and occupational status and years of experience will be most relevant. Specifically, we anticipate that there will be greater acceptance of unequal distribution of rewards between women and men with the same job experience in top-level occupations (status inconsistency), and less acceptance of inequality in bottom and medium level occupations (status consistency). We also predicted that an additional factor, parenthood, would accentuate the relationship between gender and the aforementioned characteristics. A vignette study conducted in 2017 on a representative sample of Polish respondents active in the labor force, which yielded approximately 38,000 observations, provided evidence conforming to our predictions. That is, differences in just earnings for men and women are larger in the high occupational status category than in the medium and low occupational status categories. The size of the legitimized difference in earnings also varies by age and parenthood status. We found, however, rather moderate levels of motherhood penalties and much higher premia for fatherhood. Both the motherhood and fatherhood effects increase with the age of the person described in the vignette, although the effect of age was curvilinear and plateaued around age 60. Perceptions of legitimized inequalities between genders were independent of respondents' characteristics.

Comparability of Corruption Measures in Cross-National Surveys

How to best measure corruption, the concept that is secretive in its nature? Despite the growing academic interest in cross-country corruption research, the question remains open. Many survey researchers propose to ask about perceptions as opposed to corruption incidents, which respondents may be unwilling to declare. However, the new developments of crime victimization research show that respondents are less reticent in answering questions on illegal behavior than it was previously assumed. It motivated for the raise of a new approach of measuring corruption, where actors are asked directly about their recent corruption experiences. Both measures - corruption perception and corruption experience - aim to best estimate the unobserved real corruption. Yet the relation between the two remains disputable, as well as the understanding which measure is more accurate, if any. The presentation offers the analysis of main benefits and limitations of the two currently dominant corruption measures in cross-national surveys. On the example of corruption measures, I raise the question of assessing equivalence and increasing comparability on the statistical analysis phase of a study, as opposed to design or implementation stages. The analysis is based on the Global Corruption Barometer, the European Quality of Government and the Life in Transition surveys, which cover the same 30 European countries in 2010. The results aim to open the discussion on assessing measurement quality in already existing survey data for the purpose of substantive analysis and will offer an illustration of practical challenges in substantive research with different measures of the same construct. I also intend to present two new research tools created as the result of my dissertation - a publicly available common file with the documentation of corruption variables in comparative survey projects and the harmonized dataset created for the purpose of the study of corruption in education sector in Europe.

Education Systems, Corruption and Bribe-Giving in Europe

Paper presents the main results from the analysis of corruption determinants in public schools in Europe. Corruption is often presented as the problem of the developing world, and many oversee that bribe-giving experiences and perceptions of corruption in education vary significantly between and within European countries. In my dissertation project, I examine the scale of corruption in education sector across Europe and also determine individual and country level characteristics that are associated with the likelihood of corruption in public schools. Moreover, I explore the differences and similarities in the patterns for Post-Soviet, Post-Socialist and Western European countries. This presentation offers the summary of the main results of my dissertation.

The key research questions raised in this presentation is whether there is the association between the characteristics of education systems, depicting its resources and management on the country level, with the likelihood of corruption incidences and perception of corruption prevalence in public schools. I concentrate on such characteristics of education systems as: government expenditure on education, education staff compensations, centralization of examination system and pupil-teacher ratio.

For the purpose of the analysis, the integrated dataset was created, which consists of the harmonized micro-level data based on the Life in Transition Survey, the Global Corruption Barometer and the Quality of Government survey - total 96 national surveys conducted in 30 European countries in 2010 among 31,578 respondents; and the integrated macro-level data of country level indicators and education system characteristics from the World Bank Education Statistics, the Varieties of Democracy, the Quality of Government Standard Dataset and UNE-SCO Institute of Statistics Education Indicators. The results of the analysis show substantive differences in corruption perceptions and personal bribe-giving experiences in education sector and their relation to education system characteristics.

Distinct Path of the Younger Europe? Determinants of Anti-Refugee Sentiments Among Young Poles, Czechs, Hungarians and Slovaks

The aim of this study is to analyze causes of high anti-refugee attitudes among young citizens of the so called Visegrad Four countries, that is Poland, Czech Republic, Hungary and Slovakia. These four Eastern-Central European countries have experienced political transformation in 1989, entered the European Union in 2004 and have been part of Schengen area since 2007. Previous research demonstrated that the recent attitudes of their citizens toward refugees and immigrants from the "Global South" is in sharp contrast to the attitudes of Western Europeans. Namely, it is the youngest generation that expresses the most radical reluctance toward refugees, while in the countries as Austria, Germany, Italy or Spain, the most reluctant is the older generation. While all four countries share some common structural socio-economical features they vary in respect of cultural, and religious characteristics, as well as the relevant experience of "Refugee Crisis" of 2015. Shared anti-refugee sentiment among the young generations which were born and raised in the "Open Europe" allows to expect some common structural determinants.

Solving this puzzle is crucial to understand past and to be able to predict future political and social development of this part of European Union. I base my analysis mainly on the national and international public opinion surveys (such as International Social Survey, World Value Survey, European Social Survey). During the research, I investigate links between negative attitudes towards refugees and respondent's ideological stands, political affiliations, new social media use, as well as, structural and economic characteristics. In the analysis, I take into consideration also gradual changes occurring in the societies of these four countries in the spheres of memory, identity and political preferences.

X**RC07-155.2**XABA, THOKOZANI* (*University of KwaZulu-Natal*)*Manufacturing Dissent***Manufacturing Dissent**

In *Manufacturing Consent* (1988), Edward S. Herman and Noam Chomsky explain the relationship between the *power elite* and the *corporate mass media* as well as how that relationship affects the ownership, processes and products of the corporate media as well as its impact on the general public. They argue that the profit motive propels the corporate media to create a stable and profitable pro-business environment and that in that environment reporting that is favourable to corporate business over public interest is preferred. In such an environment, reporting that favours accuracy over profits fails and is relegated to the margins of the publishing profession. The distortion of news is made worse by the news media dependence on government sources for news and information as well as the impact of sanctions that arise from being out of favour with corporate and government sources. The consequence is that, in order to stay in business, corporate news media distort their reporting to favour the views of corporate business and government.

Contrary to the *propaganda model* which sees a coincidence in the interests of the corporate media, the state, and corporations, this paper argues that, in colonies as well as in former colonies, the corporate media strategically becomes the third force which functions to demonise, counter the anti-colonial forces as well as create doubt in their objectives and strategies. After independence, when the anti-colonial forces have won, the corporate media continues its war on the post-colonial government by creating and encouraging doubt in the ability of the post-colonial government to govern. They do this in collusion, subtle and overt with opposition parties by thwarting, challenging and confronting the post-colonial government's every move. Accordingly, the policies of post-colonial governments are questioned and attacked as the media normally does for enemy states.

TG04-985.5XAVIER, BEATRIZ* (*Nursing School of Coimbra*)*Integration of Medical Regimens in Daily Lives: Living in Risk with Blood Pressure*

The study purpose was to understand the representations and practices of hypertensive patients towards their risk status and the way in which they make use of the consultation and medical recommendations. Qualitative research methodologies were used: interviews and direct observation of the consultation.

Interviews were conducted with 41 patients, focusing on the analysis of three main aspects: the process of disease and risk interpretation; the way in which patients' behaviors are shaped by the construed meanings; and the processes of coping with the disease on a daily basis.

The results reveal three standard models of "being a hypertensive patient": proactive, compliant, and detached. We can conclude that patients who are followed-up and guided through the process of leading healthier lives, through the individualization and internalization of medical and social norms and complying with the treatment, show different and unique ways of acting and combining medical information with the experience of coping with the disease and their everyday experiences.

The patients' self-assessment on what they should do and what they actually do reveals the idea of non-compliance with basic hygiene principles and its consequent moral judgements. People with blood pressure use the concepts and ideas of moderation, care and balance as mechanisms of operationalization between medical recommendations and their behaviors. They agree on the principles for a healthier lifestyle recommended by the doctor. However, this is seen as a result of personal effort and will against the structural trends of organization of work and consumption and therefore very difficult to accomplish.

RC15-287.6XAVIER, BEATRIZ* (*Nursing School of Coimbra*)*Meanings and Values of Being at Risk: Collecting the Narratives of Hypertensive Patients*

This paper aims to account for some issues related to research process on experiences and

narratives of patients with hypertension disease followed in Portuguese Primary Health Care. Qualitative research methodologies were used: interviews, using the McGill Illness Narrative Interview model (Groleau, Young & Kirmayer, 2006) and direct observation of the consultation.

Interviews were conducted with 41 persons with hypertension.

The study aimed to assess the representations and practices of hypertensive patients and how chronically ill patients related to their doctors, nurses and nutrition and medical recommendations.

The experiences reported by hypertensive patients reveal how, in practice, there is no linearity in the behaviors and how decisions to actions are played in relation to learning and knowledge sediment from previous experiences, habits, emotions and needs. The affective action is marked by the custom, that is, the conducts guided by emotional reasons or by the habit are of extreme importance in the behaviors of the hypertensive ones. These types of actions are often called irrational, but instead are based on a practical knowledge of conducting everyday activities and applying differentiated criteria of relevance. Consequently, if from the clinical point of view certain actions or behaviors of hypertensive patients seem to lack rationality, from the point of view of people such behaviors, considering the different priorities at play, but also the different capacities of choices, habits and experiences, still which are marked by ambiguities and anxieties, are a space of power and coherence.

RC50-833.1XIAO, HONGGEN* (*The Hong Kong Polytechnic University*)*"Think Tank" As a Knowledge-Based Strategy for Public Policy and Development: A Preliminary Case Study of the China Tourism Academy*

This research deals with "think tank" as a knowledge-based strategy through a case study of China Tourism Academy (CTA) as a knowledge agency in fostering evidence-based practice in tourism public policy and development in China. The objectives are three-fold: 1) To describe and analyze "think tank" as a knowledge agency in fostering evidence-based practice in tourism policy and development, 2) To identify and critique on the role of "think tank" in facilitating organizational learning in hospitality and tourism, and 3) To contribute to knowledge on the use of research for tourism policy from an applied scientific community perspective. Through documentary analyses and in-depth interviews, the study addresses six research questions: 1) What is the position of CTA as a knowledge agency in the overall scientific community of China tourism research and development practice? 2) What is the role of CTA in facilitating knowledge-based strategies for national tourism policy and development? 3) What distinguishes CTA from traditional academic and higher educational institutions such as a university? 4) What constitutes the mandate of CTA research? 5) How is a research project funded, implemented, and disseminated in the CTA system? 6) What challenges does CTA face as a unique knowledge agency in the scientific community of tourism research and practice. The research is contextualized within praxis or theory-practice relationships. Notions such as knowledge management, utilization of research for public policy, organizational learning/learning organizations, as well as communities of learning and practice serve as sensitizing concepts to inform the analysis and discussion. The study is hoped to contribute to knowledge on theory and practice in tourism development and public policies, and will be of theoretical and practical implications to the understanding of "think tank" as a knowledge agency in the nurturing of a community of learning and practice.

Recently, the phenomenon of adolescents' self-injurious behaviors has aroused the concern of society and academia. It is mainly subject to psychology, medicine and other disciplines, but few public management disciplines from the perspective of population sociology and public health management. The following conclusions are obtained: Firstly, the incidence of self-injurious behaviors among the subjects was 25.8%, which was at a moderate level comparing with the incidence of self-injurious behaviors among ordinary adolescents. Secondly, there is no significant difference in the overall score of life events between different sex and school students. Thirdly, the overall social support for girls has a number of family support, other support were significantly better than boys. Fourthly, the overall life events have a significant positive impact on the self-injurious behaviors of male and female students, and the overall social support status has a significant negative impact on the self-injurious behaviors of both gender.

RC06-140.9XING, WEI* (*University of Winnipeg*)BARTOLOME, AYANA MAE (*University of Winnipeg*)*Keeping Family Compact: Filipino Immigrants' Experience*

Migration is usually a family strategy for the survival and better wellbeing of its members; yet, the process of migration and integration often generates unique and challenging environments and conditions that make it hard to keep family system compact. Following the family system theory, this empirical study examines the dynamics of immigrant family system. Qualitative data are collected from the Pilipino community in Winnipeg, Canada. Mainly, we have found that despite the nuclear family definition and practice in Canada, Pilipino immigrants follow their original norms and rules of extended family and kinship. They adopt innovative strategies, such as "fictive kin", to preserve and strengthen their family system and its functions, keep ordinary exchanges of material and emotional resources among its members in the context of family transnational migration and cross-cultural integration.

At the Intersection of Urban- and Care-Policy : On the Invisibility of Eldercare Workers in the Global City

The global population is both urbanizing and ageing. This means that urbanization is a set of processes and logics coeval with demographic change and relations of social reproduction. Nevertheless, while feminist urban scholars have drawn much-needed attention to reproduction/care, care scholars have often neglected the urban in research on the spatial contexts of these problems. At the same time, a productivist bias in urban policies, reconstructed in the rhetoric of the global city/creative cities, makes workers invisible and denies care needs. This issue is exacerbated by normative approaches, for example grounded in gendered ideologies of home, care and familial responsibility, that too often detach the delicate social problem of eldercare from the feasibility and desirability of eldercare as a site for paid labour. Such norms and ideologies may share common features but are also historical and geographical. Analyses of eldercare policy contexts and mobilities often unproblematically read off Eurocentric scripts that assume particular histories of state provision and decommodification at the nexus of the state, the market and the family. And yet, not only does place matter in understanding the intersection of urban and care policies – and their implications for care workers and care recipients – but the differences *between* places matter. In this sense, policy discourses about urban change and demographic change share some important blind spots. Making paid eldercare workers visible through comparative research on urban contexts thus contributes to wider policy-relevant research themes: precarious employment, urban neoliberalization and precarity (notably in relation to housing and transport), and the social dimensions of urban sustainability. It also contributes to "experiments" in comparative urbanism that are "inspired by efforts to cast comparison as holding the potential to move beyond many of the ethnocentric assumptions currently embedded in urban theory.

Empirical Research on Factors Related to Subjective Well-Being in Chinese Elderly People

This paper used the data from China General Social Survey (CGSS) to examine factors related to Subjective Well-Being (SWB) in Chinese elderly people. We constructed a conceptual model adapted from Anderson's health behavioral model and probed the associations between SWB and predisposing, enabling, need and health behavior factors. We discovered that higher SWB is more likely to be found in elderly people who have spouses accompanied, maintain good quality of relationship with family relatives and friends, have stronger need for recreational activities, have better health status, exercise more, perceive an increase in their current socio-economic status compared to previous situation,

and remain optimistic about their future socio-economic status. Results also suggested that enabling factors (socio-economic status and quality of social connections) can impose more influence on elderly people's SWB. Thus, policies that maintain or boost the perception of upward socio-economic mobility and that enhance harmony between older people and their relatives and friends should be given special consideration in future.

How Does Social Development Influence Life Expectancy ? a Geographical Weighted Regression Analysis in China

The social determination of health is a hot topic. Based on the data from *China Statistical Yearbook 2001 & 2011*, this study uses the Geographical Weighted Regression method to examine how social development status influences life expectancy from a spatial perspective. China's 31 provinces are treated as our analysis units and 4 social development dimensions are exacted by exploratory factor analysis.

Results show that economic and healthcare, education and living level, social harmony and eco-environment development can significantly improve life expectancy. Specifically, the enhancing effect of economic and healthcare development generally declines from the east to the west; the enhancing effect of education and living level development generally declines from the southwest area to the northeast area; the geographical distributions of effects of social harmony and eco-environment development on life expectancy are similar, which are larger in western China and smaller in eastern China. Furthermore, according to the comparison between 2000 and 2010, the spatial variations of impacts of different social development dimensions on life expectancy also vary in distinct social stages, and the enhancing effects of the latter two dimensions, i.e. social harmony and eco-environment development, are emerging and becoming stronger gradually. Since the effects of various social development dimensions on life expectancy vary with time and space, it's a necessity to improve specific aspect of social development in specific area and social stage in order to improve life expectancy and population health efficiently.

Understanding the Development of Faith-Based Social Work Organisations in China

The Chinese government has opened the door for faith-based organisations (FBOs) to provide public services since 2005. Yet the field of faith-based social work services remains understudied. This article begins with a literature review of the institutional environment for FBOs and addresses three questions: what types of faith-based social work organisations (FBSWOs) have emerged in China? How can FBSWOs survive and develop? What does the rise of these FBSWOs mean to the development of social work as a profession in China?

By analyzing longitudinal data collected from 2006 to 2014, this article identifies three models of faith-based social work organisations that have emerged and developed in China: 1) traditional faith-based organisations that have recently hired social workers to deliver social services; 2) grassroots social service organizations supported by a certain religious body or bodies; and 3) grassroots social service organisations operated by religious social workers without strong connections to religious bodies. Implications for the development of professional social work in China are also discussed.

Is Religion Act As a Booster of Population Growth in India? a Socio-Economic Evaluation in Present Scenario.

Understanding the nature and scope of the influence of religion on reproductive behavior and outcome has been a major challenge in the demographic literature from the very beginning. But today the religious affiliation as a determinant of demographic behavior is receiving renewed attention in demography.

This discussion paper mainly investigate whether in the present scenario in India religion act as a Booster of population growth or other determinants of socioeconomic development influence the fertility rate and reproductive behavior. Different Governmental data and research evidences indicates that fertility rate today in India are more catalyzed by education and other socioeconomic developmental factors than religious factors.

The evidences shows that States with high per capita income, better health facilities, high female literacy rate and women empowerment have lower the fertility rate in India. So, in the present scenario these socioeconomic factors are more effective determinants influencing the reproductive behavior than religious factors.

The proportion of Muslims grown from 13.4% to 14.2% in a decade, while proportion of Hindu had reduced to 79.8% from 80.5%. This implicitly suggest that Muslims have more children than other religious communities but the data shows that population growth rate and Total Fertility rate vary widely between different States of India. The TFR seems more closely related to per capita income, health care and prosperity state.

So, this research paper based on secondary sources probes the micro-data from NATIONAL FAMILY AND HEALTH SURVEYS in India to multi variant analysis to assess the contribution of socioeconomic factors to the fertility differential by religion. It explores the possible reasons for the large residual effects of religion on fertility and causes for the religious disparities in socioeconomic conditions. Finally, it conclude with the assessment of the implication of the current demographic trends for the future sizes of the different religious groups in India.

A Forensic Neuroscience Approach for the Prevention of Crime

Human behavior is unpredictable and therefore in some situations, it is not easily acceptable by the society. The reason behind this incident is not clearly understood but the assessment of clinical findings including the role of neurotransmitters, hormones and molecular signaling could be a useful tool to solve the mystery of it. Behavioral genetics and cognitive neuroscience have allowed the scientific investigation of biological basis of a number of cognitive processes which are relevant to deviant behavior. Aggressive, impulsive or deviant behavior by a person is mostly depends on their mental conditions, hormonal imbalance and neurotransmitters alterations. These alterations have also been found to be linked with the exposure of environmental risk factors including injury, toxicants exposure, stress conditions, etc. In the present study, an attempt has been made to assess the behavioral abnormalities through questionnaire and link the changes with alterations in neurotransmitters and hormonal levels in the toxicant (pesticide) exposed population. Blood samples were taken for the study and analyze for the clinical findings. Alterations in the levels of hematological profile, dopamine and serotonin levels were observed in the pesticide exposed population. In recent years, there has been growing interest in the application of genetic and neuroscientific methods for the criminal mind investigations. Forensic neuroscience is an emerging area and it could be a possible tool for the criminal identification through brain activities.

Gender Gap in STEM Education and Professions in Indian Society

The status of STEM education and related professions are standard indicator of development of the nation. These subjects, has been considered as 'masculine' for a long time and gender gap in STEM education and related profession have been observed in most societies. According to recent census 2011, 82.2% of male and 65.5% of the female population of India are literate, this gender gap is observed at each level of education and it is very vivid in Indian culture in reference to STEM education. Analyses of data relating to progress in education in different fields reveal there exist gender disparity in choices of subjects at school level to career choices at the professional front. Although the eleventh five year plan report says that women comprises about half of the total population in India and due emphasis is given to participation of women, for true inclusive growth rate, yet annual report of MHRD showed lowest representation of girls

in STEM education and women in STEM professionals. In the patriarchal setting of the Indian family, girls have lower status and fewer privileges than boy children. Existing societal stereotype and parents and teacher attitudes are not very positive for encouraging the girl students to choose STEM subjects for their studies. Science textbooks and science teachers, like others, are not free from gender biases. At school stage girls are not much encourage to study mathematics and science either by parents or the schools, consequently gender gap is appear in professional area related to STEM. Teaching, medicine & nursing is considered to be conventional professional zone for women. The present paper focused on gender gap exist in STEM education associated professions and also discuss the steps taken to overcome this disparity.

New Forms of Collaborations and Work : The Case of a Collaborative Platform in It

The 4th industrial revolution, as it is called, invites firms to transform their mode of production and search for more innovative and creative modes of production. This transformation has important impacts on work, through digitalization. There appears to be more collaboration between various actors, but also appears a new statute for the worker 2.0, who often becomes an intermittent, project worker, found in various open innovation networks (P2P). Amongst important changes, we note the development of collaborative and participative platforms, the rise of online collaboration and inter-network collaborations, as well as the development of sharing and open innovation dynamics (crowd sourcing, crowd funding, maker space, Fab Lab, Innovation Laboratory Open, etc.). In order to understand how innovation is nurtured in this context, we conducted a study of an open-value network which develops various forms of innovative products and services. The network is organized around a platform on the internet where individual workers, motivated by the values of the peer to peer (P2P) or collaborative economy are involved in creating together innovations on distributed projects. In the context of the collaborative economy, this network is the place where new forms of cooperation and collaborative management appear, based on the model of P2P. Our paper will present this case study, and show how the individual workers are brought to collaborate, on the basis of a partnership of shared values system.

Exploring Narratives of Women Survivors of Abuse in the Context of Turkey: A Challenging Transition from Submission to Empowerment

This study aims to reveal women's experiences of disengagement from intimate partner violence with a particular focus of how prevalent cultural discourses on marriage in the context of Turkey obstructs their process of leaving as well as their post-separation experiences. Conservative narratives on family life in Turkey seem to normalize and justify male violence in marriages by prioritizing male dominance, which in turn making women's decision to leave and their lives afterward very complicated and challenging. In this respect, the main purpose of this research is exploring women's narratives in terms of how and in what ways patriarchal power structure of the family culture affects women's process of disengagement.

Participants included sixteen women who were exposed to violence at least for 1 year and have been separated from their abusive partners for at least two months. Two in-depth interviews with each participants were conducted. The analysis of interviews followed the principles of Grounded Theory.

The themes and contents emerged from women's narratives showed that male dominated family ideology results in feelings of ambivalence and contradictions in their separation process. The focal discourse regarding these feelings is their experience of difficulties to position themselves outside the family life and to reconstruct their identities as resistant and autonomous individuals. This transition from being submissive to getting empowered was defined as a tough one dominated by the feelings of shame and guilt because it contradicts with the internalized gender roles and the belief system of their families. Divorce was considered as a shameful act against the family honor; they were advised to be patient and to accept the marriage as it is. This becomes a very strong internal barrier for women to take the decision to leave and creates psychological and social challenges upon their efforts to build a life by themselves.

Teaching Sociology through Community-Engaged Research on a Veteran's Transitional Housing Program

In collaboration with the director of a veteran transitional housing program, I have created the "Qualitative Research" course, which is based on community-engaged research. In the course, undergraduate students are expected to learn how to design and conduct qualitative research. In this course, students are expected to engage in class lectures, read assigned readings, gather and analyze data, write up your work, and present results and findings to the program.

This community-engaged research is designed as an evaluation project and aims to investigate the impact of the veteran's transitional housing. More specifically, it is intended to find how effectively the program serves to connect homeless veterans, staff, and volunteers and identify areas to improve the delivery of services by the program. As the preliminary project, students conduct participant observations to understand staff members' experiences related to the program.

Through this community-engaged research, both community members and students benefit during the research process, gaining mutual trust and creating positive relationships. The program director and staff become our research partners and offer a research site where students could practice their sociological knowledge and skills. Students also foster their understanding of the local community. Meanwhile, the transitional housing program enhances its ability to ensure the community priorities and address its own issues and needs, while gaining a better understanding of the research process and planning how they may approach evaluation research in the future.

This community-engaged research attempts to develop our knowledge about homeless veterans and find effective ways of helping them integrating them back to the society. The veteran's transitional housing program research will facilitate our understanding of veterans' cultures. I hope this will contribute to the development of education for military and veteran students on college campuses.

Transnational Corporations and the Rare Earth Industry: A Case of Anti-Lynas Movement in Semiperipheral Malaysia

Malaysia has been rapidly industrialized since the 1970s and it has already risen up from the periphery to the semiperiphery in the world-system. Nevertheless, semiperipheral Malaysia still holds *peripherality* in its environmental problems. An Australian transnational corporation (TNC) named Lynas, operating in the rare earth industry, has carried out rare earth refining in Gebeng, Malaysia since 2011. However, the soil containing plenty of rare earth metals, for example Thorium, is brought in from Australia because the Australian government prohibited Lynas from rare earth refining in its own country. Rare earth refining entails radioactive wastes such as Uranium and they are likely to cause health damage to people around the factory. As a result, anti-Lynas movement has been organized particularly since the Fukushima nuclear power plant accident. This paper addresses the case of anti-Lynas movement in Malaysia. It is predicated on fieldwork on various social movements in Malaysia from 2013 through 2018. Firstly, this paper reviews the background and process of anti-Lynas movement. Secondly, this paper analyses the nature of rare earth industry and clarifies that it is characteristic of global keen competition. Consequently the operation of TNC has tendency to escape the regulation of core region in the world-system and to relocate dirty operations to peripheral and semiperipheral regions. A case of Lynas can be one of such examples. In fact, Lynas largely depends on financial aid by a Japanese energy organization (JOGMEC) and it supplies most of its products with a Japanese corporation (*Sojitz*). Lastly, this paper asserts that this industry, in which enough profit has not been necessarily gained recently, cannot persist without non-regulation in peripheral and semiperipheral regions. Such non-regulation can mean dependency to TNCs and *peripherality* in the country, and one of environmental problems can still be caused by the operation of global capital.

Asian Challenges to the Universal Coverage; The (Im) Possible Dream?

"Universal coverage" for health is an exigent issue as a key factor for the achievement of SDGs. The diverse and abundant experiences on "universal coverage" in Asia are informative.

Japanese government intends to attain the "universal" personal coverage with social health insurance schemes and the public assistance scheme. There are three social insurance schemes; one for the employees and their family, one for the residents and the non-workers, i.e., the self-employed, the unemployed, the workers of the informal sectors, farmers, housewives, etc., one for the elderly over the age of 70. The poor are covered with the public assistance scheme without any charges. There are no barriers to join the schemes and no structural mechanisms for the exclusion. The contents of the care are the same through all schemes.

The social insurance has the limitation concerning the coverage of the person and care to accomplish the universality. "Contribution principle" of social insurance excludes the low income peoples who cannot pay. Moreover Japanese ap-

proach that plural social insurance schemes and the public assistance cover the entire population will be valid just in a stable society where the social relations and life style are stable and fixed.

The increasing flexibility and informalization of work and life, and the globalization, cause some doubts about the effectiveness on social insurance schemes. Ultimately Japanese system have suffered from a chronic deficit and personal "uncoverage"

In Indonesia, all residents must belong to one unified social insurance scheme. For the poor and informal workers the duty to contribute will be exempted. This apparatus shall be attractive in the point of "solidarity" of all nationals and holistic approach to social protection. Considering its huge population, geographical condition, economic development and industrial structure, the success of Indonesia will be a "model" of the "universal coverage".

YAMADA, TOMIAKI* (*Matsuyama University*)

Language of Victims in the HIV Tainted Blood Product Incident in Japan in Early 1980s

In order to address the language of victims of contemporary social sufferings, we cannot avoid locating the problems concerning the appropriate ways of representing the victims; as Arthur Kleinmann et.al.(1997, *Social Suffering*, University of California Press) warned us of the media appropriation of the victims laden with the tragic stories such that the disembodied and decontextualized typical terrible images of the victims could be distributed worldwide and consumed as commercialized commodities through the TV and Newspaper separated from the original contexts. This media appropriation brought about the over-simplified understanding of the HIV tainted blood product incident in Japan which divided the actors involved in this incident into the good and the evil. The pharmaceutical companies which imported the HIV tainted products from the U.S., the state which gave permission to the products' distribution in public market and the doctors were severely accused as if acting in collusion. In contrast, the hemophilia patients were represented as innocent victims. This good and evil picture could lead to the acquisition of the empathetic public support which could be one of the reasons why the joint plaintiff of hemophilia patients could succeed in getting the court-mediated settlement in favor of them. Looking back to the warnings of A. Kleinmann, we have to leave the simplified version of the incident behind and situate the language of victims back in the original historical and social contexts. The result was that we could attain the context dependent and relational knowledge; we could follow the life-story narratives of each victim, as some proverb says, thousand lives, thousand stories.

Policy Preference Affected By Perceived Fact on Externality: Why Do People with Higher Socio-Economic Status Sometimes Prefer Stronger Income Equalization Policy?

Literature has shown that ordinary people's preferences on public policy differ by socio-economic status. Thus the conflicts over public policy sometimes seem too hard to settle. This paper is to develop techniques to show information to ease such conflicts and to enhance more satisfying and democratically legitimate agreement. Specifically, this paper focuses on income equalization (redistribution) policy and shows the followings. First, we show a new set of questionnaire items where respondents answer the desirable amounts of tax and benefit for each household, and also the unemployment benefit, in a fictional society. The responses indicate the concrete level of desired policy, unlike the "yes/no" response to some slogan in a natural language. The items also measure the perceived external effect of the policy on economic growth. The items were included in JHPS survey conducted in Japan in 2011 and 2012. Second, analyzing the obtained data, we find no evidence that those with higher income or higher education prefer weaker equalization policy; on the contrary, interestingly we find that the better-educated tend to prefer stronger equalization policy. Third, we develop a theoretical model to explain individual's policy preference, and based on the model we statistically estimate separately (i) the effects of socio-economic statuses on normative evaluation criteria (i.e. optimal equality in the eyes of each respondent), and (ii) those on perceived fact on externality (i.e. the effect on economic growth here) of equalization policy. The results imply that the better-educated prefer stronger equalization policy, not only because of their normative evaluation criteria, but also because they perceive such a policy would enhance economic growth. Our results suggest that the conflicts over equalization policy could be more reconcilable, when preference is measured in concrete levels, and also when people share a common perception about the fact on a policy's externality.

RC43-728.2YAMAMOTO, RINA* (*The University of Tokyo*)*Myth of Homeownership in Japan*

It is commonly believed in Japan that the "my home" myth (the phrase "my home" refers to owning a home of one's own and/or pursuing a family-oriented way of life) is widely accepted among the many Japanese who prefer living in the suburbs. However, this perception is now less accurate than it was half a century ago. As a result of the recent tendency for the Japanese to live in dense city centers rather than in the spread-out suburbs, more and more high-rise condominiums have been constructed for the Japanese middle class. Despite the general fall in the population nationwide, population growth in urban areas has been accelerating since the 1990s. To determine whether the "my home" myth still remains influential in the Japanese society, this study examines how homeowners have been transformed in contemporary Japan. Using an empirical survey of high-rise condominiums, it investigates changes in the residents' image. During the 1960s and 1970s, the most common image of residents was that of a nuclear family, with a full-time housewife and a white-collar husband, together with their two or three children, living in a nice suburb. However, this image gradually changed over the course of the 1990s and onwards. The resulting new image is not related to any particular person or a small group, like a family, instead it is an image of an anonymized body which is sensitive to various components of housing and the texture of materials. These findings suggest that it is difficult to sustain the "my home" myth in contemporary Japanese society, given the general transformation of the Japanese middle class. The results of this study provide new insights that can help understand the issues related to housing, such as gentrification, urban density, and dwelling disparities.

RC15-288.17YAMANAKA, HIROSHI* (*Osaka University*)*Medicalizing or Demedicalizing? : Evaluating the Impact of Diagnosis and Undiagnosis on Individual Patients' Lives.*

Since 2014 we have been interviewing 54 patients with rare diseases and rare conditions. This presentation will focus on the long term impact of obtaining diagnosis in individual patients. We will select 7 cases that include over 20 years undiagnosed periods, of which 5 patients obtained their final diagnosis and 2 remained undiagnosed. Analyzing the difference between pre- and post-diagnosis periods in each patient and also between the situations of diagnosed and undiagnosed patients could reveal the impact of diagnosis and undiagnosis on each patient's life. While the medicalization of each disease is well studied on social level, its impacts on individual patients are not sufficiently studied. We will show that the medicalization on each patient's level includes several dimensions and involves such complex issues like liminality, stigma and dilemma of difference.

Medical diagnosis presupposes medicalization of the condition on a social level. However, obtaining diagnosis does not always mean medicalizing the condition and obtaining no diagnosis does not always mean demedicalization of the condition. There are several different levels and dimensions of medicalization & demedicalization and their relationships with diagnosis and undiagnosis. Using the concepts of sickness (social dimension), illness (individual dimension) and disease (medical dimension), I like to analyze the complex situation of individuals experiencing serious ill conditions during their lives. Main focus will be on the impact of medical diagnosis and undiagnosis in sickness and illness dimensions of the conditions in the case of rare diseases on which not only general public but also general health care providers have little information and images. The analysis will also shed some light on such complex issues like liminality, stigma and dilemma of difference and their relationships with medicalization, as most of our interviewees experienced these situations during their different life stages regardless of whether they obtained diagnosis or not.

RC24-455.4YAMASHITA, HIROMI* (*Ritsumeikan Asia Pacific University*)*Environmental Risks of Living By the Sea, Memories of Coasts and Sea Walls*

This paper examines how the risk perception study of Slovic (1987) could be expanded to recent environmental discussions of risks facing communities rather than individuals. The original study has dealt with individual perceptions towards various risks, especially focusing on "dread" and "certainty" elements. However, it is clear that the difficulties of environmental risk negotiations as a group exist, and how "acute" a risk is (such as tsunamis rather than sea level rise), how communities dealt with the particular risk in the past, and memories and relationship between villagers and their coastal environment influence discussions.

To investigate this further, examples of discussions around sea wall constructions will be introduced (coastal defense structures for reducing the damages of tsunamis). Sea wall structures have played a role to protect severe weathers along coastal areas of Japan since 1950s. At the same time, they have been discussed as burdensome legacies of concrete structures in coastal villages. The construction

of further and taller sea walls has suddenly become one of the important agenda, just after the Eastern Japan earthquake devastated coastal villages in March 2011. Currently not only the eastern part, but numerous western and southern part of Japanese prefectures have plans to build sea walls surrounding their coastal lines.

Analysis of the community discussions and how people seem to be balancing between "uncertain", "dread", "acute" and group and individual risks, as well as existence of future concrete structures in the area will be drawn from existing secondary data and manuscripts of the meetings completed in the Northern part of Japan, as well as on-going public meetings in western parts of Japan for future sea wall constructions.

RC11-225.2YAMATO, REIKO* (*Faculty of Sociology, Kansai University*)*Changing Roles of the Wife and the Husband in Care-Giving to Their Older Parents in Japan*

[Background] In Japan, being influenced by Confucian norms, patrilineal care-giving (namely, the married couple lives with the husband's parents and the wife and husband provide care for the husband's parents) have been thought to be morally desirable and in fact widely observed. Recently, however, such a traditional type of care-giving may be transforming with the backdrop of urbanization, an increase of the nuclear family, gender equalization, and low birth rates which leads to an only child prevailing. [Question and hypotheses] How is care-giving by children transforming in present Japan? There are three hypotheses. First, a "patrilineal norm" hypothesis argues that the patrilineal care-giving is maintained where both the wife and husband as a couple provide more care to the *husband's* parents than to the wife's parents because the norm survives despite social changes. Second, a hypothesis of "bilateral intergenerational relationships" argues that the bilateral relationship will prevail where both the wife and husband provide almost the same amount of care to the *wife's* parents as to the *husband's* parents. These two hypotheses presuppose that the wife and husband are a unified unit and behave in the same way. In contrast, the third hypothesis of the "individualization of the wife and the husband" argues that the *wife* gives more care to *her own* parents and the *husband* give more care to *his own* parents. [Data and results] Analyses of data obtained from the National Family Research Japan 2008 reveals that the hypothesis of the "individualization of the wife and the husband" is empirically supported. This result suggests that in contemporary Japan, care-giving is not a couple's but an individualized task and that not only women but also men themselves are expected to provide physical care to their own parents even if the men have a wife. Policy implications will be discussed.

RC06-144.5YAMATO, REIKO* (*Faculty of Sociology, Kansai University*)*Do the Wife and the Husband Behave As a Unit or As Separate Individuals in Caregiving to Their Older Parents in East Asia?*

[Background] This study focuses on the wife and the husband as smaller units in the family. East Asian societies such as Japan, South Korea, Taiwan, and China have a tradition of the extended family which emphasizes the relationship between different generations. Influenced by this tradition, previous studies in East Asia have analyzed the wife and husband as a couple and as one unified unit in intergenerational relationships. Recently, however, because the individualization of the wife and the husband is proceeding, it is possible to hypothesize that the wife and the husband behave not as a unit but as separate individuals and that the wife's intergenerational relationships differ from those for the husband. [Question and hypotheses] Do the wife and the husband behave as *a unit* or as *separate individuals* in caregiving to their parents? The first hypothesis is a "patrilineal couple" hypothesis which argues that the wife and husband behave as one unit and, under the patrilineal tradition, provide more care to the husband's parents than to the wife's parents. The second hypothesis is the "individualization of the wife and the husband" which argues that the wife gives more care to *her own* parents while the husband give more care to *his own* parents. [Data and results] Data obtained from the East Asian Social Survey 2006 are analyzed. The analyses reveals that for Japan, the "individualization of the wife and the husband" hypothesis is empirically supported. This result suggests that in contemporary Japan, care-giving is not a couple's but an individualized task and that men are also expected to provide physical care to their own parents. Analyses for other East Asian societies will be presented. On the basis of those results, differences between the societies, reasons of those differences and policy implications will be discussed.

RC48-805.15YANAGIHARA, YOSHIE* (*Tokyo Denki University*)*Japanese Feminists' Struggle over Surrogacy Issues with Distortions of "Women's Autonomy"*

Recently, surrogacy practice has more clearly revealed as a new form of violence that makes use of gender and bodily attribution of woman. Although, at the beginning, few people noticed its discriminative aspects, the emergence of single male and gay couple's surrogacy cases bring this to light.

This research focuses on the discourse of Japanese women's movements pro- and anti- surrogacy practices. I analyzed cultural representation about surrogacy using a sorting system in the Oya-Soichi Library, which specializes in Japanese magazines. I searched with the Japanese keywords "dairisyussan" (surrogacy), "dairibo" (surrogate mother), "jikoketteiken" (autonomy or the right to personal autonomy in Japanese), and its related words from the first entry of the database in 1981 through to 2017. Additionally, I referred to books and treatises written by the main characters who played important roles in the surrogacy discussion.

The result shows the struggles of Japanese feminists who opposed surrogacy, and Japanese conundrum to legislate regulation of surrogacy. While they advocated surrogacy as a gender discriminative issue, the supporters of surrogacy also used feminism's framework. The supporters used "women's reproductive and sexual autonomy" to appeal "rights to have children." They applied this term because Japanese meaning of "women's autonomy" was modified as "liberty to subvert morality." This distortion derived from a discussion lead by Japanese sociologists to promote prostitution of high school girls. Due to this, "women's autonomy" had a negative connotation in Japanese society. On the other hand, when the supporters widen the market of cross-border surrogacy for gay people, feminists and some sexual minority people were fiercely against it.

Currently, even though legislation against surrogacy seems to be stagnated, Japanese feminists and some sexual minority groups play important roles to prevent legalization of surrogacy with regard to gender equality and women's human rights.

Competition of Discourses in the Change of Childcare Policy in Taiwan

Social welfare policies represent different kinds of ideology and decide how care services are provided by the state, market and/or the family. In Taiwan's complex social context of high commodification of childcare, women's low labour participation, and an on-going birth rate crisis, this article examines Taiwan's feminist social welfare movement and analyses competition of discourses in the change of childcare policies in Taiwan.

This research focuses on the Childcare Policy Alliance since its establishment in 2005, including three women's organisations and trade unions of child carers. With the research methods of discourse analysis of documents and publications of these four groups and child care policies and interviews of key members in these groups, this article aims to examine how the Childcare Policy Alliance transform the public provision of child care in Nordic model in order to construct discourse of 'public governance' of child care and how these women employ strategies to promote their discourse and compete with different discourses of child care, including familism highlighting 'mothers as best carers' and neo-liberalist and capitalist ideology of 'limiting the state's intervention of the market' and 'competition at an young age'.

Following transnational feminists' agenda, I pay attention to local complexities of feminist struggles over boundary of public/private and production/reproduction. By examination of discourses competition in childcare policy change, this research results can have further dialogues with feminist social welfare research and social welfare movement studies.

New Trade Union Activists in Shaping Childcare Policies in Taiwan

In Taiwan's historical and political context of more than 35 years of martial law (1949-1987) under a dictatorial government, trade unions were suppressed and controlled and it is until the recent change of Trade Unions Law in 2011 that the Industrial Unions are allowed to be established. Accordingly, Alliance of Educare Trade Unions (alliance of local trade unions for child carers and preschool teachers) was one of the new Industrial Unions and they participate actively in the change of childcare policies in Taiwan.

There have been several essential changes in childcare policies during the two decades in Taiwan and Early Childhood Education and Care Act in 2012 makes childcare of children between 3 and 6 years old under the Ministry of Education and this new act also changes regulations regarding to the qualifications and working conditions of preschool teachers and child carers.

This research focuses on the Alliance of Educare Trade Unions, especially on those active members who are new faces in social movements. With the focus of personal experiences in social welfare movement, this article intends to examine how these new activists are mobilized into trade unions, how they shape their strategies in discourses and their social actions and how they balance between their different roles in daily life. Since there are few research on Taiwan's women's

trade unions and newly established Industrial Unions, this research aims to fill the gap in the research and have further dialogue with feminist theories on women in civil society, labour movement and social welfare movement.

The Study of New Zealand's Teaching and Learning Based on Talis 2013

This study mainly focuses on the "school leadership" and "school climate" of the TALIS 2013 principal questionnaire which New Zealand participate in, expect that the result of the study could be used for national education.

The goals of this study are as follows: (1) To understand principals' use of time. (2) To know how principals' practice their school leadership. (3) To see principals' leadership style and school climate. (4) Summarize the above analysis and provide recommendations for school leadership.

The conclusions of the study are: (1) The school climate is good, and the principal focus on school affairs planning, improve teaching quality, rarely spend time on communicating with parents and the community. (2) The principal focus on student learning and teacher teaching, less help to deal with school administrative details and understanding of classroom teaching. (3) The factors that limit the effectiveness of the principal's leadership are policy and finance, the workload and the responsibility. (4) Good school climate is the key to reducing the students and teachers' problems.

The Geopolitics of Employment Choices – a Case Study of Young People from Borderland Kinmen, Taiwan.

This research study focuses on the geopolitics of employment choices among youth in Kinmen, Taiwan. Kinmen County is located in the southwest of the main island of Taiwan and only six kilometers to the east of Xiamen, China. Due to its close proximity to China, it was placed under War Zone Administration (WZA) during the Cold War and experienced a state of siege of forty-three years. Being geographically far away from the main island of Taiwan, Kinmen was isolated with the preservation of a patriarchal clan culture. After the Cold War ended in 1992 with China-Taiwan cross-strait relations gradually eased, Kinmen has quickly transformed from being a war frontier to become a frontline borderland for business and politics between Taiwan and China. Tourism industry-related businesses began to emerge on the small island. The government of Kinmen was also quick to act by allocating financial resources and physical spaces to accommodate rising tourism needs. Duty free shops are built to attract mainland Chinese tourists. War-themed tours from visiting barracks and tunnels to tasting sorghum (kaoliang), a strong distilled liquor unique to the island of Kinmen, are organized on a daily basis. How do rapid social transformation and the neoliberalisation of Kinmen affect the everyday life and material conditions of young people? How do intersecting factors of gender and social class influence employment opportunities? How does ongoing China-Taiwan cross-strait tensions and geopolitics affect the physical and social mobility of young people in Kinmen? How is social inequality produced and reproduced for young people growing up on a marginalized Taiwanese territory? Based on 40 in-depth interviews and participant observation, this ethnographic research examines how young people growing up in borderland Kinmen negotiate, strategize and make decisions on work and employment against a background of globalizing neoliberalism and the rise of China.

YANG, PHILIP* (*Texas Woman's University*)

Generational Differences in Educational Attainment across Asian American Groups

Existing research has uncovered a parabolic trajectory across multiple generations in educational attainment among Asian Americans as a whole, but little is known about whether and to what extent this trajectory is applicable to different Asian American groups because of a lack of multi-generation data by ethnicity. This study analyzes generational differences in educational attainment across the six largest Asian American groups, using the newly released pooled 2013-2015 Current Population Survey data. The bivariate analyses detect a reverse U-shaped pattern in educational attainment among Chinese, Filipinos, Koreans, and Asian Indians; a U-shaped pattern among Japanese; and a non-parabolic pattern among Vietnamese. Results of multiple regression analyses reveal diverse patterns in educational attainment net of other predictors: a highly significant reverse U-shaped trajectory for Chinese, a significant U-shaped pattern for Japanese, a significant upward straight-line pattern for Vietnamese, a significant downward straight-line pattern for Asian Indians, and insignificant cross-generation differences for Filipinos and Koreans. Separate analyses by

gender show even more mixed and interesting patterns across Asian American groups. These findings point to the needs to avoid overgeneralization and to attend to ethnic differences in cross-generation educational attainment among Asian Americans.

Gender Double Standard on Infidelity in China: Testimony from a Chinese Post-90s' Social Network

Changing gender dynamics in post-reform China has drawn increasing attention. In field of private family, much research has investigated gender relationships. Yet, there is a lack of studies on attitudes towards sexuality, especially from the perspective of gender double standard. This research examines whether and to what extent the gender double standard on infidelity exists and how it varies by gender.

I conducted a cell-phone based survey to ask people's attitude towards recent widely discussed extramarital infidelity behavior committed by two celebrities in China, one female and the other male. Data are collected from my 338 Wechat (the most popular cell phone social media in China) friends. My findings show that more than three fourth of participants are harsher towards the female celebrity who had the affair. Further, regression models suggest that men are more likely to hold a gender double standard on infidelity, as they are more permissive towards male than female when it goes to cheating. In contrast, women are harsher towards infidelity, no matter committed by male or female.

YANG, SOON MI* (Rural Development Administration)

Effect of a Family Support and Participative Activity Experience on Interpersonal Relationship Improvement Received By Rural Adolescent : Focusing on Comparison of Multicultural Vs. Non-Multicultural Household, and Bowlby Vs. Sullivan Perspective

This study aimed at identifying the effect of a family support and activity participation experience on the interpersonal relationships improvement perceived by rural multicultural and non-multicultural household adolescent comparing the perspective of Bowlby and Sullivan on it. For this purpose, data of 403 persons from multicultural household and 348 persons from non-multicultural household were analyzed.

As results of the analysis, firstly, the family support variable affected most significantly the interpersonal relationships improvement in both rural multicultural and non-multicultural household adolescent. Also, secondly, the number of the experienced activity at home affected significantly on it in the both adolescent. The significance of effect having age, the number of friend, or the number of the experienced traditional activity variable on it was differ according to each household adolescent.

And to conclude, a significant object affecting with important mechanism of interpersonal relationships in rural adolescent was family and parent. Therefore, it can be insist that results of this study support Bowlby's perspective on it.

Based on the results, this study suggested plans to improve the interpersonal relationships of the rural adolescent through a family support and activity participation. Also a plan for follow-up studies was suggested.

Missing Women in STEM in China: A Micro-Level Explanation from Achievement Motivation and Gender Socialization

STEM (science, technology, engineering, and mathematics) fields have long been dominated by males. Although women are increasingly earning advanced degrees in STEM majors, they remain under-represented in these fields. An empirical study was undertaken to explain a phenomenon of "missing women in STEM in China" from achievement motivation and gender socialization, using the data from the Third National Survey on the Social Status of Chinese Women. Results showed that the phenomenon was due to lower achievement motivation of women than that of men in STEM majors. The lower achievement motivation made lower professional commitment among women in STEM field. The gender differences were gradually shaped by the two stages of gender socialization. There were significantly negative impacts of the lower career expectations from parents and gender stereotypes from culture on women's achievement motivation. The gender stereotypes from schools greatly promoted male students' achievement motivation while having no significant impact on female students' achievement motivation. The traditional gender role attitudes hindered the advance of

women's achievement motivation. Therefore, in order to stop the outflow of women from STEM majors, equal gender atmosphere should be created in families, schools and society. It may decrease the gender discrimination during the gender socialization and promote achievement motivation among women.

How Social Support Affect Co-Ethnic Elderly's Health in Mexico and in the United States

The aging experience is different in the United States as an immigrant and in their home country. One of the difference is the social support. In this research, I use data from Mexican Health & Aging Study 2015, and Health and Retirement Survey 2004 to test how social support difference affect the physical and mental health of older Mexicans and Mexican-Americans. Similar to previous research, I found that elderly Mexicans report less chronic conditions and fewer symptoms of psychological distress than the counterparts in the United States. These differences can be explained by the level of social support from family members and friends, controlling their socio-demographic characteristics.

Occupy and Resist: An Empirical and Theoretical Analysis of Brazilian Student Spring in 2016

In September 2016, the Brazilian federal government announced a provisional measure that established several changes in the organization of the high school system in Brazil. For being decreed without wide discussion within the civil society and supported by neoliberal ideologies, the reform of high school turned into a target of many protests, most of them organized by the secondary students themselves. Inspired by other occupy movements, such as the Chilean Penguins Revolution in 2006 and the school occupations in the state of São Paulo in 2015, the movement, later known as the Secondary Students Spring, started in Paraná state in October and quickly spreaded all over the country, reaching more than 1,200 schools in less than two months. A significant characteristic of the movement was its autonomy. The decisions that triggered the first occupations have been taken in student assemblies and no political parties or organizations were allowed to participate. As a reflex of the great crisis of representation in the country, even the institutional student organizations had no power over the self-organized collectives. Some of the principles adopted within the occupations were direct action, horizontality, functions rotativity, and direct democracy. The use of communication technologies, as a mark of this generation, has also been a strong point. Social networks have been an important mean of communication among the occupations and for publicizing manifestos, and calling for demonstrations. They have been also a weapon against media information manipulation and to promote violent repression of the police in many cases. Leadership absence, however, turned into a weakness in the negotiation with institutional authorities, which are not prepared to work with this kind of organization. Thus, the movement has not reached its main objective, but it shows that new forms of making politics are being constructed by this new generation.

Social Support and Solidarity on Protests Repression in Brazil 2017

In the last year, the government of Brazil has announced a series of reforms that restrict workers rights. This resulted in several protests that, consequently, have been repressed with violence. Here, an experience of repression is reported by a person who had been reached by a rubber bullet in a demonstration, so as the means that were used to manage the emotions and the consequences of it. In one of the greatest demonstrations in the country in the last decades, dozens of thousands of people marched in Brasilia in May 24th against the Social Security Reform, which changes rules for retirement and contributions. Different workers unions, students organizations, political parties and popular movements went to the federal capital to protest, and were repressed by thousands of policemen with tear gas, pepper spray, rubber bullets, stun grenades and even lethal weapons. During the event, the president authorized the army to prevent the approximation of the protesters to the National Congress. The event triggered anxiety crisis and panic syndrome in some people during and after that day. Some of the protesters, most of them young students, threw stones against the policemen and acted with vandalism on the city as a reaction to the repression. A building has been set up on fire. The most prevalent value seen, however, was the solidarity. Each time a person was hurt, many unknown people, from different organizations, helped them to calm down, to find help, and to take health care. In the hospital where several people have been conducted all of them reported the same solidarity and gratefulness. This kind of support to manage this situation was prepared before

the occurrence by people that were already aware of what could happen. This shows that on those cases, social support and solidarity are fundamental to ensure rights.

In Quest of Safeguarding Children's Welfare in and through Sport

Nationwide or global sporting developments can be multifaceted and relatively hyperrealistic/simulative with regard to remaining controversies or inequalities such as changing ways or levels of access to or kaleidoscopic backstories in relation to the well-arranged sporting practices. Accordingly, the value of sporting configurations to contribute to the overall wellbeing or development of a person and society have been questioned by critical researchers exploring the (levels/ways of) unconformities between the developmental promises/missions of sports (configurations) and how they have been performed. This paper, derived from my ethnographic study of "safeguarding children's welfare in sport in Turkey", focuses on the critical results that reflect on such as the meanings of the current achievements, ongoing practices and challenges in and beyond sport fields. Moreover, the complexity of the individual and collective agency and maintaining the developmental processes regarding children's welfare in sport were addressed in the context of dynamic social structures such as transnational socio-cultural-political constraints (e.g. ableism, hegemonic masculinity, imbalances of power or development) and opportunities (e.g. geographical collaborations, inclusive traditions) which have been historically present in related interactions or institutions. In quest of safeguarding children's welfare in and through sport, this paper offers critical account and specific recommendations for Turkish context (with the acknowledgement of the importance of diverse stakeholders' role) to enhance the related body of knowledge and to further stimulate the sound research, policy and practice.

Development of Athletic Identity in Elite Adolescent Athletes

Development of Athletic Identity in Elite Adolescent Athletes
Naveen Yarlagadda
Dr. Vijayanthimala Kodali
Approximately 3/4ths of American children participate in organized sport. The large majority of these children quit by age 13, but those that stay are left with a much stronger athletic identity than their non-athletic counterparts. Many of these athletes stay for various reasons-- the benefits of sport are numerous-- but the most prominent reason athletes continue to compete when their counterparts do not is athletic success. Athletic success has a high correlation with the formation of identity. At elite levels, the athletic identities of adolescents becomes increasingly connected with their respective personal identities, and as such, become more exclusive.

An exclusive athletic identity has many drawbacks. Adolescents who base their identities primarily around athletics run the risk of practicing dangerous behaviours, such as overtraining or using performance enhancing drugs. In comparison to their counterparts, elite athletes spend considerably less time engaging in social behaviors within the framework of general society. Instead, much of their social interaction occurs in elite, exclusive athletic subcultures. This limited exposure to classical society stunts the behavioral development of adolescents. This paper looks to determine the extent to which exclusive athletic identities stunt social growth among adolescents, if it does at all.

Multi-Factor Economic Growth: A Need for an Equitable Development

This paper aims to discuss the new requirements for understanding the economic change in terms of theory and practice. Starting from the new developments in the *understanding the process of economic change* by Douglass North, it tries to explain new approaches to the subject of economy due to the increasing complexity and uncertainty of the world where standard theories are of little help.

Clarifying the new conceptualizations of economic change with an emphasis on social and cultural aspects, the effects of applying these new conceptions on the development processes are discussed.

The importance of usefulness of social sciences theories in confronting human problems, as North underlines, should always be taken into consideration. In

this sense, paying enough attention to individual characteristics of the society, in which the economic change is taking place, finds an imperative priority.

Taking into account justice as the core notion of this study, and by elucidating its different interpretations in the economic sense such as distributive justice, new considerations in applying economic policies with the purpose of having more just societies are conferred.

National Features of the Social Exclusion Regime, or on Possibilities of Applying the Underclass Theory in Russia

The main purpose of the report is to discuss the possibilities of borrowing the underclass theory to explain the reasons for the reproduction of poverty in Russia. We have been conducting research on Russian poverty in the last two decades under the conditions of radical social transformation caused by market reforms and by the transition from real socialism to real capitalism. Longitudinal qualitative research among registered poor was combined with surveys among urban residents in one's Russian region. Our research focus shifted from one point to another. We have posed different research questions. But one was and still is the same about reasons to be excluded from society or to fall into the underclass in Russia. However, the initial idea of applying the underclass theory in the Russian context was faced with a number of difficulties. In the report, we will focus on three points of the research process and how these difficulties were overcome. *The first* is connected with the way the research interest was formed and in what ways the advantages of addressing precisely this theory were seen. *The second* concerns what from this theory did not fit into Russian reality and what had to be done with the "theoretical remainder". *The third* is how the theoretical puzzle has changed, and how it has been possible to keep attention on the key research issue. As a result, we propose to discuss the comparative prospects of borrowing a theory created in a specific national context and the conditions under which such borrowing allows reconstructing an outdated theory.

Identity Politics and Intersectionality: Gender and Ethnicity in Japanese Okinawan Women

The paper aims to describe intersectional self-representation of ethnicities and gender of immigrants in Japan. In intersectionality studies, the relationship of gender and ethnicity have often discussed.

My paper is based on field research conducted in an ethnic town of Japanese old industrial area. In Tsurumi ward, Yokohama city, historically many ethnic minorities including Okinawan and Korean (both immigrants came from Japan empire colony) have moved to work in industrial complex of coastal areas. I intensively collected 1 life histories of old Okinawan immigrants in this town. Although their ethnic community functions as mutual-assistance network in Japanese discrimination, this community is male-centered and women members are marginalized. They face double suppressed: they are discriminated as Okinawan in Japan society and they are discriminated as woman in Okinawan ethnic community. However, they are also trying out practices to overcome their difficulties in their daily lives.

I conducted participant observations to Okinawa Association. Also I conducted in-depth interviews with some woman in order to understand their identities and their everyday lives. From this ethnographical research, my paper describes the aspects of Okinawan women distress between ethnic identity and gender role based on their biographical research. Through their narratives, I show the details complicated relationship of gender and ethnicity in the context of Japanese society. So I analyze their everyday practice to negotiate the challenge of dual distress.

Political Struggles in the Sharing Economy: The Case of Airbnb and Barcelona

The 'sharing economy', and similar terms including 'collaborative consumption', 'gig economy' and 'platform capitalism' signal changes in provisioning around, most notably, transportation, holiday accommodation and temporary work. The practices, impacts, and terminology itself, are sites of significant struggle. This paper reports on research which reflects on the political struggles of the sharing economy to help understanding of the interrelated processes of socio-economic change, contemporary social movements, the politics of consumption and socio-economic 'alternatives', and creative destruction. The case study is the short-term house rental service Airbnb in the city of Barcelona, which has intensified tensions

around tourism and gentrification and led to high-profile antagonisms between the company, the traditional tourism sector, civil society, and government. The paper has three sections. It introduces the sharing economy as a disputed idiom, a contested political economic arena, and an axis of struggles over the future. It outlines research questions and the theoretical questions illustrated by the phenomenon. It finally briefly describes the case study, drawing out questions and implications which further research, and case studies, might consider.

YATES, LUKE* (*University of Manchester*)

Social Movement Politics, Everyday Life and Social Change: Struggles in the 'Sharing Economy'

This presentation has two parts. The first outlines a set of contemporary challenges for social movement studies, an agenda that calls for better understanding of the relationship between everyday life and social change. These include a politics of alternative projects (as opposed to protest organisations), lifestyle and life politics, a politics of social fields, micro-politics or the 'politics of politics', the 'politics of non-collective actors', and the politics of imagined futures. Together, these six themes offer a corrective to dominant instrumental and utilitarian approaches to social movements studies and suggest a set of alternative emphases. I introduce these core areas, signalling some key findings to date and areas where development is needed. The second half explores an empirical case study, introducing the political struggles of the so-called 'sharing economy'. Disputes show how lifestyle, a diffuse emphasis on 'alternatives', fields, micropolitics and futures should figure in a properly sociological analysis of these recent struggles. I focus in particular on the short-term rental service Airbnb in the city of Barcelona and at other initiatives of alternative provisioning of housing and living space, to look at how multiple visions of the organisation of urban space, tourism, and housing intersect in an instance of socio-economic change.

Alienation of Elite Labor? the Case of Turkish Elite Business Professionals

Middle class is once again a hot topic of debate due to the prevalence of middle classes in the recent wave of uprisings all around the world such as the Arab Spring, the Occupy Movements, and the Gezi Park Resistance in Turkey, and due to its role in recent political polarization hand-in-hand with rise of right-wing everywhere. Whether the middle class in the 21st century will be consumerist and fascist or progressive and revolutionary is an agenda setting question, urging scholars to shed more light on the grievances of middle classes. In this paper, I focus on the most prestigious fraction of middle class in contemporary Turkey, the global new middle class, mostly consisting of professionals and managers who are employed by prestigious transnational corporations and who are embedded in the global field of business. Drawing from interviews with the elite Turkish white-collars working in Istanbul and New York City, and from the emerging genre of self-reflexive books written by white-collars themselves with the motto "*de te fabula narratur*," I explore the following questions: What sorts of grievances and discontents do lie beneath the enviable life-styles and jobs of the prestigious white-collars? Why and how even the elite business professionals can be dissatisfied with their works, and eventually, with their lives? Burnout syndromes due to overwork culture, performance pressure and fetishization of success, feelings of inauthenticity and status anxiety, lack of meaning and purpose in their works are among the common elements of grievances of these elite workers. Relying on these findings, I argue for a case of the alienation of elite workers, and I attempt to build a theory of alienation that is grounded in contemporary experiences of prestigious white-collars to move beyond the original Marxian conception that falls short to explain the discontent of middle class.

Nationalization, Internationalization, Regionalization, Transnationalization, and Globalization of Sociology in Japan

This paper tries to analyze important attempts of nationalization, regionalization, transnationalization and globalization of sociology in the history of sociology in Japan.

1. Nationalization: From Meiji restoration (1868) to the establishment of Japan Sociological Society in 1924. Sociologists in Japan tried to nationalize Western sociologies (German, French, English and American). I would like to show the process and characteristics of nationalization of Western sociologies in Japan. I also pay attention to the process and characteristics of institutionalization of sociology in Japan.
2. Internationalization: In this paper, internationalization means that sociologists try to participate in international activities beyond national

border. Many sociologists have been doing this. This paper shows the characteristics of internationalization of sociology in Japan by analyzing the survey of members of Japan Sociological Society on Internationalization of sociology in Japan which was conducted in 2015.

3. Regionalization: Sociologists have been trying to organize academic organizations within nation state and in global regions. This paper presents the current stage of regional sociological association in Japan. This paper also would like to point out new movements of establishing regional sociological organizations in Asia. East Asian Sociological Association is the best example of this movement.
4. Transnationalization: This is the concept which came from U. Beck's transnationalism and cosmopolitanism. This paper shows the best example of this attempts in Japan **comes** from sociologies in Okinawa, Okinawa is a small island and a kind of internal colony in Japan.
5. Globalization: Globalization is to attempt to create global multi-versal sociologies in global space. This paper shows several attempts of build global sociologies in Japan.
6. In conclusion, this paper will point out which concept is the best concept for understanding the present stage of sociology in the world.

RC47-787.1

YAZAWA, SHUJIRO* (*Center of Glocal Studies, Seijo University*)

Reflexivity in Sociological Theories and Social Movement Theories

In this paper, I would like to focus on the concept and problem of reflexivity in sociological theories and social movement theories. Reflexivity is one of the key concepts in contemporary sociological theories and has been an important concept in social Movement studies.

A. Gouldner and ethnomethodology pointed out importance of the issue of reflexivity in late 1960's. Since then, A. Giddens, U. Beck and S. Lash investigated and used the concept of reflexivity extensively in their analysis of reflexive modernization. P. Bourdieu tried to develop his own reflexive sociology. M. Archer is presenting her unique concept of reflexivity based on critical realism.

Reflexivity is also a key concept in social movement theories. Especially social movement theories from A. Touraine to A. Melucci take reflexivity seriously. Feminist theories are no exception.

This paper shows that reflexivity is a key concept in contemporary sociological theories, because it can mediate constructivism with realism by investigating reflexivity in sociological theories. It also shows that reflexivity is a key of bridging between theory and practice, and between outsiders and insiders in social movements.

This paper pays attention to one more important issue based on above investigation. Reflexivity is always trying to make clear epistemological assumptions of sociological theories. By doing so, reflexive sociology, for example Scott Lash's, calls for ontological turn in sociology. Sociology today needs to clarify not only epistemological assumptions but also ontological assumptions.

In conclusion, this paper shows a basic way of constructing social movement theories which includes the dimension of common sense, value formation, culture, social relation and social action.

YE, LEAFIA* (*University of Wisconsin-Madison*)

Single Motherhood and Children's Emotional-Behavioral Health: Does Migration Status Matter?

Prior research has repeatedly found a robust association between single motherhood and disadvantages in children's emotional-behavioral health. Most of these studies either focus on a certain population subgroup or make the underlying assumption that the association is homogeneous across groups, as their main goal is typically to explain the mechanisms for the association. Relatively few studies have rigorously considered or been able to test the possibility that the association varies across demographic groups.

Research that investigates these variations is increasingly relevant in the U.S. context given the growing diversity in the child population, especially in terms of nativity. As of 2014, one in four children in the U.S. live in an immigrant family, and they account for all growth in the American child population since 2006. The dynamics of these families often differ from their non-immigrant counterparts due to intricacies in the acculturation process.

To address this increasingly important heterogeneity, I ask: does the association between single motherhood and children's mental well-being vary by the migration status of children? Using data from National Survey of Children's Health, I find that migration status does matter to the association between single motherhood and children's mental health. The common disadvantages of children in single mother households are even more pronounced among first-generation immigrant children in the cases of depression and anxiety, but much less pronounced in the case of behavior/conduct problems. I find no such evidence among second-generation immigrant children. In other words, having a single mother might indeed mean something different for immigrant children and families, and the

stories further differ between children with different levels of acculturation. Having a single mother could be a particularly difficult experience for foreign-born children and is linked with higher risks of emotional problems, though this pattern is mixed with lower risks of behavioral health problems.

Sustainable Wellbeing: Developing a Conceptual and Analytical Framework for Policy and Practice in Care and Caring

This paper explores theoretical and methodological challenges confronting the team developing the 'Sustainable Care: connecting people and systems' programme*. Adopting a multi-disciplinary approach, this asks 'How can the care and support needs of adults living at home with chronic health problems or disabilities be sustainably met, with positive wellbeing outcomes for care systems, care providers and care receivers?'. Summarising our initial theoretical and conceptual work, the introduction outlines our rationale for adopting a multidisciplinary approach and sets out the central issue in our work: the accelerating 'crisis of care', particularly in relation to adults with support needs - an issue currently acute in the UK, but of concern in all the countries we are studying and around the world. Next, we engage with 'contested concepts' of care policies, presenting an overview of existing theorisations of care, and examining the relationship between care and conceptions of wellbeing. We draw on an extensive body of scholarship in ethics and political science, feminist economics, social policy, gerontology and sociology, also highlighting key concepts and theories in employment, family, health, migration and technology studies. The paper then engages with lacunae in understandings of care and wellbeing and presents our initial conceptual framework, which we will test in subsequent empirical/analytical work. This identifies relevant actors/ interests, and points of actual/ potential harmony, separation and conflict. We conclude with our perspective on the value and challenges of multi-disciplinary theorisation of care and caring, and its role in developing evidence of value to policymakers and stakeholders. The paper presents 'work in progress', aiming to contribute new understandings of care focusing on: structural change in care systems; roles, relationships and diversity of social actors; and all forms of caring labour. *Funded 2017-21 by UK ESRC and resources contributed by participating universities.

PILLINGER, JANE (*The Open University*)

International Healthcare Migration in Asia Pacific: International Policy Responses

This paper examines international policy responses to cross-border healthworker migration in the Asia Pacific and Oceania regions. These responses include policy agreements, policy dialogue and programmes of action in relation to key issues of ethical recruitment, 'circular' migration and labour rights. The paper argues that these policy initiatives are unfolding in spheres of cross-border governance, as well as in spheres of domestic governance and they evidence the involvement of national and transnational actors, together with the interplay between them. These comprise diverse state and non-state actors acting 'outwardly', through participation in policy-making in spheres of cross-border governance (bilateral and multilateral), as well as transnational actors (located within countries and outside of them) shaping policy responses and practices in identified country and other settings. The paper elaborates an understanding of an embedded transnational policy field of healthcare migration which keeps in clear sight specificities of country contexts and the presence of (and interplay between) transnational and national actors, institutions and policies in different but complementary spheres of governance. This analysis is integral to an expanded understanding of healthcare migration as a transnational policy field.

SURENDER, REBECCA (*University of Oxford*)

Regional Organisations in the Making of Global Health Governance and Policy

The growth of regionalist international integration strategies are integral to understanding the dynamics and consequences of the on-going restructuring of the world's economic and social systems. In otherwise rich multidisciplinary academic literatures on diverse aspects of regional public policy, global health policy, and national health and welfare systems, the significance of regionalism for globalising processes and their impacts on population health, health services

provision, and the ways in which health (and wider social) policies are being (re) made over larger integrative scales remains to be fully analysed.

This paper situates the health policies of world-regional organisations in relation to global health governance and policy making as a field of academic research and a political practice. With a particular focus on regulation, it identifies health agendas, policy approaches and policy programmes of these organisations internationally and locates them in relation to wider contexts and trends giving rise to the 'thickening' of regional organisations' involvement in health and social policies. Variance is observed in the manifestation of regional health policy, in terms of mandates, actors, policy approaches, fields of regulation, and political practices of enactment.

The paper considers the evidence through two sets of analytical themes and questions. First, how can regional organisations be understood in relation to regulatory measures in global health policy? Are they policy actors in their own right or sites of policy making? Can they be understood as 'new' global policy actors? And how does a focus on regional health policy enhance analytical understanding of the scope and nature of global health policy? Second, in a context of a complex, fragmented and dynamic global health agenda, can regional health policy in practice contribute to greater coherence in implementing the SDG goals - and if so, how? Hypothesis and findings will be tested using the case of the ASEAN.

A Re-Evaluation of Development As Modernization, Based on the Case of Iran

Abstract

Habermas's essay, "Modernity – An Incomplete Project", a critique of post-modernism in architecture, distinguishes between "Cultural Modernity", meaning modernism in art/architecture (Baudelaire) and "Societal Modernization" or "societal modernity", stating, "instead of giving up modernity and its project as a lost cause, we should learn from the mistakes of those extravagant programs which have tried to negate modernity...The project of modernity has not yet been fulfilled." President Rouhani of Iran, in his inaugural speech last August, referred to two rounds of unsuccessful privatization of Iran's quasi-socialist economy, more than ninety percent government-owned and operated since the revolution of 1979, as "privatization without the gun" (i.e., government's upper echelons) followed by "privatization with the gun" (i.e. the Revolutionary Guards), making economic competition with them well-nigh impossible. Before the 1979 revolution during the Cold War, economic development planning in Iran followed Rostow's "stages of economic growth" and "modernization theory" (Lipset, Bell, Lerner, Almond...), faced as it was with critiques from the Left, Frank etc. Islamicists adhere to "non-capitalist development path" from USSR (Ulyanovsky, Andreyev...), supposedly neither capitalist nor communist, while economists like Ghaninejad have critiqued this path. Development of societal modernity was analyzed by Marx, Polanyi, Moore...Stein's industrialization-urbanization-bureaucratization showed modernity's societal trends; and Smelser after Parsons analyzed the social institutions' interactions; Giddens has proposed "structuration". Contention between Iran's Reformists, Fundamentalists and Opposition pertains to social institutions: issues of democracy and the Constitution (political institution), extent of control by religious establishment, women's rights (institutions of family, economy, etc.), inequality, employment and unions (economy), and freedom of expression in the press, media, arts, education. By contrast, Sen's *Development as Freedom* saw two translations but was removed from bookstores after publication and extensive discussions

Factors of Politically Motivated Violence in the Urban Context

Leipzig is a city in the East of Germany which has a long history of political conflicts. Recently Leipzig received a lot of media attention because of violent conflicts involving the far left scene in a district called Connewitz. In 2015 and 2016 street fights during demonstrations against right-wing extremists, attacks on a police station and damage to state buildings such as the Federal Administrative Court, as well as counter attacks of right-wing extremists significantly disrupted the city of Leipzig. The far left scene in Leipzig also made headlines in the contexts of the violent riots during the G20 Summit in Hamburg 2017. During the debate on the Hamburg riots, political violence was discussed as a result of left-wing hotspots/ districts within the city of Leipzig.

Theories to explain politically motivated violence can be found within sociology, social psychology and many other disciplines related to criminology. Some of them on the micro-level were tested in a quantitative and multiparadigmatic study conducted at Leipzig University with the title „Youth Study Leipzig 2017“ (n=1508). On the basis of the survey data the paper discusses the following questions: To what extent do young people in the city of Leipzig support politically motivated violence against the left, the right and minorities such as foreigners or Muslims? Do factors such as specific forms of socialization, education, objective

and subjective social and political deprivation as well as individual indicators of personality (authoritarianism, narcissism etc.) have an impact on different kinds of political motivated violence? How great is the explanatory power of those theories, and what might a multivariate model to explain politically motivated violence look like?

Solidarity Economy and Informal Workers Mobilizations : A Global Countermovement ?

The redeployment, in the world, of self-managed groups and cooperatives often along with the mobilization of informal workers must draw our attention to the social movements that seize these vehicle, by examining why and how they take up a way of organizing themselves that is all but new. We argue that it highlights the emergence of a countermovement to commodification revived with neoliberalism.

This paper is based on a case study carried out in Brazil on the mobilization of workers in the solidarity economy and is supplemented by comparative data provided by observations in Québec and documents. The notion of countermovements is taken to depart from the Marxist claim that "Production provides the foundation of opposition to capitalism" (Burawoy, 2013:17). The communication argues that this analysis is a reductionism (in the meaning of Hall, 1986). It does not allow to understand the scope and significance of an emerging countermovement, which does not follow the path of labour movements organized by trade unionism. In fact, informal workers are situated at the articulation of multiple social relationships of exploitation, oppression, and domination of class, gender and race that should not be hierarchized between themselves, and their struggles are simultaneously challenging them. Therefore, their significance : the case study highlights that, insofar as they can engage in collective action at multiple scales and on an equal footing, they seek to re-establish continuities between activities (so-called reproductive and productive work) and private and public spheres, which are arbitrarily divided by the logic of commodification and domination to justify exploitation and oppression. Unlike the second half of the 19th century, "autogestion" is not a vehicle to recover an economic independence but to assert the predominance of social needs and aspirations on production choices. And this constitutes a radical opposition to commodification of labour and nature.

The Path in between. Story Telling of "Back then, the Coexistence" and "Now It Happens to Us"

This paper discusses the idealization of the past, times before the massacres and genocides, and historical analogies in the process of (analepsis) story telling during auto-biographical narrations. In these terms, it focuses on the Kurdish collective memory, questions the re-constructions of the Armenian Genocide and tackles the arguments made by the interviewees concerning different violent events happened in the past and / or conducted today. These phenomena, the anachronism and idealization, build an interrelation between events and point out a continuity, for example regarding violence exercised by the Turkish state apparatus against the Kurds, Genocide of Yazidis by ISIS in Iraq and the Armenian Genocide 1915. Alongside interrelated stories, this discursive field contains hegemonic and official nation-state representations in Turkey or dominant group narratives of Kurdish politics such as the reconciliation with the victims of genocide. Hence, a sphere of contested memories emerges within this context since the Kurdish young generations challenge the foundations of "settled" stories with their reflexive re-readings.

In these terms, I ask how such memory regimes regarding the violence, experienced or told, appear in biographical narrations, how its mnemonic processes are connected to each other as well as to the biography and what can and would be silenced in this context. I discuss these issues based on Kurdish auto-biographical accounts from Van and Istanbul in a comparative perspective.

Relatively "Free Spaces" in China: Narrating and Mobilising the Law through Digital Spaces

Recent legal reforms in China, particularly amendments in 2014 to the Environmental Protection Law, have encouraged environmental nongovernmental organisations (NGOs) to embrace legal strategies in their advocacy. Such legal mobilisation marks a novel form of collective action that links environmentalists, cause lawyers, journalists, and other concerned individuals. However, the role of social media and mobile technologies in the formulation of these new collective strategies remain understudied. To that end, this paper demonstrates how WeChat, a popular Chinese social media mobile application, has been

refashioned as a grassroots platform for cause-based experience-sharing and networking between self-joining individuals and activist groups from different regions. Through the technology, environmental activists seek to construct and disseminate their legal experiences to reach out to the wider public. The paper examines one such example in Xiamen, Fujian Province, where an ENGO, incensed by the conversion of walkways into parking spaces, led the first administrative lawsuit in the name of "pedestrians' rights" in China in early 2015. Based on an experience-near approach, through participant observation and digital ethnography conducted between May 2015 and May 2016, the paper illustrates, on the one hand, the salience of digitally-networked spaces as "[relatively] free spaces" in collective action (Polletta 1999). On the other hand, it also reveals the complementarity, if not the necessity, of "conventional" free spaces, in the form of public meetings and gatherings, for identity construction that is critical to legal mobilisation. By elucidating the activists' discourses and experiences both during and after the legal struggle, this exploratory research offers a snapshot of how popular critical consciousness develop under authoritarian rule, as well as the broader possibilities and challenges accompanying "the turn to law" in China.

Desexualization of Gender: The Concept of "Can" As an Opportunity for the Equality of Alevi Woman?

Gender equality is central in Alevism and is defined as the article of faith. However, the public and private discourse is implicitly shaped by a certain concept of "Alevi woman". In the secular space the role of Alevi woman is defined by gender and sex (following Butler) in order to reproduce patriarchal and cultural values. But in the religious space neutrality of the sexes is underlined by the concept of "Can" (soul) that means de jure that there is no gender separation. The Alevi ritual is being carried out together by women and men together. In the secular world, however, the Alevi woman still struggles for equality. For example, family honour is still defined by women's body (sex).

Taking a closer look at the "Can"-principle, it should be noted that it's not adequately practiced in the religious sphere because women are not allowed to lead a Cem (Alevi ritual). Nevertheless the "Can"-concept is a resource for participation of Alevi women, because of its de-sexualizing function. This concept of equality is raised as a positive modern feature of the Alevi in contrast to "anti-modern Sunnis" in the public discourse. Even for Alevi the rigid dogmatic, man-controlled secular space, as well as religious space, proved to be a fallacy.

The question of equality of the "Alevi woman" is a theoretically as well as an empirically relevant question regarding the fact that scientific work about this topic forms a desideratum. The talk concentrates on making the religious concept of "Can" theoretically useful for the discourse of the "(unequal) role of women in Alevism" and to investigate how the desexualization of gender with the concept of "Can" could be a resource-function of religion in the broadest sense.

Does Ethnic Social Capital Lead to Mobility? Turkish Belgian Women's Educational and Occupational Mobility

This study builds on a rich field of existing research that stresses the importance of ethnic social capital in realizing social mobility. It does so by exploring inductively the impact this form of social capital has had on the realized educational and occupational mobility of a group of highly educated Turkish Belgian women. As a result, the research sheds new light on several important issues: (1) how realized forms of mobility are informed by ethnic social capital; (2) how the kind and influence of different forms of ethnic social capital can change over time in different domains of mobility within a particular population, and; (3) whether one mobility process (e.g. educational) can have consequences for the other (e.g. professional). In addition, by focusing on a group of individuals who have succeeded against the odds, this study enables analysis of changes in the coping strategies people employ to overcome both within-community constraints and external ones. The findings suggest that the importance and influence of various forms of ethnic social capital can change over time and in relationship to different (inter-related) forms of social mobility. The conclusions discuss implications for future research on ethnic social capital and social mobility.

The Neighbourhood in an Increasingly Mobile World

This paper intends to examine the impacts of the neighbourhood in an increasingly mobile world. The neighbourhood is an important arena, not only to peoples' creation of identity and social networks, but also to many government policies that aim at solving social problems. Yet as people are increasingly mobile and the need to interact with neighbours decreases, it begs the question of whether the neighbourhood is still significant to individuals. There is, however, ample evidence that patterns of mobility are highly varied among people of different backgrounds and mobility differentials may be widening. Thus, it is possible that the neighbourhood may continue to be significant but its impacts may not be the same for different groups of people. This paper is based on project that employs a smart phone app which has been developed by the research team to track people's mobility and activity patterns. Such data will be combined with information on personal attributes that are collected from a survey and with neighbourhood attributes derived from a variety of sources in order to examine the impacts of mobility on people's sense of neighbourhood and neighbouring interaction. This research will cover 800 residents in 20 neighbourhoods in Hong Kong. Hong Kong, with its popular and efficient public transport system as well as a large but relatively mixed public housing sector offers a distinct research site for comparison with the findings of similar research which has been conducted in the very different urban contexts of US cities. The research will offer valuable inputs to social mix and neighbourhood-based social policy as well as inform and extend theoretical debate on neighbourhoods within the new mobilities perspective.

Up with Ecology, Down with Economy? the Institutionalization of the Idea of Climate Change Mitigation in the Global Public Sphere

Building on theories of valuation and evaluation, we develop an analytical framework that outlines six elements of the process of discursive institutionalization of an idea in the public sphere. We then use the framework to analyze the process of institutionalization of the idea of climate change mitigation between 1997 and 2013, focussing on the interplay between ecological and economic evaluations. Our content analysis of 1274 articles in leading newspapers in five countries around the globe shows that (1) ecological arguments increase over time, (2) economic arguments decrease over time, (3) the visibility of environmental NGOs as carriers of ecological ideas increases over time, (4) the visibility of business actors correspondingly decreases, (5) ecological ideas are increasingly adopted by political and business elites and (6) a compromise emerges between ecological and economic evaluations, in the form of the argument that climate change mitigation boosts, rather than hinders economic growth.

The Role of Social Transfers and Social Services As Investments in Re-Employment: An Evidence from Finland

Theoretical starting points: Division between the compensatory and capacitating/investment roles of social policy, i.e. rewards people receive due to social risks materializing vis a vis the welfare state as a facilitator for individuals

to increase their capacities. Following Rawls, we argue that decent social transfers are 'basic goods' that the welfare state must guarantee. However, following Sen and Nussbaum, we argue that 'basic goods' are necessary but not sufficient means to fully enhance well-being. The individuals must have capabilities to use 'basic goods'. Social services/investments are supposed to fortify individuals' capabilities.

Research questions: The aim is to explore how compensatory social transfers vis a vis capacitating social investments affect well-being and life satisfaction in re-employment. Special attention is paid on the role of social services as an efficient tool of social investment.

Data: 1,000 telephone interviews among unemployed in Finland, conducted in 2017.

Results: preliminary analysis of variance indicates that social investments/social services are a significant factor in improving well-being of the unemployed. At the scale 0 (bad) to 10 (good) means (all differences are significant) are as follows:

Access to services	Work ability	Health	Life satisfaction
No	6.7	6.8	5.9
Yes	7.7	7.7	7.3

Conclusions: From the social investment perspective, we evaluate the relative role of compensations (money) and social services (investments) as providing people the capabilities Sen and Nussbaum are advocating. Based on empirical analyses, we verify our central argument: social services play a central role as social investments when increasing unemployed individuals' overall well-being, their capabilities, and further the possibilities for re-employment.

A Battle about Gender Equality: Affect, Expertise and Resistance in the Strategic State

In my presentation I analyze a case in which researchers, including myself, aimed for setting gender equality on the agenda of the Finnish government. We provided a gender impact assessment of the government programme, in which we analyzed austerity policies of the government through gender lenses, based on feminist economic theory. The case is analyzed as an example of, firstly, the changing conditions of equality policy and feminist resistance in the 'strategic state', a form of neoliberal governance where the neoclassical theory of economy sets the frameworks of policymaking. Secondly, the case is analyzed as an example of the chances of academic expertise to have an impact on political decision making. The data consists of the researchers' gender impact assessment of the government programme as well as the making process of the assessment; the news reportage about the assessment; and politicians' responses and the policy effects of the assessment. The process is represented as a new form of resistance. The analysis makes visible how the strategic state is a difficult companion for gender equality, equality policy and feminist resistance.

My presentation is based on an article written Anna Elomäki, Johanna Kantola, Anu Koivunen and myself, published in a Finnish journal *Sociologia* (4/2016).

The Effect of Social Movement Using SNS in Policy Innovation of Local Government-Based on the Case of the Policy Making Process on Shibuya City's "Same-Sex Partnership Ordinance"

Based on the case of "The same-sex partnership ordinance" in Shibuya City, Tokyo, I analyzed how the policy innovation had been performed in the period when SNS was frequently used. This ordinance was the first case in Japan that acknowledged partner relationship between heterosexuals by issuing "partnership certificates" and the first case where the LGBT social movement left a result in political scene.

Since the 2011 Eastern Japan Great Earthquake Disaster and the movement against nuclear power plant, SNS is utilized as an important tool of social movement in Japan. In response to these circumstances, various researches have been conducted in recent years, but SNS has been recognized only as a tool to promote mobilization to demonstrations so far. However, as a local councilor, the author believes that the signature activities on the Internet and people's reactions on the SNS themselves show the effect of "framing" and widely affect political processes.

In order to see the effects of social movements using SNS, it is necessary to ask both activists' aims and feelings, as well as policy makers and decision makers'. On the activists' side, in addition to formal interview with activists, we analyzed people's reaction on Twitter. On the policy maker's side, we interviewed the mayor and city councilors. Because there is a possibility that the effect of exercise may not be clearly recognized, hearing was done by unstructured interview method.

As a result, we found that Internet signature activities and people's reactions on the SNS themselves showed the effect of "framing", which was a broad sense of input to the political process. Politicians have been losing a fixed support layer in recent years due to aging and the weakening of existing organizations. Mean-

while, they are seeking new supportive groups as a floating layer that heavily uses SNS.

Cultural Politics of Homeland Media

This study explores how the Korean diaspora appropriates different forms of Korean language media to negotiate their hybrid identities and for cultural heritage learning. With particular reference to 1.5 and 2nd generation Koreans in Canada, the study examines the role that media produced in Korea – often refers to as “homeland media” – plays in the formation of long-distance nationalism and the transnational renegotiation of Korean identity across Korean diasporic communities. Drawing on qualitative interviews conducted in Toronto and Vancouver in Canada, the proposed project explores the meaning and significance of homeland media in Korean Canadians’ struggle for cultural rights and heritage learning. By focusing on Korean Canadians’ consumption of homeland media in diasporic contexts, this project seeks to address lacunas in both sociology of diaspora and media.

The Four Worlds of Global Welfare

This paper makes an important contribution to the welfare regimes literature, by illustrating that there are now four global “Worlds of Welfare”. The expanding “Three Worlds” literature has suffered from a number of drawbacks: (i) It is radically slanted towards OECD countries, (ii) a few globalist studies does not compare OECD and non-OECD countries, (iii) they only focuses on geographical/cultural clusters and (iv) the globalist literature does not use welfare policy variables but development variables. All these have undermined the possibility of reaching at a global welfare state theory. To address these challenges, we introduce a novel dataset that contains welfare policy variables which represent the most important decommodification components such as pensions, unemployment schemes and sickness benefits. Additionally, we utilize social assistance as a crucial fourth component of decommodification, as a novelty in the literature. We conducted a cluster analysis (with hierarchical clustering analysis) and show that 52 countries from the Global North and South constitute four welfare regimes. In this first global welfare regime cluster analysis with only welfare policy variables, we used 18 welfare policy variables on 52 countries from 2013. Our analysis reveals four global welfare regimes:

1. Emerging Markets-Mediterranean-Post-communist: Social security benefits are above average while social assistance benefits are below. These countries are developing extensive social assistance programs but still based on already developed social security systems.
2. Liberal Regime: Pension benefits are lower than average while social assistance benefits are higher. These countries are building extensive social assistance benefits without a basis of extensive social security systems.
3. European Regime: Both social security and social assistance benefits are above average. These countries have extensive social security and assistance systems
4. Less developed emerging markets: These countries have lower-than-average social security and social assistance benefits. But, they still perform better in social assistance benefits.

Unmarried Women in Japan

1. Name and affiliation of the author: Akiko Yoshida, University of Wisconsin – Whitewater
2. Book title: Unmarried Women in Japan: The Drift into Singlehood
3. Publication date: 2017
4. Publisher: Routledge
5. This book, based on my qualitative interview research, attempts to identify the cause of increased singlehood among women in Japan. Increased singlehood is often explained theoretically from a “developmental” perspective, which interprets it as a reflection of women’s empowerment (e.g., economic independence, resistance to traditional marriage). My research, however, finds that many women in Japan were *unable* to form intimate relationships and drifted into singlehood against their wishes. The fundamental cause of this drift is persistent gender inequality embedded

in social structure and culture. Further, far from being empowered, women are stigmatized and economically disadvantaged for remaining unmarried. As single populations continue to surge in other patriarchal countries in Asia and other areas, it is important to critically examine this phenomenon, as well as the current sociological paradigm on singlehood, from feminist perspectives. Additionally, the developmental paradigm, which comes from Western scholarship, often excludes Japan in its theorization, treating it as an “exception.” Voices of women from non-Western societies – doubly-subordinated groups – need to be heard and considered.

6. As stated above, increased singlehood is a world-wide phenomenon that cannot be explained away simply by pointing to economic development and women’s empowerment. It is also a relatively understudied area, and my research is limited only to women in an urban area of Japan. Further research that investigates other regions and countries is highly desired. This book provides a good starting point for promoting dialogues on singlehood phenomena across the globe. Inclusion of this book in the session should help connect researchers and encourage collaboration internationally, improve our understanding and theorization, and elevate our awareness of gender inequality and women’s rights.

Exclusiveness and Slavishness Imposed on Japanese Foreign Laborers: In the Case of Technical Intern Trainees

This study analyzes the exclusiveness and slavishness of Japanese foreign labor policy. Japan has been taking close-door immigration policy, which is based on strict *jus sanguinis* principles. Its exclusiveness is also seen in the number of certified refugees, which was only 26 out of 10,901 applicants in 2016. On the other hand, Japan has been confronting “super-aged” population. In this situation, Japan needs to open the door to maintain its domestic industries in order to survive global market competition. *Technical Intern Training Program (TITP)* is one of the labor policy of Japan which aims to pull young workers from neighboring Asian countries. However, government report indicates that 71.4% of all companies which accept foreign trainees are reported to violate the labor standard law. For their poor working conditions and strict labor management, TITP is often criticized as “modern slavery”. But among the 228,588 trainees, only 6,518(2.8%) are reported to escape from workplace. It directly shows the exclusiveness of TITP, strict supervision of the government and companies over the trainees to cage them in the territories. In this respect, slavishness of TITP has been often discussed as a part of labor issue as “silent trainees”. However, trainees are deprived of not only workers’ rights but also of social rights, especially for those who are tagged as “deviator”. Therefore, this paper focuses on the trainees who tried to negotiate with their employers or escaped from workplace. As a result, this paper presents 1) trainee’s alternatives for adaptation: to endure, to fight or to escape and, 2) the background and factors of each alternatives. However, in any alternatives, trainees can hardly escape from the fear of being monitored. This paper discusses the slavishness of TITP and the challenges of labor movement by the interview data collected from 20 Filipino trainees in Japan.

Missing in Action: Structural Gender Analysis in Societal Responses to Domestic Violence in Japan

Recognition of a phenomenon as a social problem is a necessary precursor for the development of social policy and programs to address it. In Japan, domestic violence was neither recognized nor addressed prior to 1990’s. It was a feminist action research effort that named the previously unaddressed problem of domestic violence in Japan in early 1990’s. Collective grassroots organizing, action research, and advocacy efforts, aided by the international currents, such as the 1995 Beijing Declaration and Platform for Action, promoted the previously reluctant government to address domestic violence.

The enactment of the Spousal Violence Prevention Act in 2001 symbolizes a societal and governmental recognition of the problem, yet at the same time it represented a shift in the definition from a socially-rooted problem of patriarchal violence against women to an individual/interpersonal level problem of spousal violence. Consequently, the available social programs center on temporary assistance to abused spouses with virtually no measure to address structural gender inequity or patriarchal social norms. After a considerable decline from the late 1970’s to 2000’s, the proportion of adults who endorse gendered division of labor has been a rise over the last decade. Structural barriers to women’s gainful employment remain strong, including gender wage gap, the lack of affordable child care, sexual harassment, as well as the taxation and social security systems that provide substantial financial incentives for one spouse (usually the wife) to earn less than a certain threshold.

By analyzing the ways in which domestic violence was defined first by the feminist activists and researchers and how it is being redefined in the legislative and political processes, this paper examines the current lack of structural gender

analysis in the societal responses to domestic violence and its relationship to the larger socio-political-historical factors in present Japan.

The Role and Potential of Participatory Investigation: Photovoice of Women Affected By the Great East Japan Disaster

Pre-disaster inequity and vulnerabilities often intensify post-disaster. In what ways can research capture the lived experiences of the socially marginalized and lift their voices toward the creation of more inclusive disaster policies and responses?

Japan has a strong government-centered disaster prevention and response system; however, women's experiences and perspectives have not been adequately reflected in disaster policies or research in Japan prior to the 2011 Great East Japan Disaster.

The 2011 Great East Japan Disaster attracted a great number of domestic and foreign researchers. Prospective collaborators had been sought out for information, participation, and collaboration of all kinds, and many indicated that they did not wish to be "studied" any more. Heeding their feedback, a group of researchers and activists including the authors began PhotoVoice Project, a participatory investigation of the disaster's consequences in June 2011, three months after the Disaster. Over 50 women of diverse backgrounds have participated, taking photographs of their lives and communities; discussing and analyzing the disaster's consequences at the personal, interpersonal, and societal levels; and disseminating their photographs and associated voices (messages) in an effort to improve disaster policies and responses. In its 7th year, the Project is ongoing and expanding.

The participants' photographs and voices, a rare record of the Disaster from the perspective of the very individuals affected by the calamity, provide critical analyses of social issues that affect disaster prevention and management, as well as visions for change. The participants are ordinary citizens and all women, whose perspectives have not been conventionally incorporated in academic or policy discourse. Using the PhotoVoice Project as a case example, this paper examines the role and potential of participatory action research in the aftermath of major disasters, along with methodological and ethical challenges unique to participatory action research in the post-disaster context.

YOUNG, CHRISTINA* (*PhD Candidate, University of Toronto*)

The Professionalization of Perinatal Support: "Doula" Work in a Canadian Context

Over the past three decades, women in North America and elsewhere have increasingly turned to "doulas" for non-medical support in the perinatal period, particularly during childbirth. Correspondingly, more and more women are training and certifying as doulas in order to offer this type of care. Doulas offer women and their partners prenatal childbirth preparation, non-medical techniques for relaxation and pain reduction during labour, and attentive support throughout the entirety of labour and the immediate postpartum period. Their services are provided for a fee – paid for privately by individual clients – that fluctuates according to the doula's level of experience and certification status. While it is difficult to pinpoint the impetus for growing interest in doula care, at least two factors have likely played a role: the medicalization of childbirth and the lack of necessary support for women during labour and delivery in the context of neoliberal restructuring and reductions to the nursing work force. For doulas, this work represents an alternative entry point to the maternity care field that is more accessible than the highly competitive and time consuming training required to become a registered midwife. Existing literature relative to doula work has thus far considered women's experiences of doula care and doulas' perspectives on the value of their model of care for their clients. However, little attention has been paid to the experiences of doulas as workers who hold a liminal and precarious position within established health care systems and the professionalization strategies they use to legitimize their role in the field of maternity care. Drawing on qualitative interviews with doulas working in Toronto, this paper explores how doulas navigate their liminality within the state-funded maternity care system, including strategies aimed at making space for their own knowledge and skills within that field.

YOUNG, NATHAN* (*University of Ottawa*)

Negotiating Environmental Expertise: Collaboration and Conflict over "Reliable" Environmental Knowledge in a Contested Canadian Fishery

The salmon fishery in Canada's Fraser River is one of the world's largest, and most contested. The Canadian government has committed to "evidence-based management" of the salmon populations, and therefore relies strongly on internal scientific and experiential expertise (of fisheries managers, for instance). However, user groups that include powerful industry lobbies and indigenous First Nations communities frequently contest these expert assessments, offering their own observations, interpretations, and projections about the salmon populations. What results are networks of complex negotiations that occur vertically (between government and user groups) and horizontally (among and across user groups) over the reliability and veracity of environmental knowledge and expertise, as well as the trustworthiness of the individuals, groups, and institutions that claim to possess these. These negotiations are highly contextual, and involve both collaboration and conflict, leading to shifting alliances and critiques in this complex governance network.

This paper will present findings from 110 in-depth interviews with government employees (policy-makers, fisheries and aquatic scientists, and field managers) and user group leaders (commercial fisheries, sport fisheries, First Nation fisheries, recreational river users, and conservation groups). Findings from the interviews point to fundamentally different perspectives on the meaning, role, and utility of different types of expertise. For instance, government employees tend to see expertise as a tool for solving known and clearly defined problems, while user groups see expertise as a tool for further political action and negotiation. I will draw on concepts from environmental governance (adaptive co-management, adaptive governance), as well as from the sociology of science (boundary work, studies of expertise and experience (SEE)) to draw lessons from this case for better incorporating the study of expertise into environmental sociology-grounded research.

Career Development Among Palestinian Academic Women in Israel

Career development among Palestinian academic women in Israel

This research about academic Israeli-Palestinian women careerists aims to identify the barriers and the potential for their integration in the labor market, including key positions. It seeks to add another layer of knowledge regarding their status in the Israeli labor force, and to shed light on the considerations standing behind their career choices.

Most Research regarding minority women's career development point out the close intertwining of external and internal barriers – at work, at home, and in women's attitudes, which typically result in limited opportunities for professional development and promotion, lower wages, and reduced spheres of authority. In the case at hand, these barriers are increasing due to the intersection of gender and ethno-nationality. Yet despite multiple obstacles, women's growing integration into professional careers is crucial in strengthening their bargaining power in the family and in society, in improving families and women's economic wellbeing, and in raising women's self-esteem and overall sense of satisfaction. The project will identify the challenges and obstacles as perceived and experienced by women at three major stages of a career track: (orientation, entrance and initial establishment, promotion) and explore their strategizing in each respective stage. The cultural factor will be explored through the schema of the patriarchal gender contract as it affects the full domestic-public work range.

Semi-structured interviews with 45 women of three different professions (Hi-Tech, Medicine, Law) from three career junctions (Orientations, entrance, promotion) were used to gain experience-near understanding of women's perceived opportunities and pragmatic responses.

Focusing on minority women with high human capital advances a complex understanding of intersectionality as creating potential alongside disadvantages and it illustrates the combined operation of gender and ethnic barriers in competitive work arenas.

Elective Affinity of Religiosity and Perception of Justice (Case study: Iran)

Religion and justice are considered as two important social constructions that their determination and realization are dependent upon society's perception, and such perception itself is affected by political and religious socialization.

The present study is of the view that elective affinity exists between "perception of justice" and "religiosity", and some judicious perception elements are compatible with some religious (Islamic) perception elements, and some are incompatible. For example, the more one is principled to orthodox beliefs and rituals, the more important becomes the procedure-oriented distributions, and the less becomes important the personal eligibility. Moreover, the less one is principled to rituals and doubtful about old beliefs, the more important becomes the meritocracy, government intervention, and consequence-oriented distribution of goods.

The results of a field study regarding affinity based on a random sample of 360 Iranian participants in 2015 show that:

First, justice perception in Iran is a combination of people's agreement or disagreement with: (1) government agency, (2) Gap between Least Advantaged and Beneficiaries, (3) priority of individual merits in distribution, and (4) consequence/procedure-oriented distribution.

Second, diversity in religiosity among Iranians is a combination of different and sometimes opposing perceptual factors. Such variation in practical level can be related to their strong or weak fidelity to religious rules, and at the level of beliefs can be due to skepticism regarding religious beliefs and consequently, due to coordination of theoretical and practical religious beliefs.

Third, traditional religious beliefs in Iran is mostly based on "nonintervention government" and is opposed to reducing the gap between benefited and non-benefited on modernistic perceptions and reward distributions, putting emphasis on the "eligibility" and "result-orientation" norms.

In sum, it can be said that the distributional justice realization, specifically in Islamic communities, can be related to modern thinking about religion and upgrading social learning processes.

Social Enterprises in Egypt: Towards Building Inclusive Markets and Creating Sustainable Economic Growth

The key objective from this paper is to investigate through qualitative methods how social enterprises create and develop inclusive markets in weak institutional spaces to address market failures within the Egyptian context.

In 2015, the United Nations launched new sustainable goals to change the world to become more inclusive and healthier for everyone. The first item on the UN agenda over the next 15 years is to "end poverty in all its forms everywhere". It is an ambitious, however, doable goal.

Social enterprises, especially in a country like Egypt, are working to achieve this goal by developing inclusive markets that can help in a country where 2% of the population is surviving on \$1.25 a day and 18% of the population is surviving on \$2.00 US dollars.

This paper will make a significant contribution to exploring how social enterprises ameliorate poverty through the creation of new inclusive markets and critically investigate changes that occurred in Egypt after the 25th of January revolution 2011, where significant socioeconomic and political changes occurred. Furthermore, this study aims to make a valuable contribution to policy makers and practitioners alike to reinforce the need for serious actions to make bold changes within subsistence marketplaces that will eventually create a specific public policy agenda for poverty alleviation and educational empowerment within the Egyptian context.

Finally, the crux of this study is to make a theoretical contribution to the growing body of literature about social enterprises as well address the lack of the sys-

tematic empirical account of the phenomenon within the Egyptian context. The empirical focus will be conducted on the heart of Cairo, a city that has over 170 informal neighborhoods. Qualitative research methods will be implemented in the form of an in-depth ethnographical study conducted with a social enterprise currently operating in the Manshiet Naser Cairo slum.

Making Norway Great Again? an in Medias Res Analysis of the Work of the Bridge to the Future Alliance, and Its Unifying Potential in the Struggle for Climate and Jobs.

The US withdrawal from the Paris Agreement is among other things a symptom of the failure of policies and discourses that seek to align worries over global warming with the need to create jobs. It is easy to frown upon the idea that America will become great again by shoring up and stimulating the fossil fuel industry, but Norwegian Climate Change Policy displays much of the same fossil fuel jobs versus climate change policy dilemma. Despite decades of critique from research (Nilsen 2001, Sæther 2017), Norwegian Climate Change hegemony (Ytterstad 2012) continues to exempt the supply of Norwegian Oil and Gas from its mitigation equations. In civil society, by contrast, the focus on the supply side of fossil fuel has gained traction the last five years, notably in the growth of the Climate Election Alliance, supported by more than 60 organizations in Norway. These organizations all support demands which include a "brake" on Norwegian oil and to create at least "100 000 climate jobs now" in a just transition. Some of this progress can be traced to the Bridge to the Future alliance, which has held four Conferences and four publications (Ytterstad 2013, Ryggvik 2013, Ytterstad 2015, Samfunnsøkonomisk Analyse 2017). As a researcher and activist, the present author has been involved in the development of this unique alliance between environmentalists, faith societies (the Norwegian Church most of all) and parts of the Trade Union Movement. But crucially, and in line with expectations in within environmental labour studies (Räthzel and Uzzell 2012, Hampton 2015), it has not so far been supported by the two most important unions of oil and gas workers. Can the Bridge to the future alliance win over oil and gas workers to a climate change policy confronting the supply side of Norwegian fossil fuels?

Socio-Emotional Ties and the Sense of Belonging to the Destination Among Migrants

The relationship between spousal separation and the sense of belonging to the destination among migrants has not been well studied. Most migration studies focus on economic and social factors that facilitate or hinder the integration of migrants. Few have explored socio-emotional factors that facilitate or hinder their integration. Togetherness with spouse in the destination represents a highlight of strong social and emotional relationship. The study of togetherness with spouse and its relation to local identity opens a new avenue to understand the integration of migrants through the lens of social-emotional ties. Second, the discussion of spousal separation inevitably leads to the discussion of how the use of communication technologies, such as cellular phone or social media, to connect with others is related to the sense of belonging to the local community among migrants. The study incorporates the discussion on the use of communication technologies and its impact on the local identity formation – another topic that has largely escaped the discussion in most migration literature.

Our study, based on a survey of rural-urban migrants conducted during 2015-16 in Guangzhou, China, explores the role of strong social ties that provide emotional support, especially togetherness in marriage, in facilitating the integration process of migrants. This study found that those migrants who stay with their spouses at the destination show higher level of local identity than other migrants. Further analysis suggests that the likelihood of having local identity is sensitive to various factors for respondents with their spouses staying in the same city but not for other migrants. Implications of the study will be discussed.

Disruptive Impacts By a Symbol of Economic Growth: The Case Study of Shinkansen Railway

Why does a public construction project cause environmental and social disruptions and become irrational in terms of economic and social aspects? In this presentation, we will consider the case study of a high-speed railway network

called Shinkansen in Japan. Analysing the decision-making process by the strategic analysis, we will point out the fragmented process that makes a project irrational.

Since the opening of the Tokaido Shinkansen in 1964, the first Shinkansen, this railway network has expanded to seven lines. The Shinkansen has been considered as a symbol of economic growth by most people. Some researchers argue, however, that this huge project has caused n and social disruptions in a chain reaction.

In contrast to the Tokaido Shinkansen, which has over 600,000 passengers a day, the Hokkaido Shinkansen, which opened in 2015, has around 7000 passengers per day. Naturally, the Hokkaido Shinkansen is unprofitable.

The unprofitability causes some social disruptions. First, the national and local governments provide the construction cost even though most of them are in financial crisis.

Second, local governments and municipalities must agree that Japan Railway Companies cancel the operation of local railway lines. This is because Shinkansen robs passengers from local express trains, putting pressure on the company's management. Most local governments have established semipublic railway companies for cancelled lines with financial burdens.

Costs for Shinkansen construction and management of new railway companies are such heavy burdens for local governments and people that they are suffering from the rapid population decrease and financial crisis.

Third, these Shinkansen lines also disrupt natural environments (e.g., waterway destruction, land subsidence).

People may welcome a local opening of the Shinkansen but this unprofitable and irrational infrastructure can then become a burdensome legacy in the near future.

What Prevents the Work of a Voluntarism Approach to the Radioactive Waste Issue? : A Local Governments' Strategy in Japan

Does the voluntarism approach to the location of high-level radioactive waste (HLW) disposal facility work in Japan? This approach is the mainstream for the high-level radioactive waste issue in the current world. The work of this approach is based on different factors that are inherent in each country. In this presentation, we will examine a specific factor in Japan that is blocking the implementation of a voluntarism approach.

Before taking the voluntarism approach, Japanese and other governments such as the United Kingdom tried to locate these facilities only by scientific criterion from the 1970s to 1990s. These attempts, however, resulted in failure.

The Japanese government has taken the voluntarism approach since the 2000s. They established the nuclear waste management organization of Japan in October 2000. The siting process is done by open solicitation of volunteer host communities.

Officials of about 15 municipalities have shown interest in having an HLW disposal facility, but a small town in Kochi prefecture was the only applicant. However, the mayor of the town was forced to resign because a large protest occurred and residents had prepared to recall him. The new mayor withdrew from the plan.

In 2017, the government publicised a nationwide map of scientific features for geological disposal that show proper areas for this facility. Does this mean to go back to the 1980s? The Japanese government still keeps its voluntarism approach, but it looks doomed.

We will find a factor of this failure in the history of HLW disposal in Japan. A key concept for analyzing is "double standard." This is a strategy that nuclear host communities have been using. As a result of working on this strategy, a hierarchy of nuclear communities has been formed. We will point out that this hierarchy prevents the work of a voluntarism approach.

Life Satisfaction and Internal Migration Experience

Our study links the life satisfaction of internal migrants with assessment of their migration outcomes in relation to the people back home and their integration experience. Our research adds to a growing body of literature on the integration of internal migrants in three ways. First, we extend the understanding of the subjective dimension of integration. Second, we have refined two important concepts for measuring migrant experience in our research. We differentiate between ties to the current local environment and ties to the home town/village. Besides, we compare objective socioeconomic outcomes, subjective perceived economic outcomes, and compared socioeconomic status of migrants with their significant others. Third, we provide a more "realistic and comprehensive" picture of life satisfaction among migrants by comparing relative importance of a set of variables. Data for this study come from a survey of rural-urban migrants in 2015-16 in Guangzhou, China. The findings show that income, perceived social status, perceived socioeconomic status in comparison to fellow villagers back home and

to local residents, and local ties with relatives or fellow villagers all have significant relationships with life satisfaction. Implications are discussed.

Narratives of Non-Offending Pedophiles in Japan: Managing Diagnostic Discourses in the Politics of Sexuality

This paper examines the narratives of non-offending pedophiles in Japan. By reconstructing their life stories, this paper examines how pedophiles recognize their sexuality with or without managing pathologized discourses.

Dominant narratives on pedophiles have conflated them with sex offenders. This view is often intertwined with a diagnostic discourse that views pedophilia as a pathological perversion. Researchers have recently pointed out that existing studies on pedophiles share a major flaw: They focus on only sex offenders, mainly because of the difficulty of accessing non-offenders. Meanwhile, some pedophile associations in Western countries claim that their sexuality is not a mental disorder but a normal "orientation." Yet other pedophile activists argue that pedophilia should continue to be clinically diagnosed so that they can access proper help to control their behavior. Such a discursive situation can be viewed as another case of an intersection of the politics of sexuality and diagnostic culture.

Based on the above understanding, this paper focuses on the narratives of elusive non-offending pedophiles. Data were collected from five self-identified male pedophiles in Japan. Given the aforementioned sampling difficulties, a small number of cases were worth exploring.

Their narratives revealed some commonalities with existing discursive development in the gay and lesbian liberation movement, particularly with respect to rejection of a pathological explanation that looks for causes of pedophilia. They also challenged the arbitrary line between normal and abnormal by questioning the diagnostic narratives. At the same time, however, they clearly distanced themselves from political claims made by some pedophile associations that justify child molestation or demand the same social rights as gay and lesbian people. By elaborating on their unique coming-out stories, this paper describes the strategies whereby they strived to find responsible ways to live as "normal" people in Japanese society.

YUN, AELIM* (*Centre for Labour and Welfare Law*)

Rebuilding Workers' Power Beyond Corporate Boundaries

The eruption of labour movement in the Global South since the 1980s was characterized as 'social movement unionism' (Waterman 1988; Webster 1988). However, there are few literatures on what challenges those newly-erupted unionism are facing with, under the pressure of globalisation and neo-liberalism. In South Korea, for example, union membership has declined, and what is worse, the gap of union presence as well as working conditions becomes larger, depending on firm's size, gender and employment types, for decades.

Against this background, we could reflect on how to rebuild and re-compose forces of labour, relying on Silver's work (2003). This requires us to tackle with such questions as: How the changing corporate boundaries and the division of labour have transformed the context of union power resources; and How the State has institutionalised the unbalanced power distribution between capital, labour and society.

Despite various institutional barriers to organizing workers, Korean unions also have made a progress in organizing precarious workers, who were regarded as the 'vulnerable' subject, and thereby, enhanced power resources since 2000s. This paper illustrates two cases with regard to organizing precarious workers across boundaries of company and individual workplace: subcontracted workers of Samsung Electronics Service and cleaners on the premises of university. In particular, unions' attempt to enhance associational and societal power will be reviewed and it would give some ideas for balancing power distribution between labour, capital and state.

In conclusion, this paper focuses on how workers' identity and the scope of solidarity has been built and could be rebuilt. For that, it argues that demands as to reducing competition among workers, providing workers with universal platform for security irrespective of employment status and building a strategic coalition with social movement should become a priority of union strategy.

The Fall of Primary School Teachers' Authority

Educational occupations in Russia have been, and remain, subordinate to the state and have only been subject to market forces at the margins. In this article,

we shall consider the changing nature of primary school teachers' professional knowledge and authority. We undertook a qualitative in-depth interview research in public and private Moscow schools. A new policy of the Ministry of Education and Science fostered changes of primary school education. It proclaimed the need to change the content of the school teachers' job and to build an open and collegial management system in school education. The introduction of these new school standards resulted in the increased workload of primary teachers, who were burdened with bureaucratic responsibilities. Even the record-keeping of teachers doubled. They were required to keep an electronic record of pupils' performance in addition to the hand-written records. The primary school teachers argued that state policymakers' detailed control over this professional work grew, as did that of the parents who made higher demands of primary school education. The professional community was discontented with the implications of diminished discretion and with the fall of authority. There was no much freedom of choice regarding learning programmes, textbooks and working routine. The population survey showed that only 39% of adults were ready to acknowledge the authority of school teachers. Schoolchildren challenged the authority of primary school teachers too. Even primary school children were aware of the various ways to acquire knowledge (Google, Wikipedia, YouTube, etc.). They did not need teachers as a source of knowledge in the same way as pupils did a few years ago. Teachers could not derive their authority just from their position and knowledge. The most desirable type of authority was personal authority, based upon merit and respect.

The Headscarf and Nikab Politics in France, the Netherlands and Germany: Appropriating Feminism and Negotiating Difference

In this paper, we analyze headscarf and nikab debates that unfolded in the first decade of the 21st century in France, the Netherlands, and Germany. Looking at newspaper articles, policy and legal documents, we understand attempts to regulate the headscarf and nikab as attempts to manage politics toward gender and Islam in three countries. We show that while formal regulations vary importantly between them, in all three countries feminist and feminist-inspired interlocutors enacted a form of governance feminism that largely promoted an exclusionary approach to the headscarf and nikab by relying on the rhetorics of secularism, state neutrality and gender equality. They equated forbidding or curtailing the wearing of the headscarf and nikab with advancing women's liberation. We show possibilities for alternative governance strategies that lead to more inclusive approaches to gendered difference by comparing the approaches to headscarf and nikab in three countries.

Epidemiologic Profile of the Indigenous People in Australia

Objective

To analyse the current demographic and health conditions prevalent among the Indigenous people of Australia and, where possible, to compare them with corresponding national data.

Data

The 2012-13 Australian Aboriginal and Torres Strait Islander Health Survey and the 2011-12 National Health Survey have been used. Both surveys were based on probability samples representing the Indigenous and the total population respectively.

Findings:

Among the lifestyle factors affecting health, smoking was much more prevalent among the Indigenous people; 42.9% of them were current smokers compared to 17.7% nationally. Also alcohol consumption among the Indigenous communities was nearly double compared to the national average. Nearly one-in-three of the Indigenous people were suffering from high/very high stress levels compared to one-in-ten of the national population.

In nine out of the 16 ICD groups, the prevalence rates among the Indigenous people were higher than the total population. The three most common conditions for Indigenous population were the diseases of eye and adnexa, respiratory and circulatory systems. Close to one-in-three Indigenous persons aged 15 or over were suffering from either a cardiovascular diseases (17.8%), and/or diabetes (11.7%), and/or kidney disease (2.3%). When compared to the national data, the prevalence of diabetes and kidney diseases among the Indigenous was about two-fold while the cardiovascular diseases were slightly less prevalent among the Indigenous people.

Policy implications

Despite the governmental efforts to bridge the socio-epidemiologic gap between the Indigenous and rest of the Australian community, progress is rather slow - it needs to be accelerated

Migration in the Era of Globalization: The Potential of Language Integration

In the modern world, the process of exchange of information, cultural achievements, and economic benefits is intensively proceeding. Globalization stimulates the migration movement, increases the multiculturalism of many countries. The study of the social and cultural aspects of migration and its possible consequences becomes actual.

Research subject: language integration of migrants.

Method: socio-cultural approach, quantitative analysis of Eurostat and World Bank data, materials of sociological surveys.

Migration, population displacement occurs in all periods of history, it has a positive impact on economic, scientific, cultural progress. Migration in a globalized world is large-scale, differs by its structure, economic motivation, the presence of many refugees from zones of armed conflict and natural disasters. Another peculiarity is that even migrants who have arrived for permanent residence in the host country regularly maintain communication contacts with relatives from the country of retirement via Internet resources, mobile communication, social network. Finally, a significant number of migrants know at a conversational level the global language - English. It can be assumed that unlike past migrations, now migrants can retain their linguistic and ethnic identity along with a new language and a new identity in the third, fourth generation. They will be multilingual and have multiple identities. Taking into account new realities, it is necessary to carry out migration and language policies, develop programs of language and cultural integration. Today there is a successful experience in Switzerland, Germany, the USA and Canada, began to implement initiative projects in Eastern Europe and Russia. This minimizes the manifestations of stress, shock, aggression, and removes barriers to the social integration of migrants.

Conclusion. Migration processes require the coordination of efforts of international organizations, national states, cultural -linguistic and public associations in forming the course for a successful policy of harmonizing interests and values of migrants and local communities.

YUSUPOV, MUSA* (*Chechen State University, Law Faculty*)

The Crisis of Trust-the Crisis of Communication in a Changing World

Trust is a value shared by all people, regardless of their cultural, religious affiliation and social status. However, in modern reality, there is a crisis in many spheres of life, in the system of international and domestic relations. This actualizes the need for study of the state and prospects of trust relations development between various subjects.

The subject of research is trust in social and intercultural communication.

Method: sociological and cultural approaches were applied, World Values Survey data were used as well as indicators of Russian and regional sociological surveys.

Trust is perceived as a state of the individual and positive expectation of actions from the communicant. It is a value and means of successful communication of individuals and groups, representatives of states, realization of joint projects. It is advisable to consider trust at different levels and in different contexts, ontological and existential contradictions in the system of economic and cultural relations, for example, along the lines "South-North", "East-West". Another field of manifestation trust manifestation is communication between two or more states or coalition of states for solving problems in the economic, political space-area. Within the state, trust-distrust is manifested in communication at the interpersonal, group and institutional level. The barriers to confidential communication are the violation of established and agreed rules, the lack of commitment and responsibility in one or both sides of interaction, as well as the polarization of social groups by income, inequality, legal insecurity of citizens, etc. Mismatch of interests, not the desire of communicants to recognize basic values generates a crisis of confidence, and this entails a crisis in communication.

Conclusion. The measures of economic integration and rapprochement of cultures, the strengthening of interreligious tolerance, the creation of various supra-national associations will promote confidence in the changing world.

Housing, Environment and Community: The Case of Khutsong

This paper reports on research conducted in the Khutsong municipality, North-West Province, South Africa since 2013. In 2004 a presidential project was announced to resettle the Khutsong township because it was built on a dolomite hazardous area that causes sinkholes. For this purpose the biggest town redevelopment programme in South Africa was undertaken. As the project unfolded it was clear that different socio-political processes were running concurrently impacting on the outcome of the project. Town planners, local politicians, provincial government, national government, contractors and community members all had different perspectives and expectations of the project. In creative ways these different parties attempted to benefit from this major project and let it work to their advantage. Although the housing was provided the resettlement failed. The outcome of the project was therefore not necessarily in the best interest of any of the parties – it became a matter of each seizing what they can from the material opportunities presented to them. This case study demonstrates the dynamic relationship between a community and housing and environment and how poor households used this risk scenario as a tool to enhance their disadvantageous position by profiting with regard to housing. It illustrates how the parties in this project could constrain the choices of others through a multi-directional interplay of efforts to domination and secure thereby the compliance of others. Khutsong is thus a salient example of professional risk management clashing with political instincts and how inequality, exclusion and inclusion become complex concepts in such a material scenario due to the skills people have to exploit such major projects.

The Urban Effects of Privileged Jewish Immigration and Tourism on Jerusalem, Israel

Israel is an ethnic migration country with an open-door policy for Jews and extensive support benefits for immigrants. This structure privileges all Jews contemplating immigration to Israel, or even just investing money there. Yet the state has additional policies regarding highly skilled and economically affluent immigrants, particularly from Western countries. These policies aim to assist absorption, reduce bureaucracy, provide tax exemptions and benefits, and facilitate professional integration. Israeli cities are trying to attract high-status migrants from Western countries, and Jerusalem, the focus of this paper, is attracting the largest percentage of them. Since Western Jewish migration to Israel began following the 1967 war, several parts of the city became particularly attractive to these immigrants, and they established ethnic enclaves there. These inner-city neighbourhoods, close to the city centre and the Old City of Jerusalem, are not only attractive to new immigrants but also to tourists and second-home buyers who seek prime locations but also suitable communities of like-minded people and the amenities surrounding them. While this leads to growing bottom-up demands for housing in these areas, the Jerusalem Municipality, which has been seeking foreign investment for years, approved large and small-scale developments of luxury homes and hotels in many parts of the inner-city, particularly aimed at Diaspora Jews. While some projects are yet to be built and populated, it is already clear that the result of these top-down planning policies is transnational gentrification: inner-Jerusalem is becoming unaffordable for Israelis, who are pushed out to the city's suburbs. Indeed, Jerusalem's transnational gentrification has a particular context, but in effect, these are processes occurring and affecting many other cities wishing to attract high-status privileged foreigners to live, invest or visit there, much on the expense of local communities, unable to compete on housing prices.

How Social Media Affects the Lives of UAE Online Communities

Over the last two decades UAE invested greatly in Information Communication Technology (ICT), facilitating them not only renew but enlarge ICT infrastructure via the employment of new technologies. Also UAE implemented a liberal approach towards ICT development, and opened its telecommunication sector to the business and to overseas investors, reduced internet restriction, effectively increased the capacity of operations and services to meet the demand of markets. This liberal ICT policy allowed to strengthen the country's development and modernization. It is worth also pointing out that UAE not just lead Middle East and North Africa region in the use of ICT but country ranked as 29th globally

by 'The Global Competitiveness Report 2016–2017', annual report conducted by the World Economic Forum. The paper has examined the impact of social media on UAE online communities by giving sociological account of its use and consequences among local users. The paper has identified the key features of online communities and described different levels of interaction and participation among communities' members. The popularity of such social media platforms as Twitter, Instagram and Facebook, Snap chat and WhatsApp messengers will be explored in presentation. The subject of presentation is what users tweet at Twitter, what actually people post on Instagram and Facebook, and what kind of voice and text messages users are sending via Snap chat and WhatsApp; the ways users posting comments, uploading pictures, articles and video clips, sending voice and text messages will be identified. Specifically detailed account about post's content, the amount of the types of the posts such as social and cultural ones will be given. Finally the idea of presentation is to explore how UAE's communities actually using social media today, to examine the impact of social media on people's relationships, with the focus on family, gender and consumption.

Max Weber's Concept of Patrimonialism in the Political Structures of Latin America

Max Weber's Concept of Patrimonialism in the Political Structures of Latin America

The paper explores the reception and utility of Max Weber concept of patrimonialism to study the political structures in Mexico, Brazil and other Latin American countries during the Colonial Times and in the contemporary world. Within the framework of an historical long term comparative analysis, the study shows how -despite the democratic trends of recent decades- neo-patrimonialism can be used as a theoretical perspective to analyze the continuity of political structures and behaviors that explain the preservation of corruption, clientelism, corporatism, leader's discretionary use of power, and a value system where the legal framework does not always match with everyday practices and morals.

As a subtype of traditional domination, patrimonialism is considered as a pre-bureaucratic type of domination based on personal submission and piety that differs with the power bases of feudalism based on social honor and prestige. Nevertheless, as Weber mentioned in his theoretical-methodological writings, the different forms of dominations should be considered as "ideal types". As the case of Latin American countries shows, in the different historical realities we often find a combination of them: bureaucratic patrimonialism; patrimonialism domination with charismatic elements of leadership; neo-patrimonial technocracy, and so on.

Creating 'Home' Away from Home: The Home Making Practices of Female Refugees in Greece

This paper focuses on refugees' perceptions of home and homeland as well and their homemaking practices in Greece. Based on participant observation and in-depth interviews with female refugees in different reception facilities in Athens and the surrounding areas, the paper explores these refugees' efforts to symbolically and physically recreate homeland and 'home' in a variety of ways. Having experienced violence, multiple losses, separation from family and the destruction of their social and communal networks, they face multiple additional challenges in the host society associated with their transient status as asylum seekers, their racialization and exclusion due to their ethnicity and/or religion and

their uncertainty about the future. Using various homemaking practices, they try to turn the (shared) physical spaces in the controlled and surveilled institutional settings in which they currently reside (i.e. refugee shelters, camps) into 'homes' for themselves and their families. Through their day-to-day practices, daily routines and material artifacts, they try to instill a sense of 'normalcy' into their lives, renegotiate identity and belonging and symbolically recreate home away from home to counter their feelings of homelessness and uprootedness.

Young Refugees in the Economically Stricken Greece: Narratives of Dislocation, Changing Self-Perceptions and Life Trajectories

This paper focuses on the narratives of young refugees currently settled in the debt-stricken Greek society. This special category of forcibly displaced individuals is studied in relation to its identification with or differentiation from origin and host society taking into account the distinctive characteristics of young people and youth culture. Greece, as the host/ transit country, provides the context for varied (re)interpretations, perceptions and expectations which are also informed by the consequences of the economic crisis. Our study on the interpretations and expectations of young refugees is based on 5 life stories of individuals who, despite differences in terms of their social characteristics (i.e. ethnicity, gender, family's former socio-economic status), they share in common their high(er) educational capital. Through their personal narratives, we analyze: the (dis)continuities of their transition from home to host country, the ways in which they manage dislocation and loss, the disruption of their former social/communal networks, the current challenges they face and their assessment of the present conditions of living; the frustrations resulting of their temporary status as asylum seekers, their changing self-perceptions, as well as their aspirations and future prospects.

The study, which is currently conducted (2017), takes place at a moment in time when the prospect of young refugees' relocation remains ambivalent and when most natives seem to have 'compromised' with the idea of refugees' (permanent) settlement into the country.

„There Is No Bad Weather There Are Only Wrong Clothes”, Determinants of Quality of Life and Well-Being Among Polish Migrants in Norway

Economic migration from Poland to Norway is a relatively new trend that has intensified immensely after Poland joined the European Union in 2004. Polish migrants have been the largest immigrant community in Norway since 2009.

The presented sociological research is carried out in two regions: Pomerania and Rogaland. This design leads us to obtain very precise image of Polish labour migration to Norway and to depict differences between two similar groups.

In our research, among other topics, we have analyzed the changes in everyday-life choices made by men and women when dealing with domestic duties division and work-life balance. 280 in-depth interviews were conducted with forty Polish couples. The results obtained show **the dynamics of quality of life changes** fostered by migration experience including integration and acculturation processes.

Polish migrants in Norway have much more free time than Polish couples in Poland. They use it to have family quality time, to stay fit, to develop own plans and dreams. They feel less fatigue. They claim they have enough money, they have access to recreation, they do not feel discrimination nor because of their nationality, nor age nor gender.

Additionally sport and physical activity as a means of transmission of cultural patterns and a significant en in the acculturation of migrants (Berry 1996). The aim of the paper are:

- to show how joining physical and sports activities which are widely popular in the host society in fact means joining the mainstream of its culture.
- to show intercultural gaps and misunderstandings leading to separation strategy (Berry 1996). Consequently the statements of the interviewees should be understood in a broader context referring not only to participation in Norwegian culture, but also to shaping the **quality of life and well-being** of Poles living abroad and to have their subjective evaluation regarding them.

Balanced Development Index for European Countries

The paper will discuss an idea behind composite Balanced Development Index (BDI) and its application to assess socio-economic development in European OECD countries since beginning of the XXI century. BDI was initially developed for Poland and recently modified for international comparisons. Its conceptualization can be placed in broad "beyond GDP", "quality of life" and "human flourishing" theoretical traditions. So far, various indexes constructed and applied in these traditions either have neglected economic aspects of development at all, or have grossly overemphasized its social aspects. BDI is beyond but not apart of GDP, since GDP constitutes one of its components. Moreover, BDI gives equal weight to economic and social aspects of development. It is composed of four middle-level composite indices measuring: (a) functioning of the country's economy in its external (international) surrounding, (b) the domestic (internal) economic situation, (c) public predictions of future economic and social situation, and (d) the current social situation, quality of life included, measured by both public evaluations and objective social indicators. The paper compares the development in all these four spheres and the socioeconomic development as a whole in all European OECD countries. The analysis shows that the best time for European countries in XXI century was right before the last economic crisis, and that people grossly overreact to actual changes, especially in terms of their predictions. The changes in GDP and comprehensively measured socio-economic development were almost parallel before the crisis, but there is a recently growing gap between rapidly rising GDP and much less changing BDI. It may be concluded that: (a) BDI reflects changes in socio-economic development much better than GDP; (b) post-crisis economic growth takes place to a significant extent at the cost of slower improvement of human conditions. In addition to these general conclusions, the paper will discuss intercountry differences.

Scoping the Workforce of the Future: The Role of Personal Support Workers in the Healthcare Division of Labour

Globally the capacity of health professions to deal with healthcare issues in modern societies is rapidly being outrun by such factors as the development of new health knowledge, an ageing population and changing patterns of illness. Accordingly, there have been a variety of responses to this resource strain, from online communications as a means of obtaining health care knowledge, to the growing role of informal carers and volunteers – often under the supervision of health personnel. In the healthcare division of labour, doctors themselves have also devolved many tasks to less well paid health professionals through increased interprofessional collaborative working. In utilizing lower paid workers, both financial and resource strains in terms of time provided by more expensive professionals can be reduced. By far the largest body of workers involved in healthcare is the fast-expanding group of generally low paid personal support workers who typically outnumber health professionals like doctors and nurses and play a key role in coordinating and delivering care in many settings. From contemporary data presented from Canada, though, it is clear that this group is largely operating not only in precarious conditions – with, amongst other things, low pay, zero-hours' contracts and short-term working – but also in a heavily unregulated environment, with limited educational requirements. If utilization of these workers to address limited health care resource capacities continues to increase, as projections suggest, then the need to consider policies that allow for better conditions for these workers is paramount. Drawing on the experience of Canada, this paper considers how the role of personal support workers in the future might be enhanced further in terms of power and justice through policy change in order that they can become an even more effective workforce in supporting users and serving the public interest alongside other health care personnel.

ZAHNER, NINA* (*Kunstakademie Duesseldorf / State Academy of Fine Arts Duesseldorf*)

The Aesthetics of Art Audiences

The paper argues that there is an orthodoxy of approach to the study of audiences of classical concerts, operas and fine art exhibitions in sociology. The paper shows briefly how different studies on fine art and classical music audiences integrate normative ideas in their study design by drawing explicitly or implicitly on prominent social theories such as Max Weber, Pierre Bourdieu and Georg Simmel. It also shows briefly how studies drawing on an ethnographic tradition (Howard S. Becker, Merleau Ponty, Bruno Latour) often get lost in detail or start to integrate very naively concepts of art and art audiences in order to come to an interesting interpretation of their material. It is argued that these modes of studying fine art and classical music audiences does actually steady established power relations within society and the arts. The paper will suggest a different methodological approach to art audiences: An approach that focuses the actual situation of art reception and its modalities in an ethnographic perspective and contextualizes this situation historically, socially and aesthetically. In order to do so it is suggested to integrate system theory in the tradition of Niklas Luhmann

- used as as research method and not as a theory - with Howard S. Beckers approach. What is actually suggested here is an elaborated version of field theory that avoids its normative implications and that differs significantly from the sociology of conventions by Luc Boltanski and Laurent Thévenot as it integrates the aesthetic discourse differently in its methodological architecture.

RC37-658.5

ZAHNER, NINA* (*Kunstakademie Duesseldorf / State Academy of Fine Arts Duesseldorf*)

The Normativity within Methodology, the Normative Implications of the Sociology of Art Audiences and Cultural Consumption.

The paper argues that there is an orthodoxy of approach to the study of audiences of operas and art museums in the cultural science and art sociology. This approach draws on bourgeois ideas on art and music (for example on the idea of the autonomy of art) and integrates these in a very subtle, unreflected way in their study design. It thus delegitimizes other approaches to art and its reception practiced by non-bourgeois groups of audiences. It instead ensures the domination of bourgeois ideology within established institutions of music and the arts and helps to keeping out other kinds of audiences. The paper shows *how* different methodologies integrate normative ideas in their study design by drawing explicitly or implicitly on prominent social theories such as Pierre Bourdieu, Theodor W. Adorno or Alfred Schütz.

The paper thus shows *how* these theories do construct opera and arts audiences and how this steadies established power relations within society. It thus takes social theories as empirical material and analyses where these theories do locate audiences in their theoretical architecture and explains *why* they do so by contextualizing them historically and socially. It makes thus visible *how* these theories do construct audiences and *why* they do it this way and *how* this shapes contemporary research methodologies in the field of audience studies. The paper will close with suggesting a different methodological approach to art audiences. An approach that does not simply reproduce existing ideologies and power relations but makes visible how and why certain audiences segments reproduce or question existing ideas on art and its reception. To do so the paper suggests an integration of pragmatism and system theory.

All That Glitters Is Not Gold. Inequality of Labour Market Outcomes Among Polish STEM Graduates.

The labour market outcomes of education have received much attention from scholars as well as policy makers and the media. It is a well-established fact that education is strongly related to earnings and that university graduates fare better than their less educated counterparts (Card, 1999; Hout, 2012; Pascarella & Terenzini, 2005). However, educational expansion observed in developed countries makes the horizontal dimension in higher education more important in explaining social stratification (Ballarino & Bratti, 2009). The field of study is one of the key characteristics differentiating higher education graduates and their careers. There is ample evidence of the importance of the academic discipline for graduates' labour market outcomes coming from many countries, including: USA (Kim, Tamborini, & Sakamoto, 2015), Italy (Ballarino & Bratti, 2009), UK (Blackaby, Murphy, & O'Leary, 1999), Germany (Görlitz & Grave, 2012), as well as Netherlands, Norway, and Australia (van de Werfhorst, 2004).

Poland is one of the countries which experienced rapid expansion of higher education in recent decades. It was accompanied by the rise in unemployment rate among tertiary education graduates. These developments sparked a vivid debate on the quality of higher education and eventually led to the establishment of the Polish Graduate Tracking System (ELA) using administrative data to monitor the labour market performance of the entire population of graduates.

In the presentation, we discuss the differences in the labour market outcomes of graduates of various disciplines. We focus particularly on the fields of Science, Technology, Engineering, and Mathematics which are presumed to lead to the best labour market positions. We demonstrate that, contrary to popular opinion, only some of the STEM disciplines give their graduates an edge on the labour market while the rest struggle to achieve results comparable with those of graduates of Humanities and Social Sciences.

ZAJAK, SABRINA* (*Ruhr-University Bochum*)

Book: Transnational Activism, Global Labour Governance, and China. Palgrave, 2017

This book explores rising labor unrest in China as it integrates into the global political economy. It highlights the tensions present between China's efforts to internationalize and accept claims to respect freedom of association rights, and its continuing insistence on a restrictive, and often punitive, approach to worker

organizations. The book presents a novel multi-level approach capturing how trade unions and labor rights NGOs have mobilized along different pathways while attempting to influence labor standards in Chinese supply chains since 1989: within the ILO, within the European Union, leveraging global brands or directly supporting domestic labor rights NGOs. Based on extensive fieldwork in Europe, the US and China, the book shows that activists, by operating at multiple scales, were on some occasions able to support improvements over time. It also indicates how a politically and economically strong state such as China can affect transnational labor activism, by directly and indirectly undermining the opportunities that organized civil societies have to participate in the evolving global labor governance architecture.

ZAKHAROV, NIKOLAY* (*Södertörn University*)

Racism in Former Soviet Republics: A Critical Account

In assuming that racism is solely a part of the West's histories and horizons Soviet and post-Soviet polities have largely been ignored. This presentation discusses a set of case studies drawing on a wide range of new evidence and a new theoretical framework which inserts the post-Soviet experience into our global understanding of racialisation. The self-contradiction within colonialism - to civilize its others while also securing their otherness - has been transformed within the communist experience into an internal civilizing mission intended to secure the privileged otherness on the global stage. The repercussions of this program continues to provide national specificity to the engagement with the concept of race and racism in post-socialist societies. Investing in 'whiteness' after the Berlin Wall-era has represented a western, modernist approach for guaranteeing that post-Soviet states states will find their own proper place in the dominant discourses of the developed and civilized First World. Thus, racialization in post-Soviet states operates in a peculiar fashion. On the one hand, it serves in moulding the new nations and is the constitutive process of modernity. On the other hand, racialization processes maintain the idea of exceptionality, that is they became firmly established during many decades of communist power, that the socialist nations are nations created as part of an 'alternative modernity'. The strategies described above aim at the transformation of the western system of knowledge in the postsocialist space, and they imitate, to differing degrees, the master discourses of the 'colonizer'. This nevertheless leads to a creative, interactive processing of the original discourse that activates the strategies of racialization. In this context self-racialization can be understood as an attempt to rediscover the authenticity that has been lost - or stolen by the Soviet regime.

Access to Resources in Various Life Aspects As a Predictor of Attitudes Towards "Others" Among Young Adults from Poland and Israel

The theory of a real conflict (Campbell) presupposes that limited resources lead to conflict amongst social groups that compete with each other, of which stereotypes, prejudice and the discrimination are the consequence. The idea of the research was to check whether this concept will be applicable to explain social antagonisms in contemporary Poland and Israel, especially in the discourse about minorities, migrants and refugees. These two countries differ significantly in terms of society structure, with Israel being much more diverse as minorities constitute approximately 40% of its population and Poland extremely homogenous, with less than 3% of inhabitants of different cultural context.

The research was carried out in the years 2015-2017 on the group of 254 young adults from Poland (N=131) and Israel (N=123), both men and women aged 18-28. The methods used were both quantitative and qualitative, including self-descriptive questionnaires, individual interviews and focus groups. At first, respondents were asked about their satisfaction with available resources in various life aspects. Secondly, the attitudes towards other social groups including religious, national and ethnic minorities were measured. The way of choosing the research group was especially significant since it consisted of individuals working as or planning to become teachers and educators. As such, they will play an important role in shaping attitudes of a young generations. This is why observing and influencing their approach seems to be crucial for xenophobia prevention among members of the two societies.

In both Polish and Israeli sample, a number of correlations was observed between examined variables that allows to assume that improving life satisfaction and sense of stability among young adults may significantly reduce their negative attitudes and raise openness towards "others". Also, the role of contact with representatives of one of the minority groups and its quality was measured and discussed.

RC51-848.4ZALFACKRUDDIN, ASIF* (*University of Guelph*)*The Surveillance Power Continuum*

In modern society, two concepts that have become interdependent are surveillance and power. In large part, this is due to rapid advancements in technology that have not only changed the way we think about surveillance and power, but have also changed how surveillance and power operate. However, academics continue to struggle with accepting a uniform definition of the concept of surveillance and understanding the impact of surveillance power. The problem academics face in regards to agreeing upon a uniform definition of surveillance is that surveillance has become a blanket concept that covers many acts and actions. Therefore, it is imperative to deconstruct the blanket concept of surveillance into three distinct categories: traditional surveillance, sousveillance, and dataveillance. The difficulty academics face in regards to understanding the impact of surveillance power is that surveillance power is no longer a phenomena fixed to physical space. Technology has changed the landscape of society, creating three distinct worlds where social interaction can take place: the physical, the digital, and the cyber worlds. As a result, understanding surveillance power means understanding the goals, visibility, actors, and boundaries associated with it as it is applied to each world. Drawing upon a Foucauldian and Castellan framework, this research aims to shed light on the interdisciplinary impact of surveillance power in a rapidly evolving technological society. Preliminary findings suggest that surveillance power exists in a fundamentally different form as it travels from the physical world, to the digital world, and finally to the cyberworld.

RC29-532.2ZALUAR, ALBA MARIA* (*IESP/ UERJ*)*The Endless Repetition of Dealings/ Killings and the Rule of Law*

One cannot understand public security in Brazil without taking into account organized crime in drug trafficking, that is, a global perspective. In Brazil, mafia-type organization arise from bank robbers that were put together with political prisoners during the military regime and learned from the latter the importance of organizing themselves. Prison was the place where the former started factions for protecting prisoners from their attackers and scammers. Soon they discovered that drug dealers were making a lot of money without the risk of being accused under the National Security Law. As prisons are porous systems, common prisoners started to blackmail and intimidate traffickers for the protection they could be offered when arrested. Drug dealers pay bribes to policemen, lawyers, actors in the crime scene. There is a continuous string of strategic games wherein many partners' intermediaries, and opponents participate in order to avoid detention. The narratives are endless, and the negotiations with policemen linger on unpredictably, with retail dealers spending most of their time negotiating and paying dearly for their freedom. It is this chain of interactions that finally binds them to the rules of negative reciprocity based on blackmail and threats that criminal factions employ, the only possibility of protection inside a prison where they can die for nothing. Game theory called that an "endless repetition of interactions," in which partners learn how to act cooperating and being strong. What are the differences between the exchanges of drug dealers and policemen, vis-a-vis the dealings between faction members? As long as the institutional players in these games do not agree to the rule of law, those involved in crime will continue to overpass law, and to wage war with policemen. What explains crime is not poverty, but the opposition to the democratic rule of law.

RC53-878.5ZAMAN, MUHAMMAD* (*Department of Sociology, Quaid-i-Azam University, Islamabad*)ABBASI, ZULARSH (*Department of Sociology, Quaid-i-Azam University Islamabad*)*Voices of Children's, Social Security and Well-Being in Rawalpindi and Islamabad, Pakistan*

Children's well-being is measured with various indicators like well becoming and welfare in education, health, and provision of basic necessities of life. This article focuses on the children's voices regarding their social security and being safe in uncertain situations. Perspective of the children's well-being is analyzed in this paper. A 30 children from the age of 8-12 years of Rawalpindi and Islamabad, Pakistan participated in this research. The data was collected with the help of interview guide. These children drew maps and pictures to reflect their feelings. The findings of the study revealed that children were concerned about their social security and welfare. In the children's perspective, family is responsible to secure social, emotional and economic welfare. Children need money to fulfillment of the basic necessities of life and provide shelter and secure them from any threat but with the consent of the children. However, they mentioned that their consent is not counted. They also showed resilience to the corrective control of their guardians. Meanwhile, some of the children voices were also in favor of the strict control on the children and they justified parents' authority.

They want freedom in action and speech whereas its mere absence makes them sad. Children mentioned that they feel safe in the presence of people like parents, friends, siblings, teachers and security guards. They wanted to be master of their personal welfare and security. Nevertheless, the children were in favor of independence of agency and they wanted to get freedom from the structural control.

RC33-610.7ZANGGER, CHRISTOPH* (*University of Zurich*)*Missing(s) in Space: Monte Carlo Simulations and a Bayesian Approach to Missing Data in Spatial Econometric Models*

Missing data is a common concern to researchers in the social sciences. Whereas this issue has received increasing attention in sociological research based on survey data (Allison, 2001; Rubin, 1987), researchers face additional challenges when addressing missing data in spatial econometric models. Unlike in the non-spatial case, ignoring missing data is not only a problem in terms of introducing bias when the missing process is at random ('selection on observables'; MAR) or not at random (the reason of missingness is related to missing values; MNAR – Allison, 2001), but also if missings are completely at random (MCAR – Kelejian and Prucha, 2010). Due to the interdependence between units and the corresponding spatial multipliers, ignoring missing data introduces bias in spatial econometric models in any of the three cases (LeSage and Pace, 2009; Wang and Lee, 2013).

Using Monte-Carlo simulations and an empirical application from the field of political science, this paper addresses the outlined problem by means of a Bayesian framework. It can be demonstrated how the amount of bias introduced in parameter estimates is almost independent of the nature of the missing process, although it is marginally lower in the case of missings completely at random. Additionally, the amount of bias generally increases with the strength of the underlying spatial association across all different specifications. Finally, allowing for the simultaneous imputation of missing values and model estimation, the pursued Bayesian approach – although computationally intensive – offers an adequate framework to address this bias introduced in models with spatially lagged variables (and/or errors).

RC28-520.4ZAPFE, LAURA* (*Julius-Maximilians Universität Würzburg*)*Gender Wage Gap in STEM Fields in Germany*

Girls are being recruited to the STEM sector (science, technology, engineering, math) in order to compensate for the skills shortage in that area. At the same time, the STEM fields are considered to be very profitable compared to other subjects. However, the STEM fields also suffer from the gender wage gap (GWG). Among academics, the GWG is mainly driven by the gender-specific choice of field. Most studies compare the GWG in the STEM fields with those in all other fields. By doing so, they ignore the large heterogeneity within the STEM fields e.g. regarding the share of women. These differences have not been taken into account in previous studies. So how can we explain the GWG in the STEM fields? I use socialization theory to illustrate a gender-specific evaluation of individual STEM subjects. In addition, I use Human Capital Theory to highlight gender-specific differences between women and men in work experience and in gender-specific parental leave duration. Furthermore, I apply gender-status beliefs theory and the theory of statistical discrimination to argue that there are gender-specific differences in employment characteristics. To test the hypotheses derived from these theoretical approaches, I analyze data from the graduate panel (2001) of the German Centre for Higher Education Research and Science Studies (DZHW). I perform an Oaxaca-Blinder-decomposition to check which variables have an influence on the GWG in the STEM fields. The results show that the choice of STEM field can explain the highest percentage of the GWG, followed by the work experience and the gender-specific parental leave duration. There is a political need for action in relation to the GWG in order to reduce the gender-specific behavior that leads to a gender-specific choice of STEM fields and to promote family-friendly working conditions in the STEM sector.

RC23-436.2ZÁRATE VÁSQUEZ, JULIO* (*Grupo de Análisis para el Desarrollo*)CASTRO, JOSÉ (*Pontificia Universidad Católica del Perú*)RIVERA, FERNANDO (*Universidad Nacional Mayor de San Marcos*)*An Analysis of the Implementation Process of Public Policies of Nanotechnology in Latin America*

In this paper we discuss the main consequences of the implementation of nanotechnology public policies in the region in recent years. We focus on three specific areas: environment, health and consumption. At the same time, an analytical review will be elaborated based on the industrial and productive sectors from those countries with advanced systems of technological innovation. Considering the inherent risk from the introduction and production of new technologies, and the consequences thereof for the safety of consumers and

workers, we will evaluate the regulatory mechanisms that different governments use in the context of the growing expansion of nanotechnologies in Latin America.

Voices of Transition: The Role of Families in Young People's Transitions

During the transition to adulthood, peer relationships have been in the focus of research while the role of family members has been less studied. This contribution sheds light on young people's transition processes from school to work and on the meaning and relevance they attribute to their families during this life phase. Theoretically based on the life course perspective and on resource theory, we explore how young people perceive and utilize support from their families, but also how families and their ingrained expectations can be 'in the way'.

The data base consists of biographic-narrative interviews with 107 young people (39 girls, 69 boys) aged between 13 and 16, coming from families mainly with underprivileged socio-economic and many with migration backgrounds. At the time of the interviews, far-reaching choices had to be made, as respondents had to decide about their last compulsory school year, their educational future and their prospective vocational training.

Results showed a great variety in the extent of support and in respondents' perceptions of support. While many considered parents', siblings' and other kin's experiences as a valuable resource, others experienced it as hindrance. The respondents' assessment of support by family members had a major impact for young people's perception of their future prospects as manageable or menacing. We conclude that the family context appeared to be salient for understanding how young people travel through the demanding transition process from school to work.

Critical Discourse Analysis and Linguistics' Impact on Sociology

The paper will present an analysis of the development of the so-called critical discourse analysis as a field of interaction between linguistics and sociology, also taking into account the role of other disciplines such as anthropology, philosophy, cognitive psychology or political science. The paper will show, how linguistics which is a dominant actor in that field, has managed to define the basic frames of the critical discourse analysis and discourse analysis as such. As it will be argued, in this way, sociology has been considerably marginalized in a broader context of social sciences as it was not able to play a decisive role in the emergence of this important interdisciplinary field. It will be in particular shown that sociology was not able to take full advantage of the so-called discursive turn. Rather in its effect, sociology has been itself strongly influenced by paradigms and concepts representing competing disciplines, in particular, linguistics but also philosophy of language. Diffusion of sociologist's works within the discourse turn, such as Habermas' should of course also noted. However, its scope seems restricted in comparison to external influences to which sociology has been exposed at the same time. The paper will try to offer both an interpretation of selected causes of the above-mentioned dynamics as well as to present its key and lasting impacts on contemporary sociology. That analysis will be also carried out against the background of the history of earlier interactions of sociology and linguistics, including sociolinguistics, semiotics, and linguistic pragmatics.

Concepciones De Militancias Y De Política Feminista De Mujeres Jóvenes Participantes EN Organizaciones Políticas Emergentes EN Chile

Producto de la crisis que atraviesan las militancias tradicionales en Chile, cuestión que permite hablar de una crisis de participación en la política tradicional, han emergido "nuevos partidos políticos" u organizaciones que intentan transitar hacia un modelo organizacional distinto. Este es el caso del Frente Amplio (FA), compuesto mayoritariamente por personas menores de 36 años. Estas nuevas configuraciones organizacionales, han instalados como uno de sus ejes, el tema del(os) feminismo(s), constituyendo "frentes feministas" en casi todas esas colectividades. Por otra parte, ha comenzado a visualizarse un variopinto de colectivos feministas que no quieren transitar hacia la conformación de estructuras tradicionales, porque lo consideran un diseño que tiene una impronta patriarcal (la estructura de partido), pero que tienen como objetivo realizar incidencia política. Muchos de esos colectivos son conformados

exclusivamente por mujeres, al contrario del FA por ejemplo, donde hay jóvenes hombres, que intentan marcar una diferencia con la historia del movimiento feminista, discutiendo el uso de la categoría de género.

En este contexto se enmarca la investigación sobre militancias y política feminista de mujeres jóvenes participantes en organizaciones políticas emergentes en Chile, la cual tiene como objetivo: i) identificar las conceptualizaciones que tienen sobre la militancia, identificando los elementos de continuidad y ruptura entre las antiguas y nuevas formas de militancias y prácticas; ii) indagar en las formas en que se están manifestando hoy en día las militancias y la política feminista, identificando sus principales características, tensiones y desafíos; y, iv) analizar las conceptualizaciones de militancia y prácticas con las concepciones de género y la participación de jóvenes hombre en el movimiento, cuyos resultados quieren ser expuestos en el congreso.

Gender Gap in Math Aversion. Explaining Propensity to Choose Advanced Math at High Stake Exam in Poland

Some researchers show that average score differences between sexes on standardized tests are small or insignificant, while others alarm that girls have lower math self-esteem, more of them worry about math failure and are less likely to enter math-oriented majors. Altogether it suggests that other than cognitive factors influence females' decisions to pursue STEM career. We address this issue using data from Polish high stake matriculation exams. Specifically, we investigate the differences in probability of taking advanced exit exam in math for high school students while looking at statistical effects of skill and of school. Both our hypotheses: (1) that gender gap in math aversion diminishes with higher skill levels, and (2) that general high schools narrow that gap, are falsified. Application of mixed models proves important in that respect as it changes some of the key outcomes. The results have implications for the theory concerning educational choice and gender gap in STEM.

ZBIERSKI-SALAMEH, SUAVA* (*Haverford Institute*)

The Collaborative Design of a 'Community of Solidarity': Reflections on Designing a Center Square in a Rural Community in Western Poland

This paper explores creation of a 'community of solidarity' based on the author's collaborative work with a county government and Poznan architecture and sociology departments on designing a Community Center. The project is taking place in a rural community, against the backdrop of community's post-socialist transformation--changing its' economic profile from agricultural to industrial/service sector, MNFs entrance, doubling the population through migrations, becoming a bedroom community.

The collaborative work on designing the community Center presents a major departure from the standard practices in Poland, both in the approach to decision-making on the local government level, and in terms of the project objective. The project expresses a deliberative decision-making across institutional and disciplinary boundaries, where government partners with the NGO and the Universities in a non-hierarchical way, and in a conceptual openness. The objective of the project is also unique--against the construction of commercial Centers across Poland, the design of the central space in the community is driven by the concern of individualization, atomization of the community, supremacy of the personal interests, and the concern of the socialist legacy of 'familial egoism' (Skapska 1998). Thus the sociological- architectural-governmental efforts in designing the Center Square were focused on developing a space that prompts micro-practices of a new social commitment, intergenerational convergence and formation of common interest. The Center's central building - The Center for Democracy - through permanent exhibitions, workshop areas, gathering places, coffee house--are to cultivate individuals who socialize with others, develop informal relations and recognize their responsibility for common-space as 'common good', thus becoming more engaged citizens of their smaller and larger 'communities of solidarity'.

The project represents intervention on the institutional level but also aims to alter micro-practices of post-Sovietic individuals.

The Tragedy of the Anticommons As an Unintended Outcome of the Privatization Drivers in Poland

The neoliberal promise of post-socialist transition was a trajectory from state to private property. Thus the centerfold of reform programs of post-socialist regimes were the privatization drives. The binary model of the state property as a negative, homogeneous category connoting an absence of real property, has

underpinned theoretically the privatization drives. An abundance of scholarly works have shown the changes in property arrangements in Eastern Europe not synonymous with directed-from-above privatization drives'. Yet, a relative absence of studies of nature of property in post socialism persists (Kowalik, 2009). This paper employs the concept of **conjoint** property in an attempt to coin a positive content of ownership under state socialism. Focusing on the content of property bundles, the conjoint property draws a fundamental distinction from capitalist private property, and its assumed 'indivisibility' of rights to assets. Instead, Conjoint property denotes ownership where distinct parcels of rights to shared assets were assigned to distinct property subjects. The conjoint property concept, the author of this paper had developed on the basis of her ethnographic, comparative analysis of the ownership realignments in agriculture in Poland, early in the post socialist reform implementation. (Zbierski-Salameh 2012). The paper describes a case study of a current ownership change in real estate in Poland, to explore a lasting significance of her earlier theoretical conclusion about the trajectory of conjoint property into **incomplete exclusive** property. As she observed in Polish agriculture, she also observed in the current case study, that the post-socialist property's rebundling of rights to assets, produces rights' overlapping, amounting to what Heller (1998) describes as tragedy of anticommons. The legally recognized exclusive owner experiences limitations on her privilege of use of the real-estate assets by other claimants collecting on their rights of exclusion. An underuse of the asset results, instead of the expected greater economic effectiveness.

(De)Constructing Womanhood: Adolescent Personal Blogs and the Political

Researching teenage political activity online proves difficult for many reasons, both ethical and methodological (Bromseth 2002). One of them is the fact that young people rarely share their opinions directly in social media. They seem to have no political views, but research conducted offline (Jurczynsyn, Stefanski 2017) proves that this is not the case. While creating digital identities, adolescents tend to communicate their perspective in a less direct way: through memes, sharing interesting content privately with friends, clicking a "thumbs up" icon under texts they find thought-provoking. Therefore, in trying to find young people's opinions on politics or society online, one has to read between the lines. One way of doing that is observing teenage personal blogs.

Written mostly by girls, they seem to revolve around fashion and cosmetics, but under closer inspection they reveal a range of opinions on politics and society. Their authors have a growing audience and tend to use social media promotion tools very competently, so their influence is steadily growing. They are the new digital elite, creating trends and setting an example to others.

In my paper I will present several case studies of popular Polish female teenage personal blogs. My presentation will focus on the way bloggers construct womanhood, which is not limited to looks. It is also performative (Butler 1990) and influenced, mostly unknowingly, by feminism, capitalism, materialism and other ideologies. Blog authors not only introduce their views, but also act on them, for example by cooperating or aspiring to cooperate with businesses. This raises mixed emotions among readers, who express them openly. As a result, values are constantly being negotiated between authors and readers, with private and public spheres merging and infiltrating one another.

Defining Well-Being in a Local Context: Lessons from the Field

Since the fall of communism, inequality between children from poorer and wealthier environments in Poland steadily grows. Social class and economic situation are important factors in children's possible educational and professional success (Lareau 2003), and it is also known that leisure activities differ depending on class, gender, race and age (Rojek 2010). Therefore a qualitative research was conducted in Poland to establish which leisure time activities may contribute to the later success of adolescents. It took place in one city, and in an attempt to capture as many nuances of the local dynamic as possible, interviews were conducted not only with teenagers themselves, but also with their parents and local authorities.

The results suggest that on each level definition of child's well-being is constructed differently. Local authorities are convinced they do everything they should to provide equal chances for development of young people by guaranteeing access to schools, cultural institutions and sports facilities. Yet for middle class parents this is not enough, so they put strong emphasis on extracurricular education, which in Poland is mostly private and therefore expensive, but gives an opportunity to obtain skills beneficial to children's later careers. In case of lower class parents this option is not available, so they describe success differently. Adolescents also create their own definition of welfare, which focuses much more on the present than imaginable future. Furthermore, all these definitions derive from an ever-present neo-liberal narrative. If it changed, so would the definitions.

Taking all of this into account, which elements can a researcher safely compare? In my paper I will focus on finding common areas of these definitions and underline aspects that should be treated with caution.

Theoretical Tools to Understanding Perinatal Grief from a Sociological Perspective

Perinatal grief is an important social phenomenon, yet it is rarely examined in social sciences, namely in sociology. In this presentation, I would like to explore theoretical tools in the sociology of emotions that I build upon to examine my research object: the social regulation of perinatal grief as it relates to the process of meaning-making, both in its unfolding (in institutional discourse) and in its effects (in grieving women's narratives).

To do so, I call upon two theoretical currents in the sociology of emotions: symbolic interactionism and structural sociology (Jakoby, 2012). In order to understand the process of meaning-making of perinatal grief, one needs to examine it on different levels. On the macro level, one needs to study its unfolding both in the context of the two imbricated social structures (modernity/postmodernity) and the two cultures of grief (modernism/postmodernism), as well as in its specific national setting (Walter, 2007). This allows us to better understand the modalities of the dominant discourse on perinatal grief (the way it is 'framed') and the rules that underlie its management (the way it is 'handled'). The concept of frame answers the question 'what' (what meaning to assign to grief), whereas the concept of 'management' answers the questions 'how' and 'who' (how grief should be felt and displayed (Hochschild, 1979); and who is entitled to grieve and to be grieved for – which poses the question of social recognition and introduces the concept of disenfranchised grief (Doka, 2002; Robson & Walter, 2013)).

At the micro level, one needs to examine the intermediate processes between the social regulation of grief and the experience of grieving actors, namely, the processes of motivation, alignment and emotion work (Hochschild, 1979). All these tools will hopefully give a new outlook on perinatal grief.

Between Education and Depravity. Socialisation in the School Environment

Between education and depravity. Socialisation in the school environment

According to the words of such classical sociologists as John Dewey and Florian Znaniecki, the school environment is a specially protected area in which the positive impulses which help shape young people into good citizens should be concentrated and any factors that might hinder achievement of this goal should be eliminated from this area.

In the speech the diagnosis of different types of schools existing in the Polish educational system will be established (middle school/junior high school [*GB/USA], secondary school/high school*, technical college/school*, vocational school) in terms of presence of adverse behaviours in their environment (among others: aggression among youth, aggression of pupils towards teachers, undesirable behaviours). This will allow to answer to two basic questions: 1) whether school educates more or deprives young people more? 2) which of the links of the Polish education system is more effective in achieving educational goals and which is less effective? Not only will different types of schools be analysed in one set period of time but also in various periods of time.

The obtained results will be correlated with the elements of the school normative system, which will provide an opportunity to learn about the institutional determinants of school socialisation. This will also help to answer the next question: whether those responsible for the state of the school environment take measures to strengthen or to weaken the educational effects, i.e. do they pursue the ideals of school as determined by the classics of sociology, or whether their actions go in another direction.

The presentation is based on the quantitative data collected from large samples numbering a few thousand in big Polish cities (which have a population of over 300,000 inhabitants).

ZENTNER, MANFRED* (*Donau-Universität Krems*)

PAVIC ZENTNER, VERICA* (*Social Identity Research*)

Place of Birth, Citizenship, Education or Social Surrounding – What Influences the Feeling of Belonging?

In post-modern societies, youth must develop their identities based on influences from various socialisation instances. Young people create and invent their identity in the framework of a media-, information- and network society as well as in very traditional settings like families, and extended family groups in more collectivistic societies. Especially for young people from migrant families

these influences might be conflicting and thus both enabling and hindering a harmonic integration in the host country. Particularly the feeling of belonging, the personal ethnic/national attribution irrespective of actual citizenship – especially for descendants from “new” states with common history but different recent developments – is important for evidence-based integration/migration policies.

A recent qualitative research project analysed in 12 case studies the feeling of belonging of young people in Austria with and without migrant background. Yugoslavia and its successor countries was the regional origin of many migrant families in Austria. Many children in these families grew up in the Austrian education system, in an open society, with Austrian colleagues and at the same time in a family, which was rooted in a more traditional value system. To understand the influence of both, the Austrian and the Balkan culture socialisation system, helps to understand models of integration and enables to develop support measures for integration.

The research focusses on the influences of media, traditions, religions, family, friends and education on the development of feelings of belonging framed in concepts of citizenship and political participation but also in family concepts and gender roles. The consequences of voluntary or forced migration of the parental generation from Bosnia and Herzegovina, Croatia, or Serbia, and the gender interpretations in those societies in the ambivalent relation to the Austrian host society create a mixture both of gender roles interpretations and of national/ethnic self-classification.

Mobility in the Digital Age: ICTs and the Transformation of International Migration

The widespread application of digital media or ICTs, including social media and messaging apps, among migrants has commanded much academic attention. Scholars are divided on the role of digital media in shaping migration processes and post-migration outcomes. Some scholars regard it as a revolutionary force and argue that the spread of digital media has fundamentally transformed migration and migrants, creating new patterns of mobility, new identities and transnational spaces. Conversely, others stress the limited role of digital media and see it only as a new tool of information access and communication. This paper will review the debates on the role of digital media in migration by examining three transformative changes resulting from the use of digital media: the lowering of migration and communication costs, the extension and retention of social networks, and new ways of doing businesses. We will discuss how these three changes have a bearing on the key issues in migration studies including digital divide, the empowerment of migrant workers, social integration, and transnationalism. We argue that the use of digital media has a strong effect in promoting transnationalism, but it has limited effect on bridging the digital divide, and has mixed effects (both positive and negative) on migrant labor empowerment and social integration. Our research is based on a comparative study of Chinese and Indian immigrants in Singapore.

Marketization and Market Capacity: How Is the Middle-Class Formed in China? the Cases of Beijing, Shanghai and Guangzhou

In the post-reform China, the middle class remains relatively weak despite its expanding size, which is a basic structural feature of the Chinese society. How to develop the Chinese middle class has become one important issue in the middle-class research. It is suggested that three approaches can be relied on to develop Chinese's middle class: education, expertise, and market. Based on the three approaches, as well as data from the Survey of Living Conditions of Residents in Megacities, this study analyzes how the middle class is formed in China from the perspective of marketization and market capacity.

Breaking Barriers: A Gender Comparison of Newcomer Chinese High-Skilled Workers in Japanese Enterprises

This paper aims to discuss how newcomer Chinese skilled immigrants breaking the barriers and striving the equality in Japan from the economic, social and cultural aspects under gender comparison. As a significant immigrant group in Japan, with different level of human capital and socioeconomic capital, Chinese immigrant men and women opened up their migration process with different

goals and planning after their arrival to Japan. Yet, gender barriers, employment instability even pressure of child raising strictly constrained their life qualities in Japanese labor market. For this purpose, qualitative method is utilized to discuss the gender differences of Chinese skilled newcomers in Japanese labor market. Considering the generation gap and social environment, informants are limited in first generation. We found that among these Chinese immigrant informants, women are more likely to confronting gender discrimination in Japanese enterprises. Like Japanese women, even many immigrant women entered Japanese companies as “skilled professionals”, some of them are still fell into routine duties in the end. Moreover, for those who have children, they also have to facing more obstacles such as employment instability and work-life balance. On the other hand, Chinese men are confronting socioeconomic barriers in labor force participation, such as difficulty of promotion and pressure of taking care of parents. From these findings, this study explores the quests of gender and migration in transnational social spaces. Reflecting on skilled immigrants from China, it explains their engagement in uprooting and redefining their selfhood, cultures and responsibilities as they are resettling as migrants in contemporary Japanese society. This study further reflects the similarities in their circumstances highlighting the growing salience of Chinese skilled immigrants in the different sectors their “new” social space.

Striving for Better Lives: Development of Economic Activities Among Newcomer Chinese Female Immigrants in Contemporary Japan

This study explores the quests of immigrant women in transnational social spaces. Reflecting on immigrant women from China, it explains their engagement in developing their economic activities as they are resettling as migrants in contemporary Japanese society. As a significant immigrant group in Japan, Chinese women becoming the important members of labor force, their activities and social standing may affect their migration process and willingness to stay in Japan, hence influence the Japanese labor market. Therefore, this study aims to discuss how newcomer Chinese women striving better life qualities in contemporary Japanese society from the economic and social aspects. Focusing on the interrelation between gender, migration and labor market, this study further reflects the similarities in their circumstances highlighting the growing salience of women in the different sectors their ‘new’ social space. Whereas their experiences denote their vulnerabilities attributed to conditions of social distance as well as migrancy, this study underscore the active agency of women as a gendered subject – whether in the strive of higher life quality, or in the performance of their social roles as consumer, housewives and independent business women. By draws on life stories and independent interviews, this study explains how Chinese women developing their career and social standing from “special” ways, especially for those housewives. Their economic activities as migrants in modern Japanese society also reaffirms the significance of gender.

ZHANG, JOY* (*University of Kent*)

‘Participation Is Procurement’: China’s Good Food Movement and Its Social Innovations

With the world’s largest population to feed, modernising the food system has always been a paramount socio-political concern in China. Yet my recent fieldwork in 3 Chinese cities suggests that there are two conflicting views on what a ‘modern’ food system should look like. For the government, modernisation implies a rational calculation of scale and a mirroring of global trends. Thus, good food production necessitates replacing the ‘messiness’ of small farmers with predictable, profitable and ‘professionalised’ agri-industry. Yet the irony is that the more secure Chinese domestic food production is, the less safe its food has become. With an increasing number of food scandals, an alternative interpretation of modernity promoted by grassroots NGOs has been gaining ground. Commonly set out as consumer-sponsored farmers’ markets, a handful of key groups have initiated what I call the Good Food Movement by shifting their attention to reorient consumer-producer relations. Innovative practices such as ‘participation is procurement’ have not only brought back sociability into the food production-consumption chain but also given rise to new forms of communities which cut across conventional geographic, socio-economic and political boundaries.

Drawing on the ‘varieties of modernity’ thesis (Beck and Grande) and presumption theory (Ritzer), this paper shares findings from 5 focus groups and 14 interviews with participants of the emerging Good Food Movement in China. I argue that the Movement’s impact on China’s agri-economy lies not so much in the volume and scope of its production and distribution, but in its initiation of a collective reflection over the causal relations of modern food risks in major Chinese cities. It re-conditions the role of state and society in the definition and presumption of ‘good food’.

RC04-99.6ZHANG, KUN* (*The Second Branch of Beijing Administrative College*)*Evaluations of the Income Gaps of Chinese Overseas Students: A Quantitative Study of Unintended Consequences*

Over the past several decades leaders in China have encouraged college students and graduates to attend universities in the United States and Europe in order to enrich their education and enhance the national understanding of the West. Those who study in Western universities believe that such study abroad would enhance their employability in China. Initially, overseas students had great competitive advantages when compared to domestic recent graduates and often averaged 24.7% higher incomes than that of the local labour force (Wang 2011).

However, the income gap had been narrowed in recent years. First, the accelerating globalization process and the rapid development of information technology system have provided more opportunities for local graduates to get access to knowledge resources from the western countries. Second, most of overseas students had experienced cultural-conflicts after they returned back to China as they attempted to adapt to the Chinese working and living environment. Under these circumstances, it has been increasingly difficult for overseas students to obtain jobs with high salaries and thus to recoup their investments during the process of studying abroad.

Survey data collected by the author is used to understand the following issues: (a) Identification of both internal and external reasons that lead overseas students to return China and seek job positions; (b) Understanding of the main factors that influence overseas students' income once they return to China; and (c) An understanding of the experiences of Chinese students who have studied in the West in their search for employment in China and their experiences with employers and co-workers who did not study abroad. The analysis consists of regression models with covariates to explain the factors that result in costs and benefits of overseas study and the transition to participation in the Chinese labour force.

RC09-185.1ZHANG, LU* (*Temple University*)*"Race to the Bottom" or Variegated Development? Capital Mobility and Labor Politics in China's Electronics Industry*

A key debate over globalization concerns capital mobility, labor rights, and development prospects. A popular theme in the literature is that the hyper-mobility of capital from high-wage to low-wage areas in search of cheap and pliant labor has sounded the death knell for workers' capacity for collective resistance in both Global North and Global South. In particular, it is argued that with the mobilization of China's vast reserves of cheap labor, a "race to the bottom" in workers' rights and welfare has been unleashed. Notwithstanding its popularity, the thesis that capital is necessarily footloose, and that capital mobility produces a straightforward race-to-the-bottom is suspect on both theoretical and empirical grounds. This paper examines how capital mobility interacts with labor politics and local development through a comparative case study of geographical relocation and expansion of three electronics multinationals from the Yangtze River Delta to West China. More specifically, the paper examines: How are firms' relocation decisions informed by the interactions between their positions in the global value chains (GVCs) and location-sensitive labor institutions? What role do central and local governments play in firms' relocation processes concerning labor? How does management choose to organize work and control labor? And what are workers' responses and strategies in negotiating, accommodating, and challenging management discipline? What accounts for the differences among the plants of different locations? Drawing insights from critical labor geography and GVC analysis, the evidence suggests the importance of location-sensitive labor institutions and a dynamic process of relocation, diversification, and specialization in the global electronics industry that belies many assumptions of the race-to-the-bottom argument about capital movement and labor conditions. The findings provide important insights for workers and central and local states to formulate effective strategies to attain more sustainable investment and growth in an era of globalization and capital mobility.

RC34-JS-75.4ZHANG, TIANQI* (*Kyushu University*)*Cultivating Safe Space for Queer Students in Japanese Universities*

Over the past few years, Japanese people's acceptance of homosexuality has been gradually increasing (PEW Global Research 2007, 2013) and some progress can be seen in terms of visibility of queer individuals and efforts for marriage equality. In spite of these achievements, surveys by The Life Respect White Ribbon Campaign (2014), UNESCO (2015), and Human Right Watch (2016) show that queer youth in Japan frequently reported feeling unsafe and many of them had experienced bullying at school which may lead to negative impact on their well-being.

As most of these studies focused on elementary school or high school students, not much existing literature has examined life experiences and issues of

queer students on Japanese campuses. As a matter of fact, about four-fifths of high school graduates continue their education in colleges or universities (MEXT 2012). Therefore, it is likely that queer students of universities may share similar bullying experiences as in those of elementary and secondary schools.

Historically, queer student groups function as a key resource for queer students seeking support and opportunities for activism (Beemyn 2003; Wall, Kane & Wisneski 2010). And currently, over 100 active queer student groups exist on Japan campuses (Naver Matome 2017). By analyzing surveys and in-depth interviews with queer student group leaders, participants, and people concerned about the group rules, disciplines, and activities, we aim to explain how these queer student groups function in Japanese universities. In addition, by looking at external factors, such as the involvement of international students, faculty members, institutions, social networking, off-campus events, etc., and using Actor-Network Theory as a methodology, we draw connections between different components to find out how safe space for queer university students can be cultivated.

TG08-1010.9ZHANG, TIANQI* (*Kyushu University*)*Male Homosexuality in Japan from the Perspective of the Younger Generation: An Attitudinal Study of College Students*

In spite of its long history of male-male eroticism, homosexuality is stigmatized in contemporary Japan. Public figures coming out as gay are rare, and homosexual people do not have the rights to marry or adopt children. Meanwhile, it is not uncommon to see gay TV celebrities appearing on various entertainment shows in Japan, presenting, however, only one specific and feminized facet of the broad spectrum of male homosexuality. A number of surveys have examined attitudes toward homosexuality, but they are done mostly in a Western context. This study, based on a series of surveys conducted in a national university in Western Japan, focuses on attitudes towards male homosexuality in the eyes of the younger generation. Linear regression and ANOVA analyses are applied in order to examine the possible factors that affect respondents' attitudes toward male homosexuality, specifically regarding personal background (gender, age, birthplace, family background, parental education, social status) and personal experiences (reception of sex education, contact with gay men, BL manga readership, overseas experiences, knowledge about LGBT events). The results reveal that the respondents are more accepting toward male homosexuality when it comes to providing equal opportunity in job hunting and treating homosexual men equally, and also for relationships with a lower degrees of closeness to gay men (such as having a gay friend, or having a gay teacher). Meanwhile, for questions that implied higher degrees of closeness to gay men (such as embracing a gay son) and questions related to stereotypes, medico-scientific discourse, social norms, school life and LGBT-related activities on campus, respondents' attitudes were less accepting. Furthermore, this study indicates that having contact with gay men, sex education and LGBT knowledge played positive roles in respondents' attitudes toward male homosexuality. Ultimately, this study presents an analysis of how the younger generation in contemporary Japan perceives male homosexuality.

RC22-408.2ZHAO, DONG* (*Beijing Foreign Studies University*)*Post-Modernity, Media Ecology and Contemporary Chinese Humanistic Buddhism: The Case of Beijing's Digitized Longquan Temple*

The integration of religion with new media technology is a natural outcome of post-modernity. With the increasingly manifest role of globalization, Internet and Information technologies in the evolution of Humanistic Buddhism, the era of digitized Buddhism has come. Longquan Abbot Xuecheng's carefully nurtured "research monks", "highly qualified intellectual sangha", and their self-constructed information management system marked by "managing the temple through the Internet and hyper-reality" are a holographic reflection of the proselytization and management of Humanistic Buddhist temples in post-modern China. With empirical methods of virtual ethnography and participant observation, the paper carries out a qualitative study of the management pattern and operational effects of Longquan Temple in the context of digital media, and explores the digitized monastery management and the digitized discourses in preserving the pristine Buddhist tradition amid hyper-reality proselytization, political harmony and the state governing of religions; it expounds critically the ultimate goal of Buddhism as "transforming and guiding the secular world through purification and transcendence" (Xue Cheng 2016) and the proposition that tradition continues in modernity (Tu Weiming 2010). In this sense, "the media is the message" (McLuhan 1964), the classical statement of media ecology, has been proved and reinforced in such post-modernity markers as Longquan's multi-language website, micro-blogs, cartoons, robot-monks, official we-chat accounts, and particularly in its "skillful (or controversial?) means" of digital monastery management. The paper points out that the digitized management and hyper-reality proselytization contribute to the charismatic leadership of the temple (Abbot Xue Cheng), the cohesive internal management, the public belonging, and the positive community

of the monastics, lay practitioners, volunteers, believers, temple management and state governing bodies. Admittedly, it's still debatable whether this model accords with the "new contemporary mode of Buddhist proselytization, rooted in the Buddha Dharma" (Xue Yu 2009) and meanwhile preserves the essential religiousness of a Buddhist temple.

Teaching in Spoc in Post-Mooc Era

Abstract: With development of innovative information technology, MOOCs (Massive Open Online Courses) have grown dramatically throughout the world and brought great impact on higher education. However, they also encounter some problems such as high incomplete rate and low efficiency, top universities, such as UC Berkeley and Tsinghua are trying out SPOC (Small Private Online Course), a more refined course that mixes MOOCs with campus teaching. In this paper, the author introduced the concept and practices of SPOC. It concludes that SPOC has four advantages. Firstly, it promotes the university globally and improves the learning efficiency on campus. Secondly, it saves cost and can be a sustainable way to generate revenue for universities. Thirdly, it changes the role of teachers, which leads to more effective teaching outcomes. Finally, it enables learners to experience full and deeper learning and raises the completion rate.

ZHELNINA, ANNA* (CUNY Graduate Center)

Urban "Improvement" As an Instrument of Injustice: Renewal Projects in 1950s New York and 2017 Moscow

Homes give people a sense of security. Homes are also vulnerable to political economy and the interests of big capital or state institutions. People can be pushed out of their dwellings when someone with political power decides there is a better (or more profitable) use of this land. What is a home to someone, loaded with meaning and hopes, for someone else is a piece of land that must be put to a better use. Large-scale urban renewal is a classic threat to people's homes. Urban renewal and resettlement projects are one of the forms of what Porteous and Smith call "domicide" – a "deliberate destruction of home against the will of the home dweller" (Porteous and Smith 2001, 3). In the US in the 1950s, in New York City in particular, "slum clearance" affected neighborhoods that needed improvements but also ones that looked disorderly only to the outside viewer, being efficient communities (Gold 2014, 65). In contemporary Moscow, an impressive project of "renovation," which follows the similar pattern of bulldozer redevelopment, was announced in 2017. In both cities, resistance to these projects emerged almost immediately, alongside support for renewal and relocation. In both cases, the smaller buildings were to be replaced with high-rises, changing not only where but how people lived, transforming the lifestyles and community networks. This paper will focus on the way residents mobilized in response to the renewal projects, what they were opposing or supporting, how they learned to play the political game, and what they eventually managed to achieve, sometimes correcting the initial plans of the city governments.

ZIETLOW, BETTINA* (Criminological Research Institute of Lower Saxony, Hanover)

Human Trafficking for the Purpose of Sexual Exploitation - the Unprovable Criminal Offense?

During the years 2010-2012, the EU member states have indexed 30 146 victims of human trafficking. Likewise, during that timespan there were 8551 proceedings against human traffickers held within the EU, which led to 3786 condemnatory sentences. Behind every one of those numbers, there are human fates and therefore the question arises, which strategies can be used to effectively combat human trafficking. The question does not only seek for political solutions but also for a way on how to aid the oftentimes very complex police investigation regarding human trafficking cases. The work of the judiciary is also of interest: Many proceedings are suspended by the prosecutor's office. Or in other proceedings there is no conviction.

Knowledge about victims of human trafficking can be retrieved from previous studies. Yet, no independent study has so far solely focused on research about the perpetrators. Information about the modus operandi in Germany, is rare. Also, there is little knowledge about the course of criminal proceedings. Hence, the German-Austrian joint research project "Prevention and Intervention in Human Trafficking for the purpose of sexual exploitation" (PRIMSA) will within its

framework mainly concentrate on investigating the perpetrators however, nonetheless it will also consider other questions.

Hereunto, interviews with experts will be conducted, 500 files will be analysed and perpetrators as well as sex customers will be questioned. The results of this research are presented.

These findings illustrate that there is no dominant perpetrator group. In criminal proceedings the role of witnesses appears to be difficult. Psychological knowledge plays an important role here. In addition, the lecture will discuss the circumstances in which customers are willing to help the victims of trafficking in human beings.

In addition, the findings show the influence of different emphases for example in form of subject focused commissariats or specialised prosecution offices.

ZIETLOW, BETTINA* (Criminological Research Institute of Lower Saxony, Hanover)

Outlaw Motorcycle Gangs Related Crime - Research Project

Outlaw motorcycle clubs such as the Hells Angels Motorcycle Club (MC) and the Bandidos MC are an international phenomena. Having their origin in the United States, the scene spread to Europe and Germany in the 1980s. Since the very beginning, the clubs are not only known for their easy rider mentality but also for their involvement in criminal activities and violence. From the start on it has been very difficult to determine, whether rocker clubs are criminal organizations or if they simply attract members with a high affinity to crime and violence. Comprehensive, reliable data examining the phenomenon rocker and answering this question is still missing.

In this regard, the *Criminological Research Institute of Lower Saxony (KFN)* started a research project in January 2017, funded by the *Internal Security Fund of the European Union*, investigating rocker clubs and the broad topic of "rocker crime". The focus is on outlaw motorcycle clubs, the victims of rocker criminality and the difficulties in the prosecution.

The contributed presentation will focus on first research findings and grant insight on the German outlaw bikers. Furthermore, the research project aims to give an analysis of police and judicial measures and offers the opportunity to develop new prevention strategies.

Affective Visuals in Online Spaces: Studying Social Movements in the Digital Era

Social movement scholars, whose work is at the intersection of affect, spatiality, social media, and social movements, studied mostly written texts produced and circulated online, often regarding visuals background elements and supporting materials. As the current mobile technologies introduces us to a greater number of visuals everyday, we come to interact affectively with visuals in different ways in our lives, as well as within social movements.

Depicting injustice and elevating the power of the individual to stand against it, visuals construct a central narrative through framing a socio-political message, help build collective identity and pave the way for affective social spaces where multiple actors can interact within a movement context. While going beyond their representational qualities, visuals become actants (as in Latourian terms) and the ubiquitous exposure to these images creates a simulacrum (as in Deleuzian terms) among social movement participants, as today's social media algorithms and artificial intelligence have a direct impact on what we "see" in our visual echo-chambers. Given that the Internet has grown into an important part of contemporary movements, this study suggests an experimental approach to understand how the affective potentialities of visual materials contribute to the ephemeral emergence of social spaces online within the context of social movements.

This paper looks at a selection of protest-related visuals that emerged in Turkey over the span of a decade, starting from 2007, when movement participants started using intensively social media platforms like Facebook and Twitter, as well as smartphones with more visual content. Following an experimental vein, visual frame analysis combined with affect-oriented visual methodologies and non-representational theory are the main methodological guidelines of this research.

ZILINSKIENE, LAIMA* (Vilnius University)

Family Memory in Migrant Family Research

This paper aims to test the applicability of 'family memory' in analysing how memory preserves the migrant family unity across borders. The author examines the ways shared memories give family members the sense of a shared history and allow them to cope with stigmatizing labels such as 'broken families', which appear in public and political discourses. When discussing the importance of 'family memory' as a tool to study the preservation of a sense of 'familyhood' across borders, the author appeal to Aleida and Jan Assmann's (Assmann 2008:117)

terminology of cultural and communicative memory. In these concepts, cultural memory describes past representations and their functioning in fixed cultural forms and practices, while communicative memory is a transmission of important memories through generations within family networks by means of informal communication. The author argues that intergenerational solidarity is significant to understand how meaningful contents are transmitted in transnational family practices. The paper draws on the insights of two surveys of Lithuanian residents (2013; 2017) in the network of the project financed by Research Council of Lithuania for the purpose to examine family channels (parents, grandparents, siblings, parents-in-law) and kin network channels (aunts/uncles). In studying the content of memory, the author looks at how memory channels are used to transmit information about historical traumas experienced by family and kin; meaningful family events (celebrations, weddings, funerals); family unity/ painful relationships (divorce, violence) and; changes in family and kinship networks. Considering that memories are embedded with emotions the paper examines family memory by focusing on the quality of intergenerational relations.

The Last Soviet Generation in the Contexts of Changing Modernity

The presentation will feature a portrait of the last Soviet generation. The analysis of the generation will cover the search of its specific identity and identification of limits. The presentation will be based on the comparative research of three generations - the last Soviet generation, the old and the young. In the research, biographical methodology, secondary quantitative data analysis and group discussion material are applied. The identification of these generations is examined from two perspectives. Firstly, from the perspective of generation's identification - generation's own identity, perceptions of collective "us" and images given to the generation by other generations. The generation's Soviet and post-Soviet memory of transformations and their significance to generation's identity will be presented as well. Secondly, the specificity of generations' identity will be "historically" analyzed by revealing the features identified from the researcher's viewpoint - institutionalized behavior components, which are located in life records and in the quantitative demographic type of data. The analysis will be focused on the structural changes of the generations' life course and on the institutions of modernity that determined these changes. It will be analysed how different components of modernity have determined generation's experience and how this experience is reflected in the generation. Generation's features of socialization in the late Soviet times and adaptation models in the contexts of changing modernity will be analysed giving attention to the family's institution and its role in the socialization. Empirical data consists of 80 biographical interviews and three focus groups.

Zunami: Creating Cohesion Narratives with Disintegrated Urban Communities

Contemporary crises and socio-economic divides within EU and Germany are inevitably connected to intergroup conflict and phenomena of segregate identity building, as well as to othering processes, framed through "we-and-the-others" narratives. As research shows, the limited acceptance of diversity as well as low national identification and living together-orientation are central factors causing disintegration, social exclusion and othering in German society.

Heterogeneous urban spaces face phenomena of disintegration much more intensively than rural communities. The area of the old industrial town of Dortmund is a well-known locus of social disintegration and socio-spatial segregation in Germany. The presented paper reports on the first results of a new project (ZUNAMI), which creates, tests and applies new instruments for developing effective narratives and shared understanding of societal cohesion in a concrete heterogeneous multicultural societal setting. The ZUNAMI-project normatively approaches an inclusive society as a wishful condition, and considers the effective cohesion narratives as an essential for the societal resilience in times of crises. Societal cohesion is needed in order to develop resilient social ties, functioning connectedness to the community and orientation on the community welfare. ZUNAMI is based on an action research approach towards urban societal spaces as test zones for experimental and cooperative research embedded in the diverse urban community of Dortmund and integrating current stakeholders of the socio-political microcontexts of those spaces.

The citizens of Dortmund are called for developing cohesion narratives within group workshops creating deliberative communication spaces. The participation of citizens does not solely serve the research goals, but the deliberative practice itself serves the production of the cohesion narratives. The paper seeks to present the first results of the deliberative processes and seeks to discuss and improve the mechanisms of deliberative research creating for the cohesion narratives in urban communities.

How Britain and Germany Became Risk Societies – a Comparative Analysis of Discourse-Semantic Changes of British and German Newspapers, 1960-2014

The presentation reports from an ongoing research project which examines institutional and discursive changes in Britain and Germany through the analysis of digitized newspaper archives. On the basis of a number of text corpora which are built from articles of newspapers of different style and political bias, the project examines with the help of linguistic tools fundamental social changes towards a risk society. First, it suggests conceptualizing risk society in terms of a particular discursive practice. Risk stands for a discourse which utilizes risk words which reflect and shape social practices in a particular way. The 1960s are a crucial decade for a discourse semantic shift in the news media. Since then the overall number of risk words is rapidly growing. New constructs such as 'at risk' and 'put at risk' become more common and spread across a growing number of social domains. Institutional changes such as the development of epidemiology, the introduction of risk registers and the introduction of new public (risk) management as well as the ongoing crisis of the health sector coins the themes which mobilize risk communication in the media. At the same time fundamental changes in the economic systems has sustainably changed news coverage and the reporting of risk. The project has now turned to compare the results of the UK with discourse-semantic changes in Germany. It presents most recent results of similarities and differences in the development of media discourses in the UK and Germany towards Risk Societies from 1960s to 2014.

Understanding Risk-Taking – Conceptual Considerations

Dealing with and taking risks are central issues of current societies which had been characterised by heightened debates and conflicts about risk (Beck, Giddens). Even though there is good knowledge available, policies and strategies to reduce people's risk-taking are often less successful than expected. Experts are puzzled about common people not following good advice presuming people's lack of understanding. While this might be true, in many cases a growing body of research shows, rather than being merely ignorant or misinformed, people often have good knowledge when taking risks. A growing body of research provides knowledge about the complexities, dynamics and contradictions of people's risk-taking. However, there have been little attempts to systematise this body of knowledge. This presentation contributes to such an enterprise by reviewing the growing body of qualitative studies on the meaning and practices of risk-taking. It suggests distinguishing between different motives for risk-taking, different levels of control and a number of ways how reflexivity about risk is rooted in the social realm. It also explores how risk-taking is part of developing and protecting a valued identity. The presentation concludes, across different domains there is good evidence for how structural and cultural forces combine and shape risk-taking while people take risks to develop a valued identity and to protect it. Advancing expert's understanding of risk-taking and change people's risk-taking require considering and approaching the larger social contexts and individual risk practices in everyday life.

Gender Differences in Stereotypical Attitudes and Social Distance Toward Migrant Workers

One of the consequences of globalization is the migration of workers to developed economies where they find low-paid, low-prestige employment. The issue of migrant workers in Israel has recently risen to prominence in its public discourse, where it is generally seen as a threat to Israeli society. This view is a consequence of the inevitable encounter between heterogeneous groups within Israeli society and the resultant cultural tensions. The purpose of the present study was to examine whether there exist gender differences in stereotypical attitudes and in social-distance among Israelis. We checked the hypothesis that employment of migrant workers reduces stereotypical attitudes and social-distance. The Bugardus social distance scale questionnaire and a stereotypes assessment questionnaire were distributed to 150 men (75 employers and 75 non employers) and 150 women (75 employers and 75 non employers). Unsurprisingly, we found that both women and men who employed migrant workers held more positive stereotypes of migrant workers compared to non-employers. Women tended to hold more positive stereotypes than men. As for social-distance, employers reported less social-distance compared to non-employers. No gender differences were detected, thus women's more positive stereotypes of migrant workers did not result in lower social-distance.

Muslim Minority: Sociological Aspects of Communal Violence to the Question of Institutional Accessibility to Health Care Services

This paper intends to focus on the relationship between communal violence and its impact on the accessibility of health care institutions among Muslim community. However attempt is also taken to explain the problems of accessibility beyond the dimension of communal violence. The paper is based on the empirical and sociological study of health condition of Muslims in the state erstwhile state of Andhra Pradesh. The study exposes the issues of availability and accessibility of health institution in a socio-cultural and political conditions namely during communal riots or communal outbreaks and at times terrorist attack elsewhere in any region of the Indian society and reveals the discrimination experienced at household level. The issue of access is a complex concept in the debate of public health services and at least four aspects require evaluation. If services are available and there is an adequate supply of services, then the opportunity to obtain health care exists, and a population may 'have access' to services. The extent to which a population 'gains access' also depends on financial, organizational and social or cultural barriers that limit the utilization of services. This study also tries to understand the availability and accessibility of health institutions across the three regions of erstwhile state Andhra Pradesh, i.e. Telangana, Coastal Andhra and Rayaseema. It is also noted that the availability of health institution in the state is comparatively better than some of the states but the specifically the accessibility with reference to Muslim population is subject of serious concern in the paper.

ZIYAUDDIN, KHWAJA* (MAULANA AZAD NATIONAL URDU UNIVERSITY)

Rethinking the Life and Living of Muslim Minority

The recent decades have seen how Indian Muslims have been pushed at the extreme margin of society and consequently today we refer them as minority at the margin in India. The sphere of marginalization is not merely symbolic rather the socio-economic indicators clarify the necessity to examine the life of Muslims' today. With a few exceptions, Muslims can also perform if the living and environment to the localities lived by them are improved. The paper does not merely examine the multiplicity of discrimination experienced and suffered in everyday life of Muslim community. The gravity of problem is examined in the background of locating the basic available amenities and infrastructure in Muslim concentrated areas in the state in general and Hyderabad and Sangareddy Towns in particular as a case study. Hyderabad, the capital city of Telangana has highest Muslim population (around 40%) amongst all the cities of India with exceptions to Srinagar. Second Sangareddy, as a head quarter of a district (Medak) is also taken up as one town having highest Muslim Percentage (35%) in the state, for a comparative analysis. Hyderabad, particularly old city offers a classic case of 'urban deprivation' and more specifically of 'multiple deprivations', a notion which refers not only to a lack of infrastructure and facilities but also to poor education and training, low income, poor diet and hygienic conditions leading to low efficiency and ability to enhance incomes. The present paper analyses the living environmental conditions and infrastructure facilities in Hyderabad and compare the situation between the old city and new city areas from social exclusion perspective.

When Ethnicity Is a Problem. French Commercial Polarities within Deprived Suburbs.

This paper will question current renewal of disadvantaged suburbs in France (Busquet, Hérouard and Saint-Macary 2016) and especially the lack of attention of the commercial infrastructures within these areas. Our hypothesis is that these commercial infrastructures are perceived as too strongly ethnicized and therefore, according to French republican philosophy (Favell, 2016), an obstacle to political and economic integration.

Since 2003, urban renewal of disadvantaged neighborhoods in France has been based on the principle of demolition and reconstruction. As these neighborhoods have become hosts to post-colonial immigration, many French politicians wish to de-ethnicize them. Ethnicization is often equated to ghettoization (Lapeyronnie 2008). This includes shopping facilities and commercial local infrastructures, which strongly contribute to ethnicizing the image of these neighborhoods (Rath 2009).

However, some of the commercial polarities threatened by demolition enjoy great economic vitality. This is particularly the case for Mas du Taureau in Vaulx-en-Velin, a city emblematic of French deprived suburbs. This paper will show that commercial polarity located in the heart of Mas du Taureau is highly dynamic and radiates on the metropolitan level. Moreover, this polarity approaches the standards of super diversity as defined by Steven Vertovec (2007), and then by Sharon

Zukin (2015). We will question the inability of stakeholders engaged in the renewal of these neighborhoods to apprehend this economic dynamism as well as this super-diversity, and to focus instead on an ethnicity considered as closed on itself.

The paper will be based on a thesis undertaken since April 2015. A survey of a hundred interviews was carried out with public decision-makers, traders, consumers, residents and associations. In order to give a counterpoint to this French case, a survey of about twenty interviews was also conducted on a peripheral neighborhood of Montreal.

Child Labor in the Triple Frontier between Argentina, Brasil and Paraguay.

The practices included under the category of child labor, including their "worst forms", acquire a distinctive character in a transboundary peripheral region and diverse socio-territorial dynamics enable their reproduction. This work analyzes the processes that permeate these practices in the Triple Border between Argentina, Brazil and Paraguay. The imbrication between global and local dimensions configures an interconnected and diverse space marked by inequality and asymmetries in the opportunities it offers to tourists-consumers and to the inhabitants of the periphery. Child exploitation associated with tourism and trade activities is present in the region, although there are no updated figures in this regard due to the diversity of causes that make it difficult to measure them. Thousands of children are forced to work from an early age, in activities ranging from household chores at home, to sexual exploitation in conditions of slavery. Based on the above, we propose that delimiting the specificity of child labor in the region is a necessary preliminary step for the development of strategies aimed at its prevention and eventual eradication.

La Crisis De Representación De Los Dueños Del Poder En México. Los Partidos Políticos Tradicionales y Su Aportación a La Democracia Mexicana

¿La era de la democracia de partidos ha pasado? Esta comunicación busca rescatar el valor del partido político tradicional mexicano como institución clásica de la representación política y manifestación institucional de la opinión pública frente a los duros ataques a que la doctrina lo ha sometido.

Es un estudio que ofrece un intento de comprensión sobre la llamada "crisis de la representación", en momentos dignos de atención para el sistema de partidos mexicano: la primera gran derrota del partido hegemónico en la elección presidencial del año 2000 y su regreso a encabezar la primera posición política del Estado mexicano –la presidencia de la República– en el año 2012.

Analiza desde la ciudadanía mexicana la evolución o involución del sentimiento de la representación, tomando como estudio de caso a los principales partidos políticos tradicionales en términos de representatividad: Partido Revolucionario Institucional (PRI), Partido Acción Nacional (PAN) y Partido de la Revolución Democrática (PRD). Asimismo, se ofrecen algunas consideraciones útiles para el fortalecimiento de dichas instituciones y del sistema democrático representativo en México a través de la Opinión Pública y la Comunicación Política.

Una Consecuencia Del Pesimismo Imperante Encuadrado En El Imaginario Social Mexicano Hacia Los Partidos Políticos Tradicionales: La Privatización De La Socialización Política Partidista.

¿La era de la socialización política partidista ha pasado? Esta comunicación busca rescatar la función de socialización del partido político tradicional mexicano como pedagogo y formador de la sociedad política en su conjunto frente al desafío de la aparente mediatización de la socialización política.

Es un estudio que ofrece un análisis sobre la evolución o involución de la capacidad de los partidos políticos tradicionales mexicanos (PRI, PAN y PRD) para generar valores sobre lo político, visiones del papel de los sujetos en la política, así como opiniones sobre las dinámicas del sistema político y de las instituciones y actores del mismo en momentos dignos de atención para el sistema de partidos mexicano: la primera gran derrota del partido hegemónico en la elección presidencial del año 2000 y su regreso a encabezar la primera posición política del Estado mexicano – la presidencia de la República– en el año 2012.

Los datos disponibles evidencian que la incesante negatividad implantada en el imaginario social mexicano hacia dichas formas de socialización tradicionales pudiera estar relacionada con una eventual usurpación de funciones.

La ciudadanía, sociedad política y el Estado mexicano demandan un cambio organizacional en la estructura de las campañas de comunicación de estas instituciones clásicas de representatividad. Buscamos ofrecer algunas consideraciones útiles para el fortalecimiento de la socialización política partidista desde la Opinión Pública y la Comunicación Política con correcciones que pudieran hacerla más cercana, sensible y eficiente.

Construct Equivalence, Probe Questions and Comparability of the Left-Right Scale in a Cross-National Perspective

Equivalence in survey design and implementation is one of the core issues in cross-national survey research. Construct equivalence dealing with the theoretical validity of concepts measured by survey questions and item batteries is a pre-requisite for meaningful cross-national analyses and comparisons where respondents are socialized in different political, social and cultural contexts. Thus the same interpretation of concepts cannot be taken for granted.

Our paper is about construct equivalence of the left-right scale in a cross-national perspective. The left-right scale is a standard question used to measure ideological orientation in a minimalist way. However, the theoretical concepts related to left and right might differ across countries. Variation in the understanding of left and right is a comparability issue if the variation is systematic in different contexts.

To test the understanding of the left-right scale in cross-national context, we have asked about respondents' individual associations with the terms left and right by using open-ended questions in an experimental online survey fielded in Canada, Denmark, Germany, Hungary, Spain, and the U.S. in 2011. We have coded open-ended answers using an extensive coding scheme and we have tested whether the similar empirical relations and ideological dimensions can be found across countries. Similarity in this respect is interpreted as evidence supporting the hypothesis of measurement equivalence.

In a first step of cross-national analyses we concentrate on the ranking of frequencies of individual answers and on the link between left-right self-placement and open-ended questions. Results of this analysis show that respondents from different countries do not have the same ideas in mind when considering what left and what right mean for them. These results challenge the comparison error of the left-right scale because responses have different meanings in different cultural contexts and conclusions based on such comparisons might be wrong.

Seeing like a Drone: The Politics of Droneviewing

In this paper we explore the politics of the drone video production. Despite the growing literature on the use of drones as technological devices, the visual production side of the drone has been largely ignored. We explore the three distinct communities of practice and *scopic regimes*: military (and militant), activist (civil) and tourist. We explore the underlying power relations and *visual grammar* in each of these three drone-aided scopic regimes and suggest the agenda for the future visual sociological research on drones and drone produced imagery.

ZUGAYAR, MALIHA* (*The Hebrew university of Jerusalem*)
The Role of Developers in 'Vertical Slums'

Although the built-form of slums has been rather extensively reviewed, examination of the role of developers in slum-formation is much more limited. This paper examines developer involvement in the emerging form of 'vertical slums'. Vertical slums arise from a combination of four factors: limited enforcement of planning regulations, lack of public infrastructure, high costs of land and high demand for housing. Under these conditions, developers and investors have little incentive to adhere to quality and safety standards.

The paper presents findings from a detailed case study including in-depth interviews with twenty developers. The case study site of Kufar Aqab includes about 80,000 residents living in high rise standard apartment buildings of up to 15 storeys, with limited infrastructure and non-existent public services or law enforcement. The suburb lies within the municipal boundaries of Jerusalem but on the Palestinian side of the separation wall, a combination which prevents Israeli enforcement of building codes, and encourages housing demand among Palestinians.

The interviews found that trust is an important factor, since there is no enforcement mechanism to ensure repayment of loans, or building quality. Developers reported surprising adaptations of plans in order to profit, including moving to mass-production, changing tenure from ownership to rental, and reducing build-

ing height. Some developers went bankrupt and others choose to quit during construction. Overall, while pursuit of profit, linked with politics, is a key force shaping this urban space into a vertical slum, it turns out that the role of trust and community organizing are also important contributing factors.

Aging Women Migrants and Trans/National Citizenship in Japan

This paper looks at aging migrants in Japan, particularly focusing on the Filipino population, currently the third largest migrant group in Japan. While Philippine migration to Japan occurred since the pre-war years, the largest migration stream to the country was seen beginning in the late 1970s to the early 1980s, with the entry of females to work in the entertainment industry. Several years later, these women married Japanese men and began to have families, with a large number of them choosing to settle in their host country. These women have now reached their 50s and 60s and their children have become adults.

For this exploratory study, I look at the Catholic Church community in Japan and how it plays into these women's lives. More specifically, I look into the issue of trans/national citizenship among these women in the context of the church community and church participation. Unlike other migrants who are known to occupy enclaves and migrant communities, Filipinos do not occupy such; rather most of them converge in churches and centres of worship, mostly on Sundays. While legal and permanent residents in Japan enjoy social citizenship to a certain extent, for this study I examine how church participation has enabled these aging migrants to engage in trans/national citizenship practices that addressed other needs (i.e. spiritual, emotional) that may not be available to them in the host country.

For this study, I look at the case of these women in the Tokyo metropolitan area. Analyses are based on key informant interviews of church personnel, as well as the Filipino women themselves. This study aims to re-think notions of citizenship and migration through examining the case of aging women migrants.

Multiculturalism in a Base Town: The Case of Okinawa City in Japan

Okinawa City, in Okinawa Prefecture in Southern Japan, currently hosts six U.S. military installations – Kadena Airbase, Kadena Ammunition Storage Area, Camp Shields, Awase Communication Site, Camp Zukeran, and the Army Oil Storage Facility. From a typical base town, the city formerly known as Koza, began to take on a multicultural character with the influx of other foreign nationalities in recent years. The American presence notwithstanding, Okinawa City, with a population of 141,677, is currently host to 1,448 foreign residents (as of September 2017) from 45 countries. While most of the residents in this base town are Americans, there are significant numbers of Chinese, Filipinos, Koreans, Indians, and Peruvians, among others.

This study looks at community-level multicultural policies by focusing on the case of Okinawa City, a major city in Okinawa Prefecture that is host to several U.S. military facilities. For this study, I conducted key informant interviews with members and the vice-president of the Okinawa City International Association (OCIA), an association that is supported by the city government. I also interviewed and spoke to other foreign residents. Based on analyses of data gathered, I explore issues as to why multicultural policies seem to have fallen short to create a more inclusive community by arguing that the foreign residents themselves are not taking part or could not take part in these efforts, reasons for which may be connected to visa and residence status, Japanese language proficiency, and group empowerment. Moreover, I look into efforts made by both local (Japanese/Okinawan) and foreign residents in addressing this gap, and with this, I also examine how multiculturalism can contribute to the rejuvenation of cities, including militarized ones.

ZUPANČIČ, ROK* (*University of Graz, Centre for Southeast European Studies*)

Evaluating the EU Normative Power in the North of Kosovo: A Critical Appraisal

The paper evaluates the impact of the EU as a normative power actor in the north of Kosovo. The EU, as one of the most active international actors engaged in Kosovo, has set the stabilization of Kosovo as one of its priority foreign policy goals already in 1999. After the signature of the EU-brokered Brussels Dialogue (2013) between the governments in Serbia and Kosovo, the majority of the EU efforts focused on the north of Kosovo - the territory populated predominantly by the Serbs, who have been resisting to become recognized as a part of the state of Kosovo since 1999. Building on extensive field-work in the north of Kosovo (interviews & focus groups), the paper argues that the recent EU efforts

, which have been mostly focused on big infrastructure projects and civil society programmes, actually act against the desire of the EU to be recognized as “a normative power actor”, which, according to I. Manners, has “an ability to shape conceptions of normal” in international relations.

Doping As Moral Panic. Performance Enhancement and the Lost Values of a Better World.

„Doping is unfair!“ Most athletes would agree to that statement. Although known to sports since its organised beginnings at the end of the 19th century, reactions to it have changed, what once was frowned upon, today qualifies as a felony. What happened and how could doping practices become and be turned into moral panics, said to call into question societal values beyond sports?

Based on qualitative interviews with German athletes, I want to discuss why the discourse of doping, aimed at the “few” elite-athletes to whom the WADA anti-doping rules apply (roughly 7,000 in Germany), could be used to construct a moral panic that lead to a new criminal law against such practices. Why is doping so much more than regular norm breaking within sports, such as foul play for?

I will analyse the discursive basis of the anti-doping fight, i.e. the so called values of sports, which seem to represent a better world, where fairness rules, where nature overcomes culture, where humankind returns to its true spirits and virtues. Doping as its anti-thesis jeopardize such an ideal world.

I will argue that such a discourse using doping as moral panic, actually serves an industry in which those values are mere selling arguments, appealing to an audience that longs for a perfect world. A moral panic that portrays performance enhancement by (illegal) medical substances as threatening to the values of society is basically an infatuation of the capitalist conditions under which sport is performed. Doping as moral panic helps to support the myth of clean and fair sport that is actually in stark contradiction to sport in a world of consumer capitalism.

I will also discuss the possible positive effects of such a moral panic, if its reference „the true values of sports“ are redefined.

From Chaux to Google: Consuming Surveillance and the Ambient Powers of Big Data.

The so called ideal city of Chaux, built in 18th century France, represents what has become known since of as panoptic surveillance. Other than in Bentham's ideal prison however, surveillance was not only performed through a panoptic gaze, but by control of the inhabitants' everyday life, i.e. by controlling their consumption, regulating their possibilities in a small and easy to overlook environment.

250 years later such environments have vanished, but not the idea to control the possibilities of citizens via their role as consumers. But as much as this means to track what we consume, it also means that we must consume surveillance, i.e. surveillance becomes part of our consumption habits, becomes a good in itself. Hence surveillance as “big data” becomes ambient, an integral part of our lives, maybe a feature of distinction, if to be surveilled may mean to be especially cared for.

Exploring the consequences of what it means when surveillance ceased to be a distinctive practice of power, but becomes an item of consumption, I want to look at the following questions:

- If we consume surveillance, how is power organised and can it be made visible?
- If power means to manage norms and possibilities, how can this be observed under the conditions of consumerism?
- What does it mean for social justice, when surveillance separates and sorts populations, not necessarily implying that being under surveillance is a condition of the powerless.
- Introducing the concept “Consuming Surveillance” I want to discuss how life chances are affected under the dispositive of the „good life“, eventually stripping citizens of their rights and rendering them into powerless consumers.

So has Google become the new Chaux, albeit much more ambient and with less obvious control mechanisms, i.e. by seemingly free and unlimited choices of the same?

Labor, Leisure, and Well-Being from a Historical and Empirical Perspective

Relationships between individual happiness, societal well-being and the use of time, labour, and leisure, have attracted the attention of philosophers and writers since the times of Antiquity. In the first part of the paper, relationships between the role assigned to work and leisure, and subjective as well as societal well-being will be examined from a historical perspective. The views of Aristotle, Thomas Aquinas, Montaigne, Pascal, Tocqueville, Marx, Durkheim, Weber and selected authors of the 20th century will be commented upon. In the second part of the paper, time-use data from the 1986 to 2010 Canadian General Social Surveys and the Experience sampling surveys (ESM), conducted between 1985 and 2003 by the Research Group on Leisure and Cultural Development at the University of Waterloo, will be used to empirically test propositions about the relationships between work, leisure, and well-being advanced by the authors, commented upon in the historical part of the paper. Correlations of time allocated to paid work and leisure with subjective well-being and importance attributed to performed activities will be examined in an attempt to demonstrate that the relationships between labour, leisure and well-being are not “unilineal” and the well-being borderline runs not *between* labor and leisure, but *within* them. When analyzing relationships between time-use and its experiential connotations, the type of work, subgroups of leisure activities, age, gender, occupational status, and education will be used as control variables. Since the ESM surveys contains data for the freedom of choice in selecting performed activities and the amount of personal control over the situation, these variables will also be controlled for.

The Truth about Undercutting: Migration and Its Long-Term Impact upon Labour Market Outcomes of White British and Minority Workers

Increasing migration is often blamed for affecting British jobs negatively, through undercutting their earnings and/or conditions of work. Politicians from both the left and right are eager to address these concerns, which dominate public discourse. This negative view is not necessarily supported by research however which shows an overall positive effect on earnings; although the pay of workers at the bottom is negatively affected. This paper studies different aspects of work, including the security and tenure of work and job quality to build a comprehensive picture of the impact of migration. Importantly, we control for characteristics of the regional labour markets and occupational segregation.

We make use of longitudinal data from the British Household Panel Study and Understanding Society to study how sectoral changes in exposure to migrants, estimated from the UK Labour Force Survey, shape labour market experiences of individuals over time. We make use of the inflow of migrants due the eastwards expansions of the European Union in 2004 and later in 2007 when access to Romanian and Bulgarian migrants was limited to self-employment and certain sectors up until 2014. We use this exogenous variation in migrant inflows, which affected areas with pre-existent migrant communities more, to estimate the long-term effect on individuals' career using difference-in-difference and longitudinal methods. We pay specific attention to the question of who is being affected by increasing migrant inflows as migrants may not be perfect substitutes for the majority, in which case the majority may benefit from an inflow of migrants, while more vulnerable groups such as ethnic minorities and other migrants suffer from the increased competition. Preliminary results indicate that an increase in migrant exposure in the regional sector leads to lower job security and worse employment conditions.
